

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. No computing device can be absolutely secure. Therefore, despite security measures implemented in Cypress hardware or software products, Cypress shall have no liability arising out of any security breach, such as unauthorized access to or use of a Cypress product. CYPRESS DOES NOT REPRESENT, WARRANT, OR GUARANTEE THAT CYPRESS PRODUCTS, OR SYSTEMS CREATED USING CYPRESS PRODUCTS, WILL BE FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (collectively, "Security Breach"). Cypress disclaims any liability relating to any Security Breach, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any Security Breach. In addition, the products described in these materials may contain design defects or errors known as errata which may cause the product to deviate from published specifications. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. "High-Risk Device" means any device or system whose failure could cause personal injury, death, or property damage. Examples of High-Risk Devices are weapons, nuclear installations, surgical implants, and other medical devices. "Critical Component" means any component of a High-Risk Device whose failure to perform can be reasonably expected to cause, directly or indirectly, the failure of the High-Risk Device, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any use of a Cypress product as a Critical Component in a High-Risk Device. You shall indemnify and hold Cypress, its directors, officers, employees, agents, affiliates, distributors, and assigns harmless from and against all claims, costs, damages, and expenses, arising out of any claim, including claims for product liability, personal injury or death, or property damage arising from any use of a Cypress product as a Critical Component in a High-Risk Device. Cypress products are not intended or authorized for use as a Critical Component in any High-Risk Device except to the limited extent that (i) Cypress's published data sheet for the product explicitly states Cypress has qualified the product for use in a specific High-Risk Device, or (ii) Cypress has given you advance written authorization to use the product as a Critical Component in the specific High-Risk Device and you have signed a separate indemnification agreement.

Cypress, the Cypress logo, Spansion, the Spansion logo, and combinations thereof, WICED, PSoC, CapSense, EZ-USB, F-RAM, and Traveo are trademarks or registered trademarks of Cypress in the United States and other countries. For a more complete list of Cypress trademarks, visit [cypress.com](http://cypress.com). Other names and brands may be claimed as property of their respective owners.

| 30. Inter IC Sound (I2S) Registers .....             | 1569        |
| <b>Section J: System Registers</b>                   | <b>1599</b> |

# Register Mapping

The Register Mapping section discusses the registers and lists all the registers in mapping tables, in address order for PSoC® 6 MCUs. For Architecture details, see the [PSoC 6 MCU: CY8C62x6, CY8C62x7 Architecture Technical Reference Manual \(TRM\)](#).

Note that memory mapped I/O (MMIO) registers support only 32-bit access, unless otherwise specified in the register description.

## Register General Conventions

The register conventions specific to this section and the Register Reference chapter are listed in this table.

| Convention                        | Description             | Explanation                                                                                                                                                                                                                                       |
|-----------------------------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RW                                | Read/Write              | These bits can be both read and written.                                                                                                                                                                                                          |
| R                                 | Read only               | These bits can only be read. Writing has no effect on the bit value.                                                                                                                                                                              |
| W                                 | Write only              | These bits can only be written. Reading the bit returns the reset value.                                                                                                                                                                          |
| RW1C                              | Read/Write '1' to clear | These bits can be read as well as cleared by writing '1'. Writing '0' has no effect on the bit value.                                                                                                                                             |
| RW0C                              | Read/Write '0' to clear | These bits can be read as well as cleared by writing '0'. Writing '1' has no effect on the bit value.                                                                                                                                             |
| RW1S                              | Read/Write '1' to set   | These bits can be read as well as set by writing '1'. Writing '0' has no effect on the bit value.                                                                                                                                                 |
| A                                 | Alias                   | This register is an additional alias for another register. This convention is used when a physical register is mapped to multiple addresses, typically for firmware debug purposes. See the corresponding register descriptions for more details. |
| None / Reserved                   | Reserved bits           | Keep these bits at the default value                                                                                                                                                                                                              |
| 'x' in a register /bit field name | Multiple instances      | Multiple instances/address ranges of the same register/bit field                                                                                                                                                                                  |

## Acronyms

This table lists the acronyms used in this document

Table 3-1. Acronyms

| Symbol | Unit of Measure                                                                                 |
|--------|-------------------------------------------------------------------------------------------------|
| ABUS   | analog output bus                                                                               |
| AC     | alternating current                                                                             |
| ADC    | analog-to-digital converter                                                                     |
| AHB    | AMBA (advanced microcontroller bus architecture) high-performance bus, an ARM data transfer bus |
| API    | application programming interface                                                               |
| APOR   | analog power-on reset                                                                           |
| BC     | broadcast clock                                                                                 |
| BOM    | bill of materials                                                                               |
| BR     | bit rate                                                                                        |
| BRA    | bus request acknowledge                                                                         |
| BRQ    | bus request                                                                                     |

| XRES   | external reset                              |
| XRES_N | external reset, active low                  |

# Section A: Supervisory Flash Registers

This section encompasses the following chapter:

- [Supervisory Flash Registers chapter on page 10](#)

# 1 Supervisory Flash Registers

This section discusses the Supervisory Flash registers. It lists all the registers in mapping tables, in address order.

## 1.1 Register Details

| Register                                   | Address    | Description                                  |
|--------------------------------------------|------------|----------------------------------------------|
| <a href="#">SFLASH_SI_REVISION_ID</a>      | 0x16000001 | Indicates Silicon Revision ID of the device  |
| <a href="#">SFLASH_SILICON_ID</a>          | 0x16000002 | Indicates Silicon ID of the device           |
| <a href="#">SFLASH_FAMILY_ID</a>           | 0x1600000C | Indicates Family ID of the device            |
| <a href="#">SFLASH_SAR_TEMP_MULTIPLIER</a> | 0x16000648 | SAR Temperature Sensor Multiplication Factor |
| <a href="#">SFLASH_SAR_TEMP_OFFSET</a>     | 0x1600064A | SAR Temperature Sensor Offset                |

## 1.1.1 SFLASH\_SI\_REVISION\_ID

Indicates Silicon Revision ID of the device

Address: 0x16000001

Retention: Retained

| Bits      | 7                    | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------------------|---|---|---|---|---|---|---|
| SW Access | RW                   |   |   |   |   |   |   |   |
| HW Access |                      |   |   |   |   |   |   |   |
| Name      | SI_REVISION_ID [7:0] |   |   |   |   |   |   |   |

| Bits  | Name           | Description                             |
|-------|----------------|-----------------------------------------|
| 7 : 0 | SI_REVISION_ID | Silicon Revision ID<br>Default Value: X |

## 1.1.2 SFLASH\_SILICON\_ID

Indicates Silicon ID of the device

Address: 0x16000002

Retention: Retained

| Bits      | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---|---|---|---|---|---|---|
| SW Access | RW       |   |   |   |   |   |   |   |
| HW Access |          |   |   |   |   |   |   |   |
| Name      | ID [7:0] |   |   |   |   |   |   |   |

  

| Bits      | 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------|----|----|----|----|----|---|---|
| SW Access | RW        |    |    |    |    |    |   |   |
| HW Access |           |    |    |    |    |    |   |   |
| Name      | ID [15:8] |    |    |    |    |    |   |   |

| Bits   | Name | Description                    |
|--------|------|--------------------------------|
| 15 : 0 | ID   | Silicon ID<br>Default Value: X |

### 1.1.3 SFLASH\_FAMILY\_ID

Indicates Family ID of the device

Address: 0x1600000C

Retention: Retained

| Bits      | 7               | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-----------------|---|---|---|---|---|---|---|
| SW Access | RW              |   |   |   |   |   |   |   |
| HW Access |                 |   |   |   |   |   |   |   |
| Name      | FAMILY_ID [7:0] |   |   |   |   |   |   |   |

  

| Bits      | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|------------------|----|----|----|----|----|---|---|
| SW Access | RW               |    |    |    |    |    |   |   |
| HW Access |                  |    |    |    |    |    |   |   |
| Name      | FAMILY_ID [15:8] |    |    |    |    |    |   |   |

| Bits   | Name      | Description                   |
|--------|-----------|-------------------------------|
| 15 : 0 | FAMILY_ID | Family ID<br>Default Value: X |

## 1.1.4 SFLASH\_SAR\_TEMP\_MULTIPLIER

SAR Temperature Sensor Multiplication Factor

Address: 0x16000648

Retention: Retained

| Bits      | 7                     | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-----------------------|---|---|---|---|---|---|---|
| SW Access | RW                    |   |   |   |   |   |   |   |
| HW Access |                       |   |   |   |   |   |   |   |
| Name      | TEMP_MULTIPLIER [7:0] |   |   |   |   |   |   |   |

  

| Bits      | 15                     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|------------------------|----|----|----|----|----|---|---|
| SW Access | RW                     |    |    |    |    |    |   |   |
| HW Access |                        |    |    |    |    |    |   |   |
| Name      | TEMP_MULTIPLIER [15:8] |    |    |    |    |    |   |   |

| Bits   | Name            | Description                                                     |
|--------|-----------------|-----------------------------------------------------------------|
| 15 : 0 | TEMP_MULTIPLIER | Multiplier value for SAR temperature sensor<br>Default Value: X |

## 1.1.5 SFLASH\_SAR\_TEMP\_OFFSET

SAR Temperature Sensor Offset

Address: 0x1600064A

Retention: Retained

| Bits      | 7                 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------------|---|---|---|---|---|---|---|
| SW Access | RW                |   |   |   |   |   |   |   |
| HW Access |                   |   |   |   |   |   |   |   |
| Name      | TEMP_OFFSET [7:0] |   |   |   |   |   |   |   |

  

| Bits      | 15                 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|--------------------|----|----|----|----|----|---|---|
| SW Access | RW                 |    |    |    |    |    |   |   |
| HW Access |                    |    |    |    |    |    |   |   |
| Name      | TEMP_OFFSET [15:8] |    |    |    |    |    |   |   |

| Bits   | Name        | Description                                                 |
|--------|-------------|-------------------------------------------------------------|
| 15 : 0 | TEMP_OFFSET | Offset value for SAR temperature sensor<br>Default Value: X |

## Section B: Peripheral Group 0

This section encompasses the following chapters:

- [Peripheral Registers chapter on page 17](#)

## 2 Peripheral Registers

This section discusses the Peripheral registers. It lists all the registers in mapping tables, in address order.

### 2.1 Register Details

| Register                              | Address    | Description                                                                                                    |
|---------------------------------------|------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">PERI_GR0_SL_CTL</a>       | 0x40010020 | Slave control                                                                                                  |
| <a href="#">PERI_GR1_SL_CTL</a>       | 0x40010060 | Slave control                                                                                                  |
| <a href="#">PERI_GR1_TIMEOUT_CTL</a>  | 0x40010064 | Timeout control                                                                                                |
| <a href="#">PERI_GR2_SL_CTL</a>       | 0x400100A0 | Slave control                                                                                                  |
| <a href="#">PERI_GR2_TIMEOUT_CTL</a>  | 0x400100A4 | Timeout control. See <a href="#">PERI_GR1_TIMEOUT_CTL</a> for the details of bit fields.                       |
| <a href="#">PERI_GR3_CLOCK_CTL</a>    | 0x400100C0 | Clock control                                                                                                  |
| <a href="#">PERI_GR3_SL_CTL</a>       | 0x400100E0 | Slave control                                                                                                  |
| <a href="#">PERI_GR3_TIMEOUT_CTL</a>  | 0x400100E4 | Timeout control. See <a href="#">PERI_GR1_TIMEOUT_CTL</a> for the details of bit fields.                       |
| <a href="#">PERI_GR4_CLOCK_CTL</a>    | 0x40010100 | Clock control. See <a href="#">PERI_GR3_CLOCK_CTL</a> for the details of bit fields.                           |
| <a href="#">PERI_GR4_SL_CTL</a>       | 0x40010120 | Slave control                                                                                                  |
| <a href="#">PERI_GR4_TIMEOUT_CTL</a>  | 0x40010124 | Timeout control. See <a href="#">PERI_GR1_TIMEOUT_CTL</a> for the details of bit fields.                       |
| <a href="#">PERI_GR6_CLOCK_CTL</a>    | 0x40010180 | Clock control. See <a href="#">PERI_GR3_CLOCK_CTL</a> for the details of bit fields.                           |
| <a href="#">PERI_GR6_SL_CTL</a>       | 0x400101A0 | Slave control                                                                                                  |
| <a href="#">PERI_GR6_TIMEOUT_CTL</a>  | 0x400101A4 | Timeout control. See <a href="#">PERI_GR1_TIMEOUT_CTL</a> for the details of bit fields.                       |
| <a href="#">PERI_GR9_CLOCK_CTL</a>    | 0x40010240 | Clock control. See <a href="#">PERI_GR3_CLOCK_CTL</a> for the details of bit fields.                           |
| <a href="#">PERI_GR9_SL_CTL</a>       | 0x40010260 | Slave control. See <a href="#">PERI_GR1_SL_CTL</a> for the details of bit fields.                              |
| <a href="#">PERI_GR9_TIMEOUT_CTL</a>  | 0x40010264 | Timeout control. See <a href="#">PERI_GR1_TIMEOUT_CTL</a> for the details of bit fields.                       |
| <a href="#">PERI_GR10_CLOCK_CTL</a>   | 0x40010280 | Clock control. See <a href="#">PERI_GR3_CLOCK_CTL</a> for the details of bit fields.                           |
| <a href="#">PERI_GR10_SL_CTL</a>      | 0x400102A0 | Slave control                                                                                                  |

|------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31   | ENABLE | <p>Clock divider enable command (mutually exclusive with DISABLE). Typically, SW sets this field to '1' to enable a divider and HW sets this field to '0' to indicate that divider enabling has completed. When a divider is enabled, its integer and fractional (if present) counters are initialized to "0". If a divider is to be re-enabled using different integer and fractional divider values, the SW should follow these steps:</p> <ul style="list-style-type: none"> <li>0: Disable the divider using the DIV_CMD.DISABLE field.</li> <li>1: Configure the divider's DIV_XXX_CTL register.</li> <li>2: Enable the divider using the DIV_CMD_ENABLE field.</li> </ul> <p>The DIV_SEL and TYPE_SEL fields specify which divider is to be enabled. The enabled divider may be phase aligned to either "clk_peri" (typical usage) or to ANY enabled divider.</p> <p>The PA_DIV_SEL and PA_TYPE_SEL fields specify the reference divider.</p> <p>The HW sets the ENABLE field to '0' when the enabling is performed and the HW set the DIV_XXX_CTL.EN field of the divider to '1' when the enabling is performed. Note that enabling with phase alignment to a low frequency divider takes time. E.g. To align to a divider that generates a clock of "clk_peri"/n (with n being the integer divider value INT_DIV+1), up to n cycles may be required to perform alignment. Phase alignment to "clk_peri" takes affect immediately. SW can set this field to '0' during phase alignment to abort the enabling process.</p> <p>Default Value: 0</p> |

