PSOC™ Edge E8x2, E8x3, E8x5, E8x6 registers

Reference manual

About this document

Scope and purpose

The reference manual lists all the registers in the mapping tables of the PSOC™ Edge E8x2, E8x3, E8x5, and E8x6 registers in address order.
For architecture details, see PSOC™ Edge E8x2, E8x3, E8x5, E8x6 architecture reference manual.

Intended audience

This reference manual is intended for the embedded hardware engineers, software developers, and system architects who want to understand the register details of the Infineon PSOC™ Edge E8x2, E8x3, E8x5, and E8x6 series of microcontrollers.

Register mapping

The Register mapping section discusses the registers of the PSOC™ Edge devices. This document should be used in conjunction with PSOC™ Edge E8x2, E8x3, E8x5, E8x6 architecture reference manual. Register mapping section lists all the registers in mapping tables, in address order.

Register general conventions

The register conventions specific to this section and the Register Reference chapter are listed in this table.

Convention	Description	Explanation
RW	Read/Write	These bits can be both read and written.
R	Read only	These bits can only be read. Writing has no effect on the bit value.
W	Write only	These bits can only be written. Reading the bit returns the reset value.
RW1C	Read/Write ‘1’ to clear	These bits can be read as well as cleared by writing ‘1’. Writing ‘0’ has no effect on the bit value.
RW0C	Read/Write ‘0’ to clear	These bits can be read as well as cleared by writing ‘0’. Writing ‘1’ has no effect on the bit value.
RW1S	Read/Write ‘1’ to set	These bits can be read as well as set by writing ‘1’. Writing ‘0’ has no effect on the bit value.
A	Alias	This register is an additional alias or another register. This convention is used when a physical register is mapped to multiple addresses, typically for firmware debug purposes. See the corresponding register descriptions for more details.
None / Reserved	Reserved bits	Keep these bits at the default value
‘x’ in a register /bit field name	Multiple instances	Multiple instances/address ranges of the same register/bit field

Acronyms

This table lists the acronyms used in this document.

Table 1 Acronyms

Symbol	Unit of measure
ACG	Access Control Gating
ADC	Analog-to-Digital Converters
AES	Advanced Encryption Standard
AHB	AMBA (advanced microcontroller bus architecture) high-performance bus, an Arm® data transfer bus
AIRCR	Application Interrupt and Reset Control Register
AIU	Application Interface Unit
APBIC	Advanced Peripheral Bus Interconnect
APPCPUSS	Application CPU Subsystem

Acronyms

Table 1 Acronyms

Symbol	Unit of measure
ASC	Asynchronous Serial Communication
ASIC	Application Specific Integrated Circuit
ATB	Advanced Trace Bus
AUTOSAR	Automotive Open System Architecture
AXI	Advanced Extensible Interface
BLE	Bluetooth Low Energy
BNA	Buffer Not Available
BOD	Brownout Detect
BREG	Backup Register
BRESP	AXI Write Transaction Response Signal
BT	Bluetooth
C-AHB	Code AHB Interface
CAN-FD	Controller Area Network Flexible Data-rate
CBOR	Concise Binary Object Representation
CBS	Credit Base Shaping
CBS	Credit-Based Shaping
CCC	Common Command Code
CDR	Clock Data Recovery
CFI	Canonical Format Indicator
CIC	Cascaded Integrator Comb
CMD_RESP	Command Response
CMOS	Complementary Metal-Oxide Semiconductor
CoT	Chain of Trust
CPHA	Clock Phase
CPOL	Clock Polarity
CPU	Central Processing Unit
CQE	Command Queue Engine
CRC	Cyclic Redundancy Checker
CSV	Clock Supervision
CTB	Continuous Time Block
CTB	Continuous Time Block (Opamp Circuits)
CTI	Cross Trigger Interface
CTM	Cross Trigger Matrix
D-Cache	Data Cache
D-PHY	MIPI Physical layer standard used for MIPI DSI and CSI
DAA	Dynamic Address Allocation
DAP	Debug Access Port
DAR	Disable automatic retransmission

Acronyms

Table 1 Acronyms

Symbol	Unit of measure
DBI	Display Bus Interface
DBTP	Data Bit Timing and Prescaler Register
DCR	Device Characteristics Register
DDR	Double Data Rate
DE	Data Enable
DEMCR	Debug Exception and Monitor Control Register
DES	Data Encryption Standard
DHCSR	Debug Halting Control and Status Register
DICE	Device Identifier Composition Engine
DMA	Direct Memory Access
DMAC	Direct Memory Access Controller
DP	Debug Port
DPI	Display Pixel Interface
DPLL	Digital Phase Locked Loop
DPU	Display Processor Unit
DSI	Digital Serial Interface (Usually in relation to MIPI DSI)
DSP	Digital Signal Processing
DTCM	Data Tightly Coupled Memory
DU	Data unit
DW	Data Wire
DWRR	Deficit Weighted Round Robin
E2E	End-to-End
ECC	Error Correcting Code
ECO	External Crystal Oscillator
ECT	Embedded Cross Triggering
EDC	Error Detection and Correction
EFEC	Extended Filter Elements Configuration
Em_EEPROM	Emulated Electrically Erasable Programmable Read-only Memory
EMAC	Ethernet Media Access Controller
eMMC	Embedded Multimedia Card
EOL	End of List
EOPF	End-of-Periodic-Frame Boundary
EP	Endpoint
ESD	Electrostatic Discharge
ETB	Embedded Trace Buffer
ETF	Embedded Trace Fifo
ETM	Embedded Trace Macrocell
ETS	Enhanced Transmission Selection

Acronyms

Table 1 Acronyms

Symbol	Unit of measure
FCS	Frame Check Sequence
FIFO	First In First Out
FIH	Fault Injection Hardening
FIR	Finite Impulse Response
FPU	Floating Point Unit
FS	Full Speed
GFC	Global Filter Configuration
GPIO	General Purpose Input Output
GPU	Graphics Processing Unit
HAR	Human Activity Recognition
HCI	Host Controller Interface
HDR	High Date Rate
Hi-Z	High Impedance
HJ	Hot-Join
HPDMA	High Performance Direct Memory Access
HSIOM	High Speed I/O Matrix
HSM	Hardware Security Module
HUK	Hardware Unique Key
HV	High Voltage
I-Cache	Instruction Cache
I/O	Input/Output
I2C	Inter-Integrated Circuit
I2S	Inter-IC Sound Bus
I3C	Improved Inter-Integrated Circuit
IBI	In-band Interrupts
ICER	Interrupt Clear Enable Register
IDAU	Implementation Defined Attribution Unit
IMO	Internal Main Oscillator
IOC	Interrupt on Complete
IP	Internet Protocol
IPC	Inter Processor Communication
IRQ	Interrupt Request
ISB	Instruction Synchronization Barrier
ISER	Interrupt Set Enable Register
ISR	Interrupt Service Routine
ITCM	Instructions Tightly Coupled Memory
ITM	Instrumentation Trace Macrocell
ITNS	Interrupt Target Non-secure

Acronyms

Table 1 Acronyms

Symbol	Unit of measure
JTAG	Joint Test Action Group
LCD	Liquid Crystal Display
LCS	Life Cycle State
LIN	Local Interconnect Network
LLDP	Link Layer Discovery Protocol
LP	Low Power
LPCOMP	Low-Power Comparator
LPI	Low Power Idle
LPM	Link Power Management
LS	Low Speed
LSB	Least significant Byte
LUT	Look-up Table
LVD	Low Voltage Detector
LVTTL	Low Voltage Transistor-Transistor Logic
M_TTCAN	Time-Triggered CAN Module
M-AXI	Master AXI Interface
MAC	Media Access Control
MCU	Microcontroller Unit
MCWDT	Multi-counter Watchdog Timer
MDC	MDIO interface clock
MDIO	Management Data Input/Output
MII	Media-Independent Interface
MIPI	Mobile Industry Processor Interface
MISO	Master-in-slave-out
ML	Machine Learning
MMIO	Memory-mapped I/O
MNR	Message Number
MOSI	Master-out-slave-in
MPC	Memory Protection Controller
MPU	Memory Protection Unit
MR	Master Request
MRAM	Message RAM
MRL	Maximum Read Length
MSB	Most significant Byte
MSC	Master Security Controller
MSP	Main Stack Pointer
MTQ	Minimum Time Quanta
MVE	M-profile Vector Extension

Acronyms

Table 1 Acronyms

Symbol	Unit of measure
MWL	Maximum Write Length
NBTP	Nominal Bit Timing and Prescaler Register
NMI	Non-maskable Interrupt
NN	Neural Network
NPU	Neural Processing Unit
NTU	Network Time Unit
NVIC	Nested Vectored Interrupt Controller
NVM	Non-Volatile Memory
OEM	Original Equipment Manufacturer
OPC	Opcode
OTP	One-Time-Programmable Memory
OVD	Over Voltage Detector
OVP	Over Voltage Protection
OVT	Over Voltage Tolerant
P-AHB	Peripheral AHB Interface
P2P	Peer-to-Peer
PCM	Pulse Code Modulation
PDM	Pulse Density Modulation
PEC	Packet Error Check
PendSV	Pending Supervisory
PHY	Ethernet Physical (transceiver component)
PID	Product Identification
PILO	Precision Internal Low-speed Oscillator
PKC	Public-Key Cryptography
PLL	Phase Locked Loop
POR	Power-on Reset
PPB	Private Peripheral Bus
PPC	Peripheral Protection Controller
PPU	Power Policy Unit
PRB	Programmable Reference Block
PRNG	Pseudo Random Number Generator
PSA	Platform Security Architecture
PSP	Process Stack Pointer
PSR	Program and Status Register
PSRR	Power Supply Rejection Ratio
PTComp	Programmable Threshold Comparator
PTM	Pulse Time Modulation
PTP	Precision Time Protocol

Acronyms

Table 1 Acronyms

Symbol	Unit of measure
PWM	Pulse-Width Modulation
RMII	Reduced Media-Independent Interface
RoT	Root of Trust
RRAM	Resistive Random Access Memory
RRESP	AXI Read Transaction Response Signal
RTC	Real-Time Clock
RTOS	Real-time Operating System
RWDS	Read-Write-Data-Strobe
RX	Receive
RZWI	Read Zero Write Ignore
S-AHB	Slave AHB Interface
SAR	Successive-Approximation-Register
SAU	Secure Attribution Unit
SCB	Serial Communication Block
SCL	Serial Clock
SDA	Serial Data
SDHC	Secure Digital Host Controller
SDIO	Secure Digital Input Output
SDR	Single Data Rate
SESIP	Security Evaluation Standard for IoT Platforms
SFD	Start Frame Delimiter
SFEC	Standard Filter Element Configuration
SFR	Special Function Register
SHA	Secure Hash Algorithm
SHCSR	System Handler Control and State Register
SHPR	System Handler Priority Registers
SIDFC	Standard ID Filter Configuration
SIMD	Single Instruction/Multiple Data
SIO	Special Input/Output
SIR	Slave Interrupt Request
SMI	Serial Management Interface
SMIF	Serial Memory Interface
SNAP	Subnetwork Access Protocol
SoC	System on Chip
SoCMEM	System On Chip Memory
SOF	Start of Frame
SPI	Serial Peripheral Interface
SPRAM	Single Port RAM

Acronyms

Table 1 Acronyms

Symbol	Unit of measure
SRAM	Static Random Access Memory
SRAMC	Static Random Access Memory Controller
SROM	Supervisory Read Only Memory
SRSS	System Resources Sub System
STT	State-Transition Table
SVCall	Supervisory Call
SWD	Serial Wire Debug
SWO	Serial Wire Output
SWV	Serial Wire Viewer
SYSCPUSS	System CPU Subsystem
TAP	Test Access Port
TCK	Test Clock
TCP/IP	Transmission Control Protocol/Internet Protocol
TCPWM	Timer/Counter Pulse-Width Modulator
TDES	Triple Data Encryption Standard
TDI	Test Data In
TDM	Time-Division Multiplexing
TDO	Test Data Out
TM	Time Mark
TMEX	Time Mark Event External
TMIN	Time Mark Event Internal
TMS	Test Mode Select
TPA	Trace Port Analyzer
TPIU	Trace Port Interface Unit
TRN	Turnaround Period
TRNG	True Random Number Generator
TSU	Timestamp Unit
TTCAN	Time-Triggered CAN
TTL	Transistor-Transistor Logic
TX	Transmit
UART	Universal Asynchronous Receiver Transmitter
UDP	User Datagram Protocol
ULP	Ultra Low Power
USB CTRL	USB Controller
USB OTG	USB On-The-Go
USB PHY	USB Physical Layer
USBHSSS	Universal Serial Bus High Speed Subsystem
UTMI	USB Transceiver Macrocell Interface

Acronyms

Symbol	Unit of measure
VLAN	Virtual Local Area Network
VREG	Voltage Regulator
VTG	Video Timing Generation
VTOR	Vector Table Offset Register
VU	Vector Unit
WDR	Watchdog Reset
WDT	Watchdog Timer
WFE	Wait For Event
WFI	Wait For Interrupt
WIC	Wakeup Interrupt Controller
WWD	Wake Word Detection
XIDAM	Extended ID AND Mask
XIDFC	Extended ID Filter Configuration
XIP	Execute-In-Place
XN	Execute Never
XRES	External Reset

1 CPU Sub System (CPUSS) registers

This section discusses the CPUSS registers. It lists all the registers in mapping tables, in address order.

1.1 Register details

Register name	Address	Description
RAMC_PPU0_PWPR	0x42220000	Power Policy Register
RAMC_PPU0_PMER	0x42220004	Power Mode Emulation Register
RAMC_PPU0_PWSR	0x42220008	Power Status Register
RAMC_PPU0_DISR	0x42220010	Device Interface Input Current Status Register
RAMC_PPU0_MISR	0x42220014	Miscellaneous Input Current Status Register
RAMC_PPU0_STSR	0x42220018	Stored Status Register
RAMC_PPU0_UNLK	0x4222001C	Unlock register
RAMC_PPU0_PWCR	0x42220020	Power Configuration Register
RAMC_PPU0_PTCR	0x42220024	Power Mode Transition Configuration Register
RAMC_PPU0_IMR	0x42220030	Interrupt Mask Register
RAMC_PPU0_AIMR	0x42220034	Additional Interrupt Mask Register
RAMC_PPU0_ISR	0x42220038	Interrupt Status Register
RAMC_PPU0_AISR	0x4222003C	Additional Interrupt Status Register
RAMC_PPU0_IESR	0x42220040	Input Edge Sensitivity Register
RAMC_PPU0_OPSR	0x42220044	Operating Mode Active Edge Sensitivity Register
RAMC_PPU0_FUNRR	0x42220050	Functional Retention RAM Configuration Register
RAMC_PPU0_FULRR	0x42220054	Full Retention RAM Configuration Register
RAMC_PPU0_MEMRR	0x42220058	Memory Retention RAM Configuration Register
RAMC_PPU0_EDTR0	0x42220160	Power Mode Entry Delay Register 0
RAMC_PPU0_EDTR1	0x42220164	Power Mode Entry Delay Register 1
RAMC_PPU0_DCDR0	0x42220170	Device Control Delay Configuration Register 0
RAMC_PPU0_DCDR1	0x42220174	Device Control Delay Configuration Register 1
RAMC_PPU0_IDR0	0x42220FB0	PPU Identification Register 0
RAMC_PPU0_IDR1	0x42220FB4	PPU Identification Register 1
RAMC_PPU0_IIDR	0x42220FC8	Implementation Identification Register
RAMC_PPU0_AIDR	0x42220FCC	Architecture Identification Register
RAMC_PPU0_PID4	0x42220FD0	Implementation Defined Identification Register (PID4)
RAMC_PPU0_PID0	0x42220FE0	Implementation Defined Identification Register (PID0)
RAMC_PPU0_PID1	0x42220FE4	Implementation Defined Identification Register (PID1)
RAMC_PPU0_PID2	0x42220FE8	Implementation Defined Identification Register (PID2)

CPU Sub System (CPUSS) registers

Register name	Address	Description
RAMC_PPU0_PID3	0x42220FEC	Implementation Defined Identification Register (PID3)
RAMC_PPU0_ID0	0x42220FF0	Implementation Defined Identification Register (ID0)
RAMC_PPU0_ID1	0x42220FF4	Implementation Defined Identification Register (ID1)
RAMC_PPU0_ID2	0x42220FF8	Implementation Defined Identification Register (ID2)
RAMC_PPU0_ID3	0x42220FFC	Implementation Defined Identification Register (ID3)
RAMC_PPU1_PWPR	0x42221000	Power Policy Register. See RAMC_PPU0_PWPR for the details of bit fields.
RAMC_PPU1_PMER	0x42221004	Power Mode Emulation Register. See RAMC_PPU0_PMER for the details of bit fields.
RAMC_PPU1_PWSR	0x42221008	Power Status Register. See RAMC_PPU0_PWSR for the details of bit fields.
RAMC_PPU1_DISR	0x42221010	Device Interface Input Current Status Register. See RAMC_PPU0_DISR for the details of bit fields.
RAMC_PPU1_MISR	0x42221014	Miscellaneous Input Current Status Register. See RAMC_PPU0_MISR for the details of bit fields.
RAMC_PPU1_STSR	0x42221018	Stored Status Register. See RAMC_PPU0_STSR for the details of bit fields.
RAMC_PPU1_UNLK	0x4222101C	Unlock register. See RAMC_PPU0_UNLK for the details of bit fields.
RAMC_PPU1_PWCR	0x42221020	Power Configuration Register. See RAMC_PPU0_PWCR for the details of bit fields.
RAMC_PPU1_PTCR	0x42221024	Power Mode Transition Configuration Register. See RAMC_PPU0_PTCR for the details of bit fields.
RAMC_PPU1_IMR	0x42221030	Interrupt Mask Register. See RAMC_PPU0_IMR for the details of bit fields.
RAMC_PPU1_AIMR	0x42221034	Additional Interrupt Mask Register. See RAMC_PPU0_AIMR for the details of bit fields.
RAMC_PPU1_ISR	0x42221038	Interrupt Status Register. See RAMC_PPU0_ISR for the details of bit fields.
RAMC_PPU1_AISR	0x4222103C	Additional Interrupt Status Register. See RAMC_PPU0_AISR for the details of bit fields.
RAMC_PPU1_IESR	0x42221040	Input Edge Sensitivity Register. See RAMC_PPU0_IESR for the details of bit fields.
RAMC_PPU1_OPSR	0x42221044	Operating Mode Active Edge Sensitivity Register. See RAMC_PPU0_OPSR for the details of bit fields.
RAMC_PPU1_FUNRR	0x42221050	Functional Retention RAM Configuration Register. See RAMC_PPU0_FUNRR for the details of bit fields.

CPU Sub System (CPUSS) registers

Register name	Address	Description
RAMC_PPU1_FULRR	0x42221054	Full Retention RAM Configuration Register. See RAMC_PPU0_FULRR for the details of bit fields.
RAMC_PPU1_MEMRR	0x42221058	Memory Retention RAM Configuration Register. See RAMC_PPU0_MEMRR for the details of bit fields.
RAMC_PPU1_EDTR0	0x42221160	Power Mode Entry Delay Register 0. See RAMC_PPU0_EDTR0 for the details of bit fields.
RAMC_PPU1_EDTR1	0x42221164	Power Mode Entry Delay Register 1. See RAMC_PPU0_EDTR1 for the details of bit fields.
RAMC_PPU1_DCDR0	0x42221170	Device Control Delay Configuration Register 0. See RAMC_PPU0_DCDR0 for the details of bit fields.
RAMC_PPU1_DCDR1	0x42221174	Device Control Delay Configuration Register 1. See RAMC_PPU0_DCDR1 for the details of bit fields.
RAMC_PPU1_IDR0	0x42221FB0	PPU Identification Register 0. See RAMC_PPU0_IDR0 for the details of bit fields.
RAMC_PPU1_IDR1	0x42221FB4	PPU Identification Register 1. See RAMC_PPU0_IDR1 for the details of bit fields.
RAMC_PPU1_IIDR	0x42221FC8	Implementation Identification Register. See RAMC_PPU0_IIDR for the details of bit fields.
RAMC_PPU1_AIDR	0x42221FCC	Architecture Identification Register. See RAMC_PPU0_AIDR for the details of bit fields.
RAMC_PPU1_PID4	0x42221FD0	Implementation Defined Identification Register (PID4). See RAMC_PPU0_PID4 for the details of bit fields.
RAMC_PPU1_PID0	0x42221FE0	Implementation Defined Identification Register (PID0). See RAMC_PPU0_PID0 for the details of bit fields.
RAMC_PPU1_PID1	0x42221FE4	Implementation Defined Identification Register (PID1). See RAMC_PPU0_PID1 for the details of bit fields.
RAMC_PPU1_PID2	0x42221FE8	Implementation Defined Identification Register (PID2). See RAMC_PPU0_PID2 for the details of bit fields.
RAMC_PPU1_PID3	0x42221FEC	Implementation Defined Identification Register (PID3). See RAMC_PPU0_PID3 for the details of bit fields.
RAMC_PPU1_ID0	0x42221FF0	Implementation Defined Identification Register (ID0). See RAMC_PPU0_ID0 for the details of bit fields.
RAMC_PPU1_ID1	0x42221FF4	Implementation Defined Identification Register (ID1). See RAMC_PPU0_ID1 for the details of bit fields.

CPU Sub System (CPUSS) registers

Register name	Address	Description
RAMC_PPU1_ID2	0x42221FF8	Implementation Defined Identification Register (ID2). See RAMC_PPU0_ID2 for the details of bit fields.
RAMC_PPU1_ID3	0x42221FFC	Implementation Defined Identification Register (ID3). See RAMC_PPU0_ID3 for the details of bit fields.
ICACHE0_CTL	0x42223000	Cache control
ICACHE0_CMD	0x42223008	Cache command
ICACHE0_STATUS0	0x42223080	Cache status 0
ICACHE0_STATUS1	0x42223084	Cache status 1
ICACHE0_STATUS2	0x42223088	Cache status 2
CPUSS_PPU_PWPR	0x42225000	Power Policy Register
CPUSS_PPU_PMER	0x42225004	Power Mode Emulation Register
CPUSS_PPU_PWSR	0x42225008	Power Status Register
CPUSS_PPU_DISR	0x42225010	Device Interface Input Current Status Register
CPUSS_PPU_MISR	0x42225014	Miscellaneous Input Current Status Register
CPUSS_PPU_STSR	0x42225018	Stored Status Register
CPUSS_PPU_UNLK	0x4222501C	Unlock register
CPUSS_PPU_PWCR	0x42225020	Power Configuration Register
CPUSS_PPU_PTCR	0x42225024	Power Mode Transition Configuration Register
CPUSS_PPU_IMR	0x42225030	Interrupt Mask Register
CPUSS_PPU_AIMR	0x42225034	Additional Interrupt Mask Register
CPUSS_PPU_ISR	0x42225038	Interrupt Status Register
CPUSS_PPU_AISR	0x4222503C	Additional Interrupt Status Register
CPUSS_PPU_IESR	0x42225040	Input Edge Sensitivity Register
CPUSS_PPU_OPSR	0x42225044	Operating Mode Active Edge Sensitivity Register
CPUSS_PPU_FUNRR	0x42225050	Functional Retention RAM Configuration Register
CPUSS_PPU_FULRR	0x42225054	Full Retention RAM Configuration Register
CPUSS_PPU_MEMRR	0x42225058	Memory Retention RAM Configuration Register
CPUSS_PPU_EDTR0	0x42225160	Power Mode Entry Delay Register 0
CPUSS_PPU_EDTR1	0x42225164	Power Mode Entry Delay Register 1
CPUSS_PPU_DCDR0	0x42225170	Device Control Delay Configuration Register 0
CPUSS_PPU_DCDR1	0x42225174	Device Control Delay Configuration Register 1
CPUSS_PPU_IDR0	0x42225FB0	PPU Identification Register 0
CPUSS_PPU_IDR1	0x42225FB4	PPU Identification Register 1
CPUSS_PPU_IIDR	0x42225FC8	Implementation Identification Register
CPUSS_PPU_AIDR	0x42225FCC	Architecture Identification Register
CPUSS_PPU_PID4	0x42225FD0	Implementation Defined Identification Register (PID4)

CPU Sub System (CPUSS) registers

Register name	Address	Description
CPUSS_PPU_PID0	0x42225FE0	Implementation Defined Identification Register (PID0)
CPUSS_PPU_PID1	0x42225FE4	Implementation Defined Identification Register (PID1)
CPUSS_PPU_PID2	0x42225FE8	Implementation Defined Identification Register (PID2)
CPUSS_PPU_PID3	0x42225FEC	Implementation Defined Identification Register (PID3)
CPUSS_PPU_ID0	0x42225FF0	Implementation Defined Identification Register (ID0)
CPUSS_PPU_ID1	0x42225FF4	Implementation Defined Identification Register (ID1)
CPUSS_PPU_ID2	0x42225FF8	Implementation Defined Identification Register (ID2)
CPUSS_PPU_ID3	0x42225FFC	Implementation Defined Identification Register (ID3)
MXCM33_CM33_CTL	0x42260000	Control
MXCM33_CM33_CMD	0x42260004	Command
MXCM33_CM33_STATUS	0x42260008	Status
MXCM33_CM33_NMI_CTL0	0x42260080	CM33 NMI control
MXCM33_CM33_NMI_CTL1	0x42260084	CM33 NMI control. See MXCM33_CM33_NMI_CTL0 for the details of bit fields.
MXCM33_CM33_NMI_CTL2	0x42260088	CM33 NMI control. See MXCM33_CM33_NMI_CTL0 for the details of bit fields.
MXCM33_CM33_NMI_CTL3	0x4226008C	CM33 NMI control. See MXCM33_CM33_NMI_CTL0 for the details of bit fields.
MXCM33_CM33_EVENT_CTL	0x422600C0	CM33 event control
MXCM33_CM33_S_VECTOR_TABLE_BASE	0x42261000	CM33 secure vector table base
MXCM33_CM33_NS_VECTOR_TABLE_BASE	0x42261004	CM33 non-secure vector table base
MXCM33_CM33_PC_CTL	0x42262000	CM33 protection context control
MXCM33_CM33_PC0_HANDLER	0x42262040	CM33 protection context 0 handler
MXCM33_CM33_PC1_HANDLER	0x42262100	CM33 protection context 1 handler
MXCM33_CM33_PC2_HANDLER	0x42262140	CM33 protection context 2 handler
MXCM33_CM33_PC3_HANDLER	0x42262180	CM33 protection context 3 handler
CPUSS_IDENTITY	0x42290000	Identity
CPUSS_PRODUCT_ID	0x42290010	Product identifier and version (same as CoreSight RomTables)
CPUSS_DP_STATUS	0x42290020	Debug port status
CPUSS_BUFF_CTL	0x42290030	Buffer control
CPUSS_CAL_SUP_SET	0x42290040	Calibration support set and read
CPUSS_CAL_SUP_CLR	0x42290044	Calibration support clear and reset

CPU Sub System (CPUSS) registers

Register name	Address	Description
CPUSS_INFRA_CTL	0x42290050	Infrastructure Control
CPUSS_SYSTICK_S_CTL	0x42290100	Secure SysTick timer control
CPUSS_SYSTICK_NS_CTL	0x42290120	Non Secure SysTick timer control
CPUSS_INTR_MSC	0x42290200	Master security controller Interrupt
CPUSS_INTR_MASK_MSC	0x42290208	Master security controller Interrupt mask
CPUSS_INTR_MASKED_MSC	0x4229020C	Master security controller Interrupt masked
CPUSS_AP_CTL	0x42291000	Access port control
CPUSS_PROTECTION	0x42292004	Protection status
MS0_CTL	0x42294000	Master 'x' protection context control
MS4_CTL	0x42294040	Master 'x' protection context control. See MS0_CTL for the details of bit fields.
MS5_CTL	0x42294050	Master 'x' protection context control. See MS0_CTL for the details of bit fields.
MS6_CTL	0x42294060	Master 'x' protection context control
MS7_CTL	0x42294070	Master 'x' protection context control. See MS0_CTL for the details of bit fields.
MS8_CTL	0x42294080	Master 'x' protection context control. See MS0_CTL for the details of bit fields.
MS9_CTL	0x42294090	Master 'x' protection context control. See MS6_CTL for the details of bit fields.
MS10_CTL	0x422940A0	Master 'x' protection context control. See MS0_CTL for the details of bit fields.
MS11_CTL	0x422940B0	Master 'x' protection context control. See MS6_CTL for the details of bit fields.
MS29_CTL	0x422941D0	Master 'x' protection context control. See MS0_CTL for the details of bit fields.
MS31_CTL	0x422941F0	Master 'x' protection context control. See MS0_CTL for the details of bit fields.
MS_PC0_PC	0x42295000	Master 'x' protection context value
MS_PC0_PC_READ_MIR	0x42295004	Master 'x' protection context value read mirror register
MS_PC6_PC	0x42295060	Master 'x' protection context value
MS_PC6_PC_READ_MIR	0x42295064	Master 'x' protection context value read mirror register
MS_PC9_PC	0x42295090	Master 'x' protection context value. See MS_PC6_PC for the details of bit fields.
MS_PC9_PC_READ_MIR	0x42295094	Master 'x' protection context value read mirror register. See MS_PC6_PC_READ_MIR for the details of bit fields.
MS_PC11_PC	0x422950B0	Master 'x' protection context value. See MS_PC6_PC for the details of bit fields.

CPU Sub System (CPUSS) registers

Register name	Address	Description
MS_PC11_PC_READ_MIR	0x422950B4	Master 'x' protection context value read mirror register. See MS_PC6_PC_READ_MIR for the details of bit fields.
MS_PC31_PC	0x422951F0	Master 'x' protection context value. See MS_PC6_PC for the details of bit fields.
MS_PC31_PC_READ_MIR	0x422951F4	Master 'x' protection context value read mirror register. See MS_PC6_PC_READ_MIR for the details of bit fields.
CODE_MS0_MSC_ACG_CTL	0x42296000	CODE_MS0 master security Controller & ACG configuration
SYS_MS0_MSC_ACG_CTL	0x42296010	SYS_MS0 master security Controller & ACG configuration
SYS_MS1_MSC_ACG_CTL	0x42296014	SYS_MS1 master security Controller & ACG configuration
EXP_MS_MSC_ACG_CTL	0x42296020	EXP_MS master security Controller & ACG configuration
CPUSS_SL_CTL_SL_CTL	0x42298000	Slave control (Clock enables)
CPUSS_SL_CTL_SL_CTL2	0x42298004	Slave control2 (Reset enables)

CPU Sub System (CPUSS) registers

Register name	Address	Description
MS_CTL_MS_PC14_PC_READ_MIR	0x441C50E4	Master 'x' protection context value read mirror register. See MS_CTL_MS_PC13_PC_READ_MIR for the details of bit fields.
MS_CTL_MS_PC15_PC	0x441C50F0	Master 'x' protection context value. See MS_CTL_MS_PC13_PC for the details of bit fields.
MS_CTL_MS_PC15_PC_READ_MIR	0x441C50F4	Master 'x' protection context value read mirror register. See MS_CTL_MS_PC13_PC_READ_MIR for the details of bit fields.
MS_CTL_MS_PC19_PC	0x441C5130	Master 'x' protection context value. See MS_CTL_MS_PC13_PC for the details of bit fields.
MS_CTL_MS_PC19_PC_READ_MIR	0x441C5134	Master 'x' protection context value read mirror register. See MS_CTL_MS_PC13_PC_READ_MIR for the details of bit fields.
MS_CTL_MS_PC25_PC	0x441C5190	Master 'x' protection context value. See MS_CTL_MS_PC13_PC for the details of bit fields.
MS_CTL_MS_PC25_PC_READ_MIR	0x441C5194	Master 'x' protection context value read mirror register. See MS_CTL_MS_PC13_PC_READ_MIR for the details of bit fields.
MS_CTL_MS_PC26_PC	0x441C51A0	Master 'x' protection context value. See MS_CTL_MS_PC13_PC for the details of bit fields.
MS_CTL_MS_PC26_PC_READ_MIR	0x441C51A4	Master 'x' protection context value read mirror register. See MS_CTL_MS_PC13_PC_READ_MIR for the details of bit fields.
MS_CTL_MS_PC27_PC	0x441C51B0	Master 'x' protection context value. See MS_CTL_MS_PC13_PC for the details of bit fields.
MS_CTL_MS_PC27_PC_READ_MIR	0x441C51B4	Master 'x' protection context value read mirror register. See MS_CTL_MS_PC13_PC_READ_MIR for the details of bit fields.
MS_CTL_MS_PC28_PC	0x441C51C0	Master 'x' protection context value. See MS_CTL_MS_PC13_PC for the details of bit fields.
MS_CTL_MS_PC28_PC_READ_MIR	0x441C51C4	Master 'x' protection context value read mirror register. See MS_CTL_MS_PC13_PC_READ_MIR for the details of bit fields.
MS_CTL_AXIDMAC0_MSC_ACG_CTL	0x441C6010	AXI DMAC0 MSC and ACG configuration
MS_CTL_AXI_MS0_MSC_ACG_CTL	0x441C6030	AXI_MS0 master security Controller & ACG configuration
MS_CTL_AXI_MS1_MSC_ACG_CTL	0x441C6034	AXI_MS1 master security Controller & ACG configuration
MS_CTL_AXI_MS2_MSC_ACG_CTL	0x441C6038	AXI_MS2 master security Controller & ACG configuration
MS_CTL_AXI_MS3_MSC_ACG_CTL	0x441C603C	AXI_MS3 master security Controller & ACG configuration
MS_CTL_EXP_MS0_MSC_ACG_CTL	0x441C6040	EXP_MS0 master security Controller & ACG configuration

CPU Sub System (CPUSS) registers

Register name	Address	Description
MS_CTL_EXP_MS1_MSC_ACG_CTL	0x441C6044	EXP_MS1 master security Controller & ACG configuration
MS_CTL_EXP_MS2_MSC_ACG_CTL	0x441C6048	EXP_MS2 master security Controller & ACG configuration
APPCPUSS_SL_CTL_SL_CTL	0x441C8000	Slave control (Clock enables)
APPCPUSS_SL_CTL_SL_CTL2	0x441C8004	Slave control2 (Reset enables)
U550_ID	0x44600000	ID Register
U550_STATUS	0x44600004	Register describes the current operating status of the NPU
U550_CMD	0x44600008	Command register, reads as last written command
U550_RESET	0x4460000C	Request Reset and new security mode
U550_QBASE0	0x44600010	Base address of Command-queue bits [31 downto 0]. The address is 4-byte-aligned
U550_QBASE1	0x44600014	Address extension bits [47 downto 32] for queue base
U550_QREAD	0x44600018	Read offset in the command stream in bytes. Multiples of 4 in the range 0-16 MB
U550_QCONFIG	0x4460001C	AXI configuration for the command stream in the range 0-3. Same encoding as for REGIONCFG
U550_QSIZE	0x44600020	Size of the command stream in bytes. Multiples of 4 in the range 0-16 MB
U550_PROT	0x44600024	Protection level configured for the NPU when acting as an AXI master
U550_CONFIG	0x44600028	RTL configuration
U550_LOCK	0x4460002C	Lock register. This register is designed for driver use and does not affect NPU functionality
U550_REGIONCFG	0x4460003C	Base pointer configuration. Bits[2*k+1 downto 2*k] give the memory type for REGION[k]
U550_AXI_LIMIT0	0x44600040	AXI limits for port 0 counter 0
U550_AXI_LIMIT1	0x44600044	AXI limits for port 0 counter 1
U550_AXI_LIMIT2	0x44600048	AXI limits for port 1 counter 2
U550_AXI_LIMIT3	0x4460004C	AXI limits for port 1 counter 3
U550_BASEP0	0x44600080	Lower 32 bits of the base pointer for region index 0
U550_BASEP1	0x44600084	Upper 32-bits of the base pointer for region index 0
U550_BASEP2	0x44600088	Lower 32 bits of the base pointer for region index 1
U550_BASEP3	0x4460008C	Upper 32-bits of the base pointer for region index 1
U550_BASEP4	0x44600090	Lower 32 bits of the base pointer for region index 2
U550_BASEP5	0x44600094	Upper 32-bits of the base pointer for region index 2

CPU Sub System (CPUSS) registers

Register name	Address	Description
U550_BASEP6	0x44600098	Lower 32 bits of the base pointer for region index 3
U550_BASEP7	0x4460009C	Upper 32-bits of the base pointer for region index 3
U550_BASEP8	0x446000A0	Lower 32 bits of the base pointer for region index 4
U550_BASEP9	0x446000A4	Upper 32-bits of the base pointer for region index 4
U550_BASEP10	0x446000A8	Lower 32 bits of the base pointer for region index 5
U550_BASEP11	0x446000AC	Upper 32-bits of the base pointer for region index 5
U550_BASEP12	0x446000B0	Lower 32 bits of the base pointer for region index 6
U550_BASEP13	0x446000B4	Upper 32-bits of the base pointer for region index 6
U550_BASEP14	0x446000B8	Lower 32 bits of the base pointer for region index 7
U550_BASEP15	0x446000BC	Upper 32-bits of the base pointer for region index 7
U550_PMCR	0x44600180	PMU master control register
U550_PMCNTENSET	0x44600184	Count-enable set register
U550_PMCNTENCLR	0x44600188	Count-enable clear register
U550_PMOVSSET	0x4460018C	Overflow-flag status set register
U550_PMOVSCLR	0x44600190	Overflow-flag status clear register
U550_PMINTSET	0x44600194	Interrupt-enable set register
U550_PMINTCLR	0x44600198	Interrupt-enable clear register
U550_PMCCNTR_LO	0x446001A0	Performance-monitor cycle count low register
U550_PMCCNTR_HI	0x446001A4	Performance-monitor cycle count high register
U550_PMCCNTR_CFG	0x446001A8	Set start/stop event on the cycle counter.
U550_PMCAXI_CHAN	0x446001AC	Set which AXI channel monitor
U550_PMU_EVCNTR0	0x44600300	Performance monitor event counters
U550_PMU_EVCNTR1	0x44600304	Performance monitor event counters. See U550_PMU_EVCNTR0 for the details of bit fields.
U550_PMU_EVCNTR2	0x44600308	Performance monitor event counters. See U550_PMU_EVCNTR0 for the details of bit fields.
U550_PMU_EVCNTR3	0x4460030C	Performance monitor event counters. See U550_PMU_EVCNTR0 for the details of bit fields.
U550_PMU_ENTYPER0	0x44600380	Performance monitor event type control counters
U550_PMU_ENTYPER1	0x44600384	Performance monitor event type control counters. See U550_PMU_ENTYPER0 for the details of bit fields.
U550_PMU_ENTYPER2	0x44600388	Performance monitor event type control counters. See U550_PMU_ENTYPER0 for the details of bit fields.

