

CY7C1371KV33

CY7C1371KVE33

CY7C1373KV33

18-Mbit (512K × 36/1M × 18) Flow-Through SRAM with NoBL™ Architecture (With ECC)

Features

- No Bus Latency™ (NoBL™) architecture eliminates dead cycles between write and read cycles
- Supports up to 133 MHz bus operations with zero wait states
 - Data is transferred on every clock
- Pin-compatible and functionally equivalent to ZBT™ devices
- Internally self-timed output buffer control to eliminate the need to use OE
- Registered inputs for flow through operation
- Byte write capability
- 3.3 V/2.5 V I/O power supply (V_{DDQ})
- Fast clock-to-output times
 - 6.5 ns (for 133 MHz device)
- Clock enable ($\overline{CEN}$) pin to enable clock and suspend operation
- Synchronous self-timed writes
- Asynchronous output enable
- Available in JEDEC-standard Pb-free 100-pin TQFP packages
- Three chip enables for simple depth expansion
- Automatic power-down feature available using ZZ mode or CE deselect
- Burst capability – linear or interleaved burst order
- Low standby power
- On chip Error Correction Code (ECC) to reduce Soft Error Rate (SER)

Functional Description

The CY7C1371KV33/CY7C1371KVE33/CY7C1373KV33 are 3.3 V, 512K × 36/1M × 18 synchronous flow through burst SRAM designed specifically to support unlimited true back-to-back read/write operations with no wait state insertion. The CY7C1371KV33/CY7C1371KVE33/CY7C1373KV33 are equipped with the advanced No Bus Latency (NoBL) logic required to enable consecutive read/write operations with data being transferred on every clock cycle. This feature dramatically improves the throughput of data through the SRAM, especially in systems that require frequent write-read transitions.

All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock input is qualified by the clock enable ($\overline{CEN}$) signal, which when deasserted suspends operation and extends the previous clock cycle. Maximum access delay from the clock rise is 6.5 ns (133 MHz device).

Write operations are controlled by the two or four byte write select (BW_X) and a write enable ($\overline{WE}$) input. All writes are conducted with on-chip synchronous self-timed write circuitry.

Three synchronous chip enables ($\overline{CE}_1$, $\overline{CE}_2$, $\overline{CE}_3$) and an asynchronous output enable ($\overline{OE}$) provide for easy bank selection and output tristate control. To avoid bus contention, the output drivers are synchronously tristated during the data portion of a write sequence.

Selection Guide

Description		133 MHz	100 MHz	Unit
Maximum access time		6.5	8.5	ns
Maximum operating current	× 18	129	114	mA
	× 36	149	134	mA

Pin Definitions

Name	I/O	Description
A ₀ , A ₁ , A	Input-synchronous	Address inputs used to select one of the address locations. Sampled at the rising edge of the CLK. A _[1:0] are fed to the two-bit burst counter.
$\overline{BW}_A$, $\overline{BW}_B$, $\overline{BW}_C$, $\overline{BW}_D$	Input-synchronous	Byte write inputs, active LOW. Qualified with $\overline{WE}$ to conduct writes to the SRAM. Sampled on the rising edge of CLK.
$\overline{WE}$	Input-synchronous	Write enable input, active LOW. Sampled on the rising edge of CLK if $\overline{CEN}$ is active LOW. This signal must be asserted LOW to initiate a write sequence.
ADV/ $\overline{LD}$	Input-synchronous	Advance/load input. Used to advance the on-chip address counter or load a new address. When HIGH (and $\overline{CEN}$ is asserted LOW) the internal burst counter is advanced. When LOW, a new address can be loaded into the device for an access. After being deselected, ADV/ $\overline{LD}$ must be driven LOW to load a new address.
CLK	Input-clock	Clock input. Used to capture all synchronous inputs to the device. CLK is qualified with $\overline{CEN}$. CLK is only recognized if $\overline{CEN}$ is active LOW.
$\overline{CE}_1$	Input-synchronous	Chip enable 1 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_2$ and $\overline{CE}_3$ to select/deselect the device.
$\overline{CE}_2$	Input-synchronous	Chip enable 2 input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_3$ to select/deselect the device.
$\overline{CE}_3$	Input-synchronous	Chip enable 3 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_2$ to select/deselect the device.
$\overline{OE}$	Input-asynchronous	Output enable, asynchronous input, active LOW. Combined with the synchronous logic block inside the device to control the direction of the I/O pins. When LOW, the I/O pins are allowed to behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. $\overline{OE}$ is masked during the data portion of a write sequence, during the first clock when emerging from a deselected state, when the device has been deselected.
$\overline{CEN}$	Input-synchronous	Clock enable input, active LOW. When asserted LOW the Clock signal is recognized by the SRAM. When deasserted HIGH the Clock signal is masked. While deasserting $\overline{CEN}$ does not deselect the device, use $\overline{CEN}$ to extend the previous cycle when required.
ZZ	Input-asynchronous	ZZ “sleep” input. This active HIGH input places the device in a non-time critical “sleep” condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down.

