

Please note that GaN Systems is an Infineon Technologies Company

The document following this cover page is marked as “GaN Systems” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

GSWP300W-EVBPA

300W GaN E-HEMT Wireless Power Transfer Evaluation Board, Optimized for Class EF₂ Amplifiers

Technical Manual

Visit www.gansystems.com for the latest version of this user's guide.

**DANGER!**

Electrical Shock Hazard - Hazardous high voltage may be present on the board during the test and even brief contact during operation may result in severe injury or death. Follow all locally approved safety procedures when working around high voltage.

Never leave the board operating unattended. After it is de-energized, always wait until all capacitors are discharged before touching the board.

This board should be handled by qualified personnel ONLY.

PCB surface and devices can become hot. Contact may cause burns. Do not touch!

**CAUTION**

This product contains parts that are susceptible to damage by electrostatic discharge (ESD) or exposure to voltages in excess of the specified voltage. Always follow ESD prevention procedures when handling the product. Avoid applying excessive voltages to the power supply terminals or signal inputs or outputs, always connected to the load during the test on-going.

Introduction to Magnetic Resonant Wireless Power Transfer

Recent technological advances in power semiconductors are enabling Wireless Power Transfer (WPT) as a technically and commercially viable option for charging and powering equipment across a wide range of markets, applications, and power levels.

Inductive charging has been in use for a number of years. However, it's burdened with limitations that restrict it to low power applications with tightly controlled alignment between the transmitter and receiver.

A more advantageous approach, magnetic resonant charging, addresses these shortcomings by using a high frequency oscillating magnetic field to transfer energy. The benefits that magnetic resonant charging offers include variable spacing between the transmitter and receiver, the ability to charge through materials such as a desk or an enclosure, one-to-many charging, ease of installation, suitability for high power levels, and fast charging. Table 1 provides a comparison between inductive charging and magnetic resonant charging.

GaN E-HEMTs are a key enabler of magnetic resonant charging because their extremely fast switching speeds, on the order of a few nanoseconds, result in very low switching losses. This allows them to operate efficiently at very high frequencies, such as the 6.78MHz that is commonly used for magnetic resonant charging.

Table 1 A comparison of Inductive charging and Magnetic Resonant charging

Charging technology	Inductive	Magnetic Resonant
Frequency range	80-300kHz	6.78MHz
Max transfer range	5mm	50mm
Multi-device	No	Yes, at different power levels
Spatial Freedom	Low	High
Power Range	Low & limited 30W max	Broad & versatile 50W to 20kW+
Efficiency	Limited to 80%	High: up to 95%

A high-level block diagram of a resonant wireless power transfer system is shown in Figure 1. The transmit section is composed of a power amplifier, an impedance matching circuit and a transmit coil. High frequency energy is transferred wirelessly at 6.78MHz to the receive circuit which is comprised of a receive coil, an impedance matching circuit and a rectifier.

The GSWP300W-EVBPA evaluation board is designed to support and expedite the innovation of WPT systems by providing the Power Amplifier, the most challenging aspect of the system design.

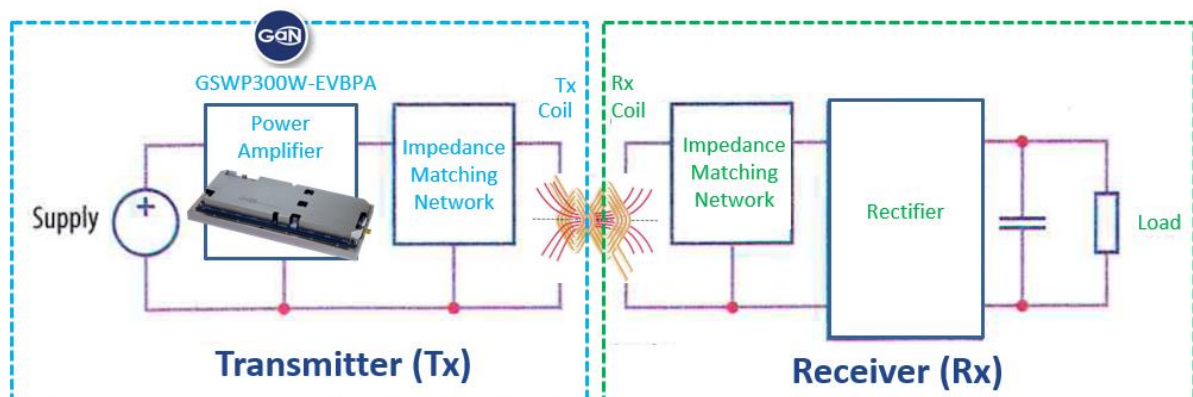

Figure 1 - A magnetic resonant wireless power transfer design.

