# TRAVEO™ T2G Automotive MCU: TVII-B-H-16M body controller high registers

## Reference manual

## About this document

### Scope and purpose

The TRAVEO™ T2G body controller high registers reference manual provides reference information for registers and contains respective programming details.

### Intended audience

This manual is for system designer and programmers who are designing or programming using TVII-B-H-16M parts.

# Definitions

## Register Permission

The following table lists the register permission based on protection context and priviledges.

| Permission | Description |
|---|---|
| READ | User mode = Read access, privilege mode = Read access, Non-secure = yes |
| PRIVILEGE - WRITE | User mode = Read access, privilege mode = Read and Write access, Non-secure = yes |
| NO-ACCESS | User mode = No access, Privilege mode = No access, Non-secure = yes |
| SECURE - READ | User mode = Read access, Privilege mode = Read access, Non-secure = No |
| FULL | Read and Write access in all modes, Non-secure = yes |

## Software Access

The following table lists the behavior of registers, on various Software Read/Write Accesses.

| SW Access | HW Access | Software Reads Register | Software Writes Register | Software Description |
|---|---|---|---|---|
| R | any | Register contents | Ignored | Software read-only |
| RW | any | Register contents | Register takes data written | Software read and write |
| RW1S | any | Register contents | Every bit is set upon writing 1 | Software read and write 1 to set |
| RW0S | any | Register contents | Every bit is set upon writing 0 | Software read and write 0 to set |
| RW1C | any | Register contents | Every bit is cleared upon writing 1 | Software read and write 1 to clear |
| RW0C | any | Register contents | Every bit is cleared upon writing 0 | Software read and write 0 to clear |
| RW1SC | any | NA | NA | Illegal |
| RW0SC | any | NA | NA | Illegal |
| W | any | Zero | Register takes data written | Software write only |
| W1S | any | Zero | Every bit is set upon writing 1 | Software write 1 to set (no read) |
| W0S | any | Zero | Every bit is set upon writing 0 | Software write 0 to set (no read) |
| W1C | any | Zero | Every bit is cleared upon writing 1 | Software write 1 to clear (no read) |
| W0C | any | Zero | Every bit is cleared upon writing 0 | Software write 0 to clear (no read) |
| W1SC | any | NA | NA | Illegal |
| W0SC | any | NA | NA | Illegal |
| A | any | NA | NA | Illegal |

## Hardware Access

The following table lists the behavior of registers, on various Hardware Read/Write Accesses.

| HW Access | SW Access | Hardware Description |
|---|---|---|
| any | R | Hardware read only |
| any | RW | Hardware read and write |
| any | RW1S | Hardware read and set |
| any | RW0S | Hardware read and set |
| any | RW1C | Hardware read and clear |
| any | RW0C | Hardware read and clear |
| any | RW1SC | Hardware read and set/clear |
| any | RW0SC | Hardware read and set/clear |
| any | W | Write access only |
| any | W1S | Hardware set |
| any | W0S | Hardware set |
| any | W1C | Hardware clear |
| any | W0C | Hardware clear |
| any | W1SC | Hardware set/clear |
| any | W0SC | Hardware set/clear |
| R | A | Not supported |
| RW | A | Hardware read and write |
| RW1S | A | Hardware read and set |
| RW0S | A | Hardware read and set |
| RW1C | A | Hardware read and clear |
| RW0C | A | Hardware read and clear |
| RW1SC | A | Not supported |
| RW0SC | A | Not supported |
| W | A | Not supported |
| W1S | A | Not supported |
| W0S | A | Not supported |
| W1C | A | Not supported |
| W0C | A | Not supported |
| W1SC | A | Not supported |
| W0SC | A | Not supported |

## Core, Bus and Memory Access

The Cortex-M7 CPUSS uses AHB-Lite also for the system interconnect. Most of the IPs are compliant to the AHB-Lite protocol.

The AHB-Lite protocol is little endian; the least significant byte of a word is mapped onto the word's lowest byte address IPs use a bus data width of 32 bit.

This allows for byte (8-bit), halfword (16-bit) and word (32-bit) transfers. We distinguish two types of transfer types:

- MMIO registers: These registers are typically used for IP control and status information. Unless otherwise noted, transfers to these registers must be 32-bit transfers; any other transfer size generates an AHB-Lite bus error. An IP's MMIO registers do not necessarily fully occupy a consecutive memory region; i.e. holes may be present in the region
- Memory structures: This includes generic memory structures, such as system FLASH, system RAM and system ROM, but also IP specific memory structures. Transfer to these memory structures may be 8-bit, 16-bit or 32-bit transfers; any other transfer size generates an AHB-Lite bus error. A memory structure fully occupies a consecutive memory region; i.e. no holes are present in the memory structure region

A bus slave memory region may contain both MMIO registers and zero or more memory structures. Gaps might exist in the bus slave's memory region, either due to gaps in the MMIO memory region or gaps between the MMIO and memory structure region(s)

Gaps in the address space are reserved. Do not access these gaps, if accessed can result in Hard faults or BUS ERROR depending on which bus segment or a peripheral an address space is allocated to.

# List of Partnumber

This TRM is valid for the following part numbers.

| MPN | Package | Code Flash(KB) | Work Flash(KB) | SRAM(KB) |
|---|---|---|---|---|
| CYT6BJ8DES | 176-TEQFP-QC | 16768 | 512 | 2048 |

## 1.1 Register Details

### 1.1.1 BACKUP_CTL

**Description:** Control
**Address:** 0x40270000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | WCO_EN [3:3] | None [2:0] | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:14] | | PRESCALER [13:12] | | None [11:10] | | CLK_SEL [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:17] | | | | | | | WCO _BYPASS [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 3 | WCO_EN | RW | A | 0 | Watch-crystal oscillator (WCO) enable. If there is a write in progress when this bit is cleared, the WCO will be internally kept on until the write completes. After enabling the WCO software must wait until STATUS.WCO_OK=1 before configuring any component that depends on clk_lf/clk_bak, like for example RTC or WDTs. Follow the procedure in BACKUP_RTC_RW to access this bit. |
| 8:9 | CLK_SEL | RW | A | 0 | Clock select for RTC clock |
| | WCO | | | 0 | Watch-crystal oscillator input, available in Active, DeepSleep, Hibernate, and XRES. |
| | ALTBAK | | | 1 | This allows to use the LFCLK selection as an alternate backup domain clock. Note that LFCLK is only available in Active and DeepSleep power modes. Note that LFCLK clock glitches can propagate into the backup logic when the clock is stopped. For this reason, if the WCO or ILO is intended as the clock source then choose it directly instead of routing through LFCLK. |
| | ILO | | | 2 | Internal Low frequency Oscillator, available in Active, DeepSleep, Hibernate, and XRES. For Hibernate operation CLK_ILO_CONFIG. ILO_BACKUP must be set. If there are multiple ILO, this is ILO0. |
| | LPECO_PRESCALER | | | 3 | Low-power external crystal oscillator prescaler output, available in Active, DeepSleep, Hibernate, and XRES. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 12:13 | PRESCALER | RW | A | 0 | Prescaler for real time clock used when WCO_BYPASS=1 and CLK_SEL = WCO. Configure this field before enabling the WCO, and do not change this setting when WCO_EN=1.<br>0: 32768 Hz square wave. Connect a 32768 Hz square wave to WCO output pin. Do not connect WCO input pin.<br>1: 60 Hz sine wave. Connect an AC-coupled sine wave to WCO input pin. Do not connect the WCO output pin at the board level. When connecting to 120V, 60Hz mains, use a capacitive divider with 2.2nF (200V) from mains to WCO input and 220nF (6V) from WCO input to ground.<br>2: 50 Hz sine wave. Connect an AC-couple sine wave to WCO input pin. Do not connect the WCO output pin at the board level. When connecting to 220V, 50Hz mains, use a capacitive divider with 1nF (250V) from mains to WCO input and 220nF (6V) from WCO input to ground.<br>3: reserved |
| 16 | WCO_BYPASS | RW | A | 0 | Configures the WCO for different board-level connections to the WCO pins. For example, this can be used to connect an external watch crystal oscillator instead of a watch crystal. In all cases, the two related GPIO pins (WCO input and output pins) must be configured as analog connections using GPIO registers, and they must be hooked at the board level as described below. Configure this field before enabling the WCO, and do not change this setting when WCO_EN=1.<br>0: Watch crystal. Connect a 32.768 kHz watch crystal between WCO input and output pins.<br>1: Clock signal, either a square wave or sine wave. See PRESCALER field for connection information. |

### 1.1.2 BACKUP_RTC_RW

**Description:** RTC Read Write register
**Address:** 0x40270008
**Offset:** 0x8
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain but reset in DEEPSLEEP.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | WRITE [1:1] | READ [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | READ | RW | A | 0 | Read bit<br>When this bit is set the RTC registers will be copied to user registers and frozen so that a coherent RTC value can safely be read. The RTC will keep on running.<br>Do not set the read bit if the RTC is still busy with a previous update (see RTC_BUSY bit) or if the Write bit is set. Do not set the Read bit at the same time that the Write bit is cleared. |
| 1 | WRITE | RW | A | 0 | Write bit<br>Only when this bit is set can the RTC registers be written to (otherwise writes are ignored). This bit cannot be set if the RTC is still busy with a previous update (see RTC_BUSY bit) or if the Read bit is set or getting set.<br>The user writes to the RTC user registers, when the Write bit is cleared by the user then the user registers content is copied to the actual RTC registers.<br>Only user RTC registers that were written to will get copied, others will not be affected.<br>When the SECONDS field is updated then TICKS will also be reset (WDT is not affected).<br>When the Write bit is cleared by a reset (brown out/DeepSleep) then the RTC update will be ignored/lost.<br>Do not set the Write bit if the RTC if the RTC is still busy with a previous update (see RTC_BUSY). Do not set the Write bit at the same time that the Read bit is cleared. |

### 1.1.3 BACKUP_CAL_CTL

**Description:** Oscillator calibration for absolute frequency
**Address:** 0x4027000C
**Offset:** 0xC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain. Calibration only works when the PRESCALER is set to 32768. Writes are ignored unless Write bit is set
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:7] | CALIB_SIGN [6:6] | CALIB_VAL [5:0] | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:18] | | | | | | CAL_COMP_PER_MIN [17:16] | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | CAL_OUT [31:31] | None [30:30] | CAL_SEL [29:28] | | None [27:24] | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:5 | CALIB_VAL | RW | A | 0 | Calibration value for absolute frequency (at a fixed temperature). Each step causes 128 ticks to be added or removed each hour. Effectively that means that each step is 1.085ppm (= 128/(60*60*32,768)) when CAL_COMP_PER_MIN is set at default value. Positive values 0x01-0x3c (1..60) add pulses, negative values remove pulses, thus giving a range of +/-65.1 ppm (limited by 60 minutes per hour, not the range of this field) when CAL_COMP_PER_MIN is set at default value .<br><br>Calibration is performed hourly, starting at 59 minutes and 59 seconds, and applied as 64 ticks every 30 seconds until there have been 2*CALIB_VAL adjustments when CAL_COMP_PER_MIN is set at default value . |
| 6 | CALIB_SIGN | RW | A | 0 | Calibration sign:<br>0= Negative sign: remove pulses (it takes more clock ticks to count one second)<br>1= Positive sign: add pulses (it takes less clock ticks to count one second) |
| 16:17 | CAL_COMP_PER_MIN | RW | A | 0 | Select how many time calibration is performed per minute per step of 64 , each time a 64 step is added or substracted one unit 2/4/8/16*CALIB_VAL is substracted. |
| | 2 | | | 0 | Calibration of 64 each is performed twice per minute for 2*CALIB_VAL per hour |
| | 4 | | | 1 | Calibration of 64 each is performed four times per minute for 4*CALIB_VAL per hour |
| | 8 | | | 2 | Calibration of 64 each is performed eight times per minute for 8*CALIB_VAL per hour |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| | 16 | | | 3 | Ca6libration of 64 each is performed sixteen times per minute for 16*CALIB_VAL per hour |
| 28:29 | CAL_SEL | RW | A | 0 | Select calibration wave output signal |
| | CAL512 | | | 0 | 512Hz wave, not affected by calibration setting (not supported for 50/60Hz input clock: CTL.PRESCALER!=0) |
| | RESERVED | | | 1 | N/A |
| | CAL2 | | | 2 | 2Hz wave, includes the effect of the calibration setting, (not supported for 50/60Hz input clock: CTL.PRESCALER!=0) |
| | CAL1 | | | 3 | 1Hz wave, includes the effect of the calibration setting (supported for all input clocks) |
| 31 | CAL_OUT | RW | A | 0 | Output enable for wave signal for calibration and allow CALIB_VAL to be written. |

### 1.1.4 BACKUP_STATUS

**Description:** Status
**Address:** 0x40270010
**Offset:** 0x10
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | WCO_OK [2:2] | None [1:1] | RTC_BUSY [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ALARM1 | RW1C | RW1S | 0 | Alarm 1 Interrupt |
| 1 | ALARM2 | RW1C | RW1S | 0 | Alarm 2 Interrupt |
| 2 | CENTURY | RW1C | RW1S | 0 | Century overflow interrupt |

### 1.1.12 BACKUP_INTR_SET

**Description:** Interrupt set request register
**Address:** 0x40270030
**Offset:** 0x30
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain. Allows setting interrupts for firmware testing.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | CENTURY [2:2] | ALARM2 [1:1] | ALARM1 [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ALARM1 | RW1S | A | 0 | Write with '1' to set corresponding bit in interrupt request register. |
| 1 | ALARM2 | RW1S | A | 0 | Write with '1' to set corresponding bit in interrupt request register. |
| 2 | CENTURY | RW1S | A | 0 | Write with '1' to set corresponding bit in interrupt request register. |

### 1.1.13 BACKUP_INTR_MASK

**Description:** Interrupt mask register
**Address:** 0x40270034
**Offset:** 0x34
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain. When Mask bit is set the interrupt is enabled.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | CENTURY [2:2] | ALARM2 [1:1] | ALARM1 [0:0] |

|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ALARM1 | RW | R | 0 | Mask bit for corresponding bit in interrupt request register. |
| 1 | ALARM2 | RW | R | 0 | Mask bit for corresponding bit in interrupt request register. |
| 2 | CENTURY | RW | R | 0 | Mask bit for corresponding bit in interrupt request register. |

### 1.1.14 BACKUP_INTR_MASKED

**Description:** Interrupt masked request register
**Address:** 0x40270038
**Offset:** 0x38
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain. When read, this register reflects a bitwise and between the interrupt request and mask registers.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | CENTURY [2:2] | ALARM2 [1:1] | ALARM1 [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ALARM1 | R | RW | 0 | Logical and of corresponding request and mask bits. |
| 1 | ALARM2 | R | RW | 0 | Logical and of corresponding request and mask bits. |
| 2 | CENTURY | R | RW | 0 | Logical and of corresponding request and mask bits. |

### 1.1.15 BACKUP_RESET

**Description:** Backup reset register
**Address:** 0x40270048
**Offset:** 0x48
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is used to reset the backup domain from firmware.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | RESET [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 31 | RESET | RW1S | A | 0 | Writing 1 to this register resets the backup logic. Hardware clears it when the reset is complete. After setting this register, firmware should confirm it reads as 0 before attempting to write other backup registers. |

### 1.1.16 BACKUP_BREG

**Description:** Backup register region
**Address:** 0x40271000
**Offset:** 0x1000
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** These bits are in vddbak domain. Backup memory
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | BREG [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | BREG | RW | A | 0 | Backup memory that contains application-specific data. Memory is retained on vbackup supply. |

# 2 CANFD

## 2.1 CANFD 0

**Description** CAN Controller
**Base Address** 0x40520000
**Size** 0x20000
**Slave Num** MMIO5 - 1

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CANFD0_CTL | 0x40521000 | FULL | Global CAN control register |
| CANFD0_STATUS | 0x40521004 | FULL | Global CAN status register |
| CANFD0_INTR0_CAUSE | 0x40521010 | FULL | Consolidated interrupt0 cause register |
| CANFD0_INTR1_CAUSE | 0x40521014 | FULL | Consolidated interrupt1 cause register |
| CANFD0_TS_CTL | 0x40521020 | FULL | Time Stamp control register |
| CANFD0_TS_CNT | 0x40521024 | FULL | Time Stamp counter value |
| CANFD0_ECC_CTL | 0x40521080 | FULL | ECC control |
| CANFD0_ECC_ERR_INJ | 0x40521084 | FULL | ECC error injection |

### 2.1.1 CH 0

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CANFD0_CH0_RXFTOP_CTL | 0x40520180 | FULL | Receive FIFO Top control |
| CANFD0_CH0_RXFTOP0_STAT | 0x405201A0 | FULL | Receive FIFO 0 Top Status |
| CANFD0_CH0_RXFTOP0_DATA | 0x405201A8 | FULL | Receive FIFO 0 Top Data |
| CANFD0_CH0_RXFTOP1_STAT | 0x405201B0 | FULL | Receive FIFO 1 Top Status |
| CANFD0_CH0_RXFTOP1_DATA | 0x405201B8 | FULL | Receive FIFO 1 Top Data |

#### 2.1.1.1 M_TTCAN

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CANFD0_CH0_CREL | 0x40520000 | FULL | Core Release Register |
| CANFD0_CH0_ENDN | 0x40520004 | FULL | Endian Register |
| CANFD0_CH0_DBTP | 0x4052000C | FULL | Data Bit Timing & Prescaler Register |
| CANFD0_CH0_TEST | 0x40520010 | FULL | Test Register |
| CANFD0_CH0_RWD | 0x40520014 | FULL | RAM Watchdog |
| CANFD0_CH0_CCCR | 0x40520018 | FULL | CC Control Register |
| CANFD0_CH0_NBTP | 0x4052001C | FULL | Nominal Bit Timing & Prescaler Register |
| CANFD0_CH0_TSCC | 0x40520020 | FULL | Timestamp Counter Configuration |
| CANFD0_CH0_TSCV | 0x40520024 | FULL | Timestamp Counter Value |

## 2.3 Register Details

### 2.3.1 CANFD_CTL

**Description:** Global CAN control register
**Address:** 0x40521000
**Offset:** 0x1000
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | STOP_REQ [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | MRAM_OFF [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | STOP_REQ | RW | R | 0 | Clock Stop Request for each TTCAN IP .<br>The m_ttcan_clkstop_req of each TTCAN IP is directly driven by these bits. |
| 31 | MRAM_OFF | RW | R | 0 | MRAM off<br>0= Default MRAM on (with MRAM retained in DeepSleep).<br>1= Switch MRAM off (not retained) to save power. Before setting this bit all the CAN channels have to be powered down using the STOP_REQ/ACK bits. When the MRAM is off any access attempt to it is considered an address error (as if MRAM_SIZE=0). After switching the MRAM on again software needs to allow for a certain power up time before MRAM can be used, i.e. before STOP_REQ can be de-asserted. The power up time is equivalent to the system SRAM power up time specified in the CPUSS.RAM_PWR_DELAY_CTL register.<br><br>MRAM_OFF should be set to 0 prior to transitioning to Hibernate mode. |

### 2.3.2 CANFD_STATUS

**Description:** Global CAN status register
**Address:** 0x40521004
**Offset:** 0x1004
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 16 | ECC_EN | RW | R | 0 | Enable ECC for CANFD SRAM<br>When disabled also all error injection functionality is disabled. |

### 2.3.8 CANFD_ECC_ERR_INJ

**Description:** ECC error injection
**Address:** 0x40521084
**Offset:** 0x1084
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0xFFFC

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ERR_ADDR [7:2] | | | | | | None [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ERR_ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:21] | | | ERR_EN [20:20] | None [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:31] | ERR_PAR [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2:15 | ERR_ADDR | RW | R | 16383 | Specifies the address of the word where an error will be injected on write or an non-correctable error will be suppressed.<br>When the ERR_EN bit is set an error parity (ERR_PAR) is injected when any write, from bus or a CAN channel, is done to this address.<br>When the ERR_EN bit is set and the access address matches ERR_ADDR then a non-correctable ECC error or an Address error will NOT result in a bus error or CAN channel shutdown.<br>Note that error reporting to the fault structure cannot be suppressed. |
| 20 | ERR_EN | RW | R | 0 | Enable error injection (ECC_EN must be 1).<br>When this bit is set the error parity (ERR_PAR) will be used when an AHB write is done to the ERR_ADDR address.<br>When the error word is read a single or double error will be reported to the fault structure just like for a real ECC error (even if this bit is no longer set).<br>When this bit is set (and ECC_EN=1) a non-correctable error (ECC or address error) for the ERR_ADDR will not be reported back to the CAN channel or AHB bus. |
| 24:30 | ERR_PAR | RW | R | 0 | ECC Parity bits to use for ECC error injection at address ERR_ADDR. |

### 2.3.9 CH

#### 2.3.9.1 CANFD_CH_RXFTOP_CTL

**Description:** Receive FIFO Top control
**Address:** 0x40520180
**Offset:** 0x180
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | RF0N | RW1C | RW | 0 | Rx FIFO 0 New Message<br>0= No new message written to Rx FIFO 0<br>1= New message written to Rx FIFO 0 |
| 1 | RF0W | RW1C | RW | 0 | Rx FIFO 0 Watermark Reached<br>0= Rx FIFO 0 fill level below watermark<br>1= Rx FIFO 0 fill level reached watermark |
| 2 | RF0F | RW1C | RW | 0 | Rx FIFO 0 Full<br>0= Rx FIFO 0 not full<br>1= Rx FIFO 0 full |
| 3 | RF0L_ | RW1C | RW | 0 | Rx FIFO 0 Message Lost<br>0= No Rx FIFO 0 message lost<br>1= Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero |
| 4 | RF1N | RW1C | RW | 0 | Rx FIFO 1 New Message<br>0= No new message written to Rx FIFO 1<br>1= New message written to Rx FIFO 1 |
| 5 | RF1W | RW1C | RW | 0 | Rx FIFO 1 Watermark Reached<br>0= Rx FIFO 1 fill level below watermark<br>1= Rx FIFO 1 fill level reached watermark |
| 6 | RF1F | RW1C | RW | 0 | Rx FIFO 1 Full<br>0= Rx FIFO 1 not full<br>1= Rx FIFO 1 full |
| 7 | RF1L_ | RW1C | RW | 0 | Rx FIFO 1 Message Lost<br>0= No Rx FIFO 1 message lost<br>1= Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero |
| 8 | HPM | RW1C | RW | 0 | High Priority Message<br>0= No high priority message received<br>1= High priority message received |
| 9 | TC | RW1C | RW | 0 | Transmission Completed<br>0= No transmission completed<br>1= Transmission completed |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 10 | TCF | RW1C | RW | 0 | Transmission Cancellation Finished<br>0= No transmission cancellation finished<br>1= Transmission cancellation finished |
| 11 | TFE | RW1C | RW | 0 | Tx FIFO Empty<br>0= Tx FIFO non-empty<br>1= Tx FIFO empty |
| 12 | TEFN | RW1C | RW | 0 | Tx Event FIFO New Entry<br>0= Tx Event FIFO unchanged<br>1= Tx Handler wrote Tx Event FIFO element |
| 13 | TEFW | RW1C | RW | 0 | Tx Event FIFO Watermark Reached<br>0= Tx Event FIFO fill level below watermark<br>1= Tx Event FIFO fill level reached watermark |
| 14 | TEFF | RW1C | RW | 0 | Tx Event FIFO Full<br>0= Tx Event FIFO not full<br>1= Tx Event FIFO full |
| 15 | TEFL_ | RW1C | RW | 0 | Tx Event FIFO Element Lost<br>0= No Tx Event FIFO element lost<br>1= Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero |
| 16 | TSW | RW1C | RW | 0 | Timestamp Wraparound<br>0= No timestamp counter wrap-around<br>1= Timestamp counter wrapped around |
| 17 | MRAF | RW1C | RW | 0 | Message RAM Access Failure<br>The flag is set, when the Rx Handler<br>- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.<br>- was not able to write a message to the Message RAM. In this case message storage is aborted.<br>In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.<br>The flag is also set when the Tx Handler was not able to read a message from the Message RAM<br>in time. In this case message transmission is aborted. In case of a Tx Handler access failure the M_TTCAN is switched into Restricted Operation Mode. To leave Restricted Operation Mode, the Host CPU has to reset CCCR.ASM.<br>0= No Message RAM access failure occurred<br>1= Message RAM access failure occurred |
| 18 | TOO | RW1C | RW | 0 | Timeout Occurred<br>0= No timeout<br>1= Timeout reached |
| 19 | DRX | RW1C | RW | 0 | Message stored to Dedicated Rx Buffer<br>The flag is set whenever a received message has been stored into a dedicated Rx Buffer.<br>0= No Rx Buffer updated<br>1= At least one received message stored into a Rx Buffer |
| 20 | BEC | RW1C | RW | 0 | Bit Error Corrected<br>This bit always reads as 0. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 21 | BEU | RW1C | RW | 0 | Bit Error Uncorrected<br>Message RAM bit error detected, uncorrected. The flag is set in the folloiwng cases.<br>- M_TTCAN detects uncorrectable ECC error from Message RAM when ECC is enabled and ECC error injection is disabled.<br>- M_TTCAN reads from an out of range Message RAM address.<br>Message RAM bit error sets CCCR.INIT to '1'. This is done to avoid transmission of corrupted data.<br>0= No bit error detected when reading from Message RAM<br>1= Bit error detected, uncorrected |
| 22 | ELO | RW1C | RW | 0 | Error Logging Overflow<br>0= CAN Error Logging Counter did not overflow<br>1= Overflow of CAN Error Logging Counter occurred |
| 23 | EP_ | RW1C | RW | 0 | Error Passive<br>0= Error_Passive status unchanged<br>1= Error_Passive status changed |
| 24 | EW_ | RW1C | RW | 0 | Warning Status<br>0= Error_Warning status unchanged<br>1= Error_Warning status changed |
| 25 | BO_ | RW1C | RW | 0 | Bus_Off Status<br>0= Bus_Off status unchanged<br>1= Bus_Off status changed |
| 26 | WDI | RW1C | RW | 0 | Watchdog Interrupt<br>0= No Message RAM Watchdog event occurred<br>1= Message RAM Watchdog event due to missing READY |
| 27 | PEA | RW1C | RW | 0 | Protocol Error in Arbitration Phase (Nominal Bit Time is used)<br>0= No protocol error in arbitration phase<br>1= Protocol error in arbitration phase detected (PSR.LEC != 0,7) |
| 28 | PED | RW1C | RW | 0 | Protocol Error in Data Phase (Data Bit Time is used)<br>0= No protocol error in data phase<br>1= Protocol error in data phase detected (PSR.DLEC != 0,7) |
| 29 | ARA | RW1C | RW | 0 | Access to Reserved Address<br>0= No access to reserved address occurred<br>1= Access to reserved address occurred |

### 2.3.9.6.17 CANFD_CH_ILS

**Description:** Interrupt Line Select
**Address:** 0x40520058
**Offset:** 0x58
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via ILE.EINT0 and ILE.EINT1.
**Default:** 0x0

**Bit-field Table**

### 2.3.9.6.57 CANFD_CH_TTILS

**Description:** TT Interrupt Line Select
**Address:** 0x40520128
**Offset:** 0x128
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The TT Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the TT Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via ILE.EINT0 and ILE.EINT1. 0= TT interrupt assigned to interrupt line m_ttcan_int0 1= TT interrupt assigned to interrupt line m_ttcan_int1
**Default:** 0x0

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:1 | EL | R | RW | 0 | Error Level<br>00= Severity 0 - No Error<br>01= Severity 1 - Warning<br>10= Severity 2 - Error<br>11= Severity 3 - Severe Error |
| 2:3 | MS | R | RW | 0 | Master State<br>00= Master_Off, no master properties relevant<br>01= Operating as Time Slave<br>10= Operating as Backup Time Master<br>11= Operating as current Time Master |
| 4:5 | SYS | R | RW | 0 | Synchronization State<br>00= Out of Synchronization<br>01= Synchronizing to TTCAN communication<br>10= Schedule suspended by Gap (In_Gap)<br>11= Synchronized to schedule (In_Schedule) |
| 6 | QGTP | R | RW | 0 | Quality of Global Time Phase<br>Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to '0'.<br>0= Global time not valid<br>1= Global time in phase with Time Master |
| 7 | QCS | R | RW | 1 | Quality of Clock Speed<br>Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to '1'.<br>0= Local clock speed not synchronized to Time Master clock speed<br>1= Synchronization Deviation <= SDL |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8:15 | RTO | R | RW | 0 | Reference Trigger Offset<br>The Reference Trigger Offset value is a signed integer with a range from -127 (0x81) to 127 (0x7F).<br>There is no notification when the lower limit of -127 is reached. In case the M_TTCAN becomes<br>Time Master (MS[1:0] = '11'), the reset of RTO is delayed due to synchronization between Host and CAN clock domain. For time slaves the value configured by TTOCF.IRTO is read.<br>0x00-FF Actual Reference Trigger offset value |
| 22 | WGTD | R | RW | 0 | Wait for Global Time Discontinuity<br>0= No global time preset pending<br>1= Node waits for the global time preset to take effect. The bit is reset when the node has transmitted a reference message with Disc_Bit = '1' or after it received a reference message. |
| 23 | GFI | R | RW | 0 | Gap Finished Indicator<br>Set when the CPU writes TTOCN.FGP, or by a time mark interrupt if TMG = '1', or via input pin m_ttcan_evt if TTOCN.GCS = '1'. Not set by Ref_Trigger_Gap or when Gap is finished by another node sending a reference message.<br>0= Reset at the end of each reference message<br>1= Gap finished by M_TTCAN |
| 24:26 | TMP | R | RW | 0 | Time Master Priority<br>0x0-7 Priority of actual Time Master |
| 27 | GSI | R | RW | 0 | Gap Started Indicator<br>0= No Gap in schedule, reset by each reference message and for all time slaves<br>1= Gap time after Basic Cycle has started |
| 28 | WFE | R | RW | 0 | Wait for Event<br>0= No Gap announced, reset by a reference message with Next_is_Gap = '0'<br>1= Reference message with Next_is_Gap = '1' received |
| 29 | AWE | R | RW | 0 | Application Watchdog Event<br>The application watchdog is served by reading TTOST. When the watchdog is not served in time, bit AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitoring Mode.<br>0= Application Watchdog served in time<br>1= Failed to serve Application Watchdog in time |
| 30 | WECS | R | RW | 0 | Wait for External Clock Synchronization<br>0= No external clock synchronization pending<br>1= Node waits for external clock synchronization to take effect. The bit is reset at the start of the next basic cycle. |
| 31 | SPL | R | RW | 0 | Schedule Phase Lock<br>The bit is valid only when external synchronization is enabled (TTOCN.ESCN = '1'). In this case it signals that the difference between cycle time configured by TTGTP.CTP and the cycle time at the rising edge at pin m_ttcan_evt is less or equal 9 NTU.<br>0= Phase outside range<br>1= Phase inside range |

## 3.4 ROM

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CM0P_ROM_ROM_SCS | 0xE00FF000 | FULL | CM0+ CoreSight ROM Table Peripheral #0 |
| CM0P_ROM_ROM_DWT | 0xE00FF004 | FULL | CM0+ CoreSight ROM Table Peripheral #1 |
| CM0P_ROM_ROM_BPU | 0xE00FF008 | FULL | CM0+ CoreSight ROM Table Peripheral #2 |
| CM0P_ROM_ROM_END | 0xE00FF00C | FULL | CM0+ CoreSight ROM Table End Marker |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CM0P_ROM_ROM_CSMT | 0xE00FFFCC | FULL | CM0+ CoreSight ROM Table Memory Type |
| CM0P_ROM_ROM_PID4 | 0xE00FFFD0 | FULL | CM0+ CoreSight ROM Table Peripheral ID #4 |
| CM0P_ROM_ROM_PID0 | 0xE00FFFE0 | FULL | CM0+ CoreSight ROM Table Peripheral ID #0 |
| CM0P_ROM_ROM_PID1 | 0xE00FFFE4 | FULL | CM0+ CoreSight ROM Table Peripheral ID #1 |
| CM0P_ROM_ROM_PID2 | 0xE00FFFE8 | FULL | CM0+ CoreSight ROM Table Peripheral ID #2 |
| CM0P_ROM_ROM_PID3 | 0xE00FFFEC | FULL | CM0+ CoreSight ROM Table Peripheral ID #3 |
| CM0P_ROM_ROM_CID0 | 0xE00FFFF0 | FULL | CM0+ CoreSight ROM Table Component ID #0 |
| CM0P_ROM_ROM_CID1 | 0xE00FFFF4 | FULL | CM0+ CoreSight ROM Table Component ID #1 |
| CM0P_ROM_ROM_CID2 | 0xE00FFFF8 | FULL | CM0+ CoreSight ROM Table Component ID #2 |
| CM0P_ROM_ROM_CID3 | 0xE00FFFFC | FULL | CM0+ CoreSight ROM Table Component ID #3 |

## 3.5 ROMTABLE

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CM0P_ROMTABLE_ADDR0 | 0xF0000000 | FULL | Link to Cortex M0+ ROM Table. |
| CM0P_ROMTABLE_ADDR1 | 0xF0000004 | FULL | Link to CoreSight CTI Table. |
| CM0P_ROMTABLE_ADDR2 | 0xF0000008 | FULL | Link to Cortex M0+ MTB Table. |
| CM0P_ROMTABLE_DID | 0xF0000FCC | FULL | Device Type Identifier register. |
| CM0P_ROMTABLE_PID4 | 0xF0000FD0 | FULL | Peripheral Identification Register 4. |
| CM0P_ROMTABLE_PID5 | 0xF0000FD4 | FULL | Peripheral Identification Register 5. |
| CM0P_ROMTABLE_PID6 | 0xF0000FD8 | FULL | Peripheral Identification Register 6. |
| CM0P_ROMTABLE_PID7 | 0xF0000FDC | FULL | Peripheral Identification Register 7. |
| CM0P_ROMTABLE_PID0 | 0xF0000FE0 | FULL | Peripheral Identification Register 0. |
| CM0P_ROMTABLE_PID1 | 0xF0000FE4 | FULL | Peripheral Identification Register 1. |
| CM0P_ROMTABLE_PID2 | 0xF0000FE8 | FULL | Peripheral Identification Register 2. |
| CM0P_ROMTABLE_PID3 | 0xF0000FEC | FULL | Peripheral Identification Register 3. |
| CM0P_ROMTABLE_CID0 | 0xF0000FF0 | FULL | Component Identification Register 0. |
| CM0P_ROMTABLE_CID1 | 0xF0000FF4 | FULL | Component Identification Register 1. |
| CM0P_ROMTABLE_CID2 | 0xF0000FF8 | FULL | Component Identification Register 2. |
| CM0P_ROMTABLE_CID3 | 0xF0000FFC | FULL | Component Identification Register 3. |

## 3.6 CTI

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CM0P_CTI_CTICONTROL | 0xF0002000 | FULL | CTI Control Register |
| CM0P_CTI_CTIINTACK | 0xF0002010 | FULL | CTI Interrupt Acknowledge Register |
| CM0P_CTI_CTIAPPSET | 0xF0002014 | FULL | CTI Application Trigger Set Register |
| CM0P_CTI_CTIAPPCLEAR | 0xF0002018 | FULL | CTI Application Trigger Clear Register |
| CM0P_CTI_CTIAPPPULSE | 0xF000201C | FULL | CTI Application Pulse Register |
| CM0P_CTI_CTIINEN0 | 0xF0002020 | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIINEN1 | 0xF0002024 | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIINEN2 | 0xF0002028 | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIINEN3 | 0xF000202C | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIINEN4 | 0xF0002030 | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIINEN5 | 0xF0002034 | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIINEN6 | 0xF0002038 | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIINEN7 | 0xF000203C | FULL | CTI Trigger to Channel Enable Registers |
| CM0P_CTI_CTIOUTEN0 | 0xF00020A0 | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTIOUTEN1 | 0xF00020A4 | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTIOUTEN2 | 0xF00020A8 | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTIOUTEN3 | 0xF00020AC | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTIOUTEN4 | 0xF00020B0 | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTIOUTEN5 | 0xF00020B4 | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTIOUTEN6 | 0xF00020B8 | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTIOUTEN7 | 0xF00020BC | FULL | CTI Channel to Trigger Enable Registers |
| CM0P_CTI_CTITRIGINSTATUS | 0xF0002130 | FULL | CTI Trigger In Status Register |
| CM0P_CTI_CTITRIGOUTSTATUS | 0xF0002134 | FULL | CTI Trigger Out Status Register |
| CM0P_CTI_CTICHINSTATUS | 0xF0002138 | FULL | CTI Channel In Status Register |
| CM0P_CTI_CTICHOUTSTATUS | 0xF000213C | FULL | CTI Channel Out Status Register |
| CM0P_CTI_CTIGATE | 0xF0002140 | FULL | Enable CTI Channel Gate Register |
| CM0P_CTI_ASICCTL | 0xF0002144 | FULL | External Multiplexor Control Register |
| CM0P_CTI_ITCHINACK | 0xF0002EDC | FULL | ITCHINACK Register |
| CM0P_CTI_ITTRIGINACK | 0xF0002EE0 | FULL | ITTRIGINACK Register |
| CM0P_CTI_ITCHOUT | 0xF0002EE4 | FULL | ITCHOUT Register |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CM0P_CTI_ITTRIGOUT | 0xF0002EE8 | FULL | ITTRIGOUT Register |
| CM0P_CTI_ITCHOUTACK | 0xF0002EEC | FULL | ITCHOUTACK Register |
| CM0P_CTI_ITTRIGOUTACK | 0xF0002EF0 | FULL | ITTRIGOUTACK Register |
| CM0P_CTI_ITCHIN | 0xF0002EF4 | FULL | ITCHIN Register |
| CM0P_CTI_ITTRIGIN | 0xF0002EF8 | FULL | ITTRIGIN Register |
| CM0P_CTI_ITCTRL | 0xF0002F00 | FULL | Integration Mode Control Register |
| CM0P_CTI_CLAIMSET | 0xF0002FA0 | FULL | Claim Tag Set Register |
| CM0P_CTI_CLAIMCLR | 0xF0002FA4 | FULL | Claim Tag Clear Register |
| CM0P_CTI_LOCKACCESS | 0xF0002FB0 | FULL | Lock Access Register |
| CM0P_CTI_LOCKSTATUS | 0xF0002FB4 | FULL | Lock Status Register |
| CM0P_CTI_AUTHSTATUS | 0xF0002FB8 | FULL | Authentication Status Register |
| CM0P_CTI_DEVID | 0xF0002FC8 | FULL | Device Configuration Register |
| CM0P_CTI_DEVTYPE | 0xF0002FCC | FULL | Device Type Identifier Register |
| CM0P_CTI_PID4 | 0xF0002FD0 | FULL | Peripheral Identification Register 4 |
| CM0P_CTI_PID5 | 0xF0002FD4 | FULL | Peripheral Identification Register 5 |
| CM0P_CTI_PID6 | 0xF0002FD8 | FULL | Peripheral Identification Register 6 |
| CM0P_CTI_PID7 | 0xF0002FDC | FULL | Peripheral Identification Register 7 |
| CM0P_CTI_PID0 | 0xF0002FE0 | FULL | Peripheral Identification Register 0 |
| CM0P_CTI_PID1 | 0xF0002FE4 | FULL | Peripheral Identification Register 1 |
| CM0P_CTI_PID2 | 0xF0002FE8 | FULL | Peripheral Identification Register 2 |
| CM0P_CTI_PID3 | 0xF0002FEC | FULL | Peripheral Identification Register 3 |
| CM0P_CTI_CID0 | 0xF0002FF0 | FULL | Component Identification Register 0 |
| CM0P_CTI_CID1 | 0xF0002FF4 | FULL | Component Identification Register 1 |
| CM0P_CTI_CID2 | 0xF0002FF8 | FULL | Component Identification Register 2 |
| CM0P_CTI_CID3 | 0xF0002FFC | FULL | Component Identification Register 3 |

## 3.7 MTB

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CM0P_MTB_POSITION | 0xF0003000 | FULL | POSITION register |
| CM0P_MTB_MASTER | 0xF0003004 | FULL | MASTER register |
| CM0P_MTB_FLOW | 0xF0003008 | FULL | FLOW register |
| CM0P_MTB_BASE | 0xF000300C | FULL | BASE register |
| CM0P_MTB_LA | 0xF0003FB0 | FULL | Lock Access register |
| CM0P_MTB_LS | 0xF0003FB4 | FULL | Lock Status register |
| CM0P_MTB_AS | 0xF0003FB8 | FULL | Authentication Status register |
| CM0P_MTB_DARCH | 0xF0003FBC | FULL | Device Architecture register |
| CM0P_MTB_DCFG | 0xF0003FC8 | FULL | Device Configuration register |
| CM0P_MTB_DID | 0xF0003FCC | FULL | Device Type Identifier register. |
| CM0P_MTB_PID4 | 0xF0003FD0 | FULL | Peripheral Identification Register 4. |
| CM0P_MTB_PID5 | 0xF0003FD4 | FULL | Peripheral Identification Register 5. |
| CM0P_MTB_PID6 | 0xF0003FD8 | FULL | Peripheral Identification Register 6. |
| CM0P_MTB_PID7 | 0xF0003FDC | FULL | Peripheral Identification Register 7. |
| CM0P_MTB_PID0 | 0xF0003FE0 | FULL | Peripheral Identification Register 0. |
| CM0P_MTB_PID1 | 0xF0003FE4 | FULL | Peripheral Identification Register 1. |
| CM0P_MTB_PID2 | 0xF0003FE8 | FULL | Peripheral Identification Register 2. |
| CM0P_MTB_PID3 | 0xF0003FEC | FULL | Peripheral Identification Register 3. |
| CM0P_MTB_CID0 | 0xF0003FF0 | FULL | Component Identification Register 0. |
| CM0P_MTB_CID1 | 0xF0003FF4 | FULL | Component Identification Register 1. |
| CM0P_MTB_CID2 | 0xF0003FF8 | FULL | Component Identification Register 2. |
| CM0P_MTB_CID3 | 0xF0003FFC | FULL | Component Identification Register 3. |

## 3.8 Register Details

### 3.8.1 DWT

#### 3.8.1.1 CM0P_DWT_DWT_CTRL

**Description:** Watchpoint Comparator Configuration
**Address:** 0xE0001000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Defines the number of comparators implemented
**Default:** 0x20000000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | NUMCOMP [31:28] | | | | None [27:24] | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 28:31 | NUMCOMP | R | | 2 | Number of comparators available |

### 3.8.1.2 CM0P_DWT_DWT_PCSR

**Description:** Watchpoint Comparator PC Sample
**Address:** 0xE000101C
**Offset:** 0x1C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Samples the current value of the program counter. Unless DWT_PCSR reads as 0xFFFFFFFF, under the conditions described in Program counter sampling support on Arm TRM page C1-344, bit [0] is RAZ. When RAZ, bit [0] does not reflect instruction set state as is the case with similar functionality in other ARM architecture profiles.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | EIASAMPLE | R | W | X | Executed Instruction Address sample value |

### 3.8.1.3 CM0P_DWT_DWT_COMP0

**Description:** Watchpoint Comparator Compare Value
**Address:** 0xE0001020
**Offset:** 0x20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Provides a reference value for use by comparator
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | COMP | RW | R | X | Reference value for comparison. See The DWT comparators on Arm TRM page C1-341. |

### 3.8.1.4 CM0P_DWT_DWT_MASK0

**Description:** Watchpoint Comparator Mask
**Address:** 0xE0001024
**Offset:** 0x24
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Provides the size of the ignore mask applied to the access address range matching
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | MASK | RW | R | X | The size of the ignore mask applied to address range matching. See The DWT comparators on Arm TRM page C1-341 for the usage model. The mask range is IMPLEMENTATION DEFINED. Writing all ones to this field and reading it back can be used to determine the maximum mask size supported. |