## 2.1.9 PERI\_DIV\_CMD (continued)

|         |             |                                                                                                                                                                                                                                                                                                                                                                                             |
|---------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 30      | DISABLE     | <p>Clock divider disable command (mutually exclusive with ENABLE). SW sets this field to '1' and HW sets this field to '0'.</p> <p>The DIV_SEL and TYPE_SEL fields specify which divider is to be disabled.</p> <p>The HW sets the DISABLE field to '0' immediately and the HW sets the DIV_XXX_CTL.EN field of the divider to '0' immediately.<br/>Default Value: 0</p>                    |
| 15 : 14 | PA_TYPE_SEL | <p>Specifies the divider type of the divider to which phase alignment is performed for the clock enable command:</p> <p>0: 8.0 (integer) clock dividers.<br/>1: 16.0 (integer) clock dividers.<br/>2: 16.5 (fractional) clock dividers.<br/>3: 24.5 (fractional) clock dividers.<br/>Default Value: 3</p>                                                                                   |
| 13 : 8  | PA_DIV_SEL  | <p>(PA_TYPE_SEL, PA_DIV_SEL) specifies the divider to which phase alignment is performed for the clock enable command. Any enabled divider can be used as reference. This allows all dividers to be aligned with each other, even when they are enabled at different times.</p> <p>If PA_DIV_SEL is "63" and PA_TYPE_SEL is "3", "clk_peri" is used as reference.<br/>Default Value: 63</p> |
| 7 : 6   | TYPE_SEL    | <p>Specifies the divider type of the divider on which the command is performed:</p> <p>0: 8.0 (integer) clock dividers.<br/>1: 16.0 (integer) clock dividers.<br/>2: 16.5 (fractional) clock dividers.<br/>3: 24.5 (fractional) clock dividers.<br/>Default Value: 3</p>                                                                                                                    |
| 5 : 0   | DIV_SEL     | <p>(TYPE_SEL, DIV_SEL) specifies the divider on which the command (DISABLE/ENABLE) is performed.</p> <p>If DIV_SEL is "63" and TYPE_SEL is "3" (default/reset value), no divider is specified and no clock signal(s) are generated.<br/>Default Value: 63</p>                                                                                                                               |

## 2.1.10 PERI\_DIV\_8\_CTL0

Divider control register (for 8.0 divider)

Address: 0x40010800

| Bits    | Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31      | ACTIVATE | SW sets this field to '1' by to activate (set to '1') a trigger as identified by TR_SEL and OUT_SEL for COUNT cycles. HW sets this field to '0' when the cycle counter is decremented to "0". Note: a COUNT value of 255 is a special case and trigger activation is under direct control of the ACTIVATE field (the counter is not decremented).<br>Default Value: 0                                                                                                                                                                                                                                                                   |
| 30      | OUT_SEL  | Specifies whether trigger activation is for a specific input or output trigger of the trigger multiplexer. Activation of a specific input trigger, will result in activation of all output triggers that have the specific input trigger selected through their TR_OUT_CTL.TR_SEL field. Activation of a specific output trigger, will result in activation of the specified TR_SEL output trigger only.<br>'0': TR_SEL selection and trigger activation is for an input trigger to the trigger multiplexer.<br>'1': TR_SEL selection and trigger activation is for an output trigger from the trigger multiplexer.<br>Default Value: 0 |
| 23 : 16 | COUNT    | Amount of "clk_peri" cycles a specific trigger is activated. During activation (ACTIVATE is '1'), HW decrements this field to "0" using a cycle counter. During activation, SW should not modify this register field. A value of 255 is a special case: HW does NOT decrement this field to "0" and trigger activation is under direct control of ACTIVATE when ACTIVATE is '1' the trigger is activated and when ACTIVATE is '0' the trigger is deactivated.<br>Default Value: 0                                                                                                                                                       |

|--------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 8 | ADDR24 | <p>This field specifies the most significant bits of the 32-bit address of an address region. The region size is defined by PPU_REGION_ATT.REGION_SIZE. A region of n Byte is always n Byte aligned. As a result, some of the lesser significant address bits of ADDR24 may be ignored in determining whether a bus transfer address is within an address region. E.g., a 64 KByte address region (REGION_SIZE is "15") is 64 KByte aligned, and ADDR24[7:0] are ignored.</p> <p>Default Value: Undefined</p> |

## 2.1.25 PERI\_PPU\_PR0\_ADDR0 (continued)

|       |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# Section C: Peripheral Group 1

This section encompasses the following chapters:

- [Cryptography Registers chapter on page 266](#)

## 3 Cryptography Registers

This section discusses the Cryptography Registers (CRYPTO) registers. It lists all the registers in mapping tables, in address order.

### 3.1 Register Details

| Register                               | Address    | Description                                                                       |
|----------------------------------------|------------|-----------------------------------------------------------------------------------|
| <a href="#">CRYPTO_CTL</a>             | 0x40110000 | Control                                                                           |
| <a href="#">CRYPTO_STATUS</a>          | 0x40110004 | Status                                                                            |
| <a href="#">CRYPTO_RAM_PWRUP_DELAY</a> | 0x40110008 | Power up delay used for SRAM power domain                                         |
| <a href="#">CRYPTO_ERROR_STATUS0</a>   | 0x40110020 | Error status 0                                                                    |

|-------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17    | BLOCK       | <p>This field specifies the behavior when an instruction is written to a full FIFO (INSTR_FIFO_WR MMIO register):</p> <p>'0': The write is ignored/dropped and the INTR.INSTR_FF_OVERFLOW interrupt cause is set to '1'.</p> <p>'1': The write is blocked, resulting in AHB-Lite wait states and the INTR.INSTR_FF_OVERFLOW interrupt cause is set to '1' (this cause may be masked out). The instruction is written to the FIFO as soon as a FIFO entry becomes available. The maximum time is roughly the time of the execution of the slowest/longest instruction. Note that this setting may "lock up" the CPU. When the CPU is "locked up" it can not respond to interrupts. As a result, the interrupt latency is increased. Default Value: 1</p> |
| 16    | CLEAR       | <p>When '1', the instruction FIFO is cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period.</p> <p>HW sets this field to '1' on when an error INTR cause is activated. Default Value: 0</p>                                                                                                                                                                                                                                                                                          |
| 2 : 0 | EVENT_LEVEL | <p>Event level. When the number of entries in the instruction FIFO is less than the amount of this field, an event is generated:</p> <p>- "event" = INSTR_FF_STATUS.USED &lt; EVENT_LEVEL.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 31 : 0 | LFSR32 | <p>State of a 32-bit Linear Feedback Shift Registers (LFSR) that is used to generate a pseudo random bit sequence. This register needs to be initialized by SW. The initialization value should be different from "0".</p> <p>The three PR_LFSR_CTL registers represents the state of a 32-bit, 31-bit and 29-bit LFSR. Individually, these LFSRs generate a pseudo random bit sequence that repeats itself after <math>(2^{32})-1</math>, <math>(2^{31})-1</math> and <math>(2^{29})-1</math> bits. The numbers <math>(2^{32})-1</math>, <math>(2^{31})-1</math> and <math>(2^{29})-1</math> are relatively prime (their greatest common denominator is "1"). The three bit sequence are combined (XOR'd) into a single bitstream to create a pseudo random bit sequence that repeats itself after <math>((2^{32})-1) * ((2^{31})-1) * ((2^{29})-1)</math> bits.</p> <p>The following polynomials are used:</p> <ul style="list-style-type: none"> <li>- 32-bit irreducible polynomial: <math>x^{32}+x^{30}+x^{26}+x^{25}+1</math>.</li> <li>- 31-bit irreducible polynomial: <math>x^{31}+x^{28}+1</math>.</li> <li>- 29-bit irreducible polynomial: <math>x^{29}+x^{27}+1</math>.</li> </ul> <p>Default Value: 3633683401</p> |

|---------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 24      | VON_NEUMANN_CORR | <p>Specifies if the "von Neumann corrector" is disabled or enabled:</p> <p>'0': disabled.</p> <p>'1': enabled.</p> <p>The "von Neumann corrector" post-processes the reduced bits to remove a '0' or '1' bias. The corrector operates on reduced bit pairs ("oldest bit, newest bit"):</p> <p>"00": no bit is produced.</p> <p>"01": '0' bit is produced (oldest bit).</p> <p>"10": '1' bit is produced (oldest bit).</p> <p>"11": no bit is produced.</p> <p>Note that the corrector produces bits at a random pace and at a frequency that is 1/4 of the reduced bit frequency (reduced bits are processed in pairs, and half of the pairs do NOT produce a bit).</p> <p>Default Value: 0</p>                                                                                                 |
| 23 : 16 | INIT_DELAY       | <p>Specifies an initialization delay: number of removed/dropped samples before reduced bits are generated. This field should be programmed in the range [1, 255]. After starting the oscillators, at least the first 2 samples should be removed/dropped to clear the state of internal synchronizers. In addition, it is advised to drop at least the second 2 samples from the oscillators (to circumvent the semi-predictable oscillator startup behavior). This result in the default field value of "3". Field encoding is as follows:</p> <p>"0": 1 sample is dropped.</p> <p>"1": 2 samples are dropped.</p> <p>...</p> <p>"255": 256 samples are dropped.</p> <p>The TR_INITIALIZED interrupt cause is set to '1', when the initialization delay is passed.</p> <p>Default Value: 3</p> |
| 15 : 8  | RED_CLOCK_DIV    | <p>Specifies the clock divider that is used to produce reduced bits.</p> <p>"0": 1 reduced bit is produced for each sample.</p> <p>"1": 1 reduced bit is produced for each 2 samples.</p> <p>...</p> <p>"255": 1 reduced bit is produced for each 256 samples.</p> <p>The reduced bits are considered random bits and shifted into TR_RESULT0.DATA32.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                               |
| 7 : 0   | SAMPLE_CLOCK_DIV | <p>Specifies the clock divider that is used to sample oscillator data. This clock divider is wrt. "clk_sys".</p> <p>"0": sample clock is "clk_sys".</p> <p>"1": sample clock is "clk_sys"/2.</p> <p>...</p> <p>"255": sample clock is "clk_sys"/256.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 0    | ALWAYS_EXECUTE | <p>Specifies if a conditional instruction is executed or not, when its condition code evaluates to false/'0'.</p> <p>'0': The instruction is NOT executed. As a result, the instruction may be handled faster than when it is executed.</p> <p>'1': The instruction is executed, but the execution result (including status field information) is not reflected in the IP. The instruction is handled just as fast as when it is executed.</p> <p>Note: a conditional instruction with a condition code that evaluates to false/'0' does not affect the architectural state: VU_STATUS fields, memory or register-file data.</p> <p>Note: Always execution is useful to prevent/complicate differential timing and differential power attacks.</p> <p>Default Value: 0</p> |

|---------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 14 | ADDR | <p>Specifies base address of vector unit operands in memory. The register-file registers provide offsets wrt. this base address.</p> <p>The base address is a multiple of 16 KB. The register-file registers provide 12-bit word address offsets in this 16 KB. Together, they provide access to a 16 KB memory region for vector unit instructions:</p> <p>ADDR[31:14] = VU_CTL1.ADDR[31:14]<br/>           ADDR[13:2] = register-file register offset</p> <p>The base address is either the IP's internal memory buffer (memory capacity is the internal memory buffer capacity) or a location in system memory (memory capacity is 16 KB).</p> <p>For best performance, the IP's memory buffer should be used and VU_CTL1.ADDR should be programmed to MEM_BUFF. If VU_CTL1.ADDR is set to MEM_BUFF and the memory buffer capacity is less than 16 KB, memory accesses beyond the memory buffer capacity access a memory hole (reads return "0" and writes are ignored). E.g., if the memory buffer is 8 KB, accesses with ADDR[13] set to '1', access a memory hole.</p> <p>If the IP's memory buffer capacity is not large enough to support the vector unit operands, VU_CTL1.ADDR can be set to a 16 KB aligned location in system memory.</p> <p>Default Value: 0</p> |

## 4 CPU Sub System (CPUSS) Registers

This section discusses the CPU Sub System (CPUSS) registers. It lists all the registers in mapping tables, in address order.

### 4.1 Register Details

| Register                                  | Address    | Description                                                                                       |
|-------------------------------------------|------------|---------------------------------------------------------------------------------------------------|
| <a href="#">CPUSS_CM0_CTL</a>             | 0x40210000 | CM0+ control                                                                                      |
| <a href="#">CPUSS_CM0_STATUS</a>          | 0x40210008 | CM0+ status                                                                                       |
| <a href="#">CPUSS_CM0_CLOCK_CTL</a>       | 0x40210010 | CM0+ clock control                                                                                |
| <a href="#">CPUSS_CM0_INT_CTL0</a>        | 0x40210020 | CM0+ interrupt control 0                                                                          |
| <a href="#">CPUSS_CM0_INT_CTL1</a>        | 0x40210024 | CM0+ interrupt control 1                                                                          |

| 31 : 16 | VECTKEYSTAT | Register key (to prevent accidental writes).<br>- Should be written with a 0x05fa key value for the write to take effect.<br>- Always reads as 0xfa05.<br>Default Value: 64005                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 1       | ENABLED     | Processor enable:<br>'0': Disabled. Processor clock is turned off and reset is activated. After SW clears this field to '0', HW automatically sets this field to '1'. This effectively results in a CM0+ reset, followed by a CM0+ warm boot.<br>'1': Enabled.<br>Note: The intent is that this bit is modified only through an external probe or by the CM4 while the CM0+ is in Sleep or DeepSleep power mode. If this field is cleared to '0' by the CM0+ itself, it should be done under controlled conditions (such that undesirable side effects can be prevented).<br>Note: The CM0+ CPU has a AIRCR.SYSRESETREQ register field that allows the CM0+ to reset the complete device (ENABLED only disables/enables the CM0+), resulting in a warm boot. This CPU register field has similar "built-in protection" as this CM0_CTL register to prevent accidental system writes (the upper 16-bits of the register need to be written with a 0x05fa key value; see CPU user manual for more details).<br>Default Value: 1 |

### 4.1.1 CPUSS\_CM0\_CTL (continued)

|   |           |                                                                                                                                                                                                                                                                   |
|---|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 | SLV_STALL | <p>Processor debug access control:</p> <p>'0': Access.</p> <p>'1': Stall access.</p> <p>This field is used to stall/delay debug accesses. This is useful to protect execution of code that needs to be protected from debug accesses.</p> <p>Default Value: 0</p> |
|---|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|---------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 24 | PERI_INT_DIV | <p>Specifies the peripheral clock divider (from the high frequency clock "clk_hf" to the peripheral clock "clk_peri"). Integer division by (1+PERI_INT_DIV). Allows for integer divisions in the range [1, 256] (PERI_INT_DIV is in the range [0, 255]).</p> <p>Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode. Note that <math>F_{peri} \leq F_{peri\_max}</math>. <math>F_{peri\_max}</math> is likely to be smaller than <math>F_{hf\_max}</math>. In other words, if <math>F_{hf} = F_{hf\_max}</math>, PERI_INT_DIV should not be set to "0".</p> <p>Default Value: 1</p> |
| 15 : 8  | SLOW_INT_DIV | <p>Specifies the slow clock divider (from the peripheral clock "clk_peri" to the slow clock "clk_slow"). Integer division by (1+SLOW_INT_DIV). Allows for integer divisions in the range [1, 256] (SLOW_INT_DIV is in the range [0, 255]).</p> <p>Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                  |

| 31 : 16 | VECTKEYSTAT | Register key (to prevent accidental writes).<br>- Should be written with a 0x05fa key value for the write to take effect.<br>- Always reads as 0xfa05.<br>Default Value: 64005                                                                                                                                                                                                                       |
| 1 : 0   | PWR_MODE    | Set Power mode for CM4<br>Default Value: 1<br><br><b>0x0: OFF :</b><br>Switch CM4 offPower off, clock off, isolate, reset and no retain.<br><br><b>0x1: RESET :</b><br>Reset CM4<br>Clock off, no isolated, no retain and reset.<br>Note: The CM4 CPU has a AIRCR.SYSRESETREQ register field that allows the CM4 to reset the complete device (RESET only resets the CM4), resulting in a warm boot. |

#### 4.1.12 CPUSS\_CM4\_PWR\_CTL (continued)

**0x2: RETAINED :**

Put CM4 in Retained mode

This can only become effective if CM4 is in SleepDeep mode. Check PWR\_DONE flag to see if CM4 RETAINED state has been reached.