Pin Definitions *(continued)*

Name	I/O	Description
DQ _s	I/O-synchronous	Bidirectional data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQ _s and DQP _[A:D] are placed in a tristate condition. The outputs are automatically tristated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of OE.
DQP _x	I/O-synchronous	Bidirectional data parity I/O lines. Functionally, these signals are identical to DQ _s .
MODE	Input strap pin	Mode input. Selects the burst order of the device. When tied to Gnd selects linear burst sequence. When tied to V _{DD} or left floating selects interleaved burst sequence.
V _{DD}	Power supply	Power supply inputs to the core of the device.
V _{DDQ}	I/O power supply	Power supply for the I/O circuitry.
V _{SS}	Ground	Ground for the device.
NC	–	No connects. Not internally connected to the die. NC/(36M, 72M, 144M, 288M, 576M, 1G) are address expansion pins and are not internally connected to the die.

Functional Overview

The CY7C1371KV33/CY7C1371KVE33/CY7C1373KV33 is a synchronous flow through burst SRAM designed specifically to eliminate wait states during write-read transitions. All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock signal is qualified with the clock enable input signal ($\overline{CEN}$). If $\overline{CEN}$ is HIGH, the clock signal is not recognized and all internal states are maintained. All synchronous operations are qualified with $\overline{CEN}$. Maximum access delay from the clock rise (t_{CDV}) is 6.5 ns (133 MHz device).

Accesses can be initiated by asserting all three chip enables ($\overline{CE_1}$, $\overline{CE_2}$, $\overline{CE_3}$) active at the rising edge of the clock. If clock enable ($\overline{CEN}$) is active LOW and $\overline{ADV/LD}$ is asserted LOW, the address presented to the device is latched. The access can either be a read or write operation, depending on the status of the write enable ($\overline{WE}$). $\overline{BW_X}$ can be used to conduct byte write operations.

Write operations are qualified by the write enable ($\overline{WE}$). All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous chip enables ($\overline{CE_1}$, $\overline{CE_2}$, $\overline{CE_3}$) and an asynchronous output enable ($\overline{OE}$) simplify depth expansion. All operations (reads, writes, and deselections) are pipelined. $\overline{ADV/LD}$ must be driven LOW after the device has been deselected to load a new address for the next operation.

Single Read Accesses

A read access is initiated when these conditions are satisfied at clock rise:

- $\overline{CEN}$ is asserted LOW
- $\overline{CE_1}$, $\overline{CE_2}$, and $\overline{CE_3}$ are all asserted active
- The write enable input signal $\overline{WE}$ is deasserted HIGH
- $\overline{ADV/LD}$ is asserted LOW.

The address presented to the address inputs is latched into the address register and presented to the memory array and control logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the output buffers. The data is available within 6.5 ns (133-MHz device) provided $\overline{OE}$ is active LOW. After the first clock of the read access, the output buffers are controlled by $\overline{OE}$ and the internal control logic. $\overline{OE}$ must be driven LOW in order for the device to drive out the requested data. On the subsequent clock, another operation (read/write/deselect) can be initiated. When the SRAM is deselected at clock rise by one of the chip enable signals, its output is tristated immediately.

Burst Read Accesses

The CY7C1371KV33/CY7C1371KVE33/CY7C1373KV33 has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four reads without reasserting the address inputs. $\overline{ADV/LD}$ must be driven LOW to load a new address into the SRAM, as described in the [Single](#)

[Read Accesses](#) section above. The sequence of the burst counter is determined by the MODE input signal. A LOW input on MODE selects a linear burst mode, a HIGH selects an interleaved burst sequence. Both burst counters use A_0 and A_1 in the burst sequence, and wraps around when incremented sufficiently. A HIGH input on $\overline{ADV/LD}$ increments the internal burst counter regardless of the state of chip enable inputs or $\overline{WE}$. $\overline{WE}$ is latched at the beginning of a burst cycle. Therefore, the type of access (read or write) is maintained throughout the burst sequence.