### 3.8.1.5 CM0P_DWT_DWT_FUNCTION0

**Description:** Watchpoint Comparator Function
**Address:** 0xE0001028
**Offset:** 0x28
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Controls the operation of the comparator
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | FUNCTION [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:25] | | | | | | | MATCHED [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | FUNCTION | RW | R | 0 | Select action on comparator match. |
| | DISABLE | | | 0 | Disabled |
| | IADDR | | | 4 | PC watchpoint event |
| | DADDR_RO | | | 5 | Watchpoint event |
| | DADDR_WO | | | 6 | Watchpoint event |
| | DADDR_RW | | | 7 | Watchpoint event |
| 24 | MATCHED | R | RW | 0 | Comparator match. It indicates that the operation defined by FUNCTION has occurred since the bit was last read:<br>0 the associated comparator has matched.<br>1 the associated comparator has not matched.<br>Reading the register clears this bit to 0. |

### 3.8.1.6 CM0P_DWT_DWT_COMP1

**Description:** Watchpoint Comparator Compare Value
**Address:** 0xE0001030
**Offset:** 0x30
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Provides a reference value for use by comparator
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | COMP | RW | R | X | Reference value for comparison. See The DWT comparators on Arm TRM page C1-341. |

### 3.8.1.7 CM0P_DWT_DWT_MASK1

**Description:** Watchpoint Comparator Mask
**Address:** 0xE0001034
**Offset:** 0x34
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Provides the size of the ignore mask applied to the access address range matching
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | MASK [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | MASK | RW | R | X | The size of the ignore mask applied to address range matching. See The DWT comparators on Arm TRM page C1-341 for the usage model. The mask range is IMPLEMENTATION DEFINED. Writing all ones to this field and reading it back can be used to determine the maximum mask size supported. |

### 3.8.1.8 CM0P_DWT_DWT_FUNCTION1

**Description:** Watchpoint Comparator Function
**Address:** 0xE0001038
**Offset:** 0x38
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Controls the operation of the comparator
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | FUNCTION [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:25] | | | | | | | MATCHED [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | FUNCTION | RW | R | 0 | Select action on comparator match. |
| | DISABLE | | | 0 | Disabled |
| | IADDR | | | 4 | PC watchpoint event |
| | DADDR_RO | | | 5 | Watchpoint event |
| | DADDR_WO | | | 6 | Watchpoint event |
| | DADDR_RW | | | 7 | Watchpoint event |
| 24 | MATCHED | R | RW | 0 | Comparator match. It indicates that the operation defined by FUNCTION has occurred since the bit was last read:<br>0 the associated comparator has matched.<br>1 the associated comparator has not matched.<br>Reading the register clears this bit to 0. |

### 3.8.1.9 CM0P_DWT_DWT_PID4

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ENABLE | RW | R | 0 | Enables the BPU:<br>0 BPU is disabled.<br>1 BPU is enabled. |
| 1 | KEY | RW | R | 0 | RAZ on reads, SBO for writes. If written as zero, the write to the register is ignored. |
| 4:7 | NUM_CODE | R | | 4 | The number of breakpoint comparators. If NUM_CODE is zero, the implementation does not support any comparators. |

### 3.8.2.2 CM0P_BP_BP_COMP0

**Description:** Breakpoint Compare Register
**Address:** 0xE0002008
**Offset:** 0x8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Holds a breakpoint address for comparison with instruction addresses in the Code memory region, see The system address map on Arm TRM page B3-258 for more information.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP_ADDR [7:2] | | | | | | None [1:1] | ENABLE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP_ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP_ADDR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | MATCH [31:30] | | None [29:29] | COMP_ADDR [28:24] | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ENABLE | RW | R | 0 | Enables the comparator:<br>Note BP_CTRL.ENABLE must also be set to 1 to enable a comparator. |
| 2:28 | COMP_ADDR | RW | R | X | Stores bits [28:2] of the comparison address. The comparison address is compared with the address from the Code memory region. Bits [31:29] and [1:0] of the comparison address are zero. |
| 30:31 | MATCH | RW | R | X | BP_MATCH defines the behavior when the COMP address is matched. |
| | NONE | | | 0 | No breakpoint matching |
| | LOWER | | | 1 | Breakpoint on lower halfword, upper is unaffected. |
| | UPPER | | | 2 | Breakpoint on upper halfword, lower is unaffected. |
| | BOTH | | | 3 | Breakpoint on both lower and upper halfwords. |

### 3.8.2.3 CM0P_BP_BP_COMP1

**Description:** Breakpoint Compare Register
**Address:** 0xE000200C

### 3.8.3 SCS

#### 3.8.3.1 CM0P_SCS_SYST_CSR

**Description:** SysTick Control & Status
**Address:** 0xE000E010
**Offset:** 0x10
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Controls the SysTick counter and provides status data. The SysTick counter is functional in the Active and Sleep power modes (and not functional in the DeepSleep, and Hibernate power modes).
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | CLKSOURCE [2:2] | TICKINT [1:1] | ENABLE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:17] | | | | | | | COUNTFLAG [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ENABLE | RW | R | 0 | Indicates the enabled status of the SysTick counter:<br>'0': counter is disabled.<br>'1': counter is operating. |
| 1 | TICKINT | RW | R | 0 | Indicates whether counting to '0' causes the status of the SysTick exception to change to pending:<br>'0': count to '0' does not affect the SysTick exception status.<br>'1': count to '0' changes the SysTick exception status to pending.<br><br>Changing the value of the counter to '0' by writing zero to the SYST_CVR register to '0' never changes the status of the SysTick exception. |
| 2 | CLKSOURCE | RW | R | 0 | Indicates the SysTick counter clock source:<br>'0': SysTick uses the low frequency clock 'clk_lf'. For this mode to function, 'clk_lf' should be less than half the frequency of 'clk_sys'. Note that 'clk_lf' is generated by a low accuracy ILO (Internal Low power Oscillator), with a target frequency of 32.768 kHz (frequency can be as low as 15 KHz and as high as 60 kHz).<br>'1': SysTick uses the system/processor clock 'clk_sys'.<br><br>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided. in SF, TSG6M products, this functionality is not provided. For these products, this field should be set to '1', such that SysTick uses the system clock 'clk_sys'. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 16 | COUNTFLAG | R | RW | 0 | Indicates whether the counter has counted to '0' since the last read of this register:<br>'0': counter has not counted to '0'.<br>'1': counter has counted to '0'.<br><br>COUNTFLAG is set to '1' by a count transition from '1' to '0'.<br>COUNTFLAG is cleared to '0' by a read of this register, and by any write to the SYST_CVR register. |

### 3.8.3.2 CM0P_SCS_SYST_RVR

**Description:** SysTick Reload Value
**Address:** 0xE000E014
**Offset:** 0x14
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Sets or reads the reload value of the SYST_CVR register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | RELOAD [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | RELOAD [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | RELOAD [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:23 | RELOAD | RW | R | X | The value to load into the SYST_CVR register when the counter reaches 0. |

### 3.8.3.3 CM0P_SCS_SYST_CVR

**Description:** SysTick Current Value
**Address:** 0xE000E018
**Offset:** 0x18
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Reads or clears the current counter value. Any write to the register clears the register to 0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | CURRENT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | CURRENT [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | CURRENT [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:23 | CURRENT | RW | R | X | Current counter value.<br>This is the value of the counter at the time it is sampled. |

### 3.8.3.4 CM0P_SCS_SYST_CALIB

**Description:** SysTick Calibration Value
**Address:** 0xE000E01C
**Offset:** 0x1C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Reads the calibration value and parameters for SysTick.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TENMS [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | TENMS [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | TENMS [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | NOREF [31:31] | SKEW [30:30] | None [29:24] | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:23 | TENMS | R | RW | X | Optionally, holds a reload value to be used for 10ms (100Hz) timing, subject to system clock skew errors. If this field is '0', the calibration value is not known.<br><br>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is 0x00:00147. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is 0x00:0000. |
| 30 | SKEW | R | RW | X | Indicates whether the 10ms calibration value is exact:<br>'0': 10ms calibration value is exact.<br>'1': 10ms calibration value is inexact, because of the clock frequency.<br><br>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '1' (due to the low accuracy ILO). In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '0'. |
| 31 | NOREF | R | | 0 | Indicates whether a implementation defined reference clock is provided:<br>'0': the reference clock is provided.<br>'1': the reference clock is not provided.<br>When this bit is '1', the SYST_CSR.CLKSOURCEis forced to '1' and cannot be cleared to '0'.<br><br>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '0'. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '1'. |

### 3.8.3.5 CM0P_SCS_ISER

**Description:** Interrupt Set-Enable Register
**Address:** 0xE000E100
**Offset:** 0x100
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Enables, or reads the enabled state of one or more interrupts.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | PRI_N2 [23:22] | | None [21:16] | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | PRI_N3 [31:30] | | None [29:24] | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 6:7 | PRI_N0 | RW | R | 0 | Priority of interrupt number N. |
| 14:15 | PRI_N1 | RW | R | 0 | Priority of interrupt number N+1. |
| 22:23 | PRI_N2 | RW | R | 0 | Priority of interrupt number N+2. |
| 30:31 | PRI_N3 | RW | R | 0 | Priority of interrupt number N+3. |

### 3.8.3.10 CM0P_SCS_CPUID

**Description:** CPUID Register
**Address:** 0xE000ED00
**Offset:** 0xD00
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Contains the part number, version, and implementation information that is specific to this processor.
**Default:** 0x410CC601

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | PARTNO [7:4] | | | | REVISION [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | PARTNO [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | VARIANT [23:20] | | | | CONSTANT [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | IMPLEMENTER [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | REVISION | R | | 1 | Indicates revision. In ARM implementations this is the minor revision number n in the pn part of the rnpn revision status, see Product revision status on Arm TRM page xii. For release r0p1. |
| 4:15 | PARTNO | R | | 3168 | Indicates part number, Cortex-M0+ |
| 16:19 | CONSTANT | R | | 12 | Indicates the architecture, ARMv6-M |
| 20:23 | VARIANT | R | | 0 | Implementation defined. In ARM implementations this is the major revision number n in the rn part of the rnpn revision status, Product revision status on Arm TRM page xii. |
| 24:31 | IMPLEMENTER | R | | 65 | Implementer code for ARM. |

### 3.8.3.11 CM0P_SCS_ICSR

**Description:** Interrupt Control State Register
**Address:** 0xE000ED04
**Offset:** 0xD04
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Controls and provides status information for the ARMv6-M.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTACTIVE [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTPENDING [15:12] | | | | None [11:9] | | | VECTACTIVE [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ISRPREEMPT [23:23] | ISRPENDING [22:22] | None [21:21] | VECTPENDING [20:16] | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | NMIPENDSET [31:31] | None [30:29] | | PENDSVSET [28:28] | PENDSVCLR [27:27] | PENDSTSETB [26:26] | PENDSTCLR [25:25] | None [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:8 | VECTACTIVE | R | RW | 0 | The exception number for the current executing exception. 0= Thread mode. This is the same value as IPSR[8:0] |
| 12:20 | VECTPENDING | R | RW | 0 | The exception number for the highest priority pending exception. 0= No pending exceptions.<br>The pending state includes the effect of memory-mapped enable and mask registers. It does not include the PRIMASK special-purpose register qualifier. |
| 22 | ISRPENDING | R | RW | 0 | Indicates if an external configurable, NVIC generated, interrupt is pending. |
| 23 | ISRPREEMPT | R | RW | 0 | Indicates whether a pending exception will be serviced on exit from debug halt state. |
| 25 | PENDSTCLR | RW1C | R | 0 | Clears a pending SysTick, whether set here or by the timer hardware. |
| 26 | PENDSTSETB | RW1S | RW | 0 | Sets a pending SysTick or reads back the current state. Writing PENDSTSET and PENDSTCLR to '1' concurrently is UNPREDICTABLE. |
| 27 | PENDSVCLR | RW1C | R | 0 | Clears a pending PendSV interrupt. |
| 28 | PENDSVSET | RW1S | RW | 0 | Sets a pending PendSV interrupt or reads back the current state. Use this normally to request a context switch. Writing PENDSVSET and PENDSVCLR to '1' concurrently is UNPREDICTABLE. |
| 31 | NMIPENDSET | RW1S | RW | 0 | Activates an NMI exception or reads back the current state.<br>Because NMI is the highest priority exception, it activates as soon as it is registered. |

### 3.8.3.12 CM0P_SCS_VTOR

**Description:** Vector Table Offset Register
**Address:** 0xE000ED08
**Offset:** 0xD08
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Holds the vector table offset address
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | TBLOFF [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | TBLOFF [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | TBLOFF [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8:31 | TBLOFF | RW | R | 0 | Table offset address.<br>All bits of the Vector table address that are not defined by the VTOR are zero. |

### 3.8.3.13 CM0P_SCS_AIRCR

**Description:** Application Interrupt and Reset Control Register
**Address:** 0xE000ED0C
**Offset:** 0xD0C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Sets or returns interrupt control data.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | SYSRESETREQ [2:2] | VECTCLRACTIVE [1:1] | None [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ENDIANNESS [15:15] | None [14:8] | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTKEY [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTKEY [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 1 | VECTCLRACTIVE | RW1C | R | 0 | Clears all active state information for fixed and configurable<br>exceptions. The effect of writing a 1 to this bit if the processor is not halted in Debug state is UNPREDICTABLE. |
| 2 | SYSRESETREQ | RW1S | R | 0 | System Reset Request. Writing 1 to this bit asserts a signal to request a reset by the external system. This will cause a full system reset of the CPU and all other components in the device. See Reset management on Arm TRM page B1-240 for more information. |
| 15 | ENDIANNESS | R | | 0 | Indicates the memory system data endianness:<br>0 little endian<br>1 big endian.<br>See Endian support on Arm TRM page A3-44 for more information. |
| 16:31 | VECTKEY | RW | R | X | Vector Key. The value 0x05FA must be written to this register, otherwise the register write is not performed. |

### 3.8.3.14 CM0P_SCS_SCR

**Description:** System Control Register
**Address:** 0xE000ED10
**Offset:** 0xD10
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Sets or returns system control data.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | SEVONPEND [4:4] | None [3:3] | SLEEPDEEP [2:2] | SLEEPONEXIT [1:1] | None [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 1 | SLEEPONEXIT | RW | R | 0 | Determines whether, on an exit from an ISR that returns to the base level of execution priority, the processor enters a sleep state:<br>0 do not enter sleep state.<br>1 enter sleep state.<br>See Power management on Arm TRM page B1-240 for more information. |
| 2 | SLEEPDEEP | RW | R | 0 | An implementation can use this bit to select DeepSleep power modes upon execution of WFI/WFE:<br>0: Select Sleep mode<br>1: Select DeepSleep |
| 4 | SEVONPEND | RW | R | 0 | Determines whether an interrupt transition from inactive state to pending state is a wakeup event:<br>0: transitions from inactive to pending are not wakeup events.<br>1: transitions from inactive to pending are wakeup events.<br>See WFE on page A6-197 for more information. |

### 3.8.3.15 CM0P_SCS_CCR

**Description:** Configuration and Control Register
**Address:** 0xE000ED14
**Offset:** 0xD14
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Returns configuration and control data.
**Default:** 0x208

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | UNALIGN_TRP [3:3] | None [2:0] | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | STKALIGN [9:9] | None [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 3 | UNALIGN_TRP | R | | 1 | 1: unaligned word and halfword accesses generate a HardFault exception. |
| 9 | STKALIGN | R | | 1 | 1: On exception entry, the SP used prior to the exception is adjusted to be 8-byte aligned and the context to restore it is saved. The SP is restored on the associated exception return. |

### 3.8.3.16 CM0P_SCS_SHPR2

**Description:** System Handler Priority Register 2
**Address:** 0xE000ED1C
**Offset:** 0xD1C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Sets or returns priority for system handler 11
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| Name | PRI_11 [31:30] | | None [29:24] | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 30:31 | PRI_11 | RW | R | 0 | Priority of system handler 11, SVCall |

### 3.8.3.17 CM0P_SCS_SHPR3

**Description:** System Handler Priority Register 3
**Address:** 0xE000ED20
**Offset:** 0xD20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Sets or returns priority for system handlers 14-15.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | PRI_14 [23:22] | | None [21:16] | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | PRI_15 [31:30] | | None [29:24] | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 22:23 | PRI_14 | RW | R | 0 | Priority of system handler 14, PendSV |
| 30:31 | PRI_15 | RW | R | 0 | Priority of system handler 15, SysTick |

### 3.8.3.18 CM0P_SCS_SHCSR

**Description:** System Handler Control and State Register
**Address:** 0xE000ED24
**Offset:** 0xD24
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Controls and provides the status of system handlers.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | SVCALLPENDED [15:15] | None [14:8] | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 15 | SVCALLPENDED | RW | RW | 0 | 0 SVCall is not pending.<br>1 SVCall is pending.<br>This bit reflects the pending state on a read, and updates the pending state, to the value written, on a write. (Pending state bits are set to 1 when an exception occurs, and are cleared to 0 when an exception becomes active.) |

### 3.8.3.19 CM0P_SCS_DFSR

**Description:** Debug Fault Status Register
**Address:** 0xE000ED30
**Offset:** 0xD30
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Provides the top level reason why a debug event has occurred. Writing 1 to a register bit clears that bit to 0. A read of the HALTED bit by an instruction executed by stepping returns an UNKNOWN value, For more information see Debug stepping on Arm TRM page C1-325.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | EXTERNAL [4:4] | VCATCH [3:3] | DWTTRAP [2:2] | BKPT [1:1] | HALTED [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | HALTED | RW1C | RW1S | 0 | Indicates a debug event generated by a C_HALT or C_STEP request, triggered by a write to the DHCSR:<br>0 no active halt request debug event.<br>1 halt request debug event active.<br>See Debug Halting Control and Status Register, DHCSR for more information. |
| 1 | BKPT | RW1C | RW1S | 0 | Indicates a debug event generated by BKPT instruction execution or a breakpoint match in the BPU:<br>0 no breakpoint debug event.<br>1 at least one breakpoint debug event. |
| 2 | DWTTRAP | RW1C | RW1S | 0 | Indicates a debug event generated by the DWT:<br>0 no debug events generated by the DWT.<br>1 at least one debug event generated by the DWT. |
| 3 | VCATCH | RW1C | RW1S | 0 | Indicates whether a vector catch debug event was generated:<br>0 no vector catch debug event generated.<br>1 vector catch debug event generated.<br>The corresponding FSR shows the primary cause of the exception. |
| 4 | EXTERNAL | RW1C | RW1S | 0 | Indicates an asynchronous debug event generated because of EDBGRQ being asserted:<br>0 no EDBGRQ debug event.<br>1 EDBGRQ debug event. |

### 3.8.3.20 CM0P_SCS_MPU_TYPE

**Description:** MPU Type Register
**Address:** 0xE000ED90
**Offset:** 0xD90
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The MPU Type Register indicates how many regions the MPU supports. Software can use it to determine if the processor mplements an MPU
**Default:** 0x800

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | SEPARATE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | DREGION [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | IREGION [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SEPARATE | R | R | 0 | Indicates support for separate instruction and data address maps. RAZ. ARMv6-M only supports a unified MPU. |
| 8:15 | DREGION | R | R | 8 | Number of regions supported by the MPU. If this field reads-as-zero the processor does not implement an MPU. |
| 16:23 | IREGION | R | R | 0 | Instruction region. RAZ. ARMv6-M only supports a unified MPU. |

### 3.8.3.21 CM0P_SCS_MPU_CTRL

**Description:** MPU Control Register
**Address:** 0xE000ED94
**Offset:** 0xD94
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Enables the MPU, and when the MPU is enabled, controls whether the default memory map is enabled as a background region for privileged accesses, and whether the MPU is enabled for HardFaults and NMIs.
If no regions are enabled and the PRIVDEFENA and ENABLE bits are set, only privileged code can execute from the system address map.
If the MPU is not implemented, this register is RAZ/WI.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | PRIVDEFENA [2:2] | HFNMIENA [1:1] | ENABLE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ENABLE | RW | R | 0 | Enables the MPU:<br>0: The MPU is disabled. Privileged and unprivileged accesses use the<br>default memory map.<br>1: The MPU is enabled. |
| 1 | HFNMIENA | RW | R | 0 | The meaning of this bit is:<br>0: disables the MPU for HardFaults and NMIs.<br>1: when the ENABLE bit is set to 1, enables the MPU for HardFaults and NMIs.<br>Note: If HFNMIENA is set to 1 when ENABLE is set to 0, behavior is UNPREDICTABLE. |
| 2 | PRIVDEFENA | RW | R | 0 | When the ENABLE bit is set to 1, the meaning of this bit is:<br>0: Disables the default memory map. Any instruction or data access that does not access a defined region faults.<br>1: Enables the default memory map as a background region for privileged access. The system address map on Arm TRM page B3-258 describes the default memory map.<br>When the ENABLE bit is set to 0, the processor ignores the PRIVDEFENA bit. |

### 3.8.3.22 CM0P_SCS_MPU_RNR

**Description:** MPU Region Number Register
**Address:** 0xE000ED98
**Offset:** 0xD98
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Selects the region currently accessed by MPU_RBAR and MPU_RASR.
Used with MPU_RBAR and MPU_RASR, see MPU Region Base Address Register, MPU_RBAR, and MPU Region Attribute and Size Register, MPU_RASR.
If an implementation supports N regions then the regions number from 0 to (N-1), and the effect of writing a value of N or greater to the REGION field is UNPREDICTABLE.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | REGION_M [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | REGION_M | RW | R | X | Indicates the memory region accessed by MPU_RBAR and MPU_RSAR.<br>Normally, software must write the required region number to MPU_RNR to select the required memory region, before accessing MPU_RBAR or MPU_RSAR. However, the MPU_RBAR.VALID bit provides an alternative way of writing to MPU_RBAR to update a region base address without first writing the region number to MPU_RNR, see MPU Region Base Address Register, MPU_RBAR. |

### 3.8.3.23 CM0P_SCS_MPU_RBAR

**Description:** MPU Region Base Address Register
**Address:** 0xE000ED9C
**Offset:** 0xD9C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Holds the base address of the region identified by MPU_RNR. On a write, can also be used to update the base address of a specified region, in the range 0 to 15, updating MPU_RNR with the new region number.
Normally, used with MPU_RBAR, see MPU Region Number Register, MPU_RNR.
If an implementation supports N regions then the regions number from 0 to (N-1). If N is less than 16 the effect of writing a value of N or greater to the REGION field is UNPREDICTABLE.
Software can find the minimum size of region supported by an MPU region by writing all ones to MPURBAR[31:5] for that region, and then reading the register to find the value saved to bits [31:5]. The number of trailing zeros in this bit field indicates the minimum supported alignment and therefore the supported region size. An implementation must support all region size values from the minimum supported to 4GB, see the description of the MPU_RASR.SIZE field in MPU Region Attribute and Size Register, MPU_RASR.
Software must ensure that the value written to the ADDR field aligns with the size of the selected region.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | VALID [4:4] | REGION [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | REGION | RW | R | X | On writes, can specify the number of the region to update, see VALID field description.<br>On reads, returns bits [3:0] of MPU_RNR. |
| 4 | VALID | RW | R | X | On writes to the register, indicates whether the write must update the base address of the<br>region identified by the REGION field. updating the MPU_RNR to indicate this new region:<br>0 Update the base address of the region indicated by MPU_RNR, ignoring the<br>value of the REGION field.<br>1 Update the least-significant four bits of the MPU_RNR.REGION field with<br>MPU_RBAR.REGION field value, writing 0b0000 to bits [7:4] of the<br>MPU_RBAR.REGION field, and updating the base address of that region.<br>This bit reads as zero |
| 8:31 | ADDR | RW | R | X | Base address of the region. |

### 3.8.3.24 CM0P_SCS_MPU_RASR

**Description:** MPU Region Attribute and Size Register
**Address:** 0xE000EDA0
**Offset:** 0xDA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Defines the size, access behavior, and memory type of the region identified by MPU_RNR, and enables that region.
Used with MPU_RBAR, see MPU Region Number Register, MPU_RNR on. Writing a SIZE value greater than the maximum size supported by the corresponding MPU_RBAR has an UNPREDICTABLE effect. The smallest supported region size is 256 bytes. This restricts the lowest possible value of SIZE.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:6] | | SIZE [5:1] | | | | | ENABLE [0:0] |

|---|---|---|---|---|---|---|---|---|
| Name | ATTRS [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ENABLE | RW | R | X | Enables this region:<br>0: when the MPU is enabled, this region is disabled.<br>1: When the MPU is enabled, this region is enabled.<br>Enabling a region has no effect unless the MPU_CTRL.ENABLE bit is set to 1, to enable the MPU. |
| 1:5 | SIZE | RW | R | X | Indicates the region size.<br>The permitted values for SIZE are 7-31, that is 0b00111-0b11111. The associated region size, in bytes, is 2^(SIZE+1). SIZE field values less than 7 are reserved, because the smallest supported region size is 256 bytes. |
| 8:15 | SRD | RW | R | X | Subregion Disable. For regions of 256 bytes or larger, each bit of this field controls whether one of the eight equal subregions is enabled.<br>0: subregion enabled.<br>1: subregion disabled. |
| 16:31 | ATTRS | RW | R | X | The MPU Region Attribute field, This field has the following subfields, defined in Region attribute control on Arm TRM page B3-300 of the ARMv6M Architetcure manual (September 2010 version):<br>XN MPU_RASR[28]<br>AP[2:0] MPU_RASR[26:24]<br>TEX[2:0] MPU_RASR[21:19]<br>S MPU_RASR[18]<br>C MPU_RASR[17]<br>B MPU_RASR[16] |

### 3.8.3.25 CM0P_SCS_DHCSR

**Description:** Debug Halting Control and Status Register
**Address:** 0xE000EDF0
**Offset:** 0xDF0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Controls halting debug. When C_DEBUGEN is set to 1, C_STEP and C_MASKINTS must not be
modified when the processor is running. Note: S_HALT is 0 when the processor is running. When C_DEBUGEN is set to 0, the processor ignores the values of all other bits in this register. For more information on the use of DHCSR, see Debug stepping on Arm TRM page C1-325.
Note: any write to this register must have [31:16]=0xA05F - if not, the write is ignored.
**Default:** 0x2000000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | C_MASKINTS [3:3] | C_STEP [2:2] | C_HALT [1:1] | C_DEBUGEN [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | DBG_KEY_P1 [23:20] | | | | S_LOCKUP [19:19] | S_SLEEP [18:18] | S_HALT [17:17] | S_REGRDY [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | DBG_KEY_P2 [31:26] | | | | | | S_RESET_ST [25:25] | S_RETIRE_ST [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | C_DEBUGEN | RW | R | 0 | Halting debug enable bit. If a debugger writes to DHCSR to change the value of this bit from 0 to 1, it must also write 0 to the C_MASKINTS bit, otherwise behavior is UNPREDICTABLE. This bit can only be written from the DAP. Access to the DHCSR from software running on the processor is IMPLEMENTATION DEFINED. However, writes to this bit from software running on the processor are ignored. |
| 1 | C_HALT | RW | R | X | Processor halt bit. The effects of writes to this bit are:<br>0 Request a halted processor to run.<br>1 Request a running processor to halt.<br>Table C1-7 on Arm TRM page C1-326 shows the effect of writes to this bit when the processor is in Debug state. |
| 2 | C_STEP | RW | R | X | Processor step bit. The effects of writes to this bit are:<br>0 Single-stepping disabled.<br>1 Single-stepping enabled.<br>For more information about the use of this bit see Table C1-7 on Arm TRM page C1-326. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 3 | C_MASKINTS | RW | R | X | When debug is enabled, the debugger can write to this bit to mask PendSV, SysTick and external configurable interrupts. The effect of any attempt to change the value of this bit is UNPREDICTABLE unless both:<br>- before the write to DHCSR, the value of the C_HALT bit is 1<br>- the write to the DHCSR that changes the C_MASKINTS bit also writes 1 to the C_HALT bit<br>This means that a single write to DHCSR cannot set the C_HALT to 0 and change the value of the C_MASKINTS bit. The bit does not affect NMI. When DHCSR.C_DEBUGEN is set to 0, the<br>value of this bit is UNKNOWN. For more information about the use of this bit see Table C1-7 on Arm TRM page C1-326. |
| 16 | S_REGRDY | R | RW | X | A handshake flag for transfers through the DCRDR:<br>- Writing to DCRSR clears the bit to 0.<br>- Completion of the DCRDR transfer then sets the bit to 1.<br>For more information about DCRDR transfers see Debug Core Register Data Register, DCRDR on Arm TRM page C1-337.<br>0: There has been a write to the DCRDR, but the transfer is<br>not complete.<br>1: The transfer to or from the DCRDR is complete.<br>This bit is only valid when the processor is in Debug state, otherwise the bit is UNKNOWN. |
| 17 | S_HALT | R | RW | 0 | Indicates whether the processor is in Debug state. |
| 18 | S_SLEEP | R | RW | 0 | Indicates whether the processor is sleeping. The debugger must set the DHCSR.C_HALT bit to 1 to gain control, or<br>wait for an interrupt or other wakeup event to wakeup the system. |
| 19 | S_LOCKUP | R | RW | 0 | Indicates whether the processor is locked up because of an unrecoverable exception. See Unrecoverable exception cases on Arm TRM page B1-238 for more information. This bit can only read as 1 when accessed by a remote debugger using the<br>DAP. The bit clears to 0 when the processor enters Debug state. |
| 20:23 | DBG_KEY_P1 | W | R | X | Debug key:<br>Software must write 0xA05F to [31:16] to enable write accesses to bits<br>[15:0], otherwise the processor ignores the write access. |
| 24 | S_RETIRE_ST | R | RW | X | When not in Debug state, indicates whether the processor has completed execution of at least one instruction since the last read of DHCSR. This is a sticky bit, that clears to 0 on a read of DHCSR.<br>This bit is UNKNOWN:<br>- after a Local reset, but is set to 1 as soon as the processor completes execution of an instruction<br>- when S_LOCKUP is set to 1<br>- when S_HALT is set to 1.<br>When the processor is not in Debug state, a debugger can check this bit to determine if the processor is stalled on a load, store or fetch access. |
| 25 | S_RESET_ST | R | RW | 1 | Indicates whether the processor has been reset since the last read of DHCSR. This is a sticky bit, that clears to 0 on a read of DHCSR |
| 26:31 | DBG_KEY_P2 | W | R | X | See desciption for Bit 20 |

### 3.8.3.26 CM0P_SCS_DCRSR

**Description:** Debug Core Register Selector Register
**Address:** 0xE000EDF4
**Offset:** 0xDF4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** With the DCRDR, see Debug Core Register Data Register, DCRDR on Arm TRM page C1-337, the DCRSR provides debug access to the ARM core registers and special-purpose registers. A write to DCRSR specifies the register to transfer, whether the transfer is a read or a write, and starts the transfer. This register is only accessible in Debug state. When the processor is in Debug state, the debugger must preserve the Exception number bits in the IPSR, otherwise behavior is UNPREDICTABLE
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | REGSEL [4:0] | | | | |

| | R10 | | | 10 | CPU R10 |
| | R11 | | | 11 | CPU R11 |
| | R12 | | | 12 | CPU R12 |
| | SP | | | 13 | Current Stack Pointer |
| | LR | | | 14 | CPU LR |
| | DBG_RA | | | 15 | DebugReturnAddress: the address of the first instruction to be executed on exit from Debug state. |
| | XPSR | | | 16 | xPSR |
| | MSP | | | 17 | Main stack pointer, MSP. |
| | PSP | | | 18 | Process stack pointer, PSP |
| | C_P | | | 20 | [31:24]: CONTROL<br>[7:0]: PRIMASK. |
| 16 | REGWNR | RW | R | X | Specifies the type of access for the transfer. |
| | READ | | | 0 | Read transfer |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| | WRITE | | | 1 | Write transfer |

### 3.8.3.27 CM0P_SCS_DCRDR

**Description:** Debug Core Register Data Register
**Address:** 0xE000EDF8
**Offset:** 0xDF8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** With the DCRSR, see Debug Core Register Selector Register, DCRSR on Arm TRM page C1-335, the DCRDR provides debug access to the ARM core registers and special-purpose registers. The DCRDR is the data register for these accesses.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | DBGTMP [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | DBGTMP [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | DBGTMP [23:16] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Name | DBGTMP [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | DBGTMP | RW | RW | X | Data temporary cache, for reading and writing CPU registers.<br>This register is UNKNOWN:<br>- on reset<br>- when DHCSR.S_HALT = 0.<br>- when DHCSR.S_REGRDY = 0 during execution of a DCRSR based transaction that updates the register |

### 3.8.3.28 CM0P_SCS_DEMCR

**Description:** Debug Exception and Monitor Control Register
**Address:** 0xE000EDFC
**Offset:** 0xDFC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Manages vector catch behavior and enables the DWT.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | VC_CORERESET [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:11] | | | | | VC_HARDERR [10:10] | None [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:25] | | | | | | | DWTENA [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | VC_CORERESET | RW | R | 0 | Enable Reset Vector Catch. This causes a Local reset to halt a running system. If DHCSR.C_DEBUGEN is set to 0, the processor ignores the value of this bit. |
| 10 | VC_HARDERR | RW | R | 0 | Enable halting debug trap on a HardFault exception. If DHCSR.C_DEBUGEN is set to 0, the processor ignores the value of this bit. |
| 24 | DWTENA | RW | R | 0 | Global enable for all features configured and controlled by the DWT unit. When DWTENA is set to 0 DWT registers return UNKNOWN values on reads. In addition, it is IMPLEMENTATION DEFINED whether the processor ignores writes to the DWT while DWTENA is 0. |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | GLBEN | RW | R | 0 | Enables or disables the ECT:<br>0 = disabled (reset)<br>1 = enabled.<br>When disabled, all cross triggering mapping logic functionality is disabled for this processor. |

### 3.8.6.2 CM0P_CTI_CTIINTACK

**Description:** CTI Interrupt Acknowledge Register
**Address:** 0xF0002010
**Offset:** 0x10
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Interrupt Acknowledge Register is write-only. Any bits written as a 1 cause the CTITRIGOUT output signal to be acknowledged. The acknowledgement is cleared when MAPTRIGOUT is deactivated. This register is used when the CTITRIGOUT is used as a sticky output, that is, no hardware acknowledge is supplied, and a software acknowledge is required.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | INTACK [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | INTACK | W | R | 0 | Acknowledges the corresponding CTITRIGOUT output:<br>1 = CTITRIGOUT is acknowledged and is cleared when MAPTRIGOUT is LOW. 0 = no effect.<br>There is one bit of the register for each CTITRIGOUT output. |

### 3.8.6.3 CM0P_CTI_CTIAPPSET

**Description:** CTI Application Trigger Set Register
**Address:** 0xF0002014
**Offset:** 0x14
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Trigger Set Register is read/write. A write to this register causes a channel event to be raised, corresponding to the bit written to.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPSET [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPSET | RW | R | 0 | Setting a bit HIGH generates a channel event for the selected channel. Read:<br>0 = application trigger inactive (reset)<br>1 = application trigger active.<br>Write:<br>0 = no effect<br>1 = generate channel event.<br>There is one bit of the register for each channel. |

### 3.8.6.4 CM0P_CTI_CTIAPPCLEAR

**Description:** CTI Application Trigger Clear Register
**Address:** 0xF0002018
**Offset:** 0x18
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Trigger Clear Register is write-only. A write to this register causes a channel event to be cleared, corresponding to the bit written to.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPCLEAR [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPCLEAR | W | R | 0 | Clears corresponding bits in the CTIAPPSET register. 1 = application trigger disabled in the CTIAPPSET register 0 = no effect. There is one bit of the register for each channel. |

### 3.8.6.5 CM0P_CTI_CTIAPPPULSE

**Description:** CTI Application Pulse Register
**Address:** 0xF000201C
**Offset:** 0x1C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Pulse Register is write-only. A write to this register causes a channel event pulse, one CTICLK period, to be generated, corresponding to the bit written to. The pulse external to the ECT can be extended to multi-cycle by the handshaking interface circuits. This register clears itself immediately, so it can be repeatedly written to without software having to clear it.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPULSE [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPULSE | W | R | 0 | Setting a bit HIGH generates a channel event pulse for the selected channel. Write:<br>1 = channel event pulse generated for one CTICLK period 0 = no effect.<br>There is one bit of the register for each channel. |

### 3.8.6.6 CM0P_CTI_CTIINEN

**Description:** CTI Trigger to Channel Enable Registers
**Address:** 0xF0002020
**Offset:** 0x20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger to Channel Enable Registers enable the signalling of an event on CTM channels when the core issues a trigger, CTITRIGIN, to the CTI. There is one register for each of the eight CTITRIGIN inputs. Within each register there is one bit for each of the four channels implemented. These registers do not affect the application trigger operations.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TRIGINEN [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TRIGINEN | RW | R | 0 | Enables a cross trigger event to the corresponding channel when an CTITRIGIN is activated.<br>1 = enables the CTITRIGIN signal to generate an event on the respective channel of the CTM.<br>There is one bit of the register for each of the four channels. For example in register CTIINEN0, TRIGINEN[0] set to 1 enables CTITRIGIN onto channel 0.<br>0 = disables the CTITRIGIN signal from generating an event on the respective channel of the CTM. |

### 3.8.6.7 CM0P_CTI_CTIOUTEN

**Description:** CTI Channel to Trigger Enable Registers
**Address:** 0xF00020A0
**Offset:** 0xA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Channel to Trigger Enable Registers define which channels can generate a CTITRIGOUT output. There is one register for each of the eight CTITRIGOUT outputs. Within each register there is one bit for each of the four channels implemented. These registers affect the mapping from application trigger to trigger outputs.
**Default:** 0x0

**Bit-field Table**

| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TRIGOUTEN | RW | R | 0 | Changing the value of this bit from a 0 to a 1 enables a channel event for the corresponding channel to generate an CTITRIGOUT output:<br>0 = the channel input (CTICHIN) from the CTM is not routed to the CTITRIGOUT output 1 = the channel input (CTICHIN) from the CTM is routed to the CTITRIGOUT output. There is one bit for each of the four channels. For example in register CTIOUTEN0, enabling bit 0 enables CTICHIN[0] to cause a trigger event on the CTITRIGOUT[0] output. |

### 3.8.6.8 CM0P_CTI_CTITRIGINSTATUS

**Description:** CTI Trigger In Status Register
**Address:** 0xF0002130
**Offset:** 0x130
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger In Status Register provides the status of the CTITRIGIN inputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TRIGINSTATUS [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | TRIGINSTATUS | R | RW | 0 | Shows the status of the CTITRIGIN inputs:<br>1 = CTITRIGIN is active<br>0 = CTITRIGIN is inactive.<br>Because the register provides a view of the raw CTITRIGIN inputs, the reset value is unknown. There is one bit of the register for each trigger input. |

### 3.8.6.9 CM0P_CTI_CTITRIGOUTSTATUS

**Description:** CTI Trigger Out Status Register
**Address:** 0xF0002134
**Offset:** 0x134
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger Out Status Register provides the status of the CTITRIGOUT outputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TRIGOUTSTATUS [7:0] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | TRIGOUTSTATUS | R | RW | 0 | Shows the status of the CTITRIGOUT outputs.<br>1 = CTITRIGOUT is active<br>0 = CTITRIGOUT is inactive (reset).<br>There is one bit of the register for each trigger output. |

### 3.8.6.10 CM0P_CTI_CTICHINSTATUS

**Description:** CTI Channel In Status Register
**Address:** 0xF0002138
**Offset:** 0x138
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Channel In Status Register provides the status of the CTI CTICHIN inputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | CTICHINSTATUS [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | CTICHINSTATUS | R | RW | 0 | Shows the status of the CTICHIN inputs:<br>1 = CTICHIN is active<br>0 = CTICHIN is inactive.<br>Because the register provides a view of the raw CTICHIN inputs from the CTM, the reset value is unknown. There is one bit of the register for each channel input. |

### 3.8.6.11 CM0P_CTI_CTICHOUTSTATUS

**Description:** CTI Channel Out Status Register
**Address:** 0xF000213C
**Offset:** 0x13C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Channel Out Status Register provides the status of the CTI CTICHOUT outputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | CTICHOUTSTATUS [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | CTICHOUTSTATUS | R | RW | 0 | Shows the status of the CTICHOUT outputs.<br>1 = CTICHOUT is active<br>0 = CTICHOUT is inactive (reset).<br>There is one bit of the register for each channel output. |

### 3.8.6.12 CM0P_CTI_CTIGATE

**Description:** Enable CTI Channel Gate Register
**Address:** 0xF0002140
**Offset:** 0x140
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The Gate Enable Register prevents the channels from propagating through the CTM to other CTIs. This enables local cross-triggering, for example for causing an interrupt when the ETM trigger occurs. It can be used effectively with CTIAPPSET, CTIAPPCLEAR, and CTIAPPPULSE for asserting trigger outputs by asserting channels, without affecting the rest of the system. On reset, this register is 0xF, and channel propagation is enabled.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | CTIGATEEN 3 [3:3] | CTIGATEEN 2 [2:2] | CTIGATEEN 1 [1:1] | CTIGATEEN 0 [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | CTCHIN | R | W | 0 | Read the values of the CTCHIN inputs |

### 3.8.6.21 CM0P_CTI_ITTRIGIN

**Description:** ITTRIGIN Register
**Address:** 0xF0002EF8
**Offset:** 0xEF8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is a read-only register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | CTTRIGIN [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | CTTRIGIN | R | W | 0 | Read the values of the CTTRIGIN inputs |

### 3.8.6.22 CM0P_CTI_ITCTRL

**Description:** Integration Mode Control Register
**Address:** 0xF0002F00
**Offset:** 0xF00
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for the purpose of integration testing and topology solving.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | MODE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | MODE | RW | R | 0 | When set, the component enters integration mode, enabling topology detection or integration testing to be performed. At reset the component must enter functional mode. If no integration functionality is implemented, this register must read as zero. |

### 3.8.6.23 CM0P_CTI_CLAIMSET

**Description:** Claim Tag Set Register
**Address:** 0xF0002FA0
**Offset:** 0xFA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.
You can determine how many claim bits are implemented by reading this register. For example, if 4 bits are implemented, a read of this register will return 0x0000000F. If no claim tag is implemented, then a read of this register will return 0x00000000.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1S | R | 15 | A bit programmable register bank which sets the Claim Tag Value. A read will return a logic 1 for all implemented locations. |

### 3.8.6.24 CM0P_CTI_CLAIMCLR

**Description:** Claim Tag Clear Register
**Address:** 0xF0002FA4
**Offset:** 0xFA4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read. The width (n) of this register can be determined from reading the Claim Tag Set Register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1C | R | 0 | A bit programmable register bank that is zero at reset. |

### 3.8.6.25 CM0P_CTI_LOCKACCESS

**Description:** Lock Access Register
**Address:** 0xF0002FB0
**Offset:** 0xFB0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This is used to enable write access to device registers. If LOCKSTATUS[0] == 0x0 then this register is not present.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | ACCESS_CODE [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | ACCESS_CODE | RW | R | 0 | Write Access Code. A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access.<br>If LOCKSTATUS[2] is set, then only bits [7:0] of this register are implemented and lock access is obtained by consecutively writing 0xC5, 0xAC, 0xCE, 0x55. Bits [31:8] are unused and any writes to them ignored. |

### 3.8.6.26 CM0P_CTI_LOCKSTATUS

**Description:** Lock Status Register
**Address:** 0xF0002FB4
**Offset:** 0xFB4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This indicates the status of the Lock control mechanism. This lock prevents accidental writes by code under debug.
This register must always be present although there might not be any lock-access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register 0xFB0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | IMPLEMENTS_8B [2:2] | ACCESS_PERMITTED [1:1] | EXISTS [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | EXISTS | R | W | 0 | Indicates that a lock control mechanism exists for this device |
| 1 | ACCESS_PERMITTED | R | W | 0 | The values of this bit mean:<br>0 = Access permitted.<br>1 = Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted |
| 2 | IMPLEMENTS_8B | R | W | 0 | This component implements an 8-bit Lock Access Register. |

### 3.8.6.27 CM0P_CTI_AUTHSTATUS

**Description:** Authentication Status Register
**Address:** 0xF0002FB8
**Offset:** 0xFB8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Reports the required security level and current status of those enables. Where functionality changes on a given security level then this change in status must be reported in this register
**Default:** 0x5

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SNIDBG [7:6] | | SIDBG [5:4] | | NSNIDBG [3:2] | | NSIDBG [1:0] | |

### 3.8.6.28 CM0P_CTI_DEVID

**Description:** Device Configuration Register
**Address:** 0xF0002FC8
**Offset:** 0xFC8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is implementation-defined for each Part Number and Designer. This indicates the capabilities of the component. The entire 32-bit field can be used because the data width is determined by the particular component. Unused bits must read as zero.
If the component is configurable then it is recommended that this register reflects any changes to a standard configuration.
**Default:** 0x40804

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | NRMUXING [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | NRTRIG [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:20] | | | | NRCHAN [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | NRMUXING | R | R | 4 | Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that you must alter accordingly. |
| 8:15 | NRTRIG | R | R | 8 | Number of ECT triggers available. |
| 16:19 | NRCHAN | R | R | 4 | Number of ECT channels available. |

### 3.8.6.29 CM0P_CTI_DEVTYPE

**Description:** Device Type Identifier Register
**Address:** 0xF0002FCC
**Offset:** 0xFCC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** 0x14 indicates this device has a major type of debug control logic component (0x4) and sub-type corresponding to cross trigger (0x1).
**Default:** 0x14

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SUB_TYPE [7:4] | | | | CLASS [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|

### 3.8.7 MTB

#### 3.8.7.1 CM0P_MTB_POSITION

**Description:** POSITION register
**Address:** 0xF0003000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Contains the trace write pointer and the wrap bit. Available in all MTB configurations. You can modify all fields by software. Automatic hardware mechanisms update all fields. A debug agent might use the WRAP bit to determine whether the trace information above and below the pointer address is valid.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | POINTER [7:3] | | | | | WRAP [2:2] | None [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | POINTER [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | POINTER [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | POINTER [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2 | WRAP | RW | RW | X | This bit is set to 1 automatically when the POINTER value wraps as determined by the MASTER.MASK field in the MASTER Trace Control Register. |
| 3:31 | POINTER | RW | RW | X | Trace packet location pointer. Because a packet consists of two words, the POINTER field is the location of the first word of a packet. This field contains bits [31:3] of the address, in the SRAM, where the next trace packet will be written. The field points to an unused location and is automatically incremented.<br><br>A debug agent can calculate the system address, on the AHB-Lite bus, of the SRAM location pointed to by the POSITION register using the following equation:<br><br>system address = BASE + ((P + (2^AWIDTH - (BASE MOD 2^AWIDTH))) MOD 2^AWIDTH).<br><br>Where P = POSITION AND 0xFFFF_FFF8.<br>Where BASE is the BASE register value.<br><br>Note:<br>- The size of the SRAM is parameterized and the most significant bits of the POINTER field can be RAZ/WI, depending on the AWIDTH parameter value.<br>- POSITION register bits greater than or equal to AWIDTH are RAZ/WI, therefore, the active POINTER field bits are [AWIDTH-4:0].<br>- The POINTER field value is relative to the base address of the SRAM in the system memory map. |

### 3.8.7.2 CM0P_MTB_MASTER

**Description:** MASTER register
**Address:** 0xF0003004
**Offset:** 0x4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Contains:
- The main trace enable bit.
- Other trace control fields.