Power off, clock off, isolate, no reset and retain.

**0x3: ENABLED :**

Switch CM4 on.

Power on, clock on, no isolate, no reset and no retain.

|-------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9 : 8 | FAST_WS | Memory wait states for the fast clock domain ("clk_fast"). The number of wait states is expressed in "clk_hf" clock domain cycles.<br>Default Value: 0                                                                                                                                                                                                                                                                                                                                   |
| 1 : 0 | SLOW_WS | Memory wait states for the slow clock domain ("clk_slow"). The number of wait states is expressed in "clk_hf" clock domain cycles.<br>Timing paths to and from the memory have a (fixed) minimum duration that always needs to be considered/met. The "clk_hf" clock domain frequency determines this field's value such that the timing paths minimum duration is met. A table/formula will be provided for this field's values for different "clk_hf" frequencies.<br>Default Value: 1 |

| Name      | NOREF         | SKEW | None [29:26] |    |    |    | CLOCK_SOURCE [25:24] |    |

| Bits | Name  | Description                                                                                                                                                                                                                                                                  |
|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31   | NOREF | Specifies if an external clock source is provided:<br>'0': An external clock source is provided.<br>'1': An external clock source is NOT provided and only the CPU internal clock can be used as SysTick timer clock source. Default Value: 0                                |
| 30   | SKEW  | Specifies the precision of the clock source and if the TENMS field represents exactly 10 ms (clock source frequency is a multiple of 100 Hz). This affects the suitability of the SysTick timer as a SW real-time clock:<br>0: Precise.<br>1: Imprecise.<br>Default Value: 1 |

|         |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 25 : 24 | CLOCK_SOURCE | <p>Specifies an external clock source:</p> <p>0: The low frequency clock <code>clk_lf</code> is selected. The precision of this clock depends on whether the low frequency clock source is a SRSS internal RC oscillator (imprecise) or a device external crystal oscillator (precise).</p> <p>1: The internal main oscillator (IMO) clock <code>clk_imo</code> is selected.</p> <p>o 2: The external crystal oscillator (ECO) clock <code>clk_eco</code> is selected.</p> <p>3: The SRSS "<code>clk_timer</code>" is selected ("<code>clk_timer</code>" is a divided/gated version of "<code>clk_hf</code>" or "<code>clk_imo</code>").</p> <p>Note: If NOREF is 1, the CLOCK_SOURCE value is NOT used.</p> <p>Note: It is SWs responsibility to provide the correct NOREF, SKEW and TENMS field values for the selected clock source.</p> <p>Default Value: 0</p> |
| 23 : 0  | TENMS        | <p>Specifies the number of clock source cycles (minus 1) that make up 10 ms. E.g., for a 32,768 Hz reference clock, TENMS is <math>328\ 1 = 327</math>.</p> <p>Default Value: 327</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|------|-------|-----------------------------------------------------------------------------|
| 0    | FAULT | Logical and of corresponding INTR and INTR_MASK fields.<br>Default Value: 0 |

## 6 Inter-Processor Communication Registers

This section discusses the Inter-Processor Communication (IPC) registers. It lists all the registers in mapping tables, in address order.

### 6.1 Register Details

| Register                                | Address    | Description                                                                                 |
|-----------------------------------------|------------|---------------------------------------------------------------------------------------------|
| <a href="#">IPC_STRUCT0_ACQUIRE</a>     | 0x40230000 | IPC acquire                                                                                 |
| <a href="#">IPC_STRUCT0_RELEASE</a>     | 0x40230004 | IPC release                                                                                 |
| <a href="#">IPC_STRUCT0_NOTIFY</a>      | 0x40230008 | IPC notification                                                                            |
| <a href="#">IPC_STRUCT0_DATA</a>        | 0x4023000C | IPC data                                                                                    |
| <a href="#">IPC_STRUCT0_LOCK_STATUS</a> | 0x40230010 | IPC lock status                                                                             |
| IPC_STRUCT1_ACQUIRE                     | 0x40230020 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT1_RELEASE                     | 0x40230024 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT1_NOTIFY                      | 0x40230028 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT1_DATA                        | 0x4023002C | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT1_LOCK_STATUS                 | 0x40230030 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT2_ACQUIRE                     | 0x40230040 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT2_RELEASE                     | 0x40230044 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT2_NOTIFY                      | 0x40230048 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT2_DATA                        | 0x4023004C | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT2_LOCK_STATUS                 | 0x40230050 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT3_ACQUIRE                     | 0x40230060 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT3_RELEASE                     | 0x40230064 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT3_NOTIFY                      | 0x40230068 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT3_DATA                        | 0x4023006C | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT3_LOCK_STATUS                 | 0x40230070 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT4_ACQUIRE                     | 0x40230080 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT4_RELEASE                     | 0x40230084 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT4_NOTIFY                      | 0x40230088 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT4_DATA                        | 0x4023008C | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT4_LOCK_STATUS                 | 0x40230090 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT5_ACQUIRE                     | 0x402300A0 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |

| Register                 | Address    | Description                                                                                 |
|--------------------------|------------|---------------------------------------------------------------------------------------------|
| IPC_STRUCT5_RELEASE      | 0x402300A4 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT5_NOTIFY       | 0x402300A8 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT5_DATA         | 0x402300AC | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT5_LOCK_STATUS  | 0x402300B0 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT6_ACQUIRE      | 0x402300C0 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT6_RELEASE      | 0x402300C4 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT6_NOTIFY       | 0x402300C8 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT6_DATA         | 0x402300CC | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT6_LOCK_STATUS  | 0x402300D0 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT7_ACQUIRE      | 0x402300E0 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT7_RELEASE      | 0x402300E4 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT7_NOTIFY       | 0x402300E8 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT7_DATA         | 0x402300EC | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT7_LOCK_STATUS  | 0x402300F0 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT8_ACQUIRE      | 0x40230100 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT8_RELEASE      | 0x40230104 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT8_NOTIFY       | 0x40230108 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT8_DATA         | 0x4023010C | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT8_LOCK_STATUS  | 0x40230110 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT9_ACQUIRE      | 0x40230120 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT9_RELEASE      | 0x40230124 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT9_NOTIFY       | 0x40230128 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |
| IPC_STRUCT9_DATA         | 0x4023012C | IPC data. See <a href="#">IPC_STRUCT0_DATA</a> for the details of bit fields.               |
| IPC_STRUCT9_LOCK_STATUS  | 0x40230130 | IPC lock status. See <a href="#">IPC_STRUCT0_LOCK_STATUS</a> for the details of bit fields. |
| IPC_STRUCT10_ACQUIRE     | 0x40230140 | IPC acquire. See <a href="#">IPC_STRUCT0_ACQUIRE</a> for the details of bit fields.         |
| IPC_STRUCT10_RELEASE     | 0x40230144 | IPC release. See <a href="#">IPC_STRUCT0_RELEASE</a> for the details of bit fields.         |
| IPC_STRUCT10_NOTIFY      | 0x40230148 | IPC notification. See <a href="#">IPC_STRUCT0_NOTIFY</a> for the details of bit fields.     |

|--------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15 : 0 | INTR_RELEASE | <p>This field allows for the generation of release events to the IPC interrupt structures, but only when the lock is acquired (LOCK_STATUS.ACQUIRED is '1'). The IPC release cause fields associated with this IPC structure are set to '1', but only for those IPC interrupt structures for which the corresponding bit field in INTR_RELEASE[] is set to '1'.</p> <p>SW writes a '1' to the bit fields to generate a release event. Due to the transient nature of this event, SW always reads a '0' from this field.</p> <p>As a side effect, a write to this register will always set LOCK_STATUS.ACQUIRED to '0' (even when no release event is generated; i.e. the written data is "0").</p> <p>Default Value: 0</p> |

## 6.1.3 IPC\_STRUCT0\_NOTIFY

IPC notification

Address: 0x40230008

Retention: Retained

|---------|---------|-----------------------------------------------------------------------------|
| 31 : 16 | NOTIFY  | Logical and of corresponding INTR and INTR_MASK fields.<br>Default Value: 0 |
| 15 : 0  | RELEASE | Logical and of corresponding request and mask bits.<br>Default Value: 0     |

# 7 Protection Unit Registers

This section discusses the Protection Unit registers. It lists all the registers in mapping tables, in address order.

## 7.1 Register Details

| Register                                     | Address    | Description                                                                                                                 |
|----------------------------------------------|------------|-----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PROT_SMPU_MS0_CTL</a>            | 0x40240000 | Master 0 protection context control                                                                                         |
| <a href="#">PROT_SMPU_MS1_CTL</a>            | 0x40240004 | Master 1 protection context control                                                                                         |
| <a href="#">PROT_SMPU_MS2_CTL</a>            | 0x40240008 | Master 2 protection context control                                                                                         |
| <a href="#">PROT_SMPU_MS3_CTL</a>            | 0x4024000C | Master 3 protection context control                                                                                         |
| <a href="#">PROT_SMPU_MS14_CTL</a>           | 0x40240038 | Master 14 protection context control                                                                                        |
| <a href="#">PROT_SMPU_MS15_CTL</a>           | 0x4024003C | Master 15 protection context control                                                                                        |
| <a href="#">PROT_SMPU_SMPU_STRUCT0_ADDR0</a> | 0x40242000 | SMPU region address 0 (slave structure)                                                                                     |
| <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT0</a>  | 0x40242004 | SMPU region attributes 0 (slave structure)                                                                                  |
| <a href="#">PROT_SMPU_SMPU_STRUCT0_ADDR1</a> | 0x40242020 | SMPU region address 1 (master structure)                                                                                    |
| <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT1</a>  | 0x40242024 | SMPU region attributes 1 (master structure)                                                                                 |
| <a href="#">PROT_SMPU_SMPU_STRUCT1_ADDR0</a> | 0x40242040 | SMPU region address 0 (slave structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ADDR0</a> for the details of bit fields.    |
| <a href="#">PROT_SMPU_SMPU_STRUCT1_ATT0</a>  | 0x40242044 | SMPU region attributes 0 (slave structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT0</a> for the details of bit fields.  |
| <a href="#">PROT_SMPU_SMPU_STRUCT1_ADDR1</a> | 0x40242060 | SMPU region address 1 (master structure)                                                                                    |
| <a href="#">PROT_SMPU_SMPU_STRUCT1_ATT1</a>  | 0x40242064 | SMPU region attributes 1 (master structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT1</a> for the details of bit fields. |
| <a href="#">PROT_SMPU_SMPU_STRUCT2_ADDR0</a> | 0x40242080 | SMPU region address 0 (slave structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ADDR0</a> for the details of bit fields.    |
| <a href="#">PROT_SMPU_SMPU_STRUCT2_ATT0</a>  | 0x40242084 | SMPU region attributes 0 (slave structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT0</a> for the details of bit fields.  |
| <a href="#">PROT_SMPU_SMPU_STRUCT2_ADDR1</a> | 0x402420A0 | SMPU region address 1 (master structure)                                                                                    |
| <a href="#">PROT_SMPU_SMPU_STRUCT2_ATT1</a>  | 0x402420A4 | SMPU region attributes 1 (master structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT1</a> for the details of bit fields. |
| <a href="#">PROT_SMPU_SMPU_STRUCT3_ADDR0</a> | 0x402420C0 | SMPU region address 0 (slave structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ADDR0</a> for the details of bit fields.    |
| <a href="#">PROT_SMPU_SMPU_STRUCT3_ATT0</a>  | 0x402420C4 | SMPU region attributes 0 (slave structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT0</a> for the details of bit fields.  |
| <a href="#">PROT_SMPU_SMPU_STRUCT3_ADDR1</a> | 0x402420E0 | SMPU region address 1 (master structure)                                                                                    |
| <a href="#">PROT_SMPU_SMPU_STRUCT3_ATT1</a>  | 0x402420E4 | SMPU region attributes 1 (master structure). See <a href="#">PROT_SMPU_SMPU_STRUCT0_ATT1</a> for the details of bit fields. |

|---------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 23 : 17 | PC_MASK_15_TO_1 | <p>Protection context mask for protection contexts "15" down to "1". Bit PC_MASK_15_TO_1[i] indicates if the MPU MS_CTL.PC[3:0] protection context field can be set to the value "i+1":</p> <ul style="list-style-type: none"> <li>- PC_MASK_15_TO_1[i] is '0': MPU MS_CTL.PC[3:0] can NOT be set to "i+1"; and PC[3:0] is not changed. If the protection context of the write transfer is "0", protection is not applied and PC[3:0] can be changed.</li> <li>- PC_MASK_15_TO_1[i] is '1': MPU MS_CTL.PC[3:0] can be set to "i+1".</li> </ul> <p>Note: When CPUSS_CM0_PC_CTL.VALID[i] is '1' (the associated protection context handler is valid), write transfers to PC_MASK_15_TO_1[i-1] always write '0', regardless of data written. This ensures that when valid protection context handlers are used to enter protection contexts 1, 2 or 3 through (HW modifies MPU MS_CTL.PC[3:0] on entry of the handler), it is NOT possible for SW to enter those protection contexts (SW modifies MPU MS_CTL.PC[3:0]).</p> <p>Default Value: 0</p> |
| 16      | PC_MASK_0       | <p>Protection context mask for protection context "0". This field is a constant '0':</p> <ul style="list-style-type: none"> <li>- PC_MASK_0 is '0': MPU MS_CTL.PC[3:0] can NOT be set to "0" and PC[3:0] is not changed. If the protection context of the write transfer is "0", protection is not applied and PC[3:0] can be changed.</li> </ul> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 7.1.1 PROT\_SMPU\_MS0\_CTL (continued)

|       |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9 : 8 | PRI0 | <p>Device wide bus arbitration priority setting ("0": highest priority, "3": lowest priority).</p> <p>Notes:</p> <p>The AHB-Lite interconnect performs arbitration on the individual beats/transfers of a burst (this optimizes latency over locality/bandwidth).</p> <p>The AXI-Lite interconnects performs a single arbitration for the complete burst (this optimizes locality/bandwidth over latency).</p> <p>Masters with the same priority setting form a "priority group". Within a "priority group", round robin arbitration is performed.</p> <p>Default Value: 3</p> |
| 1     | NS   | <p>Security setting ('0': secure mode; '1': non-secure mode).</p> <p>Notes:</p> <p>This field is ONLY used for masters that do NOT provide their own secure/non-secure access control attribute.</p> <p>Note that the default/reset field value provides non-secure mode access capabilities to all masters.</p> <p>Default Value: 1</p>                                                                                                                                                                                                                                       |
| 0     | P    | <p>Privileged setting ('0': user mode; '1': privileged mode).</p> <p>Notes:</p> <p>This field is ONLY used for masters that do NOT provide their own user/privileged access control attribute.</p> <p>The default/reset field value provides privileged mode access capabilities.</p> <p>Default Value: 1</p>                                                                                                                                                                                                                                                                  |

|--------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 8 | ADDR24 | <p>This field specifies the most significant bits of the 32-bit address of an address region. The region size is defined by ATT0.REGION_SIZE. A region of n Byte is always n Byte aligned. As a result, some of the lesser significant address bits of ADDR24 may be ignored in determining whether a bus transfer address is within an address region. E.g., a 64 KByte address region (REGION_SIZE is "15") is 64 KByte aligned, and ADDR24[7:0] are ignored.</p> <p>Default Value: Undefined</p> |