Single Write Accesses

Write access are initiated when the following conditions are satisfied at clock rise: (1) $\overline{CEN}$ is asserted LOW, (2) $\overline{CE_1}$, $\overline{CE_2}$, and $\overline{CE_3}$ are all asserted active, and (3) the write signal $\overline{WE}$ is asserted LOW. The address presented to the address bus is loaded into the address register. The write signals are latched into the control logic block. The data lines are automatically tristated regardless of the state of the $\overline{OE}$ input signal. This allows the external logic to present the data on DQs and DQP_X.

On the next clock rise the data presented to DQs and DQP_X (or a subset for byte write operations, see truth table for details) inputs is latched into the device and the write is complete. Additional accesses (read/write/deselect) can be initiated on this cycle.

The data written during the write operation is controlled by $\overline{BW_X}$ signals. The CY7C1371KV33/CY7C1371KVE33/CY7C1373KV33 provides byte write capability that is described in the truth table. Asserting the write enable input ($\overline{WE}$) with the selected byte write select input selectively writes to only the desired bytes. Bytes not selected during a byte write operation remains unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations. Byte write capability has been included to greatly simplify read/modify/write sequences, which can be reduced to simple byte write operations.

Because the CY7C1371KV33/CY7C1371KVE33/CY7C1373KV33 is a common I/O device, data must not be driven into the device while the outputs are active. The output enable ($\overline{OE}$) can be deasserted HIGH before presenting data to the DQs and DQP_X inputs. Doing so tristates the output drivers. As a safety precaution, DQs and DQP_X are automatically tristated during the data portion of a write cycle, regardless of the state of $\overline{OE}$.

Burst Write Accesses

The CY7C1371KV33/CY7C1371KVE33/CY7C1373KV33 has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four write operations without reasserting the address inputs. $\overline{ADV/LD}$ must be driven LOW to load the initial address, as described in the [Single Write Accesses](#) section above. When $\overline{ADV/LD}$ is driven HIGH on the subsequent clock rise, the chip enables ($\overline{CE_1}$, $\overline{CE_2}$, and $\overline{CE_3}$) and $\overline{WE}$ inputs are ignored and the burst counter is incremented. The correct $\overline{BW_X}$ inputs must be driven in each cycle of the burst write, to write the correct bytes of data.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation “sleep” mode. Two clock cycles are required to enter into or exit from this “sleep” mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the “sleep” mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the “sleep” mode. CE_1 , CE_2 , and CE_3 , must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

Interleaved Burst Address Table

(MODE = Floating or V_{DD})

First Address A1:A0	Second Address A1:A0	Third Address A1:A0	Fourth Address A1:A0

Notes

1. X = "Don't Care." H = Logic HIGH, L = Logic LOW. $\overline{BW}_X = 0$ signifies at least one byte write select is active, $\overline{BW}_X$ = valid signifies that the desired byte write selects are asserted, see truth table for details.
2. Write is defined by $\overline{BW}_X$, and $\overline{WE}$. See Truth Table for read/write.
3. When a write cycle is detected, all I/Os are tristated, even during byte writes.
4. The DQs and DQP_X pins are controlled by the current cycle and the $\overline{OE}$ signal. $\overline{OE}$ is asynchronous and is not sampled with the clock.
5. $\overline{CEN} = H$, inserts wait states.
6. Device powers up deselected and the I/Os in a tristate condition, regardless of $\overline{OE}$.
7. $\overline{OE}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle DQs and DQP_X = tristate when $\overline{OE}$ is inactive or when the device is deselected, and DQs and DQP_X = data when $\overline{OE}$ is active.

Partial Truth Table for Read/Write

The Partial Truth Table for Read/Write for CY7C1371KV33/CY7C1371KVE33 follows. [8, 9, 10]

Function (CY7C1371KV33/CY7C1371KVE33)	$\overline{WE}$	$\overline{BW}_A$	$\overline{BW}_B$	$\overline{BW}_C$	$\overline{BW}_D$
Read	H	X	X	X	X
Write no bytes written	L	H	H	H	H
Write byte A – (DQ _A and DQP _A)	L	L	H	H	H
Write byte B – (DQ _B and DQP _B)	L	H	L	H	H
Write byte C – (DQ _C and DQP _C)	L	H	H	L	H
Write byte D – (DQ _D and DQP _D)	L	H	H	H	L
Write all Bytes	L	L	L	L	L

Partial Truth Table for Read/Write

The Partial Truth Table for Read/Write for CY7C1373KV33 follows. [8, 9, 10]