Usage constraints - Before the MASTER.EN or MASTER.TSTARTEN bits are set to 1, software must initialize the POSITION and FLOW registers.
- If the FLOW.WATERMARK field is used to stop tracing or to halt the processor, the MASTER.MASK field must still be set to a value that prevents the POSITION.POINTER field from wrapping before it reaches the FLOW.WATERMARK value.
- The EDBGRQ output value is also affected by the Debug authentication interface.

Configurations: Available in all MTB configurations.
Attributes:
- You can modify all fields by software.
- Automatic hardware mechanisms update the EN and HALTREQ bits.

Following example MASK and POINTER values to illustrate the effect of the MASK field on the POINTER.

MASK POINTER POINTER + 1 POINTER next
0x0 0x1 0x2 0x0
0x0 0x5 0x6 0x4
0x3 0xF 0x10 0x0
0x3 0x1F 0x20 0x10

**Default:** 0x80

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SFRWPRIV [7:7] | TSTOPEN [6:6] | TSTARTEN [5:5] | MASK [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | HALTREQ [9:9] | RAMPRIV [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | EN [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | MASK | RW | R | X | This value determines the maximum size of the trace buffer in SRAM. It specifies the most-significant bit of the POSITION.POINTER field that can be updated by automatic increment. If the trace tries to advance past this power of two, the POSITION.WRAP bit is set to 1, the POSITION.POINTER[MASK:0] bits are set to zero, and the POSITION.POINTER[AWIDTH-4:MASK+1] bits remain unchanged.<br>This field causes the trace packet information to be stored in a circular buffer of size 2(MASK+4) bytes, that can be positioned in memory at multiples of this size.<br>Valid values of this field are zero to AWIDTH-4. Values greater than the maximum have the same effect as the maximum. |
| 5 | TSTARTEN | RW | R | 0 | Trace start input enable. If this bit is 1 and the TSTART signal is HIGH, then the EN bit is set to 1. Tracing continues until a stop condition occurs. |
| 6 | TSTOPEN | RW | R | 0 | Trace stop input enable. If this bit is 1 and the TSTOP signal is HIGH, then the EN bit is set to 0. If a trace packet is being written to memory, the write is completed before tracing is stopped. |
| 7 | SFRWPRIV | RW | R | 1 | Special Function Register Write Privilege bit. If this bit is 0, then User or Privileged AHB-Lite read and write accesses to the Special Function Registers are permitted. If this bit is 1, then only Privileged write accesses are permitted and User write accesses are ignored. The HPROT[1] signal determines if an access is User or Privileged.<br>Note<br>- SFR read accesses are not controlled by this bit and are always permitted.<br>- This bit is implemented only if User/Privilege support is present in the MTB configuration. If User/Privilege support is absent, then the behavior of this bit is RAZ/WI and the value of the HPROT[1] signal is ignored. |
| 8 | RAMPRIV | RW | R | 0 | SRAM Privilege bit. If this bit is 0, then User or Privileged AHB-Lite read and write accesses to the SRAM are permitted. If this bit is 1, then only Privileged AHB-Lite read and write accesses to the SRAM are permitted and User accesses are RAZ/WI. The HPROT[1] signal determines if an access is User or Privileged.<br>Note<br>This bit is implemented only if User/Privilege support is present in the MTB configuration. If User/Privilege support is absent, then the behavior of this bit is RAZ/WI and the value of the HPROT[1] signal is ignored. |
| 9 | HALTREQ | RW | RW | 0 | Halt request bit. This bit is connected to the halt request signal of the trace logic, EDBGRQ.<br>When HALTREQ is set to 1, EDBGRQ is asserted if DBGEN is also HIGH.<br>The HALTREQ bit can be automatically set to 1 using the FLOW.WATERMARK field. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 31 | EN | RW | RW | 0 | Main trace enable bit.<br>When this bit is 1 trace data is written into the SRAM memory location addressed by POSITION.POINTER.<br>The POSITION.POINTER value auto increments after the trace data packet is written.<br>The EN bit can be automatically set to 0 using the FLOW.WATERMARK field and the FLOW.AUTOSTOP bit.<br>The EN bit is automatically set to 1 if the TSTARTEN bit is 1 and the TSTART signal is HIGH.<br>The EN bit is automatically set to 0 if TSTOPEN bit is 1 and the TSTOP signal is HIGH.<br>Note:<br>If the EN bit is set to 0 because the FLOW.WATERMARK field is set, then it is not automatically set to 1 if the TSTARTEN bit is 1 and the TSTART input is HIGH. In this case tracing can only be restarted if the FLOW.WATERMARK or POSITION.POINTER value is changed by software. |

### 3.8.7.3 CM0P_MTB_FLOW

**Description:** FLOW register
**Address:** 0xF0003008
**Offset:** 0x8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Contains:
- The WATERMARK address.
- The AUTOSTOP and AUTOHALT control bits.
Usage constraints: There are no additional usage constraints.
Configurations: Available in all MTB configurations.
Attributes: You can modify all fields by software.
Note
- If you stop tracing, using the watermark auto stop feature, you cannot restart tracing until software clears the watermark auto stop. You can achieve this in one of the following ways:
- Changing the POSITION.POINTER field value to point to the beginning of the trace buffer.
- Setting the FLOW.AUTOSTOP bit to 0.
- A debug agent can use the AUTOSTOP bit to fill the trace buffer once only without halting the processor.
- A debug agent can use the AUTOHALT bit to fill the trace buffer once before causing the Cortex-M0+ processor to enter the Debug state. To enter Debug state, the Cortex-M0+ processor might have to perform additional branch type operations. Therefore you must set the WATERMARK field below the final entry in the trace buffer region.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | WATERMARK [7:3] | | | | | None [2:2] | AUTOHALT [1:1] | AUTOSTOP [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | WATERMARK [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | WATERMARK [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | WATERMARK [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | AUTOSTOP | RW | R | 0 | If this bit is 1 and WATERMARK is equal to POSITION.POINTER, then the MASTER.EN bit is automatically set to 0. This stops tracing. |
| 1 | AUTOHALT | RW | R | 0 | If this bit is 1 and WATERMARK is equal to POSITION.POINTER, then the MASTER.HALTREQ bit is automatically set to 1. If the DBGEN signal is HIGH, the MTB asserts this halt request to the Cortex-M0+ processor by asserting the EDBGRQ signal. |
| 3:31 | WATERMARK | RW | R | X | WATERMARK value. This field contains an address in the same format as the POSITION.POINTER field. When the POSITION.POINTER matches the WATERMARK field value, actions defined by the AUTOHALT and AUTOSTOP bits are performed. |

### 3.8.7.4 CM0P_MTB_BASE

**Description:** BASE register
**Address:** 0xF000300C
**Offset:** 0xC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Purpose: Indicates where the SRAM is located in the processor memory map. This register is provided to enable auto discovery of the MTB SRAM location, by a debug agent.
Usage constraints: There are no additional usage constraints.
Configurations: Available in all MTB configurations.
**Default:** 0xF0010000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

## 4.13 ROM

| Register Name | Address | Permission | Description |
|---|---|---|---|
| CM7_ROM_SCS | 0xE00FF000 | FULL | CM7 CoreSight ROM Table Peripheral #0 |
| CM7_ROM_DWT | 0xE00FF004 | FULL | CM7 CoreSight ROM Table Peripheral #1 |
| CM7_ROM_FPB | 0xE00FF008 | FULL | CM7 CoreSight ROM Table Peripheral #2 |
| CM7_ROM_ITM | 0xE00FF00C | FULL | CM7 CoreSight ROM Table Peripheral #3 |
| CM7_ROM_CSMT | 0xE00FFFCC | FULL | CM7 CoreSight ROM Table Memory Type |
| CM7_ROM_PID4 | 0xE00FFFD0 | FULL | CM7 CoreSight ROM Table Peripheral ID #4 |
| CM7_ROM_PID0 | 0xE00FFFE0 | FULL | CM7 CoreSight ROM Table Peripheral ID #0 |
| CM7_ROM_PID1 | 0xE00FFFE4 | FULL | CM7 CoreSight ROM Table Peripheral ID #1 |
| CM7_ROM_PID2 | 0xE00FFFE8 | FULL | CM7 CoreSight ROM Table Peripheral ID #2 |
| CM7_ROM_PID3 | 0xE00FFFEC | FULL | CM7 CoreSight ROM Table Peripheral ID #3 |
| CM7_ROM_CID0 | 0xE00FFFF0 | FULL | CM7 CoreSight ROM Table Component ID #0 |
| CM7_ROM_CID1 | 0xE00FFFF4 | FULL | CM7 CoreSight ROM Table Component ID #1 |
| CM7_ROM_CID2 | 0xE00FFFF8 | FULL | CM7 CoreSight ROM Table Component ID #2 |
| CM7_ROM_CID3 | 0xE00FFFFC | FULL | CM7 CoreSight ROM Table Component ID #3 |

## 4.14 Register Details

### 4.14.1 ITM

#### 4.14.1.1 CM7_ITM_STIM

**Description:** Stimulus Port registers
**Address:** 0xE0000000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The ITM_STIMx register characteristics are:
Purpose: Provide the interface for generating instrumentation messages.
Usage constraints:
- Accessible by word-aligned byte, halfword, and word accesses.
- The number of ITM_STIM registers is an IMPLEMENTATION DEFINED multiple of eight, see Trace Privilege Register, ITM_TPR on page C1-775.
- When DEMCR.TRCENA is 0, the ITM_STIM registers are UNKNOWN on reads and ignore writes.
Configurations: Always implemented.
Attributes: See Table C1-11 on Arm TRM page C1-773, and the register field descriptions.
The address of ITM_STIMn is (0xE0000000 + 4n).
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMULUS [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMULUS [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMULUS [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMULUS [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | STIMULUS | RW | R | X | Data write to the stimulus port FIFO, for forwarding as a software event packet.<br>When read, bit[0] indicates whether the stimulus port FIFO can accept data:<br>0: Stimulus port FIFO full.<br>1: Stimulus port FIFO can accept at least one word.<br>This bit is UNKNOWN after a Power-on reset. |

#### 4.14.1.2 CM7_ITM_TER

**Description:** Trace Enable Register
**Address:** 0xE0000E00
**Offset:** 0xE00
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The ITM_TERx characteristics are:
Purpose: Provide an individual enable bit for each ITM_STIM register.
Usage constraints
- Each ITM_TER provides enable bits for 32 ITM_STIM registers.
- Bits corresponding to unimplemented ITM_STIM registers are RAZ/WI. See Trace Privilege Register, ITM_TPR on page C1-775 for information about the number of implemented ITM_STIM registers.
- The processor ignores any unprivileged write to an ITM_TERx bit if the corresponding ITM_TPR.PRIVMASK bit is set to 1, see Trace Privilege Register, ITM_TPR on Arm TRM page C1-775.
Configurations: Always implemented.
Attributes: See Table C1-11 on Arm TRM page C1-773.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMENA [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMENA [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMENA [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | STIMENA [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | STIMENA | RW | R | 0 | For bit STIMENA[n]:<br>0: Stimulus port (n) disabled<br>1: Stimulus port (n) enabled |

#### 4.14.1.3 CM7_ITM_TPR

**Description:** ITM Trace Privilege Register
**Address:** 0xE0000E40
**Offset:** 0xE40
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Characteristics and bit assignments.of the ITM_TPR register.
Purpose: Enables an operating system to control the stimulus ports that are accessible by user code.
Usage constraints: You can only write to this register in privileged mode.
Configurations: This register is available if the ITM is configured in your implementation.
Attributes: Refer to the ITM register summary table.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | PRIVMASK [3:0] | | | |

| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | PRIVMASK | RW | R | 0 | Bit mask to enable tracing on ITM stimulus ports:<br>bit [0] = stimulus ports [7:0]<br>bit [1] = stimulus ports [15:8]<br>bit [2] = stimulus ports [23:16]<br>bit [3] = stimulus ports [31:24] |

#### 4.14.1.4 CM7_ITM_TCR

**Description:** Trace Control Register
**Address:** 0xE0000E80
**Offset:** 0xE80
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The ITM_TCR characteristics are:
Purpose: Configures and controls transfers through the ITM interface.
Usage constraints: For information about constraints that apply in a system that supports multiple trace streams
see CoreSight requirements for the TraceBusID field on Arm TRM page C1-778.
Configurations: Always implemented.
Attributes: See Table C1-11 on Arm TRM page C1-773, and the register field descriptions.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | SWOENA [4:4] | TXENA [3:3] | SYNCENA [2:2] | TSENA [1:1] | ITMENA [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:12] | | | | GTSFREQ [11:10] | | TSPRESCALE [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | BUSY [23:23] | TRACEBUSID [22:16] | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ITMENA | RW | R | 0 | Enables the ITM:<br>0 Disabled.<br>1 Enabled.<br>This is the master enable for the ITM unit. A debugger must set this bit to 1 to permit writes to all Stimulus Port registers.<br>A Power-on reset clears this bit to 0. |
| 1 | TSENA | RW | R | 0 | Enables Local timestamp generation:<br>0 Disabled.<br>1 Enabled.<br>A Power-on reset clears this bit to 0. |
| 2 | SYNCENA | RW | R | 0 | Enables Synchronization packet transmission for a synchronous TPIU:<br>0 Disabled.<br>1 Enabled.<br>A Power-on reset clears this bit to 0.<br>Note: If a debugger sets this bit to 1 it must also configure DWT_CTRL.SYNCTAP for the correct synchronization speed, see Control register, DWT_CTRL on Arm TRM page C1-797. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 3 | TXENA | RW | R | 0 | Enables forwarding of hardware event packet from the DWT unit to the ITM for output to the TPIU:<br>0 Disabled.<br>1 Enabled.<br>It is IMPLEMENTATION DEFINED whether the DWT discards packets that it cannot forward to the ITM.<br>Note: If a debugger changes this bit from 0 to 1, the DWT might forward a hardware event packet that it has previously generated.<br>A Power-on reset clears this bit to 0. |
| 4 | SWOENA | RW | R | 0 | Enables asynchronous clocking of the timestamp counter:<br>0 Timestamp counter uses the processor system clock.<br>1 Timestamp counter uses asynchronous clock from the TPIU interface. The timestamp counter is held in reset while the output line is idle.<br>Which clocking modes are implemented is IMPLEMENTATION DEFINED. If the implementation does not support both modes this bit is either RAZ or RAO, to indicate the implemented mode.<br>When this is a RW bit, on a Power-on reset, the value of this bit is UNKNOWN |
| 8:9 | TSPRESCALE | RW | R | 0 | Local timestamp prescaler, used with the trace packet reference clock. The possible values are:<br>00 No prescaling.<br>01 Divide by 4.<br>10 Divide by 16.<br>11 Divide by 64.<br>If implemented, a Power-on reset clears this field to zero.<br>If the processor does not implement the timestamp prescaler then these bits are reserved, RAZ/WI. |
| 10:11 | GTSFREQ | RW | R | 0 | Global timestamp frequency. Defines how often the ITM generates a global timestamp, based on the global timestamp clock frequency, or disables generation of global timestamps. The possible values are:<br>00 Disable generation of global timestamps.<br>01 Generate timestamp request whenever the ITM detects a change in global<br>timestamp counter bits[47:7]. This is approximately every 128 cycles.<br>10 Generate timestamp request whenever the ITM detects a change in global timestamp counter bits[47:13]. This is approximately every 8192 cycles.<br>11 Generate a timestamp after every packet, if the output FIFO is empty.<br>For more information see Global timestamping on Arm TRM page C1-771.<br>A Power-on reset clears this field to zero.<br>If the implementation does not support global timestamping then these bits are reserved, RAZ/WI. |
| 16:22 | TRACEBUSID | RW | R | 0 | Identifier for multi-source trace stream formatting. If multi-source trace is in use, the debugger must write a non-zero value to this field. For more information see CoreSight requirements for the TraceBusID field on Arm TRM page C1-778.<br>On a Power-on reset, the value of this field is UNKNOWN. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 23 | BUSY | RW | R | 0 | Indicates whether the ITM is currently processing events:<br>0 ITM is not processing any events.<br>1 ITM events present and being drained.<br>These bits are read-only. |

### 4.14.2 DWT

#### 4.14.2.1 CM7_DWT_CTRL

**Description:** Control register
**Address:** 0xE0001000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTRL register characteristics are:
Purpose: Provides configuration and status information for the DWT unit, and used to control features of the unit.
Usage constraints: There are no usage constraints.
Configurations: Always implemented.
Attributes: See Table C1-21 and the register field descriptions.
**Default:** 0x40000000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | POSTINIT [7:5] | | | POSTPRESET [4:1] | | | | CYCCNTENA [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:13] | | | PCSAMPLENA [12:12] | SYNCTAP [11:10] | | CYCTAP [9:9] | POSTINIT [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:23] | CYCEVTENA [22:22] | FOLDEVTENA [21:21] | LSUEVTENA [20:20] | SLEEPEVTENA [19:19] | EXCEVTENA [18:18] | CPIEVTENA [17:17] | EXCTRCENA [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | NUMCOMP [31:28] | | | | NOTRCPKT [27:27] | NOEXTTRIG [26:26] | NOCYCCNT [25:25] | NOPRFCNT [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | CYCCNTENA | RW | R | 0 | Enables CYCCNT:<br>0 Disabled.<br>1 Enabled.<br>This bit is UNK/SBZP if the NOCYCCNT bit is RAO. |
| 1:4 | POSTPRESET | RW | R | 0 | Reload value for the POSTCNT counter. For more information see The POSTCNT timer on Arm TRM page C1-792.<br>This field is UNK/SBZP if the NOCYCCNT bit is RAO. |
| 5:8 | POSTINIT | RW | R | 0 | Initial value for the POSTCNT counter. For more information see Enabling POSTCNT, and behavior of accesses to the DWT_CTRL.POSTINIT field and The POSTCNT timer on Arm TRM page C1-792.<br>This field is UNK/SBZP if the NOCYCCNT bit is RAO.<br>Note<br>This field was previously called POSTCNT. The changed name gives a better indication of its function. |
| 9 | CYCTAP | RW | R | 0 | Selects the position of the POSTCNT tap on the CYCCNT counter:<br>0 POSTCNT tap at CYCCNT[6].<br>1 POSTCNT tap at CYCCNT[10].<br>For more information see The POSTCNT timer on Arm TRM page C1-792.<br>This bit is UNK/SBZP if the NOCYCCNT bit is RAO. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 10:11 | SYNCTAP | RW | R | 0 | Selects the position of the synchronization packet counter tap on the CYCCNT counter. This determines the Synchronization packet rate:<br>00 Disabled. No Synchronization packets.<br>01 Synchronization counter tap at CYCCNT[24].<br>10 Synchronization counter tap at CYCCNT[26].<br>11 Synchronization counter tap at CYCCNT[28].<br>For more information see The synchronization packet timer on Arm TRM page C1-794.<br>This field is UNK/SBZP if the NOCYCCNT bit is RAO. |
| 12 | PCSAMPLENA | RW | R | 0 | Enables use of POSTCNT counter as a timer for Periodic PC sample packet generation:<br>0 No Periodic PC sample packets generated.<br>1 Periodic PC sample packets generated.<br>See The POSTCNT timer on Arm TRM page C1-792 for more information.<br>This bit is UNK/SBZP if the NOTRCPKT bit is RAO or the NOCYCCNT bit is RAO. |
| 16 | EXCTRCENA | RW | R | 0 | Enables generation of exception trace:<br>0 Disabled.<br>1 Enabled.<br>This bit is UNK/SBZP if the NOTRCPKT bit is RAO. |
| 17 | CPIEVTENA | RW | R | 0 | Enables generation of the CPI counter overflow event:<br>0 Disabled.<br>1 Enabled.<br>This bit is UNK/SBZP if the NOPRFCNT bit is RAO. |
| 18 | EXCEVTENA | RW | R | 0 | Enables generation of the Exception overhead counter overflow event:<br>0 Disabled.<br>1 Enabled.<br>This bit is UNK/SBZP if the NOPRFCNT bit is RAO. |
| 19 | SLEEPEVTENA | RW | R | 0 | Enables generation of the Sleep counter overflow event.<br>0 Disabled.<br>1 Enabled.<br>This bit is UNK/SBZP if the NOPRFCNT bit is RAO. |
| 20 | LSUEVTENA | RW | R | 0 | Enables generation of the LSU counter overflow event.<br>0 Disabled.<br>1 Enabled.<br>This bit is UNK/SBZP if the NOPRFCNT bit is RAO. |
| 21 | FOLDEVTENA | RW | R | 0 | Enables generation of the Folded-instruction counter overflow event:<br>0 Disabled.<br>1 Enabled.<br>This bit is UNK/SBZP if the NOPRFCNT bit is RAO. |
| 22 | CYCEVTENA | RW | R | 0 | Enables POSTCNT underflow Event counter packets generation:<br>0 No POSTCNT underflow packets generated.<br>1 POSTCNT underflow packets generated, if PCSAMPLENA set to 0.<br>See The POSTCNT timer on Arm TRM page C1-792 for more information.<br>This bit is UNK/SBZP if the NOTRCPKT bit is RAO or the NOCYCCNT bit is RAO. |
| 24 | NOPRFCNT | RW | R | 0 | Shows whether the implementation supports the profiling counters:<br>0 Supported.<br>1 Not supported.<br>For more information see Profiling counter support on Arm TRM page C1-794.<br>This bit is read-only. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 25 | NOCYCCNT | RW | R | 0 | Shows whether the implementation supports a cycle counter:<br>0 Cycle counter supported.<br>1 Cycle counter not supported.<br>For more information see CYCCNT cycle counter and related timers on Arm TRM page C1-792. This bit is read-only. |
| 26 | NOEXTTRIG | RW | R | 0 | Shows whether the implementation includes external match signals, CMPMATCH[N]:<br>0 CMPMATCH[N] supported.<br>1 CMPMATCH[N] not supported.<br>This bit is read-only. |
| 27 | NOTRCPKT | RW | R | 0 | Shows whether the implementation supports trace sampling and exception tracing:<br>0 Trace sampling and exception tracing supported.<br>1 Trace sampling and exception tracing not supported.<br>If this bit is RAZ, the NOCYCCNT bit must also RAZ.<br>This bit is read-only. |
| 28:31 | NUMCOMP | RW | R | 4 | Number of comparators implemented.<br>A value of zero indicates no comparator support.<br>These bits are read-only. |

### 4.14.2.2 CM7_DWT_CYCCNT

**Description:** Cycle Count register
**Address:** 0xE0001004
**Offset:** 0x4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CYCCNT register characteristics are:
Purpose: Shows or sets the value of the processor cycle counter, CYCCNT.
Usage constraints: The DWT unit suspends CYCCNT counting when the processor is in Debug state.
Configurations:
Implemented only when CTRL.NOCYCCNT is RAZ, see Control register, CTRL on page C1-797.
When CTRL.NOCYCCNT is RAO no cycle counter is implemented and this register is UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | CYCNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | CYCNT [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | CYCNT [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | CYCNT [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | CYCNT | RW | RW | 0 | Incrementing cycle counter value. When enabled, CYCCNT increments on each processor clock cycle. On overflow, CYCCNT wraps to zero. |

### 4.14.2.3 CM7_DWT_CPICNT

**Description:** CPI Count register
**Address:** 0xE0001008
**Offset:** 0x8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CPICNT register characteristics are:
Purpose: Counts additional cycles required to execute multi-cycle instructions and instruction fetch stalls.
Usage constraints: The counter initializes to 0 when software enables its counter overflow event by setting the CTRL.CPIEVTENA bit to 1.
Configurations:
Implemented only when CTRL.NOPRFCNT is RAZ, see Control register, CTRL on page C1-797.
If CTRL.NOPRFCNT is RAO, indicating that the implementation does not include the profiling counters, this register is UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | CPICNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | CPICNT | RW | RW | 0 | Base instruction overhead counter. Counts one on each cycle when all of the following are true:<br>- No instruction is executed.<br>- No load-store operation is in progress, see LSU Count register, DWT_LSUCNT on page C1-803.<br>- No exception-entry or exception-exit operation is in progress, see Exception Overhead Count register, DWT_EXCCNT on Arm TRM page C1-802.<br>- Not in a power saving mode, see Sleep Count register, DWT_SLEEPCNT on page C1-802.<br>The definition of 'no instruction is executed' is IMPLEMENTATION DEFINED. ARM recommends that this counts each cycle on which no instruction is retired.<br>An event is emitted on counter overflow. Initialized to zero when DWT_CTRL.CPIEVTENA transitions from 0 to 1. |

### 4.14.2.4 CM7_DWT_EXCCNT

**Description:** Exception Overhead Count register
**Address:** 0xE000100C
**Offset:** 0xC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The EXCCNT register characteristics are:
Purpose: Counts the total cycles spent in exception processing.
Usage constraints: The counter initializes to 0 when software enables its counter overflow event by setting the CTRL.EXCEVTENA bit to 1.
Configurations
Implemented only when CTRL.NOPRFCNT is RAZ, see Control register, CTRL on page C1-797.
If CTRL.NOPRFCNT is RAO, indicating that the implementation does not include the profiling counters, this register is UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | EXCCNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | EXCCNT | RW | RW | 0 | The exception overhead counter. Counts one on each cycle when all of the following are true:<br>- No instruction is executed, see CPI Count register, DWT_CPICNT on Arm TRM page C1-801.<br>- An exception-entry or exception-exit related operation is in progress.<br>Exception-entry or exception-exit related operations include the stacking of registers on exception entry, unstacking of registers on exception exit, and preemption.<br>An event is emitted on counter overflow. Initialized to zero when DWT_CTRL.EXCEVTENA transitions from 0 to 1. |

### 4.14.2.5 CM7_DWT_SLEEPCNT

**Description:** Sleep Count register
**Address:** 0xE0001010
**Offset:** 0x10
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The SLEEPCNT register characteristics are:
Purpose: Counts the total number of cycles that the processor is sleeping.
Usage constraints: The counter initializes to 0 when software enables its counter overflow event by setting the CTRL.SLEEPEVTENA bit to 1.
Configurations:
Implemented only when CTRL.NOPRFCNT is RAZ, see Control register, CTRL on page C1-797.
If CTRL.NOPRFCNT is RAO, indicating that the implementation does not include the profiling counters, this register is UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SLEEPCNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | SLEEPCNT | RW | RW | 0 | Sleep counter. Counts one on each cycle when all of the following are true:<br>- No instruction is executed, see CPI Count register, DWT_CPICNT on page C1-801.<br>- No load-store operation is in progress, see LSU Count register, DWT_LSUCNT.<br>- No exception-entry or exception-exit operation is in progress, see Exception<br>Overhead Count register, DWT_EXCCNT on Arm TRM page C1-802.<br>- In a power saving mode.<br>Power saving modes include WFI, WFE, and Sleep on exit, see Power management on page B1-616. |

### 4.14.2.6 CM7_DWT_LSUCNT

**Description:** LSU Count register
**Address:** 0xE0001014
**Offset:** 0x14
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The LSUCNT register characteristics are:
Purpose: Increments on the additional cycles required to execute all load or store instructions
Usage constraints: The counter initializes to 0 when software enables its counter overflow event by setting the CTRL.LSUEVTENA bit to 1.
Configurations:
Implemented only when CTRL.NOPRFCNT is RAZ, see Control register, CTRL on page C1-797.
If CTRL.NOPRFCNT is RAO, indicating that the implementation does not include the profiling counters, this register is UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | LSUCNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | LSUCNT | RW | RW | 0 | Load-store overhead counter. Counts one on each cycle when all of the following are true:<br>- No instruction is executed, see CPI Count register, DWT_CPICNT on page C1-801.<br>- No exception-entry or exception-exit operation is in progress, see Exception Overhead Count register, DWT_EXCCNT on Arm TRM page C1-802.<br>- A load-store operation is in progress. |

### 4.14.2.7 CM7_DWT_FOLDCNT

**Description:** Folded-instruction Count register
**Address:** 0xE0001018
**Offset:** 0x18
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The FOLDCNT register characteristics are:
Purpose: Increments on each instruction that takes 0 cycles.
Usage constraints:
- The counter initializes to 0 when software enables its counter overflow event by setting the CTRL.FOLDEVTENA bit to 1.
- If an implementation includes profiling counters but does not support instruction folding, this counter can be RAZ/WI.
Configurations:
Implemented only when CTRL.NOPRFCNT is RAZ, see Control register, CTRL on Arm TRM page C1-797.
If CTRL.NOPRFCNT is RAO, indicating that the implementation does not include the profiling counters, this register is UNK/SBZP.
Attributes: See Table C1-21 on page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | FOLDCNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | FOLDCNT | RW | RW | 0 | Foldedinstructioncounter.Countsoneachcyclewhenatleasttwoinstructionsare executed. The counter is incremented by the number of instructions executed, minus one.<br>At least one instruction is executed is the opposite of No instruction is executed. See CPI Count register, DWT_CPICNT on Arm TRM page C1-801.<br>An event is emitted on counter overflow. Initialized to zero when DWT_CTRL.LSUEVTENA transitions from 0 to 1. |

### 4.14.2.8 CM7_DWT_PCSR

**Description:** Program Counter Sample Register
**Address:** 0xE000101C
**Offset:** 0x1C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The PCSR characteristics are:
Purpose: Samples the current value of the program counter.
Usage constraints: There are no usage constraints.
Note: Bit[0] of any sampled value is RAZ and does not reflect instruction set state as it does in a PC sample on the ARMv7-A and ARMv7-R architecture profiles.
Configurations: An optional feature. Register is RAZ/WI if not implemented.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | EIASAMPLE [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | EIASAMPLE | RW | RW | 0 | Executed Instruction Address sample value. |

### 4.14.2.9 CM7_DWT_COMP0

**Description:** Comparator registers
**Address:** 0xE0001020
**Offset:** 0x20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The COMPn register characteristics are:
Purpose: Provides a reference value for use by comparator n.
Usage constraints: The operation of comparator n depends also on the registers MASKn and FUNCTIONn, see Comparator Mask registers, MASKn and Comparator Function registers, FUNCTIONn on page C1-806.
Configurations:
Implemented only when CTRL.NUMCOMP is nonzero, see Control register, CTRL on page C1-797.
CTRL.NUMCOMP defines the number of implemented COMPn registers. Implemented COMPn registers number from 0 to (NUMCOMP-1). Unimplemented registers are UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | COMP | RW | R | 0 | Reference value for comparison. |

### 4.14.2.10 CM7_DWT_MASK0

**Description:** Comparator Mask registers
**Address:** 0xE0001024
**Offset:** 0x24
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The MASKn register characteristics are:
Purpose: Provides the size of the ignore mask applied to the access address for address range matching by comparator n.
Usage constraints: The operation of comparator n depends also on the registers COMPn and FUNCTIONn, see Comparator registers, COMPn and Comparator Function registers, FUNCTIONn on Arm TRM page C1-806.
Configurations:
Implemented only when CTRL.NUMCOMP is nonzero, see Control register, CTRL on Arm TRM page C1-797.
CTRL.NUMCOMP defines the number of implemented MASKn registers. Implemented MASKn registers number from 0 to (NUMCOMP-1). Unimplemented registers are UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | MASK [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | MASK | RW | R | 0 | The size of the ignore mask, 0-31 bits, applied to address range matching.<br>The maximum mask size is IMPLEMENTATION DEFINED. A debugger can write 0b11111 to this field and then read the register back to determine the maximum mask size supported. |

### 4.14.2.11 CM7_DWT_FUNCTION0

**Description:** Comparator Function registers
**Address:** 0xE0001028
**Offset:** 0x28
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The FUNCTIONn register characteristics are:
Purpose: Controls the operation of comparator n.
Usage constraints:
The operation of comparator n depends also on the registers COMPn and MASKn, see Comparator registers, COMPn on Arm TRM page C1-805 and Comparator Mask registers, MASKn on Arm TRM page C1-805.
Reading this register clears some fields to zero. See the register field descriptions for more information, and for the usage constraints of individual fields.
Configurations:
Implemented only when CTRL.NUMCOMP is nonzero, see Control register, CTRL on Arm TRM page C1-797.
CTRL.NUMCOMP defines the number of implemented FUNCTIONn registers. Implemented FUNCTIONn registers number from 0 to (NUMCOMP-1). Unimplemented registers are UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797. See the register field descriptions for information about the values of the RO bits in the register.
**Default:** 0x0

**Bit-field Table**

|---|---|---|---|---|---|---|---|---|
| Name | None [31:25] | | | | | | | MATCHED [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | FUNCTION | RW | R | 0 | Selects action taken on comparator match:<br>0000 = Disabled or LinkAddr(), see LinkAddr support on Arm TRM page C1-789.<br>For non-zero values:<br>- If DATAVMATCH is set to 1, see Table C1-16 on Arm TRM page C1-786<br>- If DATAVMATCH is set to 0 then:<br>- If CYCMATCH is set to 0, see Table C1-14 on Arm TRM page C1-782<br>- If CYCMATCH is set to 1, see Table C1-15 on Arm TRM page C1-785.<br>This field resets to zero. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 5 | EMITRANGE | RW | R | 0 | If the implementation supports trace sampling, enables generation of Data trace address packets, that hold Daddr[15:0]:<br>0 Data trace address packets disabled.<br>1 Enable Data trace address packet generation.<br>For more information see Address comparison functions on Arm TRM page C1-781. If DWT_CTRL.NOTRCPKT is RAZ then this bit is UNK/SBZP. |
| 7 | CYCMATCH | RW | R | 0 | DWT_FUNCTION0 only.<br>If the implementation supports cycle counting, enable cycle count comparison for comparator 0:<br>0 No comparison is performed.<br>1 Compare DWT_COMP0 with the cycle counter, DWT_CYCCNT.<br>If DWT_CTRL.NOCYCCNT is RAZ then this bit is UNK/SBZP. |
| 8 | DATAVMATCH | RW | R | 0 | Enables data value comparison, if supported:<br>0 Perform address comparison.<br>1 Perform data value comparison.<br>For comparator 0, when the CYCMATCH is set to 1, DATAVMATCH must be set to 0 for it to perform cycle count comparison.<br>See LNK1ENA, DATAVSIZE, DATAVADDR0 and DATAVADDR1 for related information.<br>If the implementation does not support data value comparison this bit is RAZ/WI. |
| 9 | LNK1ENA | RW | R | 0 | Indicates whether the implementation supports use of a second linked comparator:<br>0 Second linked comparator not supported.<br>1 Second linked comparator supported.<br>When LNK1ENA is RAO, the DATAVADDR1 field specifies the comparator to use as the second linked comparator.<br>This bit is read-only |
| 10:11 | DATAVSIZE | RW | R | 0 | For data value matching, specifies the size of the required data comparison:<br>00 Byte.<br>01 Halfword.<br>10 Word.<br>The value 0b11 is reserved. Using this value means behavior is UNPREDICTABLE. |
| 12:15 | DATAVADDR0 | RW | R | 0 | When the DATAVMATCH bit is set to 1 this field can hold the comparator number of a comparator to use for linked address comparison. For more information see LinkAddr support on Arm TRM page C1-789.<br>The DWT unit ignores the value of this field if the DATAVMATCH bit is set to 0. |
| 16:19 | DATAVADDR1 | RW | R | 0 | When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a second comparator to use for linked address comparison. For more information see LinkAddr support on Arm TRM page C1-789.<br>The DWT unit ignores the value of this field unless the LNK1ENA bit is RAO and the DATAVMATCH bit is set to 1.<br>If LNK1ENA is RAZ, this field is RAZ/WI. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 24 | MATCHED | RW | R | 0 | Comparator match:<br>0 No match.<br>1 Match.<br>A value of 1 indicates that the operation defined by the FUNCTION field occurred since the last read of the register<br>Reading the register clears this bit to 0. This bit is read-only. |

### 4.14.2.12 CM7_DWT_COMP1

**Description:** Comparator registers
**Address:** 0xE0001030
**Offset:** 0x30
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The COMPn register characteristics are:
Purpose: Provides a reference value for use by comparator n.
Usage constraints: The operation of comparator n depends also on the registers MASKn and FUNCTIONn, see Comparator Mask registers, MASKn and Comparator Function registers, FUNCTIONn on page C1-806.
Configurations:
Implemented only when CTRL.NUMCOMP is nonzero, see Control register, CTRL on page C1-797.
CTRL.NUMCOMP defines the number of implemented COMPn registers. Implemented COMPn registers number from 0 to (NUMCOMP-1). Unimplemented registers are UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COMP [7:0] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Name | COMP [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | COMP | RW | R | 0 | Reference value for comparison. |

### 4.14.2.13 CM7_DWT_MASK1

**Description:** Comparator Mask registers
**Address:** 0xE0001034
**Offset:** 0x34
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The MASKn register characteristics are:
Purpose: Provides the size of the ignore mask applied to the access address for address range matching by comparator n.
Usage constraints: The operation of comparator n depends also on the registers COMPn and FUNCTIONn, see Comparator registers, COMPn and Comparator Function registers, FUNCTIONn on page C1-806.
Configurations:
Implemented only when CTRL.NUMCOMP is nonzero, see Control register, CTRL on page C1-797.
CTRL.NUMCOMP defines the number of implemented MASKn registers. Implemented MASKn registers number from 0 to (NUMCOMP-1). Unimplemented registers are UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | MASK [4:0] | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | MASK | RW | R | 0 | The size of the ignore mask, 0-31 bits, applied to address range matching.<br>The maximum mask size is IMPLEMENTATION DEFINED. A debugger can write 0b11111 to this field and then read the register back to determine the maximum mask size supported. |

### 4.14.2.14 CM7_DWT_FUNCTION1

**Description:** Comparator Function registers
**Address:** 0xE0001038
**Offset:** 0x38
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The FUNCTIONn register characteristics are:
Purpose: Controls the operation of comparator n.
Usage constraints:
The operation of comparator n depends also on the registers COMPn and MASKn, see Comparator registers, COMPn on Arm TRM page C1-805 and Comparator Mask registers, MASKn on page C1-805.
Reading this register clears some fields to zero. See the register field descriptions for more information, and for the usage constraints of individual fields.
Configurations:
Implemented only when CTRL.NUMCOMP is nonzero, see Control register, CTRL on Arm TRM page C1-797.
CTRL.NUMCOMP defines the number of implemented FUNCTIONn registers. Implemented FUNCTIONn registers number from 0 to (NUMCOMP-1). Unimplemented registers are UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797. See the register field descriptions for information about the values of the RO bits in the register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | MASK | RW | R | 0 | The size of the ignore mask, 0-31 bits, applied to address range matching.<br>The maximum mask size is IMPLEMENTATION DEFINED. A debugger can write 0b11111 to this field and then read the register back to determine the maximum mask size supported. |