### 7.1.7 PROT\_SMPU\_SMPU\_STRUCT0\_ADDR0 (continued)

|       |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 : 0 | SUBREGION_DISABLE | <p>This field is used to individually disabled the eight equally sized subregions in which a region is partitioned. Subregion disable:</p> <p>Bit 0: subregion 0 disable.<br/>         Bit 1: subregion 1 disable.<br/>         Bit 2: subregion 2 disable.<br/>         Bit 3: subregion 3 disable.<br/>         Bit 4: subregion 4 disable.<br/>         Bit 5: subregion 5 disable.<br/>         Bit 6: subregion 6 disable.<br/>         Bit 7: subregion 7 disable.</p> <p>E.g., a 64 KByte address region (ATT0.REGION_SIZE is "15") has eight 8 KByte subregions. The access control as defined by ATT0 applies if the bus transfer address is within the address region AND the addressed subregion is NOT disabled. Note that the smallest region size is 256 B and the smallest subregion size is 32 B.</p> <p>Default Value: Undefined</p> |

| 31 : 8 | ADDR24 | This field specifies the most significant bits of the 32-bit address of an address region. The region size is defined by ATT.REGION_SIZE. A region of n Byte is always n Byte aligned. As a result, some of the lesser significant address bits of ADDR24 may be ignored in determining whether a bus transfer address is within an address region. E.g., a 64 KByte address region (REGION_SIZE is "15") is 64 KByte aligned, and ADDR24[7:0] are ignored.<br>Default Value: Undefined |

## 8 Flash Controller Registers

This section discusses the Flash Controller registers. It lists all the registers in mapping tables, in address order.

### 8.1 Register Details

| Register                               | Address    | Description                                                                                              |
|----------------------------------------|------------|----------------------------------------------------------------------------------------------------------|
| <a href="#">FLASHC_FLASH_CTL</a>       | 0x40250000 | Control                                                                                                  |
| <a href="#">FLASHC_FLASH_PWR_CTL</a>   | 0x40250004 | Flash power control                                                                                      |
| <a href="#">FLASHC_FLASH_CMD</a>       | 0x40250008 | Command                                                                                                  |
| <a href="#">FLASHC_BIST_CTL</a>        | 0x40250100 | BIST control                                                                                             |
| <a href="#">FLASHC_BIST_CMD</a>        | 0x40250104 | BIST command                                                                                             |
| <a href="#">FLASHC_BIST_ADDR_START</a> | 0x40250108 | BIST address start register                                                                              |
| <a href="#">FLASHC_BIST_DATA0</a>      | 0x4025010C | BIST data register(s)                                                                                    |
| <a href="#">FLASHC_BIST_DATA1</a>      | 0x40250110 | BIST data register(s). See <a href="#">FLASHC_BIST_DATA0</a> for the details of bit fields.              |
| <a href="#">FLASHC_BIST_DATA2</a>      | 0x40250114 | BIST data register(s). See <a href="#">FLASHC_BIST_DATA0</a> for the details of bit fields.              |
| <a href="#">FLASHC_BIST_DATA3</a>      | 0x40250118 | BIST data register(s). See <a href="#">FLASHC_BIST_DATA0</a> for the details of bit fields.              |
| <a href="#">FLASHC_BIST_DATA_ACT0</a>  | 0x4025012C | BIST data actual register(s)                                                                             |
| <a href="#">FLASHC_BIST_DATA_ACT1</a>  | 0x40250130 | BIST data actual register(s). See <a href="#">FLASHC_BIST_DATA_ACT0</a> for the details of bit fields.   |
| <a href="#">FLASHC_BIST_DATA_ACT2</a>  | 0x40250134 | BIST data actual register(s). See <a href="#">FLASHC_BIST_DATA_ACT0</a> for the details of bit fields.   |
| <a href="#">FLASHC_BIST_DATA_ACT3</a>  | 0x40250138 | BIST data actual register(s). See <a href="#">FLASHC_BIST_DATA_ACT0</a> for the details of bit fields.   |
| <a href="#">FLASHC_BIST_DATA_EXP0</a>  | 0x4025014C | BIST data expected register(s)                                                                           |
| <a href="#">FLASHC_BIST_DATA_EXP1</a>  | 0x40250150 | BIST data expected register(s). See <a href="#">FLASHC_BIST_DATA_EXP0</a> for the details of bit fields. |
| <a href="#">FLASHC_BIST_DATA_EXP2</a>  | 0x40250154 | BIST data expected register(s). See <a href="#">FLASHC_BIST_DATA_EXP0</a> for the details of bit fields. |
| <a href="#">FLASHC_BIST_DATA_EXP3</a>  | 0x40250158 | BIST data expected register(s). See <a href="#">FLASHC_BIST_DATA_EXP0</a> for the details of bit fields. |
| <a href="#">FLASHC_BIST_ADDR</a>       | 0x4025016C | BIST address register                                                                                    |

|-------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8     | REMAP   | <p>Specifies remapping of FLASH macro main region.</p> <p>0: No remapping.</p> <p>1: Remapping. The highest address bit of the FLASH main region is inverted. This effectively re-maps the location of FLASH main region physical sectors in the logical address space. In other words, the higher half physical sectors are swapped with the lower half physical sectors.</p> <p>Note: remapping only affects reading of the FLASH main region (over the R interface). It does NOT affect programming/erasing of the FLASH memory region (over the C interface).</p> <p>E.g., for a 512 KB / 4 Mb main region, the logical address space ranges from [0x1000:0000, 0x1007:ffff] (the highest bit if the FLASH main region is bit 18). The memory has four physical sectors: sectors 0, 1, 2 and 3. If REMAP is '0', the physical regions logical addresses are as follows:</p> <ul style="list-style-type: none"> <li>- The physical region 0: [0x1000:0000, 0x1001:ffff].</li> <li>- The physical region 1: [0x1002:0000, 0x1003:ffff].</li> <li>- The physical region 2: [0x1004:0000, 0x1005:ffff].</li> <li>- The physical region 3: [0x1006:0000, 0x1007:ffff].</li> </ul> <p>If REMAP is '1', the physical regions logical addresses are as follows:</p> <ul style="list-style-type: none"> <li>- The physical region 0: [0x1004:0000, 0x1005:ffff].</li> <li>- The physical region 1: [0x1006:0000, 0x1007:ffff].</li> <li>- The physical region 2: [0x1000:0000, 0x1001:ffff].</li> <li>- The physical region 3: [0x1002:0000, 0x1003:ffff].</li> </ul> <p>Note: when the REMAP is changed, SW should invalidate the caches and buffers.</p> <p>Default Value: 0</p> |
| 3 : 0 | MAIN_WS | <p>FLASH macro main interface wait states:</p> <p>0: 0 wait states.</p> <p>...</p> <p>15: 15 wait states</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | INV  | FLASH cache and buffer invalidation for ALL cache and buffers. SW writes a '1' to clear the cache and buffers. HW sets this field to '0' when the operation is completed. The operation takes a maximum of three clock cycles on the slowest of the clk_slow and clk_fast clocks. The caches' LRU structures are also reset to their default state.<br>Default Value: 0 |

## 8.1.4 FLASHC\_BIST\_CTL

BIST control

| HW Access | R                      |    |    |    |    |    |    |    |
| Name      | ROW_ADDR_START [23:16] |    |    |    |    |    |    |    |

| Bits      | 31                     | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------------------|----|----|----|----|----|----|----|
| SW Access | RW                     |    |    |    |    |    |    |    |
| HW Access | R                      |    |    |    |    |    |    |    |
| Name      | ROW_ADDR_START [31:24] |    |    |    |    |    |    |    |

| Bits    | Name           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 16 | ROW_ADDR_START | Row start address. Useful to apply BIST to a part of an Flash. The value of this field should be in a legal range (a value outside of the legal range has an undefined result, and may lock up the BIST state machine). This legal range is dependent on the number of rows of the SRAM the BIST is applied to (as specified by BIST_CTL.SRAMS_ENABLED). E.g. for a Flash with m columns, the legal range is [0, m-1].<br>Default Value: 0       |
| 15 : 0  | COL_ADDR_START | Column start address. Useful to apply BIST to a part of an Flash. The value of this field should be in a legal range (a value outside of the legal range has an undefined result, and may lock up the BIST state machine). This legal range is dependent on the number of columns of the SRAM the BIST is applied to (as specified by BIST_CTL.SRAMS_ENABLED). E.g. for a Flash with n columns, the legal range is [0, n-1].<br>Default Value: 0 |

## 8.1.7 FLASHC\_BIST\_DATA0

BIST data register(s)

Address: 0x4025010C

Retention: Not Retained

|--------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 0 | DATA32 | Sense amplifier and column multiplexer structure Bytes. The read data is dependent on FM_CTL.IF_SEL:<br>- IF_SEL is "0": data as specified by the R interface address<br>- IF_SEL is "1": data as specified by FM_MEM_ADDR and the offset of the accessed FM_MEM_DATA register.<br>Default Value: 0 |

# 9 System Resources Subsystem Registers

This section discusses the System Resources Subsystem (SRSS) registers. It lists all the registers in mapping tables, in address order.

## 9.1 Register Details

| Register                         | Address    | Description                                                                                     |
|----------------------------------|------------|-------------------------------------------------------------------------------------------------|
| <a href="#">PWR_CTL</a>          | 0x40260000 | Power Mode Control                                                                              |
| <a href="#">PWR_HIBERNATE</a>    | 0x40260004 | HIBERNATE Mode Register                                                                         |
| <a href="#">PWR_LVD_CTL</a>      | 0x40260008 | Low Voltage Detector (LVD) Configuration Register                                               |
| <a href="#">PWR_BUCK_CTL</a>     | 0x40260014 | Buck Control Register                                                                           |
| <a href="#">PWR_BUCK_CTL2</a>    | 0x40260018 | Buck Control Register 2                                                                         |
| <a href="#">PWR_LVD_STATUS</a>   | 0x4026001C | Low Voltage Detector (LVD) Status Register                                                      |
| <a href="#">PWR_HIB_DATA0</a>    | 0x40260080 | HIBERNATE Data Register                                                                         |
| <a href="#">WDT_CTL</a>          | 0x40260180 | Watchdog Counter Control Register                                                               |
| <a href="#">WDT_CNT</a>          | 0x40260184 | Watchdog Counter Count Register                                                                 |
| <a href="#">WDT_MATCH</a>        | 0x40260188 | Watchdog Counter Match Register                                                                 |
| <a href="#">CLK_DSI_SELECT0</a>  | 0x40260300 | Clock DSI Select Register                                                                       |
| <a href="#">CLK_DSI_SELECT1</a>  | 0x40260304 | Clock DSI Select Register. See <a href="#">CLK_DSI_SELECT0</a> for the details of bit fields.   |
| <a href="#">CLK_DSI_SELECT2</a>  | 0x40260308 | Clock DSI Select Register. See <a href="#">CLK_DSI_SELECT0</a> for the details of bit fields.   |
| <a href="#">CLK_DSI_SELECT3</a>  | 0x4026030C | Clock DSI Select Register. See <a href="#">CLK_DSI_SELECT0</a> for the details of bit fields.   |
| <a href="#">CLK_DSI_SELECT4</a>  | 0x40260310 | Clock DSI Select Register. See <a href="#">CLK_DSI_SELECT0</a> for the details of bit fields.   |
| <a href="#">CLK_PATH_SELECT0</a> | 0x40260340 | Clock Path Select Register                                                                      |
| <a href="#">CLK_PATH_SELECT1</a> | 0x40260344 | Clock Path Select Register. See <a href="#">CLK_PATH_SELECT0</a> for the details of bit fields. |
| <a href="#">CLK_PATH_SELECT2</a> | 0x40260348 | Clock Path Select Register. See <a href="#">CLK_PATH_SELECT0</a> for the details of bit fields. |
| <a href="#">CLK_PATH_SELECT3</a> | 0x4026034C | Clock Path Select Register. See <a href="#">CLK_PATH_SELECT0</a> for the details of bit fields. |

| Bits | Name        | Description                                                                                                                                                                                                                                                                                                                                                                               |
|------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31   | ACT_REF_OK  | Indicates that the normal mode of the Active Reference is ready.<br>Default Value: 0                                                                                                                                                                                                                                                                                                      |
| 30   | ACT_REF_DIS | Disables the Active Reference. Firmware must ensure that LPM_READY==1 and BGREF_LP_MODE==1 for at least 1us before disabling the Active Reference. When enabling the Active Reference, use ACT_REF_OK indicator to know when it is ready. This register is only reset by XRES/POR/BOD/HIBERNATE.<br>0: Active Reference is enabled<br>1: Active Reference is disabled<br>Default Value: 0 |
| 29   | VREFBUF_DIS | Disable the 800mV voltage reference buffer. Firmware should only disable the buffer when there is no connected circuit that is using it. SRSS circuits that require it are the PLL and ECO. A particular product may have circuits outside the SRSS that use the buffer. This register is only reset by XRES/POR/BOD/HIBERNATE.<br>Default Value: 0                                       |