CPU Sub System (CPUSS) registers

Register name	Address	Description
U550_PMU_ENTYPER3	0x4460038C	Performance monitor event type control counters. See U550_PMU_ENTYPER0 for the details of bit fields.
U550_PID4	0x44600FD0	Peripheral ID byte 4 (Arm = code 4)
U550_PID5	0x44600FD4	Peripheral ID byte 5. (reserved)
U550_PID6	0x44600FD8	Peripheral ID byte 6. (reserved)
U550_PID7	0x44600FDC	Peripheral ID byte 7. (reserved)
U550_PID0	0x44600FE0	Peripheral ID byte 0. This is bits[7 downto 0] of the part number.
U550_PID1	0x44600FE4	Peripheral ID byte 1. This is bits[11 downto 8] of the part number in bits[3 downto 0], and bits[3 downto 0] of the Arm ID in bits[7 downto 4].
U550_PID2	0x44600FE8	Peripheral ID byte 2. This is bits[6 downto 4] of the Arm ID in bits[2 downto 0], and bit 3 indicates format B.
U550_PID3	0x44600FEC	Peripheral ID byte 3
U550_CID0	0x44600FF0	Component ID byte 0
U550_CID1	0x44600FF4	Component ID byte 1
U550_CID2	0x44600FF8	Component ID byte 2
U550_CID3	0x44600FFC	Component ID byte 3
U550_ROT_INIT	0x44601000	Initial settings
U550_ACG_CTL	0x44601004	ACG Configuration of ARMU55 Bridge
U550_MXU55_PPU_PWPR	0x44602000	Power Policy Register
U550_MXU55_PPU_PMER	0x44602004	Power Mode Emulation Register
U550_MXU55_PPU_PWSR	0x44602008	Power Status Register
U550_MXU55_PPU_DISR	0x44602010	Device Interface Input Current Status Register
U550_MXU55_PPU_MISR	0x44602014	Miscellaneous Input Current Status Register
U550_MXU55_PPU_STSR	0x44602018	Stored Status Register
U550_MXU55_PPU_UNLK	0x4460201C	Unlock register
U550_MXU55_PPU_PWCR	0x44602020	Power Configuration Register
U550_MXU55_PPU_PTCR	0x44602024	Power Mode Transition Configuration Register
U550_MXU55_PPU_IMR	0x44602030	Interrupt Mask Register
U550_MXU55_PPU_AIMR	0x44602034	Additional Interrupt Mask Register
U550_MXU55_PPU_ISR	0x44602038	Interrupt Status Register
U550_MXU55_PPU_AISR	0x4460203C	Additional Interrupt Status Register
U550_MXU55_PPU_IESR	0x44602040	Input Edge Sensitivity Register
U550_MXU55_PPU_OPSR	0x44602044	Operating Mode Active Edge Sensitivity Register
U550_MXU55_PPU_FUNRR	0x44602050	Functional Retention RAM Configuration Register
U550_MXU55_PPU_FULRR	0x44602054	Full Retention RAM Configuration Register
U550_MXU55_PPU_MEMRR	0x44602058	Memory Retention RAM Configuration Register

CPU Sub System (CPUSS) registers

Register name	Address	Description
U550_MXU55_PPU_EDTR0	0x44602160	Power Mode Entry Delay Register 0
U550_MXU55_PPU_EDTR1	0x44602164	Power Mode Entry Delay Register 1
U550_MXU55_PPU_DCDR0	0x44602170	Device Control Delay Configuration Register 0
U550_MXU55_PPU_DCDR1	0x44602174	Device Control Delay Configuration Register 1
U550_MXU55_PPU_IDR0	0x44602FB0	PPU Identification Register 0
U550_MXU55_PPU_IDR1	0x44602FB4	PPU Identification Register 1
U550_MXU55_PPU_IIDR	0x44602FC8	Implementation Identification Register

U550_MXU55_PPU_ID2	0x44602FF8	Implementation Defined Identification Register (ID2)
U550_MXU55_PPU_ID3	0x44602FFC	Implementation Defined Identification Register (ID3)
U550_PD_CTL	0x44603000	Power Domain Control. See PD_CTL for the details of bit fields.
U550_PD_PWR_UP_DELAY	0x44603004	Active switch weak enable to active switch strong enable delay. See PD_PWR_UP_DELAY for the details of bit fields.

1.1.1 RAMC_PPU0_PWPR

Description: Power Policy Register

Address: 0x42220000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				PWR_POLICY [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW	Reserved			RW
HW Access	Reserved			R	Reserved			R
Name	Reserved [15:13]			LOCK_EN	Reserved [11:9]			PWR_DY-N_EN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				OP_POLICY [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [31:25]							OP_DY-N_EN

Bits	Name	Description
24	OP_DYN_EN	Reserved Default Value: 0x0
19 : 16	OP_POLICY	Reserved Default Value: 0x0
12	LOCK_EN	Reserved Default Value: 0x0
8	PWR_DYN_EN	Power mode dynamic transition enable. When this bit is set to 1 dynamic transitions are enabled for power modes, allowing transitions to be initiated by changes on power mode DEVACTIVE inputs. Default Value: 0x1
3 : 0	PWR_POLICY	Power mode policy. When static power mode transitions are enabled, PWR_DYN_EN is set to 0, this is the target power mode for the PPU. When dynamic power mode transitions are enabled, PWR_DYN_EN is set to 1, this is the minimum power mode for the PPU. This PPU supports the following modes: OFF(0), MEM_RET(2), ON(8). Do not use WARM_RST(9) or other unsupported modes. Default Value: 0x8

1.1.2 RAMC_PPU0_PMER

Description: Power Mode Emulation Register

Address: 0x42220004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							EMU_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	EMU_EN	Reserved Default Value: 0x0

1.1.3 RAMC_PPU0_PWSR

Description: Power Status Register

Address: 0x42220008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				PWR_STATUS [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			R	Reserved			R
HW Access	Reserved			RW	Reserved			RW
Name	Reserved [15:13]			LOCK_STA-TUS	Reserved [11:9]			PWR_DY-N_STATUS

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [23:20]				OP_STATUS [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [31:25]							OP_DY-N_STATUS

Bits	Name	Description
24	OP_DYN_STATUS	Reserved Default Value: 0x0
19 : 16	OP_STATUS	Reserved Default Value: 0x0
12	LOCK_STATUS	Reserved Default Value: 0x0
8	PWR_DYN_STATUS	Power mode dynamic transition status. When set to 1 power mode dynamic transitions are enabled. There might be a delay in dynamic transitions becoming active or inactive if the PPU is transitioning when PWR_DYN_EN is programmed. Default Value: 0x0
3 : 0	PWR_STATUS	Power mode status. These bits reflect the current power mode of the PPU. See PPU_PWPR.PWR_POLICY for power mode enumeration. Default Value: 0x0

1.1.4 RAMC_PPU0_DISR

Description: Device Interface Input Current Status Register

Address: 0x42220010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PWR_DEVACTIVE_STATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					R		
HW Access	Reserved					RW		
Name	Reserved [15:11]					PWR_DEVACTIVE_STATUS [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	OP_DEVACTIVE_STATUS [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVE_STATUS	Reserved Default Value: 0x0
10 : 0	PWR_DEVACTIVE_STATUS	Status of the power mode DEVACTIVE inputs. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 0 is for Q-channel device 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0

1.1.5 RAMC_PPU0_MISR

Description: Miscellaneous Input Current Status Register

Address: 0x42220014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							PCSMPAC-CEPT_STA-TUS

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	DEVACCEPT_STATUS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	DEVDENY_STATUS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	DEVDENY_STATUS	Status of the device interface DEVDENY inputs. There is one bit for each device interface DEVQDENY. For example, bit 16 is for Q-Channel 0 DEVQDENY, and bit 17 for Q-Channel 1 DEVQDENY. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
15 : 8	DEVACCEPT_STATUS	Status of the device interface DEVACCEPT inputs. There is one bit for each device interface DEVQACCEPTn. For example, bit 8 is for Q-Channel 0 DEVQACCEPTn and bit 9 for Q-Channel 1 DEVQACCEPTn. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
0	PCSMPACCEPT_STA-TUS	The status of the PCSMPACCEPT input. Default Value: 0x0

1.1.6 RAMC_PPU0_STSR

Description: Stored Status Register

Address: 0x42220018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	STORED_DEVDENY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	STORED_DEVDENY	Reserved (this PPU has a single Q-channel) Default Value: 0x0

1.1.7 RAMC_PPU0_UNLK

Description: Unlock register

Address: 0x4222001C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							UNLOCK

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	UNLOCK	Reserved Default Value: 0x0

1.1.8 RAMC_PPU0_PWCR

Description: Power Configuration Register

Address: 0x42220020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DEVREQEN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	PWR_DEVACTIVEEN [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [23:19]					PWR_DEVACTIVEEN [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	OP_DEVACTIVEEN [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVEEN	Reserved Default Value: 0x0
18 : 8	PWR_DEVACTIVEEN	These bits enable the power mode DEVACTIVE inputs. When a bit is to 1 the related DEVACTIVE input is enabled, when set to 0 it is disabled. All available bits are reset to 1. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE, and bit 9 for the Q-Channel 1 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x001
7 : 0	DEVREQEN	When set to 1 enables the device interface handshake for transitions. All available bits are reset to 1. There is one bit for each device interface channel. For example, bit 0 is for Q-Channel 0, and bit 1 is for Q-Channel 1. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x01

1.1.9 RAMC_PPU0_PTCR

Description: Power Mode Transition Configuration Register

Address: 0x42220024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						DBG_RE-COV_POR ST_EN	WARM_RS T_DEVREQ EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	DBG_RE-COV_PORST_EN	Reserved Default Value: 0x0
0	WARM_RST_DEVREQEN	Transition behavior between ON and WARM_RST. This bit should not be modified when the PPU is in WARM_RST, or if the PPU is performing a transition, otherwise PPU behavior is UN-PREDICTABLE. 0: The PPU does not perform a device interface handshake when transitioning between ON and WARM_RST. 1: The PPU performs a device interface handshake when transitioning between ON and WARM_RST. This disables all Q-Channels for this transition. Default Value: 0x0

1.1.10 RAMC_PPU0_IMR

Description: Interrupt Mask Register

Address: 0x42220030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW	RW	RW	RW	RW	RW
HW Access	Reserved		R	R	R	R	R	R
Name	Reserved [7:6]		LOCKED_IRQ_MASK	EMU_DENY_IRQ_MASK	EMU_ACCEPT_IRQ_MASK	STA_DENY_IRQ_MASK	STA_ACCEPT_IRQ_MASK	STA_POLICY_TRN_IRQ_MASK

Name	Reserved [31:24]							

Bits	Name	Description
4	STA_POLICY_OP_IRQ_MASK	Reserved Default Value: 0x1
3	STA_POLICY_PWR_IRQ_MASK	Reserved Default Value: 0x1
2	DYN_DENY_IRQ_MASK	Dynamic transition denial event mask. Default Value: 0x1
1	DYN_ACCEPT_IRQ_MASK	Dynamic transition acceptance event mask. Default Value: 0x1
0	UNSPT_POLICY_IRQ_MASK	Unsupported Policy event mask. Default Value: 0x0

1.1.12 RAMC_PPU0_ISR

Description: Interrupt Status Register

Address: 0x42220038

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	Reserved	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C
HW Access	RW	Reserved	R	R	R	R	R	R
Name	OTH-ER_IRQ	Reserved	LOCKED_IRQ	EMU_DE-NY_IRQ	EMU_AC-CEPT_IRQ	STA_DE-NY_IRQ	STA_AC-CEPT_IRQ	STA_POLI-CY_TRN_IRQ

Bits	15	14	13	12	11	10	9	8
SW Access	RW1C							
HW Access	R							
Name	PWR_ACTIVE_EDGE_IRQ [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW1C		
HW Access	Reserved					R		
Name	Reserved [23:19]					PWR_ACTIVE_EDGE_IRQ [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C							
HW Access	R							
Name	OP_ACTIVE_EDGE_IRQ [31:24]							

Bits	Name	Description
31 : 24	OP_ACTIVE_EDGE_IRQ	Indicates which operating mode DEVPACTIVE inputs caused the input edge event. When operating modes are not supported this field is reserved. Default Value: 0x0
18 : 8	PWR_ACTIVE_EDGE_IRQ	Indicates which power mode DEVACTIVE inputs caused the input edge event. Bits for unused channels are the MSBs and are reserved. There is one bit for each device Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x00
7	OTHER_IRQ	Indicates there is an interrupt event pending in the Additional Interrupt Status Register (PPU_AISR). Default Value: 0x0
5	LOCKED_IRQ	Reserved Default Value: 0x0
4	EMU_DENY_IRQ	Reserved Default Value: 0x0
3	EMU_ACCEPT_IRQ	Reserved Default Value: 0x0
2	STA_DENY_IRQ	Static transition denial event status. Default Value: 0x0
1	STA_ACCEPT_IRQ	Static transition acceptance event status. Default Value: 0x0

1.1.12 RAMC_PPU0_ISR (continued)

0	STA_POLICY_TRN_IRQ	Static full policy transition completion event status. Default Value: 0x0

1.1.13 RAMC_PPU0_AISR

Description: Additional Interrupt Status Register

Address: 0x4222003C

Retention: Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	CLKEN_ISO_DLY	Reserved Default Value: 0x0
7 : 0	ISO_RST_DLY	Reserved Default Value: 0x0

1.1.23 RAMC_PPU0_IDR0

Description: PPU Identification Register 0

Address: 0x42220FB0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	NUM_OPMODE [7:4]				DEVCHAN [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	R	R	R	R	R	R	R	R
HW Access	RW	RW	RW	RW	RW	RW	RW	RW
Name	STA_-FUNC_RET_SPT	STA_-FULL_RET_SPT	STA_MEM_OFF_SPT	STA_LG-C_RET_SPT	STA_MEM_RET_EMU_SPT	STA_MEM_RET_SPT	STA_OFF_EMU_SPT	STA_OFF_SPT

Bits	23	22	21	20	19	18	17	16
SW Access	R	R	R	R	Reserved	R	R	R
HW Access	RW	RW	RW	RW	Reserved	RW	RW	RW
Name	DY-N_MEM_RET_EMU_SPT	DY-N_MEM_RET_SPT	DY-N_OFF_EMU_SPT	DY-N_OFF_SPT	Reserved	STA_DB-G_RE-COV_SPT	STA_WRM_RST_SPT	STA_ON_SPT

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved		R	R	R	R	R	R
HW Access	Reserved		RW	RW	RW	RW	RW	RW
Name	Reserved [31:30]		DY-N_WRM_RST_SPT	DY-N_ON_SPT	DYN_-FUNC_RET_SPT	DYN_-FULL_RET_SPT	DY-N_MEM_OFF_SPT	DYN_LG-C_RET_SPT

Bits	Name	Description
29	DYN_WRM_RST_SPT	Dynamic WARM_RST support. Default Value: 0x0
28	DYN_ON_SPT	Dynamic ON support. Default Value: 0x1
27	DYN_FUNC_RET_SPT	Dynamic FUNC_RET support. Default Value: 0x0
26	DYN_FULL_RET_SPT	Dynamic FULL_RET support. Default Value: 0x0
25	DYN_MEM_OFF_SPT	Dynamic MEM_OFF support. Default Value: 0x0
24	DYN_LGC_RET_SPT	Dynamic LOGIC_RET support. Default Value: 0x0
23	DY-N_MEM_RET_EMU_SPT	Dynamic MEM_RET_EMU support Default Value: 0x0
22	DYN_MEM_RET_SPT	Dynamic MEM_RET support. Default Value: 0x1

1.1.23 RAMC_PPU0_IDR0 (continued)

21	DYN_OFF_EMU_SPT	Dynamic OFF_EMU support. Default Value: 0x0
20	DYN_OFF_SPT	Dynamic OFF support. Default Value: 0x1
18	STA_DBG_RECOV_SPT	DBG_RECOV support. Default Value: 0x0
17	STA_WRM_RST_SPT	WARM_RST support. Ignore this bit. Do not use WARM_RST. Default Value: 0x1
16	STA_ON_SPT	ON support. Default Value: 0x1
15	STA_FUNC_RET_SPT	FUNC_RET support. Default Value: 0x0
14	STA_FULL_RET_SPT	FULL_RET support. Default Value: 0x0
13	STA_MEM_OFF_SPT	MEM_OFF support. Default Value: 0x0
12	STA_LGC_RET_SPT	LOGIC_RET support. Default Value: 0x0
11	STA_MEM_RET_EMU_SPT	MEM_RET_EMU support. Default Value: 0x0
10	STA_MEM_RET_SPT	MEM_RET support. Default Value: 0x1
9	STA_OFF_EMU_SPT	OFF_EMU support. Default Value: 0x0
8	STA_OFF_SPT	OFF support. Default Value: 0x1
7 : 4	NUM_OPMODE	No. of operating modes supported is NUM_OPMODE + 1. Default Value: 0x0
3 : 0	DEVCHAN	No. of Device Interface Channels. The device enumeration is: Device 0: PDCM Default Value: 1

1.1.24 RAMC_PPU0_IDR1

Description: PPU Identification Register 1

Address: 0x42220FB4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	R	R	R	Reserved	R	R	R
HW Access	Reserved	RW	RW	RW	Reserved	RW	RW	RW
Name	Reserved	FUNC_RET_RAM_REG	FULL_RET_RAM_REG	MEM_RET_RAM_REG	Reserved	LOCK_SPT	SW_DEV_DEL_SPT	PWR_-MODE_EN-TRY_DEL_SPT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			R	Reserved	R	R	R
HW Access	Reserved			RW	Reserved	RW	RW	RW
Name	Reserved [15:13]			OFF_MEM_RET_TRANS	Reserved	OP_AC-TIVE	STA_POLI-CY_OP_IRQ_SPT	STA_POLI-CY_P-WR_IRQ_SPT

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	OFF_MEM_RET_TRANS	OFF to MEM_RET direct transition. Indicates if direct transitions from OFF to MEM_RET and from OFF_EMU to MEM_RET_EMU are supported. Default Value: 0x0
10	OP_ACTIVE	Reserved Default Value: 0x0
9	STA_POLI-CY_OP_IRQ_SPT	Operating policy transition completion event status. Default Value: 0x0
8	STA_POLICY_P-WR_IRQ_SPT	Power policy transition completion event status. Default Value: 0x0
6	FUNC_RET_RAM_REG	Indicates if the PPU_FUNRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
5	FULL_RET_RAM_REG	Indicates if the PPU_FULRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
4	MEM_RET_RAM_REG	Indicates if the PPU_MEMRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
2	LOCK_SPT	Lock and the lock interrupt event are supported. Default Value: 0x0

1.1.24 RAMC_PPU0_IDR1 (continued)

1	SW_DEV_DEL_SPT	Software device delay control configuration support. Default Value: 0x0
0	PWR_MODE_EN- TRY_DEL_SPT	Power mode entry delay support. Default Value: 0x0

1.1.25 RAMC_PPU0_IIDR

Description: Implementation Identification Register

Address: 0x42220FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	IMPLEMENTER [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R				R			
HW Access	RW				RW			
Name	REVISION [15:12]				IMPLEMENTER [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R				R			
HW Access	RW				RW			
Name	PRODUCT_ID [23:20]				VARIANT [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID [31:24]							

Bits	Name	Description
31 : 20	PRODUCT_ID	PPU part identification. Default Value: 0x0B5
19 : 16	VARIANT	Major revision of the product. Default Value: 0
15 : 12	REVISION	Minor revision of the product. Default Value: 0
11 : 0	IMPLEMENTER	Implementer identification. [11:8] The JEP106 continuation code of the implementer. [7] Always 0. [6:0] The JEP106 identity code of the implementer. For an Arm implementation, bits [11:0] are 0x43B. Default Value: 0x43B

1.1.26 RAMC_PPU0_AIDR

Description: Architecture Identification Register

Address: 0x42220FCC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	ARCH_REV_MAJOR [7:4]				ARCH_REV_MINOR [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	ARCH_REV_MAJOR	0x1 - PPU architecture major revision 1. Other Values - Reserved. Default Value: 0x1
3 : 0	ARCH_REV_MINOR	0x1 - PPU Architecture minor revision 1. Other Values - Reserved. Default Value: 0x1

1.1.27 RAMC_PPU0_PID4

Description: Implementation Defined Identification Register (PID4)

Address: 0x42220FD0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				IMPLEMENTER_11_8 [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	IMPLEMENTER_11_8	The JEP106 continuation code of the implementer, which is 0x4 hardcoded value. Default Value: 0x4

1.1.28 RAMC_PPU0_PID0

Description: Implementation Defined Identification Register (PID0)

Address: 0x42220FE0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID_7_0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	PRODUCT_ID_7_0	PPU part identification bits [7:0]. Default Value: 0xB5

1.1.29 RAMC_PPU0_PID1

Description: Implementation Defined Identification Register (PID1)

Address: 0x42220FE4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	IMPLEMENTER_3_0 [7:4]				PRODUCT_ID_11_8 [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	IMPLEMENTER_3_0	JEP106_ID bits [3:0] Default Value: 0xB
3 : 0	PRODUCT_ID_11_8	PPU part identification bits [11:8] Default Value: 0x0

1.1.30 RAMC_PPU0_PID2

Description: Implementation Defined Identification Register (PID2)

Address: 0x42220FE8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R	R		
HW Access	RW				RW	RW		
Name	REV_CONST [7:4]				CON-ST_HIGH	IMPLEMENTER_6_4 [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	REV_CONST	Constant LOW Revision (4 bits) Default Value: 0x0
3	CONST_HIGH	Constant HIGH Default Value: 0x1
2 : 0	IMPLEMENTER_6_4	JEP106_ID bits [6:4] Default Value: 0x3

1.1.31 RAMC_PPU0_PID3

Description: Implementation Defined Identification Register (PID3)

Address: 0x42220FEC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	PID3_REVISION [7:4]				PID3_REV_CONST [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	PID3_REVISION	Minor revision of the product. Default Value: 0x0
3 : 0	PID3_REV_CONST	Constant LOW (4 bits) Default Value: 0x0

1.1.32 RAMC_PPU0_ID0

Description: Implementation Defined Identification Register (ID0)

Address: 0x42220FF0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID0	ID0 hard coded value Default Value: 0x0D

1.1.33 RAMC_PPU0_ID1

Description: Implementation Defined Identification Register (ID1)

Address: 0x42220FF4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID1 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID1	ID1 hardcoded value Default Value: 0xF0

1.1.34 RAMC_PPU0_ID2

Description: Implementation Defined Identification Register (ID2)

Address: 0x42220FF8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID2 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID2	ID2 hardcoded value Default Value: 0x05

1.1.35 RAMC_PPU0_ID3

Description: Implementation Defined Identification Register (ID3)

Address: 0x42220FFC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID3 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID3	ID3 hardcoded value Default Value: 0xB1

1.1.36 ICACHE0_CTL

Description: Cache control

Address: 0x42223000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [23:18]						WAY [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved	RW				
HW Access	R	R	Reserved	R				
Name	CA_EN	PREF_EN	Reserved	SET_ADDR [28:24]				

Bits	Name	Description
31	CA_EN	Cache enable: 0: Disabled. The cache tag valid bits are reset to "0"s and the cache LRU information is set to "1"s (making way 0 the LRU way and way 3 the MRU way). 1: Enabled. Default Value: 1
30	PREF_EN	Prefetch enable: 0: Disabled. 1: Enabled. Prefetching requires the cache to be enabled; i.e. ENABLED is "1". Default Value: 1
28 : 24	SET_ADDR	Specifies the cache set for which cache information is provided in STATUS0/1/2. Default Value: 0
17 : 16	WAY	Specifies the cache way for which cache information is provided in STATUS0/1/2. Default Value: 0

1.1.37 ICACHE0_CMD

Description: Cache command

Address: 0x42223008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW1S	RW1S
HW Access	Reserved						RW1C	RW1C
Name	Reserved [7:2]						BUFF_INV	INV

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	BUFF_INV	Invalidation of buffers (does not invalidate the caches). SW writes a "1" to clear the buffers. HW sets this field to "0" when the operation is completed. Default Value: 0
0	INV	Invalidation of cahce and buffer. SW writes a "1" to clear the caches. HW sets this field to "0" when the operation is completed. The caches' LRU structures are also reset to their default state. Default Value: 0

1.1.38 ICACHE0_STATUS0

Description: Cache status 0

Address: 0x42223080

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	VALID32 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	VALID32 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	VALID32 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	VALID32 [31:24]							

Bits	Name	Description
31 : 0	VALID32	Sixteen valid bits of the cache line specified by CTL.WAY and CTL.SET_ADDR. Default Value: 0

1.1.39 ICACHE0_STATUS1

Description: Cache status 1

Address: 0x42223084

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	TAG [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	TAG [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	TAG [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	TAG [31:24]							

Bits	Name	Description
31 : 0	TAG	Cache line address of the cache line specified by CTL.WAY and CTL.SET_ADDR. Default Value: Undefined

1.1.40 ICACHE0_STATUS2

Description: Cache status 2

Address: 0x42223088

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		R					
HW Access	Reserved		W					
Name	Reserved [7:6]		LRU [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5 : 0	LRU	Six bit LRU representation of the cache set specified by CTL.SET_ADDR. The encoding of the field is as follows ("X_LRU_Y" indicates that way X is Less Recently Used than way Y): Bit 5: 0_LRU_1: way 0 less recently used than way 1. Bit 4: 0_LRU_2. Bit 3: 0_LRU_3. Bit 2: 1_LRU_2. Bit 1: 1_LRU_3. Bit 0: 2_LRU_3. Default Value: 0x3F

1.1.41 CPUSS_PPU_PWPR

Description: Power Policy Register

Address: 0x42225000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				PWR_POLICY [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW	Reserved			RW
HW Access	Reserved			R	Reserved			R
Name	Reserved [15:13]			LOCK_EN	Reserved [11:9]			PWR_DYN_EN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				OP_POLICY [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [31:25]							OP_DYN_EN

Bits	Name	Description
24	OP_DYN_EN	Reserved Default Value: 0x0
19 : 16	OP_POLICY	Reserved Default Value: 0x0
12	LOCK_EN	Reserved Default Value: 0x0
8	PWR_DYN_EN	Power mode dynamic transition enable. When this bit is set to 1 dynamic transitions are enabled for power modes, allowing transitions to be initiated by changes on power mode DEVACTIVE inputs. Default Value: 0x1
3 : 0	PWR_POLICY	Power mode policy. When static power mode transitions are enabled, PWR_DYN_EN is set to 0, this is the target power mode for the PPU. When dynamic power mode transitions are enabled, PWR_DYN_EN is set to 1, this is the minimum power mode for the PPU. This PPU supports the following modes: OFF(0), FULL_RET(5), ON(8). Do not use WARM_RST(9) or other unsupported modes. Default Value: 0x8

1.1.42 CPUSS_PPU_PMER

Description: Power Mode Emulation Register

Address: 0x42225004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							EMU_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	EMU_EN	Reserved Default Value: 0x0

1.1.43 CPUSS_PPU_PWSR

Description: Power Status Register

Address: 0x42225008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				PWR_STATUS [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			R	Reserved			R
HW Access	Reserved			RW	Reserved			RW
Name	Reserved [15:13]			LOCK_STA-TUS	Reserved [11:9]			PWR_DY-N_STATUS

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [23:20]				OP_STATUS [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [31:25]							OP_DY-N_STATUS

Bits	Name	Description
24	OP_DYN_STATUS	Reserved Default Value: 0x0
19 : 16	OP_STATUS	Reserved Default Value: 0x0
12	LOCK_STATUS	Reserved Default Value: 0x0
8	PWR_DYN_STATUS	Power mode dynamic transition status. When set to 1 power mode dynamic transitions are enabled. There might be a delay in dynamic transitions becoming active or inactive if the PPU is transitioning when PWR_DYN_EN is programmed. Default Value: 0x0
3 : 0	PWR_STATUS	Power mode status. These bits reflect the current power mode of the PPU. See PPU_PWPR.PWR_POLICY for power mode enumeration. Default Value: 0x0

1.1.44 CPUSS_PPU_DISR

Description: Device Interface Input Current Status Register

Address: 0x42225010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PWR_DEVACTIVE_STATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					R		
HW Access	Reserved					RW		
Name	Reserved [15:11]					PWR_DEVACTIVE_STATUS [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	OP_DEVACTIVE_STATUS [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVE_STATUS	Reserved Default Value: 0x0
10 : 0	PWR_DEVACTIVE_STATUS	Status of the power mode DEVACTIVE inputs. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 0 is for Q-channel device 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0

1.1.45 CPUSS_PPU_MISR

Description: Miscellaneous Input Current Status Register

Address: 0x42225014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							PCSMPAC-CEPT_STA-TUS

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	DEVACCEPT_STATUS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	DEVDENY_STATUS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	DEVDENY_STATUS	Status of the device interface DEVDENY inputs. There is one bit for each device interface DEVQDENY. For example, bit 16 is for Q-Channel 0 DEVQDENY, and bit 17 for Q-Channel 1 DEVQDENY. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
15 : 8	DEVACCEPT_STATUS	Status of the device interface DEVACCEPT inputs. There is one bit for each device interface DEVQACCEPTn. For example, bit 8 is for Q-Channel 0 DEVQACCEPTn and bit 9 for Q-Channel 1 DEVQACCEPTn. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
0	PCSMPACCEPT_STA-TUS	The status of the PCSMPACCEPT input. Default Value: 0x0

1.1.46 CPUSS_PPU_STSR

Description: Stored Status Register

Address: 0x42225018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	STORED_DEVDENY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	STORED_DEVDENY	Status of the DEVDENY signals from the last device interface Q-Channel transition. For Q-Channel: There is one bit for each device interface DEVQDENY. For example, bit 0 is for Q-Channel 0 DEVQDENY, and bit 1 for Q-Channel 1 DEVQDENY. Refer to PPU_DISR.PWR_DEVACTIVE_STATUS for device enumeration. Default Value: 0x0

1.1.47 CPUSS_PPU_UNLK

Description: Unlock register

Address: 0x4222501C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							UNLOCK

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	UNLOCK	Reserved Default Value: 0x0

1.1.48 CPUSS_PPU_PWCR

Description: Power Configuration Register

Address: 0x42225020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DEVREQEN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	PWR_DEVACTIVEEN [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [23:19]					PWR_DEVACTIVEEN [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	OP_DEVACTIVEEN [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVEEN	Reserved Default Value: 0x00
18 : 8	PWR_DEVACTIVEEN	These bits enable the power mode DEVACTIVE inputs. When a bit is to 1 the related DEVACTIVE input is enabled, when set to 0 it is disabled. All available bits are reset to 1. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE, and bit 9 for the Q-Channel 1 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x03
7 : 0	DEVREQEN	When set to 1 enables the device interface handshake for transitions. All available bits are reset to 1. There is one bit for each device interface channel. For example, bit 0 is for Q-Channel 0, and bit 1 is for Q-Channel 1. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x03

1.1.49 CPUSS_PPU_PTCR

Description: Power Mode Transition Configuration Register

Address: 0x42225024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						DBG_RE-COV_POR ST_EN	WARM_RS T_DEVREQ EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	DBG_RE-COV_PORST_EN	Reserved Default Value: 0x0
0	WARM_RST_DEVREQEN	Transition behavior between ON and WARM_RST. This bit should not be modified when the PPU is in WARM_RST, or if the PPU is performing a transition, otherwise PPU behavior is UN-PREDICTABLE. 0: The PPU does not perform a device interface handshake when transitioning between ON and WARM_RST. 1: The PPU performs a device interface handshake when transitioning between ON and WARM_RST. This disables all Q-Channels for this transition. Default Value: 0x0

1.1.50 CPUSS_PPU_IMR

Description: Interrupt Mask Register

Address: 0x42225030

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	Name	Description
4	STA_POLICY_OP_IRQ_MASK	Reserved Default Value: 0x0
3	STA_POLICY_PWR_IRQ_MASK	Reserved Default Value: 0x0
2	DYN_DENY_IRQ_MASK	Dynamic transition denial event mask. Default Value: 0x1
1	DYN_ACCEPT_IRQ_MASK	Dynamic transition acceptance event mask. Default Value: 0x1
0	UNSPT_POLICY_IRQ_MASK	Unsupported Policy event mask. Default Value: 0x0

1.1.52 CPUSS_PPU_ISR

Description: Interrupt Status Register

Address: 0x42225038

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	Reserved	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C
HW Access	RW	Reserved	R	R	R	R	R	R
Name	OTH-ER_IRQ	Reserved	LOCKED_IRQ	EMU_DE-NY_IRQ	EMU_AC-CEPT_IRQ	STA_DE-NY_IRQ	STA_AC-CEPT_IRQ	STA_POLI-CY_TRN_IRQ

Bits	15	14	13	12	11	10	9	8
SW Access	RW1C							
HW Access	R							
Name	PWR_ACTIVE_EDGE_IRQ [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW1C		
HW Access	Reserved					R		
Name	Reserved [23:19]					PWR_ACTIVE_EDGE_IRQ [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C							
HW Access	R							
Name	OP_ACTIVE_EDGE_IRQ [31:24]							

Bits	Name	Description
31 : 24	OP_ACTIVE_EDGE_IRQ	Indicates which operating mode DEVPACTIVE inputs caused the input edge event. When operating modes are not supported this field is reserved. Default Value: 0x0
18 : 8	PWR_ACTIVE_EDGE_IRQ	Indicates which power mode DEVACTIVE inputs caused the input edge event. Bits for unused channels are the MSBs and are reserved. There is one bit for each device Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x00
7	OTHER_IRQ	Indicates there is an interrupt event pending in the Additional Interrupt Status Register (PPU_AISR). Default Value: 0x0
5	LOCKED_IRQ	Reserved Default Value: 0x0
4	EMU_DENY_IRQ	Reserved Default Value: 0x0
3	EMU_ACCEPT_IRQ	Reserved Default Value: 0x0
2	STA_DENY_IRQ	Static transition denial event status. Default Value: 0x0
1	STA_ACCEPT_IRQ	Static transition acceptance event status. Default Value: 0x0

1.1.52 CPUSS_PPU_ISR (continued)

0	STA_POLICY_TRN_IRQ	Static full policy transition completion event status. Default Value: 0x0

1.1.53 CPUSS_PPU_AISR

Description: Additional Interrupt Status Register

Address: 0x4222503C

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	Name	Description
29	DYN_WRM_RST_SPT	Dynamic WARM_RST support. Default Value: 0x0
28	DYN_ON_SPT	Dynamic ON support. Default Value: 0x1
27	DYN_FUNC_RET_SPT	Dynamic FUNC_RET support. Default Value: 0x0
26	DYN_FULL_RET_SPT	Dynamic FULL_RET support. Default Value: 0x1
25	DYN_MEM_OFF_SPT	Dynamic MEM_OFF support. Default Value: 0x0
24	DYN_LGC_RET_SPT	Dynamic LOGIC_RET support. Default Value: 0x0
23	DY-N_MEM_RET_EMU_SPT	Dynamic MEM_RET_EMU support Default Value: 0x0
22	DYN_MEM_RET_SPT	Dynamic MEM_RET support. Default Value: 0x0