### 4.14.2.20 CM7_DWT_FUNCTION3

**Description:** Comparator Function registers
**Address:** 0xE0001058
**Offset:** 0x58
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The FUNCTIONn register characteristics are:
Purpose: Controls the operation of comparator n.
Usage constraints:
The operation of comparator n depends also on the registers COMPn and MASKn, see Comparator registers, COMPn on Arm TRM page C1-805 and Comparator Mask registers, MASKn on Arm TRM page C1-805.
Reading this register clears some fields to zero. See the register field descriptions for more information, and for the usage constraints of individual fields.
Configurations:
Implemented only when CTRL.NUMCOMP is nonzero, see Control register, CTRL on Arm TRM page C1-797.
CTRL.NUMCOMP defines the number of implemented FUNCTIONn registers. Implemented FUNCTIONn registers number from 0 to (NUMCOMP-1). Unimplemented registers are UNK/SBZP.
Attributes: See Table C1-21 on Arm TRM page C1-797. See the register field descriptions for information about the values of the RO bits in the register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | CYCMATCH [7:7] | None [6:6] | EMITRANGE [5:5] | None [4:4] | FUNCTION [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | DATAVADDR0 [15:12] | | | | DATAVSIZE [11:10] | | LNK1ENA [9:9] | DATAVMATCH [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:20] | | | | DATAVADDR1 [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:25] | | | | | | | MATCHED [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | FUNCTION | RW | R | 0 | Selects action taken on comparator match:<br>0000 = Disabled or LinkAddr(), see LinkAddr support on Arm TRM page C1-789.<br>For non-zero values:<br>- If DATAVMATCH is set to 1, see Table C1-16 on Arm TRM page C1-786<br>- If DATAVMATCH is set to 0 then:<br>- If CYCMATCH is set to 0, see Table C1-14 on Arm TRM page C1-782<br>- If CYCMATCH is set to 1, see Table C1-15 on Arm TRM page C1-785.<br>This field resets to zero. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 5 | EMITRANGE | RW | R | 0 | If the implementation supports trace sampling, enables generation of Data trace address packets, that hold Daddr[15:0]:<br>0 Data trace address packets disabled.<br>1 Enable Data trace address packet generation.<br>For more information see Address comparison functions on Arm TRM page C1-781. If DWT_CTRL.NOTRCPKT is RAZ then this bit is UNK/SBZP. |
| 7 | CYCMATCH | RW | R | 0 | DWT_FUNCTION0 only.<br>If the implementation supports cycle counting, enable cycle count comparison for comparator 0:<br>0 No comparison is performed.<br>1 Compare DWT_COMP0 with the cycle counter, DWT_CYCCNT.<br>If DWT_CTRL.NOCYCCNT is RAZ then this bit is UNK/SBZP. |
| 8 | DATAVMATCH | RW | R | 0 | Enables data value comparison, if supported:<br>0 Perform address comparison.<br>1 Perform data value comparison.<br>For comparator 0, when the CYCMATCH is set to 1, DATAVMATCH must be set to 0 for it to perform cycle count comparison.<br>See LNK1ENA, DATAVSIZE, DATAVADDR0 and DATAVADDR1 for related information.<br>If the implementation does not support data value comparison this bit is RAZ/WI. |
| 9 | LNK1ENA | RW | R | 0 | Indicates whether the implementation supports use of a second linked comparator:<br>0 Second linked comparator not supported.<br>1 Second linked comparator supported.<br>When LNK1ENA is RAO, the DATAVADDR1 field specifies the comparator to use as the second linked comparator.<br>This bit is read-only |
| 10:11 | DATAVSIZE | RW | R | 0 | For data value matching, specifies the size of the required data comparison:<br>00 Byte.<br>01 Halfword.<br>10 Word.<br>The value 0b11 is reserved. Using this value means behavior is UNPREDICTABLE. |
| 12:15 | DATAVADDR0 | RW | R | 0 | When the DATAVMATCH bit is set to 1 this field can hold the comparator number of a comparator to use for linked address comparison. For more information see LinkAddr support on Arm TRM page C1-789.<br>The DWT unit ignores the value of this field if the DATAVMATCH bit is set to 0. |
| 16:19 | DATAVADDR1 | RW | R | 0 | When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a second comparator to use for linked address comparison. For more information see LinkAddr support on Arm TRM page C1-789.<br>The DWT unit ignores the value of this field unless the LNK1ENA bit is RAO and the DATAVMATCH bit is set to 1.<br>If LNK1ENA is RAZ, this field is RAZ/WI. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 24 | MATCHED | RW | R | 0 | Comparator match:<br>0 No match.<br>1 Match.<br>A value of 1 indicates that the operation defined by the FUNCTION field occurred since the last read of the register<br>Reading the register clears this bit to 0. This bit is read-only. |

| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | REV [31:28] | | | | None [27:24] | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ENABLE | RW | R | 0 | Enable bit for the FPB:<br>0 Flash Patch Breakpoint disabled.<br>1 Flash Patch Breakpoint enabled.<br>A Power-on reset clears this bit to 0. |
| 1 | KEY | RW | R | 0 | On any write to FP_CTRL, this bit must be 1. A write to the register with this bit set to zero is ignored. The Flash Patch Breakpoint unit ignores the write unless this bit is 1. This bit is RAZ. |
| 4:7 | NUM_CODE_LO | RW | R | 6 | The least significant bits, being bits[3:0], of NUM_CODE, the number of instruction address comparators.<br>If NUM_CODE[6:0] is zero, the implementation does not support any instruction address comparators.<br>These bits are read only. |
| 8:11 | NUM_LIT | RW | R | 2 | The number of literal address comparators supported, starting from NUM_CODE upwards. UNK/SBZP if Flash Patch is not implemented. Flash Patch is not implemented if<br>FP_REMAP[29] is 0.<br>If this field is zero, the implementation does not support literal comparators. These bits are read-only. |
| 12:14 | NUM_CODE_HI | RW | R | 0 | The most significant bits, being bits[6:4], of NUM_CODE, the number of instruction address comparators, see bits[7:4].<br>These bits are read only. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 28:31 | REV | RW | R | 0 | Flash Patch Breakpoint architecture revision: 0000 Flash Patch Breakpoint version 1.<br>0001 Flash Patch Breakpoint version 2. Supports breakpoints on any location in the 4GB address range. |

### 4.14.3.2 CM7_FPB_REMAP

**Description:** FlashPatch Remap register
**Address:** 0xE0002004
**Offset:** 0x4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The FP_REMAP register characteristics are:
Purpose: Indicates whether the implementation supports flash patch remap, and if it does, holds the SRAM address for remap.
Usage constraints: There are no usage constraints.
Configurations: Not Implemented. RAZ/WI for CM7.
Attributes: See Table C1-23 on Arm TRM page C1-816.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | REMAP [7:5] | | | None [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | REMAP [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | REMAP [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | RMPSPT [31:30] | | None [29:29] | REMAP [28:24] | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 5:28 | REMAP | RW | R | 0 | If the FPB supports flash patch remap, this field:<br>- Holds bits[28:5] of the base address in SRAM to which the FPB remaps the address.<br>- Has an UNKNOWN value on reset.<br>If the FPB only supports breakpoint functionality this field is UNK/SBZP. |
| 30:31 | RMPSPT | RW | R | 0 | Indicates whether the FPB unit supports flash patch remap:<br>0 Remapping not supported. The FPB only supports breakpoint functionality.<br>1 Hard-wired remap to SRAM region.<br>These bits are read only. |

### 4.14.3.3 CM7_FPB_COMP

**Description:** FlashPatch Comparator register
**Address:** 0xE0002008
**Offset:** 0x8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The FP_COMPn register characteristics are:
Purpose:
Holds an address for comparison with addresses in the Code memory region, see The system address map on page B3-648. The effect of a match depends on whether the comparator is an instruction address comparator or a literal address comparator:
Instruction address comparators
Either:
- Defines an instruction address to remap to an address based on the address specified in the FP_REMAP register.
- Defines a breakpoint address.
Literal address comparators
Defines a literal address to remap to an address based on the address specified in the FP_REMAP register.
The FP_CTRL register determines which comparators are instruction address comparators and which are literal address comparators. The version of the FPB unit determines the bit assignment for the FP_COMP register. The FP_CTRL.REV field determines which version of the FPB unit is attached. See FlashPatch Control Register, FP_CTRL on page C1-816.
The FP_REMAP.RMPSPT field determines if the FPB unit supports Flash Patch. For more information about address remapping see FlashPatch Remap register, FP_REMAP on page C1-818.
If the FPB unit is configured for remap then FP_COMPn defines a 29-bit word-aligned address.
If the FPB unit is configured for breakpoints, version 1 defines a 29-bit word-aligned address and the breakpoint can be set on either or both half-words at this address. For version 2 FPB units configured for breakpoints, FP_COMPn defines a 32-bit half-word aligned address.
Usage constraints: To enable a comparator, both the FP_CTRL.ENABLE bit and the required FP_COMPn.ENABLE bit must be set to 1.
Configuration: Always implemented. see FlashPatch Control Register, FP_CTRL on Arm TRM page C1-816 for information about the number of implemented FlashPatch comparator registers.
Attributes: See Table C1-23 on Arm TRM page C1-816.
**Default:** 0x0

### 4.14.6 CM7CTI

#### 4.14.6.1 CM7_CM7CTI_CTICONTROL

**Description:** CTI Control Register
**Address:** 0xE0042000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Control Register enables the CTI.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | GLBEN [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | GLBEN | RW | R | 0 | Enables or disables the ECT:<br>0 = disabled (reset)<br>1 = enabled.<br>When disabled, all cross triggering mapping logic functionality is disabled for this processor. |

### 4.14.6.2 CM7_CM7CTI_CTIINTACK

**Description:** CTI Interrupt Acknowledge Register
**Address:** 0xE0042010
**Offset:** 0x10
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Interrupt Acknowledge Register is write-only. Any bits written as a 1 cause the CTITRIGOUT output signal to be acknowledged. The acknowledgement is cleared when MAPTRIGOUT is deactivated. This register is used when the CTITRIGOUT is used as a sticky output, that is, no hardware acknowledge is supplied, and a software acknowledge is required.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | INTACK [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | INTACK | W | R | 0 | Acknowledges the corresponding CTITRIGOUT output:<br>1 = CTITRIGOUT is acknowledged and is cleared when MAPTRIGOUT is LOW. 0 = no effect.<br>There is one bit of the register for each CTITRIGOUT output. |

### 4.14.6.3 CM7_CM7CTI_CTIAPPSET

**Description:** CTI Application Trigger Set Register
**Address:** 0xE0042014
**Offset:** 0x14
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Trigger Set Register is read/write. A write to this register causes a channel event to be raised, corresponding to the bit written to.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPSET [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPSET | RW | R | 0 | Setting a bit HIGH generates a channel event for the selected channel. Read:<br>0 = application trigger inactive (reset)<br>1 = application trigger active.<br>Write:<br>0 = no effect<br>1 = generate channel event.<br>There is one bit of the register for each channel. |

### 4.14.6.4 CM7_CM7CTI_CTIAPPCLEAR

**Description:** CTI Application Trigger Clear Register
**Address:** 0xE0042018
**Offset:** 0x18
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Trigger Clear Register is write-only. A write to this register causes a channel event to be cleared, corresponding to the bit written to.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPCLEAR [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPCLEAR | W | R | 0 | Clears corresponding bits in the CTIAPPSET register. 1 = application trigger disabled in the CTIAPPSET register 0 = no effect.<br>There is one bit of the register for each channel. |

### 4.14.6.5 CM7_CM7CTI_CTIAPPPULSE

**Description:** CTI Application Pulse Register
**Address:** 0xE004201C
**Offset:** 0x1C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Pulse Register is write-only. A write to this register causes a channel event pulse, one CTICLK period, to be generated, corresponding to the bit written to. The pulse external to the ECT can be extended to multi-cycle by the handshaking interface circuits. This register clears itself immediately, so it can be repeatedly written to without software having to clear it.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPULSE [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPULSE | W | R | 0 | Setting a bit HIGH generates a channel event pulse for the selected channel. Write:<br>1 = channel event pulse generated for one CTICLK period 0 = no effect.<br>There is one bit of the register for each channel. |

#### 4.14.6.6 CM7_CM7CTI_CTIINEN

**Description:** CTI Trigger to Channel Enable Registers
**Address:** 0xE0042020
**Offset:** 0x20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger to Channel Enable Registers enable the signalling of an event on CTM channels when the core issues a trigger, CTITRIGIN, to the CTI. There is one register for each of the eight CTITRIGIN inputs. Within each register there is one bit for each of the four channels implemented. These registers do not affect the application trigger operations.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TRIGINEN [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TRIGINEN | RW | R | 0 | Enables a cross trigger event to the corresponding channel when an CTITRIGIN is activated.<br>1 = enables the CTITRIGIN signal to generate an event on the respective channel of the CTM.<br>There is one bit of the register for each of the four channels. For example in register CTIINEN0, TRIGINEN[0] set to 1 enables CTITRIGIN onto channel 0.<br>0 = disables the CTITRIGIN signal from generating an event on the respective channel of the CTM. |

### 4.14.6.7 CM7_CM7CTI_CTIOUTEN

**Description:** CTI Channel to Trigger Enable Registers
**Address:** 0xE00420A0
**Offset:** 0xA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Channel to Trigger Enable Registers define which channels can generate a CTITRIGOUT output. There is one register for each of the eight CTITRIGOUT outputs. Within each register there is one bit for each of the four channels implemented. These registers affect the mapping from application trigger to trigger outputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TRIGOUTEN [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TRIGOUTEN | RW | R | 0 | Changing the value of this bit from a 0 to a 1 enables a channel event for the corresponding channel to generate an CTITRIGOUT output:<br>0 = the channel input (CTICHIN) from the CTM is not routed to the CTITRIGOUT output 1 = the channel input (CTICHIN) from the CTM is routed to the CTITRIGOUT output. There is one bit for each of the four channels. For example in register CTIOUTEN0, enabling bit 0 enables CTICHIN[0] to cause a trigger event on the CTITRIGOUT[0] output. |

### 4.14.6.8 CM7_CM7CTI_CTITRIGINSTATUS

**Description:** CTI Trigger In Status Register
**Address:** 0xE0042130
**Offset:** 0x130
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger In Status Register provides the status of the CTITRIGIN inputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TRIGINSTATUS [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | TRIGINSTATUS | R | RW | 0 | Shows the status of the CTITRIGIN inputs:<br>1 = CTITRIGIN is active<br>0 = CTITRIGIN is inactive.<br>Because the register provides a view of the raw CTITRIGIN inputs, the reset value is unknown. There is one bit of the register for each trigger input. |

### 4.14.6.9 CM7_CM7CTI_CTITRIGOUTSTATUS

**Description:** CTI Trigger Out Status Register
**Address:** 0xE0042134
**Offset:** 0x134
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger Out Status Register provides the status of the CTITRIGOUT outputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | CTICHOUTSTATUS | R | RW | 0 | Shows the status of the CTICHOUT outputs.<br>1 = CTICHOUT is active<br>0 = CTICHOUT is inactive (reset).<br>There is one bit of the register for each channel output. |

### 4.14.6.12 CM7_CM7CTI_CTIGATE

**Description:** Enable CTI Channel Gate Register
**Address:** 0xE0042140
**Offset:** 0x140
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The Gate Enable Register prevents the channels from propagating through the CTM to other CTIs. This enables local cross-triggering, for example for causing an interrupt when the ETM trigger occurs. It can be used effectively with CTIAPPSET, CTIAPPCLEAR, and CTIAPPPULSE for asserting trigger outputs by asserting channels, without affecting the rest of the system. On reset, this register is 0xF, and channel propagation is enabled.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | CTIGATEEN 3 [3:3] | CTIGATEEN 2 [2:2] | CTIGATEEN 1 [1:1] | CTIGATEEN 0 [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | CTIGATEEN0 | RW | R | 1 | Enable CTICHOUT0. Set to 0 to disable channel propagation. |
| 1 | CTIGATEEN1 | RW | R | 1 | Enable CTICHOUT1. Set to 0 to disable channel propagation. |
| 2 | CTIGATEEN2 | RW | R | 1 | Enable CTICHOUT2. Set to 0 to disable channel propagation. |
| 3 | CTIGATEEN3 | RW | R | 1 | Enable CTICHOUT3. Set to 0 to disable channel propagation. |

### 4.14.6.13 CM7_CM7CTI_ASICCTL

**Description:** External Multiplexor Control Register

|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | CTCHIN | R | W | 0 | Read the values of the CTCHIN inputs |

### 4.14.6.21 CM7_CM7CTI_ITTRIGIN

**Description:** ITTRIGIN Register
**Address:** 0xE0042EF8
**Offset:** 0xEF8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is a read-only register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | CTTRIGIN [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | CTTRIGIN | R | W | 0 | Read the values of the CTTRIGIN inputs |

### 4.14.6.22 CM7_CM7CTI_ITCTRL

**Description:** Integration Mode Control Register
**Address:** 0xE0042F00
**Offset:** 0xF00
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for the purpose of integration testing and topology solving.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | MODE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | MODE | RW | R | 0 | When set, the component enters integration mode, enabling topology detection or integration testing to be performed. At reset the component must enter functional mode. If no integration functionality is implemented, this register must read as zero. |

### 4.14.6.23 CM7_CM7CTI_CLAIMSET

**Description:** Claim Tag Set Register
**Address:** 0xE0042FA0
**Offset:** 0xFA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.
You can determine how many claim bits are implemented by reading this register. For example, if 4 bits are implemented, a read of this register will return 0x0000000F. If no claim tag is implemented, then a read of this register will return 0x00000000.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1S | R | 15 | A bit programmable register bank which sets the Claim Tag Value. A read will return a logic 1 for all implemented locations. |

### 4.14.6.24 CM7_CM7CTI_CLAIMCLR

**Description:** Claim Tag Clear Register
**Address:** 0xE0042FA4
**Offset:** 0xFA4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read. The width (n) of this register can be determined from reading the Claim Tag Set Register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1C | R | 0 | A bit programmable register bank that is zero at reset. |

### 4.14.6.25 CM7_CM7CTI_LOCKACCESS

**Description:** Lock Access Register
**Address:** 0xE0042FB0
**Offset:** 0xFB0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This is used to enable write access to device registers. If LOCKSTATUS[0] == 0x0 then this register is not present.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | ACCESS_CODE [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | ACCESS_CODE | RW | R | 0 | Write Access Code. A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access.<br>If LOCKSTATUS[2] is set, then only bits [7:0] of this register are implemented and lock access is obtained by consecutively writing 0xC5, 0xAC, 0xCE, 0x55. Bits [31:8] are unused and any writes to them ignored. |

### 4.14.6.26 CM7_CM7CTI_LOCKSTATUS

**Description:** Lock Status Register
**Address:** 0xE0042FB4
**Offset:** 0xFB4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This indicates the status of the Lock control mechanism. This lock prevents accidental writes by code under debug.
This register must always be present although there might not be any lock-access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register 0xFB0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | IMPLEMENTS_8B [2:2] | ACCESS_PERMITTED [1:1] | EXISTS [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | EXISTS | R | W | 0 | Indicates that a lock control mechanism exists for this device |
| 1 | ACCESS_PERMITTED | R | W | 0 | The values of this bit mean:<br>0 = Access permitted.<br>1 = Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted |
| 2 | IMPLEMENTS_8B | R | W | 0 | This component implements an 8-bit Lock Access Register. |

### 4.14.6.27 CM7_CM7CTI_AUTHSTATUS

**Description:** Authentication Status Register
**Address:** 0xE0042FB8
**Offset:** 0xFB8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Reports the required security level and current status of those enables. Where functionality changes on a given security level then this change in status must be reported in this register
**Default:** 0x5

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SNIDBG [7:6] | | SIDBG [5:4] | | NSNIDBG [3:2] | | NSIDBG [1:0] | |

### 4.14.6.28 CM7_CM7CTI_DEVID

**Description:** Device Configuration Register
**Address:** 0xE0042FC8
**Offset:** 0xFC8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is implementation-defined for each Part Number and Designer. This indicates the capabilities of the component. The entire 32-bit field can be used because the data width is determined by the particular component. Unused bits must read as zero.
If the component is configurable then it is recommended that this register reflects any changes to a standard configuration.
**Default:** 0x40804

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | NRMUXING [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | NRTRIG [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:20] | | | | NRCHAN [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | NRMUXING | R | R | 4 | Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that you must alter accordingly. |
| 8:15 | NRTRIG | R | R | 8 | Number of ECT triggers available. |
| 16:19 | NRCHAN | R | R | 4 | Number of ECT channels available. |

### 4.14.6.29 CM7_CM7CTI_DEVTYPE

**Description:** Device Type Identifier Register
**Address:** 0xE0042FCC
**Offset:** 0xFCC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** 0x14 indicates this device has a major type of debug control logic component (0x4) and sub-type corresponding to cross trigger (0x1).
**Default:** 0x14

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SUB_TYPE [7:4] | | | | CLASS [3:0] | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | GLBEN | RW | R | 0 | Enables or disables the ECT:<br>0 = disabled (reset)<br>1 = enabled.<br>When disabled, all cross triggering mapping logic functionality is disabled for this processor. |

### 4.14.7.2 CM7_TRCCTI_CTIINTACK

**Description:** CTI Interrupt Acknowledge Register
**Address:** 0xE0080010
**Offset:** 0x10
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Interrupt Acknowledge Register is write-only. Any bits written as a 1 cause the CTITRIGOUT output signal to be acknowledged. The acknowledgement is cleared when MAPTRIGOUT is deactivated. This register is used when the CTITRIGOUT is used as a sticky output, that is, no hardware acknowledge is supplied, and a software acknowledge is required.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | INTACK [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPSET | RW | R | 0 | Setting a bit HIGH generates a channel event for the selected channel. Read:<br>0 = application trigger inactive (reset)<br>1 = application trigger active.<br>Write:<br>0 = no effect<br>1 = generate channel event.<br>There is one bit of the register for each channel. |

### 4.14.7.4 CM7_TRCCTI_CTIAPPCLEAR

**Description:** CTI Application Trigger Clear Register
**Address:** 0xE0080018
**Offset:** 0x18
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Trigger Clear Register is write-only. A write to this register causes a channel event to be cleared, corresponding to the bit written to.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPCLEAR [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPCLEAR | W | R | 0 | Clears corresponding bits in the CTIAPPSET register. 1 = application trigger disabled in the CTIAPPSET register 0 = no effect. There is one bit of the register for each channel. |

### 4.14.7.5 CM7_TRCCTI_CTIAPPPULSE

**Description:** CTI Application Pulse Register
**Address:** 0xE008001C
**Offset:** 0x1C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Application Pulse Register is write-only. A write to this register causes a channel event pulse, one CTICLK period, to be generated, corresponding to the bit written to. The pulse external to the ECT can be extended to multi-cycle by the handshaking interface circuits. This register clears itself immediately, so it can be repeatedly written to without software having to clear it.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | APPULSE [3:0] | | | |

|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | APPULSE | W | R | 0 | Setting a bit HIGH generates a channel event pulse for the selected channel. Write:<br>1 = channel event pulse generated for one CTICLK period 0 = no effect.<br>There is one bit of the register for each channel. |

### 4.14.7.6 CM7_TRCCTI_CTIINEN

**Description:** CTI Trigger to Channel Enable Registers
**Address:** 0xE0080020
**Offset:** 0x20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger to Channel Enable Registers enable the signalling of an event on CTM channels when the core issues a trigger, CTITRIGIN, to the CTI. There is one register for each of the eight CTITRIGIN inputs. Within each register there is one bit for each of the four channels implemented. These registers do not affect the application trigger operations.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TRIGINEN [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TRIGINEN | RW | R | 0 | Enables a cross trigger event to the corresponding channel when an CTITRIGIN is activated.<br>1 = enables the CTITRIGIN signal to generate an event on the respective channel of the CTM.<br>There is one bit of the register for each of the four channels. For example in register CTIINEN0, TRIGINEN[0] set to 1 enables CTITRIGIN onto channel 0.<br>0 = disables the CTITRIGIN signal from generating an event on the respective channel of the CTM. |

#### 4.14.7.7 CM7_TRCCTI_CTIOUTEN

**Description:** CTI Channel to Trigger Enable Registers
**Address:** 0xE00800A0
**Offset:** 0xA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Channel to Trigger Enable Registers define which channels can generate a CTITRIGOUT output. There is one register for each of the eight CTITRIGOUT outputs. Within each register there is one bit for each of the four channels implemented. These registers affect the mapping from application trigger to trigger outputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TRIGOUTEN [3:0] | | | |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TRIGOUTEN | RW | R | 0 | Changing the value of this bit from a 0 to a 1 enables a channel event for the corresponding channel to generate an CTITRIGOUT output:<br>0 = the channel input (CTICHIN) from the CTM is not routed to the CTITRIGOUT output 1 = the channel input (CTICHIN) from the CTM is routed to the CTITRIGOUT output. There is one bit for each of the four channels. For example in register CTIOUTEN0, enabling bit 0 enables CTICHIN[0] to cause a trigger event on the CTITRIGOUT[0] output. |

### 4.14.7.8 CM7_TRCCTI_CTITRIGINSTATUS

**Description:** CTI Trigger In Status Register
**Address:** 0xE0080130
**Offset:** 0x130
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger In Status Register provides the status of the CTITRIGIN inputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TRIGINSTATUS [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | TRIGINSTATUS | R | RW | 0 | Shows the status of the CTITRIGIN inputs:<br>1 = CTITRIGIN is active<br>0 = CTITRIGIN is inactive.<br>Because the register provides a view of the raw CTITRIGIN inputs, the reset value is unknown. There is one bit of the register for each trigger input. |

### 4.14.7.9 CM7_TRCCTI_CTITRIGOUTSTATUS

**Description:** CTI Trigger Out Status Register
**Address:** 0xE0080134
**Offset:** 0x134
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Trigger Out Status Register provides the status of the CTITRIGOUT outputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TRIGOUTSTATUS [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | TRIGOUTSTATUS | R | RW | 0 | Shows the status of the CTITRIGOUT outputs.<br>1 = CTITRIGOUT is active<br>0 = CTITRIGOUT is inactive (reset).<br>There is one bit of the register for each trigger output. |

### 4.14.7.10 CM7_TRCCTI_CTICHINSTATUS

**Description:** CTI Channel In Status Register
**Address:** 0xE0080138
**Offset:** 0x138
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Channel In Status Register provides the status of the CTI CTICHIN inputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | CTICHINSTATUS [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | CTICHINSTATUS | R | RW | 0 | Shows the status of the CTICHIN inputs:<br>1 = CTICHIN is active<br>0 = CTICHIN is inactive.<br>Because the register provides a view of the raw CTICHIN inputs from the CTM, the reset value is unknown. There is one bit of the register for each channel input. |

### 4.14.7.11 CM7_TRCCTI_CTICHOUTSTATUS

**Description:** CTI Channel Out Status Register
**Address:** 0xE008013C
**Offset:** 0x13C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CTI Channel Out Status Register provides the status of the CTI CTICHOUT outputs.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | CTICHOUTSTATUS [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | CTICHOUTSTATUS | R | RW | 0 | Shows the status of the CTICHOUT outputs.<br>1 = CTICHOUT is active<br>0 = CTICHOUT is inactive (reset).<br>There is one bit of the register for each channel output. |

### 4.14.7.12 CM7_TRCCTI_CTIGATE

**Description:** Enable CTI Channel Gate Register
**Address:** 0xE0080140
**Offset:** 0x140
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The Gate Enable Register prevents the channels from propagating through the CTM to other CTIs. This enables local cross-triggering, for example for causing an interrupt when the ETM trigger occurs. It can be used effectively with CTIAPPSET, CTIAPPCLEAR, and CTIAPPPULSE for asserting trigger outputs by asserting channels, without affecting the rest of the system. On reset, this register is 0xF, and channel propagation is enabled.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | CTIGATEEN 3 [3:3] | CTIGATEEN 2 [2:2] | CTIGATEEN 1 [1:1] | CTIGATEEN 0 [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | CTIGATEEN0 | RW | R | 1 | Enable CTICHOUT0. Set to 0 to disable channel propagation. |
| 1 | CTIGATEEN1 | RW | R | 1 | Enable CTICHOUT1. Set to 0 to disable channel propagation. |
| 2 | CTIGATEEN2 | RW | R | 1 | Enable CTICHOUT2. Set to 0 to disable channel propagation. |
| 3 | CTIGATEEN3 | RW | R | 1 | Enable CTICHOUT3. Set to 0 to disable channel propagation. |

### 4.14.7.13 CM7_TRCCTI_ASICCTL

**Description:** External Multiplexor Control Register
**Address:** 0xE0080144
**Offset:** 0x144
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ASICCTL [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | CTTRIGIN | R | W | 0 | Read the values of the CTTRIGIN inputs |

### 4.14.7.22 CM7_TRCCTI_ITCTRL

**Description:** Integration Mode Control Register
**Address:** 0xE0080F00
**Offset:** 0xF00
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for the purpose of integration testing and topology solving.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | MODE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | MODE | RW | R | 0 | When set, the component enters integration mode, enabling topology detection or integration testing to be performed. At reset the component must enter functional mode. If no integration functionality is implemented, this register must read as zero. |

### 4.14.7.23 CM7_TRCCTI_CLAIMSET

**Description:** Claim Tag Set Register
**Address:** 0xE0080FA0
**Offset:** 0xFA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.
You can determine how many claim bits are implemented by reading this register. For example, if 4 bits are implemented, a read of this register will return 0x0000000F. If no claim tag is implemented, then a read of this register will return 0x00000000.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1S | R | 15 | A bit programmable register bank which sets the Claim Tag Value. A read will return a logic 1 for all implemented locations. |

### 4.14.7.24 CM7_TRCCTI_CLAIMCLR

**Description:** Claim Tag Clear Register
**Address:** 0xE0080FA4
**Offset:** 0xFA4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read. The width (n) of this register can be determined from reading the Claim Tag Set Register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1C | R | 0 | A bit programmable register bank that is zero at reset. |

### 4.14.7.25 CM7_TRCCTI_LOCKACCESS

**Description:** Lock Access Register
**Address:** 0xE0080FB0
**Offset:** 0xFB0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This is used to enable write access to device registers. If LOCKSTATUS[0] == 0x0 then this register is not present.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | ACCESS_CODE [3:0] | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | ACCESS_CODE | RW | R | 0 | Write Access Code. A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access.<br>If LOCKSTATUS[2] is set, then only bits [7:0] of this register are implemented and lock access is obtained by consecutively writing 0xC5, 0xAC, 0xCE, 0x55. Bits [31:8] are unused and any writes to them ignored. |

### 4.14.7.26 CM7_TRCCTI_LOCKSTATUS

**Description:** Lock Status Register
**Address:** 0xE0080FB4
**Offset:** 0xFB4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This indicates the status of the Lock control mechanism. This lock prevents accidental writes by code under debug.
This register must always be present although there might not be any lock-access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register 0xFB0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | IMPLEMENTS_8B [2:2] | ACCESS_PERMITTED [1:1] | EXISTS [0:0] |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | EXISTS | R | W | 0 | Indicates that a lock control mechanism exists for this device |
| 1 | ACCESS_PERMITTED | R | W | 0 | The values of this bit mean:<br>0 = Access permitted.<br>1 = Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted |
| 2 | IMPLEMENTS_8B | R | W | 0 | This component implements an 8-bit Lock Access Register. |

### 4.14.7.27 CM7_TRCCTI_AUTHSTATUS

**Description:** Authentication Status Register
**Address:** 0xE0080FB8
**Offset:** 0xFB8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Reports the required security level and current status of those enables. Where functionality changes on a given security level then this change in status must be reported in this register
**Default:** 0x5

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

### 4.14.7.28 CM7_TRCCTI_DEVID

**Description:** Device Configuration Register
**Address:** 0xE0080FC8
**Offset:** 0xFC8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is implementation-defined for each Part Number and Designer. This indicates the capabilities of the component. The entire 32-bit field can be used because the data width is determined by the particular component. Unused bits must read as zero.
If the component is configurable then it is recommended that this register reflects any changes to a standard configuration.
**Default:** 0x40804

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | NRMUXING [4:0] | | | | |

### 4.14.9.19 CM7_ETB_CLAIMSET

**Description:** Claim Tag Set Register
**Address:** 0xE008DFA0
**Offset:** 0xFA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.
You can determine how many claim bits are implemented by reading this register. For example, if 4 bits are implemented, a read of this register will return 0x0000000F. If no claim tag is implemented, then a read of this register will return 0x00000000.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1S | R | 15 | A bit programmable register bank which sets the Claim Tag Value. A read will return a logic 1 for all implemented locations. |

### 4.14.9.20 CM7_ETB_CLAIMCLR

**Description:** Claim Tag Clear Register
**Address:** 0xE008DFA4
**Offset:** 0xFA4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read. The width (n) of this register can be determined from reading the Claim Tag Set Register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1C | R | 0 | A bit programmable register bank that is zero at reset. |

### 4.14.9.21 CM7_ETB_LOCKACCESS

**Description:** Lock Access Register
**Address:** 0xE008DFB0
**Offset:** 0xFB0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This is used to enable write access to device registers. If LOCKSTATUS[0] == 0x0 then this register is not present.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | ACCESS_CODE [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | ACCESS_CODE | RW | R | 0 | Write Access Code. A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access.<br>If LOCKSTATUS[2] is set, then only bits [7:0] of this register are implemented and lock access is obtained by consecutively writing 0xC5, 0xAC, 0xCE, 0x55. Bits [31:8] are unused and any writes to them ignored. |

### 4.14.9.22 CM7_ETB_LOCKSTATUS

**Description:** Lock Status Register
**Address:** 0xE008DFB4
**Offset:** 0xFB4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This indicates the status of the Lock control mechanism. This lock prevents accidental writes by code under debug.
This register must always be present although there might not be any lock-access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register 0xFB0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | IMPLEMENTS_8B [2:2] | ACCESS_PERMITTED [1:1] | EXISTS [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | EXISTS | R | W | 0 | Indicates that a lock control mechanism exists for this device |
| 1 | ACCESS_PERMITTED | R | W | 0 | The values of this bit mean:<br>0 = Access permitted.<br>1 = Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted |
| 2 | IMPLEMENTS_8B | R | W | 0 | This component implements an 8-bit Lock Access Register. |

### 4.14.9.23 CM7_ETB_AUTHSTATUS

**Description:** Authentication Status Register
**Address:** 0xE008DFB8
**Offset:** 0xFB8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Reports the required security level and current status of those enables. Where functionality changes on a given security level then this change in status must be reported in this register
**Default:** 0x5

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SNIDBG [7:6] | | SIDBG [5:4] | | NSNIDBG [3:2] | | NSIDBG [1:0] | |

### 4.14.9.24 CM7_ETB_DEVID

**Description:** Device ID
**Address:** 0xE008DFC8
**Offset:** 0xFC8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is implementation-defined for each Part Number and Designer. This indicates the capabilities of the component. The entire 32-bit field can be used because the data width is determined by the particular component. Unused bits must read as zero.
If the component is configurable then it is recommended that this register reflects any changes to a standard configuration.
**Default:** 0x40804

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | NRMUXING [4:0] | | | | |

### 4.14.10.20 CM7_TPIU_ITCTRL

**Description:** Integration Mode Control register
**Address:** 0xE008EF00
**Offset:** 0xF00
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for the purpose of integration testing and topology solving.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | MODE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | MODE | RW | R | 0 | When set, the component enters integration mode, enabling topology detection or integration testing to be performed. At reset the component must enter functional mode. If no integration functionality is implemented, this register must read as zero. |

### 4.14.10.21 CM7_TPIU_CLAIMSET

**Description:** Claim Tag Set Register
**Address:** 0xE008EFA0
**Offset:** 0xFA0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.
You can determine how many claim bits are implemented by reading this register. For example, if 4 bits are implemented, a read of this register will return 0x0000000F. If no claim tag is implemented, then a read of this register will return 0x00000000.
**Default:** 0xF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1S | R | 15 | A bit programmable register bank which sets the Claim Tag Value. A read will return a logic 1 for all implemented locations. |

### 4.14.10.22 CM7_TPIU_CLAIMCLR

**Description:** Claim Tag Clear Register
**Address:** 0xE008EFA4
**Offset:** 0xFA4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read. The width (n) of this register can be determined from reading the Claim Tag Set Register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | TAG [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | TAG | RW1C | R | 0 | A bit programmable register bank that is zero at reset. |

### 4.14.10.23 CM7_TPIU_LOCKACCESS

**Description:** Lock Access Register
**Address:** 0xE008EFB0
**Offset:** 0xFB0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This is used to enable write access to device registers. If LOCKSTATUS[0] == 0x0 then this register is not present.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | ACCESS_CODE [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | ACCESS_CODE | RW | R | 0 | Write Access Code. A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access.<br>If LOCKSTATUS[2] is set, then only bits [7:0] of this register are implemented and lock access is obtained by consecutively writing 0xC5, 0xAC, 0xCE, 0x55. Bits [31:8] are unused and any writes to them ignored. |

### 4.14.10.24 CM7_TPIU_LOCKSTATUS

**Description:** Lock Status Register
**Address:** 0xE008EFB4
**Offset:** 0xFB4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This indicates the status of the Lock control mechanism. This lock prevents accidental writes by code under debug.
This register must always be present although there might not be any lock-access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register 0xFB0.
**Default:** 0x3

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | NTT [2:2] | SLK [1:1] | SLI [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SLI | R | W | 1 | Software Lock Implemented. Indicates that a lock control mechanism is present from this interface.<br>0 Indicates that a lock control mechanism is not present from this interface. Write operations to the LAR are ignored.<br>1 Indicates that a lock control mechanism is present from this interface. |
| 1 | SLK | R | W | 1 | Software Lock Status. Returns the present lock status of the device, from the current interface.<br>0 Indicates that write operations are permitted from this interface.<br>1 Indicates that write operations are not permitted from this interface. Read operations are permitted. |
| 2 | NTT | R | W | 0 | Register size indicator. Always 0. Indicates that the LAR is implemented as 32-bit. |

### 4.14.10.25 CM7_TPIU_AUTHSTATUS

**Description:** Authentication Status register
**Address:** 0xE008EFB8
**Offset:** 0xFB8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Reports the required security level and current status of those enables. Where functionality changes on a given security level then this change in status must be reported in this register
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SNIDBG [7:6] | | SIDBG [5:4] | | NSNIDBG [3:2] | | NSIDBG [1:0] | |

### 4.14.10.26 CM7_TPIU_DEVID

**Description:** Device Configuration register
**Address:** 0xE008EFC8
**Offset:** 0xFC8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is implementation-defined for each Part Number and Designer. This indicates the capabilities of the component. The entire 32-bit field can be used because the data width is determined by the particular component. Unused bits must read as zero.
If the component is configurable then it is recommended that this register reflects any changes to a standard configuration.
**Default:** 0xA0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | FIFOSIZE [7:6] | | CLKRELAT [5:5] | MUXNUM [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:12] | | | | SWOUARTNRZ [11:11] | SWOMAN [10:10] | TCLKDATA [9:9] | FIFOSIZE [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | MUXNUM | R | R | 0 | Indicates the hidden level of input multiplexing. When non-zero, this value indicates the type of multiplexing on the input to the ATB. Currently only 0x00 is supported, that is, no multiplexing is present. This value helps detect the ATB structure. |
| 5 | CLKRELAT | R | R | 1 | Indicates the relationship between atclk and traceclkin. 1: atclk and traceclkin are asynchronous. |
| 6:8 | FIFOSIZE | R | R | 2 | FIFO size in powers of 2.<br>0b010: FIFO size of 4 entries, that is, 16 bytes. |
| 9 | TCLKDATA | R | R | 0 | Indicates whether trace clock plus data is supported.<br>0: Trace clock and data is supported. |
| 10 | SWOMAN | R | R | 0 | Indicates whether Serial Wire Output, Manchester encoded format, is supported.<br>0: Serial Wire Output, Manchester encoded format, is not supported. |
| 11 | SWOUARTNRZ | R | R | 0 | Indicates whether Serial Wire Output, UART or NRZ, is supported.<br>0: Serial Wire Output, UART or NRZ, is not supported. |

### 4.14.10.27 CM7_TPIU_DEVTYPE

**Description:** Device Type Identifier register
**Address:** 0xE008EFCC
**Offset:** 0xFCC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Indicates device type
**Default:** 0x11

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SUB [7:4] | | | | MAJOR [3:0] | | | |

## 5.1 Register Details

### 5.1.1 CPUSS_IDENTITY

**Description:** Identity
**Address:** 0x40200000
**Offset:** 0x0
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** This register is typically used by SW that is executed on different bus masters or with different protection contexts.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | PC [7:4] | | | | None [3:2] | | NS [1:1] | P [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:12] | | | | MS [11:8] | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | P | R | W | Undefined | This field specifies the privileged setting ('0': user mode; '1': privileged mode) of the transfer that reads the register. |
| 1 | NS | R | W | Undefined | This field specifies the security setting ('0': secure mode; '1': non-secure mode) of the transfer that reads the register. |
| 4:7 | PC | R | W | Undefined | This field specifies the protection context of the transfer that reads the register. |
| 8:11 | MS | R | W | Undefined | This field specifies the bus master identifier of the transfer that reads the register. |

### 5.1.2 CPUSS_CM7_0_STATUS

**Description:** CM7 0 status
**Address:** 0x40200004
**Offset:** 0x4
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x13

**Bit-field Table**

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SLEEPING | R | W | 1 | Specifies if the CPU is in Active, Sleep or DeepSleep power mode:<br>- Active power mode: SLEEPING is '0'.<br>- Sleep power mode: SLEEPING is '1' and SLEEPDEEP is '0'.<br>- DeepSleep power mode: SLEEPING is '1' and SLEEPDEEP is '1'. |
| 1 | SLEEPDEEP | R | W | 1 | Specifies if the CPU is in Sleep or DeepSleep power mode. See SLEEPING field. |
| 4 | PWR_DONE | R | W | 1 | After a PWR_MODE change this flag indicates if the new power mode has taken effect or not.<br>Note: this flag can also change as a result of a change in debug power up req |
| 9 | TCMC_CM7_1_MS | R | W | 0 | Outstanding transactions from CM7 1.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 1.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 1. Do not switch the CM7 power off. |
| 10 | TCMC_EXT_MS_2_TO_0 | R | W | 0 | Outstanding transactions from external AXI masters 2 to 0.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from external AXI masters 2 to 0.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from external AXI masters 2 to 0. Do not switch the CM7 power off. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 11 | TCMC_EXT_MS_3 | R | W | 0 | Outstanding transactions from external AXI master 3.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from external AXI master 3.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from external AXI master 3. Do not switch the CM7 power off. |
| 12 | TCMC_AHB_MS | R | W | 0 | Ongoing AHB transaction.<br>'0': There is no ongoing transaction to the CM7 I/D-TCM slave port (AHBS) from an AHB master.<br>'1': There is an ongoing transaction to the CM7 I/D-TCM slave port (AHBS) from an AHB master. Do not switch the CM7 power off. |
| 16 | TCMC_CM7_2_MS | R | W | 0 | Outstanding transactions from CM7 2.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 2.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 2. Do not switch the CM7 power off. |
| 17 | TCMC_CM7_3_MS | R | W | 0 | Outstanding transactions from CM7 3.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 3.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 3. Do not switch the CM7 power off. |

### 5.1.3 CPUSS_FAST_0_CLOCK_CTL

**Description:** Fast 0 clock control
**Address:** 0x40200008
**Offset:** 0x8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Clock division control to divide and generate clk_fast_0 from clk_hf<x>.
Note that this register is retained. However, the counter that is used to implement the division is not and will be initialized by HW to '0' when transitioning from DeepSleep to Active power mode.
Note that CM7 clocks must be running before accessing this register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | FRAC_DIV [7:3] | | | | | None [2:0] | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | INT_DIV [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 3:7 | FRAC_DIV | RW | R | 0 | Fractional division by (FRAC_DIV/32). Allows for fractional divisions in the range [0, 31/32]. Note that fractional division results in clock jitter as some clock periods may be 1 'clk_hf<x>' cycle longer than other clock periods. |
| 8:15 | INT_DIV | RW | R | 0 | Integer division by (1+INT_DIV). Allows for integer divisions in the range [1, 256] (INT_DIV is in the range [0, 255]). |

### 5.1.4 CPUSS_CM7_0_CTL

**Description:** CM7 0 control
**Address:** 0x4020000C
**Offset:** 0xC
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Note that CM7 clocks must be running before accessing this register.
**Default:** 0x1F