### 9.1.1 PWR\_CTL (continued)

|    |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28 | VREFBUF_LPMODE | <p>Control the power mode of the 800mV voltage reference buffer. The value in this register is ignored and normal mode is used until LPM_READY==1.</p> <p>0: Voltage Reference Buffer operates in normal mode. They work for vddd ramp rates of 100mV/us or less. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>1: Voltage Reference Buffer operates in low power mode. Power supply rejection is reduced to save current, and they work for vddd ramp rates of 10mV/us or less.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                  |
| 27 | PLL_LS_BYPASS  | <p>Bypass level shifter inside the PLL.</p> <p>0: Do not bypass the level shifter. This setting is ok for all operational modes and vccd target voltage.</p> <p>1: Bypass the level shifter. This may reduce jitter on the PLL output clock, but can only be used when vccd is targeted to 1.1V nominal. Otherwise, it can result in clock degradation and static current.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 26 | BGREF_LPMODE   | <p>Control the power mode of the Bandgap Voltage and Current References. This applies to voltage and current generation and is different than the reference voltage buffer. The value in this register is ignored and normal mode is used until LPM_READY==1. When lower power mode is used, the Active Reference circuit can be disabled to reduce current. Firmware is responsible to ensure ACT_REF_OK==1 before changing back to normal mode. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>0: Active Bandgap Voltage and Current Reference operates in normal mode. They work for vddd ramp rates of 100mV/us or less.</p> <p>1: Active Bandgap Voltage and Current Reference operates in low power mode. Power supply rejection is reduced to save current, and they work for vddd ramp rates of 10mV/us or less. The Active Reference may be disabled using ACT_REF_DIS=0.</p> <p>Default Value: 0</p> |
| 25 | PORBOD_LPMODE  | <p>Control the power mode of the POR/BOD circuits. The value in this register is ignored and normal mode is used until LPM_READY==1. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>0: POR/BOD circuits operate in normal mode. They work for vddd ramp rates of 100mV/us or less.</p> <p>1: POR/BOD circuits operate in low power mode. Response time is reduced to save current, and they work for vddd ramp rates of 10mV/us or less.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 24 | LINREG_LPMODE  | <p>Control the power mode of the Linear Regulator. The value in this register is ignored and normal mode is used until LPM_READY==1. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>0: Linear Regulator operates in normal mode. Internal current consumption is 50uA and load current capability is 50mA to 300mA, depending on the number of regulator modules present in the product.</p> <p>1: Linear Regulator operates in low power mode. Internal current consumption is 5uA and load current capability is 25mA. Firmware must ensure the current is kept within the limit.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                |
| 23 | LINREG_DIS     | <p>Disable the linear Core Regulator. This is only legal when the on-chip buck regulator supplies vccd, but there is no hardware protection for this case. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>0: Linear regulator is on.</p> <p>1: Linear regulator is off.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 9.1.1 PWR\_CTL (continued)

|       |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 20    | DPSLP_REG_DIS | <p>Disable the DeepSleep regulator. This is only legal when the on-chip buck regulator supplies vccd, but there is no hardware protection for this case. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>0: DeepSleep Regulator is on.<br/>1: DeepSleep Regulator is off.<br/>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 19    | VREFBUF_OK    | <p>Indicates that the voltage reference buffer is ready. Due to synchronization delays, it may take two IMO clock cycles for hardware to clear this bit after asserting VREFBUF_DIS=1.<br/>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 18    | IREF_LPMODE   | <p>Control the power mode of the reference current generator. The value in this register is ignored and normal mode is used until LPM_READY==1. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>0: Current reference generator operates in normal mode. It works for vddd ramp rates of 100mV/us or less.<br/>1: Current reference generator operates in low power mode. Response time is reduced to save current, and it works for vddd ramp rates of 10mV/us or less.<br/>Default Value: 0</p>                                                                                                                                                                                                                            |
| 5     | LPM_READY     | <p>Indicates whether certain low power functions are ready. The low current circuits take longer to startup after XRES/POR/BOD/HIBERNATE wakeup than the normal mode circuits. HIBERNATE mode may be entered regardless of this bit. This register is only reset by XRES/POR/BOD/HIBERNATE.</p> <p>0: If a low power circuit operation is requested, it will stay in its normal operating mode until it is ready. If DEEPSLEEP is requested by all processors WFI/WFE, the device will instead enter SLEEP. When low power circuits are ready, device will automatically enter the originally requested mode.<br/>1: Normal operation. DEEPSLEEP and low power circuits operate as requested in other registers.<br/>Default Value: 0</p> |
| 4     | DEBUG_SESSION | <p>Indicates whether a debug session is active (CDBGPWRUPREQ signal is 1)<br/>Default Value: 0</p> <p><b>0x0: NO_SESSION :</b></p> <p>No debug session active</p> <p><b>0x1: SESSION_ACTIVE :</b></p> <p>Debug session is active. Power modes behave differently to keep the debug session active.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 1 : 0 | POWER_MODE    | <p>Current power mode of the device. Note that this field cannot be read in all power modes on actual silicon.<br/>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### 9.1.1 PWR\_CTL (continued)

**0x0: RESET :**

System is resetting.

**0x1: ACTIVE :**

At least one CPU is running.

**0x2: SLEEP :**

No CPUs are running. Peripherals may be running.

**0x3: DEEPSLEEP :**

Main high-frequency clock is off; low speed clocks are available. Communication interface clocks may be present.

## 9.1.2 PWR\_HIBERNATE

HIBERNATE Mode Register

Address: 0x40260004

Retention: Retained

| Bits    | Name              | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31      | HIBERNATE         | Firmware sets this bit to enter HIBERNATE mode. The system will enter HIBERNATE mode immediately after writing to this bit and will wakeup only in response to XRES or WAKEUP event. Both UNLOCK and FREEZE must have been set correctly in a previous write operations. Otherwise, it will not enter HIBERNATE. External supplies must have been stable for 250us before entering HIBERNATE mode.<br>Default Value: 0 |
| 30      | HIBERNATE_DISABLE | Hibernate disable bit.<br>0: Normal operation, HIBERNATE works as described<br>1: Further writes to this register are ignored<br>Note: This bit is a write-once bit until the next reset. Avoid changing any other bits in this register while disabling HIBERNATE mode. Also, it is recommended to clear the UNLOCK code, if it was previously written..<br>Default Value: 0                                          |
| 27 : 24 | MASK_HIBPIN       | When set, HIBERNATE will wakeup if the corresponding pin input matches the POLARITY_HIBPIN setting. Each bit corresponds to one of the wakeup pins.<br>Default Value: 0                                                                                                                                                                                                                                                |

### 9.1.2 PWR\_HIBERNATE (continued)

|         |                 |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 23 : 20 | POLARITY_HIBPIN | Each bit sets the active polarity of the corresponding wakeup pin.<br>0: Pin input of 0 will wakeup the part from HIBERNATE<br>1: Pin input of 1 will wakeup the part from HIBERNATE<br>Default Value: 0                                                                                                                                                                                                                 |
| 19      | MASK_HIBWDT     | When set, HIBERNATE will wakeup if WDT matches<br>Default Value: 0                                                                                                                                                                                                                                                                                                                                                       |
| 18      | MASK_HIBALARM   | When set, HIBERNATE will wakeup for a RTC interrupt<br>Default Value: 0                                                                                                                                                                                                                                                                                                                                                  |
| 17      | FREEZE          | Firmware sets this bit to freeze the configuration, mode and state of all GPIOs and SIOs in the system. When entering HIBERNATE mode, the first write instructs DEEPSLEEP peripherals that they cannot ignore the upcoming freeze command. This occurs even in the illegal condition where UNLOCK is not set. If UNLOCK and HIBERNATE are properly set, the IOs actually freeze on the second write.<br>Default Value: 0 |
| 15 : 8  | UNLOCK          | This byte must be set to 0x3A for FREEZE or HIBERNATE fields to operate. Any other value in this register will cause FREEZE/HIBERNATE to have no effect, except as noted in the FREEZE description.<br>Default Value: 0                                                                                                                                                                                                  |
| 7 : 0   | TOKEN           | Contains a 8-bit token that is retained through a HIBERNATE/WAKEUP sequence that can be used by firmware to differentiate WAKEUP from a general RESET event. Note that waking up from HIBERNATE using XRES will reset this register.<br>Default Value: 0                                                                                                                                                                 |

| 7     | HVLVD1_EN     | Enable HVLVD1 voltage monitor. When the LVD is enabled, it takes 20us for it to settle. There is no hardware stabilization counter, and it may falsely trigger during settling. It is recommended that firmware keep the interrupt masked for at least 8us, write a 1'b1 to the corresponding SRSS_INTR to any falsely pended interrupt, and then optionally unmask the interrupt. After enabling, it is further recommended to read the related PWR_LVD_STATUS field, since the interrupt only triggers on edges. This bit is cleared (LVD is disabled) when entering DEEPSLEEP to prevent false interrupts during wakeup.<br>Default Value: 0 |

| Name      | WDT_LOCK [31:30] |    | None [29:24] |    |    |    |    |    |

| Bits    | Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 30 | WDT_LOCK | <p>Prohibits writing to WDT_*, CLK_ILO_CONFIG, CLK_SELECT.LFCLK_SEL, and CLK_TRIM_ILO_CTL registers when not equal 0. Requires at least two different writes to unlock. A change in WDT_LOCK takes effect beginning with the next write cycle.</p> <p>Note that this field is 2 bits to force multiple writes only. It represents only a single write protect signal protecting all those registers at the same time. WDT will lock on any reset. This field is not retained during Deep Sleep or Hibernate mode, so the WDT will be locked after wakeup from these modes.</p> <p>Default Value: 3</p> <p><b>0x0: NO_CHG :</b></p> <p>No effect</p> <p><b>0x1: CLR0 :</b></p> <p>Clears bit 0</p> |

### 9.1.8 WDT\_CTL (continued)

**0x2: CLR1 :**

Clears bit 1

**0x3: SET01 :**

Sets both bits 0 and 1

|   |        |                                                                                                                                                                                                                                                                                                           |
|---|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 | WDT_EN | Enable this watchdog timer. This field is retained during Deep Sleep and Hibernate modes. Even though the default value is 1, in most cases the Cortex-M0+ executing the SROM code will change the value of this bit to 0. So effectively the user code starts with the WDT disabled.<br>Default Value: 1 |
|---|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 9.1.9 WDT\_CNT

Watchdog Counter Count Register

Address: 0x40260184

Retention: Retained

| Bits   | Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15 : 0 | COUNTER | Current value of WDT Counter. The write feature of this register is for verification purposes, has no synchronization, and can only be applied when the WDT is off. When writing, the value is updated immediately in the WDT counter, but it will read back as the old value until this register resynchronizes just after the negative edge of ILO. Writes will be ignored if they occur when the WDT is enabled.<br>Default Value: 0 |

## 9.1.10 WDT\_MATCH

Watchdog Counter Match Register

Address: 0x40260188

Retention: Retained

| Bits      | 7           | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------|---|---|---|---|---|---|---|
| SW Access | RW          |   |   |   |   |   |   |   |

### 9.1.13 CLK\_ROOT\_SELECT0 (continued)

#### 0x3: DIV\_BY\_8 :

Divide selected clock source by 8

3 : 0 ROOT\_MUX

Selects a clock path as the root of HFCLK and for SRSS DSI input . Use CLK\_SELECT\_PATH[i] to configure the desired path. Some paths may have FLL or PLL available (product-specific), and the control and bypass mux selections of these are in other registers. Configure the FLL using CLK\_FLL\_CONFIG register. Configure a PLL using the related CLK\_PLL\_CONFIG[k] register. Note that not all products support all clock sources. Selecting a clock source that is not supported will result in undefined behavior.

Default Value: 0

#### 0x0: PATH0 :

Select PATH0 (can be configured for FLL)

#### 0x1: PATH1 :

Select PATH1 (can be configured for PLL0, if available in the product)

#### 0x2: PATH2 :

Select PATH2 (can be configured for PLL1, if available in the product)

#### 0x3: PATH3 :

Select PATH3 (can be configured for PLL2, if available in the product)

#### 0x4: PATH4 :

Select PATH4 (can be configured for PLL3, if available in the product)

#### 0x5: PATH5 :

Select PATH5 (can be configured for PLL4, if available in the product)

#### 0x6: PATH6 :

Select PATH6 (can be configured for PLL5, if available in the product)

#### 0x7: PATH7 :

Select PATH7 (can be configured for PLL6, if available in the product)

#### 0x8: PATH8 :

Select PATH8 (can be configured for PLL7, if available in the product)

#### 0x9: PATH9 :

Select PATH9 (can be configured for PLL8, if available in the product)

### 9.1.13 CLK\_ROOT\_SELECT0 (continued)

**0xa: PATH10 :**

Select PATH10 (can be configured for PLL9, if available in the product)

**0xb: PATH11 :**

Select PATH11 (can be configured for PLL10, if available in the product)

**0xc: PATH12 :**

Select PATH12 (can be configured for PLL11, if available in the product)

**0xd: PATH13 :**

Select PATH13 (can be configured for PLL12, if available in the product)

**0xe: PATH14 :**

Select PATH14 (can be configured for PLL13, if available in the product)

**0xf: PATH15 :**

Select PATH15 (can be configured for PLL14, if available in the product)

To change the settings, do the following:</p> <ol style="list-style-type: none"> <li>1) If the pump clock is enabled, write PUMP_ENABLE=0 without changing PUMP_SEL and PUMP_DIV.</li> <li>2) Change PUMP_SEL and PUMP_DIV to desired settings with PUMP_ENABLE=0.</li> <li>3) Write PUMP_ENABLE=1 without changing PUMP_SEL and PUMP_DIV.</li> </ol> <p>Default Value: 0</p> |
| 14 : 12 | PUMP_DIV    | <p>Division ratio for PUMPCLK. Uses selected PUMP_SEL clock as the source.</p> <p>Default Value: 0</p> <p><b>0x0: NO_DIV :</b></p> <p>Transparent mode, feed through selected clock source w/o dividing.</p> <p><b>0x1: DIV_BY_2 :</b></p> <p>Divide selected clock source by 2</p>                                                                                                                                                                                                                                                                         |

## 9.1.14 CLK\_SELECT (continued)

### 0x2: DIV\_BY\_4 :

Divide selected clock source by 4

### 0x3: DIV\_BY\_8 :

Divide selected clock source by 8

### 0x4: DIV\_BY\_16 :

Divide selected clock source by 16

11 : 8 PUMP\_SEL

Selects clock PATH, where k=PUMP\_SEL. The output of this mux goes to the PUMP\_DIV to make PUMPCLK. Each product has a specific number of available clock paths. Selecting a path that is not implemented on a product will result in undefined behavior. Note that this is not a glitch free mux.

Default Value: 0

1 : 0 LFCLK\_SEL

Select source for LFCLK. Note that not all products support all clock sources. Selecting a clock source that is not supported will result in undefined behavior. Writes to this field are ignored unless the WDT is unlocked using WDT\_LOCK register.

