Functional Description

The CY621472E30 is a high-performance CMOS static RAM (SRAM) organized as 256K words by 16 bits. This device features advanced circuit design to provide ultra-low active current. It is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device

also has an automatic power-down feature that significantly reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99 percent when deselected ($\overline{CE}_1$ HIGH or CE_2 LOW or both $\overline{BLE}$ and $\overline{BHE}$ are HIGH). The input and output pins (I/O_0 through I/O_{15}) are placed in a high-impedance state when:

- Deselected ($\overline{CE}_1$ HIGH or CE_2 LOW)
- Outputs are disabled ($\overline{OE}$ HIGH)
- Both Byte High Enable and Byte Low Enable are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH)
- Write operation is active ($\overline{CE}_1$ LOW and CE_2 HIGH and $\overline{WE}$ LOW)

To write to the device, take Chip Enable ($\overline{CE}_1$ LOW and CE_2 HIGH) and Write Enable ($\overline{WE}$) inputs LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the I/O pins (I/O_0 through I/O_7) is written into the location specified on the address pins (A_0 through A_{17}). If Byte High Enable ($\overline{BHE}$) is LOW, then data from the I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{17}).

To read from the device, take Chip Enable ($\overline{CE}_1$ LOW and CE_2 HIGH) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins appear on I/O_0 to I/O_7 . If Byte High Enable ($\overline{BHE}$) is LOW, then data from the memory appears on I/O_8 to I/O_{15} . See the [Truth Table on page 11](#) for a complete description of read and write modes.

Notes

14. Test conditions for all parameters other than tristate parameters assume a signal transition time of 3 ns (1 V/ns) or less, timing reference levels of $V_{CC}(typ)/2$, input pulse levels of 0 to $V_{CC}(typ)$, and output loading of the specified I_{OL}/I_{OH} as shown in the [Figure 2 on page 5](#).
15. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
16. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
17. If both byte enables are together, this value is 10 ns.
18. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE} = V_{IL}$, $\overline{BHE}$, $\overline{BLE}$, or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

Notes

19. The device is continuously selected. $\overline{\text{OE}}$, $\overline{\text{CE}}$ = V_{IL} , $\overline{\text{BHE}}$, $\overline{\text{BLE}}$, or both = V_{IL} .

20. $\overline{\text{WE}}$ is HIGH for read cycle.

21. $\overline{\text{CE}}$ refers to the internal logical combination of $\overline{\text{CE}}_1$ and CE_2 such that when $\overline{\text{CE}}_1$ is LOW and CE_2 is HIGH, $\overline{\text{CE}}$ is LOW. For all other cases $\overline{\text{CE}}$ is HIGH.

Notes

23. $\overline{\text{CE}}$ refers to the internal logical combination of $\overline{\text{CE}}_1$ and CE_2 such that when $\overline{\text{CE}}_1$ is LOW and CE_2 is HIGH, $\overline{\text{CE}}$ is LOW. For all other cases $\overline{\text{CE}}$ is HIGH.
24. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}}$, $\overline{\text{CE}} = V_{\text{IL}}$, $\overline{\text{BHE}}$, $\overline{\text{BLE}}$, or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
25. Data I/O is high-impedance if $\overline{\text{OE}} = V_{\text{IH}}$.
26. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}} = V_{\text{IH}}$, the output remains in a high-impedance state.
27. During this period, the I/Os are in output state. Do not apply input signals.

Notes

28. $\overline{CE}$ refers to the internal logical combination of $\overline{CE}_1$ and CE_2 such that when $\overline{CE}_1$ is LOW and CE_2 is HIGH, $\overline{CE}$ is LOW. For all other cases $\overline{CE}$ is HIGH.

29. If $\overline{CE}$ goes HIGH simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high-impedance state.

30. During this period, the I/Os are in output state. Do not apply input signals.
