Where to find previous versions of iMOTION™ tools and firmware

Dear customer,

Thank you for using Infineon products. Infineon continuously improves tools and firmware for iMOTION™ family of motor control ICs. Each new version of tools or firmware brings new features to improve your motor control system performance, ease and accelerate the motor control system development, and enhance user experience. At the same time, new versions also bring in the improvements and fixes of the existing features.

New versions of tools and firmware are released several times a year and Infineon recommends users to always start new designs with the latest version of the tools and firmware. However, for customers already in the design or production stage, it is not mandatory to switch to the new version. In this case, Infineon advises our customers to read and analyze the release notes of the new version and assess if in their particular case they can benefit from the new features or fixes included in the new release, or the version they are currently using is meeting all their system requirements.

For of all our customers which already started the development, or which are already in production with previous versions of iMOTION™ tools and firmware, and do not plan to switch to the newer version, all supported versions of the iMOTION™ tools and firmware will continue to be available for download on our websites. Here is the instruction on where to find these files.

1. iMOTION™ development tools: MCEWizard and MCEDesigner

All previously released and still supported versions of the MCEWizard and MCEDesigner can be found in folder:

www.infineon.com/imotion-software > Additional Product Information

2. iMOTION™ firmware packages

All previously released and still supported versions of the firmware packages for specific iMOTION™ ICs can be found on the specific device's web page under:

Tools & Software > Firmware