Default Value: 0

### 0x0: ILO :

ILO - Internal Low-speed Oscillator

### 0x1: WCO :

WCO - Watch-Crystal Oscillator. Requires Backup domain to be present and properly configured (including external watch crystal, if used).

### 0x2: ALTLF :

ALTLF - Alternate Low-Frequency Clock. Capability is product-specific

### 0x3: PILO :

PILO - Precision ILO. If present, it works in DEEPSLEEP and higher modes. Does not work in HIBERNATE mode.

|---------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31      | ENABLE        | Enable for TIMERCLK.<br>0: TIMERCLK is off<br>1: TIMERCLK is enabled<br>Default Value: 0                                                                                                                                                                                                                                                                                                                                  |
| 23 : 16 | TIMER_DIV     | Divide selected timer clock source by (1+TIMER_DIV). The output of this divider is TIMERCLK. Allows for integer divisions in the range [1, 256]. Do not change this setting while the timer is enabled.<br>Default Value: 7                                                                                                                                                                                               |
| 9 : 8   | TIMER_HF0_DIV | Predivider used when HF0_DIV is selected in TIMER_SEL. If HFCLK0 frequency is less than 100MHz and has approximately 50% duty cycle, then no division is required (NO_DIV). Otherwise, select a divide ratio of 2, 4, or 8 before selected HF0_DIV as the timer clock.<br>Default Value: 0<br><br><b>0x0: NO_DIV :</b><br><br>Transparent mode, feed through selected clock source w/o dividing or correcting duty cycle. |

### 9.1.15 CLK\_TIMER\_CTL (continued)

**0x1: DIV\_BY\_2 :**

Divide HFCLK0 by 2.

**0x2: DIV\_BY\_4 :**

Divide HFCLK0 by 4.

**0x3: DIV\_BY\_8 :**

Divide HFCLK0 by 8.

0      TIMER\_SEL

Select source for TIMERCLK. The output of this mux can be further divided using TIMER\_DIV.  
 Default Value: 0

**0x0: IMO :**

IMO - Internal Main Oscillator

**0x1: HF0\_DIV :**

Select the output of the predivider configured by TIMER\_HF0\_DIV.

## 9.1.18 CLK\_OUTPUT\_FAST (continued)

### 0x2: EXTCLK :

External clock input (EXTCLK)

### 0x3: ALTHF :

Alternate High-Frequency (ALTHF) clock input to SRSS

### 0x4: TIMERCLK :

Timer clock. It is grouped with the fast clocks because it may be a gated version of a fast clock, and therefore may have a short high pulse.

### 0x5: PATH\_SEL1 :

Selects the clock path chosen by PATH\_SEL1 field

### 0x6: HFCLK\_SEL1 :

Selects the output of the HFCLK\_SEL1 mux

### 0x7: SLOW\_SEL1 :

Selects the output of CLK\_OUTPUT\_SLOW.SLOW\_SEL1

11 : 8 HFCLK\_SEL0

Selects a HFCLK tree for use in fast clock output #0  
Default Value: 0

7 : 4 PATH\_SEL0

Selects a clock path to use in fast clock output #0 logic. 0: FLL output  
1-15: PLL output on path1-path15 (if available)  
Default Value: 0

3 : 0 FAST\_SEL0

Select signal for fast clock output #0  
Default Value: 0

### 0x0: NC :

Disabled - output is 0. For power savings, clocks are blocked before entering any muxes, including PATH\_SEL0 and HFCLK\_SEL0.

### 0x1: ECO :

External Crystal Oscillator (ECO)

### 0x2: EXTCLK :

External clock input (EXTCLK)

### 0x3: ALTHF :

Alternate High-Frequency (ALTHF) clock input to SRSS

### 9.1.18 CLK\_OUTPUT\_FAST (continued)

**0x4: TIMERCLK :**

Timer clock. It is grouped with the fast clocks because it may be a gated version of a fast clock, and therefore may have a short high pulse.

**0x5: PATH\_SEL0 :**

Selects the clock path chosen by PATH\_SEL0 field

**0x6: HFCLK\_SEL0 :**

Selects the output of the HFCLK\_SEL0 mux

**0x7: SLOW\_SEL0 :**

Selects the output of CLK\_OUTPUT\_SLOW.SLOW\_SEL0

|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31     | CAL_COUNTER_DONE | Status bit indicating that the internal counter #1 is finished counting and CLK_CAL_CNT2.COUNTER stopped counting up<br>Default Value: 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 23 : 0 | CAL_COUNTER1     | Down-counter clocked on fast clock output #0 (see CLK_OUTPUT_FAST). This register always reads as zero. Counting starts internally when this register is written with a nonzero value. CAL_COUNTER_DONE goes immediately low to indicate that the counter has started and will be asserted when the counters are done. Do not write this field unless CAL_COUNTER_DONE==1. Both clocks must be running or the measurement will not complete. A stalled counter can be recovered by selecting valid clocks, waiting until the measurement completes, and discarding the first result.<br>Default Value: 0 |

|------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31   | FLL_ENABLE | <p>Master enable for FLL. The FLL requires firmware sequencing when enabling, disabling, and entering/exiting DEEPSLEEP.</p> <p>To enable the FLL, first enable the CCO by writing CLK_FLL_CONFIG4.CCO_ENABLE=1 and wait until CLK_FLL_STATUS.CCO_READY==1. Next, ensure the reference clock has stabilized and CLK_FLL_CONFIG3.BYPASS_SEL=FLL_REF. Next, write FLL_ENABLE=1 and wait until CLK_FLL_STATUS.LOCKED==1. Finally, write CLK_FLL_CONFIG3.BYPASS_SEL=FLL_OUT to switch to the FLL output. It takes seven reference clock cycles plus four FLL output cycles to switch to the FLL output. Do not disable the FLL before this time completes.</p> <p>To disable the FLL, write CLK_FLL_CONFIG3.BYPASS_SEL=FLL_REF and (optionally) read the same register to ensure the write completes. Then, wait at least seven FLL reference clock cycles before disabling it with FLL_ENABLE=0. Lastly, disable the CCO by writing CLK_FLL_CONFIG4.CCO_ENABLE=0.</p> <p>Before entering DEEPSLEEP, either disable the FLL using above sequence or use the following procedure to deselect/select it before/after DEEPSLEEP. Before entering DEEPSLEEP, write CLK_FLL_CONFIG3.BYPASS_SEL=FLL_REF to change the FLL to use its reference clock. After DEEPSLEEP wakeup, wait until CLK_FLL_STATUS.LOCKED==1 and then write CLK_FLL_CONFIG3.BYPASS_SEL=FLL_OUT to switch to the FLL output.</p> <p>0: Block is powered off<br/>         1: Block is powered on<br/>         Default Value: 0</p> |

| 0    | WDT_MATCH | Mask for watchdog timer. Clearing this bit will not forward the interrupt to the CPU. It will not, however, disable the WDT reset generation on 2 missed interrupts. When WDT resets the chip, it also internally pends an interrupt that survives the reset. To prevent unintended ISR execution, clear SRSS_INTR.WDT_MATCH before setting this bit.<br>Default Value: 0 |

| 31 : 30 | ACT_REG_BOOST | <p>Controls the tradeoff between output current and internal operating current for the Active Regulator. The maximum output current depends on the silicon implementation, but an application may limit its maximum current to less than that. This may allow a reduction in the internal operating current of the regulator. The regulator internal operating current depends on the boost setting:</p> <p>2'b00: 50uA<br/>           2'b01: 100uA<br/>           2'b10: 150uA<br/>           2'b11: 200uA</p> <p>The allowed setting is a lookup table based on the chip-specific maximum (set in factory) and an application-specific maximum (set by customer). The defaults are set assuming the application consumes the maximum allowed by the chip.</p> <p>50mA chip: 2'b00 (default);<br/>           100mA chip: 2'b00 (default);<br/>           150mA chip: 50..100mA app =&gt; 2'b00, 150mA app =&gt; 2'b01 (default);<br/>           200mA chip: 50mA app =&gt; 2'b00, 100..150mA app =&gt; 2'b01, 200mA app =&gt; 2'b10 (default);<br/>           250mA chip: 50mA app =&gt; 2'b00, 100..150mA app =&gt; 2'b01, 200..250mA app =&gt; 2'b10 (default);<br/>           300mA chip: 50mA app =&gt; 2'b00, 100..150mA app =&gt; 2'b01, 200..250mA app =&gt; 2'b10, 300mA app =&gt; 2'b11 (default);</p> <p>This register is only reset by XRES/POR/BOD/HIBERNATE.<br/>           Default Value: X</p> |

|-------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 : 0 | ACT_REG_TRIM | Trim for the Active-Regulator. This sets the output voltage level. This register is only reset by XRES/POR/BOD/HIBERNATE. Two voltages are supported: 0.9V and 1.1V. The codes for these are stored in SFLASH_LDO_0P9V_TRIM and SFLASH_LDO_1P1V_TRIM, respectively. Default Value: 23 |
|-------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# 10 Multi-Counter WDT (MCWDT) Registers

This section discusses the Multi-Counter WDT (MCWDT) registers. It lists all the registers in mapping tables, in address order.

## 10.1 Register Details

| Register                           | Address    | Description                                                                                                                     |
|------------------------------------|------------|---------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">MCWDT_CNTLOW0</a>      | 0x40260204 | Multi-Counter Watchdog Sub-counters 0/1                                                                                         |
| <a href="#">MCWDT_CNTHIGH0</a>     | 0x40260208 | Multi-Counter Watchdog Sub-counter 2                                                                                            |
| <a href="#">MCWDT_MATCH0</a>       | 0x4026020C | Multi-Counter Watchdog Counter Match Register                                                                                   |
| <a href="#">MCWDT_CONFIG0</a>      | 0x40260210 | Multi-Counter Watchdog Counter Configuration                                                                                    |
| <a href="#">MCWDT_CTL0</a>         | 0x40260214 | Multi-Counter Watchdog Counter Control                                                                                          |
| <a href="#">MCWDT_INTR0</a>        | 0x40260218 | Multi-Counter Watchdog Counter Interrupt Register                                                                               |
| <a href="#">MCWDT_INTR_SET0</a>    | 0x4026021C | Multi-Counter Watchdog Counter Interrupt Set Register                                                                           |
| <a href="#">MCWDT_INTR_MASK0</a>   | 0x40260220 | Multi-Counter Watchdog Counter Interrupt Mask Register                                                                          |
| <a href="#">MCWDT_INTR_MASKED0</a> | 0x40260224 | Multi-Counter Watchdog Counter Interrupt Masked Register                                                                        |
| <a href="#">MCWDT_LOCK0</a>        | 0x40260228 | Multi-Counter Watchdog Counter Lock Register                                                                                    |
| MCWDT_CNTLOW1                      | 0x40260244 | Multi-Counter Watchdog Sub-counters 0/1. See <a href="#">MCWDT_CNTLOW0</a> for the details of bit fields.                       |
| MCWDT_CNTHIGH1                     | 0x40260248 | Multi-Counter Watchdog Sub-counter 2. See <a href="#">MCWDT_CNTHIGH0</a> for the details of bit fields.                         |
| MCWDT_MATCH1                       | 0x4026024C | Multi-Counter Watchdog Counter Match Register. See <a href="#">MCWDT_MATCH0</a> for the details of bit fields.                  |

| Bits    | Name       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 30 | MCWDT_LOCK | <p>Prohibits writing control and configuration registers related to this MCWDT when not equal 0 (as specified in the other register descriptions). Requires at least two different writes to unlock. Note that this field is 2 bits to force multiple writes only. Each MCWDT has a separate local lock. LFCLK settings are locked by the global WDT_LOCK register, and this register has no effect on that.</p> <p>Default Value: 0</p> <p><b>0x0: NO_CHG :</b></p> <p>No effect</p> <p><b>0x1: CLR0 :</b></p> <p>Clears bit 0</p> <p><b>0x2: CLR1 :</b></p> <p>Clears bit 1</p> |

### 10.1.10 MCWDT\_LOCK0 (continued)

**0x3: SET01 :**

Sets both bits 0 and 1

# 11 Backup System Registers

This section discusses the Backup System registers. It lists all the registers in mapping tables, in address order.

## 11.1 Register Details

| Register                           | Address    | Description                                                                             |
|------------------------------------|------------|-----------------------------------------------------------------------------------------|
| <a href="#">BACKUP_CTL</a>         | 0x40270000 | Control                                                                                 |
| <a href="#">BACKUP_RTC_RW</a>      | 0x40270008 | RTC Read Write register                                                                 |
| <a href="#">BACKUP_CAL_CTL</a>     | 0x4027000C | Oscillator calibration for absolute frequency                                           |
| <a href="#">BACKUP_STATUS</a>      | 0x40270010 | Status                                                                                  |
| <a href="#">BACKUP_RTC_TIME</a>    | 0x40270014 | Calendar Seconds, Minutes, Hours, Day of Week                                           |
| <a href="#">BACKUP_RTC_DATE</a>    | 0x40270018 | Calendar Day of Month, Month, Year                                                      |
| <a href="#">BACKUP_ALM1_TIME</a>   | 0x4027001C | Alarm 1 Seconds, Minute, Hours, Day of Week                                             |
| <a href="#">BACKUP_ALM1_DATE</a>   | 0x40270020 | Alarm 1 Day of Month, Month                                                             |
| <a href="#">BACKUP_ALM2_TIME</a>   | 0x40270024 | Alarm 2 Seconds, Minute, Hours, Day of Week                                             |
| <a href="#">BACKUP_ALM2_DATE</a>   | 0x40270028 | Alarm 2 Day of Month, Month                                                             |
| <a href="#">BACKUP_INTR</a>        | 0x4027002C | Interrupt request register                                                              |
| <a href="#">BACKUP_INTR_SET</a>    | 0x40270030 | Interrupt set request register                                                          |
| <a href="#">BACKUP_INTR_MASK</a>   | 0x40270034 | Interrupt mask register                                                                 |
| <a href="#">BACKUP_INTR_MASKED</a> | 0x40270038 | Interrupt masked request register                                                       |
| <a href="#">BACKUP_OSCCNT</a>      | 0x4027003C | 32kHz oscillator counter                                                                |
| <a href="#">BACKUP_TICKS</a>       | 0x40270040 | 128Hz tick counter                                                                      |
| <a href="#">BACKUP_PMIC_CTL</a>    | 0x40270044 | PMIC control register                                                                   |
| <a href="#">BACKUP_RESET</a>       | 0x40270048 | Backup reset register                                                                   |
| <a href="#">BACKUP_BREG0</a>       | 0x40271000 | Backup register region                                                                  |
| <a href="#">BACKUP_BREG1</a>       | 0x40271004 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_BREG2</a>       | 0x40271008 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_BREG3</a>       | 0x4027100C | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_BREG4</a>       | 0x40271010 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_BREG5</a>       | 0x40271014 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_BREG6</a>       | 0x40271018 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_BREG7</a>       | 0x4027101C | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_BREG8</a>       | 0x40271020 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |

| Register                    | Address    | Description                                                                             |
|-----------------------------|------------|-----------------------------------------------------------------------------------------|
| BACKUP_BREG9                | 0x40271024 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| BACKUP_BREG10               | 0x40271028 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| BACKUP_BREG11               | 0x4027102C | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| BACKUP_BREG12               | 0x40271030 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| BACKUP_BREG13               | 0x40271034 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| BACKUP_BREG14               | 0x40271038 | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| BACKUP_BREG15               | 0x4027103C | Backup register region. See <a href="#">BACKUP_BREG0</a> for the details of bit fields. |
| <a href="#">BACKUP_TRIM</a> | 0x4027FF00 | Trim Register                                                                           |