1.1.63 CPUSS_PPU_IDR0 (continued)

21	DYN_OFF_EMU_SPT	Dynamic OFF_EMU support. Default Value: 0x0
20	DYN_OFF_SPT	Dynamic OFF support. Default Value: 0x1
18	STA_DBG_RECOV_SPT	DBG_RECOV support. Default Value: 0x0
17	STA_WRM_RST_SPT	WARM_RST support. Ignore this bit. Do not use WARM_RST. Default Value: 0x1
16	STA_ON_SPT	ON support. Default Value: 0x1
15	STA_FUNC_RET_SPT	FUNC_RET support. Default Value: 0x0
14	STA_FULL_RET_SPT	FULL_RET support. Default Value: 0x1
13	STA_MEM_OFF_SPT	MEM_OFF support. Default Value: 0x0
12	STA_LGC_RET_SPT	LOGIC_RET support. Default Value: 0x0
11	STA_MEM_RET_EMU_SPT	MEM_RET_EMU support. Default Value: 0x0
10	STA_MEM_RET_SPT	MEM_RET support. Default Value: 0x0
9	STA_OFF_EMU_SPT	OFF_EMU support. Default Value: 0x0
8	STA_OFF_SPT	OFF support. Default Value: 0x1
7 : 4	NUM_OPMODE	No. of operating modes supported is NUM_OPMODE + 1. Default Value: 0x0
3 : 0	DEVCHAN	No. of Device Interface Channels. 0: This is a P-Channel PPU. Refer to PPU_IDR1.OP_ACTIVE for the number of DEVPACTIVE inputs and their meaning. non-zero: The value is the number of Q-Channels. The device enumeration is: Device 0: SRSS PDCM, Device 1: CPUSS SEQ between SS level LPD500 EXP & PERI Q-Channel Default Value: 0x2

1.1.64 CPUSS_PPU_IDR1

Description: PPU Identification Register 1

Address: 0x42225FB4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	R	R	R	Reserved	R	R	R
HW Access	Reserved	RW	RW	RW	Reserved	RW	RW	RW
Name	Reserved	FUNC_RET_RAM_REG	FULL_RET_RAM_REG	MEM_RET_RAM_REG	Reserved	LOCK_SPT	SW_DEV_DEL_SPT	PWR_MODE_ENTRY_DEL_SPT

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	OFF_MEM_RET_TRANS	OFF to MEM_RET direct transition. Indicates if direct transitions from OFF to MEM_RET and from OFF_EMU to MEM_RET_EMU are supported. Default Value: 0x0
10	OP_ACTIVE	Operating mode use model for dynamic transitions. 0: Ladder use model. 1: Independent use model. When operating modes are not supported (PPU_IDR0.NUM_OPMODE==0), this field is reserved. Default Value: 0x0
9	STA_POLICY_OP_IRQ_SPT	Operating policy transition completion event status. Default Value: 0x0
8	STA_POLICY_PWR_IRQ_SPT	Power policy transition completion event status. Default Value: 0x0
6	FUNC_RET_RAM_REG	Indicates if the PPU_FUNRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
5	FULL_RET_RAM_REG	Indicates if the PPU_FULRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
4	MEM_RET_RAM_REG	Indicates if the PPU_MEMRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0

1.1.64 CPUSS_PPU_IDR1 (continued)

2	LOCK_SPT	Lock and the lock interrupt event are supported. Default Value: 0x0
1	SW_DEV_DEL_SPT	Software device delay control configuration support. Default Value: 0x0
0	PWR_MODE_EN- TRY_DEL_SPT	Power mode entry delay support. Default Value: 0x0

1.1.65 CPUSS_PPU_IIDR

Description: Implementation Identification Register

Address: 0x42225FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	IMPLEMENTER [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R				R			
HW Access	RW				RW			
Name	REVISION [15:12]				IMPLEMENTER [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R				R			
HW Access	RW				RW			
Name	PRODUCT_ID [23:20]				VARIANT [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID [31:24]							

Bits	Name	Description
31 : 20	PRODUCT_ID	PPU part identification. Default Value: 0x0B5
19 : 16	VARIANT	Major revision of the product. Default Value: 0
15 : 12	REVISION	Minor revision of the product. Default Value: 0
11 : 0	IMPLEMENTER	Implementer identification. [11:8] The JEP106 continuation code of the implementer. [7] Always 0. [6:0] The JEP106 identity code of the implementer. For an Arm implementation, bits [11:0] are 0x43B. Default Value: 0x43B

1.1.66 CPUSS_PPU_AIDR

Description: Architecture Identification Register

Address: 0x42225FCC

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved		RW	RW	RW	RW	RW
HW Access	R	Reserved		R	R	R	R	R
Name	IDC_MASK	Reserved [30:29]		IXC_MASK	UFC_MASK	OFC_MASK	DZC_MASK	IOC_MASK

Bits	Name	Description
31	IDC_MASK	CPU FPU exception mask for the CPU's FPCSR.IDC "input denormalized" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Note: if the CPU FPCSR.FZ field is set to '1', denormalized inputs are "flushed to zero". Dependent on the FPU algorithm, this may or may not occur frequently. To prevent frequent CPU FPU interrupts as a result of denormalized inputs, this field may be set to '0'. Default Value: 0
28	IXC_MASK	CPU FPU exception mask for the CPU's FPCSR.IXC "inexact" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Note: the "inexact" condition is set as a result of rounding. Rounding may occur frequently and is typically not an error condition. To prevent frequent CPU FPU interrupts as a result of rounding, this field is typically set to '0'. Default Value: 0
27	UFC_MASK	CPU FPU exception mask for the CPU's FPCSR.UFC "underflow" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Default Value: 0
26	OFC_MASK	CPU FPU exception mask for the CPU's FPCSR.OFC "overflow" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Default Value: 0

1.1.76 MXCM33_CM33_CTL (continued)

25	DZC_MASK	CPU FPU exception mask for the CPU's FPCSR.DZC "divide by zero" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Default Value: 0
24	IOC_MASK	CPU floating point unit (FPU) exception mask for the CPU's FPCSR.IOC "invalid operation" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Note: the ARM architecture does NOT support FPU exceptions; i.e. there is no precise FPU exception handler. Instead, FPU conditions are captured in the CPU's FPCSR register and the conditions are provided as CPU interface signals. The interface signals are "masked" with the fields provided by this register (CM33_CTL). The "masked" signals are reduced/OR-ed into a single CPU floating point interrupt signal. The associated CPU interrupt handler allows for imprecise handling of FPU exception conditions. Note: the CPU's FPCSR exception conditions are "sticky". Typically, the CPU FPU interrupt handler will clear the exception condition(s) to '0'. Note: by default, the FPU exception masks are '0'. Therefore, FPU exception conditions will NOT activate the CPU's floating point interrupt. Default Value: 0
12	LOCKSAU	Asserting this bit prevents changes to Secure SAU memory regions already programmed. All writes to the registers are ignored. '1': Disables writes to the SAU_CTRL, SAU_RNR, SAU_RBAR and SAU_RLAR registers from software or from a debug agent connected to the processor. '0': Unlocks these registers. This signal has no affect if the Cortex-M33 processor has not been configured with support for the Armv8-M Security Extension, or if no SAU regions have been configured. Default Value: 0
11	LOCKNSMPU	Asserting this bit prevents changes to Nonsecure MPU memory regions already programmed. All writes to the registers are ignored. '1': Disables writes to the MPU_CTRL_NS, MPU_RNR_NS, MPU_RBAR_NS, MPU_RLAR_NS, MPU_RBAR_A_NSn and MPU_RLAR_A_NSn from software or from a debug agent connected to the processor. '0': Unlocks these registers. This signal has no affect if the Cortex-M33 processor has been configured without any Nonsecure MPU regions. Default Value: 0
10	LOCKSMPU	Asserting this bit prevents changes to programmed Secure MPU memory regions and all writes to the registers are ignored. '1': Disables writes to the MPU_CTRL, MPU_RNR, MPU_RBAR, MPU_RLAR, MPU_RBAR_An and MPU_RLAR_An from software or from a debug agent connected to the processor in Secure state. '0': Unlocks these registers. This bit has no affect if the Cortex-M33 processor has not been configured with support for the Armv8-M Security Extension, or if no Secure MPU regions have been configured. Default Value: 0
9	LOCKSVTAIRCR	Asserting this bit prevents changes to: - The Secure vector table base address. - Handling of Secure interrupt priority. - BusFault, HardFault, and NMI security target settings in the processor. '1': Disables writes to the VTOR_S,AIRCR.PRIS, and AIRCR.BFHFNMINS registers. '0': Unlocks these registers. Default Value: 0
8	LOCKNSVTOR	Asserting this bit prevents changes to the Non-secure vector table base address. '1': Disables writes to the VTOR_NS register. '0': Unlocks this register. Default Value: 0
4	CPU_WAIT	When this signal is '1' out of reset, it forces the CPU into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven '0'. Default Value: 1

1.1.77 MXCM33_CM33_CMD

Description: Command

Address: 0x42260004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	Reserved
HW Access	Reserved						RW1S	Reserved
Name	Reserved [7:2]						ENABLED	Reserved

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access								
Name	VECTKEYSTAT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access								
Name	VECTKEYSTAT [31:24]							

Bits	Name	Description
31 : 16	VECTKEYSTAT	Register key (to prevent accidental writes). - Should be written with a 0x05fa key value for the write to take effect. - Always reads as 0xfa05. Default Value: 0xFA05
1	ENABLED	Processor enable: '0': Disabled. Processor clock is turned off and reset is activated. After SW clears this field to '0', HW automatically sets this field to '1'. This effectively results in a CM33 reset, followed by a CM33 warm boot. '1': Enabled. Note: The intent is that this bit is modified only through an external probe or by the other CM33 while this CM33 is in Sleep or DeepSleep power mode. If this field is cleared to '0' by this CM33 itself, it should be done under controlled conditions (such that undesirable side effects can be prevented). Note: The CM33 CPU has a AIRCR.SYSRESETREQ register field that allows the CM33 to reset the complete device (ENABLED only disables/enables the CM33), resulting in a warm boot. This CPU register field has similar "built-in protection" as this register to prevent accidental system writes (the upper 16-bits of the register need to be written with a 0x05fa key value; see CPU user manual for more details). Default Value: 1

1.1.78 MXCM33_CM33_STATUS

Description: Status

Address: 0x42260008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	R
HW Access	Reserved						W	W
Name	Reserved [7:2]						SLEEP-DEEP	SLEEPING

Bits	15	14	13	12	11	10	9	8

Bits	Name	Description
23 : 20	MINOR_REV	Minor Revision, starts with 1, increments with metal layer only tape-out (implemented with metal ECO-able tie-off) Default Value: Undefined
19 : 16	MAJOR_REV	Major Revision, starts with 1, increments with all layer tape-out (implemented with metal ECO-able tie-off) Default Value: Undefined
11 : 0	FAMILY_ID	Family ID. Common ID (Partnumber a.k.a. Silicon ID) for a product family. Default Value: 277

1.1.90 CPUSS_DP_STATUS

Description: Debug port status

Address: 0x42290020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R	R	R	R
HW Access	Reserved				W	W	W	W
Name	Reserved [7:4]				SWJ_SWD_SEL	SWJ_-JTAG_SEL	SWJ_DE-BUG_EN	SWJ_CON-NECTED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3	SWJ_SWD_SEL	Specifies if the SWD interface is selected. '0': SWD not selected. '1': SWD selected. Default Value: 0
2	SWJ_JTAG_SEL	Specifies if the JTAG interface is selected. '0': JTAG not selected. '1': JTAG selected. Default Value: 0
1	SWJ_DEBUG_EN	Specifies if SWJ debug is enabled, i.e. CDBGPWRUPACK is '1' and thus debug clocks are on: '0': Disabled. '1': Enabled. Default Value: 0
0	SWJ_CONNECTED	Specifies if the SWJ debug port is connected; i.e. debug host interface is active: '0': Not connected/not active. '1': Connected/active. Default Value: 0

1.1.91 CPUSS_BUFF_CTL

Description: Buffer control

Address: 0x42290030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							WRITE_BUFF

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	WRITE_BUFF	Specifies if write transfer can be buffered in the bus infrastructure bridges: '0': Write transfers are not buffered, independent of the transfer's bufferable attribute. '1': Write transfers can be buffered, if the transfer's bufferable attribute indicates that the transfer is a bufferable/posted write. This bit controls buffering only for subsystems that interfaced using the AHB2AHB bridge, not for components utilised from the ARM SIE200, such as the 32-bit SYS interconnect in SYSCPUSS, Peripheral Group0, MSC etc. Default Value: 1

1.1.92 CPUSS_CAL_SUP_SET

Description: Calibration support set and read

Address: 0x42290040

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved				RW	
HW Access	R	R	Reserved				R	
Name	NOREF	SKEW	Reserved [29:26]				CLOCK_SOURCE [25:24]	

Bits	Name	Description
31	NOREF	Specifies if an external clock source is provided: '0': An external clock source is provided. '1': An external clock source is NOT provided and only the CPU internal clock can be used as SysTick timer clock source. Default Value: 0
30	SKEW	Specifies the precision of the clock source and if the TENMS field represents exactly 10 ms (clock source frequency is a multiple of 100 Hz). This affects the suitability of the SysTick timer as a SW real-time clock: '0': Precise. '1': Imprecise. Default Value: 1
25 : 24	CLOCK_SOURCE	Specifies an external clock source: "0": The low frequency clock "clk_lf" is selected. The precision of this clock depends on whether the low frequency clock source is a SRSS internal RC oscillator (imprecise) or a device external crystal oscillator (precise). "1": The internal main oscillator (IMO) clock "clk_imo" is selected. o "2": The external crystal oscillator (ECO) clock "clk_eco" is selected. "3": The SRSS "clk_timer" is selected ("clk_timer" is a divided/gated version of "clk_hf" or "clk_imo"). Note: If NOREF is '1', the CLOCK_SOURCE value is NOT used. Note: It is SW's responsibility to provide the correct NOREF, SKEW and TENMS field values for the selected clock source. Default Value: 0
23 : 0	TENMS	Specifies the number of clock source cycles (minus 1) that make up 10 ms. E.g., for a 32,768 Hz reference clock, TENMS is 328 - 1 = 327. Default Value: 327

1.1.96 CPUSS_SYSTICK_NS_CTL

Name	Reserved	SYS_SECURE_DISABLE	Reserved	CM33_0_SECURE_DISABLE	Reserved [27:26]		CM33_1_NID_DISABLE	CM33_1_DBG_DISABLE

Bits	Name	Description
30	SYS_SECURE_DISABLE	Disables the system secure AP interface: '0': Enabled. '1': Disabled. Typically, this field is set by the Infineon boot code with information from OTP memory. The access port is only enabled when SYS_SECURE_DISABLE is '0' and SYS_SECURE_ENABLE is '1'. Default Value: 0
28	CM33_0_SECURE_DISABLE	Disables the CM33_0 secure AP interface: '0': Enabled. '1': Disabled. Typically, this field is set by the Infineon boot code with information from OTP memory. The access port is only enabled when CM33_0_DISABLE is '0' and CM33_0_ENABLE is '1'. Default Value: 0

1.1.100 CPUSS_AP_CTL (continued)

25	CM33_1_NID_DISABLE	Disable Non-invasive debug for CM33_1. '1': Disables all trace and non-invasive debug features. '0': Enables all trace and non-invasive debug features. Typically, this field is set by the Infineon boot code with information from OTP memory. The non-invasive debug is only enabled when CM33_1_NID_DISABLE is '0' and CM33_1_NID_ENABLE is '1'. Default Value: 0
24	CM33_1_DBG_DISABLE	Disable Invasive debug for CM33_1. '1': Disables all halt-mode and invasive debug features. '0': Enables invasive debug features. Typically, this field is set by the Infineon boot code with information from OTP memory. The invasive debug is only enabled when CM33_1_DBG_DISABLE is '0' and CM33_1_DBG_ENABLE is '1'. Default Value: 0
23	CM33_0_SPNID_DISABLE	Secure non-invasive debug disable for CM33_0. '1': Disables non-invasive debug features when the processor is in Secure state. '0': Enables non-invasive debug features when the processor is in Secure state. Typically, this field is set by the Infineon boot code with information from OTP memory. The non-invasive debug in secure state is only enabled when CM33_0_SPNID_DISABLE is '0' and CM33_0_SPNID_ENABLE is '1'. Default Value: 0
22	CM33_0_SPID_DISABLE	Secure invasive debug disable for CM33_0. '1': disables all halt mode and invasive debug features when the processor is in Secure state. '0': Enables all halt mode and invasive debug features when the processor is in Secure state. Typically, this field is set by the Infineon boot code with information from OTP memory. The invasive debug in secure state is only enabled when CM33_0_SPID_DISABLE is '0' and CM33_0_SPID_ENABLE is '1'. Default Value: 0
21	CM33_0_NID_DISABLE	Disable Non-invasive debug for CM33_0. '1': Disables all trace and non-invasive debug features. '0': Enables all trace and non-invasive debug features. Typically, this field is set by the Infineon boot code with information from OTP memory. The non-invasive debug is only enabled when CM33_0_NID_DISABLE is '0' and CM33_0_NID_ENABLE is '1'. Default Value: 0
20	CM33_0_DBG_DISABLE	Disable Invasive debug for CM33_0. '1': Disables all halt-mode and invasive debug features. '0': Enables invasive debug features. Typically, this field is set by the Infineon boot code with information from OTP memory. The invasive debug is only enabled when CM33_0_DBG_DISABLE is '0' and CM33_0_DBG_ENABLE is '1'. Default Value: 0
18	SYS_DISABLE	Disables the system AP interface: '0': Enabled. '1': Disabled. Typically, this field is set by the Infineon boot code with information from OTP memory. The access port is only enabled when SYS_DISABLE is '0' and SYS_ENABLE is '1'. Default Value: 0
17	CM33_1_DISABLE	Disables the CM33_1 AP interface: '0': Enabled. '1': Disabled. Typically, this field is set by the Infineon boot code with information from OTP memory. The access port is only enabled when CM33_1_DISABLE is '0' and CM33_1_ENABLE is '1'. Default Value: 0
16	CM33_0_DISABLE	Disables the CM33_0 AP interface: '0': Enabled. '1': Disabled. Typically, this field is set by the Infineon boot code with information from OTP memory. The access port is only enabled when CM33_0_DISABLE is '0' and CM33_0_ENABLE is '1'. Default Value: 0

1.1.100 CPUSS_AP_CTL (continued)

14	SYS_SECURE_ENABLE	Enables the system secure AP interface: '0': Disabled. '1': Enabled. Default Value: 0
12	CM33_0_SECURE_ENABLE	Enables the CM33_0 secure AP interface: '0': Disabled. '1': Enabled. Default Value: 0
9	CM33_1_NID_ENABLE	Non-invasive debug enable for CM33_1. '0': Disables all trace and non-invasive debug features. '1': Enables all trace and non-invasive debug features. Default Value: 0
8	CM33_1_DBG_ENABLE	Invasive debug enable for CM33_1. '0': Disables all halt-mode and invasive debug features. '1': Enables invasive debug features. Default Value: 0
7	CM33_0_SPNID_ENABLE	Secure non-invasive debug enable for CM33_0. '0': Disables non-invasive debug features when the processor is in Secure state. '1': Enables non-invasive debug features when the processor is in Secure state. Default Value: 0
6	CM33_0_SPID_ENABLE	Secure invasive debug enable for CM33_0. '0': disables all halt mode and invasive debug features when the processor is in Secure state. '1': Enables all halt mode and invasive debug features when the processor is in Secure state. Default Value: 0
5	CM33_0_NID_ENABLE	Non-invasive debug enable for CM33_0. '0': Disables all trace and non-invasive debug features. '1': Enables all trace and non-invasive debug features. Default Value: 0
4	CM33_0_DBG_ENABLE	Invasive debug enable for CM33_0. '0': Disables all halt-mode and invasive debug features. '1': Enables invasive debug features. Default Value: 1
2	SYS_ENABLE	Enables the system AP interface: '0': Disabled. '1': Enabled. Default Value: 0
1	CM33_1_ENABLE	Enables the CM33_1 AP interface: '0': Disabled. '1': Enabled. Default Value: 0
0	CM33_0_ENABLE	Enables the CM33_0 AP interface: '0': Disabled. '1': Enabled. Default Value: 0

Bits	Name	Description
23 : 16	PC_MASK	Protection context mask for protection contexts "15" down to "0". Bit PC_MASK[i] indicates if the MS_PC_STRUCT[x].PC[3:0] protection context field can be set to the value "i": - PC_MASK[i] is '0': MS_PC_STRUCT[x].PC[3:0] can NOT be set to "i"; and PC[3:0] is not changed. - PC_MASK[i] is '1': MS_PC_STRUCT[x].PC[3:0] can be set to "i". Note: When CM33_0 CM33_PC_CTL.VALID[i] is '1' (the associated protection context handler is valid), write transfers to PC_MASK[i] always write '0', regardless of data written. This ensures that when valid protection context handlers are used to enter protection contexts 0, 1, 2 or 3 through HW (HW modifies MS_PC_STRUCT[x].PC[3:0] on entry of the handler), it is NOT possible for SW to enter those protection contexts. Default Value: 4

1.1.103 MS6_CTL

Description: Master 'x' protection context control

Address: 0x42294060

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						NS	P

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	PC_MASK	Protection context mask for protection contexts "15" down to "0". Bit PC_MASK[i] indicates if the MS_PC_STRUCT[x].PC[3:0] protection context field can be set to the value "i": - PC_MASK[i] is '0': MS_PC_STRUCT[x].PC[3:0] can NOT be set to "i"; and PC[3:0] is not changed. - PC_MASK[i] is '1': MS_PC_STRUCT[x].PC[3:0] can be set to "i". Note: When CM33_0 CM33_PC_CTL.VALID[i] is '1' (the associated protection context handler is valid), write transfers to PC_MASK[i] always write '0', regardless of data written. This ensures that when valid protection context handlers are used to enter protection contexts 0, 1, 2 or 3 through HW (HW modifies MS_PC_STRUCT[x].PC[3:0] on entry of the handler), it is NOT possible for SW to enter those protection contexts. Default Value: 4
1	NS	Master security controller configuration. 0: Bus master is secure. Master can send both secure and non-secure transfers. Accesses to secure addresses are not blocked and the security flag, HNONSEC, is set accordingly. 1: Bus master is non-secure. Master can send only non-secure transfers. Access to secure addresses, that is, outside the Uncheck regions, are blocked. Default Value: 0
0	P	Privileged setting ('0': user mode; '1': privileged mode). Notes: This field is ONLY used for masters that do NOT provide their own user/privileged access control attribute. The default/reset field value provides privileged mode access capabilities. Default Value: 1

1.1.104 MS_PC0_PC

Description: Master 'x' protection context value

Address: 0x42295000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				RW			
Name	Reserved [7:4]				PC [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16

Name	Reserved [23:20]				PC_SAVED [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19 : 16	PC_SAVED	Saved protection context. Modifications to this field are constrained by the associated MS_CTL_STRUCT[x].CTL.PC_MASK. Note: this field is ONLY used by the CM33_0. Default Value: 2

3 : 0	PC	Active protection context (PC). Modifications to this field are constrained by the associated MS_CTL_STRUCT[x].CTL.PC_MASK value. PC[3:0] can be set to "i" only if the corresponding mask bit (PC_MASK[i]) is '1'.
		The CM33_0 PC register is special: the PC field is modifiable by BOTH HW and SW (for all other masters, the PC field is modifiable by SW ONLY. For CM33_0 PC field HW modifications, the following holds:
		* On entry of a CM33_PC0/1/2/3_HANDLER exception/interrupt handler:
		IF (the new PC is the same as MS_PC_STRUCT[0].PC)
		PC is not affected; PC_SAVED is not affected.
		ELSE IF (CM33_PC_CTL.VALID[MS_PC_STRUCT[0].PC])
		An AHB5 bus error is generated for the exception handler fetch;
		PC is not affected; PC_SAVED is not affected.
		ELSE
		PC = "new PC"; PC_SAVED = PC (push operation).
		* On entry of any other exception/interrupt handler:
		PC = PC_SAVED; PC_SAVED is not affected (pop operation).
		
		Note: this field is NOT used by the DW controllers, DMA controllers as they inherit the protection context from master that configures the corresponding channel.
		Default Value: 2

Name	Reserved [31:25]							OP_DYN_EN

Bits	Name	Description
24	OP_DYN_EN	Reserved Default Value: 0x0
19 : 16	OP_POLICY	Reserved Default Value: 0x0
12	LOCK_EN	Reserved Default Value: 0x0
8	PWR_DYN_EN	Power mode dynamic transition enable. When this bit is set to 1 dynamic transitions are enabled for power modes, allowing transitions to be initiated by changes on power mode DEVACTIVE inputs. Default Value: 0x1
3 : 0	PWR_POLICY	Power mode policy. When static power mode transitions are enabled, PWR_DYN_EN is set to 0, this is the target power mode for the PPU. When dynamic power mode transitions are enabled, PWR_DYN_EN is set to 1, this is the minimum power mode for the PPU. This PPU supports the following modes: OFF(0), FULL_RET(5), ON(8). Do not use WARM_RST(9) or other unsupported modes. Default Value: 0x8

1.1.116 PPU_APPCPUSS_PMER

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	OP_DEVACTIVE_STATUS [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVE_STATUS	Reserved Default Value: 0x0
10 : 0	PWR_DEVACTIVE_STATUS	Status of the power mode DEVACTIVE inputs. For Q-Channel: There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 0 is for the Q-Channel 0 DEVQACTIVE, and bit 1 for the QChannel 1 DEVQACTIVE. For a Q-Channel PPU bits [10:8] are always reserved as only 8 device interface QChannels are supported. For P-Channel: There is one bit for each bit of the power mode DEVPACTIVE inputs. For example, bit 10 is for DEVPACTIVE[10], and bit 9 is for DEVPACTIVE[9]. Bit 0 relates to DEVPACTIVE[0] and is always 0 Default Value: 0x0

1.1.119 PPU_APPCPUSS_MISR

Description: Miscellaneous Input Current Status Register

Address: 0x44100014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	STORED_DEVDENY	Status of the DEVDENY signals from the last device interface Q-Channel transition. For Q-Channel: There is one bit for each device interface DEVQDENY. For example, bit 0 is for Q-Channel 0 DEVQDENY, and bit 1 for Q-Channel 1 DEVQDENY. Refer to PPU_DISR.PWR_DEVACTIVE_STATUS for device enumeration. Default Value: 0x0

1.1.121 PPU_APPCPUSS_UNLK

Description: Unlock register

Address: 0x4410001C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							UNLOCK

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	UNLOCK	Reserved Default Value: 0x0

1.1.122 PPU_APPCPUSS_PWCR

Description: Power Configuration Register

Address: 0x44100020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DEVREQEN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	PWR_DEVACTIVEEN [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [23:19]					PWR_DEVACTIVEEN [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	OP_DEVACTIVEEN [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVEEN	Reserved Default Value: 0x00
18 : 8	PWR_DEVACTIVEEN	These bits enable the power mode DEVACTIVE inputs. When a bit is to 1 the related DEVACTIVE input is enabled, when set to 0 it is disabled. All available bits are reset to 1. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE, and bit 9 for the Q-Channel 1 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x03
7 : 0	DEVREQEN	When set to 1 enables the device interface handshake for transitions. All available bits are reset to 1. There is one bit for each device interface channel. For example, bit 0 is for Q-Channel 0, and bit 1 is for Q-Channel 1. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x03

1.1.123 PPU_APPCPUSS_PTCR

Description: Power Mode Transition Configuration Register

Address: 0x44100024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						DBG_RE-COV_POR ST_EN	WARM_RS T_DEVREQ EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	DBG_RE-COV_PORST_EN	Reserved Default Value: 0x0
0	WARM_RST_DEVREQEN	Transition behavior between ON and WARM_RST. This bit should not be modified when the PPU is in WARM_RST, or if the PPU is performing a transition, otherwise PPU behavior is UN-PREDICTABLE. 0: The PPU does not perform a device interface handshake when transitioning between ON and WARM_RST. 1: The PPU performs a device interface handshake when transitioning between ON and WARM_RST. This disables all Q-Channels for this transition. Default Value: 0x0

1.1.124 PPU_APPCPUSS_IMR

Description: Interrupt Mask Register

Address: 0x44100030

Retention: Retained

Name	Reserved [23:19]					PWR_ACTIVE_EDGE_IRQ [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C							
HW Access	R							
Name	OP_ACTIVE_EDGE_IRQ [31:24]							

Bits	Name	Description
31 : 24	OP_ACTIVE_EDGE_IRQ	Indicates which operating mode DEVPACTIVE inputs caused the input edge event. When operating modes are not supported this field is reserved. Default Value: 0x0
18 : 8	PWR_ACTIVE_EDGE_IRQ	Indicates which power mode DEVACTIVE inputs caused the input edge event. Bits for unused channels are the MSBs and are reserved. There is one bit for each device Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x00
7	OTHER_IRQ	Indicates there is an interrupt event pending in the Additional Interrupt Status Register (PPU_AISR). Default Value: 0x0
5	LOCKED_IRQ	Reserved Default Value: 0x0
4	EMU_DENY_IRQ	Reserved Default Value: 0x0
3	EMU_ACCEPT_IRQ	Reserved Default Value: 0x0
2	STA_DENY_IRQ	Static transition denial event status. Default Value: 0x0
1	STA_ACCEPT_IRQ	Static transition acceptance event status. Default Value: 0x0

1.1.126 PPU_APPCPUSS_ISR (continued)

0	STA_POLICY_TRN_IRQ	Static full policy transition completion event status. Default Value: 0x0

1.1.127 PPU_APPCPUSS_AISR

Description: Additional Interrupt Status Register

8	STA_OFF_SPT	OFF support. Default Value: 0x1
7 : 4	NUM_OPMODE	No. of operating modes supported is NUM_OPMODE + 1. Default Value: 0x0
3 : 0	DEVCHAN	No. of Device Interface Channels. 0: This is a P-Channel PPU. Refer to PPU_IDR1.OP_ACTIVE for the number of DEVPACTIVE inputs and their meaning. non-zero: The value is the number of Q-Channels. The device enumeration is: Device 0: SRSS PDCM, Device 1: CPUSS SEQ between SS level LPD500 EXP & PERI Q-Channel Default Value: 0x2

1.1.138 PPU_APPCPUSS_IDR1

Description: PPU Identification Register 1

Address: 0x44100FB4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	R	R	R	Reserved	R	R	R
HW Access	Reserved	RW	RW	RW	Reserved	RW	RW	RW
Name	Reserved	FUNC_RET_RAM_REG	FULL_RET_RAM_REG	MEM_RET_RAM_REG	Reserved	LOCK_SPT	SW_DEV_DEL_SPT	PWR_-MODE_EN-TRY_DEL_SPT

Bits	15	14	13	12	11	10	9	8

HW Access	Reserved			RW	Reserved	RW	RW	RW
Name	Reserved [15:13]			OFF_MEM_RET_TRANS	Reserved	OP_AC-TIVE	STA_POLI-CY_OP_IRQ_SPT	STA_POLI-CY_P-WR_IRQ_SPT

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	OFF_MEM_RET_TRANS	OFF to MEM_RET direct transition. Indicates if direct transitions from OFF to MEM_RET and from OFF_EMU to MEM_RET_EMU are supported. Default Value: 0x0
10	OP_ACTIVE	Operating mode use model for dynamic transitions. 0: Ladder use model. 1: Independent use model. When operating modes are not supported (PPU_IDR0.NUM_OPMODE==0), this field is reserved. Default Value: 0x0
9	STA_POLI-CY_OP_IRQ_SPT	Operating policy transition completion event status. Default Value: 0x0
8	STA_POLICY_P-WR_IRQ_SPT	Power policy transition completion event status. Default Value: 0x0
6	FUNC_RET_RAM_REG	Indicates if the PPU_FUNRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
5	FULL_RET_RAM_REG	Indicates if the PPU_FULRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
4	MEM_RET_RAM_REG	Indicates if the PPU_MEMRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0

1.1.138 PPU_APPCPUSS_IDR1 (continued)

2	LOCK_SPT	Lock and the lock interrupt event are supported. Default Value: 0x0
1	SW_DEV_DEL_SPT	Software device delay control configuration support. Default Value: 0x0
0	PWR_MODE_EN- TRY_DEL_SPT	Power mode entry delay support. Default Value: 0x0

1.1.139 PPU_APPCPUSS_IIDR

Description: Implementation Identification Register

Address: 0x44100FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	IMPLEMENTER [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R				R			
HW Access	RW				RW			
Name	REVISION [15:12]				IMPLEMENTER [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R				R			
HW Access	RW				RW			
Name	PRODUCT_ID [23:20]				VARIANT [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID [31:24]							

Bits	Name	Description
31 : 20	PRODUCT_ID	PPU part identification. Default Value: 0x0B6
19 : 16	VARIANT	Major revision of the product. Default Value: 1
15 : 12	REVISION	Minor revision of the product. Default Value: 0
11 : 0	IMPLEMENTER	Implementer identification. [11:8] The JEP106 continuation code of the implementer. [7] Always 0. [6:0] The JEP106 identity code of the implementer. For an Arm implementation, bits [11:0] are 0x43B. Default Value: 0x43B

1.1.140 PPU_APPCPUSS_AIDR

Description: Architecture Identification Register

Address: 0x44100FCC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	ARCH_REV_MAJOR [7:4]				ARCH_REV_MINOR [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	IMPLEMENTER_3_0	JEP106_ID bits [3:0] Default Value: 0xB
3 : 0	PRODUCT_ID_11_8	PPU part identification bits [11:8] Default Value: 0x0

1.1.144 PPU_APPCPUSS_PID2

Description: Implementation Defined Identification Register (PID2)

Address: 0x44100FE8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R	R		
HW Access	RW				RW	RW		
Name	REV_CONST [7:4]				CON-ST_HIGH	IMPLEMENTER_6_4 [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	REV_CONST	Revision 1(4 bits) Default Value: 0x1
3	CONST_HIGH	Constant HIGH Default Value: 0x1
2 : 0	IMPLEMENTER_6_4	JEP106_ID bits [6:4] Default Value: 0x3

1.1.145 PPU_APPCPUSS_PID3

Description: Implementation Defined Identification Register (PID3)

Address: 0x44100FEC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	PID3_REVISION [7:4]				PID3_REV_CONST [3:0]			

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID3	ID3 hardcoded value Default Value: 0xB1

1.1.150 PPU_CM55_0_PWPR

Description: Power Policy Register

Address: 0x44101000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				PWR_POLICY [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW	Reserved			RW
HW Access	Reserved			R	Reserved			R
Name	Reserved [15:13]			LOCK_EN	Reserved [11:9]			PWR_DYN_EN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				OP_POLICY [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [31:25]							OP_DYN_EN

Bits	Name	Description
24	OP_DYN_EN	Operating mode dynamic transition enable. When this bit is set to 0b1 dynamic transitions are enabled for operating modes, allowing transitions to be initiated by changes on operating mode DEVACTIVE inputs. Default Value: 0x1
19 : 16	OP_POLICY	Operating mode policy. When static operating mode transitions are enabled,OP_DYN_EN is set to 0b0, then this is the target operating mode for the PPU. When dynamic operating mode transitions are enabled,OP_DYN_EN is set to 0b1, then this is the minimum operating mode for the PPU. Default Value: 0x1
12	LOCK_EN	Reserved Default Value: 0x0
8	PWR_DYN_EN	Power mode dynamic transition enable. When this bit is set to 1 dynamic transitions are enabled for power modes, allowing transitions to be initiated by changes on power mode DEVACTIVE inputs. Default Value: 0x1
3 : 0	PWR_POLICY	Power mode policy. When static power mode transitions are enabled, PWR_DYN_EN is set to 0, this is the target power mode for the PPU. When dynamic power mode transitions are enabled, PWR_DYN_EN is set to 1, this is the minimum power mode for the PPU. This PPU supports the following modes: OFF(0), FULL_RET(5), ON(8). Do not use WARM_RST(9) or other unsupported modes. Default Value: 0x0

1.1.151 PPU_CM55_0_PMER

Description: Power Mode Emulation Register

Address: 0x44101004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							EMU_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	EMU_EN	Reserved Default Value: 0x0

1.1.152 PPU_CM55_0_PWSR

Description: Power Status Register

Address: 0x44101008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				PWR_STATUS [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			R	Reserved			R
HW Access	Reserved			RW	Reserved			RW
Name	Reserved [15:13]			LOCK_STATUS	Reserved [11:9]			PWR_DYN_STATUS

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [23:20]				OP_STATUS [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [31:25]							OP_DYN_STATUS