Evaluation board overview

The GSWP300W-EVBPA uses GaN Systems' GS66508B E-HEMTs in a 6.78MHz Class EF2 power amplifier. The GS66508Bs are used with the integrated high-speed TI LMG1210 gate driver in a push-pull configuration. The outputs of the LMG1210 are capable of providing switching transition speeds in the nano-seconds range for hard switching applications.

This User's Guide includes a circuit description, a quick-start guide and measurement results.

Evaluation Kit Contents and Requirements

Kit Contents

The GSWP300W-EVBPA includes the following hardware for evaluating the GaN E-HEMT 300W power amplifier.

Table 2 GSWP300W-EVBPA Evaluation Kit Contents

Quantity	Description
1	GaN E-HEMT GS66508B WPT PA evaluation board assembly
1	WPT PA heatplate
1	WPT PA EMC shield
2	2 pins DC cord

Hardware Requirements

In order to evaluate the performance of the evaluation board, the following equipment is required:

- DC power supply 100V/15A
- TEK scope with current probe TCM0030A
- Fluke 87 multimeter for input current
- 50dB 500W attenuator as load
- Spectrum analyzer
- Power meter
- Thermal meter

Evaluation Board Assembly Overview

The evaluation board (EVB) is assembled with two GS66508B E-HEMT transistors and two LMG1210 GaN E-HEMT drivers. Headers are included for monitoring the signal input, signal output, power connections and detection monitoring signals. Probe points are included for waveform measurements. Provision has been made for a single, suitable heatsink to be fastened against the two E-HEMTs, using the two holes in the center of the bottom heatplate.

Figure 2 • Top side of GSWP300W-EVBPA Evaluation Board Assembly

Figure 3 • Bottom side of GSWP300W-EVBPA Evaluation Board Assembly, showing copper coins

The block diagram of the evaluation board is provided in Figures 4 through 6.

Note: The coil in Figure 4 is not included in the EVB.