## 11.1.1 BACKUP\_CTL

Control

Address: 0x40270000

|---------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31 : 24 | EN_CHARGE_KEY | When set to 3C, the supercap charger circuit is enabled. Any other code disables the supercap charger. THIS CHARGING CIRCUIT IS FOR A SUPERCAP ONLY AND CANNOT SAFELY CHARGE A BATTERY. DO NOT WRITE THIS KEY WHEN VBACKUP IS CONNECTED TO A BATTERY.<br>Default Value: 0                                                                               |
| 19      | VBACKUP_MEAS  | Connect vbackup supply to the vbackup_meas output for measurement by an ADC attached to amuxbusa_adft_vddd. The vbackup_meas signal is scaled by 40% so it is within the supply range of the ADC.<br>Default Value: 0                                                                                                                                   |
| 18 : 17 | VDDBAK_CTL    | Controls the behavior of the switch that generates vddbak from vbackup or vddd.<br>0: automatically select vddd if its brownout detector says it is valid. If the brownout says its not valid, then use vmax which is the highest of vddd or vbackup.<br>1,2,3: force vddbak and vmax to select vbackup, regardless of its voltage.<br>Default Value: 0 |

### 11.1.1 BACKUP\_CTL (continued)

|         |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16      | WCO_BYPASS | <p>Configures the WCO for different board-level connections to the WCO pins. For example, this can be used to connect an external watch crystal oscillator instead of a watch crystal. In all cases, the two related GPIO pins (WCO input and output pins) must be configured as analog connections using GPIO registers, and they must be hooked at the board level as described below. Configure this field before enabling the WCO, and do not change this setting when WCO_EN=1.</p> <p>0: Watch crystal. Connect a 32.768 kHz watch crystal between WCO input and output pins.</p> <p>1: Clock signal, either a square wave or sine wave. See PRESCALER field for connection information.</p> <p>Default Value: 0</p> |
| 13 : 12 | PRESCALER  | <p>Prescaler for real time clock used when WCO_BYPASS=1. Configure this field before enabling the WCO, and do not change this setting when WCO_EN=1.</p> <p>0: 32768 Hz square wave. Connect a 32768 Hz square wave to WCO output pin. Do not connect WCO input pin.</p> <p>1: 60 Hz sine wave. Connect an AC-coupled sine wave to WCO input pin. Do not connect the WCO output pin at the board level.</p> <p>2: 50 Hz sine wave. Connect an AC-couple sine wave to WCO input pin. Do not connect the WCO output pin at the board level.</p> <p>3: reserved (32768 Hz)</p> <p>Default Value: 0</p>                                                                                                                        |
| 9 : 8   | CLK_SEL    | <p>Clock select for BAK clock</p> <p>Default Value: 0</p> <p><b>0x0: WCO :</b></p> <p>Watch-crystal oscillator input.</p> <p><b>0x1: ALTBAK :</b></p> <p>This allows to use the LFCLK selection as an alternate backup domain clock. Note that LFCLK is not available in all power modes, and clock glitches can propagate into the backup logic when the clock is stopped. For this reason, if the WCO is intended as the clock source then choose it directly instead of routing through LFCLK.</p>                                                                                                                                                                                                                      |
| 3       | WCO_EN     | <p>Watch-crystal oscillator (WCO) enable. If there is a write in progress when this bit is cleared, the WCO will be internally kept on until the write completes.</p> <p>After enabling the WCO software must wait until STATUS.WCO_OK=1 before configuring any component that depends on clk_lf/clk_bak, like for example RTC or WDTs.</p> <p>Default Value: 0</p>                                                                                                                                                                                                                                                                                                                                                        |

| Name      | None [23:17]  |                |               |              |    |    |    | POLARITY |
| Bits      | 31            | 30             | 29            | 28           | 27 | 26 | 25 | 24       |
| SW Access | RW            | RW1S           | RW            | None         |    |    |    |          |
| HW Access | A             | R              | A             | None         |    |    |    |          |
| Name      | PMIC_EN       | PMIC_ALWAYSSEN | PMIC_EN_OUTEN | None [28:24] |    |    |    |          |

| Bits | Name           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31   | PMIC_EN        | Enable for external PMIC that supplies vddd (if present). This bit will only clear if UNLOCK was written correctly in a previous write operation and PMIC_ALWAYSSEN=0. When PMIC_EN=0, the system functions normally until vddd is no longer present (OFF w/Backup mode). Firmware can set this bit, if it does so before vddd is actually removed. This bit is also set by any RTC alarm or PMIC pin wakeup event regardless of UNLOCK setting.<br>Default Value: 1 |
| 30   | PMIC_ALWAYSSEN | Override normal PMIC controls to prevent accidentally turning off the PMIC by errant firmware.<br>0: Normal operation, PMIC_EN and PMIC_OUTEN work as described<br>1: PMIC_EN and PMIC_OUTEN are ignored and the output pad is forced enabled.<br>Note: This bit is a write-once bit until the next backup reset.<br>Default Value: 0                                                                                                                                |
| 29   | PMIC_EN_OUTEN  | Output enable for the output driver in the PMIC_EN pad.<br>0: Output pad is tristate for PMIC_EN pin. This can allow this pin to be used for another purpose. Tristate condition is kept only if the UNLOCK key (0x3A) is present<br>1: Output pad is enabled for PMIC_EN pin.<br>Default Value: 1                                                                                                                                                                   |

### 11.1.17 **BACKUP\_PMIC\_CTL** (continued)

|        |          |                                                                                                                                                                                                                                                                                                                          |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16     | POLARITY | Set polarity of wakeup signal used to enable the PMIC. Always write this bit "1".<br>0: reserved for future use,<br>1: PMIC enables when wakeup signal is high.<br>Default Value: 0                                                                                                                                      |
| 15 : 8 | UNLOCK   | This byte must be set to 0x3A for PMIC to be disabled. When the UNLOCK code is not present: writes to PMIC_EN field are ignored and the hardware ignores the value in PMIC_EN. Do not change PMIC_EN in the same write cycle as setting/clearing the UNLOCK code; do these in separate write cycles.<br>Default Value: 0 |

## 11.1.18 BACKUP\_RESET

Backup reset register

Address: 0x40270048

Retention: Retained

| Bits      | 7          | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|---|
| SW Access | None       |   |   |   |   |   |   |   |
| HW Access | None       |   |   |   |   |   |   |   |
| Name      | None [7:0] |   |   |   |   |   |   |   |

# 12 Direct Memory Access (DMA) Registers

This section discusses the Direct Memory Access (DMA) registers. It lists all the registers in mapping tables, in address order.

## 12.1 Register Details

| Register                                   | Address    | Description                                                                                                       |
|--------------------------------------------|------------|-------------------------------------------------------------------------------------------------------------------|
| <a href="#">DW0_CTL0</a>                   | 0x40280000 | Control                                                                                                           |
| <a href="#">DW0_STATUS0</a>                | 0x40280004 | Status                                                                                                            |
| <a href="#">DW0_PENDING0</a>               | 0x40280008 | Pending channels                                                                                                  |
| <a href="#">DW0_STATUS_INTR0</a>           | 0x40280010 | System interrupt control                                                                                          |
| <a href="#">DW0_STATUS_INTR_MASKED0</a>    | 0x40280014 | Status of interrupts masked                                                                                       |
| <a href="#">DW0_ACT_DESCR_CTL0</a>         | 0x40280020 | Active descriptor control                                                                                         |
| <a href="#">DW0_ACT_DESCR_SRC0</a>         | 0x40280024 | Active descriptor source                                                                                          |
| <a href="#">DW0_ACT_DESCR_DST0</a>         | 0x40280028 | Active descriptor destination                                                                                     |
| <a href="#">DW0_ACT_DESCR_X_CTL0</a>       | 0x40280030 | Active descriptor X loop control                                                                                  |
| <a href="#">DW0_ACT_DESCR_Y_CTL0</a>       | 0x40280034 | Active descriptor Y loop control                                                                                  |

|------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31   | ENABLED     | <p>Channel enable:</p> <p>0: Disabled. The channels trigger is ignored and the channel cannot be made pending and therefore cannot be made active. If a pending channel is disabled, the channel is made non pending. If the activate channel is disabled, the channel is de-activated (bus transactions are completed).</p> <p>1: Enabled.</p> <p>SW sets this field to 1 to enable a specific channel.</p> <p>HW sets this field to 0 on an error interrupt cause (the specific error is specified by CH_STATUS.INTR_CAUSE).</p> <p>Default Value: 0</p>                                                                                                               |
| 18   | PREEMPTABLE | <p>Specifies if the channel is preemptable.</p> <p>'0': Not preemptable.</p> <p>1: Preemptable. This field allows higher priority pending channels (from a higher priority group; i.e. an active channel can NOT be preempted by a pending channel in the same priority group) to preempt the active channel in between "single transfers" (a 1D transfer consists out of X_COUNT single transfers; a 2D transfer consists out of X_COUNT*Y_COUNT single transfers). Preemption will NOT affect the pending status of channel. As a result, after completion of a higher priority activated channel, the current channel may be reactivated.</p> <p>Default Value: 0</p> |

## 12.1.14 DW0\_CH\_STRUCT0\_CH\_CTL (continued)

|         |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 22 : 16 | MON_SEL     | This field specifies the monitor input signal to be observed by the profiling counter.<br>The monitor signals are product specific, see product definition spreadsheet tab "Monitor" for details.<br>Default Value: 0                                                                                                                                                                              |
| 6 : 4   | REF_CLK_SEL | This field specifies the reference clock used for a counting time base when counting durations.<br>Has no effect when CTL.CNT_DURATION=0.<br>Default Value: 0<br><br><b>0x0: CLK_TIMER :</b><br>Timer clock (divided or undivided high frequency clock, e.g. from IMO). Selection is done in SRSS register CLK_TIMER_CTL.TIMER_SEL.<br><br><b>0x1: CLK_IMO :</b><br>IMO - Internal Main Oscillator |

### 14.1.8 PROFILE\_CNT\_STRUCT0\_CTL (continued)

**0x2: CLK\_ECO :**

ECO - External-Crystal Oscillator

**0x3: CLK\_LF :**

Low frequency clock (ILO, WCO or ALTLF).

Selection is done in SRSS register CLK\_SELECT.LFCLK\_SEL.

**0x4: CLK\_HF :**

High frequency clock ("clk\_hfx").

**0x5: CLK\_PERI :**

Peripheral clock ("clk\_peri").

**0x6: RESERVED\_6 :**

Reserved. Do not use.

When using, the behavior of this profiling counter is undefined.

**0x7: RESERVED\_7 :**

Reserved. Do not use.

When using, the behavior of this profiling counter is undefined.

0 CNT\_DURATION

This field specifies if events (edges) or a duration of the monitor signal is counted.

'0': Events are monitored. An edge detection is done. All edges of the selected monitor signal are counted.

'1': A duration is monitored. No edge detection is done. The monitored signal is taken as a (high active) level signal for enabling the profiling counter.

Note: All monitor signals which only can represent events are edge encoded in hardware, therefore a selection of CTL.CNT\_DURATION=1 will not produce meaningful results.

Default Value: 0

## 14.1.9 PROFILE\_CNT\_STRUCT0\_CNT

Profile counter value

Address: 0x402D0808

# 15 High Speed IO Matrix (HSIOM) Registers

This section discusses the High-Speed I/O Matrix (HSIOM) registers. It lists all the registers in mapping tables, in address order.

## 15.1 Register Details

| Register                             | Address    | Description                                                                               |
|--------------------------------------|------------|-------------------------------------------------------------------------------------------|
| <a href="#">HSIOM_PRT0_PORT_SEL0</a> | 0x40310000 | Port selection 0                                                                          |
| <a href="#">HSIOM_PRT0_PORT_SEL1</a> | 0x40310004 | Port selection 1                                                                          |
| HSIOM_PRT1_PORT_SEL0                 | 0x40310010 | Port selection 0. See <a href="#">HSIOM_PRT0_PORT_SEL0</a> for the details of bit fields. |
| HSIOM_PRT1_PORT_SEL1                 | 0x40310014 | Port selection 1. See <a href="#">HSIOM_PRT0_PORT_SEL1</a> for the details of bit fields. |
| HSIOM_PRT2_PORT_SEL0                 | 0x40310020 | Port selection 0. See <a href="#">HSIOM_PRT0_PORT_SEL0</a> for the details of bit fields. |
| <a href="#">HSIOM_PRT2_PORT_SEL1</a> | 0x40310024 | Port selection 1                                                                          |

|---|--------------|-----------------------------------------------------------------------------------------------------------|

# 16 General Purpose I/O (GPIO) Registers

This section discusses the General Purpose I/O (GPIO) registers. It lists all the registers in mapping tables, in address order.