Bits	Name	Description
24	OP_DYN_STATUS	Operating mode dynamic transition enable. When this bit is set to 0b1 dynamic transitions are enabled for operating modes, allowing transitions to be initiated by changes on operating mode DEVACTIVE inputs. Default Value: 0x0
19 : 16	OP_STATUS	Operating mode policy. When static operating mode transitions are enabled,OP_DYN_EN is set to 0b0, then this is the target operating mode for the PPU. When dynamic operating mode transitions are enabled,OP_DYN_EN is set to 0b1, then this is the minimum operating mode for the PPU. Default Value: 0x0
12	LOCK_STATUS	Reserved Default Value: 0x0
8	PWR_DYN_STATUS	Power mode dynamic transition status. When set to 1 power mode dynamic transitions are enabled. There might be a delay in dynamic transitions becoming active or inactive if the PPU is transitioning when PWR_DYN_EN is programmed. Default Value: 0x0
3 : 0	PWR_STATUS	Power mode status. These bits reflect the current power mode of the PPU. See PPU_PWPR.PWR_POLICY for power mode enumeration. Default Value: 0x0

1.1.153 PPU_CM55_0_DISR

Description: Device Interface Input Current Status Register

Address: 0x44101010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PWR_DEVACTIVE_STATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					R		
HW Access	Reserved					RW		
Name	Reserved [15:11]					PWR_DEVACTIVE_STATUS [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	OP_DEVACTIVE_STATUS [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVE_STATUS	Reserved Default Value: 0x0
10 : 0	PWR_DEVACTIVE_STATUS	Status of the power mode DEVACTIVE inputs. For Q-Channel: There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 0 is for the Q-Channel 0 DEVQACTIVE, and bit 1 for the QChannel 1 DEVQACTIVE. For a Q-Channel PPU bits [10:8] are always reserved as only 8 device interface QChannels are supported. For P-Channel: There is one bit for each bit of the power mode DEVPACTIVE inputs. For example, bit 10 is for DEVPACTIVE[10], and bit 9 is for DEVPACTIVE[9]. Bit 0 relates to DEVPACTIVE[0] and is always 0 Default Value: 0x0

1.1.154 PPU_CM55_0_MISR

Description: Miscellaneous Input Current Status Register

Address: 0x44101014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							PCSMPACCEPT_STATUS

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	DEVACCEPT_STATUS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	DEVDENY_STATUS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	DEVDENY_STATUS	Status of the device interface DEVDENY inputs. There is one bit for each device interface DEVQDENY. For example, bit 16 is for Q-Channel 0 DEVQDENY, and bit 17 for Q-Channel 1 DEVQDENY. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
15 : 8	DEVACCEPT_STATUS	Status of the device interface DEVACCEPT inputs. There is one bit for each device interface DEVQACCEPTn. For example, bit 8 is for Q-Channel 0 DEVQACCEPTn and bit 9 for Q-Channel 1 DEVQACCEPTn. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
0	PCSMPACCEPT_STATUS	The status of the PCSMPACCEPT input. Default Value: 0x0

1.1.155 PPU_CM55_0_STSR

Description: Stored Status Register

Address: 0x44101018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	STORED_DEVDENY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	STORED_DEVDENY	Status of the DEVDENY signals from the last device interface Q-Channel transition. For Q-Channel: There is one bit for each device interface DEVQDENY. For example, bit 0 is for Q-Channel 0 DEVQDENY, and bit 1 for Q-Channel 1 DEVQDENY. Refer to PPU_DISR.PWR_DEVACTIVE_STATUS for device enumeration. Default Value: 0x0

1.1.156 PPU_CM55_0_UNLK

Description: Unlock register

Address: 0x4410101C

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	Name	Description
31 : 24	OP_DEVACTIVEEN	Reserved Default Value: 0x00
18 : 8	PWR_DEVACTIVEEN	These bits enable the power mode DEVACTIVE inputs. When a bit is to 1 the related DEVACTIVE input is enabled, when set to 0 it is disabled. All available bits are reset to 1. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE, and bit 9 for the Q-Channel 1 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x03
7 : 0	DEVREQEN	When set to 1 enables the device interface handshake for transitions. All available bits are reset to 1. There is one bit for each device interface channel. For example, bit 0 is for Q-Channel 0, and bit 1 is for Q-Channel 1. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x03

1.1.158 PPU_CM55_0_PTCR

Description: Power Mode Transition Configuration Register

Address: 0x44101024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						DBG_RE-COV_POR ST_EN	WARM_RS T_DEVREQ EN

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	DBG_RE-COV_PORST_EN	Reserved Default Value: 0x0
0	WARM_RST_DEVREQEN	Transition behavior between ON and WARM_RST. This bit should not be modified when the PPU is in WARM_RST, or if the PPU is performing a transition, otherwise PPU behavior is UN-PREDICTABLE. 0: The PPU does not perform a device interface handshake when transitioning between ON and WARM_RST. 1: The PPU performs a device interface handshake when transitioning between ON and WARM_RST. This disables all Q-Channels for this transition. Default Value: 0x0

1.1.159 PPU_CM55_0_IMR

Description: Interrupt Mask Register

Address: 0x44101030

Retention: Retained

Bits	Name	Description
12	OFF_MEM_RET_TRANS	OFF to MEM_RET direct transition. Indicates if direct transitions from OFF to MEM_RET and from OFF_EMU to MEM_RET_EMU are supported. Default Value: 0x0
10	OP_ACTIVE	Operating mode use model for dynamic transitions. 0: Ladder use model. 1: Independent use model. When operating modes are not supported (PPU_IDR0.NUM_OPMODE==0), this field is reserved. Default Value: 0x0
9	STA_POLI-CY_OP_IRQ_SPT	Operating policy transition completion event status. Default Value: 0x0
8	STA_POLICY_P-WR_IRQ_SPT	Power policy transition completion event status. Default Value: 0x0
6	FUNC_RET_RAM_REG	Indicates if the PPU_FUNRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
5	FULL_RET_RAM_REG	Indicates if the PPU_FULRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
4	MEM_RET_RAM_REG	Indicates if the PPU_MEMRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0

1.1.173 PPU_CM55_0_IDR1 (continued)

2	LOCK_SPT	Lock and the lock interrupt event are supported. Default Value: 0x0
1	SW_DEV_DEL_SPT	Software device delay control configuration support. Default Value: 0x0
0	PWR_MODE_EN- TRY_DEL_SPT	Power mode entry delay support. Default Value: 0x0

1.1.174 PPU_CM55_0_IIDR

Description: Implementation Identification Register

Address: 0x44101FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	IMPLEMENTER [7:0]							

Bits	15	14	13	12	11	10	9	8

SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [23:18]						LOCKDT-GU	LOCKITGU

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved		RW	RW	RW	RW	RW
HW Access	R	Reserved		R	R	R	R	R
Name	IDC_MASK	Reserved [30:29]		IXC_MASK	UFC_MASK	OFC_MASK	DZC_MASK	IOC_MASK

Bits	Name	Description
31	IDC_MASK	CPU FPU exception mask for the CPU's FPCSR.IDC "input denormalized" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Note: if the CPU FPCSR.FZ field is set to '1', denormalized inputs are "flushed to zero". Dependent on the FPU algorithm, this may or may not occur frequently. To prevent frequent CPU FPU interrupts as a result of denormalized inputs, this field may be set to '0'. Default Value: 0
28	IXC_MASK	CPU FPU exception mask for the CPU's FPCSR.IXC "inexact" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Note: the "inexact" condition is set as a result of rounding. Rounding may occur frequently and is typically not an error condition. To prevent frequent CPU FPU interrupts as a result of rounding, this field is typically set to '0'. Default Value: 0
27	UFC_MASK	CPU FPU exception mask for the CPU's FPCSR.UFC "underflow" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Default Value: 0
26	OFC_MASK	CPU FPU exception mask for the CPU's FPCSR.OFC "overflow" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Default Value: 0

1.1.187 MXCM55_CM55_CTL (continued)

25	DZC_MASK	CPU FPU exception mask for the CPU's FPCSR.DZC "divide by zero" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Default Value: 0
24	IOC_MASK	CPU floating point unit (FPU) exception mask for the CPU's FPCSR.IOC "invalid operation" exception condition: '0': The CPU's exception condition does NOT activate the CPU's floating point interrupt. '1': the CPU's exception condition activates the CPU's floating point interrupt. Note: the ARM architecture does NOT support FPU exceptions; i.e. there is no precise FPU exception handler. Instead, FPU conditions are captured in the CPU's FPCSR register and the conditions are provided as CPU interface signals. The interface signals are "masked" with the fields provided by this register (CM55_CTL). The "masked" signals are reduced/OR-ed into a single CPU floating point interrupt signal. The associated CPU interrupt handler allows for imprecise handling of FPU exception conditions. Note: the CPU's FPCSR exception conditions are "sticky". Typically, the CPU FPU interrupt handler will clear the exception condition(s) to '0'. Note: by default, the FPU exception masks are '0'. Therefore, FPU exception conditions will NOT activate the CPU's floating point interrupt. Default Value: 0
17	LOCKDTGU	Asserting this bit prevents changes to the security gating configuration of the DTCM. '1': Disables writes to the DTGUCTRL, DTGU_LUTn from software or from a debug agent connected to the processor. '0': Unlocks these registers. Default Value: 0
16	LOCKITGU	Asserting this bit prevents changes to the security gating configuration of the ITCM. '1': Disables writes to the ITGUCTRL, ITGU_LUTn from software or from a debug agent connected to the processor. '0': Unlocks these registers. Default Value: 0
15	LOCKTCM	Asserting this bit prevents changes to the TCM configuration. All writes to the registers are ignored. '1': Disables writes to the ITCMCR, DTCMCR from software or from a debug agent connected to the processor. '0': Unlocks these registers. Default Value: 0
14	LOCKDCAIC	Disable access to the instruction cache direct cache access registers DCAICLR and DCAICRR. Setting this bit to '1' prevents direct access to the instruction cache Tag or Data RAM content. This is required when using eXecutable Only Memory (XOM) on the AXI master interface. When LOCKDCAIC is asserted: DCAICLR is RAZ/WI. DCAICRR is RAZ. Default Value: 0
13	LOCKPAHB	Setting this bit to '1' disable writes to the PAHBCR register from software or from a debug agent connected to the processor. Asserting this signal prevents changes to P-AHB port enable status in PAHBCR.EN. Default Value: 0
12	LOCKSAU	Asserting this bit prevents changes to Secure SAU memory regions already programmed. All writes to the registers are ignored. '1': Disables writes to the SAU_CTRL, SAU_RNR, SAU_RBAR and SAU_RLAR registers from software or from a debug agent connected to the processor. '0': Unlocks these registers. This signal has no affect if the Cortex-M55 processor has not been configured with support for the Armv8-M Security Extension, or if no SAU regions have been configured. Default Value: 0

1.1.187 MXCM55_CM55_CTL (continued)

11	LOCKNSMPU	Asserting this bit prevents changes to Nonsecure MPU memory regions already programmed. All writes to the registers are ignored. '1': Disables writes to the MPU_CTRL_NS, MPU_RNR_NS, MPU_RBAR_NS, MPU_RLAR_NS, MPU_RBAR_A_NSn and MPU_RLAR_A_NSn from software or from a debug agent connected to the processor. '0': Unlocks these registers. This signal has no affect if the Cortex-M55 processor has been configured without any Nonsecure MPU regions. Default Value: 0
10	LOCKSMPU	Asserting this bit prevents changes to programmed Secure MPU memory regions and all writes to the registers are ignored. '1': Disables writes to the MPU_CTRL, MPU_RNR, MPU_RBAR, MPU_RLAR, MPU_RBAR_An and MPU_RLAR_An from software or from a debug agent connected to the processor in Secure state. '0': Unlocks these registers. This bit has no affect if the Cortex-M55 processor has not been configured with support for the Armv8-M Security Extension, or if no Secure MPU regions have been configured. Default Value: 0
9	LOCKSVTAIRCR	Asserting this bit prevents changes to: - The Secure vector table base address. - Handling of Secure interrupt priority. - BusFault, HardFault, and NMI security target settings in the processor. '1': Disables writes to the VTOR_S,AIRCR.PRIS, and AIRCR.BFHFNMINS registers. '0': Unlocks these registers. Default Value: 0
8	LOCKNSVTOR	Asserting this bit prevents changes to the Non-secure vector table base address. '1': Disables writes to the VTOR_NS register. '0': Unlocks this register. Default Value: 0
4	CPU_WAIT	When this signal is '1' out of reset, it forces the CPU into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven '0'. Default Value: 1

1.1.188 MXCM55_CM55_CMD

Description: Command

Address: 0x44160004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							RW1C
Name	Reserved [7:1]							RESET

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access								
Name	VECTKEYSTAT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access								
Name	VECTKEYSTAT [31:24]							

Bits	Name	Description
31 : 16	VECTKEYSTAT	Register key (to prevent accidental writes). - Should be written with a 0x05fa key value for the write to take effect. - Always reads as 0xfa05. Default Value: 0xFA05
0	RESET	CM55 Processor reset: '1': RESET. Processor reset is activated. After SW set this field to '1', HW automatically clears this field to '0'. This effectively results in a CM55 reset, followed by a CM55 warm boot. This bit effectively enables WARM_RST state of the CM55 PPU and works only when dynamic transitions are enabled in CM55 PPU. '0': No reset of CM55. Note: The intent is that this bit is modified only through an external probe or by the other CPU while this CM55 is in Sleep or DeepSleep. If this field is set to '1' by this CM55 itself, it should be done under controlled conditions (such that undesirable side effects can be prevented). Note: The CM55 CPU has a AIRCR.SYSRESETREQ register field that allows the CM55 to reset the complete device (RESET field in this register only resets the CM55), resulting in a warm boot. This CPU register field has similar "built-in protection" as this register to prevent accidental system writes (the upper 16-bits of the register need to be written with a 0x05fa key value; see CPU user manual for more details). Default Value: 0

1.1.189 MXCM55_CM55_STATUS

Description: Status

Address: 0x44160008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3	SWJ_SWD_SEL	Specifies if the SWD interface is selected. '0': SWD not selected. '1': SWD selected. Default Value: 0
2	SWJ_JTAG_SEL	Specifies if the JTAG interface is selected. '0': JTAG not selected. '1': JTAG selected. Default Value: 0
1	SWJ_DEBUG_EN	Specifies if SWJ debug is enabled, i.e. CDBGPWRUPACK is '1' and thus debug clocks are on: '0': Disabled. '1': Enabled. Default Value: 0
0	SWJ_CONNECTED	Specifies if the SWJ debug port is connected; i.e. debug host interface is active: '0': Not connected/not active. '1': Connected/active. Default Value: 0

1.1.199 APPCPUSS_BUFF_CTL

Description: Buffer control

Address: 0x441C0030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							WRITE_BUFF

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	WRITE_BUFF	Specifies if write transfer can be buffered in the bus infrastructure bridges: '0': Write transfers are not buffered, independent of the transfer's bufferable attribute. '1': Write transfers can be buffered, if the transfer's bufferable attribute indicates that the transfer is a bufferable/posted write. This bit controls buffering only for subsystems that interfaced using the AHB2AHB bridge, not for components utilised from ARM. Default Value: 1

1.1.200 APPCPUSS_INFRA_CTL

Description: Infrastructure Control

Address: 0x441C0050

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							CLOCK_-FORCE

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CLOCK_FORCE	Force Infrastructure clock gating to be always ON. 0: Disabled 1: Enabled Default Value: 0

1.1.201 APPCPUSS_SYSTICK_NS_CTL

Description: Non Secure SysTick timer control

Address: 0x441C0120

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	TENMS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	TENMS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	TENMS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved				RW	
HW Access	R	R	Reserved				R	
Name	NOREF	SKEW	Reserved [29:26]				CLOCK_SOURCE [25:24]	

Bits	Name	Description
31	NOREF	Specifies if an external clock source is provided: '0': An external clock source is provided. '1': An external clock source is NOT provided and only the CPU internal clock can be used as SysTick timer clock source. Default Value: 0
30	SKEW	Specifies the precision of the clock source and if the TENMS field represents exactly 10 ms (clock source frequency is a multiple of 100 Hz). This affects the suitability of the SysTick timer as a SW real-time clock: '0': Precise. '1': Imprecise. Default Value: 1
25 : 24	CLOCK_SOURCE	Specifies an external clock source: "0": The low frequency clock "clk_lf" is selected. The precision of this clock depends on whether the low frequency clock source is a SRSS internal RC oscillator (imprecise) or a device external crystal oscillator (precise). "1": The internal main oscillator (IMO) clock "clk_imo" is selected. The MXS40 platform uses a fixed frequency IMO clock. o "2": The external crystal oscillator (ECO) clock "clk_eco" is selected. "3": The SRSS "clk_timer" is selected ("clk_timer" is a divided/gated version of "clk_hf" or "clk_i-mo"). Note: If NOREF is '1', the CLOCK_SOURCE value is NOT used. Note: It is SW's responsibility to provide the correct NOREF, SKEW and TENMS field values for the selected clock source. Default Value: 0

1.1.201 APPCPUSS_SYSTICK_NS_CTL (continued)

23 : 0	TENMS	Specifies the number of clock source cycles (minus 1) that make up 10 ms. E.g., for a 32,768 Hz reference clock, TENMS is 328 - 1 = 327. Default Value: 327

1.1.202 APPCPUSS_INTR_MSC

Description: Master security controller Interrupt

Address: 0x441C0200

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C	RW1C	RW1C	RW1C	Reserved	RW1C	Reserved	
HW Access	A	A	A	A	Reserved	A	Reserved	
Name	AXI_MS3_MSC	AXI_MS2_MSC	AXI_MS1_MSC	AXI_MS0_MSC	Reserved	AXID-MAC0_MSC	Reserved [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					RW1C	RW1C	RW1C
HW Access	Reserved					A	A	A
Name	Reserved [15:11]					EXP_MS2_MSC	EXP_MS1_MSC	EXP_MS0_MSC

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
10	EXP_MS2_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on external AHB master 2 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0
9	EXP_MS1_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on external AHB master 1 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0
8	EXP_MS0_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on external AHB master 0 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0
7	AXI_MS3_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on external AXI master 3 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0

1.1.202 APPCPUSS_INTR_MSC (continued)

6	AXI_MS2_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on external AXI master 2 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0
5	AXI_MS1_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on external AXI master 1 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0
4	AXI_MS0_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on external AXI master 0 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0
2	AXIDMAC0_MSC	This interrupt cause field is activated (HW sets the field to '1') when there is a security violation on AXI DMA controller 0 interface. SW writes a '1' to this field to clear the interrupt cause to '0'. The HW captures a new MSC interrupt only after clearing the interrupt cause. Default Value: 0

1.1.203 APPCPUSS_INTR_MASK_MSC

Description: Master security controller Interrupt mask

HW Access	Reserved		R	R	Reserved		R	R
Name	Reserved [23:22]		CM55_0_NID_DISABLE	CM55_0_DBG_DISABLE	Reserved [19:18]		CM55_1_DISABLE	CM55_0_DISABLE

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved						RW1S	RW1S
HW Access	Reserved						R	R
Name	Reserved [31:26]						CM55_1_NID_DISABLE	CM55_1_DBG_DISABLE

Bits	Name	Description
25	CM55_1_NID_DISABLE	Refer CM55_0_NID_DISABLE description. Default Value: 0
24	CM55_1_DBG_DISABLE	Refer CM55_0_DBG_DISABLE description. Default Value: 0
21	CM55_0_NID_DISABLE	Disable Non-invasive debug for CM55_0. '1': Disables all trace and non-invasive debug features. '0': Enables all trace and non-invasive debug features. Typically, this field is set by the Cypress boot code with information from eFUSE. The non-invasive debug is only enabled when CM55_0_NID_DISABLE is '0' and CM55_0_NID_ENABLE is '1'. Default Value: 0
20	CM55_0_DBG_DISABLE	Disable Invasive debug for CM55_0. '1': Disables all halt-mode and invasive debug features. '0': Enables invasive debug features. Typically, this field is set by the Cypress boot code with information from eFUSE. The invasive debug is only enabled when CM55_0_DBG_DISABLE is '0' and CM55_0_DBG_ENABLE is '1'. Default Value: 0

1.1.209 APPCPUSS_AP_CTL (continued)

17	CM55_1_DISABLE	Disables the CM55_1 AP interface: '0': Enabled. '1': Disabled. Typically, this field is set by the Cypress boot code with information from eFUSE. The access port is only enabled when CM55_1_DISABLE is '0' and CM55_1_ENABLE is '1'. Default Value: 0
16	CM55_0_DISABLE	Disables the CM55_0 AP interface: '0': Enabled. '1': Disabled. Typically, this field is set by the Cypress boot code with information from eFUSE. The access port is only enabled when CM55_0_DISABLE is '0' and CM55_0_ENABLE is '1'. Default Value: 0
9	CM55_1_NID_ENABLE	Refer CM55_0_NID_ENABLE. Default Value: 0
8	CM55_1_DBG_ENABLE	Refer CM55_0_DBG_ENABLE. Default Value: 0
5	CM55_0_NID_ENABLE	Non-invasive debug enable for CM55_0. '0': Disables all trace and non-invasive debug features. '1': Enables all trace and non-invasive debug features. Default Value: 0
4	CM55_0_DBG_ENABLE	Invasive debug enable for CM55_0. '0': Disables all halt-mode and invasive debug features. '1': Enables invasive debug features. Default Value: 0
1	CM55_1_ENABLE	Enables the CM55_1 AP interface: '0': Disabled. '1': Enabled. Default Value: 0
0	CM55_0_ENABLE	Enables the CM55_0 AP interface: '0': Disabled. '1': Enabled. Default Value: 0

1.1.210 MS_CTL_MS13_CTL

Description: Master 'x' protection context control

Address: 0x441C40D0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						NS	P

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	PC_MASK [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	PC_MASK	Protection context mask for protection contexts "15" down to "0". Bit PC_MASK[i] indicates if the MS_PC_STRUCT[x].PC[3:0] protection context field can be set to the value "i": - PC_MASK[i] is '0': MS_PC_STRUCT[x].PC[3:0] can NOT be set to "i"; and PC[3:0] is not changed. - PC_MASK[i] is '1': MS_PC_STRUCT[x].PC[3:0] can be set to "i". Note: When CM33_0 CM33_PC_CTL.VALID[i] is '1' (the associated protection context handler is valid), write transfers to PC_MASK[i] always write '0', regardless of data written. This ensures that when valid protection context handlers are used to enter protection contexts 0, 1, 2 or 3 through HW (HW modifies MS_PC_STRUCT[x].PC[3:0] on entry of the handler), it is NOT possible for SW to enter those protection contexts. Default Value: 64
1	NS	Master security controller configuration. 0: Bus master is secure. Master can send both secure and non-secure transfers. Accesses to secure addresses are not blocked and the security flag, HNONSEC, is set accordingly. 1: Bus master is non-secure. Master can send only non-secure transfers. Access to secure addresses, that is, outside the Uncheck regions, are blocked. Default Value: 1
0	P	Privileged setting ('0': user mode; '1': privileged mode). Notes: This field is ONLY used for masters that do NOT provide their own user/privileged access control attribute. The default/reset field value provides privileged mode access capabilities. Default Value: 1

1.1.211 MS_CTL_MS19_CTL

Description: Master 'x' protection context control

Address: 0x441C4130

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	PC	Active protection context (PC). Modifications to this field are constrained by the associated MS_CTL_STRUCT[x].CTL.PC_MASK value. PC[3:0] can be set to "i" only if the corresponding mask bit (PC_MASK[i]) is '1'. Note: When the APPCPUSS works with the M33SYSCPUSS, PCx_HANDLER is NOT implemented as CM33_0_PC_CTL.VALID[3:0] is exported to the APPCPUSS to clear PC_MASK[i] of the APPCPUSS masters. Default Value: 6

1.1.213 MS_CTL_MS_PC13_PC_READ_MIR

Description: Master 'x' protection context value read mirror register

Address: 0x441C50D4

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	IRQ_HISTORY_MASK [31:24]							

Bits	Name	Description
31 : 16	IRQ_HISTORY_MASK	IRQ History mask This is used for debug purposes. Each IRQ or Event operation provides a 16-bit mask which is logically ORed into these bits. The bits can be cleared using the command register. Default Value: 0
15 : 12	FAULTING_CHANNEL	Faulting channel on a bus abort. Read: 0=Cmd, 1=IFM, 2=Weights, 3=Scale+Bias, 4=Mem2Mem; Write: 8=OFM, 9=Mem2Mem Default Value: 0
11	FAULTING_INTERFACE	Faulting interface on bus abort. 0=AXI-M0, 1=AXI-M1 Default Value: 0
6	PMU_IRQ_RAISED	0=No PMU IRQ, 1=PMU IRQ raised. Cleared by using command register bit 1 Default Value: 0
5	CMD_END_REACHED	0=Not reached, 1=Reached. Cleared by writing QBASE or QSIZE when the NPU is in stopped state. Default Value: 0
4	CMD_PARSE_ERROR	0=No error, 1=Command-stream parsing error detected. Can only be cleared by a reset. Default Value: 0

1.1.225 U550_STATUS (continued)

3	RESET_STATUS	Reset is ongoing and only this register can be read (other registers read as 0 and writes are ignored). A value of 0 means the NPU is not being reset and can be accessed as normal. Default Value: 1
2	BUS_STATUS	0=OK, 1=Bus abort detected and processing halted (the NPU has reached IDLE state and does not start to process any more commands/AXI transactions). Can only be cleared by a reset. Default Value: 0
1	IRQ_RAISED	Raw IRQ status: 0 = IRQ not raised, 1 = IRQ raised. IRQ is cleared using command register bit 1. Default Value: 0
0	STATE	NPU state; 0 = Stopped, 1 = Running Default Value: 0

1.1.226 U550_CMD

Description: Command register, reads as last written command

Address: 0x44600008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW	RW	RW	RW
HW Access	Reserved							
Name	Reserved [7:4]				POWER_Q_ENABLE	CLOCK_Q_ENABLE	CLEAR_IRQ	TRANSITION_TO_RUNNING_STATE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access								
Name	CLEAR_IRQ_HISTORY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	CLEAR_IRQ_HISTORY [31:24]							

Bits	Name	Description
31 : 16	CLEAR_IRQ_HISTORY	Clears the IRQ history mask. When bit k is set, then the corresponding bit k of the STATUS register (IRQ history) is cleared. Default Value: 0
3	POWER_Q_ENABLE	Write 1 to this bit to enable power off using the Power Q-interface. Default Value: 1
2	CLOCK_Q_ENABLE	Write 1 to this bit to enable clock off using the Clock Q-interface and enable the main clock gate. Default Value: 1
1	CLEAR_IRQ	Write 1 to clear the IRQ status in the STATUS register. Writing 0 has no effect. Default Value: 0
0	TRANSITION_TO_RUNNING_STATE	Write 1 to transition the NPU to running state. Writing 0 has no effect. Default Value: 0

1.1.227 U550_RESET

Description: Request Reset and new security mode

Address: 0x4460000C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						RW	RW
Name	Reserved [7:2]						PEND-ING_CSL	PEND-ING_CPL

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	PENDING_CSL	Current security level: 0=Secure (default), 1=Non secure Default Value: 0
0	PENDING_CPL	Current privilege level: 0=User (default), 1=Privileged Default Value: 0

1.1.228 U550_QBASE0

Description: Base address of Command-queue bits [31 downto 0]. The address is 4-byte-aligned

Address: 0x44600010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	QBASE0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	QBASE0 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	QBASE0 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	QBASE0 [31:24]							

Bits	Name	Description
31 : 0	QBASE0	The 4-byte-aligned lower bytes of the base address value for the command stream. Default Value: 0

1.1.229 U550_QBASE1

Description: Address extension bits [47 downto 32] for queue base

Address: 0x44600014

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	QBASE1 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	QBASE1 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	QBASE1 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	QBASE1 [31:24]							

Bits	Name	Description
31 : 0	QBASE1	The 4-byte-aligned upper bytes of the base address value for the command stream Default Value: 0

1.1.230 U550_QREAD

Description: Read offset in the command stream in bytes. Multiples of 4 in the range 0-16 MB

Address: 0x44600018

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RO							
HW Access	RW							
Name	QREAD [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RO							
HW Access	RW							
Name	QREAD [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RO							
HW Access	RW							
Name	QREAD [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RO							
HW Access	RW							
Name	QREAD [31:24]							

Bits	Name	Description
31 : 0	QREAD	The read offset of the current command under execution Default Value: 0

1.1.231 U550_QCONFIG

Description: AXI configuration for the command stream in the range 0-3. Same encoding as for REGIONCFG

Address: 0x4460001C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	QCONFIG [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	QCONFIG [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW

Name	QCONFIG [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	QCONFIG [31:24]							

Bits	Name	Description
31 : 0	QCONFIG	AXI configuration for the command stream in the range 0-3 Default Value: 0

1.1.232 U550_QSIZE

Description: Size of the command stream in bytes. Multiples of 4 in the range 0-16 MB

Address: 0x44600020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	QSIZE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	QSIZE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	QSIZE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	QSIZE [31:24]							

Bits	Name	Description
31 : 0	QSIZE	Size of the next command stream to be executed by the NPU Default Value: 0

1.1.233 U550_PROT

Description: Protection level configured for the NPU when acting as an AXI master

Address: 0x44600024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	R
HW Access	Reserved						R	R
Name	Reserved [7:2]						ACTIVE_CSL	ACTIVE_CPL

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	ACTIVE_CSL	Current security level. 0 = Secure 1 = Non-secure This is used as AxPROT[1] when the NPU is a master and set from Pending CSL after the reset is complete. - After a hard reset, this is set to Power-on-reset security level (PORSL), which allows for CPUs that do not support TrustZone. - After a soft reset, this is set to pending_CSL, if PPROT[1]==0, otherwise it is set to 1. For this to be effective, there must be a memory-protection controller included in the system. Depends on ROT_INIT.SECURITY_LEVEL Default Value: 1
0	ACTIVE_CPL	Current privilege level. 0 = User 1 = Privilege This is used as AxPROT[0] when the NPU is a master. - After hard reset, this is set to Power-on-reset privilege level (PORPL). - After soft reset, this is set to pending_CPL, if PPROT[0]==1, otherwise it is set to 0. For this to be effective, there must be a system-level MPU built for the system. Depends on ROT_INIT.PRIVILEGE_LEVEL Default Value: 0

1.1.234 U550_CONFIG

Description: RTL configuration

Address: 0x44600028

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RO				RO			
HW Access	R				R			
Name	CMD_STREAM_VERSION [7:4]				MACS_PER_CC [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	RO							
HW Access	R							
Name	SHRAM_SIZE [15:8]							

Bits	23	22	21	20	19	18	17	16

Name	Reserved [31:24]							

Bits	Name	Description
15 : 11	NUM_EVENT_CNT	Number of event counters available for performance measurement Default Value: 0x04
3	MASK_EN	PMU can be enabled/disabled by command stream operation NPU_OP_PMU_MASK Default Value: 0
2	CYCLE_CNT_RST	Reset cycle counter. Writing a 1 to this register resets the cycle counter. If the cycle counter is active, it will continue counting after reset. This register bit always reads a 0. Default Value: 0
1	EVENT_CNT_RST	Reset event counter. Writing a 1 to this field resets all event counters. If any counter is active, it will continue counting after reset. This register bit always reads a 0. Default Value: 0
0	CNT_EN	Enable counter. This is the master switch. When the switch is disabled, the PMU is always off. Default Value: 0

1	EVENT_CNT_1_INT	Event-counter overflow interrupt-request disable bit for PMU_EVCNTR1 0 (default) When read, it means that the event-counter interrupt request is disabled. When written, it has no effect. 1 When read, it means that the event-counter interrupt request is enabled. When written, it disables the interrupt request. Default Value: 0
0	EVENT_CNT_0_INT	Event-counter overflow interrupt-request disable bit for PMU_EVCNTR0 0 (default) When read, it means that the event-counter interrupt request is disabled. When written, it has no effect. 1 When read, it means that the event-counter interrupt request is enabled. When written, it disables the interrupt request. Default Value: 0

1.1.264 U550_PMCCNTR_LO

Description: Performance-monitor cycle count low register

Address: 0x446001A0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	CYCLE_CNT_LO [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access								
Name	CYCLE_CNT_LO [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access								
Name	CYCLE_CNT_LO [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	CYCLE_CNT_LO [31:24]							

Bits	Name	Description
31 : 0	CYCLE_CNT_LO	Performance-monitor cycle count low register. This represents the lower 32 bits of the dedicated 48-bit cycle counter, PMCCNTR. Default Value: 0

1.1.265 U550_PMCCNTR_HI

Description: Performance-monitor cycle count high register

Address: 0x446001A4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	CYCLE_CNT_HI [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access								
Name	CYCLE_CNT_HI [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	CYCLE_CNT_HI	Performance-monitor cycle count high register. This represents the higher 16 bits of the dedicated 48-bit cycle counter, PMCCNTR. Default Value: 0

1.1.266 U550_PMCCNTR_CFG

Description: Set start/stop event on the cycle counter.