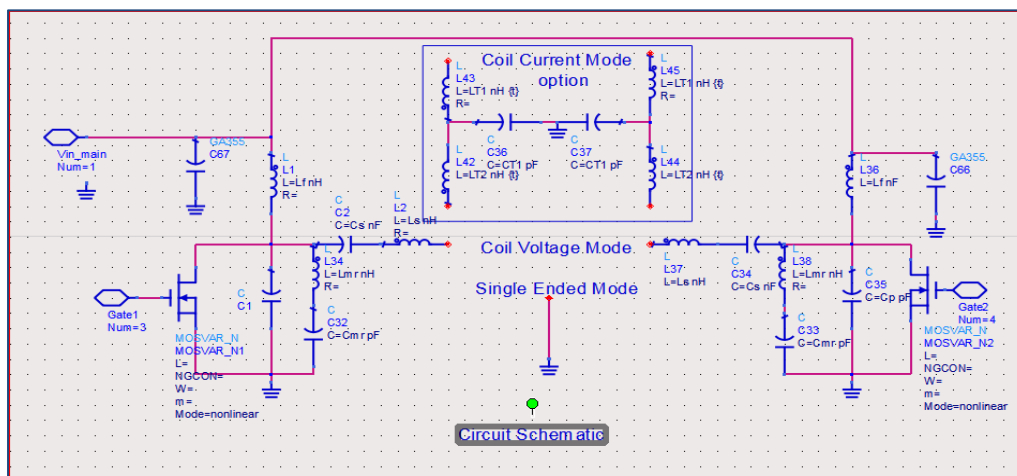

Figure 5 • GSWP300W-EVBPA WPT Class EF2 PA Block Diagram

Note: The switch devices are GaN Systems' GS66508B E-HEMTs

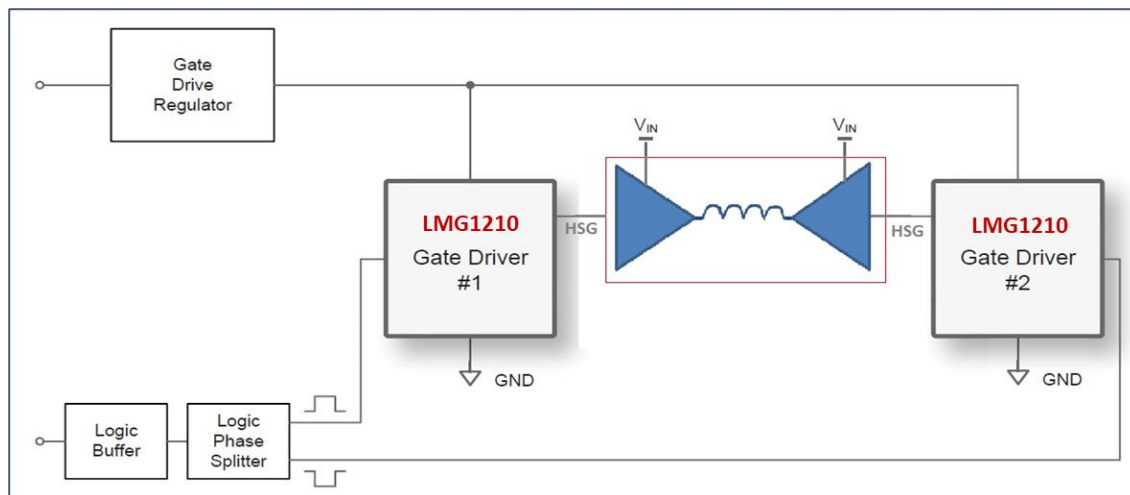

Figure 6 • GSWP300W-EVBPA WPT driver Block Diagram

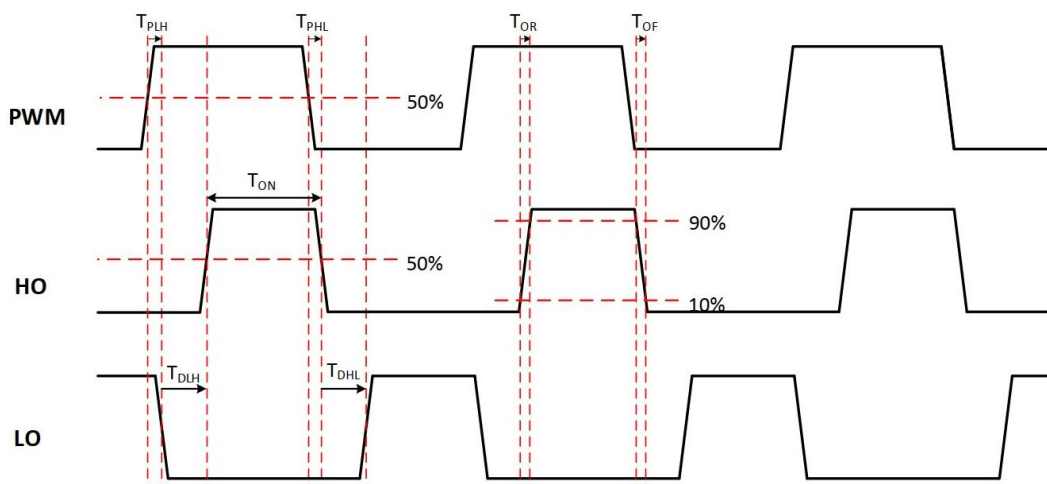

Figure 7 • LMG1210 Dead-time Waveforms and Duty Cycle Setting

LMG1210 drivers in this EVB work in PWM mode. The dead time can be set with a resistor (R_{ext}) placed between DHL/DLH and Vss. Equation 1 is the calculation for the dead time (t_{dt}), t_{dt} in ns and R_{ext} in kohm.

$$R_{ext} = (900 / t_{dt}) - 25 \quad (1)$$

Circuit Description

The Push-Pull circuit is comprised of two single ended PAs which share a common supply, however; the impedance matching and EMI filters are separated.

The high-side E-HEMTs are powered by a DC source, referred to as the HV supply. It is connected through J32 or J28. The voltage of this source should not exceed 100V_{DC}.

The low-voltage logic circuitry runs off a 3.3V_{DC} voltage regulator, U88, which is powered from a +5V_{DC} source connected through JP35 or J28. The +5V_{DC} rail also feeds two LMG1210 drivers U86 and U90, which are driven independently by U87, a common logic D-type flip/flop. U87 has a frequency divider configuration, which is driven by a crystal oscillator Y8 at a frequency of 13.56MHz. The two LMG1210 gate drives are capable of 5.5V operation (The internal LDO is bypassed in this application).

The PA can be configured to operate in a number of different modes, which include:

- Push-pull configuration with an EMI filter
- Single ended mode
- Operation without an EMI filter
- Operation with an external oscillator signal input. Users can run multiple PAs together at the same frequency for high power operation.

Detailed operation procedures and setup for these alternative configurations are provided in the section titled “quick start guide”.