## 16.1 Register Details

| Register                              | Address    | Description                                                                                                     |
|---------------------------------------|------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">GPIO_PRT0_OUT</a>         | 0x40320000 | Port output data register                                                                                       |
| <a href="#">GPIO_PRT0_OUT_CLR</a>     | 0x40320004 | Port output data clear register                                                                                 |
| <a href="#">GPIO_PRT0_OUT_SET</a>     | 0x40320008 | Port output data set register                                                                                   |
| <a href="#">GPIO_PRT0_OUT_INV</a>     | 0x4032000C | Port output data invert register                                                                                |
| <a href="#">GPIO_PRT0_IN</a>          | 0x40320010 | Port input state register                                                                                       |
| <a href="#">GPIO_PRT0_INTR</a>        | 0x40320014 | Port interrupt status register                                                                                  |
| <a href="#">GPIO_PRT0_INTR_MASK</a>   | 0x40320018 | Port interrupt mask register                                                                                    |
| <a href="#">GPIO_PRT0_INTR_MASKED</a> | 0x4032001C | Port interrupt masked status register                                                                           |
| <a href="#">GPIO_PRT0_INTR_SET</a>    | 0x40320020 | Port interrupt set register                                                                                     |
| <a href="#">GPIO_PRT0_INTR_CFG</a>    | 0x40320024 | Port interrupt configuration register                                                                           |
| <a href="#">GPIO_PRT0_CFG</a>         | 0x40320028 | Port configuration register                                                                                     |
| <a href="#">GPIO_PRT0_CFG_IN</a>      | 0x4032002C | Port input buffer configuration register                                                                        |
| <a href="#">GPIO_PRT0_CFG_OUT</a>     | 0x40320030 | Port output buffer configuration register                                                                       |
| <a href="#">GPIO_PRT1_OUT</a>         | 0x40320080 | Port output data register. See <a href="#">GPIO_PRT0_OUT</a> for the details of bit fields.                     |
| <a href="#">GPIO_PRT1_OUT_CLR</a>     | 0x40320084 | Port output data clear register. See <a href="#">GPIO_PRT0_OUT_CLR</a> for the details of bit fields.           |
| <a href="#">GPIO_PRT1_OUT_SET</a>     | 0x40320088 | Port output data set register. See <a href="#">GPIO_PRT0_OUT_SET</a> for the details of bit fields.             |
| <a href="#">GPIO_PRT1_OUT_INV</a>     | 0x4032008C | Port output data invert register. See <a href="#">GPIO_PRT0_OUT_INV</a> for the details of bit fields.          |
| <a href="#">GPIO_PRT1_IN</a>          | 0x40320090 | Port input state register. See <a href="#">GPIO_PRT0_IN</a> for the details of bit fields.                      |
| <a href="#">GPIO_PRT1_INTR</a>        | 0x40320094 | Port interrupt status register. See <a href="#">GPIO_PRT0_INTR</a> for the details of bit fields.               |
| <a href="#">GPIO_PRT1_INTR_MASK</a>   | 0x40320098 | Port interrupt mask register. See <a href="#">GPIO_PRT0_INTR_MASK</a> for the details of bit fields.            |
| <a href="#">GPIO_PRT1_INTR_MASKED</a> | 0x4032009C | Port interrupt masked status register. See <a href="#">GPIO_PRT0_INTR_MASKED</a> for the details of bit fields. |
| <a href="#">GPIO_PRT1_INTR_SET</a>    | 0x403200A0 | Port interrupt set register. See <a href="#">GPIO_PRT0_INTR_SET</a> for the details of bit fields.              |
| <a href="#">GPIO_PRT1_INTR_CFG</a>    | 0x403200A4 | Port interrupt configuration register. See <a href="#">GPIO_PRT0_INTR_CFG</a> for the details of bit fields.    |
| <a href="#">GPIO_PRT1_CFG</a>         | 0x403200A8 | Port configuration register. See <a href="#">GPIO_PRT0_CFG</a> for the details of bit fields.                   |
| <a href="#">GPIO_PRT1_CFG_IN</a>      | 0x403200AC | Port input buffer configuration register. See <a href="#">GPIO_PRT0_CFG_IN</a> for the details of bit fields.   |
| <a href="#">GPIO_PRT1_CFG_OUT</a>     | 0x403200B0 | Port output buffer configuration register. See <a href="#">GPIO_PRT0_CFG_OUT</a> for the details of bit fields. |
| <a href="#">GPIO_PRT2_OUT</a>         | 0x40320100 | Port output data register                                                                                       |

| Register                               | Address    | Description                                                                                                     |
|----------------------------------------|------------|-----------------------------------------------------------------------------------------------------------------|
| GPIO_PRT2_OUT_CLR                      | 0x40320104 | Port output data clear register. See <a href="#">GPIO_PRT0_OUT_CLR</a> for the details of bit fields.           |
| GPIO_PRT2_OUT_SET                      | 0x40320108 | Port output data set register. See <a href="#">GPIO_PRT0_OUT_SET</a> for the details of bit fields.             |
| GPIO_PRT2_OUT_INV                      | 0x4032010C | Port output data invert register. See <a href="#">GPIO_PRT0_OUT_INV</a> for the details of bit fields.          |
| <a href="#">GPIO_PRT2_IN</a>           | 0x40320110 | Port input state register                                                                                       |
| <a href="#">GPIO_PRT2_INTR</a>         | 0x40320114 | Port interrupt status register                                                                                  |
| <a href="#">GPIO_PRT2_INTR_MASK</a>    | 0x40320118 | Port interrupt mask register                                                                                    |
| <a href="#">GPIO_PRT2_INTR_MASKEDT</a> | 0x4032011C | Port interrupt masked status register                                                                           |
| <a href="#">GPIO_PRT2_INTR_SET</a>     | 0x40320120 | Port interrupt set register                                                                                     |
| <a href="#">GPIO_PRT2_INTR_CFG</a>     | 0x40320124 | Port interrupt configuration register                                                                           |
| <a href="#">GPIO_PRT2_CFG</a>          | 0x40320128 | Port configuration register                                                                                     |
| <a href="#">GPIO_PRT2_CFG_IN</a>       | 0x4032012C | Port input buffer configuration register                                                                        |
| <a href="#">GPIO_PRT2_CFG_OUT</a>      | 0x40320130 | Port output buffer configuration register                                                                       |
| GPIO_PRT3_OUT                          | 0x40320180 | Port output data register. See <a href="#">GPIO_PRT0_OUT</a> for the details of bit fields.                     |
| GPIO_PRT3_OUT_CLR                      | 0x40320184 | Port output data clear register. See <a href="#">GPIO_PRT0_OUT_CLR</a> for the details of bit fields.           |
| GPIO_PRT3_OUT_SET                      | 0x40320188 | Port output data set register. See <a href="#">GPIO_PRT0_OUT_SET</a> for the details of bit fields.             |
| GPIO_PRT3_OUT_INV                      | 0x4032018C | Port output data invert register. See <a href="#">GPIO_PRT0_OUT_INV</a> for the details of bit fields.          |
| GPIO_PRT3_IN                           | 0x40320190 | Port input state register. See <a href="#">GPIO_PRT0_IN</a> for the details of bit fields.                      |
| GPIO_PRT3_INTR                         | 0x40320194 | Port interrupt status register. See <a href="#">GPIO_PRT0_INTR</a> for the details of bit fields.               |
| GPIO_PRT3_INTR_MASK                    | 0x40320198 | Port interrupt mask register. See <a href="#">GPIO_PRT0_INTR_MASK</a> for the details of bit fields.            |
| GPIO_PRT3_INTR_MASKED                  | 0x4032019C | Port interrupt masked status register. See <a href="#">GPIO_PRT0_INTR_MASKED</a> for the details of bit fields. |
| GPIO_PRT3_INTR_SET                     | 0x403201A0 | Port interrupt set register. See <a href="#">GPIO_PRT0_INTR_SET</a> for the details of bit fields.              |
| GPIO_PRT3_INTR_CFG                     | 0x403201A4 | Port interrupt configuration register. See <a href="#">GPIO_PRT0_INTR_CFG</a> for the details of bit fields.    |
| GPIO_PRT3_CFG                          | 0x403201A8 | Port configuration register. See <a href="#">GPIO_PRT0_CFG</a> for the details of bit fields.                   |
| GPIO_PRT3_CFG_IN                       | 0x403201AC | Port input buffer configuration register. See <a href="#">GPIO_PRT0_CFG_IN</a> for the details of bit fields.   |
| GPIO_PRT3_CFG_OUT                      | 0x403201B0 | Port output buffer configuration register. See <a href="#">GPIO_PRT0_CFG_OUT</a> for the details of bit fields. |
| <a href="#">GPIO_PRT4_OUT</a>          | 0x40320200 | Port output data register                                                                                       |
| GPIO_PRT4_OUT_CLR                      | 0x40320204 | Port output data clear register. See <a href="#">GPIO_PRT0_OUT_CLR</a> for the details of bit fields.           |
| GPIO_PRT4_OUT_SET                      | 0x40320208 | Port output data set register. See <a href="#">GPIO_PRT0_OUT_SET</a> for the details of bit fields.             |
| GPIO_PRT4_OUT_INV                      | 0x4032020C | Port output data invert register. See <a href="#">GPIO_PRT0_OUT_INV</a> for the details of bit fields.          |
| <a href="#">GPIO_PRT4_IN</a>           | 0x40320210 | Port input state register                                                                                       |
| <a href="#">GPIO_PRT4_INTR</a>         | 0x40320214 | Port interrupt status register                                                                                  |
| <a href="#">GPIO_PRT4_INTR_MASK</a>    | 0x40320218 | Port interrupt mask register                                                                                    |
| <a href="#">GPIO_PRT4_INTR_MASKED</a>  | 0x4032021C | Port interrupt masked status register                                                                           |
| <a href="#">GPIO_PRT4_INTR_SET</a>     | 0x40320220 | Port interrupt set register                                                                                     |
| <a href="#">GPIO_PRT4_INTR_CFG</a>     | 0x40320224 | Port interrupt configuration register                                                                           |
| <a href="#">GPIO_PRT4_CFG</a>          | 0x40320228 | Port configuration register                                                                                     |
| <a href="#">GPIO_PRT4_CFG_IN</a>       | 0x4032022C | Port input buffer configuration register                                                                        |
| <a href="#">GPIO_PRT4_CFG_OUT</a>      | 0x40320230 | Port output buffer configuration register                                                                       |
| GPIO_PRT5_OUT                          | 0x40320280 | Port output data register. See <a href="#">GPIO_PRT2_OUT</a> for the details of bit fields.                     |

| 3     | IN_EN0      | Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue.<br>'0': Input buffer disabled<br>'1': Input buffer enabled<br>Default Value: 0                                                                                                                                                                                                                                                                                                    |
| 2 : 0 | DRIVE_MODE0 | The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode.<br>Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus.<br>Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0').<br>Note: D_OUT, D_OUT_EN are pins of GPIO cell.<br>Default Value: 0 |

#### 0x0: HIGHZ :

Output buffer is off creating a high impedance input  
 D\_OUT = '0': High Impedance  
 D\_OUT = '1': High Impedance

#### 0x1: RESERVED :

This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases.

For GPIO & UDB/DSI peripherals:

When D\_OUT\_EN = 1:

D\_OUT = '0': Strong pull down

D\_OUT = '1': Strong pull up

When D\_OUT\_EN = 0:

D\_OUT = '0': High impedance

D\_OUT = '1': High impedance

For peripherals other than GPIO & UDB/DSI:

When D\_OUT\_EN = 1:

D\_OUT = '0': Strong pull down

D\_OUT = '1': Strong pull up

When D\_OUT\_EN = 0:

D\_OUT = '0': High impedance

D\_OUT = '1': High impedance

## 16.1.11 GPIO\_PRT0\_CFG (continued)

### 0x2: PULLUP :

Resistive pull up  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Weak/resistive pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': Weak/resistive pull up  
   D\_OUT = '1': Weak/resistive pull up

### 0x3: PULLDOWN :

Resistive pull down  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Weak/resistive pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': Weak/resistive pull down  
   D\_OUT = '1': Weak/resistive pull down

### 0x4: OD\_DRIVESLOW :

Open drain, drives low  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': High Impedance  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': High Impedance

## 16.1.11 GPIO\_PRT0\_CFG (continued)

### 0x5: OD\_DRIVESHIGH :

Open drain, drives high  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': High Impedance

### 0x6: STRONG :

Strong D\_OUTput buffer  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': High Impedance

### 0x7: PULLUP\_DOWN :

Pull up or pull down  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = '0':  
   GPIO\_DSI\_OUT = '0': Weak/resistive pull down  
   GPIO\_DSI\_OUT = '1': Weak/resistive pull up  
 where "GPIO\_DSI\_OUT" is a function of PORT\_SEL, OUT & DSI\_DATA\_OUT.  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': Weak/resistive pull down  
   D\_OUT = '1': Weak/resistive pull up

### 0x2: PULLUP :

Resistive pull up  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Weak/resistive pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': Weak/resistive pull up  
   D\_OUT = '1': Weak/resistive pull up

### 0x3: PULLDOWN :

Resistive pull down  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Weak/resistive pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': Weak/resistive pull down  
   D\_OUT = '1': Weak/resistive pull down

### 0x4: OD\_DRIVESLOW :

Open drain, drives low  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': High Impedance  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': High Impedance

## 16.1.21 GPIO\_PRT2\_CFG (continued)

### 0x5: OD\_DRIVESHIGH :

Open drain, drives high  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': High Impedance

### 0x6: STRONG :

Strong D\_OUTput buffer  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High impedance  
   D\_OUT = '1': High impedance  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': High Impedance  
   D\_OUT = '1': High Impedance

### 0x7: PULLUP\_DOWN :

Pull up or pull down  
 For GPIO & UDB/DSI peripherals:  
 When D\_OUT\_EN = '0':  
   GPIO\_DSI\_OUT = '0': Weak/resistive pull down  
   GPIO\_DSI\_OUT = '1': Weak/resistive pull up  
 where "GPIO\_DSI\_OUT" is a function of PORT\_SEL, OUT & DSI\_DATA\_OUT.  
 For peripherals other than GPIO & UDB/DSI:  
 When D\_OUT\_EN = 1:  
   D\_OUT = '0': Strong pull down  
   D\_OUT = '1': Strong pull up  
 When D\_OUT\_EN = 0:  
   D\_OUT = '0': Weak/resistive pull down  
   D\_OUT = '1': Weak/resistive pull up

| 21 : 20 | DRIVE_SEL2 | Sets the GPIO drive strength for IO pin 2<br>Default Value: 0 |
| 19 : 18 | DRIVE_SEL1 | Sets the GPIO drive strength for IO pin 1<br>Default Value: 0 |
| 17 : 16 | DRIVE_SEL0 | Sets the GPIO drive strength for IO pin 0<br>Default Value: 0 |

### 16.1.23 GPIO\_PRT2\_CFG\_OUT (continued)

#### 0x0: FULL\_DRIVE :

Full drive strength: GPIO drives current at its max rated spec.

#### 0x1: ONE\_HALF\_DRIVE :

1/2 drive strength: GPIO drives current at 1/2 of its max rated spec

#### 0x2: ONE\_QUARTER\_DRIVE :

1/4 drive strength: GPIO drives current at 1/4 of its max rated spec.

#### 0x3: ONE\_EIGHTH\_DRIVE :

1/8 drive strength: GPIO drives current at 1/8 of its max rated spec.

|   |       |                                                                                                       |
|---|-------|-------------------------------------------------------------------------------------------------------|
| 7 | SLOW7 | Enables slow slew rate for IO pin 7<br>Default Value: 0                                               |
| 6 | SLOW6 | Enables slow slew rate for IO pin 6<br>Default Value: 0                                               |
| 5 | SLOW5 | Enables slow slew rate for IO pin 5<br>Default Value: 0                                               |
| 4 | SLOW4 | Enables slow slew rate for IO pin 4<br>Default Value: 0                                               |
| 3 | SLOW3 | Enables slow slew rate for IO pin 3<br>Default Value: 0                                               |
| 2 | SLOW2 | Enables slow slew rate for IO pin 2<br>Default Value: 0                                               |
| 1 | SLOW1 | Enables slow slew rate for IO pin 1<br>Default Value: 0                                               |
| 0 | SLOW0 | Enables slow slew rate for IO pin 0<br>'0': Fast slew rate<br>'1': Slow slew rate<br>Default Value: 0 |