Address: 0x446001A8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	CYCLE_CNT_CFG_START [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved							
Name	Reserved [15:10]						CYCLE_CNT_CF-G_START [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access								
Name	CYCLE_CNT_CFG_STOP [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved						RW	
HW Access	Reserved							
Name	Reserved [31:26]						CYCLE_CNT_CFG_STOP [25:24]	

Bits	Name	Description
25 : 16	CYCLE_CNT_CFG_STOP	Cycle counter stop event Default Value: 0
9 : 0	CYCLE_CNT_CF-G_START	Cycle counter start event Default Value: 0

1.1.267 U550_PMCAXI_CHAN

Description: Set which AXI channel monitor

Address: 0x446001AC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved							
Name	Reserved [7:4]				CH_SEL [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					RW	RW	
HW Access	Reserved							
Name	Reserved [15:11]					BW_CH_SEL_EN	AXI_CNT_SEL [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
10	BW_CH_SEL_EN	Enable bandwidth channel selector: 0=AXI bw events measured for all channels, 1=AXI bw events measured for channel specified by CH_SEL Default Value: 0
9 : 8	AXI_CNT_SEL	Select AXI counter to monitor for latency measurements (0=AXI0 counter0, 1=AXI0 counter1, 2=AXI1 counter 2, 3=AXI1 counter3) Default Value: 0
3 : 0	CH_SEL	Specify the type of traffic for bandwidth or latency measurements (Read: 0=command traffic, 1=IFM traffic, 2=Weight traffic, 3=Scale+Bias, 4=Mem2Mem traffic - read direction; Write: 8=OFM traffic, 9=Mem2Mem traffic - write direction) Default Value: 0

1.1.268 U550_PMU_EVCNTR0

Description: Performance monitor event counters

Address: 0x44600300

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	SW							
HW Access								
Name	PMU_EVCNTR [7:0]							

Bits	15	14	13	12	11	10	9	8

24	OP_DYN_EN	Reserved Default Value: 0x0
19 : 16	OP_POLICY	Reserved Default Value: 0x0
12	LOCK_EN	Reserved Default Value: 0x0
8	PWR_DYN_EN	Power mode dynamic transition enable. When this bit is set to 1 dynamic transitions are enabled for power modes, allowing transitions to be initiated by changes on power mode DEVACTIVE inputs. Default Value: 0x0
3 : 0	PWR_POLICY	Power mode policy. When static power mode transitions are enabled, PWR_DYN_EN is set to 0, this is the target power mode for the PPU. When dynamic power mode transitions are enabled, PWR_DYN_EN is set to 1, this is the minimum power mode for the PPU. This PPU supports the following modes: OFF(0), ON(8). Do not use WARM_RST(9) or other unsupported modes. Default Value: 0x0

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	OP_DEVACTIVEEN [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVEEN	Reserved Default Value: 0x0
18 : 8	PWR_DEVACTIVEEN	These bits enable the power mode DEVACTIVE inputs. When a bit is to 1 the related DEVACTIVE input is enabled, when set to 0 it is disabled. All available bits are reset to 1. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE, and bit 9 for the Q-Channel 1 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x007
7 : 0	DEVREQEN	When set to 1 enables the device interface handshake for transitions. All available bits are reset to 1. There is one bit for each device interface channel. For example, bit 0 is for Q-Channel 0, and bit 1 is for Q-Channel 1. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x07

1.1.292 U550_MXU55_PPU_PTCR

Description: Power Mode Transition Configuration Register

Address: 0x44602024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						DBG_RE-COV_POR ST_EN	WARM_RS T_DEVREQ EN

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	DBG_RE-COV_PORST_EN	Reserved Default Value: 0x0
0	WARM_RST_DEVREQEN	Transition behavior between ON and WARM_RST. This bit should not be modified when the PPU is in WARM_RST, or if the PPU is performing a transition, otherwise PPU behavior is UN-PREDICTABLE. 0: The PPU does not perform a device interface handshake when transitioning between ON and WARM_RST. 1: The PPU performs a device interface handshake when transitioning between ON and WARM_RST. This disables all Q-Channels for this transition. Default Value: 0x0

SW Access	R	R	R	R	Reserved	R	R	R
HW Access	RW	RW	RW	RW	Reserved	RW	RW	RW
Name	DY-N_MEM_RET_EMU_SPT	DY-N_MEM_RET_SPT	DY-N_OFF_EMU_SPT	DY-N_OFF_SPT	Reserved	STA_DB-G_RE-COV_SPT	STA_WRM_RST_SPT	STA_ON_SPT

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved		R	R	R	R	R	R
HW Access	Reserved		RW	RW	RW	RW	RW	RW
Name	Reserved [31:30]		DY-N_WRM_RST_SPT	DY-N_ON_SPT	DYN_-FUNC_RET_SPT	DYN_-FULL_RET_SPT	DY-N_MEM_OFF_SPT	DYN_LG-C_RET_SPT

Bits	Name	Description
29	DYN_WRM_RST_SPT	Dynamic WARM_RST support. Default Value: 0x0
28	DYN_ON_SPT	Dynamic ON support. Default Value: 0x1
27	DYN_FUNC_RET_SPT	Dynamic FUNC_RET support. Default Value: 0x0
26	DYN_FULL_RET_SPT	Dynamic FULL_RET support. Default Value: 0x0
25	DYN_MEM_OFF_SPT	Dynamic MEM_OFF support. Default Value: 0x0
24	DYN_LGC_RET_SPT	Dynamic LOGIC_RET support. Default Value: 0x0
23	DY-N_MEM_RET_EMU_SPT	Dynamic MEM_RET_EMU support Default Value: 0x0
22	DYN_MEM_RET_SPT	Dynamic MEM_RET support. Default Value: 0x0

1.1.306 U550_MXU55_PPU_IDR0 (continued)

21	DYN_OFF_EMU_SPT	Dynamic OFF_EMU support. Default Value: 0x0
20	DYN_OFF_SPT	Dynamic OFF support. Default Value: 0x1
18	STA_DBG_RECOV_SPT	DBG_RECOV support. Default Value: 0x0
17	STA_WRM_RST_SPT	WARM_RST support. Ignore this bit. Do not use WARM_RST. Default Value: 0x1
16	STA_ON_SPT	ON support. Default Value: 0x1
15	STA_FUNC_RET_SPT	FUNC_RET support. Default Value: 0x0
14	STA_FULL_RET_SPT	FULL_RET support. Default Value: 0x0
13	STA_MEM_OFF_SPT	MEM_OFF support. Default Value: 0x0
12	STA_LGC_RET_SPT	LOGIC_RET support. Default Value: 0x0
11	STA_MEM_RET_EMU_SPT	MEM_RET_EMU support. Default Value: 0x0
10	STA_MEM_RET_SPT	MEM_RET support. Default Value: 0x0
9	STA_OFF_EMU_SPT	OFF_EMU support. Default Value: 0x0
8	STA_OFF_SPT	OFF support. Default Value: 0x1
7 : 4	NUM_OPMODE	No. of operating modes supported is NUM_OPMODE + 1. Default Value: 0x0
3 : 0	DEVCHAN	No. of Device Interface Channels. The device enumeration is: Device 0: PDCM Device 1: U55 Device 2: U55 Sync-Down Bridge Default Value: 3

1.1.307 U550_MXU55_PPU_IDR1

Description: PPU Identification Register 1

Address: 0x44602FB4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	R	R	R	Reserved	R	R	R
HW Access	Reserved	RW	RW	RW	Reserved	RW	RW	RW
Name	Reserved	FUNC_RET_RAM_REG	FULL_RET_RAM_REG	MEM_RET_RAM_REG	Reserved	LOCK_SPT	SW_DEV_DEL_SPT	PWR_-MODE_EN-TRY_DEL_SPT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			R	Reserved	R	R	R
HW Access	Reserved			RW	Reserved	RW	RW	RW
Name	Reserved [15:13]			OFF_MEM_RET_TRANS	Reserved	OP_AC-TIVE	STA_POLI-CY_OP_IRQ_SPT	STA_POLI-CY_P-WR_IRQ_SPT

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	OFF_MEM_RET_TRANS	OFF to MEM_RET direct transition. Indicates if direct transitions from OFF to MEM_RET and from OFF_EMU to MEM_RET_EMU are supported. Default Value: 0x0
10	OP_ACTIVE	Reserved Default Value: 0x0
9	STA_POLI-CY_OP_IRQ_SPT	Operating policy transition completion event status. Default Value: 0x0
8	STA_POLICY_P-WR_IRQ_SPT	Power policy transition completion event status. Default Value: 0x0
6	FUNC_RET_RAM_REG	Indicates if the PPU_FUNRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
5	FULL_RET_RAM_REG	Indicates if the PPU_FULRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
4	MEM_RET_RAM_REG	Indicates if the PPU_MEMRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
2	LOCK_SPT	Lock and the lock interrupt event are supported. Default Value: 0x0

1.1.307 U550_MXU55_PPU_IDR1 (continued)

1	SW_DEV_DEL_SPT	Software device delay control configuration support. Default Value: 0x0
0	PWR_MODE_EN- TRY_DEL_SPT	Power mode entry delay support. Default Value: 0x0

1.1.308 U550_MXU55_PPU_IIDR

Description: Implementation Identification Register

Address: 0x44602FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	IMPLEMENTER [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R				R			
HW Access	RW				RW			
Name	REVISION [15:12]				IMPLEMENTER [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R				R			
HW Access	RW				RW			
Name	PRODUCT_ID [23:20]				VARIANT [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID [31:24]							

Bits	Name	Description
31 : 20	PRODUCT_ID	PPU part identification. Default Value: 0x0B6
19 : 16	VARIANT	Major revision of the product. Default Value: 0x1
15 : 12	REVISION	Minor revision of the product. Default Value: 0
11 : 0	IMPLEMENTER	Implementer identification. [11:8] The JEP106 continuation code of the implementer. [7] Always 0. [6:0] The JEP106 identity code of the implementer. For an Arm implementation, bits [11:0] are 0x43B. Default Value: 0x43B

1.1.309 U550_MXU55_PPU_AIDR

Description: Architecture Identification Register

Address: 0x44602FCC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	ARCH_REV_MAJOR [7:4]				ARCH_REV_MINOR [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	ARCH_REV_MAJOR	0x1 - PPU architecture major revision 1. Other Values - Reserved. Default Value: 0x1
3 : 0	ARCH_REV_MINOR	0x1 - PPU Architecture minor revision 1. Other Values - Reserved. Default Value: 0x1

1.1.310 U550_MXU55_PPU_PID4

Description: Implementation Defined Identification Register (PID4)

Address: 0x44602FD0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				IMPLEMENTER_11_8 [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	IMPLEMENTER_11_8	The JEP106 continuation code of the implementer, which is 0x4 hardcoded value. Default Value: 0x4

1.1.311 U550_MXU55_PPU_PID0

Description: Implementation Defined Identification Register (PID0)

Address: 0x44602FE0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID_7_0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	PRODUCT_ID_7_0	PPU part identification bits [7:0]. Default Value: 0xB6

1.1.312 U550_MXU55_PPU_PID1

Description: Implementation Defined Identification Register (PID1)

Address: 0x44602FE4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	IMPLEMENTER_3_0 [7:4]				PRODUCT_ID_11_8 [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	IMPLEMENTER_3_0	JEP106_ID bits [3:0] Default Value: 0xB
3 : 0	PRODUCT_ID_11_8	PPU part identification bits [11:8] Default Value: 0x0

1.1.313 U550_MXU55_PPU_PID2

Description: Implementation Defined Identification Register (PID2)

Address: 0x44602FE8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R	R		
HW Access	RW				RW	RW		
Name	REV [7:4]				JDEC	JEP106_ID_6_4 [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	REV	Revision identifier for the PCK-600 PPU: - 0x0 = r0p0. - 0x1 = r0p1, r0p2. Default Value: 0x1
3	JDEC	Indicates the use of a JEDEC-assigned ID value. Default Value: 0x1
2 : 0	JEP106_ID_6_4	JEDEC JEP106 ID code. See also PID1.JEP_ID[3:0] and the Standard Manufacturer's Identification Code. Default Value: 0x3

1.1.314 U550_MXU55_PPU_PID3

Description: Implementation Defined Identification Register (PID3)

Address: 0x44602FEC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	PID3_REVISION [7:4]				PID3_REV_CONST [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	PID3_REVISION	Minor revision of the product. Default Value: 0x0
3 : 0	PID3_REV_CONST	Constant LOW (4 bits) Default Value: 0x0

1.1.315 U550_MXU55_PPU_ID0

Description: Implementation Defined Identification Register (ID0)

Address: 0x44602FF0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID0	ID0 hard coded value Default Value: 0x0D

1.1.316 U550_MXU55_PPU_ID1

Description: Implementation Defined Identification Register (ID1)

Address: 0x44602FF4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID1 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID1	ID1 hardcoded value Default Value: 0xF0

1.1.317 U550_MXU55_PPU_ID2

Description: Implementation Defined Identification Register (ID2)

Address: 0x44602FF8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID2 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID2	ID2 hardcoded value Default Value: 0x05

1.1.318 U550_MXU55_PPU_ID3

Description: Implementation Defined Identification Register (ID3)

Address: 0x44602FFC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID3 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID3	ID3 hardcoded value Default Value: 0xB1

2 Inter Processor Communication (IPC) registers

This section discusses the IPC registers. It lists all the registers in mapping tables, in address order.

2.1 Register details

Register name	Address	Description
IPC0_STRUCT0_ACQUIRE	0x422A0000	IPC acquire
IPC0_STRUCT0_RELEASE	0x422A0004	IPC release
IPC0_STRUCT0_NOTIFY	0x422A0008	IPC notification
IPC0_STRUCT0_DATA0	0x422A000C	IPC data 0
IPC0_STRUCT0_DATA1	0x422A0010	IPC data 1
IPC0_STRUCT0_LOCK_STATUS	0x422A001C	IPC lock status
IPC0_STRUCT1_ACQUIRE	0x422A0020	IPC acquire. See IPC0_STRUCT0_ACQUIRE for the details of bit fields
IPC0_STRUCT1_RELEASE	0x422A0024	IPC release. See IPC0_STRUCT0_RELEASE for the details of bit fields
IPC0_STRUCT1_NOTIFY	0x422A0028	IPC notification. See IPC0_STRUCT0_NOTIFY for the details of bit fields
IPC0_STRUCT1_DATA0	0x422A002C	IPC data 0. See IPC0_STRUCT0_DATA0 for the details of bit fields
IPC0_STRUCT1_DATA1	0x422A0030	IPC data 1. See IPC0_STRUCT0_DATA1 for the details of bit fields
IPC0_STRUCT1_LOCK_STATUS	0x422A003C	IPC lock status. See IPC0_STRUCT0_LOCK_STATUS for the details of bit fields
IPC0_STRUCT2_ACQUIRE	0x422A0040	IPC acquire. See IPC0_STRUCT0_ACQUIRE for the details of bit fields
IPC0_STRUCT2_RELEASE	0x422A0044	IPC release. See IPC0_STRUCT0_RELEASE for the details of bit fields
IPC0_STRUCT2_NOTIFY	0x422A0048	IPC notification. See IPC0_STRUCT0_NOTIFY for the details of bit fields
IPC0_STRUCT2_DATA0	0x422A004C	IPC data 0. See IPC0_STRUCT0_DATA0 for the details of bit fields
IPC0_STRUCT2_DATA1	0x422A0050	IPC data 1. See IPC0_STRUCT0_DATA1 for the details of bit fields
IPC0_STRUCT2_LOCK_STATUS	0x422A005C	IPC lock status. See IPC0_STRUCT0_LOCK_STATUS for the details of bit fields
IPC0_STRUCT3_ACQUIRE	0x422A0060	IPC acquire. See IPC0_STRUCT0_ACQUIRE for the details of bit fields
IPC0_STRUCT3_RELEASE	0x422A0064	IPC release. See IPC0_STRUCT0_RELEASE for the details of bit fields
IPC0_STRUCT3_NOTIFY	0x422A0068	IPC notification. See IPC0_STRUCT0_NOTIFY for the details of bit fields

Inter Processor Communication (IPC) registers

Register name	Address	Description
IPC0_STRUCT3_DATA0	0x422A006C	IPC data 0. See IPC0_STRUCT0_DATA0 for the details of bit fields
IPC0_STRUCT3_DATA1	0x422A0070	IPC data 1. See IPC0_STRUCT0_DATA1 for the details of bit fields
IPC0_STRUCT3_LOCK_STATUS	0x422A007C	IPC lock status. See IPC0_STRUCT0_LOCK_STATUS for the details of bit fields
IPC0_STRUCT4_ACQUIRE	0x422A0080	IPC acquire. See IPC0_STRUCT0_ACQUIRE for the details of bit fields
IPC0_STRUCT4_RELEASE	0x422A0084	IPC release. See IPC0_STRUCT0_RELEASE for the details of bit fields
IPC0_STRUCT4_NOTIFY	0x422A0088	IPC notification. See IPC0_STRUCT0_NOTIFY for the details of bit fields
IPC0_STRUCT4_DATA0	0x422A008C	IPC data 0. See IPC0_STRUCT0_DATA0 for the details of bit fields
IPC0_STRUCT4_DATA1	0x422A0090	IPC data 1. See IPC0_STRUCT0_DATA1 for the details of bit fields
IPC0_STRUCT4_LOCK_STATUS	0x422A009C	IPC lock status. See IPC0_STRUCT0_LOCK_STATUS for the details of bit fields
IPC0_STRUCT5_ACQUIRE	0x422A00A0	IPC acquire. See IPC0_STRUCT0_ACQUIRE for the details of bit fields
IPC0_STRUCT5_RELEASE	0x422A00A4	IPC release. See IPC0_STRUCT0_RELEASE for the details of bit fields
IPC0_STRUCT5_NOTIFY	0x422A00A8	IPC notification. See IPC0_STRUCT0_NOTIFY for the details of bit fields
IPC0_STRUCT5_DATA0	0x422A00AC	IPC data 0. See IPC0_STRUCT0_DATA0 for the details of bit fields
IPC0_STRUCT5_DATA1	0x422A00B0	IPC data 1. See IPC0_STRUCT0_DATA1 for the details of bit fields
IPC0_STRUCT5_LOCK_STATUS	0x422A00BC	IPC lock status. See IPC0_STRUCT0_LOCK_STATUS for the details of bit fields
IPC0_STRUCT6_ACQUIRE	0x422A00C0	IPC acquire. See IPC0_STRUCT0_ACQUIRE for the details of bit fields
IPC0_STRUCT6_RELEASE	0x422A00C4	IPC release. See IPC0_STRUCT0_RELEASE for the details of bit fields
IPC0_STRUCT6_NOTIFY	0x422A00C8	IPC notification. See IPC0_STRUCT0_NOTIFY for the details of bit fields
IPC0_STRUCT6_DATA0	0x422A00CC	IPC data 0. See IPC0_STRUCT0_DATA0 for the details of bit fields
IPC0_STRUCT6_DATA1	0x422A00D0	IPC data 1. See IPC0_STRUCT0_DATA1 for the details of bit fields

Register name	Address	Description
IPC1_INTR_STRUCT1_INTR_MASK	0x441D1028	Interrupt mask. See IPC0_INTR_STRUCT0_INTR_MASK for the details of bit fields
IPC1_INTR_STRUCT1_INTR_MASKED	0x441D102C	Interrupt masked. See IPC0_INTR_STRUCT0_INTR_MASKED for the details of bit fields
IPC1_INTR_STRUCT2_INTR	0x441D1040	Interrupt. See IPC0_INTR_STRUCT0_INTR for the details of bit fields
IPC1_INTR_STRUCT2_INTR_SET	0x441D1044	Interrupt set. See IPC0_INTR_STRUCT0_INTR_SET for the details of bit fields
IPC1_INTR_STRUCT2_INTR_MASK	0x441D1048	Interrupt mask. See IPC0_INTR_STRUCT0_INTR_MASK for the details of bit fields
IPC1_INTR_STRUCT2_INTR_MASKED	0x441D104C	Interrupt masked. See IPC0_INTR_STRUCT0_INTR_MASKED for the details of bit fields
IPC1_INTR_STRUCT3_INTR	0x441D1060	Interrupt. See IPC0_INTR_STRUCT0_INTR for the details of bit fields
IPC1_INTR_STRUCT3_INTR_SET	0x441D1064	Interrupt set. See IPC0_INTR_STRUCT0_INTR_SET for the details of bit fields
IPC1_INTR_STRUCT3_INTR_MASK	0x441D1068	Interrupt mask. See IPC0_INTR_STRUCT0_INTR_MASK for the details of bit fields
IPC1_INTR_STRUCT3_INTR_MASKED	0x441D106C	Interrupt masked. See IPC0_INTR_STRUCT0_INTR_MASKED for the details of bit fields
IPC1_INTR_STRUCT4_INTR	0x441D1080	Interrupt. See IPC0_INTR_STRUCT0_INTR for the details of bit fields
IPC1_INTR_STRUCT4_INTR_SET	0x441D1084	Interrupt set. See IPC0_INTR_STRUCT0_INTR_SET for the details of bit fields
IPC1_INTR_STRUCT4_INTR_MASK	0x441D1088	Interrupt mask. See IPC0_INTR_STRUCT0_INTR_MASK for the details of bit fields
IPC1_INTR_STRUCT4_INTR_MASKED	0x441D108C	Interrupt masked. See IPC0_INTR_STRUCT0_INTR_MASKED for the details of bit fields
IPC1_INTR_STRUCT5_INTR	0x441D10A0	Interrupt. See IPC0_INTR_STRUCT0_INTR for the details of bit fields
IPC1_INTR_STRUCT5_INTR_SET	0x441D10A4	Interrupt set. See IPC0_INTR_STRUCT0_INTR_SET for the details of bit fields
IPC1_INTR_STRUCT5_INTR_MASK	0x441D10A8	Interrupt mask. See IPC0_INTR_STRUCT0_INTR_MASK for the details of bit fields
IPC1_INTR_STRUCT5_INTR_MASKED	0x441D10AC	Interrupt masked. See IPC0_INTR_STRUCT0_INTR_MASKED for the details of bit fields
IPC1_INTR_STRUCT6_INTR	0x441D10C0	Interrupt. See IPC0_INTR_STRUCT0_INTR for the details of bit fields

Inter Processor Communication (IPC) registers

Register name	Address	Description
IPC1_INTR_STRUCT6_INTR_SET	0x441D10C4	Interrupt set. See IPC0_INTR_STRUCT0_INTR_SET for the details of bit fields
IPC1_INTR_STRUCT6_INTR_MASK	0x441D10C8	Interrupt mask. See IPC0_INTR_STRUCT0_INTR_MASK for the details of bit fields
IPC1_INTR_STRUCT6_INTR_MASKED	0x441D10CC	Interrupt masked. See IPC0_INTR_STRUCT0_INTR_MASKED for the details of bit fields
IPC1_INTR_STRUCT7_INTR	0x441D10E0	Interrupt. See IPC0_INTR_STRUCT0_INTR for the details of bit fields
IPC1_INTR_STRUCT7_INTR_SET	0x441D10E4	Interrupt set. See IPC0_INTR_STRUCT0_INTR_SET for the details of bit fields
IPC1_INTR_STRUCT7_INTR_MASK	0x441D10E8	Interrupt mask. See IPC0_INTR_STRUCT0_INTR_MASK for the details of bit fields
IPC1_INTR_STRUCT7_INTR_MASKED	0x441D10EC	Interrupt masked. See IPC0_INTR_STRUCT0_INTR_MASKED for the details of bit fields

2.1.1 IPC0_STRUCT0_ACQUIRE

Description: IPC acquire

Address: 0x422A0000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				Reserved		R	R
HW Access	W				Reserved		W	W
Name	PC [7:4]				Reserved [3:2]		NS	P

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved		R					
HW Access	Reserved		W					
Name	Reserved [15:14]		MS [13:8]					

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	SUCCESS	Reserved [30:24]						

Bits	Name	Description
31	SUCCESS	Specifies if the lock is successfully acquired or not (reading the ACQUIRE register can have affect on SUCCESS and LOCK_STATUS.ACQUIRED): '0': Not successfully acquired; i.e. the lock was already acquired by another read transaction and not released. The P, NS, PC and MS fields reflect the access attributes of the transaction that previously successfully acuired the lock; the fields are NOT affected by the current access. '1': Successfully acquired. The P, NS, PC and MS fields reflect the access attributes of the current access. Note that this field is NOT SW writable. A lock is released by writing to the associated RELEASE register (irrespective of the write value). Default Value: 0
13 : 8	MS	This field specifies the bus master identifier that successfully acquired the lock. Default Value: Undefined
7 : 4	PC	This field specifies the protection context that successfully acquired the lock. Default Value: Undefined
1	NS	Secure/non-secure access control: '0': secure. '1': non-secure. This field is set with the secure/non-secure access control of the access that successfully acquired the lock. Default Value: Undefined
0	P	User/privileged access control: '0': user mode. '1': privileged mode. This field is set with the user/privileged access control of the access that successfully acquired the lock. Default Value: Undefined

2.1.2 IPC0_STRUCT0_RELEASE

Description: IPC release

Address: 0x422A0004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access								
Name	INTR_RELEASE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	INTR_RELEASE	Writing this field releases a lock and allows for the generation of release events to the IPC interrupt structures, but only when the lock is acquired (LOCK_STATUS.ACQUIRED is '1'). The IPC release cause fields associated with this IPC structure are set to '1', but only for those IPC interrupt structures for which the corresponding bit field in INTR_RELEASE[] is set to '1'. SW writes a '1' to the bit fields to generate a release event. Due to the transient nature of this event, SW always reads a '0' from this field. Default Value: 0

2.1.3 IPC0_STRUCT0_NOTIFY

Description: IPC notification

Address: 0x422A0008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access								
Name	INTR_NOTIFY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	INTR_NOTIFY	This field allows for the generation of notification events to the IPC interrupt structures. The IPC notification cause fields associated with this IPC structure are set to '1', but only for those IPC interrupt structures for which the corresponding bit field in INTR_NOTIFY[] is set to '1'. SW writes a '1' to the bit fields to generate a notify event. Due to the transient nature of this event, SW always reads a '0' from this field. Default Value: 0

2.1.4 IPC0_STRUCT0_DATA0

Description: IPC data 0

Address: 0x422A000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access								
Name	DATA [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access								
Name	DATA [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	This field holds a 32-bit data element that is associated with the IPC structure. Default Value: Undefined

2.1.5 IPC0_STRUCT0_DATA1

Description: IPC data 1

Address: 0x422A0010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access								
Name	DATA [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access								
Name	DATA [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	This field holds a 32-bit data element that is associated with the IPC structure. Default Value: Undefined

2.1.6 IPC0_STRUCT0_LOCK_STATUS

Description: IPC lock status

Address: 0x422A001C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				Reserved		R	R
HW Access	W				Reserved		W	W
Name	PC [7:4]				Reserved [3:2]		NS	P

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	MS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	W	Reserved						
Name	ACQUIRED	Reserved [30:24]						

Bits	Name	Description
31	ACQUIRED	Specifies if the lock is acquired. This field is set to '1', if a ACQUIRE read transfer successfully acquires the lock (the ACQUIRE read transfer returns ACQUIRE.SUCCESS as '1'). If zero, P, NS, PC, and MS are not valid. Default Value: 0
15 : 8	MS	This field specifies the bus master identifier that successfully acquired the lock. Default Value: Undefined
7 : 4	PC	This field specifies the protection context that successfully acquired the lock. Default Value: Undefined
1	NS	This field specifies the secure/non-secure access control: '0': secure. '1': non-secure. Default Value: Undefined
0	P	This field specifies the user/privileged access control: '0': user mode. '1': privileged mode. Default Value: Undefined

2.1.7 IPC0_INTR_STRUCT0_INTR

Description: Interrupt

Address: 0x422A1000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C							
HW Access	RW1S							
Name	RELEASE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW1C							
HW Access	RW1S							
Name	RELEASE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW1C							
HW Access	RW1S							
Name	NOTIFY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C							
HW Access	RW1S							
Name	NOTIFY [31:24]							

Bits	Name	Description
31 : 16	NOTIFY	These interrupt cause fields are activated (HW sets the field to '1') when a IPC notification event is detected. One bit field for each master. SW writes a '1' to these field to clear the interrupt cause. Default Value: 0
15 : 0	RELEASE	These interrupt cause fields are activated (HW sets the field to '1') when a IPC release event is detected. One bit field for each master. SW writes a '1' to these field to clear the interrupt cause. Default Value: 0

2.1.8 IPC0_INTR_STRUCT0_INTR_SET

Description: Interrupt set

Address: 0x422A1004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1S							
HW Access	A							
Name	RELEASE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW1S							
HW Access	A							
Name	RELEASE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW1S							
HW Access	A							
Name	NOTIFY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S							
HW Access	A							
Name	NOTIFY [31:24]							

Bits	Name	Description
31 : 16	NOTIFY	SW writes a '1' to this field to set the corresponding field in the INTR register. Default Value: 0
15 : 0	RELEASE	SW writes a '1' to this field to set the corresponding field in the INTR register. Default Value: 0

2.1.9 IPC0_INTR_STRUCT0_INTR_MASK

Description: Interrupt mask

Address: 0x422A1008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	RELEASE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	RELEASE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	NOTIFY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	NOTIFY [31:24]							

Bits	Name	Description
31 : 16	NOTIFY	Mask bit for corresponding field in the INTR register. Default Value: 0
15 : 0	RELEASE	Mask bit for corresponding field in the INTR register. Default Value: 0

2.1.10 IPC0_INTR_STRUCT0_INTR_MASKED

Description: Interrupt masked

Address: 0x422A100C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	RELEASE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	RELEASE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	NOTIFY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	NOTIFY [31:24]							

Bits	Name	Description
31 : 16	NOTIFY	Logical and of corresponding INTR and INTR_MASK fields. Default Value: 0
15 : 0	RELEASE	Logical and of corresponding request and mask bits. Default Value: 0

3 SRAM Controller registers

This section discusses the SRAM Controller registers. It lists all the registers in mapping tables, in address order.

3.1 Register details

Register name	Address	Description
RAMC0_CTL	0x42230000	Control
RAMC0_STATUS	0x42230008	Status
RAMC0_PWR_MACRO_CTL	0x42230200	SRAM power partition power control
RAMC0_PWR_MACRO_CTL_LOCK	0x42230240	SRAM power partition power control Lock
RAMC0_PWR_DELAY_CTL	0x42230280	SRAM power switch power up & sequence delay
RAMC0_MPC0_CFG	0x42234000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system.
RAMC0_MPC0_CTRL	0x42234100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc)
RAMC0_MPC0_BLK_MAX	0x42234104	Max value of block-based index register
RAMC0_MPC0_BLK_CFG	0x42234108	Block size & initialization in progress
RAMC0_MPC0_BLK_IDX	0x4223410C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)
RAMC0_MPC0_BLK_LUT	0x42234110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>
RAMC0_MPC0_ROT_CTRL	0x42234200	Control register with lock bit and auto-increment only
RAMC0_MPC0_ROT_BLK_MAX	0x42234208	Max value of block-based index register for ROT
RAMC0_MPC0_ROT_BLK_CFG	0x4223420C	Same as BLK_CFG
RAMC0_MPC0_ROT_BLK_IDX	0x42234210	Index of 8-block group accessed through ROT_BLK_LUT_*
RAMC0_MPC0_ROT_BLK_PC	0x42234214	Protection context of 8-block group accesses through ROT_BLK_LUT
RAMC0_MPC0_ROT_BLK_LUT	0x42234218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC
RAMC1_CTL	0x42240000	Control. See RAMC0_CTL for the details of bit fields.
RAMC1_STATUS	0x42240008	Status. See RAMC0_STATUS for the details of bit fields.
RAMC1_PWR_MACRO_CTL	0x42240200	SRAM power partition power control. See RAMC0_PWR_MACRO_CTL for the details of bit fields.
RAMC1_PWR_MACRO_CTL_LOCK	0x42240240	SRAM power partition power control Lock. See RAMC0_PWR_MACRO_CTL_LOCK for the details of bit fields.
RAMC1_PWR_DELAY_CTL	0x42240280	SRAM power switch power up & sequence delay. See RAMC0_PWR_DELAY_CTL for the details of bit fields.

SRAM Controller registers

Register name	Address	Description
RAMC1_MPC0_CFG	0x42244000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system.. See RAMC0_MPC0_CFG for the details of bit fields.
RAMC1_MPC0_CTRL	0x42244100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc). See RAMC0_MPC0_CTRL for the details of bit fields.
RAMC1_MPC0_BLK_MAX	0x42244104	Max value of block-based index register. See RAMC0_MPC0_BLK_MAX for the details of bit fields.
RAMC1_MPC0_BLK_CFG	0x42244108	Block size & initialization in progress. See RAMC0_MPC0_BLK_CFG for the details of bit fields.
RAMC1_MPC0_BLK_IDX	0x4224410C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc). See RAMC0_MPC0_BLK_IDX for the details of bit fields.
RAMC1_MPC0_BLK_LUT	0x42244110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>. See RAMC0_MPC0_BLK_LUT for the details of bit fields.
RAMC1_MPC0_ROT_CTRL	0x42244200	Control register with lock bit and auto-increment only. See RAMC0_MPC0_ROT_CTRL for the details of bit fields.
RAMC1_MPC0_ROT_BLK_MAX	0x42244208	Max value of block-based index register for ROT. See RAMC0_MPC0_ROT_BLK_MAX for the details of bit fields.
RAMC1_MPC0_ROT_BLK_CFG	0x4224420C	Same as BLK_CFG. See RAMC0_MPC0_ROT_BLK_CFG for the details of bit fields.
RAMC1_MPC0_ROT_BLK_IDX	0x42244210	Index of 8-block group accessed through ROT_BLK_LUT_*. See RAMC0_MPC0_ROT_BLK_IDX for the details of bit fields.
RAMC1_MPC0_ROT_BLK_PC	0x42244214	Protection context of 8-block group accesses through ROT_BLK_LUT. See RAMC0_MPC0_ROT_BLK_PC for the details of bit fields.
RAMC1_MPC0_ROT_BLK_LUT	0x42244218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC. See RAMC0_MPC0_ROT_BLK_LUT for the details of bit fields.

3.1.1 RAMC0_CTL

Description: Control

Address: 0x42230000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [7:2]						SRAM_WS [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [23:17]							CLOCK_-FORCE

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	CLOCK_FORCE	Force EAM clock gating to be always ON. 0: Disabled 1: Enabled This bit provides fail safe mechanism for dynamic clock gating added on EAM block. Default Value: 0
1 : 0	SRAM_WS	Wait states. Default Value: 0 **0x0: WS_0 :** **0x1: WS_1 :** **0x2: WS_2 :** **0x3: WS_3 :**

3.1.2 RAMC0_STATUS

Description: Status

Address: 0x42230008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			R	Reserved			
HW Access	Reserved			W	Reserved			
Name	Reserved [7:5]			PWR_-DONE	Reserved [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
4	PWR_DONE	After a PWR_MACRO_CTL.OFF change this flag indicates if the new power mode has taken effect or not. 1: Indicates change is effective; 0: Indicates change is in progress; Default Value: 1

3.1.3 RAMC0_PWR_MACRO_CTL

Description: SRAM power partition power control

Address: 0x42230200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	OFF [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	OFF	Each bit represent the individual RAM power partition power state. One bit for each macro of RAM controller when all 32 bits are populated as 32 independent power partitions. 0: Macros in power partion is to be powered-ON 1: Macros in power partion is to be powered-OFF Note 1: it is not allowed to disable a macro during access to its address range. Note 2: it is not allowed to disable few macros while enable others in the same AHB write transaction. It is mandatory to check for STATUS.PWR_DONE to become 1 once this PWR_MACRO_DTL register contents are changed to ensure SRAM mode transition is completed successfully. Default Value: 0

3.1.4 RAMC0_PWR_MACRO_CTL_LOCK

Description: SRAM power partition power control Lock

Address: 0x42230240

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						A	
Name	Reserved [7:2]						PWR_MACRO_CT-L_LOCK [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1 : 0	PWR_MACRO_CT-L_LOCK	Prohibits Read/Write access to PWR_MACRO_CTL register when this field is not equal to 0. Requires at least two different writes to unlock. Note that this field is 2 bits to force multiple writes only. By default AHB reads/writes to PWR_MACRO_CTL register are locked. Default Value: 3 **0x0: NO_CHG :** No effect **0x1: CLR0 :** Clears bit 0 **0x2: CLR1 :** Clears bit 1 **0x3: SET01 :** Sets both bits 0 and 1

3.1.5 RAMC0_PWR_DELAY_CTL

Description: SRAM power switch power up & sequence delay

Address: 0x42230280

Retention: Retained

31 : 24	SEQ1_DELAY	Number of IMO clock cycles delay needed for sequence-1 of SRAM power transition Default Value: 0x9
23 : 16	SEQ0_DELAY	Number of IMO clock cycles delay needed for sequence-0 of SRAM power transition Default Value: 0x2
9 : 0	UP	Number of IMO clock cycles delay needed after power domain power up Default Value: 0x9

3.1.6 RAMC0_MPC0_CFG

Description: Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system.

Address: 0x42234000

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	Reserved						
HW Access	R	Reserved						
Name	LOCK	Reserved [30:24]						

Bits	Name	Description
31	LOCK	Security lockdown for this protection context. Software can set this bit but not clear it once set. When set, write operations to BLK_LUT are not possible from this protection context. Setting LOCK also blocks writes to CTRL itself (for that PC copy). All writes are ignored. Default Value: 0
8	AUTO_INC	Auto-increment BLK_IDX by 1 for this protection context as a side effect of each read/write access to BLK_LUT Default Value: 1

3.1.8 RAMC0_MPC0_BLK_MAX

Description: Max value of block-based index register

Address: 0x42234104

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	
HW Access	Reserved						R

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	INIT_IN_PROGRESS	Reserved [30:24]						

Bits	Name	Description
31	INIT_IN_PROGRESS	During initialization INIT_IN_PROGRESS is '1' and MMIO register accesses to BLK_LUT is blocked (BLK_IDX increment is also ignored). The block attributes are retained in DeepSleep (and obviously Active) power mode. Initialization is only required from a power mode in which the block attributes are not retained. E.g., initialization is required for a cold boot (after a Power-on-Reset). HW initializes the block attributes: the NS attributes are set to '0' (secure), the R attributes are set to '1' (read access allowed) and the W attributes are set to '1' (write access allowed). During initialization, the MPC supports memory accesses (memory accesses are NOT blocked) with the initialization block attribute values as mentioned above. This e.g. allows MPC initialization to proceed in parallel with boot program memory accesses (as opposed to serializing the two), improving device boot time. Default Value: 1
3 : 0	BLOCK_SIZE	Block size of individually protected blocks (0: 32B, 1: 64B, ... up to 15: 1MB) Block size= (1<<(BLOCK_SIZE+5)) The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 7

3.1.10 RAMC0_MPC0_BLK_IDX

Description: Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)

Address: 0x4223410C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						RW	
Name	Reserved [7:2]						VALUE [1:0]	

Bits	15	14	13	12	11	10	9	8

3.1.12 RAMC0_MPC0_ROT_CTRL

Description: Control register with lock bit and auto-increment only

Address: 0x42234200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							AUTO_INC

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	Reserved						
HW Access	R	Reserved						
Name	LOCK	Reserved [30:24]						

Bits	Name	Description
31	LOCK	Security lockdown for the root-of-trust configuration registers. Software can set this bit but not clear it once set. When set, write operations to ROT_BLK_LUT are not possible. Write is ignored. Default Value: 0
8	AUTO_INC	Auto-increment BLK_IDX by 1 for each read/write of ROT_BLK_LUT Default Value: 1

3.1.13 RAMC0_MPC0_ROT_BLK_MAX

Description: Max value of block-based index register for ROT

Address: 0x42234208

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				R			
Name	Reserved [7:4]				VALUE [3:0]

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	INIT_IN_PROGRESS	Reserved [30:24]						

Bits	Name	Description
31	INIT_IN_PROGRESS	During initialization INIT_IN_PROGRESS is '1' and MMIO register accesses to ROT_BLK_LUT is RAZWI. The block attributes are retained in DeepSleep (and obviously Active) power mode. Initialization is only required from a power mode in which the block attributes are not retained. E.g., initialization is required for a cold boot (after a Power-on-Reset). HW initializes the block attributes: the NS attributes are set to '0' (secure), the R attributes are set to '1' (read access allowed) and the W attributes are set to '1' (write access allowed). During initialization, the MPC supports memory accesses (memory accesses are NOT blocked) with the initialization block attribute values as mentioned above. This e.g. allows MPC initialization to proceed in parallel with boot program memory accesses (as opposed to serializing the two), improving device boot time. Default Value: 1
3 : 0	BLOCK_SIZE	Block size of individually protected blocks (0: 32B, 1: 64B, ...up to 15:1MB) Block size= (1<<(BLOCK_SIZE+5)) The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 7

3.1.15 RAMC0_MPC0_ROT_BLK_IDX

Description: Index of 8-block group accessed through ROT_BLK_LUT_*

Address: 0x42234210

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				RW

SW Access	Reserved	RW			Reserved	RW		
HW Access	Reserved	RW			Reserved	RW		
Name	Reserved	ATTR7 [30:28]			Reserved	ATTR6 [26:24]		

Bits	Name	Description
30 : 28	ATTR7	W/R/NS bits for block 7 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
26 : 24	ATTR6	W/R/NS bits for block 6 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
22 : 20	ATTR5	W/R/NS bits for block 5 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
18 : 16	ATTR4	W/R/NS bits for block 4 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
14 : 12	ATTR3	W/R/NS bits for block 3 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
10 : 8	ATTR2	W/R/NS bits for block 2 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
6 : 4	ATTR1	W/R/NS bits for block 1 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
2 : 0	ATTR0	W/R/NS bits for block 0 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0

4 System-on-Chip Memory (SoCMEM) registers

This section discusses the SoCMEM registers. It lists all the registers in mapping tables, in address order.