The PA includes an over-temperature protection circuit. Temperature sensor U9, placed close to the GS66508B E-HEMTs, monitors their temperature. In an over-temperature condition, the LMG1210 driver will be disabled through U133 and stop driving the E-HEMTs. The design also includes circuitry to protect against over-current, and load mismatch.

The evaluation board includes an EMI filter, comprised of one low pass filter and one notch filter. The output of PA can be configured, through jumpers, to operate either with or without an EMI filter. The detailed jumper and SMA connector configurations are listed in Table 4

For convenience, test points are provided to monitor and measure the electrical signals. A description of the test points and diagram of their location is provided in Table 5.

The PA also includes a Micro Controller Unit (MCU) monitor interface header, J1. The signals available through J1 can be used to control the PA system for close loop in the WPT system. A definition of the signals available on header J1 is provided in Figure 8.

- Monitor signals on J1.
- Pin1: PA GND
- Pin2: 5V Input
- Pin3: output voltage detection
- Pin4: PA HV DC current
- Pin5: 3.3V DC
- Pin6: over voltage and current
- Pin7: output power detection
- Pin8: Temperature sensor voltage
- Pin9: PA HV DC input
- Pin10: Fan control enable

Figure 8 • MCU interface definition. Signals on J1

The PA connectivity is depicted in Figure 9 and includes the RF input and output, the DC biases and the MCU monitor interface.

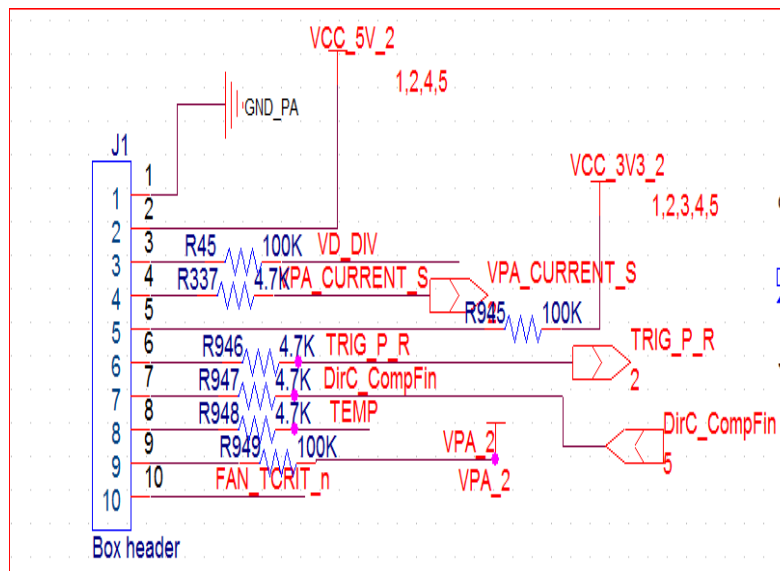

Figure 9 • Circuit Connectivity

Protection Circuit

The PA includes circuitry to protect against input DC overcurrent, device over temperature, output RF overvoltage and Voltage Standing Wave Ratio (VSWR) protection. The protection signals are combined by U133, a 3 inputs NOR gate logic chip, and will shut the driver down under a fault condition.

Input DC overcurrent protection (OCP): U91 is the DC current sensor chip, which can handle a maximum of 10A. The output of the current sensor ship is a current sense signal that goes thru buffer OP U122 and is compared to a reference voltage. The reference voltage is set with R101 and

R177. Upon an over current event, a signal is generated to signal OCP_TRIG.

Overvoltage protection (OVP): The design includes overvoltage protection circuitry for both the high side and the low side. The high side voltage sensor is comprised of C276, C277, and two Schottky diodes; D52 and D44. C276/C277 form a voltage divider, the ratio of which can be changed. Two diodes rectify the RF signal to DC thru C278/C22 and R111 and the resulting voltage represents the high side output. The low side circuit is similar. It's comprised of C279, C280, and two diode D50, D53. These two voltage detection signals go to a two-channel comparator U68 and are combined with OR gate U70 into one overvoltage trigger, OVP_TRIG.

The OVP and OCP go into a hard combine circuit D45, which a dual diode in one. To generate an overcurrent / overvoltage protection trigger signal.

Standing Wave Ratio (SWR) detection: two of coupler, T2, T83, comprise of the board band bidirectional coupler. The reflection signal goes thru D74, C723, C762, it turns into DC signal which goes thru the buffer OP U132 into comparator U131, of which the reference voltage is set by the R890/R892, the trigger point can be set by the reference voltage, which is refer the SWR. The direction of the coupler is around 15dB at 6.78MHz.

