Functional Description

The CY62167EV30 is a high-performance CMOS static RAM organized as 1M words by 16 bits or 2M words by 8 bits. This device features an advanced circuit design that provides an ultra low active current. Ultra low active current is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that reduces power consumption by 99 percent when addresses are not toggling. Place the device in standby mode when deselected ($\overline{CE}_1$ HIGH or CE_2 LOW or both $\overline{BHE}$ and $\overline{BLE}$ are HIGH). The input and output pins (I/O_0 through I/O_{15}) are placed in a high-impedance state when: the device is deselected ($\overline{CE}_1$ HIGH or CE_2 LOW), outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or a write operation is in progress ($\overline{CE}_1$ LOW, CE_2 HIGH and $\overline{WE}$ LOW).

To write to the device, take Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Write Enable ($\overline{WE}$) input LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O_0 through I/O_7) is written into the location specified on the address pins (A_0 through A_{19}). If Byte High Enable ($\overline{BHE}$) is LOW, then data from the I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{19}).

To read from the device, take Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins appears on I/O_0 to I/O_7 . If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory appears on I/O_8 to I/O_{15} . See [Truth Table on page 13](#) for a complete description of read and write modes.

Notes

- Ball H6 for the VFBGA package can be used to upgrade to a 32M density.
- NC pins are not connected on the die.
- The **BYTE** pin in the 48-pin TSOP I package has to be tied to V_{CC} to use the device as a 1M × 16 SRAM. The 48-pin TSOP I package can also be used as a 2M × 8 SRAM by tying the **BYTE** signal to V_{SS}. In the 2M × 8 configuration, Pin 45 is A20, while **BHE**, **BLE** and I/O₈ to I/O₁₄ pins are not used.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(typ)}, T_A = 25 °C.
- Refer to PIN#183401 for details of changes.

Notes

6. $V_{IL(min)}$ = -2.0 V for pulse durations less than 20 ns.

7. $V_{IH(max)}$ = $V_{CC} + 0.75 \text{ V}$ for pulse durations less than 20 ns.

8. Full Device AC operation assumes a 100 μs ramp time from 0 to $V_{CC(min)}$ and 200 μs wait time after V_{CC} stabilization.

9. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC(typ)}$, $T_A = 25 \text{ °C}$.

10. Under DC conditions the device meets a V_{IL} of 0.8 V. However, in dynamic conditions Input LOW Voltage applied to the device must not be higher than 0.7 V. This is applicable to TSOP I package only.

11. Refer to PIN#183401 for details of changes.

12. Chip enables ($\overline{CE}_1$ and CE_2), byte enables ($\overline{BHE}$ and $\overline{BLE}$) and $\overline{BYTE}$ must be tied to CMOS levels to meet the $I_{SB1}/I_{SB2}/I_{CCDR}$ spec. Other inputs can be left floating

Notes

21. Test conditions for all parameters other than tristate parameters assume signal transition time of 1 V/ns, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in Figure 3 on page 6.

22. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.

23. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.

24. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE}_1 = V_{IL}$, $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IL} , and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.

25. The minimum pulse width for Write Cycle No. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) should be equal to the sum of t_{SD} and t_{HZWE} .

Figure 5. Read Cycle No. 1 (Address Transition Controlled)^[26, 27]

26. The device is continuously selected. $\overline{\text{OE}}, \overline{\text{CE}}_1 = V_{\text{IL}}, \overline{\text{BHE}}, \overline{\text{BLE}}$ or both = V_{IL} , and $\text{CE}_2 = V_{\text{IH}}$.

27. $\overline{WE}$ is HIGH for read cycle.

28. Address valid before or similar to $\overline{\text{CE}}_1$, $\overline{\text{BHE}}$, $\overline{\text{BLE}}$ transition LOW and CE_2 transition HIGH.

Switching Waveforms (continued)

Figure 7. Write Cycle No. 1 ($\overline{\text{WE}}$ Controlled)^[29, 30, 31]

Notes

29. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}}$, $\overline{\text{CE}}_1 = V_{\text{IL}}$, $\overline{\text{BHE}}$ or $\overline{\text{BLE}}$ or both = V_{IL} , and $\text{CE}_2 = V_{\text{IH}}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
30. Data I/O is high impedance if $\overline{\text{OE}} = V_{\text{IH}}$.
31. If $\overline{\text{CE}}_1$ goes HIGH and CE_2 goes LOW simultaneously with $\overline{\text{WE}} = V_{\text{IH}}$, the output remains in a high impedance state.
32. During this period the I/Os are in output state. Do not apply input signals.

The data input setup and hold timing must refer to the edge of the signal that terminates the write.
34. If $\overline{CE_1}$ goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
35. During this period the I/Os are in output state. Do not apply input signals.