Function (CY7C1373KV33)	$\overline{WE}$	$\overline{BW}_A$	$\overline{BW}_B$
Read	H	X	X
Write - no bytes written	L	H	H
Write byte A – (DQ _A and DQP _A)	L	L	H
Write byte B – (DQ _B and DQP _B)	L	H	L
Write all bytes	L	L	L

Notes

8. X = "Don't Care." H = Logic HIGH, L = Logic LOW. $\overline{BW}_X = 0$ signifies at least one byte write select is active, $\overline{BW}_X$ = valid signifies that the desired byte write selects are asserted, see [Truth Table on page 11](#) for details.
9. Write is defined by $\overline{BW}_X$ and $\overline{WE}$. See [Truth Table on page 11](#) for read/write.
10. Table only lists a partial listing of the byte write combinations. Any Combination of $\overline{BW}_X$ is valid Appropriate write is based on which byte write is active.

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature -65 °C to +150 °C

Ambient temperature
with power applied -55 °C to +125 °C

Supply voltage on V_{DD} relative to GND -0.5 V to +4.6 V

Supply voltage on V_{DDQ} relative to GND -0.5 V to + V_{DD}

DC voltage applied to outputs
in tristate -0.5 V to $V_{DDQ} + 0.5$ V

DC input voltage -0.5 V to $V_{DD} + 0.5$ V

Current into outputs (LOW) 20 mA

Static discharge voltage
(MIL-STD-883, method 3015) > 2001 V

Latch up current > 200 mA

Operating Range

Range	Ambient Temperature	V_{DD}	V_{DDQ}
Commercial	0 °C to +70 °C	3.3 V – 5% / + 10%	2.5 V – 5% to V_{DD}
Industrial	-40 °C to +85 °C		

Neutron Soft Error Immunity

Parameter	Description	Test Conditions	Typ	Max*	Unit
LSBU (Device without ECC)	Logical Single-Bit Upsets	25 °C	<5	5	FIT/Mb
LSBU (Device with ECC)			0	0.01	FIT/Mb
LMBU	Logical Multi-Bit Upsets	25 °C	0	0.01	FIT/Mb
SEL	Single Event Latch up	85 °C	0	0.1	FIT/Dev

* No LMBU or SEL events occurred during testing; this column represents a statistical χ^2 , 95% confidence limit calculation. For more details refer to Application Note AN54908 "Accelerated Neutron SER Testing and Calculation of Terrestrial Failure Rates".

Electrical Characteristics

Over the Operating Range

Parameter ^[11, 12]	Description	Test Conditions	Min	Max	Unit
V_{DD}	Power Supply Voltage		3.135	3.6	V
V_{DDQ}	I/O Supply Voltage	for 3.3 V I/O	3.135	V_{DD}	V
		for 2.5 V I/O	2.375	2.625	V
V_{OH}	Output HIGH Voltage	for 3.3 V I/O, $I_{OH} = -4.0$ mA	2.4	–	V
		for 2.5 V I/O, $I_{OH} = -1.0$ mA	2.0	–	V
V_{OL}	Output LOW Voltage	for 3.3 V I/O, $I_{OL} = 8.0$ mA	–	0.4	V
		for 2.5 V I/O, $I_{OL} = 1.0$ mA	–	0.4	V

Parameter ^[13, 14]	Description	133 MHz		100 MHz		Unit
		Min	Max	Min	Max	
t _{POWER}	V _{DD} (typical) to the first access ^[15]	1	–	1	–	ms
Clock						
t _{CYC}	Clock cycle time	7.5	–	10	–	ns
t _{CH}	Clock HIGH	2.1	–	2.5	–	ns
t _{CL}	Clock LOW	2.1	–	2.5	–	ns
Output Times						
t _{CDV}	Data output valid after CLK rise	–	6.5	–	8.5	ns
t _{DOH}	Data output hold after CLK rise	2.0	–	2.0	–	ns
t _{CLZ}	Clock to low Z ^[16, 17, 18]	2.0	–	2.0	–	ns
t _{CHZ}	Clock to high Z ^[16, 17, 18]	–	4.0	–	5.0	ns
t _{OE_V}	$\overline{\text{OE}}$ LOW to output valid	–	3.2	–	3.8	ns
t _{OE_{LZ}}	$\overline{\text{OE}}$ LOW to output low Z ^[16, 17, 18]	0	–	0	–	ns
t _{OE_{HZ}}	$\overline{\text{OE}}$ HIGH to output high Z ^[16, 17, 18]	–	4.0	–	5.0	ns
Setup Times						
t _{AS}	Address setup before CLK rise	1.5	–	1.5	–	ns
t _{ALS}	ADV/LD setup before CLK rise	1.5	–	1.5	–	ns
t _{WES}	$\overline{\text{WE}}$, $\overline{\text{BW}}_{\text{X}}$ setup before CLK rise	1.5	–	1.5	–	ns
t _{CENS}	$\overline{\text{CEN}}$ setup before CLK rise	1.5	–	1.5	–	ns
t _{DS}	Data input setup before CLK rise	1.5	–	1.5	–	ns
t _{CES}	Chip enable setup before CLK rise	1.5	–	1.5	–	ns
Hold Times						
t _{AH}	Address hold after CLK rise	0.5	–	0.5	–	ns
t _{ALH}	ADV/LD hold after CLK rise	0.5	–	0.5	–	ns
t _{WEH}	$\overline{\text{WE}}$, $\overline{\text{BW}}_{\text{X}}$ hold after CLK rise	0.5	–	0.5	–	ns
t _{CENH}	$\overline{\text{CEN}}$ hold after CLK rise	0.5	–	0.5	–	ns
t _{DH}	Data input hold after CLK rise	0.5	–	0.5	–	ns
t _{CEH}	Chip enable hold after CLK rise	0.5	–	0.5	–	ns