Figure 10 • Connectivity locations

Thermal Management

Thermal management of the GaN E-HEMTs in this RF power system is a critical aspect of the

design. Maintaining low device temperatures through proper thermal management enhances the system reliability and extends the range of operating temperature.

The GS66508B are bottom-side cooled devices that use GaNPX® packaging, designed for optimal thermal performance. For effective thermal management, a hole is cut out of the PCB to permit access to the copper coins. The two GS66508Bs' bottom side thermal pads are soldered directly onto the copper coins on the bottom side of the PCB and the Gate, Drain and Source signals are routed on the top side of the PCB. This set up provides an ultra-low thermal impedance from the die to the copper coins.

Figure 11 • Copper coins soldered beneath PCB and devices top PCB

Figure 12 • Aluminum heatplate with housing for two copper coins.

Quick Start Guide

The GSWP300W-EVBPA EVB is designed to as a platform for evaluating the GS66508B E-HEMTs in a Push-Pull Class EF2 PA for WPT. This chapter will guide the user through the evaluation board overview, PA operation, bench setup and test results.

Evaluation Board Overview

Kit Contents

The GSWP300W-EVBPA evaluation kit contains:

- Power Amplifier evaluation board assembly
- PA heatplate
- PA EMC shield
- 4 pins DC cord

Evaluation board specifications

Table 3: EVB specifications:

PARAMETER	SPECS
Input Voltage range	100V _{DC} max
Tx output power	300W
Tx efficiency (peak)	88%
Topology/Class	EF2
Frequency	6.78 MHz
Switching type	Push/Pull
GaN Systems part number	GS66508B
Number of GS devices	2
Optimized RL (load)	30Ω
Constant current mode	optional

The maximum operating specifications of the evaluation board are as follows:

- Maximum HV J32 supply input operating voltage of 100V_{DC}. The 100V_{DC} limit is based on capacitor selection. Operation at a higher power level can be achieved if the capacitors are replaced with ones having a higher voltage rating.

- Maximum LV JP35 supply input operating voltage of 7V_{DC}
- Frequency of operation of 6.78MHz.
- Maximum output power of 300W (default setting, adjustable)

Note: * The maximum output power depends on the input voltage, as shown in Figures 18 and 22

Configurations

The PA can be configured into three different operating options: voltage mode, current mode, and single ended. Table 4 describes how to configure the board using the jumpers provided.

Table 4: Configuration options

Jumper	Option	Jumper on/off
JP51	Internal oscillator (default)	JP51 on / JP52 off
JP52	External oscillator	JP51 off / JP52 on
Voltage mode (without EMI filter)	Voltage mode	JP5/JP43/JP6/JP44 off
Current mode (with EMI filter)	Current mode	JP5/JP43/JP6/JP44 on
Voltage mode output	RF output	JP56
Current mode output	RF output	JP57

Test points

To monitor the performance of PA, test points are provided and as described in Table 5. All test points are available on the top side of the board, none are on the bottom side. The test points locations are silkscreened on the PCB.

Table 5: Test point description

Test point	Description	
TP197	U90 input (LMG1210 driver)	
TP76	U6 input (LMG1210 driver)	
TP8	Q77 Gate voltage	
TP81	Q76 Gate voltage	
TP189	Q77 Drain voltage	
TP82	Q76 Drain voltage	
TP176	60V DC current detection	
TP194	External oscillator monitor	

Evaluation Bench Test Setup

The test bench setup for the GSWP300W-EVBPA EVB is shown in Figure 13. Ensure that the safety precautions mentioned on page 2 are followed.

Figure 13 • Bench setup

A recommended list equipment is provided below. Equipment with equivalent performance specifications can be substituted. In all cases, ensure that it is well calibration.

- DC power supply 100V/15A
- TEK scope with current probe TCM0030A

-
- Fluke 87 multimeter for input current
 - 50dB 500W attenuator as load
 - Spectrum analyzer: RIGOL DSA 815
 - Power meter: GiGa 8542C
 - Thermal meter, sensor is located at screw of copper coin

Note: The WPT test setup is normally a non-50Ω system. If the PA is tested under a non-50Ω system, the measurement results may not correlate with 50Ω system due to the mismatch.

Hardware Operation

The following steps provide a guideline for proper hardware operation and configuration.