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | CPU_WAIT [4:4] | PPB_LOCK [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:12] | | | | INIT_RMW_EN [11:10] | | INIT_TCM_EN [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | TCMC_EN [23:23] | DTCM _READ _WS [22:22] | DTCM _ECC_INJ _EN [21:21] | DTCM _ECC_EN [20:20] | ITCM_ECC _CHECK _DIS [19:19] | ITCM _READ _WS [18:18] | ITCM_ECC _INJ_EN [17:17] | ITCM_ECC _EN [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | IDC_MASK [31:31] | None [30:29] | | IXC_MASK [28:28] | UFC_MASK [27:27] | OFC _MASK [26:26] | DZC_MASK [25:25] | IOC_MASK [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | PPB_LOCK | RW | R | 15 | Write disable for specific CPU registers:<br>Bit 0: ITCMR register. '0': enabled; '1': disabled.<br>Bit 1: DTCMR register. '0': enabled; '1': disabled.<br>Bit 2: AHBPCR register. '0': enabled; '1': disabled.<br>Bit 3: VTOR register. '0': enabled; '1': disabled. |
| 4 | CPU_WAIT | RW | R | 1 | When this signal is '1' out of reset, it forces the CPU into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven '0'. This allows the TCMs to be loaded by the system before the CPU performs any TCM accesses. The CPU AHBS interface functions while CPU_WAIT is '1' and services transactions initiated by the system (e.g. DMA controller) to load the TCMs. |
| 8:9 | INIT_TCM_EN | RW | R | 0 | TCM enable initialization after reset:<br>Bit 0: ITCM. '0': disabled; '1': enabled.<br>Bit 1: DTCM. '0': disabled; '1': enabled. |
| 10:11 | INIT_RMW_EN | RW | R | 0 | TCM read-modify-write enable initialization after reset:<br>Bit 0: ITCM. '0': disabled; '1': enabled.<br>Bit 1: DTCM. '0': disabled; '1': enabled.<br><br>Note: When TCM ECC is enabled, the read-modify-write functionality should be enabled. This prevents partial (sub-word) writes to the TCM. |
| 16 | ITCM_ECC_EN | RW | R | 0 | ITCM ECC enable:<br>'0': Disabled.<br>'1': Enabled. |
| 17 | ITCM_ECC_INJ_EN | RW | R | 0 | ITCM ECC error injection enable:<br>'0': Disabled.<br>'1': Enabled. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 18 | ITCM_READ_WS | RW | R | 0 | ITCM read wait states (writes have no wait states).<br>'0': 0 wait states.<br>'1': 1 wait state. |
| 19 | ITCM_ECC_CHECK_DIS | RW | R | 0 | Disable ECC checking and thus fault reports. This also disables ECC correction (required to enable initialization). Intended usage is initialization. This bit is ignored when TCM_ECC_EN=0. |
| 20 | DTCM_ECC_EN | RW | R | 0 | DTCM ECC enable:<br>'0': Disabled.<br>'1': Enabled. |
| 21 | DTCM_ECC_INJ_EN | RW | R | 0 | DTCM ECC error injection enable:<br>'0': Disabled.<br>'1': Enabled. |
| 22 | DTCM_READ_WS | RW | R | 0 | DTCM read wait states (writes have no wait states).<br>'0': 0 wait states.<br>'1': 1 wait state. |
| 23 | TCMC_EN | RW | R | 0 | CM7 TCMC access control:<br>'0': Disable access to the CM7 I/D-TCM slave port (AHBS). Access attempts will get a bus error response.<br>'1': Enable access to the CM7 I/D-TCM slave port (AHBS).<br><br>Before switching the CM7 power off, set this field to 0, and confirm that there are no outstanding AXI transactions and no ongoing AHB transactions to the CM7 TCMs, by checking that bits TCMC_* in CM7_x_STATUS are '0'. |
| 24 | IOC_MASK | RW | R | 0 | CPU floating point unit (FPU) exception mask for the CPU's FPCSR.IOC 'invalid operation' exception condition:<br>'0': The CPU's exception condition does NOT activate the CPU's floating point interrupt.<br>'1': the CPU's exception condition activates the CPU's floating point interrupt.<br><br>Note: the ARM architecture does NOT support FPU exceptions; i.e. there is no precise FPU exception handler. Instead, FPU conditions are captured in the CPU's FPCSR register and the conditions are provided as CPU interface signals. The interface signals are 'masked' with the fields a provide by this register (CM7_0_CTL). The 'masked' signals are reduced/OR-ed into a single CPU floating point interrupt signal. The associated CPU interrupt handler allows for imprecise handling of FPU exception conditions.<br><br>Note: the CPU's FPCSR exception conditions are 'sticky'. Typically, the CPU FPU interrupt handler will clear the exception condition(s) to '0'.<br><br>Note: by default, the FPU exception masks are '0'. Therefore, FPU exception conditions will NOT activate the CPU's floating point interrupt. |
| 25 | DZC_MASK | RW | R | 0 | CPU FPU exception mask for the CPU's FPCSR.DZC 'divide by zero' exception condition:<br>'0': The CPU's exception condition does NOT activate the CPU's floating point interrupt.<br>'1': the CPU's exception condition activates the CPU's floating point interrupt. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 26 | OFC_MASK | RW | R | 0 | CPU FPU exception mask for the CPU's FPCSR.OFC 'overflow' exception condition:<br>'0': The CPU's exception condition does NOT activate the CPU's floating point interrupt.<br>'1': the CPU's exception condition activates the CPU's floating point interrupt. |
| 27 | UFC_MASK | RW | R | 0 | CPU FPU exception mask for the CPU's FPCSR.UFC 'underflow' exception condition:<br>'0': The CPU's exception condition does NOT activate the CPU's floating point interrupt.<br>'1': the CPU's exception condition activates the CPU's floating point interrupt. |
| 28 | IXC_MASK | RW | R | 0 | CPU FPU exception mask for the CPU's FPCSR.IXC 'inexact' exception condition:<br>'0': The CPU's exception condition does NOT activate the CPU's floating point interrupt.<br>'1': the CPU's exception condition activates the CPU's floating point interrupt.<br><br>Note: the 'inexact' condition is set as a result of rounding. Rounding may occur frequently and is typically not an error condition. To prevent frequent CPU FPU interrupts as a result of rounding, this field is typically set to '0'. |
| 31 | IDC_MASK | RW | R | 0 | CPU FPU exception mask for the CPU's FPCSR.IDC 'input denormalized' exception condition:<br>'0': The CPU's exception condition does NOT activate the CPU's floating point interrupt.<br>'1': the CPU's exception condition activates the CPU's floating point interrupt.<br><br>Note: if the CPU FPCSR.FZ field is set to '1', denormalized inputs are 'flushed to zero'. Dependent on the FPU algorithm, this may or may not occur frequently. To prevent frequent CPU FPU interrupts as a result of denormalized inputs, this field may be set to '0'. |

### 5.1.5 CPUSS_CM7_0_INT_STATUS

**Description:** CM7 0 interrupt status
**Address:** 0x40200100
**Offset:** 0x100
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SYSTEM_INT_IDX [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | SYSTEM_INT_IDX [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | SYSTEM_INT_VALID [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | SYSTEM_INT_IDX | R | W | Undefined | Lowest CM7_0 activated system interrupt index for CPU interrupt.<br><br>See description of CM0_INT0_STATUS. |
| 31 | SYSTEM_INT_VALID | R | W | 0 | See description of CM0_INT0_STATUS. |

### 5.1.6 CPUSS_CM7_0_VECTOR_TABLE_BASE

**Description:** CM7 0 vector table base
**Address:** 0x40200200
**Offset:** 0x200
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Note that CM7 clocks must be running before accessing this register.
**Default:** 0x1000000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [7:7] | None [6:0] | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 7:31 | ADDR25 | RW | R | 131072 | The default CM7 vector table base address is 0x0100:0000 (CM7 VTOR and reset exception handler address after reset). This is the location of the system ROM memory.<br><br>The system ROM is mirrored at 0x0000:0000. This is required for the CM0+ boot process (the CM0+ VTOR and reset exception handler address is at fixed address 0x0000:00000 after reset). The system ROM requires mirroring as the CM7 CPUs' ITCMs are located at base address 0x0000:0000 and effectively cut a hole in the system ROM mirror address space (but the 0x0100:0000 address space is not affected). |

### 5.1.7 CPUSS_CM7_0_NMI_CTL

**Description:** CM7 0 NMI control
**Address:** 0x40200240
**Offset:** 0x240
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Note that multiple (four) CM7_0_NMI_CTL registers exist, allowing for multiple (four) system interrupts to be connnected to the CPU NMI. The four selected system interrupts are logically OR'd into a single CPU NMI input. The NMI handler may need to investigate all selected system interrupt sources to identify the source of CPU NMI.
**Default:** 0x3FF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SYSTEM_INT_IDX [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | SYSTEM_INT_IDX [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | SYSTEM_INT_IDX | RW | R | 1023 | System interrupt select for CPU NMI. The reset value ('1023') ensures that the CPU NMI is NOT connected to any system interrupt after DeepSleep reset. |

### 5.1.8 CPUSS_TRC_DBG_CLOCK_CTL

**Description:** Trace and debug clock control
**Address:** 0x40200320
**Offset:** 0x320
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Clock division control to divide and generate clk_trc_dbg from clk_hf0_dbg (clk_hf0_dbg is same as clk_hf0, but runs only when debugger is connected i.e when CDBGPWRUPREQ=1).
**Default:** 0x200

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | INT_DIV [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8:15 | INT_DIV | RW | R | 2 | Integer division by (1+INT_DIV). Allows for integer divisions in the range [1, 256] (INT_DIV is in the range [0, 255]).<br>Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to '0' when transitioning from DeepSleep to Active power mode. |

### 5.1.9 CPUSS_CM7_1_STATUS

**Description:** CM7 1status
**Address:** 0x40200404
**Offset:** 0x404
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x13

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:5] | | | PWR_DONE [4:4] | None [3:2] | | SLEEPDEEP [1:1] | SLEEPING [0:0] |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SLEEPING | R | W | 1 | Specifies if the CPU is in Active, Sleep or DeepSleep power mode:<br>- Active power mode: SLEEPING is '0'.<br>- Sleep power mode: SLEEPING is '1' and SLEEPDEEP is '0'.<br>- DeepSleep power mode: SLEEPING is '1' and SLEEPDEEP is '1'. |
| 1 | SLEEPDEEP | R | W | 1 | Specifies if the CPU is in Sleep or DeepSleep power mode. See SLEEPING field. |
| 4 | PWR_DONE | R | W | 1 | After a PWR_MODE change this flag indicates if the new power mode has taken effect or not.<br>Note: this flag can also change as a result of a change in debug power up req |
| 8 | TCMC_CM7_0_MS | R | W | 0 | Outstanding transactions from CM7 0.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 0.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 0. Do not switch the CM7 power off. |
| 10 | TCMC_EXT_MS_2_TO_0 | R | W | 0 | Refer CM7_0_STATUS description. |
| 11 | TCMC_EXT_MS_3 | R | W | 0 | Refer CM7_0_STATUS description. |
| 12 | TCMC_AHB_MS | R | W | 0 | Refer CM7_0_STATUS description. |
| 16 | TCMC_CM7_2_MS | R | W | 0 | Outstanding transactions from CM7 2.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 2.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 2. Do not switch the CM7 power off. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 17 | TCMC_CM7_3_MS | R | W | 0 | Outstanding transactions from CM7 3.<br>'0': There are no outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 3.<br>'1': There are outstanding transactions to the CM7 I/D-TCM slave port (AHBS) from CM7 3. Do not switch the CM7 power off. |

### 5.1.10 CPUSS_FAST_1_CLOCK_CTL

**Description:** Fast 1 clock control
**Address:** 0x40200408
**Offset:** 0x408
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Clock division control to divide and generate clk_fast_1 from clk_hf<x>. Note that this register is retained. However, the counter that is used to implement the division is not and will be initialized by HW to '0' when transitioning from DeepSleep to Active power mode.
Note that CM7 clocks must be running before accessing this register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | FRAC_DIV [7:3] | | | | | None [2:0] | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | INT_DIV [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

| Name | SYSTEM_INT_VALID [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | SYSTEM_INT_IDX | R | W | Undefined | Lowest CM7_3 activated system interrupt index for CPU interrupt 0.<br><br>See description of CM0_INT0_STATUS. |
| 31 | SYSTEM_INT_VALID | R | W | 0 | See description of CM0_INT0_STATUS. |

### 5.1.25 CPUSS_CM7_3_VECTOR_TABLE_BASE

**Description:** CM7 3 vector table base
**Address:** 0x40200E00
**Offset:** 0xE00
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Note that CM7 clocks must be running before accessing this register.
**Default:** 0x1000000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [7:7] | None [6:0] | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR25 [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 7:31 | ADDR25 | RW | R | 131072 | The default CM7 vector table base address is 0x0100:0000 (CM7 VTOR and reset exception handler address after reset). This is the location of the system ROM memory.<br><br>The system ROM is mirrored at 0x0000:0000. This is required for the CM0+ boot process (the CM0+ VTOR and reset exception handler address is at fixed address 0x0000:00000 after reset). The system ROM requires mirroring as the CM7 CPUs' ITCMs are located at base address 0x0000:0000 and effectively cut a hole in the system ROM mirror address space (but the 0x0100:0000 address space is not affected). |

### 5.1.26 CPUSS_CM7_3_NMI_CTL

**Description:** CM7 3 NMI control
**Address:** 0x40200E40
**Offset:** 0xE40
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x3FF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SYSTEM_INT_IDX [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | SYSTEM_INT_IDX [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | SYSTEM_INT_IDX | RW | R | 1023 | Refer CM7_0_NMI_CTL description. |

### 5.1.27 CPUSS_CM0_CTL

**Description:** CM0+ control
**Address:** 0x40201000
**Offset:** 0x1000
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0xFA050002

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | ENABLED [1:1] | SLV _STALL [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTKEYSTAT [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTKEYSTAT [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SLV_STALL | RW | R | 0 | Processor debug access control:<br>'0': Access.<br>'1': Stall access.<br><br>This field is used to stall/delay debug accesses. This is useful to protect execution of code that needs to be protected from debug accesses. |
| 1 | ENABLED | RW | RW1S | 1 | Processor enable:<br>'0': Disabled. Processor clock is turned off and reset is activated. After SW clears this field to '0', HW automatically sets this field to '1'. This effectively results in a CM0+ reset, followed by a CM0+ warm boot.<br>'1': Enabled.<br>Note: The intent is that this bit is modified only through an external probe or by the CM7 while the CM0+ is in Sleep or DeepSleep power mode. If this field is cleared to '0' by the CM0+ itself, it should be done under controlled conditions (such that undesirable side effects can be prevented).<br><br>Note: The CM0+ CPU has a AIRCR.SYSRESETREQ register field that allows the CM0+ to reset the complete device (ENABLED only disables/enables the CM0+), resulting in a warm boot. This CPU register field has similar 'built-in protection' as this CM0_CTL register to prevent accidental system writes (the upper 16-bits of the register need to be written with a 0x05fa key value; see CPU user manual for more details). |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 16:31 | VECTKEYSTAT | R | | 64005 | Register key (to prevent accidental writes).<br>- Should be written with a 0x05fa key value for the write to take effect.<br>- Always reads as 0xfa05.<br>Note: Although the SW attribute for this field says "R', SW need to write the key 0x05fa in this field for this register write to happen. This is a built in protection provided to prevent accidental writes from SW. |

### 5.1.28 CPUSS_CM0_STATUS

**Description:** CM0+ status
**Address:** 0x40201004
**Offset:** 0x1004
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | SLEEPDEEP [1:1] | SLEEPING [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SLEEPING | R | W | 0 | Specifies if the CPU is in Active, Sleep or DeepSleep power mode:<br>- Active power mode: SLEEPING is '0'.<br>- Sleep power mode: SLEEPING is '1' and SLEEPDEEP is '0'.<br>- DeepSleep power mode: SLEEPING is '1' and SLEEPDEEP is '1'. |
| 1 | SLEEPDEEP | R | W | 0 | Specifies if the CPU is in Sleep or DeepSleep power mode. See SLEEPING field. |

### 5.1.29 CPUSS_SLOW_CLOCK_CTL

**Description:** Slow clock control
**Address:** 0x40201008
**Offset:** 0x1008
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | INT_DIV [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8:15 | INT_DIV | RW | R | 0 | Specifies the slow clock divider (from the memory/AXI clock 'clk_mem' to the slow clock 'clk_slow'). Integer division by (1+INT_DIV). Allows for integer divisions in the range [1, 256] (INT_DIV is in the range [0, 255]).<br><br>Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to '0' when transitioning from DeepSleep to Active power mode. |

### 5.1.30 CPUSS_PERI_CLOCK_CTL

**Description:** Peripheral interconnect clock control
**Address:** 0x4020100C
**Offset:** 0x100C
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Clock division control to divide and generate clk_peri from clk_hf0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | INT_DIV [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8:15 | INT_DIV | RW | R | 0 | Integer division by (1+INT_DIV). Allows for integer divisions in the range [1, 256] (INT_DIV is in the range [0, 255]).<br>Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to '0' when transitioning from DeepSleep to Active power mode. |

### 5.1.31 CPUSS_MEM_CLOCK_CTL

**Description:** Memory clock control
**Address:** 0x40201010
**Offset:** 0x1010
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Clock division control to divide and generate clk_mem from clk_hf0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | INT_DIV [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8:15 | INT_DIV | RW | R | 0 | Integer division by (1+INT_DIV). Allows for integer divisions in the range [1, 256] (INT_DIV is in the range [0, 255]).<br>Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to '0' when transitioning from DeepSleep to Active power mode. |

### 5.1.32 CPUSS_CM0_INT0_STATUS

**Description:** CM0+ interrupt 0 status
**Address:** 0x40201100
**Offset:** 0x1100
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SYSTEM_INT_IDX [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | SYSTEM_INT_IDX [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|

### 5.1.40 CPUSS_CM0_VECTOR_TABLE_BASE

**Description:** CM0+ vector table base
**Address:** 0x40201120
**Offset:** 0x1120
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR24 [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR24 [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR24 [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8:31 | ADDR24 | RW | | 0 | The default CM0+ vector table base address is 0x0000:0000 (CM0+ VTOR and reset exception handler address after reset). This is the location of the mirror system ROM memory.<br><br>This register is provided for SW purposes. It 'survives' a CM0+ warm reset cycle (CM0_CTL.ENABLED).<br><br>Note: the use of the mirror system ROM memory can be disabled using the protection infrastructure (SMPU). |

### 5.1.41 CPUSS_CM0_NMI_CTL

**Description:** CM0+ NMI control
**Address:** 0x40201140
**Offset:** 0x1140
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Note that multiple (four) CM0_NMI_CTL registers exist, allowing for multiple (four) system interrupts to be connnected to the CPU NMI. The four selected system interrupts are logically OR'd into a single CPU NMI input. The NMI handler may need to investigate all selected system interrupt sources to identify the source of CPU NMI.
**Default:** 0x3FF

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SYSTEM_INT_IDX [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | SYSTEM_INT_IDX [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | SYSTEM_INT_IDX | RW | R | 1023 | System interrupt select for CPU NMI. The reset value ('1023') ensures that the CPU NMI is NOT connected to any system interrupt after DeepSleep reset. |

### 5.1.42 CPUSS_CM7_0_PWR_CTL

**Description:** CM7 0 power control
**Address:** 0x40201200
**Offset:** 0x1200
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register controls the CM7_0 power state. Please note that this register must not be modified while the CM7_0 is executing; doing so may corrupt/abort pending bus transaction by the CM7_0 and cause unexpected behaviors in the system, including deadlock. The intended usage of this register is by the CM0+ while the CM7_0 is in DeepSleep mode.
Note that CM7 clocks must be running before accessing this register.
**Default:** 0xFA050000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | PWR_MODE [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTKEYSTAT [23:16] | | | | | | | |

### 5.1.50 CPUSS_RAM0_CTL0

**Description:** RAM 0 control
**Address:** 0x40201300
**Offset:** 0x1300
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x30001

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | SLOW_WS [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | FAST_WS [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:20] | | | | ECC_CHECK_DIS [19:19] | ECC_INJ_EN [18:18] | ECC_AUTO_CORRECT [17:17] | ECC_EN [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:1 | SLOW_WS | RW | R | 1 | Memory wait states for the slow clock domain ('clk_slow') intefrace. The number of wait states is expressed in 'clk_mem' clock domain cycles. |
| 8:9 | FAST_WS | RW | R | 0 | Memory wait states for the fast clock domain ('clk_fast_0/1') interface. The number of wait states is expressed in 'clk_mem' clock domain cycles. |
| 16 | ECC_EN | RW | R | 1 | Enable ECC checking:<br>'0': Disabled.<br>'1': Enabled. |
| 17 | ECC_AUTO_CORRECT | RW | R | 1 | HW ECC autocorrect functionality:<br>'0': Disabled.<br>'1': Enabled. HW automatically writes back SRAM with corrected data when a recoverable ECC error is detected. |
| 18 | ECC_INJ_EN | RW | R | 0 | Enable ECC parity injection. Instead of calculating the parity from the write data to the RAM, the parity is taken from ECC_CTL PARITY upon a match of ECC_CTL WORD_ADDR. The write data can be of any size. This bit is ignored when ECC_EN=0.<br>Note: Parity injection invalidates the write buffer for this word address. If only a part of 64-bit data is written and consistency should be maintained, RAMC#_STATUS WB_EMPTY=1 should be checked before. |
| 19 | ECC_CHECK_DIS | RW | R | 0 | Disable ECC checking and thus fault reports. This also disables ECC correction (required to enable initialization). Intended usage is initialization. This bit is ignored when ECC_EN=0. |

### 5.1.51 CPUSS_RAM0_STATUS

**Description:** RAM 0 status
**Address:** 0x40201304
**Offset:** 0x1304
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is for the CPUSS system SRAM controller 0.
**Default:** 0x1

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | WB _EMPTY [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | WB_EMPTY | R | W | 1 | Write buffer empty. This information is used when entering DeepSleep power mode: WB_EMPTY must be '1' before a transition to system DeepSleep power mode.<br>'0': Write buffer NOT empty.<br>'1': Write buffer empty.<br><br>Note: the SRAM controller write buffer is only used when ECC checking is enabled. (RAMi_CTL.ECC_EN is '1'). |

### 5.1.52 CPUSS_RAM0_PWR_MACRO_CTL

**Description:** RAM 0 power control
**Address:** 0x40201340
**Offset:** 0x1340
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** These registers control the system SRAM 0 power states of a single macro. System SRAM 0 consists of up to sixteen 32 kB macros. Each macro is a single power partition and is controlled through a dedicated control field in one of these registers.
**Default:** 0xFA050003

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | PWR_MODE [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTKEYSTAT [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTKEYSTAT [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:1 | PWR_MODE | RW | R | 3 | Power mode. |
| | OFF | | | 0 | Turn OFF the SRAM. This will trun OFF both array and periphery power of the SRAM and SRAM memory contents are lost. |
| | RESERVED | | | 1 | undefined |
| | RETAINED | | | 2 | Keep SRAM in Retained mode. This will turn OFF the SRAM periphery power, but array power is ON to retain memory contents. |
| | ENABLED | | | 3 | Enable SRAM for regular operation. |
| 16:31 | VECTKEYSTAT | R | | 64005 | Register key (to prevent accidental writes).<br>- Should be written with a 0x05fa key value for the write to take effect.<br>- Always reads as 0xfa05.<br>Note: Although the SW attribute for this field says "R', SW need to write the key 0x05fa in this field for this register write to happen. This is a built in protection provided to prevent accidental writes from SW. |

### 5.1.53 CPUSS_RAM1_CTL0

**Description:** RAM 1 control
**Address:** 0x40201380
**Offset:** 0x1380
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is for the CPUSS system SRAM controller 1.
**Default:** 0x30001

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | SLOW_WS [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | FAST_WS [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:20] | | | | ECC_CHECK_DIS [19:19] | ECC_INJ_EN [18:18] | ECC_AUTO_CORRECT [17:17] | ECC_EN [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:1 | SLOW_WS | RW | R | 1 | Refer RAM0_CTL0 descriotion. |
| 8:9 | FAST_WS | RW | R | 0 | Refer RAM0_CTL0 descriotion. |
| 16 | ECC_EN | RW | R | 1 | Refer RAM0_CTL0 descriotion. |
| 17 | ECC_AUTO_CORRECT | RW | R | 1 | Refer RAM0_CTL0 descriotion. |
| 18 | ECC_INJ_EN | RW | R | 0 | Enable ECC parity injection. Instead of calculating the parity from the write data to the RAM, the parity is taken from ECC_CTL PARITY upon a match of ECC_CTL WORD_ADDR. The write data can be of any size. This bit is ignored when ECC_EN=0.<br>Note: Parity injection invalidates the write buffer for this word address. If only a part of 64-bit data is written and consistency should be maintained, RAMC#_STATUS WB_EMPTY=1 should be checked before. |
| 19 | ECC_CHECK_DIS | RW | R | 0 | Disable ECC checking and thus fault reports. This also disables ECC correction (required to enable initialization). Intended usage is initialization. This bit is ignored when ECC_EN=0. |

### 5.1.54 CPUSS_RAM1_STATUS

**Description:** RAM 1 status
**Address:** 0x40201384
**Offset:** 0x1384
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is for the CPUSS system SRAM controller 1.
**Default:** 0x1

**Bit-field Table**

### 5.1.59 CPUSS_RAM_PWR_DELAY_CTL

**Description:** Power up delay used for all SRAM power domains
**Address:** 0x402013C0
**Offset:** 0x13C0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x96

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | UP [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | UP [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | UP | RW | R | 150 | Number clock cycles delay needed after power domain power up |

### 5.1.60 CPUSS_ROM_CTL

**Description:** ROM control
**Address:** 0x402013C4
**Offset:** 0x13C4
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x1

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | SLOW_WS [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | FAST_WS [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:1 | SLOW_WS | RW | R | 1 | Memory wait states for the slow clock domain ('clk_slow'). The number of wait states is expressed in 'clk_mem' clock domain cycles.<br><br>Timing paths to and from the memory have a (fixed) minimum duration that always needs to be considered/met. The 'clk_mem' clock domain frequency determines this field's value such that the timing paths minimum duration is met.<br>ROM_CTL.SLOW_WS = '0' when clk_mem <=100 MHz.<br>ROM_CTL.SLOW_WS = '1' when 100MHz < clk_mem <=200MHz. |
| 8:9 | FAST_WS | RW | R | 0 | Memory wait states for the fast clock domain ('clk_fast'). The number of wait states is expressed in 'clk_mem' clock domain cycles.<br>ROM_CTL.FAST_WS = '0' when clk_mem <= 200MHz. |

### 5.1.61 CPUSS_ECC_CTL

**Description:** ECC control
**Address:** 0x402013C8
**Offset:** 0x13C8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | WORD_ADDR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | WORD_ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | WORD_ADDR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | PARITY [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:23 | WORD_ADDR | RW | R | 0 | Specifies the word address where an error will be injected.<br>- On a write transfer to this SRAM address and when the corresponding RAM0/RAM1/RAM2/ITCM/DTCM ECC_INJ_EN bit is '1', the parity (PARITY) is injected. This field needs to be written with the offset address within the memory, divided by the ECC word width in bytes (for RAM0/RAM1/RAM2/ITCM this is 8, for DTCM this is 4). For example, if the RAM0 start address is 0x2800000, and an error is to be injected to address 0x28000080, then this field needs to configured to 0x000010. |
| 24:31 | PARITY | RW | R | 0 | ECC parity to use for ECC error injection at address WORD_ADDR. For the DTCM which has only 7 parity bits, PARITY[6:0] is used as ECC parity. |

### 5.1.62 CPUSS_PRODUCT_ID

**Description:** Product identifier and version (same as CoreSight RomTables)
**Address:** 0x40201400
**Offset:** 0x1400
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | FAMILY_ID [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:12] | | | | FAMILY_ID [11:8] | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | MINOR_REV [23:20] | | | | MAJOR_REV [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:11 | FAMILY_ID | R | W | 276 | Family ID. Common ID for a product family. |
| 16:19 | MAJOR_REV | R | W | Undefined | Major Revision, starts with 1, increments with all layer tape-out (implemented with metal ECO-able tie-off) |
| 20:23 | MINOR_REV | R | W | Undefined | Minir Revision, starts with 1, increments with metal layer only tape-out (implemented with metal ECO-able tie-off) |

### 5.1.63 CPUSS_DP_STATUS

**Description:** Debug port status
**Address:** 0x40201410
**Offset:** 0x1410
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x4

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | SWJ_JTAG_SEL [2:2] | SWJ_DEBUG_EN [1:1] | SWJ_CONNECTED [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SWJ_CONNECTED | R | W | 0 | Specifies if the SWJ debug port is connected; i.e. debug host interface is active:<br>'0': Not connected/not active.<br>'1': Connected/active. |
| 1 | SWJ_DEBUG_EN | R | W | 0 | Specifies if SWJ debug is enabled, i.e. CDBGPWRUPACK is '1' and thus debug clocks are on:<br>'0': Disabled.<br>'1': Enabled. |
| 2 | SWJ_JTAG_SEL | R | W | 1 | Specifies if the JTAG or SWD interface is selected. This signal is valid when DP_CTL.PTM_SEL is '0' (SWJ mode selected) and SWJ_CONNECTED is '1' (SWJ is connected).<br>'0': SWD selected.<br>'1': JTAG selected. |

### 5.1.64 CPUSS_AP_CTL

**Description:** Access port control
**Address:** 0x40201414
**Offset:** 0x1414
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register enables individual test controller access ports (AP). Note that the system AP is further controlled by a AP specific MPU, the SMPU and PPUs. The system AP MPU may be programmed to provide no or limited test controller access capabilities.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | SYS _ENABLE [2:2] | CM7 _ENABLE [1:1] | CM0 _ENABLE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:19] | | | | | SYS _DISABLE [18:18] | CM7 _DISABLE [17:17] | CM0 _DISABLE [16:16] |

|---|---|---|---|---|---|
| 18 | SYS_DISABLE | RW1S | R | 0 | Disables the system AP interface:<br>'0': Enabled.<br>'1': Disabled.<br><br>Typically, this field is set by the Cypress boot code with information from eFUSE. The access port is only enabled when SYS_DISABLE is '0' and SYS_ENABLE is '1'. |

### 5.1.65 CPUSS_BUFF_CTL

**Description:** Buffer control
**Address:** 0x40201500
**Offset:** 0x1500
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The ARM CM0+ and CM7 CPUs use bufferable write transfers to the peripherals by default. As a result, CPU completion of the write transfer does not guarantee that the write transfer reached its destination, as the transfer may be buffered/posted in the bus infrastructure. Moreover, it is possible that the write transfer does not take place at all due to a PPU violation or a slave error, and in this case the resulting bus error response is not passed to the CPU. This may cause complications if the CPU assumes that completion of the write transfer implies that the write transfer has taken effect in a peripheral (e.g. clearing a peripheral's interrupt cause field). There are multiple possibilities to address this complication:
- Follow the write transfer with a read transfer from the same address, and check that the read data matches the expectation.
- Configure a fault structure such that the following faults are reported: MS_PPU_0 to MS_PPU_4 to report PPU violations, timeout or bus errors in the PERI master interfaces, and GROUP_FAULT_0 to GROUP_FAULT_15 (only for the existing peripheral groups) to report decode or slave errors in the peripheral groups. The CPU can perform a read transfer after a series of write transfers to the same peripheral group. If the read transfer completes and no faults are reported, then the write transfers have been executed. Note that the fault reporting has some latency, so the faults may be reported after the completion of the read transfer.
- Use the CPU MPU to set write transfers to non-bufferable/non-posted.
- Use BUFF_CTL.WRITE_BUFF to ensure that all write transfers are non-bufferable/non-posted.
**Default:** 0x1

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | WRITE_BUFF [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | WRITE_BUFF | RW | R | 1 | Specifies if write transfer can be buffered in the bus infrastructure bridges:<br>'0': Write transfers are not buffered, independent of the transfer's bufferable attribute.<br>'1': Write transfers can be buffered, if the transfer's bufferable attribute indicates that the transfer is a bufferable/posted write. |

### 5.1.66 CPUSS_SYSTICK_CTL

**Description:** SysTick timer control
**Address:** 0x40201600
**Offset:** 0x1600
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The CPUSS SYSTICK_CTL MMIO NOREF, SKEW, TENMS register fields are reflected in the CPU's SysTick timer calibration register: SYST_CALIB (the CLOCK_SOURCE field is NOT reflected and only SW accessible through the CPUSS SYSTICK_CTL MMIO register).
**Default:** 0x40000147

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TENMS [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | TENMS [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | TENMS [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | NOREF [31:31] | SKEW [30:30] | None [29:26] | | | | CLOCK_SOURCE [25:24] | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:23 | TENMS | RW | R | 327 | Specifies the number of clock source cycles (minus 1) that make up 10 ms. E.g., for a 32,768 Hz reference clock, TENMS is 328 - 1 = 327. |
| 24:25 | CLOCK_SOURCE | RW | R | 0 | Specifies an external clock source:<br>'0': The low frequency clock 'clk_lf' is selected. The precision of this clock depends on whether the low frequency clock source is a SRSS internal RC oscillator (imprecise) or a device external crystal oscillator (precise).<br>'1': The internal main oscillator (IMO) clock 'clk_imo' is selected. The MXS40 platform uses a fixed frequency IMO clock.<br>o '2': The external crystal oscillator (ECO) clock 'clk_eco' is selected.<br>'3': The SRSS 'clk_timer' is selected ('clk_timer' is a divided/gated version of 'clk_hf' or 'clk_imo').<br><br>Note: If NOREF is '1', the CLOCK_SOURCE value is NOT used.<br>Note: It is SW's responsibility to provide the correct NOREF, SKEW and TENMS field values for the selected clock source. |
| 30 | SKEW | RW | R | 1 | Specifies the precision of the clock source and if the TENMS field represents exactly 10 ms (clock source frequency is a multiple of 100 Hz). This affects the suitability of the SysTick timer as a SW real-time clock:<br>'0': Precise.<br>'1': Imprecise. |
| 31 | NOREF | RW | R | 0 | Specifies if an external clock source is provided:<br>'0': An external clock source is provided.<br>'1': An external clock source is NOT provided and only the CPU internal clock can be used as SysTick timer clock source. |

### 5.1.67 CPUSS_CAL_SUP_SET

**Description:** Calibration support set and read
**Address:** 0x40201800
**Offset:** 0x1800
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** For ETAS support
**Default:** 0x0

**Bit-field Table**

### 5.1.75 CPUSS_TRIM_ROM_CTL

**Description:** ROM trim control
**Address:** 0x40202100
**Offset:** 0x2100
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** This register is used to trim ALL ROM memories in the device. Different operating Voltages may require different trim settings.
SW should change the TRIM settings appropriately while chaning the core operating voltage (E.g while switchting from 1.1v to 0.9v or vice versa on a ULP device).
Refer respective ROM IP BROS for the trim settings required based on operating voltage.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | TRIM [2:0] | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | TRIM | RW | R | 98 | See TRIM_RAM_CTL for description.<br>CM7 Cache and TCM memories are connected to this register.<br><br>All CM7 cache and TCM SRAM macros are controlled using bias control power switches, so bits [7:5] of this register controls the bias pins of the CM7 cache and TCM SRAM power switches. |

### 5.1.79 CPUSS_CM0_SYSTEM_INT_CTL

**Description:** CM0+ system interrupt control
**Address:** 0x40208000
**Offset:** 0x8000
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | CM0_CPU_INT_IDX [2:0] | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | CPU_INT_VALID [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:2 | CM0_CPU_INT_IDX | RW | R | Undefined | CPU interrupt index (legal range [0, 7]). This field specifies to which CPU interrupt the system interrupt is mapped. E.g., if CPU_INT_IDX is '6', the system interrupt is mapped to CPU interrupt '6'.<br><br>Note: it is possible to map multiple system interrupts to the same CPU interrupt. It is advised to assign different priorities to the CPU interrupts and to assign system interrupts to CPU interrupts accordingly. |
| 31 | CPU_INT_VALID | RW | R | 0 | Interrupt enable:<br>'0': Disabled. The system interrupt will NOT be mapped to any CPU interrupt.<br>'1': Enabled. The system interrupt is mapped on CPU interrupt CPU_INT_IDX.<br><br>Note: the CPUs have dedicated XXX_SYSTEM_INT_CTL registers. In other words, the CPUs can use different CPU interrupts for the same system interrupt. However, typically only one of the CPUs will have the ENABLED field of a specific system interrupt set to '1'. |

### 5.1.80 CPUSS_CM7_0_SYSTEM_INT_CTL

**Description:** CM7 0 system interrupt control
**Address:** 0x4020A000
**Offset:** 0xA000
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Only present when SYSTEM_IRQ_PRESENT is '1'
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

## 7.9 Register Details

### 7.9.1 DMAC_CTL

**Description:** Control
**Address:** 0x402A0000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ENABLED [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 31 | ENABLED | RW | R | 0 | IP enable:<br>'0': Disabled. All non-retention registers (command and status registers) are reset to their default value when the IP is disabled. All retention registers retain their value when the IP is disabled.<br>'1': Enabled. |
| | DISABLED | | | 0 | N/A |
| | ENABLED | | | 1 | N/A |

### 7.9.2 DMAC_ACTIVE

**Description:** Active channels
**Address:** 0x402A0008
**Offset:** 0x8
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ACTIVE [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | ACTIVE | R | W | 0 | Specifies active channels; i.e. enabled channels whose trigger got activated. |

### 7.9.3 CH

#### 7.9.3.1 DMAC_CH_CTL

**Description:** Channel control
**Address:** 0x402A1000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x2

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | PC [7:4] | | | | None [3:3] | B [2:2] | NS [1:1] | P [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | PRIO [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ENABLED [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | P | RW | R | 0 | User/privileged access control:<br>'0': user mode.<br>'1': privileged mode.<br><br>This field is set with the user/privileged access control of the transaction that writes this register; i.e. the access control is inherited from the write transaction and not specified by the transaction write data.<br><br>All transactions for this channel use the P field for the user/privileged access control. |
| 1 | NS | RW | R | 1 | Secure/on-secure access control:<br>'0': secure.<br>'1': non-secure.<br><br>This field is set with the secure/non-secure access control of the transaction that writes this register; i.e. the access control is inherited from the write transaction and not specified by the transaction write data.<br><br>All transactions for this channel use the NS field for the secure/non-secure access control. |
| 2 | B | RW | R | 0 | Non-bufferable/bufferable access control:<br>'0': non-bufferable.<br>'1': bufferable.<br><br>This field is used to indicate to an AMBA bridge that a write transaction can complete without waiting for the destination to accept the write transaction data.<br><br>All transactions for this channel uses the B field for the non-bufferable/bufferable access control. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 4:7 | PC | RW | R | 0 | Protection context.<br><br>This field is set with the protection context of the transaction that writes this register; i.e. the context is inherited from the write transaction and not specified by the transaction write data.<br><br>All transactions for this channel uses the PC field for the protection context. |
| 8:9 | PRIO | RW | R | 0 | Channel priority:<br>'0': highest priority.<br>'1'<br>'2'<br>'3': lowest priority.<br><br>Channels with the same priority constitute a priority group and within this priority group, the following 'roundrobin' arbitration is applied.<br>A 'round' consists of a contiguous sequence of channel activations, within this priority group, without any repetition. Within a round, higher priority is given to the lower channel indices. The notion of a round guarantees that within a group, higher channel indices do not yield to lower indices indefinitely. |
| 31 | ENABLED | RW | RW1C | 0 | Channel enable:<br>'0': Disabled. The channel's trigger is ignored and the channel cannot be made pending and therefore cannot be made active. If a pending channel is disabled, the channel is made non pending. If the activate channel is disabled, the channel is de-activated (bus transactions are completed).<br>'1': Enabled.<br><br>SW sets this field to '1' to enable a specific channel.<br><br>HW sets this field to '0' when an error interrupt cause is activated. |

### 7.9.3.2 DMAC_CH_IDX

**Description:** Channel current indices
**Address:** 0x402A1010
**Offset:** 0x10
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | X [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | X [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | Y [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | Y [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | X | R | W | Undefined | Specifies the X loop index. In the range of [0, X_COUNT], with X_COUNT taken from the current descriptor.<br><br>Note: HW sets this field to '0' when it loads a descriptor. |
| 16:31 | Y | R | W | Undefined | Specifies the Y loop index, with Y_COUNT taken from the current descriptor.<br><br>Note: HW sets this field to '0' when it loads a descriptor.. |

### 7.9.3.3 DMAC_CH_SRC

**Description:** Channel current source address
**Address:** 0x402A1014
**Offset:** 0x14
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | ADDR | R | W | Undefined | Current address of source location. |

### 7.9.3.4 DMAC_CH_DST

**Description:** Channel current destination address
**Address:** 0x402A1018
**Offset:** 0x18
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | ADDR | R | W | Undefined | Current address of destination location. |

### 7.9.3.5 DMAC_CH_CURR

**Description:** Channel current descriptor pointer
**Address:** 0x402A1020
**Offset:** 0x20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [7:2] | | | | | | None [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2:31 | PTR | RW | RW | Undefined | Address of current descriptor. When this field is '0', there is no valid descriptor.<br><br>Note: HW updates the current descriptor pointer CH_CURR_PTR with DESCR_NEXT_PTR after execution of the current descriptor. |

### 7.9.3.6 DMAC_CH_TR_CMD

**Description:** Channle software trigger
**Address:** 0x402A1028
**Offset:** 0x28
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | ACTIVATE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ACTIVATE | RW1S | A | 0 | Software trigger. When written with '1', a trigger is generated which sets 'trigger pending' (only if the channel is enabled). A read always returns a 0. |

### 7.9.3.7 DMAC_CH_DESCR_STATUS

**Description:** Channel descriptor status
**Address:** 0x402A1040
**Offset:** 0x40
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | VALID [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 31 | VALID | R | W | 0 | Indicates whether the descriptor information present in DESCR_CTL, DESCR_SRC, DESCR_DST, DESCR_X_SIZE, DESCR_X_INCR, DESCR_Y_SIZE, DESCR_Y_INCR, DESCR_NEXT status registers is valid or not. |

### 7.9.3.8 DMAC_CH_DESCR_CTL

**Description:** Channel descriptor control
**Address:** 0x402A1060
**Offset:** 0x60
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_CTL of the currently active descriptor.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TR_IN_TYPE [7:6] | | TR_OUT_TYPE [5:4] | | INTR_TYPE [3:2] | | WAIT_FOR_DEACT [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:9] | | | | | | | DATA_PREFETCH [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:18] | | | | | | DATA_SIZE [17:16] | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:31] | DESCR_TYPE [30:28] | | | DST_TRANSFER_SIZE [27:27] | SRC_TRANSFER_SIZE [26:26] | None [25:25] | CH_DISABLE [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:1 | WAIT_FOR_DEACT | R | W | Undefined | Specifies whether the controller should wait for the input trigger to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controller with the agent that generated the trigger. This field is ONLY used at the completion of the transfer as specified by TR_IN. E.g., a TX FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the controller AND received by the agent. Furthermore, the agent's trigger may be delayed by a few cycles before it reaches the controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to '0'). The wait cycles incurred by this field reduce DW controller performance.<br>'0': Do not wait for trigger de-activation (for pulse sensitive triggers).<br>'1': Wait for up to 4 cycles.<br>'2': Wait for up to 16 cycles.<br>'3': Wait indefinitely. This option may result in controller lockup if the trigger is not de-activated. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2:3 | INTR_TYPE | R | W | Undefined | Specifies when a completion interrupt is generated (CH_STATUS.INTR_CAUSE is set to COMPLETION):<br>'0': An interrupt is generated after a single transfer.<br>'1': An interrupt is generated after a single 1D transfer or a memory copy transfer<br>- If the descriptor type is 'single', the interrupt is generated after a single transfer.<br>- If the descriptor type is '1D' or '2D', the interrupt is generated after the execution of a 1D transfer.<br>- If the descriptor type is 'memory copy', the interrupt is generated after the execution of a memory copy transfer.<br>- If the descriptor type is 'scatter' the interrupt is generated after the execution of a scatter transfer.<br>'2': An interrupt is generated after the execution of the current descriptor (independent of the value of DESCR_NEXT_PTR.ADDR of the current descriptor).<br>'3': An interrupt is generated after the execution of the current descriptor and the current descriptor's DESCR_NEXT_PTR.ADDR is '0'. |
| 4:5 | TR_OUT_TYPE | R | W | Undefined | Specifies when an output trigger is generated:<br>'0': An output trigger is generated after a single transfer.<br>'1': An output trigger is generated after a single 1D transfer or a memory copy transfer.<br>- If the descriptor type is 'single', the output trigger is generated after a single transfer.<br>- If the descriptor type is '1D' or '2D', the output trigger is generated after the execution of a 1D transfer.<br>- If the descriptor type is 'memory copy', the output trigger is generated after the execution of a memory copy transfer.<br>- If the descriptor type is 'scatter', the output trigger is generated after the execution of a scatter transfer.<br>'2': An output trigger is generated after the execution of the current descriptor.<br>'3': An output trigger is generated after the execution of a descriptor list: after the execution of the current descriptor AND the current descriptor's DESCR_NEXT_PTR.ADDR is '0'. |
| 6:7 | TR_IN_TYPE | R | W | Undefined | Specifies the input trigger type (not to be confused with the descriptor type):<br>'0': A trigger results in the execution of a single transfer. The descriptor type can be single, 1D or 2D.<br>'1': A trigger results in the execution of a single 1D transfer.<br>- If the descriptor type is 'single', the trigger results in the execution of a single transfer.<br>- If the descriptor type is '1D' or '2D', the trigger results in the execution of a 1D transfer.<br>- If the descriptor type is 'memory copy', the trigger results in the execution of a memory copy transfer.<br>- If the descriptor type is 'scatter', the trigger results in the execution of an scatter transfer.<br>'2': A trigger results in the execution of the current descriptor.<br>'3': A trigger results in the execution of the current descriptor and continues (without requiring another input trigger) with the execution of the next descriptor using the next descriptor's information. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 8 | DATA_PREFETCH | R | W | Undefined | Source data prefetch:<br>'0': No source data prefetch. Source data transfers are only initiated AFTER the input trigger is activated.<br>'1': Source data prefetch. Source data transfers are initiated as soon as the channel is enabled, the current descriptor pointer is NOT '0' and there is space available in the channel's data FIFO. When the input trigger is activated, the trigger can initiate destination data transfers with data that is already in the channel's data FIFO. This effectively shortens the initial delay of the data transfer.<br><br>Note: data prefetch should be used with care, to ensure that data coherency is guaranteed and that prefetches do not cause undesired side effects. |
| 16:17 | DATA_SIZE | R | W | Undefined | Specifies the data element size:<br>'0': Byte (8 bits).<br>'1': Halfword (16 bits).<br>'2': Word (32 bits).<br>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:<br>- DATA is 8 bit, SRC is 8 bit, DST is 8 bit.<br>- DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit.<br>- DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made '0').<br>- DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made '0').<br>- DATA is 16 bit, SRC is 16 bit, DST is 16 bit.<br>- DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit.<br>- DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made '0').<br>- DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made '0').<br>- DATA is 32 bit, SRC is 32 bit, DST is 32 bit.<br><br>Note: this field is not used for a 'memory copy' descriptor type. Note: this field must be set to '2' for a 'initialization' descriptor type. |
| 24 | CH_DISABLE | R | W | Undefined | Specifies whether the channel is disabled or not after completion of the current descriptor (independent of the value of the DESCR_NEXT_PTR value):<br>'0': Channel is not disabled.<br>'1': Channel is disabled. |
| 26 | SRC_TRANSFER_SIZE | R | W | Undefined | Specifies the bus transfer size to the source location:<br>'0': As specified by DATA_SIZE.<br>'1': Word (32 bits).<br>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.<br><br>Note: this field is not used for a 'memory copy' descriptor type. Note: this field must be set to '1' for a 'scatter' descriptor type. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 27 | DST_TRANSFER_SIZE | R | W | Undefined | Specifies the bus transfer size to the destination location:<br>'0': As specified by DATA_SIZE.<br>'1': Word (32 bits).<br>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.<br><br>Note: this field is not used for a 'memory copy' descriptor type. Note: this field must be set to '1' for a 'scatter' descriptor type. |
| 28:30 | DESCR_TYPE | R | W | Undefined | Specifies the descriptor type (not to be confused with the trigger type):<br>'0': Single transfer.<br>The DESCR_X_SIZE, DESCR_X_INCR, DESCR_Y_SIZE and DESCR_Y_INCR registers are NOT present. The DESCR_NEXT_PTR is at offset 0x0c.<br>'1': 1D transfer.<br>The DESCR_X_SIZE and DESCR_X_INCR registers are present, the DESCR_Y_SIZE and DESCR_Y_INCR are NOT present. A 1D transfer consists out of DESCR_X_SIZE.X_COUNT+1 single transfers. The DESCR_NEXT_PTR is at offset 0x14.<br>'2': 2D transfer.<br>The DESCR_X_SIZE, DESCR_X_INCR, DESCR_Y_SIZE and DESCR_Y_INCR registers are present. A 2D transfer consists of (DESCR_X_SIZE.X_COUNT+1)*(DESCR_Y_SIZE.Y_COUNT+1)single transfers. The DESCR_NEXT_PTR is at offset<br>0x1c.<br>'3': Memory copy.<br>The DESCR_X_SIZE register is present, the DESCR_X_INCR, DESCR_Y_SIZE and DESCR_Y_INCR are NOT present. A memory copy transfer copies DESCR_X_SIZE.X_COUNT+1 Bytes and may use Byte, halfword and word transfers. The DESCR_NEXT_PTR is at offset 0x10.<br>'4': Scatter transfer. The DESCR_X_SIZE register is present, the DESCR_DST, DESCR_X_INCR, DESCR_Y_SIZE and DESCR_Y_INCR are NOT present.<br>'5'-'7': Undefined.<br>After the execution of the current descriptor, the DESCR_NEXT_PTR address is copied to the channel's CH_CURR_PTR address and CH_STATUS.X_IDX and CH_STATUS.Y_IDX are set to '0'. |