Notes

13. Timing reference level is 1.5 V when V_{DDQ} = 3.3 V and is 1.25 V when V_{DDQ} = 2.5 V.

14. Test conditions shown in (a) of Figure 3 on page 15 unless otherwise noted.

15. This part has a voltage regulator internally; t_{POWER} is the time that the power needs to be supplied above V_{DD(minimum)} initially, before a read or write operation can be initiated.

16. t_{CHZ}, t_{CLZ}, t_{OE_{LZ}}, and t_{OE_{HZ}} are specified with AC test conditions shown in part (b) of Figure 3 on page 15. Transition is measured ±200 mV from steady-state voltage.

17. At any voltage and temperature, t_{OE_{HZ}} is less than t_{OE_{LZ}} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus.

These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.

18. This parameter is sampled and not 100% tested.

Switching Waveforms

Figure 4. Read/Write Waveforms [19, 20, 21]

Notes

19. For this waveform ZZ is tied LOW.

20. When $\overline{CE}$ is LOW, $\overline{CE}_1$ is LOW, CE_2 is HIGH and $\overline{CE}_3$ is LOW. When $\overline{CE}$ is HIGH, $\overline{CE}_1$ is HIGH or CE_2 is LOW or $\overline{CE}_3$ is HIGH.

21. Order of the burst sequence is determined by the status of the MODE (0 = Linear, 1 = Interleaved). Burst operations are optional.

Switching Waveforms *(continued)*

Figure 5. NOP, STALL AND DESELECT Cycles [22, 23, 24]

Notes

22. For this waveform ZZ is tied LOW.

23. When $\overline{CE}$ is LOW, $\overline{CE}_1$ is LOW, CE_2 is HIGH and $\overline{CE}_3$ is LOW. When $\overline{CE}$ is HIGH, $\overline{CE}_1$ is HIGH or CE_2 is LOW or $\overline{CE}_3$ is HIGH.

24. The IGNORE CLOCK EDGE or STALL cycle (Clock 3) illustrates CEN being used to create a pause. A write is not performed during this cycle.

Switching Waveforms *(continued)*

Figure 6. ZZ Mode Timing [25, 26]

Notes

25. Device must be deselected when entering ZZ mode. See truth table for all possible signal conditions to deselect the device.
 26. DQs are in high Z when exiting ZZ sleep mode.

Acronyms

Acronym	Description
CMOS	Complementary Metal Oxide Semiconductor
$\overline{\text{CE}}$	Chip Enable
$\overline{\text{CEN}}$	Clock Enable
EIA	Electronic Industries Alliance
I/O	Input/Output
JEDEC	Joint Electron Devices Engineering Council
JTAG	Joint Test Action Group
LSB	Least Significant Bit
MSB	Most Significant Bit
NoBL	No Bus Latency
$\overline{\text{OE}}$	Output Enable
SRAM	Static Random Access Memory
TAP	Test Access Port
TCK	Test Clock
TDI	Test Data Input
TMS	Test Mode Select
TDO	Test Data Output
TQFP	Thin Quad Flat Pack
TTL	Transistor-Transistor Logic
$\overline{\text{WE}}$	Write Enable

Document Conventions

Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
MHz	megahertz
μA	microampere
mA	milliampere
mm	millimeter
ms	millisecond
mV	millivolt
nm	nanometer
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
V	volt
W	watt