- 1) First, set the current limit to 0.3A for the +5V_{DC} supply feeding JP35 or J28.
- 2) Set the current limit to 1A for the HV DC supply feeding J32 or J28 at a voltage of between +20V_{DC} and +50V_{DC}.
- 3) Verify that all DC power supplies are turned off.
- 4) Make sure the load is connected to JP56 or JP57.
- 5) Verify the Class EF2 waveform via test points TP8, TP81 with JP35 +5V_{DC}.
- 6) Connect the V_{DD} power supply to J32 or J28. Apply between +4V to +20V_{DC} to J32. Read the output power at JP56 or JP57.
- 7) Turn on the HV supply to the desired value. Do not exceed the absolute maximum voltage of +100V_{DC} J32, Keep the JP35 +5V_{DC} on.
- 8) To power the evaluation board down, reverse the steps above.

Measurement Technique

When measuring the high frequency content switch node, care must be taken to avoid long ground leads. Measure the switch node by placing the oscilloscope probe tip at JP192 and JP193 (designed for this purpose) or to the closest ground screws. Refer to Figure 14 for the proper probe technique.

Figure 14 • Proper oscilloscope probe measurement technique

PA Performance without EMI filter

Power-on Procedure without EMI filter

- An additional heatsink may be required. The PA heatplate is provided with threaded hole locations that can be used to attach the heatsink to the heatplate with 4-40 screws. To ensure excellent thermal conduction, apply thermal grease to the PA / heatsink interface before screwing the units together. Enough thermal grease should be applied so that a small amount extrudes on all four sides as the screws are tightened. Wipe the assembly clean.
- Make sure jumpers JP5/JP43/JP6/JP44 are off
- Solder the wires with the SMA connector to JP56.
- Connect the load to JP56
- Plug the 5V_{DC} supply into JP35. Pin 1: positive. Pin 2: negative. Turn the supply on and set the DC input voltage to 5V
- Plug the HV supply into J32. Pin 1: positive. Pin 2: negative. Turn the supply on and ramp the voltage from 0V to 20V.
- Monitor the test point voltage by comparing the power meter measurement to GaN Systems' test data which is available in Appendix A.
- If the measurements correlate, increase the HV supply to 60V_{DC}.
- **IMPORTANT:** Ensure the 5V_{DC} supply does not exceed 6V during testing.

Evaluation Results-without EMI filter

The evaluation results for performance without an EMI filter are captured in Figures 15 through 19.

Figure 15 • Oscilloscope Plot Showing Both GS66508B Gate Node Signals at TP8, TP81

For a Class EF2 power amplifier topology, the optimal efficiency is achieved at a duty cycle of approximately 35%. At that operating point, the PA can work under very ZVS wide impedance range with high efficiency. The PA duty cycle is controlled by gate driver LMG1210. For a detailed time-delay design please refer to Figure 8 and Equation 1. The total resistor value of R955/R565 dominates the dead time of U86, and the delay time of U90 is controlled by R953/R592. Both of LMG1210 use the low side path. The high side path also works at the same time while the HO pin is floated.

Typical waveforms at the device's Drain node are shown in Figure 16. Channel 1 is shown in yellow and channel 2 is shown in blue. At 88V_{DC} input voltage, the output power is 300W before the EMI filter.