4.1 Register details

Register name	Address	Description
SOCMEM_CTL	0x44640000	Control
SOCMEM_STATUS	0x44640004	Status
SOCMEM_GK_CTL	0x44640008	Gate keeper control
SOCMEM_GK_STATUS	0x4464000C	Gate keeper status
SOCMEM_ARB_DYN_CTL0	0x44640010	Port arbitration control
SOCMEM_ARB_DYN_CTL1	0x44640014	Port arbitration control. See SOCMEM_ARB_DYN_CTL0 for the details of bit fields.
SOCMEM_ARB_DYN_CTL2	0x44640018	Port arbitration control. See SOCMEM_ARB_DYN_CTL0 for the details of bit fields.
SOCMEM_ARB_DYN_CTL3	0x4464001C	Port arbitration control. See SOCMEM_ARB_DYN_CTL0 for the details of bit fields.
SOCMEM_ARB_DYN_CTL4	0x44640020	Port arbitration control. See SOCMEM_ARB_DYN_CTL0 for the details of bit fields.
SOCMEM_MPC_READ_PORT_CTL	0x44640060	MPC MMIO read port index control
SOCMEM_WOUNDING	0x44640110	Wounding
SOCMEM_PWR_PARTITION_CTL0	0x44640200	SRAM partition power control
SOCMEM_PWR_PARTITION_CTL1	0x44640204	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL2	0x44640208	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL3	0x4464020C	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL4	0x44640210	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL5	0x44640214	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.

System-on-Chip Memory (SoCMEM) registers

Register name	Address	Description
SOCMEM_PWR_PARTITION_CTL6	0x44640218	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL7	0x4464021C	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL8	0x44640220	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL9	0x44640224	SRAM partition power control. See SOCMEM_PWR_PARTITION_CTL0 for the details of bit fields.
SOCMEM_PWR_PARTITION_CTL_LOCK	0x44640280	SRAM power partition control Lock
SOCMEM_PWR_DELAY_CTL	0x44640284	SRAM power switch power up & sequence delay
SOCMEM_PWR_STATUS	0x44640288	SRAM power status
SOCMEM_SRAM_MPC0_CFG	0x44642000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system.
SOCMEM_SRAM_MPC0_CTRL	0x44642100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc)
SOCMEM_SRAM_MPC0_BLK_MAX	0x44642104	Max value of block-based index register
SOCMEM_SRAM_MPC0_BLK_CFG	0x44642108	Block size & initialization in progress
SOCMEM_SRAM_MPC0_BLK_IDX	0x4464210C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)
SOCMEM_SRAM_MPC0_BLK_LUT	0x44642110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>
SOCMEM_SRAM_MPC0_ROT_CTRL	0x44642200	Control register with lock bit and auto-increment only
SOCMEM_SRAM_MPC0_ROT_BLK_MAX	0x44642208	Max value of block-based index register for ROT
SOCMEM_SRAM_MPC0_ROT_BLK_CFG	0x4464220C	Same as BLK_CFG
SOCMEM_SRAM_MPC0_ROT_BLK_IDX	0x44642210	Index of 8-block group accessed through ROT_BLK_LUT_*
SOCMEM_SRAM_MPC0_ROT_BLK_PC	0x44642214	Protection context of 8-block group accesses through ROT_BLK_LUT
SOCMEM_SRAM_MPC0_ROT_BLK_LUT	0x44642218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC
SOCMEM_PATCH_STRUCT_CTL00	0x44650800	Patch structure control
SOCMEM_PATCH_STRUCT_CTL10	0x44651800	Patch structure control. See SOCMEM_PATCH_STRUCT_CTL00 for the details of bit fields.

System-on-Chip Memory (SoCMEM) registers

Register name	Address	Description
SOCMEM_PATCH_STRUCT_CTL20	0x44652800	Patch structure control. See SOCMEM_PATCH_STRUCT_CTL00 for the details of bit fields.

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [23:17]							PORT_MP-C_INIT_-DONE

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	PORT_MPC_INIT_DONE	Port MPC SRAM initialisation done. It is a combined single initialisation done for all the ports mpc sram. Default Value: 0
3 : 0	WB_EMPTY	Write buffer empty. This information is used when entering DEEPSLEEP or DEEPSLEEP_RAM system power modes: WB_EMPTY must be '1' before a transition to DEEPSLEEP or DEEPSLEEP_RAM system power modes. '0': Write buffer NOT empty. '1': Write buffer empty. Note: the SoCMEM controller write buffer is only used when ECC checking is enabled. (ECC_CTL.EN is '1'). Default Value: Undefined

4.1.3 SOCMEM_GK_CTL

Description: Gate keeper control

Address: 0x44640008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW

HW Access	Reserved							R
Name	Reserved [23:17]							LATENCY

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	LATENCY	Specifies if the port is latency sensitive. '0': Non latency sensitive or less latency sensitive (e.g. a DMA controller). '1': Latency sensitive (e.g. a CPU or a real-time master such as a sound or display controller). As described above, the scheduler favors latency sensitive masters over non latency sensitive masters. Default Value: 0

4.1.5 SOCMEM_ARB_DYN_CTL0 (continued)

6 : 0	CREDIT	Port account increment. Value in the range [0, 127]. Total available SRAM/SROM bank bandwidth is partitioned into 128 partitions. The CREDIT value specifies what guaranteed relative bandwidth is assigned to the port. E.g., when CREDIT is "32", 25% of the relative bandwidth is assigned to the port. Note that for absolute bandwidth, the SRAM/SROM frequency and wait states need to be taken into account as well. An arbiter/scheduler operation is performed when one or more port requests for a SRAM/SROM bank are present and the SRAM/SROM bank is available for a new request. Each SRAM/SROM bank has a dedicated scheduler. The scheduler uses port account values: 9-bit values in the range [0, 511]. The port account values identify: - Non credit-worthy ports (account value in the range [0, 255]). - Credit-worthy ports (account value in the range [256, 511]). In addition, each port is specified to be either non (less) latency sensitive or latency sensitive (LATENCY). A scheduler operation is defined as follows: IF ("Any requesting port is a credit-worthy, latency port") "Select port with lowest index from requesting, credit-worthy, latency ports" ELSE IF ("Any requesting port is a credit-worthy, non latency port") "Select port with lowest index from requesting, credit-worthy, non latency ports" ELSE IF ("Any requesting port is a non credit-worthy, latency port") "Select port with lowest index from requesting, non credit-worthy, latency ports" ELSE IF ("Any requesting port is a non credit-worthy, non latency port") "Select port with lowest index from requesting, non credit-worthy, non latency ports" After a scheduler operation, account values are updated: - The selected port's account is incremented by CREDIT and decremented with "128". If ECC is enabled AND the transaction was a partial write, an additional "128" is decremented, because two transactions (read-modify-write) are needed to change the ECC. Clipping to "0" is performed to prevent negative values. - Non-selected port account are increment by CREDIT, if the current account value is less than "256". Otherwise, the port account value is not updated. Default Value: 0

4.1.6 SOCMEM_MPC_READ_PORT_CTL

Description: MPC MMIO read port index control

Address: 0x44640060

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				INDEX [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	INDEX	specifies port index for any MPC read access using SOCMEM.SRAM_MPC/SROM_MPC. 0- Any SW MPC MMIO read through SOCMEM.SRAM/SROM_MPC is from port-0. 1- Any SW MPC MMIO read through SOCMEM.SRAM/SROM_MPC is from port-1. . . 15- Any SW MPC MMIO read through SOCMEM.SRAM/SROM_MPC is from port-15. Note that INDEX field value programmed by SW must be between 0 and one less than number of configured SOCMEM ports (number of ports is design time config option using parameter PORT_NR). IMPORTANT: When MPC.CTRL.AUTO_INC is 1, each read access will auto-increment MPC.BLK_IDX in the port specified by MPC_READ_PORT_CTL.INDEX; not all ports are updated. Each write access will auto-increment MPC.BLK_IDX.VALUE in all ports. When MPC.CTRL.AUTO_INC is 1, to ensure that all ports are initialized correctly, write to MPC.BLK_IDX.VALUE before any series of writes to MPC.BLK_LUT. Writing to MPC.BLK_IDX.VALUE sets the index in all ports to the same value. Default Value: 0

4.1.7 SOCMEM_WOUNDING

Description: Wounding

Address: 0x44640110

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW1S		
HW Access	Reserved					R		
Name	Reserved [7:3]					WOUND [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2 : 0	WOUND	Indicates the amount of accessible SRAM in this device. The value in this field is effectively write-once (it is only possible to set bits to '1', not clear them to '0'). Accesses to non-accessible SRAM return a bus error. Wounding control is rounded to next power of two bytes. "0": entire memory accessible "1": first 1/2 of the memory accessible. "2": first 1/4 of the memory accessible. "3": first 1/8 of the memory accessible. "4": first 1/16 of the memory accessible. "5": first 1/32 of the memory accessible. "6": first 1/64 of the memory accessible. "7": first 1/128 of the memory accessible. Default Value: 0

4.1.8 SOCMEM_PWR_PARTITION_CTL0

Description: SRAM partition power control

Address: 0x44640200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [7:2]						ACT_OFF [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [15:10]						RET_OFF [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 8	RET_OFF	This field defines the power state of each SRAM partition in DeepSleep/DeepSleep-RAM power modes. (Note that partition-0 can support upto two sub partitions within, when parameter SUB-_PARTITION_NR is set to 1 i.e. partition 0 is divided into partition-A and partition-B). 2'b00- sub partition-B is to be powered-ON and sub partition- A is to be powered-ON. 2'b01- sub partition-B is to be powered-ON and sub partition- A is to be powered-OFF. 2'b10- sub partition-B is to be powered-OFF and sub partition- A is to be powered-ON. 2'b11- sub partition-B is to be powered-OFF and sub partition- A is to be powered-OFF. (Note if a partition has a sub-partition, 2'b00,2'b01,2'b10,2'b11 are all valid values. If a partition doesn't have sub-partition, Only 2'b00, 2'b01 are valid values , 2'b10,2'b11 are reserved.) Notes: RET_OFF is exact replica of PWR_PARTITION_CTL.ACT_OFF, which enables independent SRAM partition granularity control in Active vs DeepSleep* modes and avoids SW reconfiguration of PWR_PARTITION_CTL register while switching power modes. Since this register field PWR_PARTITION_CTL.RET_OFF is applicable and used by HW only in retention mode, any update to this register field (PWR_PARTITION_CTL.RET_OFF) does not change status of PWR_STATUS.PWR_DONE. i.e. PWR_STATUS.PWR_DONE is not applicable for RET_OFF field SW programming. Default Value: 0

4.1.8 SOCMEM_PWR_PARTITION_CTL0 (continued)

1 : 0	ACT_OFF	This field defines the power state of each SRAM partition in Active power mode (Note that partition-0 can support upto two sub partitions within, when parameter SUB_PARTITION_NR is set to 1 i.e. partition 0 is divided into partition-A and partition-B). 2'b00- sub partition-B is to be powered-ON and sub partition- A is to be powered-ON. 2'b01- sub partition-B is to be powered-ON and sub partition- A is to be powered-OFF. 2'b10- sub partition-B is to be powered-OFF and sub partition- A is to be powered-ON. 2'b11- sub partition-B is to be powered-OFF and sub partition- A is to be powered-OFF. (Note if a partition has a sub-partition, 2'b00,2'b01,2'b10,2'b11 are all valid values. If a partition doesn't have sub-partition, Only 2'b00, 2'b01 are valid values , 2'b10,2'b11 are reserved.) It is mandatory to check for PWR_STATUS.PWR_DONE to become 1 once this PWR_PARTITION_CTL register contents are changed to ensure SRAM mode transition is completed successfully. Default Value: 0

4.1.9 SOCMEM_PWR_PARTITION_CTL_LOCK

Description: SRAM power partition control Lock

Address: 0x44640280

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						A

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	INIT_IN_PROGRESS	Reserved [30:24]						

Bits	Name	Description
31	INIT_IN_PROGRESS	During initialization INIT_IN_PROGRESS is '1' and MMIO register accesses to BLK_LUT is blocked (BLK_IDX increment is also ignored). The block attributes are retained in DeepSleep (and obviously Active) power mode. Initialization is only required from a power mode in which the block attributes are not retained. E.g., initialization is required for a cold boot (after a Power-on-Reset). HW initializes the block attributes: the NS attributes are set to '0' (secure), the R attributes are set to '1' (read access allowed) and the W attributes are set to '1' (write access allowed). During initialization, the MPC supports memory accesses (memory accesses are NOT blocked) with the initialization block attribute values as mentioned above. This e.g. allows MPC initialization to proceed in parallel with boot program memory accesses (as opposed to serializing the two), improving device boot time. Default Value: 1
3 : 0	BLOCK_SIZE	Block size of individually protected blocks (0: 32B, 1: 64B, ... up to 15: 1MB) Block size= (1<<(BLOCK_SIZE+5)) The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 8

4.1.16 SOCMEM_SRAM_MPC0_BLK_IDX

Description: Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)

Address: 0x4464210C

Retention: Not Retained

Name	MATCH_ADDR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	MATCH_ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	MATCH_ADDR [31:24]							

Bits	Name	Description
4098 : 3	MATCH_ADDR	Match address. SROM accesses are matched/compared to this address. An address match results into patching/redirection of the SROM access (if PATCH_CTL.ENABLED is '1'): the SROM access is redirected to an SRAM access. The PATCH_SRAM register and the "matching" patch structure index determine the SRAM access address. Specifically, given an index i, the SRAM access address is given by: PATCH_SRAM.ADDR + i * "patch size", where patch size is the number of Bytes that are patched by a single patch structure (2 ^ (3+CFG.PATCH_SIZE)). The MATCH_ADDR[] bit range is dependent on two design time configuration parameters: - The lowest index is determined by PATCH_SIZE. E.g., a 8 Byte patch size uses "3" as the lowest bit index, a 16 Byte patch size uses "4" as the lowest bit index, etc. Unused lower bit indices are '0'. - The highest index is determined by the SROM size as specified by SROM_MASK (the next power of two multiple of the SROM size). E.g., a 0xffff:0000 mask specifies a 64 KByte SROM size and uses "15" as the highest bit index, a 0xfff0:0000 mask specifies a 1 MByte SROM size and uses "19" as the highest bit index, etc. Unused higher bit indices reflect the SROM location in the address space. Default Value: Undefined
0	VALID	Patch structure validity: '0': Not valid. '1': Valid. Note: VALID uses the bit field "0" location, rather than the more typical bit field "31" location. This architecture decision was made to allow for SROM location anywhere in a 32-bit address space, and not require extensive address manipulation when accessing PATCH_CTL.MATCH_ADDR. Default Value: 0

4.1.25 SOCMEM_PPU_SOCMEM_PWPR

Description: Power Policy Register

Address: 0x44660000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				PWR_POLICY [3:0]

4.1.32 SOCMEM_PPU_SOCMEM_PWCR

Description: Power Configuration Register

Address: 0x44660020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DEVREQEN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	PWR_DEVACTIVEEN [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [23:19]					PWR_DEVACTIVEEN [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	OP_DEVACTIVEEN [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVEEN	Reserved Default Value: 0x0
18 : 8	PWR_DEVACTIVEEN	These bits enable the power mode DEVACTIVE inputs. When a bit is to 1 the related DEVACTIVE input is enabled, when set to 0 it is disabled. All available bits are reset to 1. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE, and bit 9 for the Q-Channel 1 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x003
7 : 0	DEVREQEN	When set to 1 enables the device interface handshake for transitions. All available bits are reset to 1. There is one bit for each device interface channel. For example, bit 0 is for Q-Channel 0, and bit 1 is for Q-Channel 1. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x03

4.1.33 SOCMEM_PPU_SOCMEM_PTCR

Description: Power Mode Transition Configuration Register

Address: 0x44660024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						DBG_RE-COV_POR ST_EN	WARM_RS T_DEVREQ EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	DBG_RE-COV_PORST_EN	Reserved Default Value: 0x0
0	WARM_RST_DEVREQEN	Transition behavior between ON and WARM_RST. This bit should not be modified when the PPU is in WARM_RST, or if the PPU is performing a transition, otherwise PPU behavior is UN-PREDICTABLE. 0: The PPU does not perform a device interface handshake when transitioning between ON and WARM_RST. 1: The PPU performs a device interface handshake when transitioning between ON and WARM_RST. This disables all Q-Channels for this transition. Default Value: 0x0

4.1.34 SOCMEM_PPU_SOCMEM_IMR

Description: Interrupt Mask Register

Address: 0x44660030

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C							
HW Access	R							
Name	OP_ACTIVE_EDGE_IRQ [31:24]							

Bits	Name	Description
31 : 24	OP_ACTIVE_EDGE_IRQ	Indicates which operating mode DEVPACTIVE inputs caused the input edge event. When operating modes are not supported this field is reserved. Default Value: 0x0
18 : 8	PWR_ACTIVE_EDGE_IRQ	Indicates which power mode DEVACTIVE inputs caused the input edge event. Bits for unused channels are the MSBs and are reserved. There is one bit for each device Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x00
7	OTHER_IRQ	Indicates there is an interrupt event pending in the Additional Interrupt Status Register (PPU_AISR). Default Value: 0x0
5	LOCKED_IRQ	Reserved Default Value: 0x0
4	EMU_DENY_IRQ	Reserved Default Value: 0x0
3	EMU_ACCEPT_IRQ	Reserved Default Value: 0x0
2	STA_DENY_IRQ	Static transition denial event status. Default Value: 0x0
1	STA_ACCEPT_IRQ	Static transition acceptance event status. Default Value: 0x0

4.1.36 SOCMEM_PPU_SOCMEM_ISR (continued)

0	STA_POLICY_TRN_IRQ	Static full policy transition completion event status. Default Value: 0x0

4.1.37 SOCMEM_PPU_SOCMEM_AISR

Description: Additional Interrupt Status Register

8	STA_OFF_SPT	OFF support. Default Value: 0x1
7 : 4	NUM_OPMODE	No. of operating modes supported is NUM_OPMODE + 1. Default Value: 0x0
3 : 0	DEVCHAN	No. of Device Interface Channels. The device enumeration is: Device 0: SOCMEM SEQ between between SOCMEM MMIO, ports & Banks. Device 1: SRSS PDCM Default Value: 0x2

4.1.48 SOCMEM_PPU_SOCMEM_IDR1

Description: PPU Identification Register 1

Address: 0x44660FB4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	R	R	R	Reserved	R	R	R
HW Access	Reserved	RW	RW	RW	Reserved	RW	RW	RW
Name	Reserved	FUNC_RET_RAM_REG	FULL_RET_RAM_REG	MEM_RET_RAM_REG	Reserved	LOCK_SPT	SW_DEV_DEL_SPT	PWR_MODE_ENTRY_DEL_SPT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			R	Reserved	R	R	R
HW Access	Reserved			RW	Reserved	RW	RW	RW
Name	Reserved [15:13]			OFF_MEM_RET_TRANS	Reserved	OP_ACTIVE	STA_POLICY_OP_IRQ_SPT	STA_POLICY_PWR_IRQ_SPT

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	OFF_MEM_RET_TRANS	OFF to MEM_RET direct transition. Indicates if direct transitions from OFF to MEM_RET and from OFF_EMU to MEM_RET_EMU are supported. Default Value: 0x0
10	OP_ACTIVE	Reserved Default Value: 0x0
9	STA_POLICY_OP_IRQ_SPT	Operating policy transition completion event status. Default Value: 0x0
8	STA_POLICY_PWR_IRQ_SPT	Power policy transition completion event status. Default Value: 0x0
6	FUNC_RET_RAM_REG	Indicates if the PPU_FUNRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
5	FULL_RET_RAM_REG	Indicates if the PPU_FULRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
4	MEM_RET_RAM_REG	Indicates if the PPU_MEMRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x1
2	LOCK_SPT	Lock and the lock interrupt event are supported. Default Value: 0x0

4.1.48 SOCMEM_PPU_SOCMEM_IDR1 (continued)

1	SW_DEV_DEL_SPT	Software device delay control configuration support. Default Value: 0x0
0	PWR_MODE_EN-TRY_DEL_SPT	Power mode entry delay support. Default Value: 0x0

4.1.49 SOCMEM_PPU_SOCMEM_IIDR

Description: Implementation Identification Register

Address: 0x44660FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	IMPLEMENTER [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R				R			
HW Access	RW				RW			
Name	REVISION [15:12]				IMPLEMENTER [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R				R			
HW Access	RW				RW			
Name	PRODUCT_ID [23:20]				VARIANT [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID [31:24]							

Bits	Name	Description
31 : 20	PRODUCT_ID	PPU part identification. Default Value: 0x0B6
19 : 16	VARIANT	Major revision of the product. Default Value: 0
15 : 12	REVISION	Minor revision of the product. Default Value: 0
11 : 0	IMPLEMENTER	Implementer identification. [11:8] The JEP106 continuation code of the implementer. [7] Always 0. [6:0] The JEP106 identity code of the implementer. For an Arm implementation, bits [11:0] are 0x43B. Default Value: 0x43B

4.1.50 SOCMEM_PPU_SOCMEM_AIDR

Description: Architecture Identification Register

Address: 0x44660FCC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	ARCH_REV_MAJOR [7:4]				ARCH_REV_MINOR [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	ARCH_REV_MAJOR	0x1 - PPU architecture major revision 1. Other Values - Reserved. Default Value: 0x1
3 : 0	ARCH_REV_MINOR	0x1 - PPU Architecture minor revision 1. Other Values - Reserved. Default Value: 0x1

4.1.51 SOCMEM_PPU_SOCMEM_PID4

Description: Implementation Defined Identification Register (PID4)

Address: 0x44660FD0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				IMPLEMENTER_11_8 [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	IMPLEMENTER_11_8	The JEP106 continuation code of the implementer, which is 0x4 hardcoded value. Default Value: 0x4

4.1.52 SOCMEM_PPU_SOCMEM_PID0

Description: Implementation Defined Identification Register (PID0)

Address: 0x44660FE0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PRODUCT_ID_7_0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	PRODUCT_ID_7_0	PPU part identification bits [7:0]. Default Value: 0xB6

4.1.53 SOCMEM_PPU_SOCMEM_PID1

Description: Implementation Defined Identification Register (PID1)

Address: 0x44660FE4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	IMPLEMENTER_3_0 [7:4]				PRODUCT_ID_11_8 [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	IMPLEMENTER_3_0	JEP106_ID bits [3:0] Default Value: 0xB
3 : 0	PRODUCT_ID_11_8	PPU part identification bits [11:8] Default Value: 0x0

4.1.54 SOCMEM_PPU_SOCMEM_PID2

Description: Implementation Defined Identification Register (PID2)

Address: 0x44660FE8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R	R		
HW Access	RW				RW	RW		
Name	REV_CONST [7:4]				CON-ST_HIGH	IMPLEMENTER_6_4 [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	REV_CONST	Constant LOW Revision (4 bits) Default Value: 0x1
3	CONST_HIGH	Constant HIGH Default Value: 0x1
2 : 0	IMPLEMENTER_6_4	JEP106_ID bits [6:4] Default Value: 0x3

4.1.55 SOCMEM_PPU_SOCMEM_PID3

Description: Implementation Defined Identification Register (PID3)

Address: 0x44660FEC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	RW				RW			
Name	PID3_REVISION [7:4]				PID3_REV_CONST [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	PID3_REVISION	Minor revision of the product. Default Value: 0x0
3 : 0	PID3_REV_CONST	Constant LOW (4 bits) Default Value: 0x0

4.1.56 SOCMEM_PPU_SOCMEM_ID0

Description: Implementation Defined Identification Register (ID0)

Address: 0x44660FF0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID0	ID0 hard coded value Default Value: 0x0D

4.1.57 SOCMEM_PPU_SOCMEM_ID1

Description: Implementation Defined Identification Register (ID1)

Address: 0x44660FF4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID1 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID1	ID1 hardcoded value Default Value: 0xF0

4.1.58 SOCMEM_PPU_SOCMEM_ID2

Description: Implementation Defined Identification Register (ID2)

Address: 0x44660FF8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID2 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID2	ID2 hardcoded value Default Value: 0x05

4.1.59 SOCMEM_PPU_SOCMEM_ID3

Description: Implementation Defined Identification Register (ID3)

Address: 0x44660FFC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	ID3 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ID3	ID3 hardcoded value Default Value: 0xB1

4.1.60 SOCMEM_SOCMEM_PD_CTL

Description: Power Domain Control

Address: 0x44661000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							BLEED_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	BLEED_EN	Activates bleed feature for the controlled power domain Default Value: 0

4.1.61 SOCMEM_SOCMEM_PD_PWR_UP_DELAY

Description: Active switch weak enable to active switch strong enable delay

Address: 0x44661004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	COUNT_LOAD [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	MEM_COUNT_LOAD [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	MEM_COUNT_LOAD	Load value for counter running on clk_pwr (10MHz) providing the timing from weak MEM switch enable to strong MEM switch enable. Default is 5 for ~500ns Default Value: 0
7 : 0	COUNT_LOAD	Load value for counter running on clk_pwr (10MHz) providing the timing from weak ACTIVE switch enable to strong ACTIVE switch enable. Default is 5 for ~500ns Default Value: 5

5 Non-Volatile Memory (NVM) registers

This section discusses the NVM registers. It lists all the registers in mapping tables, in address order.

5.1 Register details

Register name	Address	Description
RRAMC0_RRAM_EXTRA_AREA_GENERAL_OTP0	0x42204000	GENERAL_OTP subregion (5.5KB). This is the starting address of a register bank containing 1408 registers (RRAMC0_RRAM_EXTRA_AREA_GENERAL_OTP0 to RRAMC0_RRAM_EXTRA_AREA_GENERAL_OTP1407).
RRAMC0_RRAMC0_AHB_HRESP	0x42210000	RRAMC AHB HRESP
RRAMC0_RRAMC0_PC_MASK	0x42210020	PC acquisition and releasing
RRAMC0_RRAMC0_RRAM_PROTECTED_X	0x42210024	Size of PROTECTED_NVM subregion (8KB * X)
RRAMC0_RRAMC0_RRAM_SFLASH_Y	0x42210028	Size of SFLASH_NVM subregion (8KB * Y)
RRAMC0_RRAMC0_RRAM_WORK_Z	0x4221002C	Size of WORK_NVM subregion (8KB * Z)
RRAMC0_RRAMC0_RRAM_MAIN_N	0x42210030	Size of MAIN_NVM subregion (8KB * N)
RRAMC0_RRAMC0_RRAM_CTL	0x42210100	RRAM macro OSC control
RRAMC0_RRAMC0_PROTECTED_LOCKABLE_LOCK	0x42210104	PROTECTED_NVM lockable configuration
RRAMC0_RRAMC0_UDS_CTL	0x42210110	UDS control
RRAMC0_RRAMC0_RECLAIMED_MAIN_NVM_SIZE	0x42210114	Reclaimed size (KB) from upgradeable
RRAMC0_RRAMC0_TB_GATING_CTL	0x42210118	Turn-off Tagbit post-read gating control check
RRAMC0_MPC0_CFG	0x42211000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system.
RRAMC0_MPC0_CTRL	0x42211100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc)
RRAMC0_MPC0_BLK_MAX	0x42211104	Max value of block-based index register
RRAMC0_MPC0_BLK_CFG	0x42211108	Block size & initialization in progress
RRAMC0_MPC0_BLK_IDX	0x4221110C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)
RRAMC0_MPC0_BLK_LUT	0x42211110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>

Non-Volatile Memory (NVM) registers

Register name	Address	Description
RRAMC0_MPC0_ROT_CTRL	0x42211200	Control register with lock bit and auto-increment only
RRAMC0_MPC0_ROT_BLK_MAX	0x42211208	Max value of block-based index register for ROT
RRAMC0_MPC0_ROT_BLK_CFG	0x4221120C	Same as BLK_CFG
RRAMC0_MPC0_ROT_BLK_IDX	0x42211210	Index of 8-block group accessed through ROT_BLK_LUT_*
RRAMC0_MPC0_ROT_BLK_PC	0x42211214	Protection context of 8-block group accesses through ROT_BLK_LUT
RRAMC0_MPC0_ROT_BLK_LUT	0x42211218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC
RRAMC0_MPC1_CFG	0x42212000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system.. See RRAMC0_MPC0_CFG for the details of bit fields.
RRAMC0_MPC1_CTRL	0x42212100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc). See RRAMC0_MPC0_CTRL for the details of bit fields.
RRAMC0_MPC1_BLK_MAX	0x42212104	Max value of block-based index register. See RRAMC0_MPC0_BLK_MAX for the details of bit fields.
RRAMC0_MPC1_BLK_CFG	0x42212108	Block size & initialization in progress. See RRAMC0_MPC0_BLK_CFG for the details of bit fields.
RRAMC0_MPC1_BLK_IDX	0x4221210C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc). See RRAMC0_MPC0_BLK_IDX for the details of bit fields.
RRAMC0_MPC1_BLK_LUT	0x42212110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>. See RRAMC0_MPC0_BLK_LUT for the details of bit fields.
RRAMC0_MPC1_ROT_CTRL	0x42212200	Control register with lock bit and auto-increment only. See RRAMC0_MPC0_ROT_CTRL for the details of bit fields.

Non-Volatile Memory (NVM) registers

Register name	Address	Description
RRAMC0_MPC1_ROT_BLK_MAX	0x42212208	Max value of block-based index register for ROT. See RRAMC0_MPC0_ROT_BLK_MAX for the details of bit fields.
RRAMC0_MPC1_ROT_BLK_CFG	0x4221220C	Same as BLK_CFG. See RRAMC0_MPC0_ROT_BLK_CFG for the details of bit fields.
RRAMC0_MPC1_ROT_BLK_IDX	0x42212210	Index of 8-block group accessed through ROT_BLK_LUT_*. See RRAMC0_MPC0_ROT_BLK_IDX for the details of bit fields.
RRAMC0_MPC1_ROT_BLK_PC	0x42212214	Protection context of 8-block group accesses through ROT_BLK_LUT. See RRAMC0_MPC0_ROT_BLK_PC for the details of bit fields.
RRAMC0_MPC1_ROT_BLK_LUT	0x42212218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC. See RRAMC0_MPC0_ROT_BLK_LUT for the details of bit fields.
RRAMC0_RRAM_SFR_NVM_STATUS	0x42213000	status register
RRAMC0_RRAM_SFR_NVM_PROG	0x42213004	programming control register
RRAMC0_RRAM_SFR_NVM_ADDR	0x42213008	address register
RRAMC0_RRAM_SFR_NVM_CONF1	0x4221300C	configuration register
RRAMC0_RRAM_SFR_NVM_HARDEN1	0x42213010	hardening configuration register
RRAMC0_RRAM_SFR_NVM_HARDADDR	0x42213014	hardening address register
RRAMC0_RRAM_SFR_NVM_HRESP	0x42213018	bus response register
RRAMC0_RRAM_SFR_NVM_ECCLOG	0x4221301C	ECC failure logging register
RRAMC0_RRAM_SFR_NVM_ECCLOGIR	0x42213020	ECC failure logging interrupt register
RRAMC0_RRAM_SFR_NVM_VMODE	0x42213024	voltage mode register

5.1.1 RRAMC0_RRAM_EXTRA_AREA_GENERAL_OTP0

Description: GENERAL_OTP subregion (5.5KB)

Address: 0x42204000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	GENERAL_OTP_VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	GENERAL_OTP_VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	GENERAL_OTP_VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	GENERAL_OTP_VALUE [31:24]							

Bits	Name	Description
31 : 0	GENERAL_OTP_VALUE	GENERAL_OTP subregion (5.5KB) Default Value: 0

5.1.2 RRAMC0_RRAMC0_AHB_HRESP

Description: RRAMC AHB HRESP

Address: 0x42210000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				HRESP [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	RW	Reserved						
Name	RE-SET_HRE-SP	Reserved [30:24]						

Bits	Name	Description
31	RESET_HRESP	0: No reset to AHB_HRESP 1: Triggering reset to AHB_HRESP by hardware after one clock cycle Default Value: 0

5.1.2 RRAMC0_RRAMC0_AHB_HRESP (continued)

3 : 0	HRESP	Logs RRAMC AHB bus errors/faults on the PROTECTED interface and SFR/MMIO PC acquisition/status violations. 4'b0000: No AHB bus error 4'b0001: OTP Tagbit[2:0] violation during write (the target OTP is tagged 3'b111) 4'b0010: Post-read check Tagbit[2:0] violation during read (when target NVM/OTP tagged other than 3'b000) 4'b0011: Post-read check address fault alarm 4'b0100: RARM IP AHB bus error (Needs to read RRAM SFR NVM_HRESP for causes of the error) 4'b0101: Incomplete write or 8/16 write on the protected interface 4'b0110: Indirect sequence where AHB write address mismatch with SFR NVM_ADDR on the protected interface or direct write target address not in defined range on the BISR interface 4'b0111: Programming PROTECTED_NVM lockable subsection when PROTECTED_LOCKABLE_LOCK.LOCK is locked (write-protected) 4'b1000: 4'b1001: Detecting UDS read access while UDS is locked 4'b1010: 4'b1011: 4'b1100: Executing indirect operation without a PC acquired 4'b1101: Transaction PC is different (or same PC but different HMASTER_ID) than the acquired PC or transaction PC is not PC0 in VIRGIN/SORT LCS 4'b1110: Executing forming or looped forming in SORT LCS 4'b1111: Protected interface MPC violation Default Value: 0

5.1.3 RRAMC0_RRAMC0_PC_MASK

Description: PC acquisition and releasing

Address: 0x42210020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				PC [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW				Reserved			
HW Access	R				Reserved			
Name	PC_LOCK [31:28]				Reserved [27:24]			

Bits	Name	Description
31 : 28	PC_LOCK	SW writes to PC_LOCK to acquire / release a PC. 4'b0000: Not locked, any PC can lock again 4'b1111: PC [3:0] locked PC_LOCK is redundantly implemented. Any other bit encoding besides the aforementioned two values during programming or at any instance in time causes an AHB bus error, resulting into a fault/interrupt to the system fault reporting infrastructure. Default Value: 0
3 : 0	PC	PC allowed for an indirect sequence 4'b0000: PC0 4'b0001: PC1 4'b0010: PC2 4'b0011: PC3 ... 4'b0111: PC7 Default Value: 0

5.1.4 RRAMC0_RRAMC0_RRAM_PROTECTED_X

Description: Size of PROTECTED_NVM subregion (8KB * X)

Address: 0x42210024

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5	OSC_OUT_ON	Enables the RRAM macro oscillator output after RRAM reset. Determines the reset value of NVM_OSCCONF.OSC_OUT Static signal of RRAM macro. 0: Disabled . 1: Enabled. Default Value: 0
4	OSC_EXKEEP_RUN	Keep internal oscillator running. If osc_exkeeprun_i is '0', and the FSM signals the internal oscillator to switch off, it is really switched off (without generating spikeson the clock signal). If osc_exkeeprun_i is '1' and the FSM signals the internal oscillator to switch off, it is not switched off. Instead it waits for osc_exkeeprun_i to become '0' and then isswitched off (without generating spikes on the clock signal). When osc_exkeeprun_i becomes'1', the internal oscillator is switched on again. Note: For NVM_OSCCONF.OSC_ON = '0', the oscillator is switched off independent of signal osc_exkeeprun_i. Default Value: 0
3	OSC_EXCLK10_EN	Enables the RRAM macro oscillator output with oscillator frequency/16. 0: Disabled . 1: Enabled. This is effective only when OSC_OUT_ON is 1. Default Value: 0
2	OSC_EXCLK40_EN	Enables the RRAM macro oscillator output with oscillator frequency/4. 0: Disabled . 1: Enabled. This is effective only when OSC_OUT_ON is 1. Default Value: 0