### 7.9.3.9 DMAC_CH_DESCR_SRC

**Description:** Channel descriptor source
**Address:** 0x402A1064
**Offset:** 0x64
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_SRC of the currently active descriptor.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | ADDR | R | W | Undefined | Base address of source location. |

### 7.9.3.10 DMAC_CH_DESCR_DST

**Description:** Channel descriptor destination
**Address:** 0x402A1068
**Offset:** 0x68
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_DST of the currently active descriptor.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | ADDR | R | W | Undefined | Base address of destination location. |

### 7.9.3.11 DMAC_CH_DESCR_X_SIZE

**Description:** Channel descriptor X size
**Address:** 0x402A106C
**Offset:** 0x6C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_X_SIZE of the currently active descriptor.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | X_COUNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | X_COUNT [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | X_COUNT | R | W | Undefined | Number of iterations (minus 1) of the 'X loop' (X_COUNT+1 is the number of single transfers in a 1D transfer). This field is an unsigned number in the range [0, 65535], representing 1 through 65536 iterations.<br><br>For the 'memory copy' descriptor type, (X_COUNT + 1) is the number of transferred Bytes. For the 'scatter' descriptor type, ceiling(X_COUNT/2) is the number of (address, write data) initialization pairs processed. |

### 7.9.3.12 DMAC_CH_DESCR_X_INCR

**Description:** Channel descriptor X increment
**Address:** 0x402A1070
**Offset:** 0x70
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_X_INCR of the currently active descriptor.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SRC_X [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | SRC_X [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | DST_X [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | DST_X [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | SRC_X | R | W | Undefined | Specifies increment of source address for each X loop iteration (in multiples of SRC_TRANSFER_SIZE). This field is a signed number (sign-magnitude format) in the range [-32768, 32767]. If this field is '0', the source address is not incremented. This is useful for reading from RX FIFO structures. |
| 16:31 | DST_X | R | W | Undefined | Specifies increment of destination address for each X loop iteration (in multiples of DST_TRANSFER_SIZE). This field is a signed number (sign-magnitude format) in the range [-32768, 32767]. If this field is '0', the destination address is not incremented. This is useful for writing to TX FIFO structures. |

### 7.9.3.13 DMAC_CH_DESCR_Y_SIZE

**Description:** Channel descriptor Y size
**Address:** 0x402A1074
**Offset:** 0x74
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_Y_SIZE of the currently active descriptor.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | Y_COUNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | Y_COUNT [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | Y_COUNT | R | W | Undefined | Number of iterations (minus 1) of the 'Y loop' (X_COUNT+1)*(Y_COUNT+1) is the number of single transfers in a 2D transfer). This field is an unsigned number in the range [0, 65535], representing 1 through 65536 iterations. |

### 7.9.3.14 DMAC_CH_DESCR_Y_INCR

**Description:** Channel descriptor Y increment
**Address:** 0x402A1078
**Offset:** 0x78
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_Y_INCR of the currently active descriptor.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SRC_Y [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | SRC_Y [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | DST_Y [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | DST_Y [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | SRC_Y | R | W | Undefined | Specifies increment of source address for each Y loop iteration (in multiples of SRC_TRANSFER_SIZE). This field is a signed number in the range [-32768, 32767]. |
| 16:31 | DST_Y | R | W | Undefined | Specifies increment of destination address for each Y loop iteration (in multiples of DST_TRANSFER_SIZE). This field is a signed number in the range [-32768, 32767]. |

### 7.9.3.15 DMAC_CH_DESCR_NEXT

**Description:** Channel descriptor next pointer
**Address:** 0x402A107C
**Offset:** 0x7C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** Copy of DESCR_NEXT_PTR of the currently active descriptor. For a single transfer descriptor type, this register is at offset 0x0c. For a 1D transfer descriptor type, this register is at offset 0x14. For a 2D transfer descriptor type, this register is at offset 0x1c. For a memory copy transfer descriptor type, this register is at offset 0x10. For a scatter transfer descriptor type, this register is at offset 0x0c.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [7:2] | | | | | | None [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | PTR [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2:31 | PTR | R | W | Undefined | Address of next descriptor in descriptor list. When this field is '0', this is the last descriptor in the descriptor list. |

### 7.9.3.16 DMAC_CH_INTR

**Description:** Interrupt
**Address:** 0x402A1080
**Offset:** 0x80
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** The register fields are not retained. This is to ensure that they come up as '0' after coming out of DeepSleep system power mode.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | DESCR_BUS_ERROR [7:7] | ACTIVE_CH_DISABLED [6:6] | CURR_PTR_NULL [5:5] | DST_MISAL [4:4] | SRC_MISAL [3:3] | DST_BUS_ERROR [2:2] | SRC_BUS_ERROR [1:1] | COMPLETION [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | COMPLETION | RW1C | RW1S | 0 | Activated (set to '1') on completion of data transfer(s) as specified by the descriptor's CH_DESCR_CTL.INTR_TYPE. |
| 1 | SRC_BUS_ERROR | RW1C | RW1S | 0 | Activated (set to '1') on a bus error for a load from the source. |
| 2 | DST_BUS_ERROR | RW1C | RW1S | 0 | Activated (set to '1') on a bus error for a store to the destination. |
| 3 | SRC_MISAL | RW1C | RW1S | 0 | Activated (set to '1') on a misalignment of the source address. |
| 4 | DST_MISAL | RW1C | RW1S | 0 | Activated (set to '1') on a misalignment of the destination address. |
| 5 | CURR_PTR_NULL | RW1C | RW1S | 0 | Activated (set to '1') when the channel is enabled (CH_CTL.ENABLED is '1') and CH_CURR_PTR is '0'. |
| 6 | ACTIVE_CH_DISABLED | RW1C | RW1S | 0 | Activated (set to '1') if the channel is disabled by SW (accidentally/incorrectly) when the data transfer engine is busy. |
| 7 | DESCR_BUS_ERROR | RW1C | RW1S | 0 | Activated (set to '1') on a bus error for a load of the descriptor. |

### 7.9.3.17 DMAC_CH_INTR_SET

**Description:** Interrupt set
**Address:** 0x402A1084
**Offset:** 0x84
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** When read, this register reflects the INTR register.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | DESCR_BUS_ERROR [7:7] | ACTIVE_CH_DISABLED [6:6] | CURR_PTR_NULL [5:5] | DST_MISAL [4:4] | SRC_MISAL [3:3] | DST_BUS_ERROR [2:2] | SRC_BUS_ERROR [1:1] | COMPLETION [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | COMPLETION | RW1S | A | 0 | Write this field with '1' to set INTR.COMPLETION field to '1' (a write of '0' has no effect). |
| 1 | SRC_BUS_ERROR | RW1S | A | 0 | Write this field with '1' to set INTR.SRC_BUS_ERROR field to '1' (a write of '0' has no effect). |
| 2 | DST_BUS_ERROR | RW1S | A | 0 | Write this field with '1' to set INTR.DST_BUS_ERROR field to '1' (a write of '0' has no effect). |
| 3 | SRC_MISAL | RW1S | A | 0 | Write this field with '1' to set INTR.SRC_MISAL field to '1' (a write of '0' has no effect). |
| 4 | DST_MISAL | RW1S | A | 0 | Write this field with '1' to set INTR.DST_MISAL field to '1' (a write of '0' has no effect). |
| 5 | CURR_PTR_NULL | RW1S | A | 0 | Write this field with '1' to set INTR.CURR_PTR_NULL field to '1' (a write of '0' has no effect). |
| 6 | ACTIVE_CH_DISABLED | RW1S | A | 0 | Write this field with '1' to set INTR.ACT_CH_DISABLED field to '1' (a write of '0' has no effect). |
| 7 | DESCR_BUS_ERROR | RW1S | A | 0 | Write this field with '1' to set INTR.DESCR_BUS_ERROR field to '1' (a write of '0' has no effect). |

### 7.9.3.18 DMAC_CH_INTR_MASK

**Description:** Interrupt mask
**Address:** 0x402A1088
**Offset:** 0x88
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | DESCR_BUS_ERROR [7:7] | ACTIVE_CH_DISABLED [6:6] | CURR_PTR_NULL [5:5] | DST_MISAL [4:4] | SRC_MISAL [3:3] | DST_BUS_ERROR [2:2] | SRC_BUS_ERROR [1:1] | COMPLETION [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | COMPLETION | RW | R | 0 | Mask for INTR.COMPLETION interrupt. |
| 1 | SRC_BUS_ERROR | RW | R | 0 | Mask for INTR.SRC_BUS_ERROR interrupt. |
| 2 | DST_BUS_ERROR | RW | R | 0 | Mask for INTR.DST_BUS_ERROR interrupt. |
| 3 | SRC_MISAL | RW | R | 0 | Mask for INTR.SRC_MISAL interrupt. |
| 4 | DST_MISAL | RW | R | 0 | Mask for INTR.DST_MISAL interrupt. |
| 5 | CURR_PTR_NULL | RW | R | 0 | Mask for INTR.CURR_PTR_NULL interrupt. |
| 6 | ACTIVE_CH_DISABLED | RW | R | 0 | Mask for INTR.ACTIVE_CH_DISABLED interrupt. |
| 7 | DESCR_BUS_ERROR | RW | R | 0 | Mask for INTR.DESCR_BUS_ERROR interrupt. |

### 7.9.3.19 DMAC_CH_INTR_MASKED

**Description:** Interrupt masked
**Address:** 0x402A108C
**Offset:** 0x8C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** When read, this register reflects a bitwise AND between the INTR and INTR_MASK registers. This register allows SW to read the status of all mask enabled interrupt causes with a single load operation, rather than two load operations: one for INTR and one for INTR_MASK. This simplifies Firmware development. The associated interrupt is active ('1'), when INTR_MASKED != 0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | DESCR_BUS_ERROR [7:7] | ACTIVE_CH_DISABLED [6:6] | CURR_PTR_NULL [5:5] | DST_MISAL [4:4] | SRC_MISAL [3:3] | DST_BUS_ERROR [2:2] | SRC_BUS_ERROR [1:1] | COMPLETION [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | COMPLETION | R | W | 0 | Logical and of corresponding INTR.COMPLETION and INTR_MASK.COMPLETION fields. |
| 1 | SRC_BUS_ERROR | R | W | 0 | Logical and of corresponding INTR.SRC_BUS_ERROR and INTR_MASK.SRC_BUS_ERROR fields. |
| 2 | DST_BUS_ERROR | R | W | 0 | Logical and of corresponding INTR.DST_BUS_ERROR and INTR_MASK.DST_BUS_ERROR fields. |
| 3 | SRC_MISAL | R | W | 0 | Logical and of corresponding INTR.SRC_MISAL and INTR_MASK.SRC_MISAL fields. |
| 4 | DST_MISAL | R | W | 0 | Logical and of corresponding INTR.DST_MISAL and INTR_MASK.DST_MISAL fields. |
| 5 | CURR_PTR_NULL | R | W | 0 | Logical and of corresponding INTR.CURR_PTR_NULL and INTR_MASK.CURR_PTR_NULL fields. |
| 6 | ACTIVE_CH_DISABLED | R | W | 0 | Logical and of corresponding INTR.ACTIVE_CH_DISABLED and INTR_MASK.ACTIVE_CH_DISABLED fields. |
| 7 | DESCR_BUS_ERROR | R | W | 0 | Logical and of corresponding INTR.DESCR_BUS_ERROR and INTR_MASK.DESCR_BUS_ERROR fields. |

# 8 DW

## 8.1 DW 0

**Description** Datawire Controller
**Base Address** 0x40280000

## 8.3 Register Details

### 8.3.1 DW_CTL

**Description:** Control
**Address:** 0x40280000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x1

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:2] | | | | | | ECC_INJ_EN [1:1] | ECC_EN [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ENABLED [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ECC_EN | RW | R | 1 | Enable ECC checking:<br>'0': Disabled.<br>'1': Enabled. |
| 1 | ECC_INJ_EN | RW | R | 0 | Enable parity injection for SRAM.<br>When '1', the parity (ECC_CTL.PARITY) is used when a full 32-bit write is done to the ECC_CTL.WORD_ADDR word address of the SRAM. |
| 31 | ENABLED | RW | R | 0 | IP enable:<br>'0': Disabled. Disabling the IP activates the IP's Active logic reset: Active logic and non-retention MMIO registers are reset (retention MMIO registers are not affected).<br>'1': Enabled. |

### 8.3.2 DW_STATUS

**Description:** Status
**Address:** 0x40280004
**Offset:** 0x4
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | PC [7:4] | | | | None [3:3] | B [2:2] | NS [1:1] | P [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:12] | | | | PREEMPTABLE [11:11] | None [10:10] | PRIO [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | CH_IDX [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ACTIVE [31:31] | STATE [30:28] | | | None [27:25] | | | CH_IDX [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | P | R | RW | Undefined | Active channel, user/privileged access control:<br>'0': user mode.<br>'1': privileged mode. |
| 1 | NS | R | RW | Undefined | Active channel, secure/non-secure access control:<br>'0': secure.<br>'1': non-secure. |
| 2 | B | R | RW | Undefined | Active channel, non-bufferable/bufferable access control:<br>'0': non-bufferable<br>'1': bufferable. |
| 4:7 | PC | R | RW | Undefined | Active channel protection context. |
| 8:9 | PRIO | R | W | Undefined | Active channel priority. |
| 11 | PREEMPTABLE | R | W | Undefined | Active channel preemptable. |
| 16:24 | CH_IDX | R | W | Undefined | Active channel index. |
| 28:30 | STATE | R | W | 0 | State of the DW controller.<br>'0': Default/inactive state.<br>'1': Loading descriptor.<br>'2': Loading data element from source location.<br>'3': Storing data element to destination location.<br>'4': CRC functionality (only used for CRC transfer descriptor type).<br>'5': Update of active control information (e.g. source and destination addresses) and wait for trigger de-activation.<br>'6': Error. |
| 31 | ACTIVE | R | W | 0 | Active channel present:<br>'0': No.<br>'1': Yes. |

### 8.3.3 DW_ACT_DESCR_CTL

**Description:** Active descriptor control
**Address:** 0x40280020
**Offset:** 0x20
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | DATA [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | DATA [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | DATA [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | DATA [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | DATA | R | W | Undefined | Copy of DESCR_CTL of the currently active descriptor.<br>[1:0] WAIT_FOR_DEACT<br>Specifies whether the controller should wait for the input trigger to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controller with the agent that generated the trigger. This field is ONLY used at the completion of the transfer as specified by TR_IN. E.g., a TX FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the controller AND received by the agent. Furthermore, the agent's trigger may be delayed by a few cycles before it reaches the controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to '0'). The wait cycles incurred by this field reduce DW controller performance.<br>'0': Do not wait for trigger de-activation (for pulse sensitive triggers).<br>'1': Wait for up to 4 cycles.<br>'2': Wait for up to 16 cycles.<br>'3': Wait indefinitely. This option may result in controller lockup if the trigger is not de-activated.<br>[3:2] INTR_TYPE<br>Specifies the input trigger type (not to be confused with the descriptor type):<br>'0': A trigger results in the execution of a single transfer. The descriptor type can be single, 1D or 2D.<br>'1': A trigger results in the execution of a single 1D transfer.<br>- If the descriptor type is 'single', the trigger results in the execution of a single transfer.<br>- If the descriptor type is '1D' or '2D', the trigger results in the execution of a 1D transfer.<br>'2': A trigger results in the execution of the current descriptor.<br>'3': A trigger results in the execution of the current descriptor and continues (without requiring another input trigger) with the execution of the next descriptor using the next descriptor's information.<br>[5:4] TR_OUT_TYPE<br>Specifies when an output trigger is generated:<br>'0': An output trigger is generated after a single transfer.<br>'1': An output trigger is generated after a single 1D transfer.<br>- If the descriptor type is 'single', the output trigger is generated after a single transfer.<br>- If the descriptor type is '1D', 'CRC' or '2D', the output trigger is generated after the execution of a 1D transfer.<br>'2': An output trigger is generated after the execution of the current descriptor.<br>'3': An output trigger is generated after the execution of a descriptor list: after the execution of the current descriptor AND the current descriptor DESCR_NEXT_PTR.ADDR is '0'.<br>[7:6] TR_IN_TYPE<br>Specifies the input trigger type (not to be confused with the descriptor type):<br>'0': A trigger results in the execution of a single transfer. The descriptor type can be single, 1D or 2D.<br>'1': A trigger results in the execution of a single 1D transfer.<br>dropped), DST is 32 bit (higher 16 bits are made '0').<br>- DATA is 32 bit, SRC is 32 bit, DST is 32 bit. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| | | | | | (Continuation)<br>- If the descriptor type is 'single', the trigger results inthe exe cution of a single transfer.<br>- If the descriptor type is '1D' or '2D', the trigger resultsin the execution of a 1D transfer.<br>'2': A trigger results in the execution of the current descriptor.<br>'3': A trigger results in the execution of the current descriptor and continues (without requiring another input trigger) with the execution of the next descriptorusing t he next descriptor's information.<br><br>[24] CH_DISABLE<br>Specifies whether the channel is disabled or not aftercompl etion of the current descriptor (independent ofthe value of t he DESCR_NEXT_PTR value):<br>'0': Channel is not disabled.<br>'1': Channel is disabled.<br><br>Note: a disabled channel will ignore its input trigger.<br><br>[26] SRC_TRANSFER_SIZE<br>Specifies the bus transfer size to the source location:'0': As s pecified by DATA_SIZE.<br>'1': Word (32 bits).<br>Distinguishing bus transfer size from data element sizeallows for source components with data elements thatare smaller th an their 32-bit bus interface width. E.g.,an ADC source has a 32-bit bus transfer size, but onlyprovides a 16-bit data eleme nt.<br>[27] DST_TRANSFER_SIZE<br>Specifies the bus transfer size to the destination location:<br>'0': As specified by DATA_SIZE.<br>'1': Word (32 bits).<br>Distinguishing bus transfer size from data element size allow s for destination components with data elements that are sma ller than their 32-bit bus interface width.<br>E.g., a DAC destination has a 32-bit bus transfer size,but only requires a 16-bit data element.<br><br>[29:28] DATA_SIZE<br>Specifies the data element size:<br>'0': Byte (8 bits).<br>'1': Halfword (16 bits).<br>'2': Word (32 bits).<br>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how dataeleme nts are transferred. The following are the 9 legalsettings:<br>- DATA is 8 bit, SRC is 8 bit, DST is 8 bit.<br>- DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit.<br>- DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24bits are made '0').<br>- DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made '0').- DATA is 16 bit, SRC is 16 bit, DST is 16 bit.<br>- DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit.<br>- DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher16 bits a re made '0').<br>- DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made '0').<br>- DATA is 32 bit, SRC is 32 bit, DST is 32 bit.<br>[31:30] DESCR_TYPE<br>Specifies the descriptor type (not to be confused with the trigger type):<br>'0': Single transfer. The DESCR_X_CTL and DESCR_Y_CTL registers are not present and DESCR_NEXT_PTR is at offset 0x0c. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| | | | | | (Continuation)<br>'1': 1D transfer. The DESCR_X_CTL register is present, the DESCR_Y_CTL is not present and DESCR_NEXT_PTR is at offset 0x10. A 1D transfer consists out of DESCR_X_CTL.X_COUNT single transfers.<br>'2': 2D transfer. The DESCR_X_CTL and DESCR_Y_CTL registers are present and DESCR_NEXT_PTR is at offset 0x14. A 2D transfer consists of DESCR_X_CTL.X_COUNT*DESCR_Y_CTL.Y_COUNT single transfers.<br>'3': CRC transfer. The DESCR_X_CTL register is present, theDESCR_Y_CTL is not present and DESCR_NEXT_PTR is at offset 0x10. A CRC transfer consists out of DESCR_X_CTL.X_COUNT single transfers.<br><br>After the execution of the current descriptor, the DESCR_NEXT_PTR address is copied to the channel's CH_CURR_PTR address and CH_STATUS.X_IDX and CH_STATUS.Y_IDX are set to '0'. |

### 8.3.4 DW_ACT_DESCR_SRC

**Description:** Active descriptor source
**Address:** 0x40280024
**Offset:** 0x24
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

|---|---|---|---|---|---|---|---|---|
| Name | DATA [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | DATA | R | W | Undefined | Copy of DESCR_DST of the currently active descriptor.<br><br>Base address of destination location.<br><br>Note: For a CRC transfer descriptor, this field should be programmed with the address of the CRC_LFSR_CTL register. The calculated CRC LFSR state is written to this address (through the CRYPTO AHB-Lite master interface) when the input trigger is processed. The write transfer will be submitted to the CPUSS and PERI protection schemes. |

### 8.3.6 DW_ACT_DESCR_X_CTL

**Description:** Active descriptor X loop control
**Address:** 0x40280030
**Offset:** 0x30
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** If the currently active descriptor has not X_CTL register, this MMIO register provides undefined information.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|
| Name | PARITY [31:25] | | | | | | | None [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | WORD_ADDR | RW | R | 0 | Specifies the word address where an error will be injected.<br>- On a write transfer to this SRAM word address and when CTL.ECC_INJ_EN bit is '1', the parity (PARITY) is injected. |
| 25:31 | PARITY | RW | R | 0 | ECC parity to use for ECC error injection at address WORD_ADDR. |

### 8.3.12 DW_CRC_CTL

**Description:** CRC control
**Address:** 0x40280100
**Offset:** 0x100
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | DATA_REVERSE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:9] | | | | | | | REM_REVERSE [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | DATA_REVERSE | RW | R | 0 | Specifies the bit order in which a data Byte is processed (reversal is performed after XORing):<br>'0': Most significant bit (bit 1) first.<br>'1': Least significant bit (bit 0) first. |
| 8 | REM_REVERSE | RW | R | 0 | Specifies whether the remainder is bit reversed (reversal is performed after XORing):<br>'0': No.<br>'1': Yes. |

### 8.3.13 DW_CRC_DATA_CTL

**Description:** CRC data control
**Address:** 0x40280110
**Offset:** 0x110
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | DATA_XOR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | DATA_XOR | RW | R | 0 | Specifies a byte mask with which each data byte is XOR'd. The XOR is performed before data reversal. |

### 8.3.14 DW_CRC_POL_CTL

**Description:** CRC polynomial control
**Address:** 0x40280120
**Offset:** 0x120
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | POLYNOMIAL [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | POLYNOMIAL [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | POLYNOMIAL [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | POLYNOMIAL [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | POLYNOMIAL | RW | R | 0 | CRC polynomial. The polynomial is represented WITHOUT the high order bit (this bit is always assumed '1'). The polynomial should be aligned/shifted such that the more significant bits (bit 31 and down) contain the polynomial and the less significant bits (bit 0 and up) contain padding '0's. Some frequently used polynomials:<br>- CRC32: POLYNOMIAL is 0x04c11db7 (x^32 + x^26 + x^23 + x^22 + x^16 + x^12 + x^11 + x^10 + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1).<br>- CRC16: POLYNOMIAL is 0x80050000 (x^16 + x^15 + x^2 + 1, shifted by 16 bit positions).<br>- CRC16 CCITT: POLYNOMIAL is 0x10210000 (x^16 + x^12 + x^5 + 1, shifted by 16 bit positions). |

### 8.3.15 DW_CRC_LFSR_CTL

**Description:** CRC LFSR control
**Address:** 0x40280130
**Offset:** 0x130
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | LFSR32 [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | LFSR32 [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | LFSR32 [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | LFSR32 [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | LFSR32 | RW | RW | 0 | State of a 32-bit Linear Feedback Shift Registers (LFSR) that is used to implement CRC. This register needs to be initialized by SW to provide the CRC seed value.<br><br>The seed value should be aligned such that the more significant bits (bit 31 and down) contain the seed value and the less significant bits (bit 0 and up) contain padding '0's.<br><br>Note that SW can write this field. This functionality can be used prevent information leakage (through either CRC_LFSR_CTL or CRC_REM_RESULT). |

### 8.3.16 DW_CRC_REM_CTL

**Description:** CRC remainder control
**Address:** 0x40280140
**Offset:** 0x140
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | REM_XOR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | REM_XOR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | REM_XOR [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | REM_XOR [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | REM_XOR | RW | R | 0 | Specifies a mask with which the CRC_LFSR_CTL.LFSR32 register is XOR'd to produce a remainder. The XOR is performed before remainder reversal. |

### 8.3.17 DW_CRC_REM_RESULT

**Description:** CRC remainder result
**Address:** 0x40280148
**Offset:** 0x148
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | REM [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | REM [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | REM [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | REM [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | REM | R | W | 0 | Remainder value. The alignment of the remainder depends on CRC_REM_CTL0.REM_REVERSE:<br>'0': the more significant bits (bit 31 and down) contain the remainder.<br>'1': the less significant bits (bit 0 and up) contain the remainder.<br><br>Note: This field is combinatorially derived from CRC_LFSR_CTL.LFSR32, CRC_CTL.REM_REVERSE and CRC_REM_CTL.REM_XOR. |

### 8.3.18 CH_STRUCT

#### 8.3.18.1 DW_CH_STRUCT_CH_CTL

**Description:** Channel control
**Address:** 0x40288000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | PC [7:4] | | | | None [3:3] | B [2:2] | NS [1:1] | P [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:12] | | | | PREEMPTABLE [11:11] | None [10:10] | PRIO [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ENABLED [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | P | RW | R | Undefined | User/privileged access control:<br>'0': user mode.<br>'1': privileged mode.<br><br>This field is set with the user/privileged access control of the transaction that writes this register; i.e. the 'write data' is ignored and instead the access control is inherited from the write transaction (note the field attributes should be HW:RW, SW:R).<br><br>All transactions for this channel use the P field for the user/privileged access control ('hprot[1]'). |
| 1 | NS | RW | R | Undefined | Secure/on-secure access control:<br>'0': secure.<br>'1': non-secure.<br><br>This field is set with the secure/non-secure access control of the transaction that writes this register; i.e. the 'write data' is ignored and instead the access control is inherited from the write transaction (note the field attributes should be HW:RW, SW:R).<br><br>All transactions for this channel use the NS field for the secure/non-secure access control ('hprot[4]'). |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2 | B | RW | R | Undefined | Non-bufferable/bufferable access control:<br>'0': non-bufferable.<br>'1': bufferable.<br><br>This field is used to indicate to an AMBA bridge that a write transaction can complete without waiting for the destination to accept the write transaction data.<br><br>All transactions for this channel uses the B field for the non-bufferable/bufferable access control ('hprot[2]'). |
| 4:7 | PC | RW | R | Undefined | Protection context.<br><br>This field is set with the protection context of the transaction that writes this register; i.e. the 'write data' is ignored and instead the context is inherited from the write transaction (note the field attributes should be HW:RW, SW:R).<br><br>All transactions for this channel uses the PC field for the protection context. |
| 8:9 | PRIO | RW | R | 0 | Channel priority:<br>'0': highest priority.<br>'1'<br>'2'<br>'3': lowest priority.<br><br>Channels with the same priority constitute a priority group. Priority decoding determines the highest priority pending channel. This channel is determined as follows. First, the highest priority group with pending channels is identified. Second, within this priority group, round robin arbitration is applied. Round robin arbitration (within a priority group) gives the highest priority to the lower channel indices (within the priority group). |
| 11 | PREEMPTABLE | RW | R | Undefined | Specifies if the channel is preemptable.<br>'0': Not preemptable.<br>'1': Preemptable. This field allows higher priority pending channels (from a higher priority group; i.e. an active channel can NOT be preempted by a pending channel in the same priority group) to preempt the active channel in between 'single transfers' (a 1D transfer consists out of X_COUNT single transfers; a 2D transfer consists out of X_COUNT*Y_COUNT single transfers). Preemption will NOT affect the pending status of channel. As a result, after completion of a higher priority activated channel, the current channel may be reactivated. |
| 31 | ENABLED | RW | RW1C | 0 | Channel enable:<br>'0': Disabled. The channel's trigger is ignored and the channel cannot be made pending and therefore cannot be made active. If a pending channel is disabled, the channel is made non pending. If the activate channel is disabled, the channel is de-activated (bus transactions are completed).<br>'1': Enabled.<br><br>SW sets this field to '1' to enable a specific channel.<br><br>HW sets this field to '0' on an error interrupt cause (the specific error is specified by CH_STATUS.INTR_CAUSE). |

### 8.3.18.2 DW_CH_STRUCT_CH_STATUS

**Description:** Channel status
**Address:** 0x40288004
**Offset:** 0x4
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | PENDING [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | INTR_CAUSE | R | W | Undefined | Specifies the source of the interrupt cause:<br>'0': No interrupt generated<br>'1': Interrupt based on transfer complettion configuration based on INTR_TYPE<br>'2': Source transfer bus error<br>'3': Destination transfer bus error<br>'4': Source address misalignment<br>'5': Destination address misalignment<br>'6': Current descriptor pointer is null<br>'7': Active channel is disabled<br>'8': Descriptor bus error<br>'9'-'15': Not used.<br><br>For error related interrupt causes (INTR_CAUSE is '2', '3', ..., '8'), the channel is disabled (HW sets CH_CTL.ENABLED to '0'). |
| 31 | PENDING | R | W | 0 | Specifies pending DW channels; i.e. enabled channels whose trigger got activated. This field includes all channels that are in the pending state (not scheduled) or active state (scheduled and performing data transfer(s)). |

### 8.3.18.3 DW_CH_STRUCT_CH_IDX

**Description:** Channel current indices
**Address:** 0x40288008
**Offset:** 0x8
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** Note that this register is retained during DeepSleep system power mode.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | X_IDX [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | Y_IDX [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2:31 | ADDR | RW | RW | Undefined | Address of current descriptor. When this field is '0', there is no valid descriptor.<br><br>Note: HW updates the current descriptor pointer CH_CURR_PTR with DESCR_NEXT_PTR after execution of the current descriptor.<br><br>Note: Typically, when SW updates the current descriptor pointer CH_CURR_PTR, it also sets CH_IDX.X_IDX and CH_IDX.Y_IDX to '0'. |

### 8.3.18.5 DW_CH_STRUCT_INTR

**Description:** Interrupt
**Address:** 0x40288010
**Offset:** 0x10
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** The register fields are not retained. This is to ensure that they come up as '0' after coming out of DeepSleep system power mode.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | CH [0:0] |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | CH | RW | R | 0 | Mask for corresponding field in INTR register. |

### 8.3.18.8 DW_CH_STRUCT_INTR_MASKED

**Description:** Interrupt masked
**Address:** 0x4028801C
**Offset:** 0x1C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** When read, this register reflects a bitwise AND between the INTR and INTR_MASK registers. This register allows SW to read the status of all mask enabled interrupt causes with a single load operation, rather than two load operations: one for INTR and one for INTR_MASK. This simplifies Firmware development. The associated interrupt is active ('1'), when INTR_MASKED != 0.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | CH [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | CH | R | W | 0 | Logical and of corresponding INTR and INTR_MASK fields. |

### 8.3.18.9 DW_CH_STRUCT_SRAM_DATA0

**Description:** SRAM data 0
**Address:** 0x40288020
**Offset:** 0x20
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** SRAM_DATA0 and SRAM_DATA1 are provided for ECC fault injection functionality. These register should NOT be used to control regular functionality (except that they can be used for initialization of DW SRAMs).

Some of the CH_CTL, CH_STATUS, CH_IDX and CH_CURR_PTR fields are implemented using SRAM storage. Each channel uses two 32-bit SRAM data words. The fields of a register that are implemented using SRAM storage are mapped on a subset of either of the two 32-bit SRAM data words. Specifically, the first 32-bit SRAM data word implements CH_CTL.P, CH_CTL.NS, CH_CTL.B, CH_CTL.PC, CH_CTL.PREEMPTABLE, CH_IDX.X_IDX and CH_IDX.Y_IDX fields and the second 32-bit SRAM data word implements the CH_CURR_PTR.ADDR field. As a result, CH_CTL, CH_IDX and CH_CURR_PTR writes only update a subset of a 32-bit SRAM data word.

For ECC fault injection, it is required to update a complete 32-bit SRAM data word with a user provided ECC parity (specified by ECC_CTL.PARITY) at a specific SRAM location (specified by ECC_CTL.WORD_ADDR). Therefore, SRAM_DATA0 and SRAM_DATA1 provide access to specific SRAM locations. For a channel i, SRAM_DATA0 provides access to SRAM word address 2*i and SRAM_DATA1 provides access to SRAM word address 2*i + 1. E.g., to inject a fault at SRAM word address '13', CTL.ECC_INJ_EN is set to '1', ECC_CTL.WORD_ADDR is set to '13', and ECC_CTL.PARITY is set to the faulting parity. Next, the SW performs a 32-bit write to SRAM_DATA1 of channel 6 (2*6 + 1 = 13). The write data and the faulting parity is written to SRAM word address '13'.
**Default:** Undefined as one or more bit fields have a default value that is undefined

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | ACTIVATE | RW1S | A | 0 | Software trigger. When written with '1', a trigger is generated which sets 'trigger pending' (only if the channel is enabled). A read always returns a 0. |

# 9 EFUSE

**Description** EFUSE MXS40 registers
**Base Address** 0x402C0000
**Size** 0x200
**Slave Num** MMIO2 - 11

# 10 EFUSE_DATA

**Description** eFUSE memory
**Base Address** 0x402C0800
**Size** 0x200
**Slave Num** MMIO2 - 11

| Register Name | Address | Permission | Description |
|---|---|---|---|
| EFUSE_DATA_CUSTOMER_DATA0 | 0x402C0868 | NO-ACCESS | Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx. |
| EFUSE_DATA_CUSTOMER_DATA1 | 0x402C086C | NO-ACCESS | Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx. |
| EFUSE_DATA_CUSTOMER_DATA2 | 0x402C0870 | NO-ACCESS | Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx. |
| EFUSE_DATA_CUSTOMER_DATA3 | 0x402C0874 | NO-ACCESS | Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx. |
| EFUSE_DATA_CUSTOMER_DATA4 | 0x402C0878 | NO-ACCESS | Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx. |
| EFUSE_DATA_CUSTOMER_DATA5 | 0x402C087C | NO-ACCESS | Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx. |

## 10.1 Register Details

### 10.1.1 EFUSE_DATA_CUSTOMER_DATA

**Description:** Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx.
**Address:** 0x402C0868
**Offset:** 0x68
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The eFUSE memory consists of an array of eFUSE macros. The memory can only be read with AHB-Lite Byte read transfers. A non-Byte AHB-Lite read transfer results in an AHB-Lite bus error. An AHB-Lite write transfer results in an AHB-Lite bus error. Furthermore, an AHB-Lite read transfer while a program operation is in progress (CMD.START is '1') results in an AHB-Lite bus error.