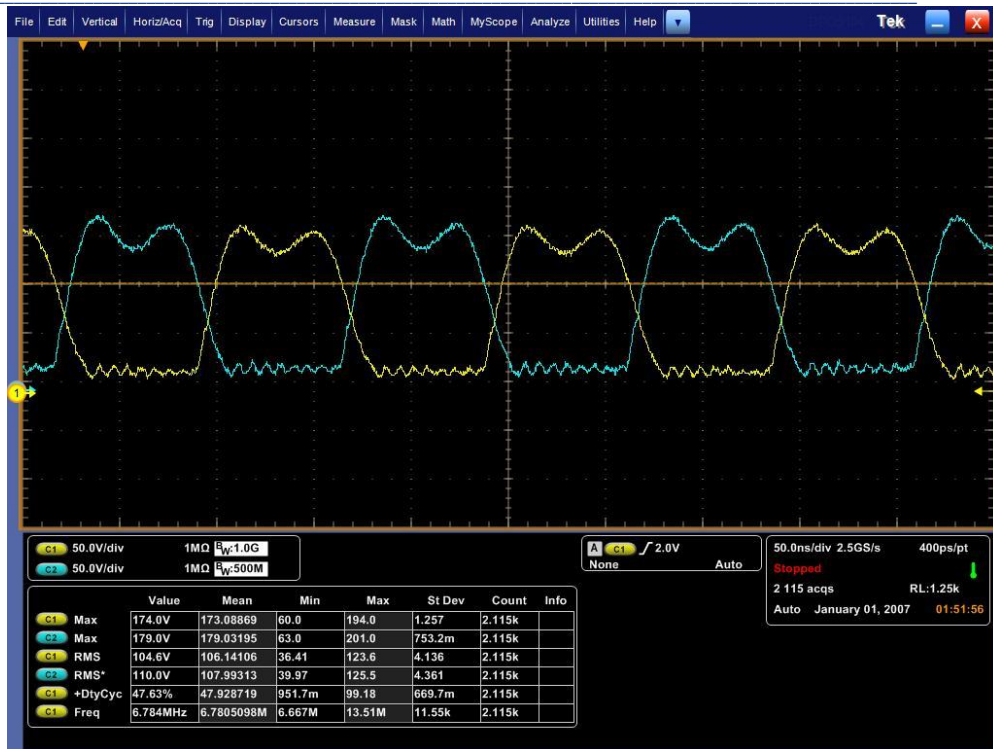

Figure 16 • Oscilloscope Plot Showing Both GS66508B Drain Node Signals, without EMI filter

The ratio of maximum Drain voltage and input DC voltage is 2.03. This operating condition of Class EF2 PA eliminates voltage stress on the transistors.

Switch mode Power Amplifiers have a lot of harmonics at the output. One significant advantage of the Class EF2 topology is that it has a lower 2nd harmonic component comparing to other PA topologies. This advantage results in a Class EF2 PA with much better EMI performance.

Figure 17 shows the spectrum of the PA at 300W output power without an EMI filter. Compared to the fundamental frequency, the 2nd harmonic is -47dBc, the 3rd harmonic is -17dBc, and the 4th harmonic is -49dBc. This extremely low 2nd harmonic performance makes it much easier to filter out the PA's high order harmonic. This allows designers to meet EMI specifications and regulations without additional cost.

The PA's output power and efficiency are shown in Figure 18. This PA delivers 93% efficiency at 70W output power and 27V_{DC} input voltage. This remarkable efficiency performance makes PA the best candidate of the WPT systems, and particularly advantageous for high power applications such as drone, autonomous robot and E-bike charging.

Figure 17 • Spectrum Plot of output terminal JP56 SMA after 51.8dB attenuation at 300W output power. Operation without an EMI filter.

Figure 18 • Output power and efficiency of PA without EMI filter at JP56 SMA
Note: With the EMI filter, the maximum power level is limited to 300W, due to the 50Ω test.

The PA's system reliability is optimized when the temperature rise of each device is kept to a minimum,

including that of the GaN E-HEMTs. The GS66508Bs are especially well suited in this regard, for a number of reasons. First, they have very low switching losses which allows them to operate at high efficiency and a low temperature rise at 6.78MHz, the common frequency used for resonant wireless power transfer. Secondly, the bottom-side cooled GaN[®]PX[®] packaging provides an extremely low thermal impedance for efficient heat transfer to the heatsink, thereby drawing heat out of the device. This GaN based design is able to operate over a wide ambient temperature and with convection cooling, eliminating the need for cooling fans. These advantages support a PA design with excellent thermal performance up to 300W output power.

The temperature plot of the PA design was measured and captured with a SEEK thermal camera and is shown in Figure 19. The hottest devices are the first inductors, with the hottest inductor recording 68°C above ambient. The temperature rise of the GaN E-HEMTs, by comparison, is only 12°C. Because the GaN E-HEMTs run very cool, this allows operation over a very wide temperature range and extends operation to a higher power level while simultaneously simplifying the cooling system design and reducing the cost.

Figure 19 • Thermal measurement of PA without EMI filter at 300W output power

PA Performance with EMI filter

Power-on Procedure with EMI filter

- An additional heatsink may be required. The PA heatplate is provided with threaded hole locations that can be used to attach the heatsink to the heatplate with 4-40 screws. To ensure excellent thermal conduction, apply thermal grease to the PA / heatsink interface before screwing the units together. Enough thermal grease should be applied so that a small amount extrudes on all four sides as the screws are tightened. Wipe the assembly clean.
- Make sure jumpers JP5/JP43/JP6/JP44 are on
- Do not attach a cable or wire to JP56.
- Connect the load to JP57.
- Plug 5V_{DC} supply into JP35. Pin 1: positive. Pin 2: negative. Adjust the voltage to 5V.
- Plug the HV supply into J32. Pin 1: positive. Pin 2: negative. Turn the supply on and ramp the voltage from 0V to 20V
- Monitor the test point voltage by comparing the power meter measurement to GaN Systems' test data which is available in Appendix A.
- If the measurements correlate, increase the HV supply to 60V_{DC}.
- **IMPORTANT:** Ensure the 5V_{DC} supply does not exceed 6V during testing.
- The optimized impedance of the current mode PA is around 30Ω. Using a 50Ω load will not cause damage, however, the system will operate at a lower efficiency.