5.1.8 RRAMC0_RRAMC0_RRAM_CTL (continued)

1	OSC_EXCLK80_EN	Enables the RRAM macro oscillator output with oscillator frequency/2. 0: Disabled . 1: Enabled. This is effective only when OSC_OUT_ON is 1. Default Value: 0
0	OSC_EXCLK160_EN	Enables the RRAM macro oscillator output with default oscillator frequency. 0: Disabled . 1: Enabled. This is effective only when OSC_OUT_ON is 1. Default Value: 0

5.1.9 RRAMC0_RRAMC0_PROTECTED_LOCKABLE_LOCK

Description: PROTECTED_NVM lockable configuarion

Address: 0x42210104

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	PARTITION_SIZE_0 [7:0]

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	Reserved						
HW Access	R	Reserved						
Name	LOCK	Reserved [30:24]						

Bits	Name	Description
31	LOCK	Security lockdown for this protection context. Software can set this bit but not clear it once set. When set, write operations to BLK_LUT are not possible from this protection context. Setting LOCK also blocks writes to CTRL itself (for that PC copy). All writes are ignored. Default Value: 0
8	AUTO_INC	Auto-increment BLK_IDX by 1 for this protection context as a side effect of each read/write access to BLK_LUT Default Value: 1

5.1.15 RRAMC0_MPC0_BLK_MAX

Description: Max value of block-based index register

Address: 0x42211104

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	
HW Access	Reserved						R	
Name	Reserved [7:2]						VALUE [1:0]

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	INIT_IN_PROGRESS	Reserved [30:24]						

Bits	Name	Description
31	INIT_IN_PROGRESS	During initialization INIT_IN_PROGRESS is '1' and MMIO register accesses to BLK_LUT is blocked (BLK_IDX increment is also ignored). The block attributes are retained in DeepSleep (and obviously Active) power mode. Initialization is only required from a power mode in which the block attributes are not retained. E.g., initialization is required for a cold boot (after a Power-on-Reset). HW initializes the block attributes: the NS attributes are set to '0' (secure), the R attributes are set to '1' (read access allowed) and the W attributes are set to '1' (write access allowed). During initialization, the MPC supports memory accesses (memory accesses are NOT blocked) with the initialization block attribute values as mentioned above. This e.g. allows MPC initialization to proceed in parallel with boot program memory accesses (as opposed to serializing the two), improving device boot time. Default Value: 1
3 : 0	BLOCK_SIZE	Block size of individually protected blocks (0: 32B, 1: 64B, ... up to 15: 1MB) Block size= (1<<(BLOCK_SIZE+5)) The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 7

5.1.17 RRAMC0_MPC0_BLK_IDX

Description: Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)

Address: 0x4221110C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						RW	
Name	Reserved [7:2]						VALUE [1:0]

0	ATTR_NS0	NS bit for block 0 based on BLK_IDX Default Value: 0

5.1.19 RRAMC0_MPC0_ROT_CTRL

Description: Control register with lock bit and auto-increment only

Address: 0x42211200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							AUTO_INC

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	Reserved						
HW Access	R	Reserved						
Name	LOCK	Reserved [30:24]						

Bits	Name	Description
31	LOCK	Security lockdown for the root-of-trust configuration registers. Software can set this bit but not clear it once set. When set, write operations to ROT_BLK_LUT are not possible. Write is ignored. Default Value: 0
8	AUTO_INC	Auto-increment BLK_IDX by 1 for each read/write of ROT_BLK_LUT Default Value: 1

5.1.20 RRAMC0_MPC0_ROT_BLK_MAX

Description: Max value of block-based index register for ROT

Address: 0x42211208

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				R			
Name	Reserved [7:4]				VALUE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	VALUE	Maximum value of block-based index register. The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 15

5.1.21 RRAMC0_MPC0_ROT_BLK_CFG

Description: Same as BLK_CFG

Address: 0x4221120C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				R			
Name	Reserved [7:4]				BLOCK_SIZE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	INIT_IN_PROGRESS	Reserved [30:24]						

Bits	Name	Description
31	INIT_IN_PROGRESS	During initialization INIT_IN_PROGRESS is '1' and MMIO register accesses to ROT_BLK_LUT is RAZWI. The block attributes are retained in DeepSleep (and obviously Active) power mode. Initialization is only required from a power mode in which the block attributes are not retained. E.g., initialization is required for a cold boot (after a Power-on-Reset). HW initializes the block attributes: the NS attributes are set to '0' (secure), the R attributes are set to '1' (read access allowed) and the W attributes are set to '1' (write access allowed). During initialization, the MPC supports memory accesses (memory accesses are NOT blocked) with the initialization block attribute values as mentioned above. This e.g. allows MPC initialization to proceed in parallel with boot program memory accesses (as opposed to serializing the two), improving device boot time. Default Value: 1
3 : 0	BLOCK_SIZE	Block size of individually protected blocks (0: 32B, 1: 64B, ...up to 15:1MB) Block size= (1<<(BLOCK_SIZE+5)) The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 7

5.1.22 RRAMC0_MPC0_ROT_BLK_IDX

Description: Index of 8-block group accessed through ROT_BLK_LUT_*

Address: 0x42211210

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				RW			
Name	Reserved [7:4]				VALUE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	VALUE	Index value for accessing block-based lookup table using ROT_BLK_LUT. Programming out of LUT range is an user error and it loops back to "0" once overflow occurs. Default Value: 0

5.1.23 RRAMC0_MPC0_ROT_BLK_PC

Description: Protection context of 8-block group accesses through ROT_BLK_LUT

Address: 0x42211214

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				PC [3:0]			

Bits	15	14	13	12	11	10	9	8

SW Access	Reserved	RW			Reserved	RW		
HW Access	Reserved	RW			Reserved	RW		
Name	Reserved	ATTR7 [30:28]			Reserved	ATTR6 [26:24]		

Bits	Name	Description
30 : 28	ATTR7	W/R/NS bits for block 7 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
26 : 24	ATTR6	W/R/NS bits for block 6 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
22 : 20	ATTR5	W/R/NS bits for block 5 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
18 : 16	ATTR4	W/R/NS bits for block 4 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
14 : 12	ATTR3	W/R/NS bits for block 3 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
10 : 8	ATTR2	W/R/NS bits for block 2 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
6 : 4	ATTR1	W/R/NS bits for block 1 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0
2 : 0	ATTR0	W/R/NS bits for block 0 indicated by ROT_BLK_IDX for ROT_BLK_PC PC Default Value: 0

5.1.25 RRAMC0_RRAM_SFR_NVM_STATUS

Description: status register

Address: 0x42213000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	R	R	R			R	R
HW Access	W	W	W	W			W	W
Name	ECC1READ	RWWERR	WRPERR	VERR [4:2]			SLEEP	BUSY

Bits	15	14	13	12	11	10	9	8
SW Access	R				R	R	R	R
HW Access	W				W	W	W	W
Name	WBFILL [15:12]				ECCA-READ	ECC4READ	ECC3READ	ECC2READ

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved			R	R	R	R	R
HW Access	Reserved			W	W	W	W	W
Name	Reserved [23:21]			ECCAMRD	ECC4MRD	ECC3MRD	ECC2MRD	ECC1MRD

Bits	31	30	29	28	27	26	25	24
SW Access	R	R		R	R	R		
HW Access	W	W		W	W	W		
Name	WSUSP	REREA [30:29]		HARDFLAG	OLRFLAG	CONFSTATE [26:24]		

Bits	Name	Description
31	WSUSP	0: NVM not in write suspended mode. 1: NVM in write suspended mode. Resume command expected. Default Value: 0
30 : 29	REREA	Information on number of re-reads triggered by uncorrectable ECC read failures in the last read operations (and the initial reading of existing data for an indirect write operation): 00: no re-read operation was performed 01: in maximum one re-read operation was performed 10: in maximum two consecutive re-read operations were performed 11: in maximum three consecutive re-read operations were performed REREA is updated every time an uncorrectable ECC read failure triggered re_x0002_read operation(s) and a higher number of consecutive re-reads was performed than is indicated so far. REREA is reset by hardware, when NVM_PROG.RSTECC is written. Note: REREA is not changed when a re-read is performed within thehardening operation. Note: Maximum number of consecutive re-reads is configured in NVM_SETUP1.REREAD. Default Value: 0
28	HARDFLAG	Information, if hardening operation has performed internal write operation: 0: no 1: yes HARDFLAG is reset by hardware, when NVM_PROG.RSTVERR is written. HARDFLAG is automatically reset, when write mode, verify-only mode, hardening mode, or forming mode are entered (writing NVM_PROG.ACTION "not equal" "0000"). HARDFLAG does not accumulate, i.e. HARDFLAG is updated every time (latest at the end of a write or hardening operation started with NVM_PROG.STARTOP = "11". Default Value: 0

5.1.25 RRAMC0_RRAM_SFR_NVM_STATUS (continued)

27	OLRFLAG	Information, if online-repair (OLR) was triggered by last direct or indirect write operation: 0: no 1: yes OLRFLAG is reset by hardware, when NVM_PROG.RSTVERR is written. OLRFLAG is automatically reset, when write mode, verify-only mode, hardening mode, or forming mode are entered (writing NVM_PROG.ACTION "not equal" "0000"). OLRFLAG does not accumulate, i.e. OLRFLAG is updated every time (latest at the end of a write or hardening operation started with NVM_PROG.STARTOP = "11"). Default Value: 0
26 : 24	CONFSTATE	Information, on configuration status: xx0: NVM_SYSCONF* are not configured xx1: NVM_SYSCONF* are configured x0x: not all SFRs (excluding NVM_SYSCONF* and NVM_ALGO*) are configured x1x: all SFRs (excluding NVM_SYSCONF* and NVM_ALGO*) are configured 0xx: NVM_ALGO* are not configured 1xx: NVM_ALGO* are configured Default Value: 0
20	ECCAMRD	0: No address mismatch ECC failure during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). 1: An address mismatch ECC failure was detected during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). ECCAMRD is only set, if NVM_TEST1.ECCOFFRD = "0x" . For NVM_TEST1.ECCOFFRD = "1x", ECCAMRD is reset. The flag does not accumulate but is updated with every new loading of the read-buffer. Default Value: 0
19	ECC4MRD	0: No ECC-uncorrectable multi-bit failure during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). 1: An ECC-uncorrectable multi-bit failure was detected during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). ECC4MRD is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) still yields an ECC_x0002_uncorrectable multi-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC4MRD is reset. The flag does not accumulate but is updated with every new loading of the read-buffer. Default Value: 0
18	ECC3MRD	0: No ECC triple-bit failure during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). 1: An ECC triple-bit failure was detected and corrected during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). ECC3MRD is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC triple-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC3MRD is reset. The flag does not accumulate but is updated with every new loading of the read-buffer. Default Value: 0
17	ECC2MRD	0" No ECC double-bit failure during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). 1: An ECC double-bit failure was detected and corrected during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). ECC2MRD is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC double-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC2MRD is reset. The flag does not accumulate but is updated with every new loading of the read-buffer. Default Value: 0

5.1.25 RRAMC0_RRAM_SFR_NVM_STATUS (continued)

16	ECC1MRD	0: No ECC single-bit failure during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). 1: An ECC single-bit failure was detected and corrected during the most recent memory read operation to a new block (or the initial reading of existing data for an indirect write operation). ECC1MRD is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC single-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC1MRD is reset. The flag does not accumulate but is updated with every new loading of the read-buffer. Default Value: 0
15 : 12	WBFILL	Filling state for the write-buffer data words. E.g. WBFILL = 0000 (Write-Buffer invalid), WBFILL = 0011 (Write-Buffer intermediate), WBFILL = 1111 (Write-Buffer valid) The bits of WBFILL are set by the hardware, when write, verify-only, or forming data is written into the write-buffer. WBFILL is reset after each direct write, online-repair, or hardening operation. Default Value: 0
11	ECCAREAD	0: No address mismatch ECC failure during the last memory read operations (or the initial reading of existing data for an indirect write operation). 1: At least one address mismatch ECC failure was detected during the last memory read operations (or the initial reading of existing data for an indirect write operation). ECCAREAD is only set, if NVM_TEST1.ECCOFFRD = "0x". For NVM_TEST1.ECCOFFRD = "1x", ECCAREAD stays unchanged. The flag accumulates until it is reset by hardware when NVM_PROG.RSTECC is written, i.e. sticky version of ECCAMRD. Default Value: 0
10	ECC4READ	0: No ECC-uncorrectable multi-bit failure during the last memory read operations (or the initial reading of existing data for an indirect write operation). 1: At least one ECC-uncorrectable multi-bit failure was detected during the last memory read operations (or the initial reading of existing data for an indirect write operation). ECC4READ is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) still yields an ECC-uncorrectable multi-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC4READ stays unchanged. The flag accumulates until it is reset by hardware when NVM_PROG.RSTECC is written, i.e. sticky version of ECC4MRD. Default Value: 0
9	ECC3READ	0: No ECC triple-bit failure during the last memory read operations (or the initial reading of existing data for an indirect write operation). 1: At least one ECC triple-bit failure was detected and corrected during the last memory read operations (or the initial reading of existing data for an indirect write operation). ECC3READ is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC triple-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC3READ stays unchanged. The flag accumulates until it is reset by hardware when NVM_PROG.RSTECC is written, i.e. sticky version of ECC3MRD. Default Value: 0
8	ECC2READ	0: No ECC double-bit failure during the last memory read operations (or the initial reading of existing data for an indirect write operation) 1: At least one ECC double-bit failure was detected and corrected during the last memory read operations (or the initial reading of existing data for an indirect write operation). ECC2READ is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC double-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC2READ stays unchanged. The flag accumulates until it is reset by hardware when NVM_PROG.RSTECC is written, i.e. sticky version of ECC2MRD Default Value: 0

5.1.25 RRAMC0_RRAM_SFR_NVM_STATUS (continued)

7	ECC1READ	0: No ECC single-bit failure during the last memory read operations (or the initial reading of existing data for an indirect write operation). 1: At least one ECC single-bit failure was detected and corrected during the last memory read operations (or the initial reading of existing data for an indirect write operation). ECC1READ is only set, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC single-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC1READ stays unchanged. The flag accumulates until it is reset by hardware when NVM_PROG.RSTECC is written, i.e. sticky version of ECC1MRD. Default Value: 0
6	RWWERR	0: No read operation was stalled because of write, verify-only, forming, or hardening operation active. 1: At least one read operation was stalled because of write, verify-only, forming, or hardening operation active. The flag accumulates until it is reset by hardware when NVM_PROG.RSTECC is written. Default Value: 0
5	WRPERR	0: No operation triggered by writing NVM_PROG.STARTOP was ignored because of write protection. 1: At least one operation triggered by writing NVM_PROG.STARTOP was ignored because of write protection. The flag accumulates until it is reset by hardware when NVM_PROG.RSTECC is written. Default Value: 0
4 : 2	VERR	Information on number of fail bits for a block after verify operations in indirect write, verify-only, and forming operations: 000: no fail bit. 001: single-bit fail. 010: double-bit fail. 011: triple-bit fail. 100: uncorrectable fail bits encountered. 101: address mismatch ECC failure encountered. 110: no configuration retrieved, since no marker word found. 111: no algorithm settings retrieved, since no marker word found. VERR is reset by hardware, when NVM_PROG.RSTVERR is written. VERR is automatically reset, when write mode, verify-only mode, hardening mode, forming mode, or 'retrieve configuration settings' are entered (writing NVM_PROG.ACTION "not equal" "0000"). VERR does not accumulate, i.e. VERR is updated every time (at the end of an operation started with NVM_PROG.STARTOP = "11".) Note: VERR is not changed by hardening or direct write operations, except for the case where these operations need to internally call the 'retrieve configuration settings' operation. Default Value: 0
1	SLEEP	0: NVM not in sleep mode, and no sleep or wake up procedure in progress. 1: NVM in sleep mode, or busy due to a sleep or wake up procedure. Default Value: 1
0	BUSY	0: NVM is not busy. Memory accesses and register write accesses are possible. 1: NVM is busy. Memory accesses and register write accesses are not possible. Default Value: 0

5.1.26 RRAMC0_RRAM_SFR_NVM_PROG

Description: programming control register

Address: 0x42213004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				ACTION [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	RW		RW	RW	RW	RW	RW	RW
HW Access	W		W	W	W	W	W	W
Name	STARTOP [15:14]		RSTECC	RSTVERR	RBINVAL	RSTIR	RSTTRAP	SELRCS

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved		RW		Reserved	RW		
HW Access	Reserved		W		Reserved	W		
Name	Reserved [23:22]		SELAL [21:20]		Reserved	OLREN [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW				Reserved			RW
HW Access	W				Reserved			W
Name	TEMP [31:28]				Reserved [27:25]			RDWB

Bits	Name	Description
31 : 28	TEMP	actual junction temperature: 0000: invalid/unknown junction temperature value. others: junction temperature value to be used for voltage compensation in programming algorithms. Example for coding: 0001: Tj <= 50C 0010: 50C < Tj <= 85C 0100: 85C < Tj <= 100C 1000: 100C < Tj <= 110C 1010: 110C < Tj <=120C 1100: Tj > 120C Note: The coding has to use increasing values of TEMP for increasing temperatures and it has to match to the coding employed in NVM_COMPEN.TMIN*. Default Value: 0
24	RDWB	Read from write-buffer: 0: disabled. 1: enabled for memory bus reads with ACTION = ["0001", "0010", "1000", "1110", "0111"] and read address matching content of NVMADDR. RDWB is automatically reset, when the content of the write-buffer is invalidated or when ACTION is changed. Default Value: 0

5.1.26 RRAMC0_RRAM_SFR_NVM_PROG (continued)

21 : 20	SELAL	Select type of write algorithm: 00: Employ first (typically standard, 8 bit parallel) algorithm defined by NVM_SELALGO1.SEL*ALGO1. 01: Employ second (typically strong, 8 bit parallel) algorithm defined by NVM_SELALGO1.SEL*ALGO2. 1x: Employ third (typically standard, 1 bit parallel) algorithm defined by NVM_SELALGO2.SEL*ALGO3. Default Value: 0
18 : 16	OLREN	000: disable online-repair (OLR). 001: enable online-repair for >= single-bit write or forming fail in block. 010: enable online-repair for >= double-bit write or forming fail in block. 011: enable online-repair for>= triple-bit write or forming fail in block. 1xx: enable online-repair for > triple-bit write or forming fail in block. Default Value: 0
15 : 14	STARTOP	Can only be set by software, is reset automatically by hardware after one clock cycle. 00: No start of operation defined by ACTION. 11: Start operation defined by ACTION, if these are not changed with the same write operation that sets STARTOP. Others: Interpreted and stored in SFR as "00". Default Value: 0
13	RSTECC	Can only be set by software, is reset automatically by hardware after one clock cycle. 0: No reset of NVM_STATUS.ECC*READ, NVM_STATUS.REREA, NVM_STATUS.RWWERR, and NVM_STATUS.WRPERR. 1: Reset of NVM_STATUS.ECC*READ, NVM_STATUS.REREA, NVM_STATUS.RWWERR, and NVM_STATUS.WRPERR. Default Value: 0
12	RSTVERR	Can only be set by software, is reset automatically by hardware after one clock cycle. 0: No reset of NVM_STATUS.VERR, NVM_STATUS.HARDFLAG, and NVM_STATUS.OLRFLAG. 1: Reset of NVM_STATUS.VERR, NVM_STATUS.HARDFLAG, and NVM_STATUS.OLRFLAG. Default Value: 0
11	RBINVAL	Can only be set by software, is reset automatically by hardware after one clock cycle. 0: No invalidation of read-buffer content. 1: Invalidation of read-buffer content. Default Value: 0
10	RSTIR	Can only be set by software, is reset automatically by hardware after one clock cycle. 0: No reset of ECC logging interrupt on nvm_ir_ecclog_req_o. 1: Reset of ECC logging interrupt on nvm_ir_ecclog_req_o. Default Value: 0
9	RSTTRAP	Can only be set by software, is reset automatically by hardware after one clock cycle. 0: No reset of NVM ready trap on nvm_trap_req_o. 1: Reset of NVM ready trap on nvm_trap_req_o. Default Value: 0
8	SELRCS	Select parameter for operation 'retrieve configuration settings' from configuration space in extra area. 0: Retrieve SYSCONF information and configuration settings, but do not retrieve write algorithm information. 1: Retrieve SYSCONF information, configuration settings, and write algorithm information. Note: SELRCS only applies to the sequence explicitly started with ACTION = "1011", but not to the implicitly started sequences during wake-up and write sequences Default Value: 0

5.1.26 RRAMC0_RRAM_SFR_NVM_PROG (continued)

3 : 0	ACTION	Selects indirect write, verify-only, hardening or forming operations: 0000: Idle state, no action triggered. Writing "0000" exits current mode. 0001: Select indirect write operation, using algorithm selected by SELAL, NVM_SELALGO1/2.SEL*ALGO1/2/3, and NVM_SETUP1.FSMSEQ. 0010: Select verify-only: Written data is compared to array content. 0100: Select hardening: Existing data is verified and hardened/corrected if necessary. 1000: Select forming operation, using algorithm selected by NVM_SELALGO2.SELFALGO. 1110: Select looped write operation, using algorithm selected by SLSTRAL, NVM_SELALGO1/2.SEL*ALGO1/2/3, and NVM_SETUP1.FSMSEQ; cannot be set, if NVM_ACC.ACC2_EN = '0'. Note: Only to be used in production test flow. 0111: Select looped forming operation, using algorithm selected by NVM_SELALGO2.SELFALGO; cannot be set, if NVM_ACC.ACC2_EN = '0'. Note: Only to be used in production test flow. 1011: Select operation 'retrieve configuration settings' from configuration space in extra area; cannot be set, if NVM_ACC.ACC3_EN = '0'. Others: Interpreted and stored in SFR as "0000" The operation selected by ACTION is performed, when STARTOP = "11" is written while ACTION stays constant. NVM_ADDR defines the address for the operation. Verification results can be read at NVM_STATUS.VERR. ACTION can only be changed to a value other than "0000", if the current value of ACTION is "0000". Otherwise ACTION = "0000" is stored. Once ACTION is set to a value other than "0000", ACTION can only be written again with its current value; any other value leads to a reset of ACTION to "0000" Default Value: 0

5.1.27 RRAMC0_RRAM_SFR_NVM_ADDR

Description: address register

Address: 0x42213008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW			RW				
HW Access	R			R				
Name	ADDRWL [7:5]			ADDRB [4:0]				

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDRS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [23:18]						ADDRS [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17 : 8	ADDRS	sector address for operations started with NVM_PROG. Default Value: 0
7 : 5	ADDRWL	wordline address for operations started with NVM_PROG. Default Value: 0
4 : 0	ADDRB	block address for operations started with NVM_PROG. Default Value: 0

5.1.28 RRAMC0_RRAM_SFR_NVM_CONF1

Description: configuration register

Address: 0x4221300C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	RW			Reserved		RW	
HW Access	Reserved	R			Reserved		R	
Name	Reserved	DWVERR [6:4]			Reserved [3:2]		HRLEV [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	RW	RW	Reserved					
HW Access	R	R	Reserved					
Name	NVM_ON	TRAP_ON	Reserved [13:8]					

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	SECPROT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved					RW	
HW Access	R	Reserved					R	
Name	WPLCK	Reserved [30:26]					SECPROT [25:24]	

Bits	Name	Description
31	WPLCK	Locking of protection settings in SECPROT: 0: SECPROT can be changed. 1: SECPROT cannot be changed. WPLCK cannot be written by software, if it is '1'. Default Value: 0
25 : 16	SECPROT	number of write protected sectors, starting with sector 0. SECPROT cannot be changed, if WPLCK = '1'. Default Value: 0
15	NVM_ON	0: NVM is switched to or stays in NVM sleep mode. 1: NVM is switched to or stays in normal mode. Default Value: 1
14	TRAP_ON	0: no NVM ready traps are generated on nvm_trap_req_o. 1: NVM ready traps are generated when long lasting NVM actions (indirect write, hardening, forming, and wake-up) are finished Note: Direct write operations and verify-only operations never generate a ready trap. Default Value: 0
6 : 4	DWVERR	for direct write operations, defines the threshold for a verify error indication: 000: verify is pass only, if no fail bit. 001: verify is pass only, if at most a single-bit fail. 010: verify is pass only, if at most a double-bit fail. 011: verify is pass only, if at most a triple-bit fail. 1xx: verify is always pass, independent of any fail bits. Default Value: 0x2

5.1.28 RRAMC0_RRAM_SFR_NVM_CONF1 (continued)

1 : 0	HRLEV	defines single hardread level for verify-only operation started for NVM_PROG.ACTION = "0010": 00: normal read. 01: hardread reset. 1x: hardread set. Default Value: 0

5.1.29 RRAMC0_RRAM_SFR_NVM_HARDEN1

Description: hardening configuration register

Address: 0x42213010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	BLOCKS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW	Reserved						RW

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17 : 8	ADDRS	sector address for automatic hardening Default Value: 0
7 : 5	ADDRWL	wordline address for automatic hardening Default Value: 0
4 : 0	ADDRB	block address for automatic hardening Default Value: 0

5.1.31 RRAMC0_RRAM_SFR_NVM_HRESP

Description: bus response register

Address: 0x42213018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R		
HW Access	Reserved					W		
Name	Reserved [7:3]					HRESP [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	RW	Reserved						
HW Access	W	Reserved						
Name	RSTHRESP	Reserved [14:8]						

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15	RSTHRESP	reset of NVM_HRESP: 0: no reset of HRESP triggered trigger 1: reset of HRESP RSTHRESP is reset automatically by hardware after one clock cycle Default Value: 0
2 : 0	HRESP	Root cause for triggered AHB-HRESP response: 000: AHB-HRESP not triggered. 001: reserved. 010: AHB-HRESP triggered by an error in configuration read started by direct write access or hardening. 011: AHB-HRESP triggered by use of unsupported ahb_hsize_i size code or by an incorrectly aligned address during a memory access. 100: AHB-HRESP triggered by an uncorrectable ECC read error or by an address mismatch ECC error. 101: AHB-HRESP triggered by direct write accesses to write protected addresses. 110: AHB-HRESP triggered by unsuccessful direct write, i.e. caused by direct write access where the fail-bit count exceeds NVM_CONF1.DWVERR. 111: AHB-HRESP triggered by simultaneously activated select signals. HRESP can be reset by software by writing RSTHRESP = '1'. Default Value: 0

5.1.32 RRAMC0_RRAM_SFR_NVM_ECCLOG

Description: ECC failure logging register

Address: 0x4221301C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	ECC1CNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	ECC1CNT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	ECC2CNT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R				R			
HW Access	W				W			
Name	ECC4CNT [31:28]				ECC3CNT [27:24]			

Bits	Name	Description
31 : 28	ECC4CNT	Number of ECC-uncorrectable multi-bit failures detected during the last memory read operations (or the initial reading of existing data for a write operation). ECC4CNT is only updated, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) still yields an ECC-uncorrectable multi-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC4CNT stays unchanged. Default Value: 0
27 : 24	ECC3CNT	Number of ECC triple-bit failures detected and corrected during the last memory read operations (or the initial reading of existing data for a write operation). ECC3CNT is only updated, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC triple-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC3CNT stays unchanged. Default Value: 0
23 : 16	ECC2CNT	Number of ECC double-bit failures detected and corrected during the last memory read operations (or the initial reading of existing data for a write operation). ECC2CNT is only updated, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC double-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC2CNT stays unchanged. Default Value: 0
15 : 0	ECC1CNT	Number of ECC single-bit failures detected and corrected during the last memory read operations (or the initial reading of existing data for a write operation). ECC1CNT is only updated, if NVM_TEST1.ECCOFFRD = "0x" and if even the last re-read operation (configured in NVM_SETUP1.REREAD) yields an ECC single-bit failure. For NVM_TEST1.ECCOFFRD = "1x", ECC1CNT stays unchanged. Default Value: 0

5.1.33 RRAMC0_RRAM_SFR_NVM_ECCLOGIR

Description: ECC failure logging interrupt register

Address: 0x42213020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	W							
Name	ECC1CNTIR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	W							
Name	ECC1CNTIR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	W							
Name	ECC2CNTIR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW				RW			
HW Access	W				W			
Name	ECC4CNTIR [31:28]				ECC3CNTIR [27:24]			

Bits	Name	Description
31 : 28	ECC4CNTIR	Interrupt threshold for number of ECC-uncorrectable multi-bit failures indicated in NVM_ECCLOG.ECC4CNT: If NVM_ECCLOG.ECC4CNT becomes larger than ECC4CNTIR, an ECC logging interrupt is triggered. Default Value: 0xF
27 : 24	ECC3CNTIR	Interrupt threshold for number of ECC triple-bit failures indicated in NVM_ECCLOG.ECC3CNT: If NVM_ECCLOG.ECC3CNT becomes larger than ECC3CNTIR, an ECC logging interrupt is triggered Default Value: 0xF
23 : 16	ECC2CNTIR	Interrupt threshold for number of ECC double-bit failures indicated in NVM_ECCLOG.ECC2CNT: If NVM_ECCLOG.ECC2CNT becomes larger than ECC2CNTIR, an ECC logging interrupt is triggered. Default Value: 0xFF
15 : 0	ECC1CNTIR	Interrupt threshold for number of ECC single-bit failures indicated in NVM_ECCLOG.ECC1CNT: If NVM_ECCLOG.ECC1CNT becomes larger than ECC1CNTIR, an ECC logging interrupt is triggered. Default Value: 0xFFFF

5.1.34 RRAMC0_RRAM_SFR_NVM_VMODE

Description: voltage mode register

Address: 0x42213024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						W	
Name	Reserved [7:2]						VMODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1 : 0	VMODE	voltage/frequency mode for operations: 00: undefined / unknown 01: ULP mode 10: MF mode 11: LP mode Default Value: 0

6 Fault Monitoring registers

This section discusses the Fault Monitoring registers. It lists all the registers in mapping tables, in address order.

6.1 Register details

Register name	Address	Description
FAULT_STRUCT0_CTL	0x422B0000	Fault control
FAULT_STRUCT0_STATUS	0x422B000C	Fault status
FAULT_STRUCT0_DATA0	0x422B0010	Fault data
FAULT_STRUCT0_DATA1	0x422B0014	Fault data. See FAULT_STRUCT0_DATA0 for the details of bit fields.
FAULT_STRUCT0_DATA2	0x422B0018	Fault data. See FAULT_STRUCT0_DATA0 for the details of bit fields.
FAULT_STRUCT0_DATA3	0x422B001C	Fault data. See FAULT_STRUCT0_DATA0 for the details of bit fields.
FAULT_STRUCT0_PENDING0	0x422B0040	Fault pending 0
FAULT_STRUCT0_PENDING1	0x422B0044	Fault pending 1
FAULT_STRUCT0_PENDING2	0x422B0048	Fault pending 2
FAULT_STRUCT0_MASK0	0x422B0050	Fault mask 0
FAULT_STRUCT0_MASK1	0x422B0054	Fault mask 1
FAULT_STRUCT0_MASK2	0x422B0058	Fault mask 2
FAULT_STRUCT0_INTR	0x422B00C0	Interrupt
FAULT_STRUCT0_INTR_SET	0x422B00C4	Interrupt set
FAULT_STRUCT0_INTR_MASK	0x422B00C8	Interrupt mask
FAULT_STRUCT0_INTR_MASKED	0x422B00CC	Interrupt masked
FAULT_STRUCT1_CTL	0x422B0100	Fault control. See FAULT_STRUCT0_CTL for the details of bit fields.
FAULT_STRUCT1_STATUS	0x422B010C	Fault status. See FAULT_STRUCT0_STATUS for the details of bit fields.
FAULT_STRUCT1_DATA0	0x422B0110	Fault data. See FAULT_STRUCT0_DATA0 for the details of bit fields.
FAULT_STRUCT1_DATA1	0x422B0114	Fault data. See FAULT_STRUCT0_DATA0 for the details of bit fields.
FAULT_STRUCT1_DATA2	0x422B0118	Fault data. See FAULT_STRUCT0_DATA0 for the details of bit fields.
FAULT_STRUCT1_DATA3	0x422B011C	Fault data. See FAULT_STRUCT0_DATA0 for the details of bit fields.
FAULT_STRUCT1_PENDING0	0x422B0140	Fault pending 0. See FAULT_STRUCT0_PENDING0 for the details of bit fields.
FAULT_STRUCT1_PENDING1	0x422B0144	Fault pending 1. See FAULT_STRUCT0_PENDING1 for the details of bit fields.

Fault Monitoring registers

Register name	Address	Description
FAULT_STRUCT1_PENDING2	0x422B0148	Fault pending 2. See FAULT_STRUCT0_PENDING2 for the details of bit fields.
FAULT_STRUCT1_MASK0	0x422B0150	Fault mask 0. See FAULT_STRUCT0_MASK0 for the details of bit fields.
FAULT_STRUCT1_MASK1	0x422B0154	Fault mask 1. See FAULT_STRUCT0_MASK1 for the details of bit fields.
FAULT_STRUCT1_MASK2	0x422B0158	Fault mask 2. See FAULT_STRUCT0_MASK2 for the details of bit fields.
FAULT_STRUCT1_INTR	0x422B01C0	Interrupt. See FAULT_STRUCT0_INTR for the details of bit fields.
FAULT_STRUCT1_INTR_SET	0x422B01C4	Interrupt set. See FAULT_STRUCT0_INTR_SET for the details of bit fields.
FAULT_STRUCT1_INTR_MASK	0x422B01C8	Interrupt mask. See FAULT_STRUCT0_INTR_MASK for the details of bit fields.
FAULT_STRUCT1_INTR_MASKED	0x422B01CC	Interrupt masked. See FAULT_STRUCT0_INTR_MASKED for the details of bit fields.

