

User manual for TDA38827 evaluation board

25 A single-phase buck regulator with 1.0 V output

About this document

Scope and purpose

The TDA38827 is a synchronous buck converter, providing a compact, high-performance and flexible solution in a small 6 mm x 5 mm power QFN package.

Key features offered by the IR38827 include internal digital soft-start, precision 0.6 V reference voltage, power good (PGood), thermal protection, programmable switching frequency in the range of 600 kHz to 2 MHz, enable input, input undervoltage lockout (UVLO) for proper start-up, latched off or unlatched overvoltage protection (OVP) and pre-bias start-up.

Output overcurrent protection (OCP) function is implemented by sensing the voltage developed across the on-resistance of the synchronous MOSFET for optimum cost and performance, and the current limit is thermally compensated.

This user manual contains the schematic and bill of materials for the EVAL_38827_1Vout engineering evaluation board. The manual describes operation and use of the evaluation board itself. Detailed application information for TDA38827 is available in the TDA38827 datasheet.

Intended audience

This document is intended as a guide for design engineers evaluating TDA38827 performance with the engineering EVAL_38827_1Vout demo board.

1 Board information

1.1 Board features

$V_{in} = +12\text{ V}$, $V_{out} = +1.0\text{ V}$ at 0 to 25 A

$F_s = 600\text{ kHz}/800\text{ kHz}/1000\text{ kHz}$

$L = 150\text{ nH}$ (9.6 mm x 6.4 mm x 10 mm, DCR = 0.145 mΩ)

$C_{in} = 10 \times 22\text{ }\mu\text{F}$ (25 V, ceramic 0805) + 1 x 330 μF (25 V, electrolytic, optional)

$C_{out} = 10 \times 47\text{ }\mu\text{F}$ (6.3 V, ceramic 0805) + 1 x 470 μF (2 V, 6 mΩ, SP-cap)

1.2 Connections and operating instructions

TDA38827 demo board requires a single +12 V for the input power and can deliver up to 25 A load current. The operation modes and OCP limits can be selected through jumpers.

Table 1 Connections

Label		Descriptions
Input	PV _{in}	Connect input power (+12 V) to this pin
	GND	Return of input power
	PV _{in} , GND	Sense pins for the input voltage
Output	V _{out}	Connect a load (25 A max.) to this pin
	GND	Return of V _{out}
	V _{out} , GND	Sense pins for the output voltage
Enable	ENABLE	Connect a scope probe to this pin to monitor enable signal
	GND	Or, an external enable signal can be applied to this pin to over-drive the onboard enable signal
Bode	A	For bode plot measurement
	B	
SS/Latch	OVP latch	Use a jumper to make one of four soft-start time selections (1 ms, 2 ms, 4 ms and 8 ms), and latched OVP or unlatched OVP
	OVP no latch	
Ton/Mode	FCCM	Use a jumper to select FCCM or DEM, and switching frequency. Four preset switching frequencies are 600 kHz, 800 kHz, 1000 kHz and 1200 kHz. One additional jumper is a placeholder for user-selected switching frequency.
	DEM	
ILIM		Use a jumper to select one of four OCP limits. OCP4 is the highest OCP limit and OCP1 is the lowest OCP limit.
PGood	PGood	Connect a scope probe to this pin to monitor power good signal
	GND	GND
	EPGb	External PGood pull-up bias pin. The PGood pin is pulled up to V _{CC} through R4 on the standard demo board. By removing R4 and populating R42 with 49.9 kΩ, an external PGood pull-up bias can be applied to the EPGb pin.
V _{CC}	V _{CC}	The standard demo board is configured to use the internal LDO. Connect a scope probe to this pin to monitor the output of the internal LDO.
	GND	

1.3 Layout

The PCB is a six-layer board (3.75 in. x 3.0 in.) using FR4 material. The top and bottom layers use 1.5 oz. copper and the inner layers use 2 oz. copper. The PCB thickness is 0.062 in. The TDA38827 and other major power components are mounted on the top side of the board.