Evaluation Results-with EMI filter

For improved EMI performance, a filter can be used to reduce the higher order harmonics in each side of the push-pull arm. Also, the addition of an EMI filter converts the PA from operating in voltage mode to current mode, which provides a constant current for the WPT system.

Figure 20 shows the waveforms at the device's Drain nodes. Channel 1 is shown in yellow and channel 2 is shown in blue. At 90V_{DC} input voltage, the output power is 300W after the EMI filter. The ratio of maximum Drain voltage over input DC voltage is 2.84.

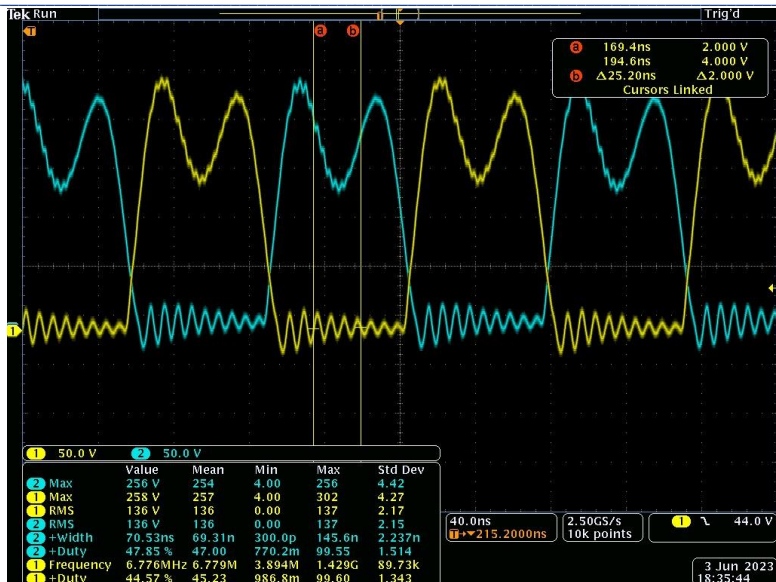

Figure 20 • Oscilloscope Plot Showing Both GS66508B Drain Node Signals, with EMI filter

The frequency spectrum of the PA is depicted in Figure 21. The 3rd harmonic rejection is around -49dBc, with more than -50dBc rejection on high order harmonics. This outstanding performance will greatly help the WPT system level EMI performance.

Figure 21 • Spectrum plot of output terminal JP57 SMA after 51.8dB attenuation at 300W output power.
Operation with EMI filter

The output power and efficiency with an EMI filter are shown in Figure 22. This PA design delivers 88% efficiency at 300W output power and 90V_{DC} input voltage. This efficiency performance is lower than the one of without EMI filter due to the loss id and mismatch loss from the EMI filter. The design of EMI filter

is optimal at 30 Ω , but the data is taken at 50 Ω .

Figure 22 • GSWP300W-EVBPA power (W) and efficiency (%) plotted against input voltage at 50 Ω load

The SEEK thermal camera photo of the PA is depicted in Figure 23. The hottest points of the circuit are the two 2nd harmonics shunt inductors which have a temperature rise of 147°C. The temperature rise of the GaN devices is about 20 °C.

Figure 23 • Thermal measurement of PA with EMI filter at 300W output power

Evaluation Board/kit Important Notice

GaN Systems Inc. (GaN Systems) provides the enclosed product(s) under the following **AS IS** conditions:

This evaluation board/kit being sold or provided by GaN Systems is intended for use for **ENGINEERING DEVELOPMENT, DEMONSTRATION, and OR EVALUATION PURPOSES ONLY** and is not considered by GaN Systems to be a finished end-product fit for general consumer use. As such, the goods being sold or provided are not intended to be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety and environmental measures typically found in end products that incorporate such semiconductor components or circuit boards. This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and therefore may not meet the technical requirements of these directives,

or other related regulations.

If this evaluation board/kit does not meet the specifications indicated in the User's Guide, the board/kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies GaN Systems from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

No License is granted under any patent right or other intellectual property right of GaN Systems whatsoever. **GaN Systems assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

GaN Systems currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

Please read the User's Guide and, specifically, the Warnings and Restrictions notice in the User's Guide prior to handling the product. Persons handling the product(s) must have electronics training and observe good engineering practice standards.

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a GaN Systems' application engineer.