The number of eFUSE memory Bytes is determined by the EFUSE_NR configuration parameter. This parameter specifies the number of instantiated eFUSE macros. Each macro has 16 Bytes. E.g., if EFUSE_NR is 8, the eFUSE memory has 8*16 Bytes = 128 Bytes.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 0:31 | DATA_BYTE | RW | R | 0 | Available EFUSE bits for customer usage.They can be programmed in NORMAL protection state via CMx/DAP and in SECURE protection state via CMx. |

# 11 ETH

## 11.1 ETH 0

**Description** Ethernet Interface
**Base Address** 0x40480000
**Size** 0x10000
**Slave Num** MMIO4 - 2

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH0_CTL | 0x40480000 | FULL | MXETH Control Register |
| ETH0_STATUS | 0x40480004 | FULL | MXETH Status Register |
| ETH0_NETWORK_CONTROL | 0x40481000 | FULL | The network control register contains general MAC control functions for both receiver and transmitter. |
| ETH0_NETWORK_CONFIG | 0x40481004 | FULL | The network configuration register contains functions for setting the mode of operation for the Gigabit Ethernet MAC. |
| ETH0_NETWORK_STATUS | 0x40481008 | FULL | The network status register returns status information with respect to the PHY management interface. |
| ETH0_USER_IO_REGISTER | 0x4048100C | FULL | Not presents. Access to the register will return AHB error. |
| ETH0_DMA_CONFIG | 0x40481010 | FULL | DMA Configuration Register |
| ETH0_TRANSMIT_STATUS | 0x40481014 | FULL | This register, when read, provides details of the status of a transmit. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register. |
| ETH0_RECEIVE_Q_PTR | 0x40481018 | FULL | This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the network control register. Once reception is enabled, any write to the receive buffer queue base address register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the used bits. In terms of AMBA (AXI) operation, the receive descriptors are read from memory using a single 32bit AXI access. When the datapath is configured at 64bit, the receive descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is written to using a single 64bit AXI access. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH0_TRANSMIT_Q_PTR | 0x4048101C | FULL | This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit, the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access. |
| ETH0_RECEIVE_STATUS | 0x40481020 | FULL | This register, when read provides details of the status of a receive. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register. |
| ETH0_INT_STATUS | 0x40481024 | FULL | If not configured for priority queueing, the GEM generates a single interrupt. This register indicates the source of this interrupt. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the ethernet_int signal will be asserted. For test purposes each bit can be set or reset by writing to the interrupt mask register. The default configuration is shown below whereby all bits are reset to zero on read. Changing the validity of the `gem_irq_read_clear define will instead require a one to be written to the appropriate bit in order to clear it. In this mode reading has no affect on the status of the bit. |
| ETH0_INT_ENABLE | 0x40481028 | FULL | At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero. |
| ETH0_INT_DISABLE | 0x4048102C | FULL | Writing a 1 to the relevant bit location disables that particular interrupt. This register is write only and when read will return zero. |
| ETH0_INT_MASK | 0x40481030 | FULL | The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH0_PHY_MANAGEMENT | 0x40481034 | FULL | The PHY maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit-2 is set in the network status register. It takes about 2000 pclk cycles to complete, when MDC is set for pclk divide by 32 in the network configuration register. An interrupt is generated upon completion. During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO. See Section 22.2.4.5 of the IEEE 802.3 standard. Reading during the shift operation will return the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits will be updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced. The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. For a description of MDC generation, see Network Configuration Register. |
| ETH0_PAUSE_TIME | 0x40481038 | FULL | Received Pause Quantum Register |
| ETH0_TX_PAUSE_QUANTUM | 0x4048103C | FULL | Transmit Pause Quantum Register |
| ETH0_PBUF_TXCUTTHRU | 0x40481040 | FULL | Partial store and forward is only applicable when using the DMA configured in SRAM based packet buffer mode. It is also not available when using multi buffer frames. TX Partial Store and Forward |
| ETH0_PBUF_RXCUTTHRU | 0x40481044 | FULL | RX Partial Store and Forward |
| ETH0_JUMBO_MAX_LENGTH | 0x40481048 | FULL | Maximum Jumbo Frame Size. |
| ETH0_EXTERNAL_FIFO_INTERFACE | 0x4048104C | FULL | Not presents. |
| ETH0_AXI_MAX_PIPELINE | 0x40481054 | FULL | Used to set the maximum amount of outstanding transactions on the AXI bus between AR / R channels and AW / W channels. Cannot be more than the depth of the configured AXI pipeline FIFO (defined in verilog defs.v) |
| ETH0_RSC_CONTROL | 0x40481058 | FULL | Not presents. Access to the register will return AHB error. |
| ETH0_INT_MODERATION | 0x4048105C | FULL | Used to moderate the number of transmit and receive complete interrupts issued. With interrupt moderation enabled receive and transmit interrupts are not generated immediately a frame is transmitted or received. Instead when a receive or transmit event occurs a timer is started and the interrupt is asserted after it times out. This limits the frequency with which the CPU receives interrupts. When interrupt moderation is enabled interrupt status bit one is always used for receive and bit 7 is always used for transmit even when priority queuing is enabled. With interrupt moderation 800ns periods are counted. GEM determines what constitutes an 800ns period by looking at the tbi (bit 11), gigabit bit (10) and speed (bit 0) bits in the network configuration register and counting tx_clk cycles. Bit 0 needs to be set to 1 for 100M operation. |
| ETH0_SYS_WAKE_TIME | 0x40481060 | FULL | Used to pause transmission after deassertion of tx_lpi_en. Each unit in this register corresponds to 64ns in gigabit mode, 320ns in 100M mode and 3200ns at 10M. After tx_lpi_en is deasserted transmission will pause for the set time. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH0_HASH_BOTTOM | 0x40481080 | FULL | The unicast hash enable and the multicast hash enable bits in the network configuration register enable the reception of hash matched frames. Hash Register Bottom (31 to 0 bits) |
| ETH0_HASH_TOP | 0x40481084 | FULL | Hash Register Top (63 to 32 bits) |
| ETH0_SPEC_ADD1_BOTTOM | 0x40481088 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH0_SPEC_ADD1_TOP | 0x4048108C | FULL | Specific Address Top |
| ETH0_SPEC_ADD2_BOTTOM | 0x40481090 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH0_SPEC_ADD2_TOP | 0x40481094 | FULL | Specific Address Top |
| ETH0_SPEC_ADD3_BOTTOM | 0x40481098 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH0_SPEC_ADD3_TOP | 0x4048109C | FULL | Specific Address Top |
| ETH0_SPEC_ADD4_BOTTOM | 0x404810A0 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH0_SPEC_ADD4_TOP | 0x404810A4 | FULL | Specific Address Top |
| ETH0_SPEC_TYPE1 | 0x404810A8 | FULL | Type ID Match 1 |
| ETH0_SPEC_TYPE2 | 0x404810AC | FULL | Type ID Match 2 |
| ETH0_SPEC_TYPE3 | 0x404810B0 | FULL | Type ID Match 3 |
| ETH0_SPEC_TYPE4 | 0x404810B4 | FULL | Type ID Match 4 |
| ETH0_WOL_REGISTER | 0x404810B8 | FULL | Wake on LAN Register. Presents in design, but feature is not supported. |
| ETH0_STRETCH_RATIO | 0x404810BC | FULL | IPG stretch register |
| ETH0_STACKED_VLAN | 0x404810C0 | FULL | Stacked VLAN Register |
| ETH0_TX_PFC_PAUSE | 0x404810C4 | FULL | Transmit PFC Pause Register |
| ETH0_MASK_ADD1_BOTTOM | 0x404810C8 | FULL | Specific Address Mask 1 Bottom (31 to 0 bits) |
| ETH0_MASK_ADD1_TOP | 0x404810CC | FULL | Specific Address Mask 1 Top (47 to 32 bits) |
| ETH0_DMA_ADDR_OR_MASK | 0x404810D0 | FULL | Receive DMA Data Buffer Address Mask |
| ETH0_RX_PTP_UNICAST | 0x404810D4 | FULL | PTP RX unicast IP destination address |
| ETH0_TX_PTP_UNICAST | 0x404810D8 | FULL | PTP TX unicast IP destination address |
| ETH0_TSU_NSEC_CMP | 0x404810DC | FULL | TSU timer comparison value nanoseconds |
| ETH0_TSU_SEC_CMP | 0x404810E0 | FULL | TSU timer comparison value seconds (31 to 0 bits) |
| ETH0_TSU_MSB_SEC_CMP | 0x404810E4 | FULL | TSU timer comparison value seconds (47 to 32 bits) |
| ETH0_TSU_PTP_TX_MSB_SEC | 0x404810E8 | FULL | PTP Event Frame Transmitted Seconds Register (47 to 32 bits) |
| ETH0_TSU_PTP_RX_MSB_SEC | 0x404810EC | FULL | PTP Event Frame Received Seconds Register (47 to 32 bits) |
| ETH0_TSU_PEER_TX_MSB_SEC | 0x404810F0 | FULL | PTP Peer Event Frame Transmitted Seconds Register (47 to 32 bits) |
| ETH0_TSU_PEER_RX_MSB_SEC | 0x404810F4 | FULL | PTP Peer Event Frame Received Seconds Register (47 to 32 bits) |
| ETH0_DPRAM_FILL_DBG | 0x404810F8 | FULL | The fill levels for the TX & RX packet buffers can be read using this register, including the fill level for each queue in the TX direction. |
| ETH0_REVISION_REG | 0x404810FC | FULL | This register indicates a Cadence module identification number and module revision. The value of this register is read only as defined by `gem_revision_reg_value |
| ETH0_OCTETS_TXED_BOTTOM | 0x40481100 | FULL | Octets Transmitted lower bits (31 to 0 bits) |
| ETH0_OCTETS_TXED_TOP | 0x40481104 | FULL | Octets Transmitted higher bits (47 to 32 bits) |

|---|---|---|---|
| ETH0_TRANSMIT_Q1_PTR | 0x40481440 | FULL | This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit , the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access. |
| ETH0_TRANSMIT_Q2_PTR | 0x40481444 | FULL | This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. | Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH0_CBS_CONTROL | 0x404814BC | FULL | The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the portTransmitRate which is dependent on the speed of operation, eg, portTranmsitRate. 1Gb/s = 32'h07735940 (125 Mbytes/s), 100Mb/sec = 32'h017D7840 (25 Mnibbles/s), 10Mb/sec = 32'h002625A0 (2.5 Mnibbles/s). If 50 percent of bandwidth was to be allocated to a particular queue in 1Gb/sec mode then the IdleSlope value for that queue would be calculated as 32'h07735940/2. Note that Credit-Based Shaping should be disabled prior to updating the IdleSlope values. As another example, for a 1722 audio packet with a payload of 6 samples per channel, the packet size would be 7 (preamble) + 1 (SFD) + 50 (packet header) + 6x4x2(payload) + 4 (CRC) = 110 bytes. For a rate of 8000 packets per second, the desired rate would 110 x 8000 bytes per second, so the programmed idleSlope value would be 880000 for a 1Gb/s connection, or 1760000 for a 100Mb/s or 10Mbs connection. See Figure 6.3 in the IEEE 1722 standard. In practice, the actual transmission rate will be vary slightly from that calculated. In this case, the idleSlope value should be recalibrated based on the variance between the measured and expected rate, and in this case very accurate transmission rates can be achieved. |
| ETH0_CBS_IDLESLOPE_Q_A | 0x404814C0 | FULL | queue A is the highest priority queue. This would be queue 8 in an 8 queue configuration. |
| ETH0_CBS_IDLESLOPE_Q_B | 0x404814C4 | FULL | queue B is the 2nd highest priority queue. This would be queue 7 in an 8 queue configuration. |

| ETH0_HIDDEN_REG5 | 0x404814FC | FULL | Hidden registers defined in edma_defs.v `define gem_axi_tx_full_threshold1 12'h4fc // AXI full threshold setting *** HIDDEN Register ***'. |
| ETH0_SCREENING_TYPE_1_REGISTER_0 | 0x40481500 | FULL | Screening type 1 registers are used to allocate up to 16 priority queues to received frames based on certain IP or UDP fields of incoming frames. Firstly, when DS/TC match enable is set (bit 28), the DS (Differentiated Services) field of the received IPv4 header or TCfield (traffic class) of IPv6 headers are matched against bits 11 to 4. Secondly, when UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27 to 12. Both UDP and DS/TC matching can be enabled simultaneously or individually. If a match is successful, then the queue value programmed in bits 2 to 0 is allocated to the frame. The required number of Type 1 screening registers is configured in the gem defines file. Up to 16 type 1 screening registers have been allocated APB address space between 0x500 and 0x53C. |
| ETH0_SCREENING_TYPE_1_REGISTER_1 | 0x40481504 | FULL | screening type 1 register 1, same as screening_type_1_register_0 |
| ETH0_SCREENING_TYPE_1_REGISTER_2 | 0x40481508 | FULL | screening type 1 register 2, same as screening_type_1_register_0 |

| ETH0_SCREENING_TYPE_2_REGISTER_5 | 0x40481554 | FULL | screening type 2 register 5, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_6 | 0x40481558 | FULL | screening type 2 register 6, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_7 | 0x4048155C | FULL | screening type 2 register 7, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_8 | 0x40481560 | FULL | screening type 2 register 8, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_9 | 0x40481564 | FULL | screening type 2 register 9, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_10 | 0x40481568 | FULL | screening type 2 register 10, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_11 | 0x4048156C | FULL | screening type 2 register 11, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_12 | 0x40481570 | FULL | screening type 2 register 12, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_13 | 0x40481574 | FULL | screening type 2 register 13, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_14 | 0x40481578 | FULL | screening type 2 register 14, same as screening_type_2_register_0 |
| ETH0_SCREENING_TYPE_2_REGISTER_15 | 0x4048157C | FULL | screening type 2 register 15, same as screening_type_2_register_0 |
| ETH0_TX_SCHED_CTRL | 0x40481580 | FULL | This register controls the transmit scheduling algorithm the user can select for each active transmit queue. By default all queues are initialized to fixed priority, with the top indexed queue having overall priority |
| ETH0_BW_RATE_LIMIT_Q0TO3 | 0x40481590 | FULL | This register holds the DWRR weighting value or the ETS bandwidth percentage value used by the transmit scheduler for queues 0 to 3. |
| ETH0_BW_RATE_LIMIT_Q4TO7 | 0x40481594 | FULL | Not presents. MXETH has only 3 queues. Access to the register returns AHB error. |
| ETH0_BW_RATE_LIMIT_Q8TO11 | 0x40481598 | FULL | Not presents. MXETH has only 3 queues. Access to the register returns AHB error. |
| ETH0_BW_RATE_LIMIT_Q12TO15 | 0x4048159C | FULL | Not presents. MXETH has only 3 queues. Access to the register returns AHB error. |
| ETH0_TX_Q_SEG_ALLOC_Q0TO7 | 0x404815A0 | FULL | This register allows the user to distribute the Transmit SRAM used by the DMA across the priority queues, for queues 0 to 7. The SRAM itself is split into a number of evenly sized segments (this is defined in the verilog configuration defs file - for the configuration used to generate this register description, the total number of segments was set to '16'). Those segments can then be freely distributed across the active queues, in powers of 2. I.e. a value of 0 would mean 1 segment has been allocated to the queue. A value of 1 would mean 2 segments, a value of 2 means 4 segments and so on. The reset values of these registers are defined in the configuration defs file. |
| ETH0_TX_Q_SEG_ALLOC_Q8TO15 | 0x404815A4 | FULL | Not presents. Access to the register returns AHB error. |
| ETH0_RECEIVE_Q8_PTR | 0x404815C0 | FULL | receive_q8_ptr to receive_q15_ptr doesn't present. Access to the register returns AHB error. |
| ETH0_RECEIVE_Q15_PTR | 0x404815DC | FULL | Not presents. |
| ETH0_DMA_RXBUF_SIZE_Q8 | 0x404815E0 | FULL | dma_rxbuf_size_q8 to dma_rxbuf_size_q15 doesn't present. Access to the register returns AHB error. |
| ETH0_DMA_RXBUF_SIZE_Q15 | 0x404815FC | FULL | Not presents. |
| ETH0_INT_Q1_ENABLE | 0x40481600 | FULL | At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH0_INT_Q2_ENABLE | 0x40481604 | FULL | At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero. |
| ETH0_INT_Q3_ENABLE | 0x40481608 | FULL | int_q3_enable to int_q7_enable doesn't present. Access to the register returns AHB error. |
| ETH0_INT_Q7_ENABLE | 0x40481618 | FULL | Not presents. |
| ETH0_INT_Q1_DISABLE | 0x40481620 | FULL | Writing a 1 to the relevant bit location disables that particular interrupt. This register is write only and when read will return zero. |
| ETH0_INT_Q2_DISABLE | 0x40481624 | FULL | Writing a 1 to the relevant bit location disables that particular interrupt. This register is write only and when read will return zero. |
| ETH0_INT_Q3_DISABLE | 0x40481628 | FULL | int_q3_disable to int_q7_disable doesn't present. Access to the register returns AHB error. |
| ETH0_INT_Q7_DISABLE | 0x40481638 | FULL | Not presents. |
| ETH0_INT_Q1_MASK | 0x40481640 | FULL | The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register. |
| ETH0_INT_Q2_MASK | 0x40481644 | FULL | The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register. |
| ETH0_INT_Q3_MASK | 0x40481648 | FULL | int_q3_mask to int_q7_mask doesn't present. Access to the register returns AHB error. |
| ETH0_INT_Q7_MASK | 0x40481658 | FULL | Not presents. |
| ETH0_INT_Q8_ENABLE | 0x40481660 | FULL | int_q8_enable to int_q15_enable doesn't present. Access to the register returns AHB error. |
| ETH0_INT_Q15_ENABLE | 0x4048167C | FULL | Not presents. |
| ETH0_INT_Q8_DISABLE | 0x40481680 | FULL | int_q8_disable to int_q15_disable doesn't present. Access to the register returns AHB error. |
| ETH0_INT_Q15_DISABLE | 0x4048169C | FULL | Not presents. |
| ETH0_INT_Q8_MASK | 0x404816A0 | FULL | int_q8_mask to int_q15_mask doesn't present. Access to the register returns AHB error. |
| ETH0_INT_Q15_MASK | 0x404816BC | FULL | Not presents. |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_0 | 0x404816E0 | FULL | Ethertype Register |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_1 | 0x404816E4 | FULL | Ethertype Register |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_2 | 0x404816E8 | FULL | Ethertype Register |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_3 | 0x404816EC | FULL | Ethertype Register |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_4 | 0x404816F0 | FULL | Ethertype Register |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_5 | 0x404816F4 | FULL | Ethertype Register |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_6 | 0x404816F8 | FULL | Ethertype Register |
| ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_7 | 0x404816FC | FULL | Ethertype Register |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH0_TYPE2_COMPARE_0_WORD_0 | 0x40481700 | FULL | 'Compare A, B and C fields of the screener type 2 match register are pointers to a pool of up to 32 compare registers. If enabled the compare is true if the data at the OFFSET into the frame, ANDed with the MASK Value if the mask is enabled, is equal to the COMPARE Value. Either a 16 bit comparison or a 32 bit comparison is done. This selection is made via the associated compare word1 register bit 9. If a 16 bit comparison is selected, then a 16 bit mask is also available to the user to select which bits should be compared. If the 32 bit compare option is selected, then no mask is available. The byte at the OFFSET number of bytes from the index start is compared thru bits 7 to 0 of the configured VALUE. The byte at the OFFSET number of bytes + 1 from the index start is compared thru bits 15 to 8 of the configured VALUE and so on. The OFFSET can be configured to be from 0 to 127 bytes from either the start of the frame, the byte following the therType field (last EtherType in the header if the frame is VLAN tagged), the byte following the IP header (IPv4 or IPv6) or from the byte following the start of the TCP/UDP header. The required number of Type 2 screening registers up to a maximum of 32 is configurable in the gem defines file and have been allocated APB address space between 0x700 and 0x7fc. Note. when using RX Partial Store and Forward mode and priority queues, the frame offset must be less than the Partial Store and Forward watermark. If the offset is higher than the watermark value it's not possible to identify the priority queue before the frame is sent to the AMBA interface, and an incorrect priority queue may be used. ' |

## 11.2 ETH 1

**Description** Ethernet Interface
**Base Address** 0x40490000
**Size** 0x10000
**Slave Num** MMIO4 - 3

This instance is not available in the following part numbers:
CYT6BJ8DES, CYT6BJ8DEE, CYT4BJ8DES, CYT4BJ8DEE, CYT6BH8DES, CYT6BH8DEE, CYT6BH8DDS, CYT6BH8DDE, CYT6A0103S, CYT4BH8DES, CYT4BH8DEE, CYT4BH8DDS, CYT4BH8DDE.

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH1_CTL | 0x40490000 | FULL | MXETH Control Register |
| ETH1_STATUS | 0x40490004 | FULL | MXETH Status Register |
| ETH1_NETWORK_CONTROL | 0x40491000 | FULL | The network control register contains general MAC control functions for both receiver and transmitter. |
| ETH1_NETWORK_CONFIG | 0x40491004 | FULL | The network configuration register contains functions for setting the mode of operation for the Gigabit Ethernet MAC. |
| ETH1_NETWORK_STATUS | 0x40491008 | FULL | The network status register returns status information with respect to the PHY management interface. |
| ETH1_USER_IO_REGISTER | 0x4049100C | FULL | Not presents. Access to the register will return AHB error. |
| ETH1_DMA_CONFIG | 0x40491010 | FULL | DMA Configuration Register |
| ETH1_TRANSMIT_STATUS | 0x40491014 | FULL | This register, when read, provides details of the status of a transmit. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH1_RECEIVE_Q_PTR | 0x40491018 | FULL | This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the network control register. Once reception is enabled, any write to the receive buffer queue base address register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the used bits. In terms of AMBA (AXI) operation, the receive descriptors are read from memory using a single 32bit AXI access. When the datapath is configured at 64bit, the receive descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is written to using a single 64bit AXI access. |
| ETH1_TRANSMIT_Q_PTR | 0x4049101C | FULL | This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit, the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access. |
| ETH1_RECEIVE_STATUS | 0x40491020 | FULL | This register, when read provides details of the status of a receive. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register. |
| ETH1_INT_STATUS | 0x40491024 | FULL | If not configured for priority queueing, the GEM generates a single interrupt. This register indicates the source of this interrupt. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the ethernet_int signal will be asserted. For test purposes each bit can be set or reset by writing to the interrupt mask register. The default configuration is shown below whereby all bits are reset to zero on read. Changing the validity of the `gem_irq_read_clear define will instead require a one to be written to the appropriate bit in order to clear it. In this mode reading has no affect on the status of the bit. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH1_INT_ENABLE | 0x40491028 | FULL | At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero. |
| ETH1_INT_DISABLE | 0x4049102C | FULL | Writing a 1 to the relevant bit location disables that particular interrupt. This register is write only and when read will return zero. |
| ETH1_INT_MASK | 0x40491030 | FULL | The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register. |
| ETH1_PHY_MANAGEMENT | 0x40491034 | FULL | The PHY maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit-2 is set in the network status register. It takes about 2000 pclk cycles to complete, when MDC is set for pclk divide by 32 in the network configuration register. An interrupt is generated upon completion. During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO. See Section 22.2.4.5 of the IEEE 802.3 standard. Reading during the shift operation will return the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits will be updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced. The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. For a description of MDC generation, see Network Configuration Register. |
| ETH1_PAUSE_TIME | 0x40491038 | FULL | Received Pause Quantum Register |
| ETH1_TX_PAUSE_QUANTUM | 0x4049103C | FULL | Transmit Pause Quantum Register |
| ETH1_PBUF_TXCUTTHRU | 0x40491040 | FULL | Partial store and forward is only applicable when using the DMA configured in SRAM based packet buffer mode. It is also not available when using multi buffer frames. TX Partial Store and Forward |
| ETH1_PBUF_RXCUTTHRU | 0x40491044 | FULL | RX Partial Store and Forward |
| ETH1_JUMBO_MAX_LENGTH | 0x40491048 | FULL | Maximum Jumbo Frame Size. |
| ETH1_EXTERNAL_FIFO_INTERFACE | 0x4049104C | FULL | Not presents. |
| ETH1_AXI_MAX_PIPELINE | 0x40491054 | FULL | Used to set the maximum amount of outstanding transactions on the AXI bus between AR / R channels and AW / W channels. Cannot be more than the depth of the configured AXI pipeline FIFO (defined in verilog defs.v) |
| ETH1_RSC_CONTROL | 0x40491058 | FULL | Not presents. Access to the register will return AHB error. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH1_INT_MODERATION | 0x4049105C | FULL | Used to moderate the number of transmit and receive complete interrupts issued. With interrupt moderation enabled receive and transmit interrupts are not generated immediately a frame is transmitted or received. Instead when a receive or transmit event occurs a timer is started and the interrupt is asserted after it times out. This limits the frequency with which the CPU receives interrupts. When interrupt moderation is enabled interrupt status bit one is always used for receive and bit 7 is always used for transmit even when priority queuing is enabled. With interrupt moderation 800ns periods are counted. GEM determines what constitutes an 800ns period by looking at the tbi (bit 11), gigabit bit (10) and speed (bit 0) bits in the network configuration register and counting tx_clk cycles. Bit 0 needs to be set to 1 for 100M operation. |
| ETH1_SYS_WAKE_TIME | 0x40491060 | FULL | Used to pause transmission after deassertion of tx_lpi_en. Each unit in this register corresponds to 64ns in gigabit mode, 320ns in 100M mode and 3200ns at 10M. After tx_lpi_en is deasserted transmission will pause for the set time. |
| ETH1_HASH_BOTTOM | 0x40491080 | FULL | The unicast hash enable and the multicast hash enable bits in the network configuration register enable the reception of hash matched frames. Hash Register Bottom (31 to 0 bits) |
| ETH1_HASH_TOP | 0x40491084 | FULL | Hash Register Top (63 to 32 bits) |
| ETH1_SPEC_ADD1_BOTTOM | 0x40491088 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH1_SPEC_ADD1_TOP | 0x4049108C | FULL | Specific Address Top |
| ETH1_SPEC_ADD2_BOTTOM | 0x40491090 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH1_SPEC_ADD2_TOP | 0x40491094 | FULL | Specific Address Top |
| ETH1_SPEC_ADD3_BOTTOM | 0x40491098 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH1_SPEC_ADD3_TOP | 0x4049109C | FULL | Specific Address Top |
| ETH1_SPEC_ADD4_BOTTOM | 0x404910A0 | FULL | The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. |
| ETH1_SPEC_ADD4_TOP | 0x404910A4 | FULL | Specific Address Top |
| ETH1_SPEC_TYPE1 | 0x404910A8 | FULL | Type ID Match 1 |
| ETH1_SPEC_TYPE2 | 0x404910AC | FULL | Type ID Match 2 |
| ETH1_SPEC_TYPE3 | 0x404910B0 | FULL | Type ID Match 3 |
| ETH1_SPEC_TYPE4 | 0x404910B4 | FULL | Type ID Match 4 |
| ETH1_WOL_REGISTER | 0x404910B8 | FULL | Wake on LAN Register. Presents in design, but feature is not supported. |
| ETH1_STRETCH_RATIO | 0x404910BC | FULL | IPG stretch register |
| ETH1_STACKED_VLAN | 0x404910C0 | FULL | Stacked VLAN Register |
| ETH1_TX_PFC_PAUSE | 0x404910C4 | FULL | Transmit PFC Pause Register |
| ETH1_MASK_ADD1_BOTTOM | 0x404910C8 | FULL | Specific Address Mask 1 Bottom (31 to 0 bits) |
| ETH1_MASK_ADD1_TOP | 0x404910CC | FULL | Specific Address Mask 1 Top (47 to 32 bits) |
| ETH1_DMA_ADDR_OR_MASK | 0x404910D0 | FULL | Receive DMA Data Buffer Address Mask |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH1_RX_PTP_UNICAST | 0x404910D4 | FULL | PTP RX unicast IP destination address |
| ETH1_TX_PTP_UNICAST | 0x404910D8 | FULL | PTP TX unicast IP destination address |
| ETH1_TSU_NSEC_CMP | 0x404910DC | FULL | TSU timer comparison value nanoseconds |
| ETH1_TSU_SEC_CMP | 0x404910E0 | FULL | TSU timer comparison value seconds (31 to 0 bits) |
| ETH1_TSU_MSB_SEC_CMP | 0x404910E4 | FULL | TSU timer comparison value seconds (47 to 32 bits) |
| ETH1_TSU_PTP_TX_MSB_SEC | 0x404910E8 | FULL | PTP Event Frame Transmitted Seconds Register (47 to 32 bits) |
| ETH1_TSU_PTP_RX_MSB_SEC | 0x404910EC | FULL | PTP Event Frame Received Seconds Register (47 to 32 bits) |
| ETH1_TSU_PEER_TX_MSB_SEC | 0x404910F0 | FULL | PTP Peer Event Frame Transmitted Seconds Register (47 to 32 bits) |
| ETH1_TSU_PEER_RX_MSB_SEC | 0x404910F4 | FULL | PTP Peer Event Frame Received Seconds Register (47 to 32 bits) |
| ETH1_DPRAM_FILL_DBG | 0x404910F8 | FULL | The fill levels for the TX & RX packet buffers can be read using this register, including the fill level for each queue in the TX direction. |
| ETH1_REVISION_REG | 0x404910FC | FULL | This register indicates a Cadence module identification number and module revision. The value of this register is read only as defined by `gem_revision_reg_value |
| ETH1_OCTETS_TXED_BOTTOM | 0x40491100 | FULL | Octets Transmitted lower bits (31 to 0 bits) |
| ETH1_OCTETS_TXED_TOP | 0x40491104 | FULL | Octets Transmitted higher bits (47 to 32 bits) |
| ETH1_FRAMES_TXED_OK | 0x40491108 | FULL | Frames Transmitted |

| ETH1_TRANSMIT_Q1_PTR | 0x40491440 | FULL | This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit , the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access. |

| ETH1_DMA_RXBUF_SIZE_Q7 | 0x404914B8 | FULL | Not presents. |
| ETH1_CBS_CONTROL | 0x404914BC | FULL | The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the portTransmitRate which is dependent on the speed of operation, eg, portTranmsitRate. 1Gb/s = 32'h07735940 (125 Mbytes/s), 100Mb/sec = 32'h017D7840 (25 Mnibbles/s), 10Mb/sec = 32'h002625A0 (2.5 Mnibbles/s). If 50 percent of bandwidth was to be allocated to a particular queue in 1Gb/sec mode then the IdleSlope value for that queue would be calculated as 32'h07735940/2. Note that Credit-Based Shaping should be disabled prior to updating the IdleSlope values. As another example, for a 1722 audio packet with a payload of 6 samples per channel, the packet size would be 7 (preamble) + 1 (SFD) + 50 (packet header) + 6x4x2(payload) + 4 (CRC) = 110 bytes. For a rate of 8000 packets per second, the desired rate would 110 x 8000 bytes per second, so the programmed idleSlope value would be 880000 for a 1Gb/s connection, or 1760000 for a 100Mb/s or 10Mbs connection. See Figure 6.3 in the IEEE 1722 standard. In practice, the actual transmission rate will be vary slightly from that calculated. In this case, the idleSlope value should be recalibrated based on the variance between the measured and expected rate, and in this case very accurate transmission rates can be achieved. |
| ETH1_CBS_IDLESLOPE_Q_A | 0x404914C0 | FULL | queue A is the highest priority queue. This would be queue 8 in an 8 queue configuration. |
| ETH1_CBS_IDLESLOPE_Q_B | 0x404914C4 | FULL | queue B is the 2nd highest priority queue. This would be queue 7 in an 8 queue configuration. |

| ETH1_SCREENING_TYPE_1_REGISTER_0 | 0x40491500 | FULL | Screening type 1 registers are used to allocate up to 16 priority queues to received frames based on certain IP or UDP fields of incoming frames. Firstly, when DS/TC match enable is set (bit 28), the DS (Differentiated Services) field of the received IPv4 header or TCfield (traffic class) of IPv6 headers are matched against bits 11 to 4. Secondly, when UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27 to 12. Both UDP and DS/TC matching can be enabled simultaneously or individually. If a match is successful, then the queue value programmed in bits 2 to 0 is allocated to the frame. The required number of Type 1 screening registers is configured in the gem defines file. Up to 16 type 1 screening registers have been allocated APB address space between 0x500 and 0x53C. |

| ETH1_TX_SCHED_CTRL | 0x40491580 | FULL | This register controls the transmit scheduling algorithm the user can select for each active transmit queue. By default all queues are initialized to fixed priority, with the top indexed queue having overall priority |
| ETH1_BW_RATE_LIMIT_Q0TO3 | 0x40491590 | FULL | This register holds the DWRR weighting value or the ETS bandwidth percentage value used by the transmit scheduler for queues 0 to 3. |
| ETH1_BW_RATE_LIMIT_Q4TO7 | 0x40491594 | FULL | Not presents. MXETH has only 3 queues. Access to the register returns AHB error. |
| ETH1_BW_RATE_LIMIT_Q8TO11 | 0x40491598 | FULL | Not presents. MXETH has only 3 queues. Access to the register returns AHB error. |

| Register Name | Address | Permission | Description |
|---|---|---|---|
| ETH1_BW_RATE_LIMIT_Q12TO15 | 0x4049159C | FULL | Not presents. MXETH has only 3 queues. Access to the register returns AHB error. |
| ETH1_TX_Q_SEG_ALLOC_Q0TO7 | 0x404915A0 | FULL | This register allows the user to distribute the Transmit SRAM used by the DMA across the priority queues, for queues 0 to 7. The SRAM itself is split into a number of evenly sized segments (this is defined in the verilog configuration defs file - for the configuration used to generate this register description, the total number of segments was set to '16'). Those segments can then be freely distributed across the active queues, in powers of 2. I.e. a value of 0 would mean 1 segment has been allocated to the queue. A value of 1 would mean 2 segments, a value of 2 means 4 segments and so on. The reset values of these registers are defined in the configuration defs file. |
| ETH1_TX_Q_SEG_ALLOC_Q8TO15 | 0x404915A4 | FULL | Not presents. Access to the register returns AHB error. |
| ETH1_RECEIVE_Q8_PTR | 0x404915C0 | FULL | receive_q8_ptr to receive_q15_ptr doesn't present. Access to the register returns AHB error. |
| ETH1_RECEIVE_Q15_PTR | 0x404915DC | FULL | Not presents. |

|---|---|---|---|
| ETH1_TYPE2_COMPARE_0_WORD_0 | 0x40491700 | FULL | 'Compare A, B and C fields of the screener type 2 match register are pointers to a pool of up to 32 compare registers. If enabled the compare is true if the data at the OFFSET into the frame, ANDed with the MASK Value if the mask is enabled, is equal to the COMPARE Value. Either a 16 bit comparison or a 32 bit comparison is done. This selection is made via the associated compare word1 register bit 9. If a 16 bit comparison is selected, then a 16 bit mask is also available to the user to select which bits should be compared. If the 32 bit compare option is selected, then no mask is available. The byte at the OFFSET number of bytes from the index start is compared thru bits 7 to 0 of the configured VALUE. The byte at the OFFSET number of bytes + 1 from the index start is compared thru bits 15 to 8 of the configured VALUE and so on. The OFFSET can be configured to be from 0 to 127 bytes from either the start of the frame, the byte following the therType field (last EtherType in the header if the frame is VLAN tagged), the byte following the IP header (IPv4 or IPv6) or from the byte following the start of the TCP/UDP header. The required number of Type 2 screening registers up to a maximum of 32 is configurable in the gem defines file and have been allocated APB address space between 0x700 and 0x7fc. Note. when using RX Partial Store and Forward mode and priority queues, the frame offset must be less than the Partial Store and Forward watermark. If the offset is higher than the watermark value it's not possible to identify the priority queue before the frame is sent to the AMBA interface, and an incorrect priority queue may be used. ' |

## 11.3 Register Details

### 11.3.1 ETH_CTL

**Description:** MXETH Control Register
**Address:** 0x40480000
**Offset:** 0x0
**Retention:** Retained
**IsDeepSleep:** No
**Comment:** The field ETH_MODE and REFCLK_SRC will select clock source for MAC transmit and receive logic in different Eth mode, it should NOT be changed while ENABLED is '1'.
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:3] | | | | | REFCLK_SRC_SEL [2:2] | ETH_MODE [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | REFCLK_DIV [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ENABLED [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:1 | ETH_MODE | RW | R | 0 | Set ethernet mode. The speed of 10M/100M/1G is selected by programming network_config after IP is enabled.<br>The field also specifies the clock source of internal tx_clk and rx_clk domain. |
| | MII | | | 0 | MII mode (10/100MHz speed is determined by network_config[0]). |
| | GMII | | | 1 | GMII mode (network_config[10] must be set to enable 1G operation). |
| | RGMII | | | 2 | RGMII mode (10M/100M/1G speed is determined by network_config[10] and network_config[0]). |
| | RMII | | | 3 | RMII mode (10M/100M speed is determined by network_config[0]). |
| 2 | REFCLK_SRC_SEL | RW | R | 0 | Select the source for ref_clk.<br>0: Ref_clk comes from REF_CLK_IN input port (HSIO).<br>1: Ref_clk comes from REF_CLK_INT_IN input port (PLL). |
| 8:15 | REFCLK_DIV | RW | R | 0 | Specify the ref_clk divider. Integer division by (1+REFCLK_DIV). Allows for integer divisions in the range [1, 256]. |
| 31 | ENABLED | RW | R | 0 | MXETH enable:<br>'0': Disabled.<br>'1': Enabled. |

### 11.3.2 ETH_STATUS

**Description:** MXETH Status Register
**Address:** 0x40480004
**Offset:** 0x4
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:1] | | | | | | | PFC_NEGOTIATE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | RX_PFC_PAUSED [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | PFC_NEGOTIATE | R | W | 0 | Identifies that PFC priority based pause flow control has been negotiated.<br>0 - No PFC priority based pause frames have yet been received, flow control is being handled using classic 802.3 pause frames.<br>1 - At least one PFC priority based pause frames has been received. All subsequent 802.3 pause frames will be dropped. |
| 8:15 | RX_PFC_PAUSED | R | W | 0 | Each bit corresponds to a priority indicated within the PFC priority based pause frame.<br>Each bit is set when a PFC priority based pause frame has been received, and the associated priority pause time quantum is non-zero. Each bit is cleared when the associated pause time identified by the received pause time quantum has elapsed. |

### 11.3.3 ETH_NETWORK_CONTROL

**Description:** The network control register contains general MAC control functions for both receiver and transmitter.
**Address:** 0x40481000
**Offset:** 0x1000
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | STATS_WRITE_EN [7:7] | INC_ALL_STATS_REGS [6:6] | CLEAR_ALL_STATS_REGS [5:5] | MAN_PORT_EN [4:4] | ENABLE_TRANSMIT [3:3] | ENABLE_RECEIVE [2:2] | LOOPBACK_LOCAL [1:1] | LOOPBACK [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | STORE_RX_TS [15:15] | REMOVED_14 [14:14] | REMOVED_13 [13:13] | TX_PAUSE_FRAME_ZERO [12:12] | TX_PAUSE_FRAME_REQ [11:11] | TX_HALT_PCLK [10:10] | TX_START_PCLK [9:9] | BACK_PRESSURE [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | EXT_TSU_PORT_ENABLE [23:23] | STORE_UDP_OFFSET [22:22] | ALT_SGMII_MODE [21:21] | PTP_UNICAST_ENA [20:20] | TX_LPI_EN [19:19] | FLUSH_RX_PKT_PCLK [18:18] | TRANSMIT_PFC_PRIORITY_BASED_PAUSE_FRAME [17:17] | PFC_ENABLE [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | EXT_RXQ_RESERVED_31 [31:31] | IFG_EATS_QAV_CREDIT [30:30] | TWO_PT_FIVE_GIG [29:29] | SEL_MII_ON_RGMII [28:28] | OSS_CORRECTION_FIELD [27:27] | EXT_RXQ_SEL_EN [26:26] | PFC_CTRL [25:25] | ONE_STEP_SYNC_MODE [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | LOOPBACK | RW | R | 0 | Loopback - controls the loopback output pin. |
| 1 | LOOPBACK_LOCAL | RW | R | 0 | Loopback local - asserts the loopback_local signal to the system clock generator. Also connects txd to rxd, tx_en to rx_dv and forces full duplex mode. Bit 11 of the network configuration register must be set low to disable TBI mode when in internal loopback. rx_clk and tx_clk may malfunction as the GEM is switched into and out of internal loopback. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loopback. Local loopback functionality is optional and may not be supported by some instantiations of the GEM. |
| 2 | ENABLE_RECEIVE | RW | R | 0 | Receive enable - when set, it enables the GEM to receive data. When reset frame reception will stop immediately and the receive pipeline will be cleared. The receive queue pointer register is unaffected. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 3 | ENABLE_TRANSMIT | RW | R | 0 | Transmit enable - when set, it enables the GEM transmitter to send data. When reset transmission will stop immediately, the transmit pipeline and control registers will be cleared and the transmit queue pointer register will reset to point to the start of the transmit descriptor list. |
| 4 | MAN_PORT_EN | RW | R | 0 | Management port enable - set to one to enable the management port. When zero forces mdio to high impedance state and mdc low. |
| 5 | CLEAR_ALL_STATS _REGS | W | R | 0 | Clear statistics registers - this bit is write only. Writing a one clears the statistics registers. Self clearing register. |
| 6 | INC_ALL_STATS_REGS | W | R | 0 | Incremental statistics registers - this bit is write only. Writing a one increments all the statistics registers by one for test purposes. Self clearing register. |
| 7 | STATS_WRITE_EN | RW | R | 0 | Write enable for statistics registers - setting this bit to one means the statistics registers can be written for functional test purposes. |
| 8 | BACK_PRESSURE | RW | R | 0 | Back pressure if set in 10M or 100M half duplex mode will force collisions on all received frames. Ignored in gigabit half duplex mode. |
| 9 | TX_START_PCLK | W | R | 0 | Start transmission - writing one to this bit starts transmission. |
| 10 | TX_HALT_PCLK | W | R | 0 | Transmit halt - writing one to this bit halts transmission as soon as any ongoing frame transmission ends. |
| 11 | TX_PAUSE_FRAME _REQ | W | R | 0 | Transmit pause frame - writing one to this bit causes a pause frame to be transmitted. Self clearing register. |
| 12 | TX_PAUSE_FRAME _ZERO | W | R | 0 | Transmit zero quantum pause frame - writing one to this bit causes a pause frame with zero quantum to be transmitted. |
| 13 | REMOVED_13 | R | R | 0 | Write ignore, read 0 |
| 14 | REMOVED_14 | R | R | 0 | Write ignore, read 0 |
| 15 | STORE_RX_TS | RW | R | 0 | Store receive time stamp to memory. Setting this bit to one will cause the CRC of every received frame to be replaced with the value of the nanoseconds field of the 1588 timer that was captured as the receive frame passed the message time stamp point. Set to zero for normal operation. |
| 16 | PFC_ENABLE | RW | R | 0 | Enable PFC Priority Based Pause Reception capabilities. Setting this bit will enable PFC negotiation and recognition of priority based pause frames. |
| 17 | TRANSMIT_PFC_PRIORI TY_BASED_PAUSE _FRAME | W | R | 0 | Write a one to transmit PFC priority based pause frame. Takes the values stored in the Transmit PFC Pause Register. Self clearing register. |
| 18 | FLUSH_RX_PKT_PCLK | W | R | 0 | Flush the next packet from the external RX DPRAM. Writing one to this bit will only have an effect if the DMA is not currently writing a packet already stored in the DPRAM to memory. Self clearing register. |
| 19 | TX_LPI_EN | RW | R | 0 | Enable LPI transmission when set LPI (low power idle) is immediately transmitted. LPI is transmitted even if bit 3 transmit enable is disabled. Setting this bit also sends a pause signal to the transmit datapath. |
| 20 | PTP_UNICAST_ENA | RW | R | 0 | Enable detection of unicast PTP unicast frames. |
| 21 | ALT_SGMII_MODE | RW | R | 0 | Alternative sgmii mode. If asserted with sgmii_mode in the network control register the ACK bit is driven before ability detect during transfer of status information from the PHY to the MAC. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 22 | STORE_UDP_OFFSET | RW | R | 0 | Store UDP / TCP offset to memory. Setting this bit to one will cause the upper 16-bits of the CRC of every received frame to be replaced with the offset from start of frame to the beginning of the UDP or TCP header. The lower 16-bits of the CRC are replaced with zero and reserved for future use. The offset is measured in units of 2 bytes. Set to zero for normal operation. |
| 23 | EXT_TSU_PORT _ENABLE | R | R | 0 | Write ignore, read 0 |
| 24 | ONE_STEP_SYNC _MODE | RW | R | 0 | 1588 One Step Sync Mode. Write 1 to enable. Replace timestamp field in the 1588 header for TX Sync Frames with current TSU timer value. |
| 25 | PFC_CTRL | RW | R | 0 | 'Enable multiple PFC pause quantums, one per pause priority' |
| 26 | EXT_RXQ_SEL_EN | RW | R | 0 | Enable external selection of receive queue. When this bit is high the ext_match1, ext_match2, ext_match3 and ext_match4 inputs will determine which receive queue a frame is routed to. This will be the case regardless of the state of the external address match enable bit 9 of the network config register. Note that receive frames will be dropped unless they are matched by the internal frame filtering functionality. If the external address match enable bit 9 in the network config register is set frames may be matched by an external address match filter as long as one of the ext_match1, ext_match2, ext_match3 and ext_match4 inputs is asserted early enough. When set ext_rxq_sel_en takes precedence over the existing screener functionality. This bit is only relevant if priority queuing is configured. |
| 27 | OSS_CORRECTION _FIELD | RW | R | 0 | 1588 One Step Correction Field Update. Set this bit high to enable updating the correction field of PTP 1588 version 2 sync frames by adding current TSU timer value. |
| 28 | SEL_MII_ON_RGMII | RW | R | 0 | If the RGMII interface being used set this bit high to configure the interface for MII operation. |
| 29 | TWO_PT_FIVE_GIG | RW | R | 0 | 2.5G operation selected - setting this bit high drives the speed_mode[3] top level output pin high and also adjusts the link timer in the PCS auto-negotiation block to ensure it delivers 10ms for 2500BASE-X and 1.6ms in SGMII mode, and also ensures int_moderation counts 800ns periods with the speeded up MAC clocks. |
| 30 | IFG_EATS_QAV_CREDIT | RW | R | 0 | Setting this bit high modifies the CBS algorithm so the IFG/IPG associated with a transmit frame counts towards its 802.1Qav credit. |
| 31 | EXT_RXQ_RESERVED _31 | R | R | 0 | Reserved, read as 0, ignored on write. |

### 11.3.4 ETH_NETWORK_CONFIG

**Description:** The network configuration register contains functions for setting the mode of operation for the Gigabit Ethernet MAC.
**Address:** 0x40481004
**Offset:** 0x1004
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x2C0000

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | UNICAST_HASH_ENABLE [7:7] | MULTICAST_HASH_ENABLE [6:6] | NO_BROADCAST [5:5] | COPY_ALL_FRAMES [4:4] | JUMBO_FRAMES [3:3] | DISCARD_NON_VLAN_FRAMES [2:2] | FULL_DUPLEX [1:1] | SPEED [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | RECEIVE_BUFFER_OFFSET [15:14] | | PAUSE_ENABLE [13:13] | RETRY_TEST [12:12] | PCS_SELECT [11:11] | GIGABIT_MODE_ENABLE [10:10] | EXTERNAL_ADDRESS_MATCH_ENABLE [9:9] | RECEIVE_1536_BYTE_FRAMES [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | DISABLE_COPY_OF_PAUSE_FRAMES [23:23] | DATA_BUS_WIDTH [22:21] | | MDC_CLOCK_DIVISION [20:18] | | | FCS_REMOVE [17:17] | LENGTH_FIELD_ERROR_FRAME_DISCARD [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | RESERVED_31 [31:31] | IGNORE_IPG_RX_ER [30:30] | NSP_CHANGE [29:29] | IPG_STRETCH_ENABLE [28:28] | SGMII_MODE_ENABLE [27:27] | IGNORE_RX_FCS [26:26] | EN_HALF_DUPLEX_RX [25:25] | RECEIVE_CHECKSUM_OFFLOAD_ENABLE [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | SPEED | RW | R | 0 | Speed - set to logic one to indicate 100Mbps operation, logic zero for 10Mbps. |
| 1 | FULL_DUPLEX | RW | R | 0 | Full duplex - if set to logic one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting. Also controls the half_duplex pin. |
| 2 | DISCARD_NON_VLAN_FRAMES | RW | R | 0 | Discard non-VLAN frames - when set only VLAN tagged frames will be passed to the address matching logic. |
| 3 | JUMBO_FRAMES | RW | R | 0 | Jumbo frames - set to one to enable jumbo frames up to `gem_jumbo_max_length bytes to be accepted. The default length is 10,240 bytes. |
| 4 | COPY_ALL_FRAMES | RW | R | 0 | Copy all frames - when set to logic one, all valid frames will be accepted. |
| 5 | NO_BROADCAST | RW | R | 0 | No broadcast - when set to logic one, frames addressed to the broadcast address of all ones will not be accepted. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 6 | MULTICAST_HASH _ENABLE | RW | R | 0 | Multicast hash enable - when set, multicast frames will be accepted when the 6 bit hash function of the destination address points to a bit that is set in the hash register. |
| 7 | UNICAST_HASH _ENABLE | RW | R | 0 | Unicast hash enable - when set, unicast frames will be accepted when the 6 bit hash function of the destination address points to a bit that is set in the hash register. |
| 8 | RECEIVE_1536_BYTE_F RAMES | RW | R | 0 | Receive 1536 byte frames - setting this bit means the GEM will accept frames up to 1536 bytes in length. Normally the GEM would reject any frame above 1518 bytes. |
| 9 | EXTERNAL_ADDRESS _MATCH_ENABLE | RW | R | 0 | External address match enable - when set the external address match interface can be used to copy frames to memory. |
| 10 | GIGABIT_MODE _ENABLE | RW | R | 0 | Gigabit mode enable - setting this bit configures the GEM for 1000 Mbps operation.<br>0: 10/100 operation using MII interface<br>1: Gigabit operation using GMI interface |
| 11 | PCS_SELECT | RW | R | 0 | PCS select - selects between MII/GMII and TBI |
| 12 | RETRY_TEST | RW | R | 0 | Retry test - must be set to zero for normal operation. If set to one the backoff between collisions will always be one slot time. Setting this bit to one helps test the too many retries condition. Also used in the pause frame tests to reduce the pause counter's decrement time from 512 bit times, to every rx_clk cycle. |
| 13 | PAUSE_ENABLE | RW | R | 0 | Pause enable - when set, transmission will pause if a non zero 802.3 classic pause frame is received and PFC has not been negotiated. |
| 14:15 | RECEIVE_BUFFER _OFFSET | RW | R | 0 | Receive buffer offset - indicates the number of bytes by which the received data is offset from the start of the receive buffer. |
| 16 | LENGTH_FIELD_ERROR _FRAME_DISCARD | RW | R | 0 | Length field error frame discard - setting this bit causes frames with a measured length shorter than the extracted length field (as indicated by bytes 13 and 14 in a non-VLAN tagged frame) to be discarded. This only applies to frames with a length field less than 0x0600. |
| 17 | FCS_REMOVE | RW | R | 0 | FCS remove - setting this bit will cause received frames to be written to memory without their frame check sequence (last 4 bytes). The frame length indicated will be reduced by four bytes in this mode. |
| 18:20 | MDC_CLOCK_DIVISION | RW | R | 3 | MDC clock division - set according to pclk speed. These three bits determine the number pclk will be divided by to generate MDC. For conformance with the 802.3 specification, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations). The reset value for this can be changed by defining a new value for gem_mdc_clock_div in gem_defs.v<br>000: divide pclk by 8 (pclk up to 20 MHz)<br>001: divide pclk by 16 (pclk up to 40 MHz)<br>010: divide pclk by 32 (pclk up to 80 MHz)<br>011: divide pclk by 48 (pclk up to 120MHz)<br>100: divide pclk by 64 (pclk up to 160 MHz)<br>101: divide pclk by 96 (pclk up to 240 MHz)<br>110: divide pclk by 128 (pclk up to 320 MHz)<br>111: divide pclk by 224 (pclk up to 540 MHz).<br>Note. The reset value of this field is equal to the gem_mdc_clock_div define, which is user configurable. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 21:22 | DATA_BUS_WIDTH | RW | R | 1 | Data bus width - set according to AMBA (AXI/AHB) or external FIFO data bus width. The reset value for this can be changed by defining a new value for gem_dma_bus_width_def in gem_defs. Only valid bus widths may be written if the system is configured to a maximum width less than 128-bits.<br>00: 32 bit data bus width 01: 64 bit AMBA (AXI/AHB) data bus width<br>10: 128 bit AMBA (AXI/AHB) data bus width<br>11: 128 bit AMBA (AXI/AHB) data bus width.<br>Note. The reset value of this field is equal to the gem_dma_bus_width_def define, which is user configurable.<br>Note:<br>For AXI_MASTER_PRESENT=1, MXETH only supports 64b DMA data bus width, so must set it 1.<br>For AXI_MASTER_PRESENT=0, MXETH only supports 32b DMA data bus width, so must set it 0. |
| 23 | DISABLE_COPY_OF_PAUSE_FRAMES | RW | R | 0 | Disable copy of pause frames - set to one to prevent pause frames being copied to memory. When set, neither control frames with type id 8808, nor pause frames with destination address 010000c28001 are copied to memory, this functionality was enhanced in release 1p09 (mxeth uses 1p09). Note that valid pause frames received will still increment pause statistics and pause the transmission of frames as required. |
| 24 | RECEIVE_CHECKSUM_OFFLOAD_ENABLE | RW | R | 0 | Receive checksum offload enable - when set, the receive checksum engine is enabled. Frames with bad IP, TCP or UDP checksums are discarded. |
| 25 | EN_HALF_DUPLEX_RX | RW | R | 0 | Enable frames to be received in half-duplex mode while transmitting. |
| 26 | IGNORE_RX_FCS | RW | R | 0 | Ignore RX FCS - when set frames with FCS/CRC errors will not be rejected. FCS error statistics will still be collected for frames with bad FCS and FCS status will be recorded in frame's DMA descriptor. For normal operation this bit must be set to zero. |
| 27 | SGMII_MODE_ENABLE | RW | R | 0 | SGMII mode enable - changes behaviour of the auto-negotiation advertisement and link partner ability registers to meet the requirements of SGMII and reduces the duration of the link timer from 10 ms to 1.6 ms. |
| 28 | IPG_STRETCH_ENABLE | RW | R | 0 | IPG stretch enable - when set the transmit IPG can be increased above 96 bit times depending on the previous frame length using the IPG stretch register. |
| 29 | NSP_CHANGE | RW | R | 0 | Receive bad preamble. When set frames with non-standard preamble are not rejected. |
| 30 | IGNORE_IPG_RX_ER | RW | R | 0 | Ignore IPG rx_er. When set rx_er has no effect on the GEMs operation when rx_dv is low. Set this when using the RGMII wrapper in half-duplex mode. |
| 31 | RESERVED_31 | RW | R | 0 | Reserved. Writeable register. Ignore on read. |

### 11.3.5 ETH_NETWORK_STATUS

**Description:** The network status register returns status information with respect to the PHY management interface.
**Address:** 0x40481008
**Offset:** 0x1008
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x6

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | LPI_INDICATE_PCLK [7:7] | PFC_NEGOTIATE_PCLK [6:6] | REMOVED_5_4 [5:4] | | MAC_FULL_DUPLEX [3:3] | MAN_DONE [2:2] | MDIO_IN [1:1] | PCS_LINK_STATE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | PCS_LINK_STATE | R | W | 0 | Returns status of PCS link state. If auto-negotiation is disabled this returns the synchronisation status. If auto-negotiation is enabled it is set in the LINK_OK state as long as a compatible duplex mode is resolved. |
| 1 | MDIO_IN | R | W | 1 | Returns status of the mdio_in pin. |
| 2 | MAN_DONE | R | W | 1 | The PHY management logic is idle (i.e. has completed). |
| 3 | MAC_FULL_DUPLEX | R | W | 0 | PCS auto-negotiation duplex resolution. Set to one if the resolution function determines that both devices are capable of full duplex operation. If zero half-duplex operation is possible as long as bit 0 (PCS link state) is also one. |
| 4:5 | REMOVED_5_4 | R | W | 0 | Reserved, read as 0, ignored on write. |
| 6 | PFC_NEGOTIATE_PCLK | R | W | 0 | Set when PFC Priority Based Pause has been negotiated. |
| 7 | LPI_INDICATE_PCLK | R | W | 0 | LPI Indication - Low power idle has been detected on receive. This bit is set when LPI is detected and reset when normal idle is detected. An interrupt is generated when the state of this bit changes. |

### 11.3.6 ETH_USER_IO_REGISTER

**Description:** Not presents. Access to the register will return AHB error.
**Address:** 0x4048100C
**Offset:** 0x100C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

|---|---|---|---|---|---|---|---|---|
| Name | RX_BUF_SIZE [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:31] | DMA_ADDR_BUS_WIDTH_1 [30:30] | TX_BD_EXTENDED_MODE_EN [29:29] | RX_BD_EXTENDED_MODE_EN [28:28] | None [27:27] | FORCE_MAX_AMBA_BURST_TX [26:26] | FORCE_MAX_AMBA_BURST_RX [25:25] | FORCE_DISCARD_ON_ERR [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:4 | AMBA_BURST_LENGTH | RW | R | 4 | Selects the burst length to use on the AMBA (AHB/AXI) when transferring frame data. Not used for DMA management operations and only used where space and data size allow and respecting AXI/AHB burst boundary rules. One-hot priority encoding enforced automatically on register writes as follows, where x represents don't care:<br>1xxxx: Attempt to use bursts of up to 16.<br>01xxx: Attempt to use bursts of up to 8.<br>001xx: Attempt to use bursts of up to 4.<br>0001x: Always use SINGLE bursts.<br>00001: Always use SINGLE bursts.<br>00000: Attempt to use bursts of up to 256.<br>Note: MXETH only supports burst length up to 16. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 5 | HDR_DATA_SPLITTING_EN | RW | R | 0 | Enable header data Splitting. When set, receive frames will be forwarded to main memory using a minimum of two DMA data buffers. The first X data buffers will contain the frame header, consisting of the Ethernet,VLAN,(IPv4 or IPv6),(TCP or UDP). X= (frame header size divided by rx_buf_size as defined in bits 23:16 of this register). The last Y data buffers will contain the frame payload. Y= (frame payload size divided by rx_buf_size). Note that for non VLAN/IP/TCP/UDP frames, the header will always be 14 bytes. When this feature is disabled, the frame is forwarded to main memory in blocks of rx_buf_size. Note: For AXI_MASTER_PRESENT=0 i.e. AHB master support, this feature cannot be set. |
| 6 | ENDIAN_SWAP_MANAGEMENT | RW | R | 0 | endian swap mode enable for management descriptor accesses. When set, selects swapped endianism for AMBA (AXI/AHB) transfers. When clear, selects little endian mode. Note, the default value of this bit equals to `gem_endian_swap_def, which is design time configuration. |
| 7 | ENDIAN_SWAP_PACKET | RW | R | 0 | endian swap mode enable for packet data accesses. When set, selects swapped endianism for AMBA (AXI/AHB) transfers. When clear, selects little endian mode. Note, the default value of this bit equals to `gem_endian_swap_def, which is design time configuration. |
| 8:9 | RX_PBUF_SIZE | RW | R | 3 | Receiver packet buffer memory size select. Having these bits at less than 11 reduces the amount of memory used for the receive packet buffer. This reduces the amount of memory used by the GEM. It is important to set these bits both to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 8 Kbytes.<br>11: Use full configured addressable space (8 Kb)<br>10: Do not use top address bit (4 Kb)<br>01: Do not use top two address bits (2 Kb)<br>00: Do not use top three address bits (1 Kb)<br>If the GEM is not configured to use the DMA packet buffer, these bits are not implemented and will be treated as reserved, read as 0, ignored on write. Note. The reset value of this field is equal to the gem_rx_pbuf_size_def define, which is user configurable. |
| 10 | TX_PBUF_SIZE | RW | R | 1 | Transmitter packet buffer memory size select. Having this bit at zero halves the amount of memory used for the transmit packet buffer. This reduces the amount of memory used by the GEM. It is important to set this bit to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 4 Kbytes.<br>1: Use full configured addressable space (4 Kb)<br>0: Do not use top address bit (2 Kb)<br>If the GEM is not configured to use the DMA packet buffer, this bit is not implemented and will be treated as reserved, read as 0, ignored on write. Note. The reset value of this field is equal to the gem_tx_pbuf_size_def define, which is user configurable. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 11 | TX_PBUF_TCP_EN | RW | R | 0 | Transmitter IP, TCP and UDP checksum generation offload enable (not supported when in TX Partial Store and Forward mode). When set, the transmitter checksum generation engine is enabled, to calculate and substitute checksums for transmit frames. When clear, frame data is unaffected. If the GEM is not configured to use the DMA packet buffer, this bit is not implemented and will be treated as reserved, read as 0, ignored on write. |
| 12 | INFINITE_LAST_DBUF_SIZE_EN | RW | R | 0 | Forces the DMA to consider the data buffer pointed to by last descriptor in the descriptor list to be of infinite size. |
| 13 | CRC_ERROR_REPORT | RW | R | 0 | When the bit is set, bit 16 of the receive buffer descriptor will represent FCS/CRC error (only if frames with FCS are copied to memory as enabled by bit 26 in the network config register). When this bit is clear, bit 16 of the receive buffer descriptor will represent the Canonical format indicator (CFI) bit as extracted from the receive frame (if the receive buffer descriptor is pointing to the last data buffer of the receive frame and the received frame was VLAN tagged). |
| 16:23 | RX_BUF_SIZE | RW | R | 24 | DMA receive buffer size in external AMBA (AXI/AHB) system memory. The value defined by these bits determines the size of buffer to use in main system memory when writing received data. The value is defined in multiples of 64 bytes.<br>0x01 corresponds to buffers of 64 bytes<br>0x02 corresponds to 128 bytes etc.<br>For example:<br>0x02: 128 byte.<br>0x18: 1536 byte (1*max length frame/buffer)<br>0xA0: 10240 byte (1*10K jumbo frame/buffer)<br>Note that this value should never be written as zero.<br>Note. The reset value of this field is equal to the gem_rx_buffer_length_def define, which is user configurable. |
| 24 | FORCE_DISCARD_ON_ERR | RW | R | 0 | Auto Discard RX pkts during lack of resource. When set, the GEM DMA will automatically discard receive packets from the receiver packet buffer memory when no AMBA (AXI/AHB) resource is available. When low, then received packets will remain to be stored in the SRAM based packet buffer until AMBA (AXI/AHB) buffer resource next becomes available. A write to this bit is ignored if the DMA is not configured in the packet buffer full store and forward mode. |
| 25 | FORCE_MAX_AMBA_BURST_RX | RW | R | 0 | Force max length bursts on RX. Force the RX DMA to always issue max length bursts on EOP(end of packet) or EOB(end of buffer)transfers, even if there is less than max burst real packet data required to write. Any extra bytes of pad data is set to 0x00. Does not apply on bursts that break 1k boundary rule. |
| 26 | FORCE_MAX_AMBA_BURST_TX | RW | R | 0 | Force max length bursts on TX. Force the TX DMA to always issue max length bursts on EOP(end of packet) or EOB(end of buffer) transfers as defined by bits 4:0 of this register, even when there is less that max burst data bytes to read. Residual data read is ignored. Does not apply on bursts that break 1k boundary rule. |
| 28 | RX_BD_EXTENDED_MODE_EN | RW | R | 0 | Enable RX extended BD mode. See RX BD control register definition for description of feature. |
| 29 | TX_BD_EXTENDED_MODE_EN | RW | R | 0 | Enable TX extended BD mode. See TX BD control register definition for description of feature. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 30 | DMA_ADDR_BUS_WIDTH_1 | RW | R | 0 | DMA address bus width. 0 = 32b, 1 = 64b. MXETH only supports 32b DMA address bus width, so must set it 0. |

### 11.3.8 ETH_TRANSMIT_STATUS

**Description:** This register, when read, provides details of the status of a transmit. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register.
**Address:** 0x40481014
**Offset:** 0x1014
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:9] | | | | | | | RESP_NOT_OK123 [8:8] |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | USED_BIT_READ | RW1C | RW1S | 0 | Used bit read - set when a transmit buffer descriptor is read with its used bit set. Cleared by writing a one to this bit. |
| 1 | COLLISION_OCCURRED | RW1C | RW1S | 0 | Collision occurred - set by the assertion of collision. Cleared by writing a one to this bit. When operating in 10/100 mode, this status indicates either a collision or a late collision. In gigabit mode, this status is not set for a late collision. |
| 2 | RETRY_LIMIT_EXCEEDED | RW1C | RW1S | 0 | Retry limit exceeded - cleared by writing a one to this bit. |
| 3 | TRANSMIT_GO | R | W | 0 | Transmit go - if high transmit is active. When using the exposed FIFO interface, this bit represents bit 3 of the network control register. When using the DMA interface this bit represents the tx_go variable as specified in the transmit buffer description. |
| 4 | AMBA_ERROR123 | RW1C | RW1S | 0 | Transmit frame corruption due to AMBA (AXI/AHB) errors. Set if an error occurs whilst midway through reading transmit frame from external memory including RRESP or BRESP errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and tx_er asserted). Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size. Cleared by writing a one to this bit. |
| 5 | TRANSMIT_COMPLETE123 | RW1C | RW1S | 0 | Transmit complete - set when a frame has been transmitted. Cleared by writing a one to this bit. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 6 | TRANSMIT_UNDER_RUN123 | RW1C | RW1S | 0 | Transmit under run - this bit is set if the transmitter was forced to terminate a frame that it had already began transmitting due to further data being unavailable. This bit is set if a transmitter status write back has not completed when another status write back is attempted. When using the DMA interface configured for packet buffer mode, this bit will never be set. Cleared by writing a 1. |
| 7 | LATE_COLLISION_OCCURRED | RW1C | RW1S | 0 | Late collision occurred - only set if the condition occurs in gigabit mode, as retry is not attempted. Cleared by writing a one to this bit. |
| 8 | RESP_NOT_OK123 | RW1C | RW1S | 0 | bresp/hresp not OK - set when the DMA block sees bresp/hresp not OK. Cleared by writing a one to this bit. |

### 11.3.9 ETH_RECEIVE_Q_PTR

**Description:** This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the network control register. Once reception is enabled, any write to the receive buffer queue base address register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the used bits. In terms of AMBA (AXI) operation, the receive descriptors are read from memory using a single 32bit AXI access. When the datapath is configured at 64bit, the receive descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is written to using a single 64bit AXI access.

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | DMA_RX_DIS_Q | RW | R | 0 | Disable queue if set to 1. This can be used to reduce the number of active queues and should only be changed while receive is not enabled. |
| 2:31 | DMA_RX_Q_PTR | RW | R | 0 | Receive buffer queue base address - written with the address of the start of the receive queue. |

### 11.3.10 ETH_TRANSMIT_Q_PTR

**Description:** This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit, the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access.

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | None [7:4] | | | | RESP_NOT_OK1234 [3:3] | RECEIVE_OVERRUN123 [2:2] | FRAME_RECEIVED [1:1] | BUFFER_NOT_AVAILABLE [0:0] |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | BUFFER_NOT_AVAILABLE | RW1C | RW1S | 0 | Buffer not available - an attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA will reread the pointer each time an end of frame is received until a valid pointer is found. This bit is set following each descriptor read attempt that fails, even if consecutive pointers are unsuccessful and software has in the mean time cleared the status flag. Cleared by writing a one to this bit. |
| 1 | FRAME_RECEIVED | RW1C | RW1S | 0 | Frame received - one or more frames have been received and placed in memory. Cleared by writing a one to this bit. |
| 2 | RECEIVE_OVERRUN123 | RW1C | RW1S | 0 | Receive overrun - this bit is set if either the gem_dma RX FIFO or external RX FIFO were unable to store the receive frame due to a FIFO overflow, or if the receive status, reported by the gem_rx module to the gem_dma was not taken at end of frame. This bit is also set in DMA packet buffer mode if the packet buffer overflows. For DMA operation the buffer will be recovered if an overrun occurs. This bit is cleared by writing a one to it. |
| 3 | RESP_NOT_OK1234 | RW1C | RW1S | 0 | bresp not OK - set when the DMA block sees bresp/hresp not OK. Cleared by writing a one to this bit. |

### 11.3.12 ETH_INT_STATUS

**Description:** If not configured for priority queueing, the GEM generates a single interrupt. This register indicates the source of this interrupt. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the ethernet_int signal will be asserted. For test purposes each bit can be set or reset by writing to the interrupt mask register. The default configuration is shown below whereby all bits are reset to zero on read. Changing the validity of the `gem_irq_read_clear define will instead require a one to be written to the appropriate bit in order to clear it. In this mode reading has no affect on the status of the bit.

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:30] | | TSU_TIMER_COMPARISON_INTERRUPT [29:29] | REMOVED_28 [28:28] | RECEIVE_LPI_INDICATION_STATUS_BIT_CHANGE [27:27] | TSU_SECONDS_REGISTER_INCREMENT [26:26] | PTP_PDELAY_RESP_FRAME_TRANSMITTED [25:25] | PTP_PDELAY_REQ_FRAME_TRANSMITTED [24:24] |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0 | MANAGEMENT_FRAME_SENT | RW1C | RW1S | 0 | Management frame sent - the PHY maintenance register has completed its operation. |
| 1 | RECEIVE_COMPLETE | RW1C | RW1S | 0 | Receive complete - a frame has been stored in memory. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 2 | RX_USED_BIT_READ | RW1C | RW1S | 0 | RX used bit read - set when a receive buffer descriptor is read with its used bit set. |
| 3 | TX_USED_BIT_READ | RW1C | RW1S | 0 | TX used bit read - set when a transmit buffer descriptor is read with its used bit set. |
| 4 | TRANSMIT_UNDER_RUN | RW1C | RW1S | 0 | Transmit under run - this interrupt is set if the transmitter was forced to terminate a frame that it has already began transmitting due to further data being unavailable. If an under run occurs, the transmitter will force bad crc and tx_er high. This interrupt is set if a transmitter status write back has not completed when another status write back is attempted. When using the DMA interface configured for internal FIFO mode, this interrupt is also set when the transmit DMA has written the SOP data into the FIFO and either the AHB bus was not granted in time for further data, or because an AHB/AXI error response was returned by the connected slave, or because a used bit was read. When using the DMA interface configured for packet buffer mode, this bit will never be set. When using the external FIFO interface, this interrupt is also set when the tx_r_underflow input was asserted during a frame transfer. |
| 5 | RETRY_LIMIT_EXCEEDED_OR_LATE_COLLISION | RW1C | RW1S | 0 | Retry limit exceeded or late collision - transmit error. Late collision will only cause this status bit to be set in gigabit mode (as a retry is not attempted). |
| 6 | AMBA_ERROR | RW1C | RW1S | 0 | Transmit frame corruption due to AMBA (AXI/AHB) error. Set if an error occurs whilst midway through reading transmit frame from external system memory, including HRESP (AHB), RRESP or BRESP(AXI) errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and tx_er asserted). Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size. |
| 7 | TRANSMIT_COMPLETE | RW1C | RW1S | 0 | Transmit complete - set when a frame has been transmitted. |
| 9 | REMOVED_9 | R | R | 0 | Write ignore, read 0 |
| 10 | RECEIVE_OVERRUN | RW1C | RW1S | 0 | Receive overrun - set when the receive overrun status bit gets set. |
| 11 | RESP_NOT_OK | RW1C | RW1S | 0 | bresp not OK - set when the DMA block sees bresp not OK. |
| 12 | PAUSE_FRAME_WITH_NON_ZERO_PAUSE_QUANTUM_RECEIVED | RW1C | RW1S | 0 | Pause frame with non-zero pause quantum received - indicates a valid pause has been received that has a non-zero pause quantum field. |
| 13 | PAUSE_TIME_ELAPSED | RW1C | RW1S | 0 | Pause Time elapsed. set when either the pause time register at address 0x38 decrements to zero, or when a valid pause frame is received with a zero pause quantum field. |
| 14 | PAUSE_FRAME_TRANSMITTED | RW1C | RW1S | 0 | Pause frame transmitted - indicates a pause frame has been successfully transmitted after being initiated from the network control register or from the tx_pause control pin. |
| 15 | REMOVED_15 | R | R | 0 | Write ignore, read 0 |
| 16 | REMOVED_16 | R | R | 0 | Write ignore, read 0 |
| 17 | REMOVED_17 | R | R | 0 | Write ignore, read 0 |
| 18 | PTP_DELAY_REQ_FRAME_RECEIVED | RW1C | RW1S | 0 | PTP delay_req frame received indicates a PTP delay_req frame has been received. |
| 19 | PTP_SYNC_FRAME_RECEIVED | RW1C | RW1S | 0 | PTP sync frame received indicates a PTP sync frame has been received. |

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 20 | PTP_DELAY_REQ _FRAME_TRANSMITTED | RW1C | RW1S | 0 | PTP delay_req frame transmitted indicates a PTP delay_req frame has been transmitted. |
| 21 | PTP_SYNC_FRAME _TRANSMITTED | RW1C | RW1S | 0 | PTP sync frame transmitted indicates a PTP sync frame has been transmitted. |
| 22 | PTP_PDELAY_REQ _FRAME_RECEIVED | RW1C | RW1S | 0 | PTP pdelay_req frame received indicates a PTP pdelay_req frame has been received. |
| 23 | PTP_PDELAY_RESP _FRAME_RECEIVED | RW1C | RW1S | 0 | PTP pdelay_resp frame received indicates a PTP pdelay_resp frame has been received. |
| 24 | PTP_PDELAY_REQ _FRAME_TRANSMITTED | RW1C | RW1S | 0 | PTP pdelay_req frame transmitted indicates a PTP pdelay_req frame has been transmitted. |
| 25 | PTP_PDELAY_RESP _FRAME_TRANSMITTED | RW1C | RW1S | 0 | PTP pdelay_resp frame transmitted indicates a PTP pdelay_resp frame has been transmitted. |
| 26 | TSU_SECONDS _REGISTER_INCREMEN T | RW1C | RW1S | 0 | TSU seconds register increment indicates the register has incremented. |
| 27 | RECEIVE_LPI_INDICAT ION_STATUS_BIT _CHANGE | RW1C | RW1S | 0 | Receive LPI indication status bit change |
| 28 | REMOVED_28 | R | R | 0 | Write ignore, read 0 |
| 29 | TSU_TIMER _COMPARISON _INTERRUPT | RW1C | RW1S | 0 | TSU timer comparison interrupt. Indicates when TSU timer count value is equal to programmed value. |

### 11.3.13 ETH_INT_ENABLE

**Description:** At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero.
**Address:** 0x40481028
**Offset:** 0x1028
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

### 11.3.15 ETH_INT_MASK

**Description:** The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register.

**Address:** 0x40481030

**Offset:** 0x1030

**Retention:** Not Retained

**IsDeepSleep:** No

| 24 | PTP_PDELAY_REQ _FRAME_TRANSMITTED _MASK | R | W | 1 | A read of this register returns the value of the PTP pdelay_req frame transmitted mask.<br>0: Interrupt is enabled.<br>1: Interrupt is disabled.<br>A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. |
| 25 | PTP_PDELAY_RESP _FRAME_TRANSMITTED _MASK | R | W | 1 | A read of this register returns the value of the PTP pdelay_resp frame transmitted mask.<br>0: Interrupt is enabled.<br>1: Interrupt is disabled.<br>A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. |
| 26 | TSU_SECONDS _REGISTER_INCREMEN T_MASK | R | W | 1 | A read of this register returns the value of the TSU seconds register increment mask.<br>0: Interrupt is enabled.<br>1: Interrupt is disabled.<br>A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. |
| 27 | RX_LPI_INDICATION_M ASK | R | W | 1 | A read of this register returns the value of the RX LPI indication mask.<br>0: Interrupt is enabled.<br>1: Interrupt is disabled.<br>A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written |
| 28 | UNUSED_28 | R | W | 1 | unused |
| 29 | TSU_TIMER _COMPARISON_MASK | R | W | 1 | Enable TSU timer comparison interrupt mask. |

### 11.3.16 ETH_PHY_MANAGEMENT

**Description:** The PHY maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit-2 is set in the network status register. It takes about 2000 pclk cycles to complete, when MDC is set for pclk divide by 32 in the network configuration register. An interrupt is generated upon completion. During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO. See Section 22.2.4.5 of the IEEE 802.3 standard. Reading during the shift operation will return the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits will be updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced. The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. For a description of MDC generation, see Network Configuration Register.

|---|---|---|---|---|---|
| 0:31 | REMOVED_31_0 | R | R | 0 | Write ignore, read 0 |

### 11.3.25 ETH_INT_MODERATION

**Description:** Used to moderate the number of transmit and receive complete interrupts issued. With interrupt moderation enabled receive and transmit interrupts are not generated immediately a frame is transmitted or received. Instead when a receive or transmit event occurs a timer is started and the interrupt is asserted after it times out. This limits the frequency with which the CPU receives interrupts. When interrupt moderation is enabled interrupt status bit one is always used for receive and bit 7 is always used for transmit even when priority queuing is enabled. With interrupt moderation 800ns periods are counted. GEM determines what constitutes an 800ns period by looking at the tbi (bit 11), gigabit bit (10) and speed (bit 0) bits in the network configuration register and counting tx_clk cycles. Bit 0 needs to be set to 1 for 100M operation.

**Address:** 0x4048105C
**Offset:** 0x105C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**

| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | ADDRESS_TOP | RW | R | 0 | Specific address 1. The most significant bits of the destination/source address that is to be compared, that is bits 47:32. |
| 16 | FILTER_TYPE | RW | R | 0 | This control bit selects whether this filter should be comparing the MAC source address or the MAC destination address of the received Ethernet frame. When set to zero, the filter is a destination address filter. When set to one, the filter is a source address filter. Specific address 1. The most significant bits of the destination address, that is bits 47:32. |

### 11.3.31 ETH_SPEC_ADD2_BOTTOM

**Description:** The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written.
**Address:** 0x40481090
**Offset:** 0x1090
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDRESS_BOTTOM [7:0] | | | | | | | |

| 31 | ENABLE_COPY | RW | R | 0 | Enable copying of type ID match 4 matched frames. |

### 11.3.41 ETH_WOL_REGISTER

**Description:** Wake on LAN Register. Presents in design, but feature is not supported.
**Address:** 0x404810B8
**Offset:** 0x10B8
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:20] | | | | WOL _MASK_3 [19:19] | WOL _MASK_2 [18:18] | WOL _MASK_1 [17:17] | WOL _MASK_0 [16:16] |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | ADDR | RW | R | 0 | Wake on LAN ARP request IP address. Written to define the least significant 16 bits of the target IP address that is matched to generate a Wake on LAN event. A value of zero will not generate an event, even if this is matched by the received frame. |
| 16 | WOL_MASK_0 | RW | R | 0 | Wake on LAN magic packet event enable. When set magic packet events will cause the wol output to be asserted. |
| 17 | WOL_MASK_1 | RW | R | 0 | Wake on LAN ARP request event enable. When set ARP request events will cause the wol output to be asserted. |
| 18 | WOL_MASK_2 | RW | R | 0 | Wake on LAN specific address register 1 event enable. When set specific address 1 events will cause the wol output to be asserted. |
| 19 | WOL_MASK_3 | RW | R | 0 | Wake on LAN multicast hash event enable. When set multicast hash events will cause the wol output to be asserted. |

### 11.3.42 ETH_STRETCH_RATIO

**Description:** IPG stretch register
**Address:** 0x404810BC
**Offset:** 0x10BC
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | IPG_STRETCH [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | IPG_STRETCH [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | IPG_STRETCH | RW | R | 0 | IPG Stretch. Bits 7:0 are multiplied with the previously transmitted frame length (including preamble) bits 15:8 +1 divide the frame length. If the resulting number is greater than 96 and bit 28 is set in the network configuration register then the resulting number is used for the transmit inter-packet-gap. 1 is added to bits 15:8 to prevent a divide by zero. |

### 11.3.43 ETH_STACKED_VLAN

**Description:** Stacked VLAN Register
**Address:** 0x404810C0
**Offset:** 0x10C0
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | MATCH [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | MATCH [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ENABLE_PROCESSING [31:31] | None [30:24] | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | MATCH | RW | R | 0 | User defined VLAN_TYPE field. When Stacked VLAN is enabled, the first VLAN tag in a received frame will only be accepted if the VLAN type field is equal to this user defined VLAN_TYPE OR equal to the standard VLAN type (0x8100). Note that the second VLAN tag of a Stacked VLAN packet will only be matched correctly if its VLAN_TYPE field equals 0x8100. |
| 31 | ENABLE_PROCESSING | RW | R | 0 | Enable stacked VLAN processing mode |

### 11.3.44 ETH_TX_PFC_PAUSE

**Description:** Transmit PFC Pause Register
**Address:** 0x404810C4
**Offset:** 0x10C4
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTOR_ENABLE [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | VECTOR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | VECTOR_ENABLE | RW | R | 0 | Priority Vector Enable. If bit 17 of the network control register is written with a one then the priority enable vector of the PFC priority based pause frame will be set equal to the value stored in this register [7:0]. |
| 8:15 | VECTOR | RW | R | 0 | Priority Vector Pause Size. If bit 17 of the network control register is written with a one then for each entry equal to zero in the Transmit PFC Pause Register[15:8], the PFC pause frame's pause quantum field associated with that entry will be taken from the transmit pause quantum register. For each entry equal to one in the Transmit PFC Pause Register [15:8], the pause quantum associated with that entry will be zero. |

### 11.3.45 ETH_MASK_ADD1_BOTTOM

**Description:** Specific Address Mask 1 Bottom (31 to 0 bits)
**Address:** 0x404810C8
**Offset:** 0x10C8
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDRESS_MASK_BOTTOM [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDRESS_MASK_BOTTOM [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDRESS_MASK_BOTTOM [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | ADDRESS_MASK_BOTTOM [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:31 | ADDRESS_MASK_BOTTOM | RW | R | 0 | Specific Address Mask. Setting a bit to one masks the corresponding bit in the specific address 1 register (31 to 0 bits) |

### 11.3.46 ETH_MASK_ADD1_TOP

|---|---|---|---|---|---|---|---|---|
| Name | MASK_VALUE_DA [31:28] | | | | None [27:24] | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:3 | MASK_ENABLE | RW | R | 0 | Data Buffer Address Mask Enable. These bits are associated directly with bits[31:28].When bit 0 is set, the AXI/AHB address bit 28 used for accessing the receive data buffers will be forced to the value stored in bit 28 of this register. When bit 1 is set, the AXI/AHB address bit 29 used for accessing the receive data buffers will be forced to the value stored in bit 29 of this register. When bit 2 is set, the AXI/AHB address bit 30 used for accessing the receive data buffers will be forced to the value stored in bit 30 of this register. When bit 3 is set, the AXI/AHB address bit 31 used for accessing the receive data buffers will be forced to the value stored in bit 31 of this register. When these bits are clear, the associated value stored in bits 31:28 have no effect on the AXI/AHB address used for receive data buffer accesses. Any changes to this register will be ignored while the DMA is currently processing a receive packet. It will only affect the next full packet to be written to external memory. |
| 28:31 | MASK_VALUE_DA | RW | R | 0 | Data Buffer Address Mask Value. Values used to force bits 31:28 of the receive data buffer AHB address to a particular value when the associated enable bits stored in this register [3:0] are set. Any changes to this register will be ignored while the DMA is currently processing a receive packet. It will only affect the next full packet to be written to external system memory. |

|---|---|---|---|---|---|---|---|---|
| Name | FIX_NUMBER [31:28] | | | | MODULE_IDENTIFICATION_NUMBER [27:24] | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | MODULE_REVISION | R | W | 265 | Module revision - fixed value specific to the revision of the design which is incremented for each non-fix release of the IP. |
| 16:27 | MODULE_IDENTIFICATION_NUMBER | R | W | 7 | Module identification number - for the GEM, this value is fixed. |
| 28:31 | FIX_NUMBER | R | W | 0 | Fix number - incremented for fix releases. |

### 11.3.59 ETH_OCTETS_TXED_BOTTOM

**Description:** Octets Transmitted lower bits (31 to 0 bits)
**Address:** 0x40481100
**Offset:** 0x1100
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:** These registers reset to zero on a read and stick at all ones when they count to their maximum value. They should be read frequently enough to prevent loss of data. In order to reduce overall design area, the statistics registers may be optionally removed in the configuration file if they are deemed unnecessary for a particular design. The receive statistics registers are only incremented when the receive enable bit is set in the network control register. The statistics registers optionally have a snapshot capability which, when exercised, will simultaneously store and clear the current values of all the statistics registers into a snapshot register set in order to allow a consistent set of statistics to be read by the processor. The snapshot is controlled using bit 13 of the network control register. The read snapshot control indicated by bit 14 of the network control register determines whether the processor reads the snapshot registers (logic 1) or the incrementing registers (logic 0). The default GEM configuration does not support the snapshot capability. See Parameterization section under Implementation Application Notes for an explanation of how to enable this function. All the statistics registers are read only. For test purposes they may be written by setting bit 7 (Write Enable) in the network control register. Setting bit 6 (increment statistics) in the network control register causes all the statistics registers to increment by one, again for test purposes. Once a statistics register has been read, it is automatically cleared. When reading the octets transmitted and octets received registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation. The statistics register block contains the following registers. Octets Transmitted [31:0]
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | COUNT16 | RC | W | 0 | Excessive collisions - a 10 bit register counting the number of frames that failed to be transmitted because they experienced 16 collisions. |

### 11.3.76 ETH_LATE_COLLISIONS

**Description:** Late Collisions. Presents in design but not support.
**Address:** 0x40481144
**Offset:** 0x1144
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COUNT17 [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | COUNT17 [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | COUNT17 | RC | W | 0 | Late collisions - a 10 bit register counting the number of late collision occurring after the slot time (512 bits) has expired. In 10/100 mode, late collisions are counted twice i.e. both as a collision and a late collision. In gigabit mode, a late collision causes the transmission to be aborted, thus the single and multi collision registers are not updated. |

### 11.3.77 ETH_DEFERRED_FRAMES

**Description:** Deferred Transmission Frames. Presents in design but not support.
**Address:** 0x40481148
**Offset:** 0x1148
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COUNT18 [7:0] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Name | None [23:18] | | | | | | COUNT18 [17:16] | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:17 | COUNT18 | RC | W | 0 | Deferred transmission frames - an 18 bit register counting the number of frames experiencing deferral due to carrier sense being active on their first attempt at transmission. Frames involved in any collision are not counted nor are frames that experienced a transmit under run. |

### 11.3.78 ETH_CRS_ERRORS

**Description:** Carrier Sense Errors. Presents in design but not support.
**Address:** 0x4048114C
**Offset:** 0x114C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | COUNT19 | RC | W | 0 | Carrier sense errors - a 10 bit register counting the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no under run). Only incremented in half duplex mode. The only effect of a carrier sense error is to increment this register. The behaviour of the other statistics registers is unaffected by the detection of a carrier sense error. |

### 11.3.79 ETH_OCTETS_RXED_BOTTOM

**Description:** Octets Received (31 to 0 bits)
**Address:** 0x40481150
**Offset:** 0x1150
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | COUNT_FCS_ERR | RC | W | 0 | Frame check sequence errors - a 10 bit register counting frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 set in network configuration register, 10,240 bytes if bit 3 is set in the network configuration register). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes. This register is incremented for a frame with bad FCS, regardless of whether it is copied to memory due to ignore FCS mode being enabled in bit 26 of the network configuration register. |

### 11.3.96 ETH_RX_LENGTH_ERRORS

**Description:** Length Field Frame Errors
**Address:** 0x40481194
**Offset:** 0x1194
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COUNT_LENGTH_ERR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | COUNT_LENGTH_ERR [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | COUNT_LENGTH_ERR | RC | W | 0 | Length field frame errors - this 10-bit register counts the number of frames received that have a measured length shorter than that extracted from the length field (bytes 13 and 14). This condition is only counted if the value of the length field is less than 0x0600, the frame is not of excessive length and checking is enabled through bit 16 of the network configuration register. |

### 11.3.97 ETH_RX_SYMBOL_ERRORS

**Description:** Receive Symbol Errors
**Address:** 0x40481198
**Offset:** 0x1198
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COUNT_SYMBOL_ERR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | None [15:10] | | | | | | COUNT_SYMBOL_ERR [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:9 | COUNT_SYMBOL_ERR | RC | W | 0 | Receive symbol errors - a 10-bit register counting the number of frames that had rx_er asserted during reception. For 10/100 mode symbol errors are counted regardless of frame length checks. For gigabit mode the frame must satisfy slot time requirements in order to count a symbol error. Additionally, in gigabit half duplex mode, carrier extension errors are also recorded. Receive symbol errors will also be counted as an FCS or alignment error if the frame is between 64 and 1518 bytes (1536 bytes if bit 8 is set in the network configuration register, 10240 bytes if bit 3 is set in the network configuration register). If the frame is larger it will be recorded as a jabber error. |

### 11.3.98 ETH_ALIGNMENT_ERRORS

**Description:** Alignment Errors
**Address:** 0x4048119C
**Offset:** 0x119C
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | COUNT_ALIGNMENT_ERROR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | COUNT_FLUSHED | RC | W | 0 | Flushed RX packets counter. A 16 bit register counting the number of frames that have been flushed from the receive SRAM based packet buffer due to one of the following reasons .1. When partial store and forward mode is enabled or bit 24 of the DMA configuration register is enabled, a packet is received while there is no AMBA (AXI/AHB) resource. 2. When partial store and forward mode is enabled and an AMBA (AXI/AHB) error is encountered while writing the packet data to external memory. When bit 18 of the network control register(software action to flush a packet from the head of the PBUF queue) is pulsed and the GEM DMA is not currently busy. |

### 11.3.105 ETH_TSU_TIMER_INCR_SUB_NSEC

**Description:** 1588 Timer Increment Register sub nsec
**Address:** 0x404811BC
**Offset:** 0x11BC
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | SUB_NS_INCR [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | SUB_NS_INCR [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | SUB_NS_INCR_LSB [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | SUB_NS_INCR | RW | R | 0 | These are the most significant bits [23:8] of the sub-ns value by which the 1588 timer will be incremented each clock cycle. 24 bits of sub nanosecond precision gives resolution of approximately 5.86E-17 seconds (16 bits gives 15.2 femtoseconds). |
| 24:31 | SUB_NS_INCR_LSB | RW | R | 0 | These are the least significant bits [7:0] of the sub-ns value by which the 1588 timer will be incremented each clock cycle. |

### 11.3.106 ETH_TSU_TIMER_MSB_SEC

**Description:** 1588 Timer Seconds Register (47 to 32 bits)
**Address:** 0x404811C0
**Offset:** 0x11C0
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Name | TIMER_MSB_SEC [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| Name | TIMER_MSB_SEC [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|---|---|---|---|---|---|---|---|---|
| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:15 | TIMER_MSB_SEC | RW | RW | 0 | TSU timer value (s). Most significant 16 bits of seconds timer count. The register is writeable. The 48-bit counter increments by one when the 1588 nanoseconds counter counts to one second. It may also be incremented or decremented when the timer adjust register is written (if decremented from zero the 48-bit combined count would roll back to 0xFFFFFFFFFFFF). Note: The value of this register is used only when the lower 32 bit register is written to. This is to ensure a single update of the 48 bit seconds value |

### 11.3.107 ETH_TSU_STROBE_MSB_SEC

**Description:** 1588 Timer Sync Strobe Seconds Register (47 to 32 bits)
**Address:** 0x404811C4
**Offset:** 0x11C4
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Name | None [31:30] | | TIMER_NSEC [29:24] | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:29 | TIMER_NSEC | RW | RW | 0 | Timer count in nanoseconds. This register is writeable. It can also be adjusted by writes to the 1588 timer adjust register. It increments by the value of the 1588 timer increment register each clock cycle (if this register is close to zero and a write to the timer adjust register causes a decrement the seconds register will be decremented if necessary and the nanoseconds register will roll back to 9999999xx(decimal)). |

### 11.3.112 ETH_TSU_TIMER_ADJUST

**Description:** This register is used to adjust the value of the timer in the TSU. It allows an integral number of nanoseconds to be added or subtracted from the timer in a one-off operation. This register returns all zeroes when read.
**Address:** 0x404811D8
**Offset:** 0x11D8
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
**Default:** 0x0

**Bit-field Table**

| Name | None [31:24] | | | | | | | |

**Bit-fields**

| Bits | Name | SW | HW | Default or Enum | Description |
|---|---|---|---|---|---|
| 0:7 | NS_INCREMENT | RW | R | 0 | A count of nanoseconds by which the 1588 timer nanoseconds register will be incremented each clock cycle. These are the most significant 8 bits of the 32 bit timer_increment counter. The tsu_timer_incr_sub_nsec register holds the least significant 24 bits of the increment. |
| 8:15 | ALT_NS_INCR | RW | R | 0 | Alternative nanoseconds count. Alternative count of nanoseconds by which the 1588 timer nanoseconds register will be incremented each clock cycle. |
| 16:23 | NUM_INCS | RW | R | 0 | Number of incs before alt inc. The number of increments after which the alternative increment is used. |

### 11.3.114 ETH_TSU_PTP_TX_SEC

**Description:** PTP Event Frame Transmitted Seconds Register (31 to 0 bits)
**Address:** 0x404811E0
**Offset:** 0x11E0
**Retention:** Not Retained
**IsDeepSleep:** No
**Comment:**