6.1.1 FAULT_STRUCT0_CTL

Description: Fault control

Address: 0x422B0000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					R	R	R
Name	Reserved [7:3]					RE-SET_REQ_EN	OUT_EN	TR_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	RESET_REQ_EN	Reset request enable: '0': Disabled. '1': Enabled. The output reset request signal "fault_reset_req" reflects STATUS.VALID. This reset causes a warm/soft/core reset. This warm/soft/core reset does not affect the fault logic STATUS, DATA0, ..., DATA3 registers (allowing for post soft reset failure analysis). The "fault_reset_req" signals of the individual fault report structures are combined (logically OR'd) into a single SRSS "fault_reset_req" signal. Default Value: 0
1	OUT_EN	IO output signal enable: '0': Disabled. The IO output signal "fault_out" is '0'. The IO output enable signal "fault_out_en" is '0'. '1': Enabled. The IO output signal "fault_out" reflects STATUS.VALID. The IO output enable signal "fault_out_en" is '1'. Default Value: 0
0	TR_EN	Trigger output enable: '0': Disabled. The trigger output "tr_fault" is '0'. '1': Enabled. The trigger output "tr_fault" reflects STATUS.VALID. The trigger can be used to initiate a Datawire transfer of the FAULT data (FAULT_DATA0 through FAULT_DATA3). Default Value: 0

6.1.2 FAULT_STRUCT0_STATUS

Description: Fault status

Address: 0x422B000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	RW						
HW Access	Reserved	W						
Name	Reserved	IDX [6:0]						

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	RW1S	Reserved						
Name	VALID	Reserved [30:24]						

Bits	Name	Description
31	VALID	Valid indication: '0': Invalid. '1': Valid. STATUS.IDX, DATA0, ..., DATA3 specify the fault. Note: Typically, HW sets this field to '1' (on an activated HW fault source that is "enabled" by the MASK registers) and SW clears this field to '0' (typically by boot code SW (after a warm system reset, when the fault is handled). In this typical use case scenario, the HW source fault data is simultaneously captured into DATA0, ..., DATA3 when the VALID field is set to '1'. An exceptional SW use case scenario is identified as well. In this scenario, SW sets this field to '1' with a fault source index different to one of the defined HW fault sources. SW update is not restricted by the MASK registers). In both use case scenarios, the following holds: - STATUS.IDX, DATA0, ..., DATA3 can only be written when STATUS.VALID is '0'; the fault structure is not in use yet. Writing STATUS.VALID to '1' effectively locks the fault structure (until SW clears STATUS.VALID to '0'). This restriction requires a SW update to sequentially update the DATA registers followed by an update of the STATUS register. Note: For the exceptional SW use case, sequential updates to the DATA and STATUS registers may be "interrupted" by a HW fault capture. In this case, the SW DATA register updates are over-written by the HW update (and the STATUS.IDX field will reflect the HW capture) Default Value: 0
6 : 0	IDX	The fault source index for which fault information is captured in DATA0 through DATA3. The fault information is fault source specific and described below. Note: this register field (and associated fault source data in DATA0 through DATA3) should only be considered valid, when VALID is '1'. The description of the encoded meaning of this field is comes from the Fault assignment in the Product TRM. Default Value: Undefined

6.1.3 FAULT_STRUCT0_DATA0

Description: Fault data

Address: 0x422B0010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	W							
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	W							
Name	DATA [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	W							
Name	DATA [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	W							
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	Captured fault source data. Note: the DATA registers can only be written when STATUS.VALID is '0'. Note: the fault source index STATUS.IDX specifies the format of the DATA registers. Default Value: Undefined

6.1.4 FAULT_STRUCT0_PENDING0

Description: Fault pending 0

Address: 0x422B0040

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	SOURCE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	SOURCE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	SOURCE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	SOURCE [31:24]							

Bits	Name	Description
31 : 0	SOURCE	This field specifies the fault source. The list of fault sources is in the product.xls in the "Faults" tab. Default Value: Undefined

6.1.5 FAULT_STRUCT0_PENDING1

Description: Fault pending 1

Address: 0x422B0044

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W

Name	SOURCE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	SOURCE [31:24]							

Bits	Name	Description
31 : 0	SOURCE	This field specifies the following sources: Bit 0 - 31: See STATUS register. Default Value: Undefined

6.1.7 FAULT_STRUCT0_MASK0

Description: Fault mask 0

Address: 0x422B0050

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SOURCE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	SOURCE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	SOURCE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	SOURCE [31:24]							

Bits	Name	Description
31 : 0	SOURCE	Fault source enables: Bits 31-0: Fault sources 31 to 0. Default Value: 0

6.1.8 FAULT_STRUCT0_MASK1

Description: Fault mask 1

Address: 0x422B0054

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SOURCE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	SOURCE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	SOURCE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	SOURCE [31:24]							

Bits	Name	Description
31 : 0	SOURCE	Fault source enables: Bits 31-0: Fault sources 63 to 32. Default Value: 0

6.1.9 FAULT_STRUCT0_MASK2

Description: Fault mask 2

Address: 0x422B0058

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SOURCE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	SOURCE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	SOURCE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	SOURCE [31:24]							

Bits	Name	Description
31 : 0	SOURCE	Fault source enables: Bits 31-0: Fault sources 95 to 64. Default Value: 0

6.1.10 FAULT_STRUCT0_INTR

Description: Interrupt

Address: 0x422B00C0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1C
HW Access	Reserved							RW1S
Name	Reserved [7:1]							FAULT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	FAULT	This interrupt cause field is activated (HW sets the field to '1') when an enabled (MASK0/MASK1/MASK2) pending fault source is captured: - STATUS.VALID is set to '1'. - STATUS.IDX specifies the fault source index. - DATA0 through DATA3 captures the fault source data. SW writes a '1' to this field to clear the interrupt cause to '0'. SW clear STATUS.VALID to '0' to enable capture of the next fault. Note that when there is an enabled pending fault source, the pending fault source is captured immediately and INTR.FAULT is immediately activated (set to '1'). Default Value: 0

6.1.11 FAULT_STRUCT0_INTR_SET

Description: Interrupt set

Address: 0x422B00C4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [7:1]							FAULT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	FAULT	SW writes a '1' to this field to set the corresponding field in the INTR register. Default Value: 0

6.1.12 FAULT_STRUCT0_INTR_MASK

Description: Interrupt mask

Address: 0x422B00C8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							FAULT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	FAULT	Mask bit for corresponding field in the INTR register. Default Value: 0

6.1.13 FAULT_STRUCT0_INTR_MASKED

Description: Interrupt masked

Address: 0x422B00CC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							FAULT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	FAULT	Logical and of corresponding INTR and INTR_MASK fields. Default Value: 0

7 High Performance Direct Memory Access (HPDMA) registers

This section discusses the HPDMA registers. It lists all the registers in mapping tables, in address order.

7.1 Register details

Register name	Address	Description
SAXI_DMAC_CTL	0x441A0000	Control
SAXI_DMAC_STATUS	0x441A0004	Enabled channels
SAXI_DMAC_ACTIVE	0x441A0008	Active channels
SAXI_DMAC_CH0_CTL	0x441A1000	Channel control
SAXI_DMAC_CH0_STATUS	0x441A1004	Channel status
SAXI_DMAC_CH0_IDX	0x441A1010	Channel current X and Y indices
SAXI_DMAC_CH0_SRC	0x441A1014	Channel current source address
SAXI_DMAC_CH0_DST	0x441A1018	Channel current destination address
SAXI_DMAC_CH0_M_IDX	0x441A101C	Channel current M index
SAXI_DMAC_CH0_CURR	0x441A1020	Channel current descriptor pointer
SAXI_DMAC_CH0_TR_CMD	0x441A1028	Channel software trigger
SAXI_DMAC_CH0_DESCR_STATUS	0x441A1040	Channel descriptor status
SAXI_DMAC_CH0_DESCR_CTL	0x441A1050	Channel descriptor control
SAXI_DMAC_CH0_DESCR_SRC	0x441A1054	Channel descriptor source
SAXI_DMAC_CH0_DESCR_DST	0x441A1058	Channel descriptor destination
SAXI_DMAC_CH0_DESCR_M_SIZE	0x441A105C	Channel descriptor M size
SAXI_DMAC_CH0_DESCR_X_SIZE	0x441A1060	Channel descriptor X size
SAXI_DMAC_CH0_DESCR_X_INCR	0x441A1064	Channel descriptor X increment
SAXI_DMAC_CH0_DESCR_Y_SIZE	0x441A1068	Channel descriptor Y size
SAXI_DMAC_CH0_DESCR_Y_INCR	0x441A106C	Channel descriptor Y increment
SAXI_DMAC_CH0_DESCR_NEXT	0x441A1070	Channel descriptor next pointer
SAXI_DMAC_CH0_INTR	0x441A1080	Interrupt
SAXI_DMAC_CH0_INTR_SET	0x441A1084	Interrupt set
SAXI_DMAC_CH0_INTR_MASK	0x441A1088	Interrupt mask
SAXI_DMAC_CH0_INTR_MASKED	0x441A108C	Interrupt masked
SAXI_DMAC_CH1_CTL	0x441A1100	Channel control. See SAXI_DMAC_CH0_CTL for the details of bit fields
SAXI_DMAC_CH1_STATUS	0x441A1104	Channel status. See SAXI_DMAC_CH0_STATUS for the details of bit fields
SAXI_DMAC_CH1_IDX	0x441A1110	Channel current X and Y indices. See SAXI_DMAC_CH0_IDX for the details of bit fields
SAXI_DMAC_CH1_SRC	0x441A1114	Channel current source address. See SAXI_DMAC_CH0_SRC for the details of bit fields

High Performance Direct Memory Access (HPDMA) registers

Register name	Address	Description
SAXI_DMAC_CH1_DST	0x441A1118	Channel current destination address. See SAXI_DMAC_CH0_DST for the details of bit fields
SAXI_DMAC_CH1_M_IDX	0x441A111C	Channel current M index. See SAXI_DMAC_CH0_M_IDX for the details of bit fields
SAXI_DMAC_CH1_CURR	0x441A1120	Channel current descriptor pointer. See SAXI_DMAC_CH0_CURR for the details of bit fields
SAXI_DMAC_CH1_TR_CMD	0x441A1128	Channel software trigger. See SAXI_DMAC_CH0_TR_CMD for the details of bit fields
SAXI_DMAC_CH1_DESCR_STATUS	0x441A1140	Channel descriptor status. See SAXI_DMAC_CH0_DESCR_STATUS for the details of bit fields
SAXI_DMAC_CH1_DESCR_CTL	0x441A1150	Channel descriptor control. See SAXI_DMAC_CH0_DESCR_CTL for the details of bit fields
SAXI_DMAC_CH1_DESCR_SRC	0x441A1154	Channel descriptor source. See SAXI_DMAC_CH0_DESCR_SRC for the details of bit fields
SAXI_DMAC_CH1_DESCR_DST	0x441A1158	Channel descriptor destination. See SAXI_DMAC_CH0_DESCR_DST for the details of bit fields
SAXI_DMAC_CH1_DESCR_M_SIZE	0x441A115C	Channel descriptor M size. See SAXI_DMAC_CH0_DESCR_M_SIZE for the details of bit fields
SAXI_DMAC_CH1_DESCR_X_SIZE	0x441A1160	Channel descriptor X size. See SAXI_DMAC_CH0_DESCR_X_SIZE for the details of bit fields
SAXI_DMAC_CH1_DESCR_X_INCR	0x441A1164	Channel descriptor X increment. See SAXI_DMAC_CH0_DESCR_X_INCR for the details of bit fields
SAXI_DMAC_CH1_DESCR_Y_SIZE	0x441A1168	Channel descriptor Y size. See SAXI_DMAC_CH0_DESCR_Y_SIZE for the details of bit fields
SAXI_DMAC_CH1_DESCR_Y_INCR	0x441A116C	Channel descriptor Y increment. See SAXI_DMAC_CH0_DESCR_Y_INCR for the details of bit fields
SAXI_DMAC_CH1_DESCR_NEXT	0x441A1170	Channel descriptor next pointer. See SAXI_DMAC_CH0_DESCR_NEXT for the details of bit fields
SAXI_DMAC_CH1_INTR	0x441A1180	Interrupt. See SAXI_DMAC_CH0_INTR for the details of bit fields
SAXI_DMAC_CH1_INTR_SET	0x441A1184	Interrupt set. See SAXI_DMAC_CH0_INTR_SET for the details of bit fields
SAXI_DMAC_CH1_INTR_MASK	0x441A1188	Interrupt mask. See SAXI_DMAC_CH0_INTR_MASK for the details of bit fields
SAXI_DMAC_CH1_INTR_MASKED	0x441A118C	Interrupt masked. See SAXI_DMAC_CH0_INTR_MASKED for the details of bit fields

High Performance Direct Memory Access (HPDMA) registers

Register name	Address	Description
SAXI_DMAC_CH2_CTL	0x441A1200	Channel control. See SAXI_DMAC_CH0_CTL for the details of bit fields
SAXI_DMAC_CH2_STATUS	0x441A1204	Channel status. See SAXI_DMAC_CH0_STATUS for the details of bit fields
SAXI_DMAC_CH2_IDX	0x441A1210	Channel current X and Y indices. See SAXI_DMAC_CH0_IDX for the details of bit fields
SAXI_DMAC_CH2_SRC	0x441A1214	Channel current source address. See SAXI_DMAC_CH0_SRC for the details of bit fields
SAXI_DMAC_CH2_DST	0x441A1218	Channel current destination address. See SAXI_DMAC_CH0_DST for the details of bit fields
SAXI_DMAC_CH2_M_IDX	0x441A121C	Channel current M index. See SAXI_DMAC_CH0_M_IDX for the details of bit fields
SAXI_DMAC_CH2_CURR	0x441A1220	Channel current descriptor pointer. See SAXI_DMAC_CH0_CURR for the details of bit fields
SAXI_DMAC_CH2_TR_CMD	0x441A1228	Channel software trigger. See SAXI_DMAC_CH0_TR_CMD for the details of bit fields
SAXI_DMAC_CH2_DESCR_STATUS	0x441A1240	Channel descriptor status. See SAXI_DMAC_CH0_DESCR_STATUS for the details of bit fields
SAXI_DMAC_CH2_DESCR_CTL	0x441A1250	Channel descriptor control. See SAXI_DMAC_CH0_DESCR_CTL for the details of bit fields
SAXI_DMAC_CH2_DESCR_SRC	0x441A1254	Channel descriptor source. See SAXI_DMAC_CH0_DESCR_SRC for the details of bit fields
SAXI_DMAC_CH2_DESCR_DST	0x441A1258	Channel descriptor destination. See SAXI_DMAC_CH0_DESCR_DST for the details of bit fields
SAXI_DMAC_CH2_DESCR_M_SIZE	0x441A125C	Channel descriptor M size. See SAXI_DMAC_CH0_DESCR_M_SIZE for the details of bit fields
SAXI_DMAC_CH2_DESCR_X_SIZE	0x441A1260	Channel descriptor X size. See SAXI_DMAC_CH0_DESCR_X_SIZE for the details of bit fields
SAXI_DMAC_CH2_DESCR_X_INCR	0x441A1264	Channel descriptor X increment. See SAXI_DMAC_CH0_DESCR_X_INCR for the details of bit fields
SAXI_DMAC_CH2_DESCR_Y_SIZE	0x441A1268	Channel descriptor Y size. See SAXI_DMAC_CH0_DESCR_Y_SIZE for the details of bit fields
SAXI_DMAC_CH2_DESCR_Y_INCR	0x441A126C	Channel descriptor Y increment. See SAXI_DMAC_CH0_DESCR_Y_INCR for the details of bit fields
SAXI_DMAC_CH2_DESCR_NEXT	0x441A1270	Channel descriptor next pointer. See SAXI_DMAC_CH0_DESCR_NEXT for the details of bit fields

High Performance Direct Memory Access (HPDMA) registers

Register name	Address	Description
SAXI_DMAC_CH2_INTR	0x441A1280	Interrupt. See SAXI_DMAC_CH0_INTR for the details of bit fields
SAXI_DMAC_CH2_INTR_SET	0x441A1284	Interrupt set. See SAXI_DMAC_CH0_INTR_SET for the details of bit fields
SAXI_DMAC_CH2_INTR_MASK	0x441A1288	Interrupt mask. See SAXI_DMAC_CH0_INTR_MASK for the details of bit fields
SAXI_DMAC_CH2_INTR_MASKED	0x441A128C	Interrupt masked. See SAXI_DMAC_CH0_INTR_MASKED for the details of bit fields
SAXI_DMAC_CH3_CTL	0x441A1300	Channel control. See SAXI_DMAC_CH0_CTL for the details of bit fields
SAXI_DMAC_CH3_STATUS	0x441A1304	Channel status. See SAXI_DMAC_CH0_STATUS for the details of bit fields
SAXI_DMAC_CH3_IDX	0x441A1310	Channel current X and Y indices. See SAXI_DMAC_CH0_IDX for the details of bit fields
SAXI_DMAC_CH3_SRC	0x441A1314	Channel current source address. See SAXI_DMAC_CH0_SRC for the details of bit fields
SAXI_DMAC_CH3_DST	0x441A1318	Channel current destination address. See SAXI_DMAC_CH0_DST for the details of bit fields
SAXI_DMAC_CH3_M_IDX	0x441A131C	Channel current M index. See SAXI_DMAC_CH0_M_IDX for the details of bit fields
SAXI_DMAC_CH3_CURR	0x441A1320	Channel current descriptor pointer. See SAXI_DMAC_CH0_CURR for the details of bit fields
SAXI_DMAC_CH3_TR_CMD	0x441A1328	Channel software trigger. See SAXI_DMAC_CH0_TR_CMD for the details of bit fields
SAXI_DMAC_CH3_DESCR_STATUS	0x441A1340	Channel descriptor status. See SAXI_DMAC_CH0_DESCR_STATUS for the details of bit fields
SAXI_DMAC_CH3_DESCR_CTL	0x441A1350	Channel descriptor control. See SAXI_DMAC_CH0_DESCR_CTL for the details of bit fields
SAXI_DMAC_CH3_DESCR_SRC	0x441A1354	Channel descriptor source. See SAXI_DMAC_CH0_DESCR_SRC for the details of bit fields
SAXI_DMAC_CH3_DESCR_DST	0x441A1358	Channel descriptor destination. See SAXI_DMAC_CH0_DESCR_DST for the details of bit fields
SAXI_DMAC_CH3_DESCR_M_SIZE	0x441A135C	Channel descriptor M size. See SAXI_DMAC_CH0_DESCR_M_SIZE for the details of bit fields
SAXI_DMAC_CH3_DESCR_X_SIZE	0x441A1360	Channel descriptor X size. See SAXI_DMAC_CH0_DESCR_X_SIZE for the details of bit fields
SAXI_DMAC_CH3_DESCR_X_INCR	0x441A1364	Channel descriptor X increment. See SAXI_DMAC_CH0_DESCR_X_INCR for the details of bit fields

High Performance Direct Memory Access (HPDMA) registers

Register name	Address	Description
SAXI_DMAC_CH3_DESCR_Y_SIZE	0x441A1368	Channel descriptor Y size. See SAXI_DMAC_CH0_DESCR_Y_SIZE for the details of bit fields
SAXI_DMAC_CH3_DESCR_Y_INCR	0x441A136C	Channel descriptor Y increment. See SAXI_DMAC_CH0_DESCR_Y_INCR for the details of bit fields
SAXI_DMAC_CH3_DESCR_NEXT	0x441A1370	Channel descriptor next pointer. See SAXI_DMAC_CH0_DESCR_NEXT for the details of bit fields
SAXI_DMAC_CH3_INTR	0x441A1380	Interrupt. See SAXI_DMAC_CH0_INTR for the details of bit fields
SAXI_DMAC_CH3_INTR_SET	0x441A1384	Interrupt set. See SAXI_DMAC_CH0_INTR_SET for the details of bit fields
SAXI_DMAC_CH3_INTR_MASK	0x441A1388	Interrupt mask. See SAXI_DMAC_CH0_INTR_MASK for the details of bit fields
SAXI_DMAC_CH3_INTR_MASKED	0x441A138C	Interrupt masked. See SAXI_DMAC_CH0_INTR_MASKED for the details of bit fields

7.1.1 SAXI_DMAC_CTL

Description: Control

Address: 0x441A0000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	IP enable: '0': Disabled. Clearing this field to '0' by software shuts down all channels by clearing their CH_CTL.ENABLED fields, unless all CH_STATUS.ENABLED fields are '0'. After all channels have completed their AXI transactions, all non-retention registers (command and status registers) are reset to their default value, and all retention registers retain their value. '1': Enabled. Default Value: 0 **0x0: DISABLED :** **0x1: ENABLED :**

7.1.2 SAXI_DMAC_STATUS

Description: Enabled channels

Address: 0x441A0004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				W			
Name	Reserved [7:4]				CH_EN [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	CH_EN	Specifies channels whose CH_STATUS.ENABLED = '1', i.e. channels that are either enabled, or are still completing their AXI transactions after being disabled. Default Value: 0

7.1.3 SAXI_DMAC_ACTIVE

Description: Active channels

Address: 0x441A0008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				W			
Name	Reserved [7:4]				ACTIVE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	ACTIVE	Specifies active channels; i.e. enabled channels whose trigger got activated. Default Value: 0

7.1.4 SAXI_DMAC_CH0_CTL

Description: Channel control

Address: 0x441A1000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				Reserved	RW	RW	RW
HW Access	R				Reserved	R	R	R
Name	PC [7:4]				Reserved	B	NS	P

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [15:10]						PRIO [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	RW1C	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	Channel enable: '0': Disabled. The channel's trigger is ignored and the channel cannot be made active. If an active channel is disabled, the channel is de-activated: This field is set to '0' immediately, and CH_STATUS.ENABLED is set to '0' by HW after AXI bus transactions are completed. '1': Enabled. SW sets this field to '1' to enable a specific channel. HW sets this field to '0' in the following cases: - when an error interrupt cause is activated - when a descriptor has completed, if CH_DESCR_CTL.CH_DISABLE is '1' - when CTL.ENABLED is cleared to '0' by SW while the CH_STATUS.ENABLED field of at least one channel is '1' Default Value: 0
9 : 8	PRIO	Channel priority: "0": highest priority. "1" "2" "3": lowest priority. Channels with the same priority constitute a priority group. Priority decoding determines the highest priority pending channel. This channel is determined as follows. First, the highest priority group with pending channels is identified. Second, within this priority group, roundrobin arbitration is applied. Roundrobin arbitration (within a priority group) gives the highest priority to the lower channel indices (within the priority group). Default Value: 0

7.1.4 SAXI_DMAC_CH0_CTL (continued)

7 : 4	PC	Protection Context This field can only be updated based on software write to this register. However, value of this field is set with the protection context of the transaction that writes this register; i.e. the 'write data' is ignored and instead the context is inherited from the write transaction All transactions for this channel uses the PC field for the protection context. Note: This is an exception as compared to other Registers, where the field value is inherited from the bus, instead of 'write data'. Default Value: 0
2	B	Non-bufferable/bufferable access control: '0': non-bufferable. '1': bufferable. This field is used to indicate to an AMBA bridge that a write transaction can complete without waiting for the destination to accept the write transaction data. All transactions for this channel uses the B field for the non-bufferable/bufferable access control ("acache[0]"). Default Value: 0
1	NS	Secure/on-secure access control: '0': secure. '1': non-secure. This field can only be updated based on software write to this register. However, value of this field is set with the secure/non-secure access control of the transaction that writes this register; i.e. the 'write data' is ignored and instead the access control is inherited from the write transaction ("hnonsec") All transactions for this channel use the NS field for the secure/non-secure access control ("aprot[1]"). Note: This is an exception as compared to other registers, where the field value is inherited from the bus, instead of 'write data'. Default Value: 1
0	P	User/privileged access control: '0': user mode. '1': privileged mode. This field can only be updated based on software write to this register. However, value of this field is set with the user/privileged access control of the transaction that writes this register; i.e. the 'write data' is ignored and instead the access control is inherited from the write transaction ("hprot[1]") All transactions for this channel use the P field for the user/privileged access control ("aprot[0]"). Note: This is an exception as compared to other registers, where the field value is inherited from the bus, instead of 'write data'. Default Value: 0

7.1.5 SAXI_DMAC_CH0_STATUS

Description: Channel status

Address: 0x441A1004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	W	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	Indicates the enable status of the channel. '0': Disabled. '1': Enabled. When CH_CTL.ENABLED is set to '0' by SW or by the activation of an error interrupt cause or by disabling the entire DMAC, HW sets this field to '0' after the channel has completed AXI transactions. When SW sets CH_CTL.ENABLED to '1' and this field is '0', it changes from '0' to '1' immediately (if the entire DMAC is still disabled by CTL.ENABLED, it changes from '0' to '1' after the DMAC gets enabled). If this field is '1' at the time CH_CTL_ENABLED is changed from '0' to '1', then this field is first set to '0' by HW after the channel has completed AXI transactions, and it is set to '1' after one clock cycle if CH_CTL.ENABLED is still '1'. This ensures that the channel is properly initialized (except the retained registers). Default Value: 0

7.1.6 SAXI_DMAC_CH0_IDX

Description: Channel current X and Y indices

Address: 0x441A1010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	X [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R

Name	M [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	M [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 0	M	Specifies the M loop index. In the range of [0, M_COUNT], with M_COUNT taken from the current descriptor. Note: HW sets this field to "0" when it loads a descriptor. Default Value: Undefined

7.1.10 SAXI_DMAC_CH0_CURR

Description: Channel current descriptor pointer

Address: 0x441A1020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW					Reserved		
HW Access	RW					Reserved		
Name	PTR [7:3]					Reserved [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	PTR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	PTR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	PTR [31:24]							

Bits	Name	Description
31 : 3	PTR	Address of current descriptor. When this field is "0", there is no valid descriptor. Note: HW updates the current descriptor pointer CH_CURR_PTR with DESCR_NEXT_PTR after execution of the current descriptor. Note: When this field is "0", and the DMAC and the channel are enabled, and the channel is triggered, then this will raise the CURR_PTR_NULL interrupt, and initiate the disabling of the channel. If this field is changed to a value different from "0" afterwards, then the channel may start to fetch the descriptor before finally being disabled, and the ISR will find this field not being "0" although the CURR_PTR_NULL interrupt has been raised. Default Value: Undefined

7.1.11 SAXI_DMAC_CH0_TR_CMD

Description: Channel software trigger

Address: 0x441A1028

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [7:1]							ACTIVATE

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	DESCR_BUS_ERROR	Activated (set to '1') on a bus error for a load of the descriptor. Default Value: 0
6	ACTIVE_CH_DISABLED	Activated (set to '1') when the channel is disabled and the data transfer engine is busy, i.e there is a pending trigger. This flag is also set if an input trigger is received at the same time another error occurs (in this case, ACT_CH_DISABLED is set in addition to another error interrupt flag). Default Value: 0
5	CURR_PTR_NULL	Activated (set to '1') when the channel is enabled (CH_CTL.ENABLED is '1'), CH_CURR_PTR is "0", and the channel is triggered. Default Value: 0
3	INVALID_DESCR_TYPE	Activated (set to '1') when the descriptor type is invalid. Default Value: 0
2	DST_BUS_ERROR	Activated (set to '1') on a bus error for a store to the destination. Also activated when an AXI write response is received although there is no outstanding write transaction. Default Value: 0
1	SRC_BUS_ERROR	Activated (set to '1') on a bus error for a load from the source. Note that INTR.COMPLETION is not valid if it is activated along with INTR.SRC_BUS_ERROR. When INTR.SRC_BUS_ERROR status is activated, then destination data may be corrupted. Default Value: 0

7.1.22 SAXI_DMAC_CH0_INTR (continued)

0	COMPLETION	Activated (set to '1') on completion of data transfer(s) as specified by the descriptor's CH_DESCR_CTL.INTR_TYPE. Note that this flag is not valid if it is activated along with INTR.SRC_BUS_ERROR. In this case destination data corresponding to this completion flag may be corrupted. Default Value: 0

7.1.23 SAXI_DMAC_CH0_INTR_SET

Description: Interrupt set

Address: 0x441A1084

Retention: Not Retained

1	SRC_BUS_ERROR	Default Value: 0
0	COMPLETION	Mask for corresponding field in INTR register. Default Value: 0

7.1.25 SAXI_DMAC_CH0_INTR_MASKED

Description: Interrupt masked

Address: 0x441A108C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	R	R	Reserved	R	R	R	R
HW Access	W	W	W	Reserved	W	W	W	W
Name	DE-SCR_BUS_ ERROR	AC-TIVE_CH_- DISABLED	CUR-R_PTR_NU LL	Reserved	INVALID_- DESCR_- TYPE	DST_BUS_ ERROR	SRC_BUS_ ERROR	COMPLE-TION

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	DESCR_BUS_ERROR	Default Value: 0
6	ACTIVE_CH_DISABLED	Default Value: 0
5	CURR_PTR_NULL	Default Value: 0
3	INVALID_DESCR_TYPE	Default Value: 0
2	DST_BUS_ERROR	Default Value: 0
1	SRC_BUS_ERROR	Default Value: 0
0	COMPLETION	Logical and of corresponding INTR and INTR_MASK fields. Default Value: 0

8 Direct Memory Access (DMA) registers

This section discusses the DMA registers. It lists all the registers in mapping tables, in address order.

8.1 Register details

Register name	Address	Description
DW0_CTL	0x42270000	Control
DW0_STATUS	0x42270004	Status
DW0_ACT_DESCR_CTL	0x42270020	Active descriptor control
DW0_ACT_DESCR_SRC	0x42270024	Active descriptor source
DW0_ACT_DESCR_DST	0x42270028	Active descriptor destination
DW0_ACT_DESCR_X_CTL	0x42270030	Active descriptor X loop control
DW0_ACT_DESCR_Y_CTL	0x42270034	Active descriptor Y loop control
DW0_ACT_DESCR_NEXT_PTR	0x42270038	Active descriptor next pointer
DW0_ACT_SRC	0x42270040	Active source
DW0_ACT_DST	0x42270044	Active destination
DW0_CRC_CTL	0x42270100	CRC control
DW0_CRC_DATA_CTL	0x42270110	CRC data control
DW0_CRC_POL_CTL	0x42270120	CRC polynomial control
DW0_CRC_LFSR_CTL	0x42270130	CRC LFSR control
DW0_CRC_REM_CTL	0x42270140	CRC remainder control
DW0_CRC_REM_RESULT	0x42270148	CRC remainder result
DW0_CH_STRUCT0_CH_CTL	0x42278000	Channel control
DW0_CH_STRUCT0_CH_STATUS	0x42278004	Channel status
DW0_CH_STRUCT0_CH_IDX	0x42278008	Channel current indices
DW0_CH_STRUCT0_CH_CURR_PTR	0x4227800C	Channel current descriptor pointer
DW0_CH_STRUCT0_INTR	0x42278010	Interrupt
DW0_CH_STRUCT0_INTR_SET	0x42278014	Interrupt set
DW0_CH_STRUCT0_INTR_MASK	0x42278018	Interrupt mask
DW0_CH_STRUCT0_INTR_MASKED	0x4227801C	Interrupt masked
DW0_CH_STRUCT0_TR_CMD	0x42278028	Channel software trigger
DW0_CH_STRUCT1_CH_CTL	0x42278040	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT1_CH_STATUS	0x42278044	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT1_CH_IDX	0x42278048	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Register name	Address	Description
DW0_CH_STRUCT1_CH_CURR_PTR	0x4227804C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT1_INTR	0x42278050	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT1_INTR_SET	0x42278054	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT1_INTR_MASK	0x42278058	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT1_INTR_MASKED	0x4227805C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT1_TR_CMD	0x42278068	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT2_CH_CTL	0x42278080	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT2_CH_STATUS	0x42278084	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT2_CH_IDX	0x42278088	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.
DW0_CH_STRUCT2_CH_CURR_PTR	0x4227808C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT2_INTR	0x42278090	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT2_INTR_SET	0x42278094	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT2_INTR_MASK	0x42278098	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT2_INTR_MASKED	0x4227809C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT2_TR_CMD	0x422780A8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT3_CH_CTL	0x422780C0	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT3_CH_STATUS	0x422780C4	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT3_CH_IDX	0x422780C8	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Register name	Address	Description
DW0_CH_STRUCT3_CH_CURR_PTR	0x422780CC	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT3_INTR	0x422780D0	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT3_INTR_SET	0x422780D4	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT3_INTR_MASK	0x422780D8	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT3_INTR_MASKED	0x422780DC	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT3_TR_CMD	0x422780E8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT4_CH_CTL	0x42278100	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT4_CH_STATUS	0x42278104	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT4_CH_IDX	0x42278108	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.
DW0_CH_STRUCT4_CH_CURR_PTR	0x4227810C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT4_INTR	0x42278110	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT4_INTR_SET	0x42278114	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT4_INTR_MASK	0x42278118	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT4_INTR_MASKED	0x4227811C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT4_TR_CMD	0x42278128	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT5_CH_CTL	0x42278140	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT5_CH_STATUS	0x42278144	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT5_CH_IDX	0x42278148	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Direct Memory Access (DMA) registers

Register name	Address	Description
DW0_CH_STRUCT5_CH_CURR_PTR	0x4227814C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT5_INTR	0x42278150	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT5_INTR_SET	0x42278154	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT5_INTR_MASK	0x42278158	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT5_INTR_MASKED	0x4227815C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT5_TR_CMD	0x42278168	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT6_CH_CTL	0x42278180	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT6_CH_STATUS	0x42278184	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT6_CH_IDX	0x42278188	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.
DW0_CH_STRUCT6_CH_CURR_PTR	0x4227818C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT6_INTR	0x42278190	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT6_INTR_SET	0x42278194	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT6_INTR_MASK	0x42278198	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT6_INTR_MASKED	0x4227819C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT6_TR_CMD	0x422781A8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT7_CH_CTL	0x422781C0	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT7_CH_STATUS	0x422781C4	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT7_CH_IDX	0x422781C8	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Register name	Address	Description
DW0_CH_STRUCT7_CH_CURR_PTR	0x422781CC	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT7_INTR	0x422781D0	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT7_INTR_SET	0x422781D4	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT7_INTR_MASK	0x422781D8	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT7_INTR_MASKED	0x422781DC	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT7_TR_CMD	0x422781E8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT8_CH_CTL	0x42278200	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT8_CH_STATUS	0x42278204	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT8_CH_IDX	0x42278208	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.
DW0_CH_STRUCT8_CH_CURR_PTR	0x4227820C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT8_INTR	0x42278210	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT8_INTR_SET	0x42278214	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT8_INTR_MASK	0x42278218	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT8_INTR_MASKED	0x4227821C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT8_TR_CMD	0x42278228	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT9_CH_CTL	0x42278240	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT9_CH_STATUS	0x42278244	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT9_CH_IDX	0x42278248	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Direct Memory Access (DMA) registers

Register name	Address	Description
DW0_CH_STRUCT9_CH_CURR_PTR	0x4227824C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT9_INTR	0x42278250	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT9_INTR_SET	0x42278254	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT9_INTR_MASK	0x42278258	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT9_INTR_MASKED	0x4227825C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT9_TR_CMD	0x42278268	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT10_CH_CTL	0x42278280	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT10_CH_STATUS	0x42278284	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT10_CH_IDX	0x42278288	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.
DW0_CH_STRUCT10_CH_CURR_PTR	0x4227828C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT10_INTR	0x42278290	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT10_INTR_SET	0x42278294	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT10_INTR_MASK	0x42278298	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT10_INTR_MASKED	0x4227829C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT10_TR_CMD	0x422782A8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT11_CH_CTL	0x422782C0	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT11_CH_STATUS	0x422782C4	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT11_CH_IDX	0x422782C8	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Direct Memory Access (DMA) registers

Register name	Address	Description
DW0_CH_STRUCT11_CH_CURR_PTR	0x422782CC	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT11_INTR	0x422782D0	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT11_INTR_SET	0x422782D4	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT11_INTR_MASK	0x422782D8	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT11_INTR_MASKED	0x422782DC	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT11_TR_CMD	0x422782E8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT12_CH_CTL	0x42278300	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT12_CH_STATUS	0x42278304	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT12_CH_IDX	0x42278308	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.
DW0_CH_STRUCT12_CH_CURR_PTR	0x4227830C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT12_INTR	0x42278310	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT12_INTR_SET	0x42278314	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT12_INTR_MASK	0x42278318	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT12_INTR_MASKED	0x4227831C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT12_TR_CMD	0x42278328	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT13_CH_CTL	0x42278340	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT13_CH_STATUS	0x42278344	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT13_CH_IDX	0x42278348	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Direct Memory Access (DMA) registers

Register name	Address	Description
DW0_CH_STRUCT13_CH_CURR_PTR	0x4227834C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT13_INTR	0x42278350	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT13_INTR_SET	0x42278354	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT13_INTR_MASK	0x42278358	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT13_INTR_MASKED	0x4227835C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT13_TR_CMD	0x42278368	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT14_CH_CTL	0x42278380	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT14_CH_STATUS	0x42278384	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT14_CH_IDX	0x42278388	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.
DW0_CH_STRUCT14_CH_CURR_PTR	0x4227838C	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT14_INTR	0x42278390	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT14_INTR_SET	0x42278394	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT14_INTR_MASK	0x42278398	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT14_INTR_MASKED	0x4227839C	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT14_TR_CMD	0x422783A8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.
DW0_CH_STRUCT15_CH_CTL	0x422783C0	Channel control. See DW0_CH_STRUCT0_CH_CTL for the details of bit fields.
DW0_CH_STRUCT15_CH_STATUS	0x422783C4	Channel status. See DW0_CH_STRUCT0_CH_STATUS for the details of bit fields.
DW0_CH_STRUCT15_CH_IDX	0x422783C8	Channel current indices. See DW0_CH_STRUCT0_CH_IDX for the details of bit fields.

Direct Memory Access (DMA) registers

Register name	Address	Description
DW0_CH_STRUCT15_CH_CURR_PTR	0x422783CC	Channel current descriptor pointer. See DW0_CH_STRUCT0_CH_CURR_PTR for the details of bit fields.
DW0_CH_STRUCT15_INTR	0x422783D0	Interrupt. See DW0_CH_STRUCT0_INTR for the details of bit fields.
DW0_CH_STRUCT15_INTR_SET	0x422783D4	Interrupt set. See DW0_CH_STRUCT0_INTR_SET for the details of bit fields.
DW0_CH_STRUCT15_INTR_MASK	0x422783D8	Interrupt mask. See DW0_CH_STRUCT0_INTR_MASK for the details of bit fields.
DW0_CH_STRUCT15_INTR_MASKED	0x422783DC	Interrupt masked. See DW0_CH_STRUCT0_INTR_MASKED for the details of bit fields.
DW0_CH_STRUCT15_TR_CMD	0x422783E8	Channel software trigger. See DW0_CH_STRUCT0_TR_CMD for the details of bit fields.

8.1.1 DW0_CTL

Description: Control

Address: 0x42270000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	IP enable: '0': Disabled. Disabling the IP activates the IP's Active logic reset: Active logic and non-retention MMIO registers are reset (retention MMIO registers are not affected). Note that DW SRAM writes/reads are possible when ENABLED=0 also. '1': Enabled. Default Value: 0

8.1.2 DW0_STATUS

Description: Status

Address: 0x42270004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				Reserved	R	R	R
HW Access	RW				Reserved	RW	RW	RW

Bits	Name	Description
31	ACTIVE	Active channel present: '0': No. '1': Yes. Default Value: 0
30 : 28	STATE	State of the DW controller. "0": Default/inactive state. "1": Loading descriptor. "2": Loading data element from source location. "3": Storing data element to destination location. "4": CRC functionality (only used for CRC transfer descriptor type). "5": Update of active control information (e.g. source and destination addresses) and wait for trigger de-activation. "6": Error. Default Value: 0
16	CH_IDX	Active channel index. Default Value: Undefined
11	PREEMPTABLE	Active channel preemptable. Default Value: Undefined
9 : 8	PRIO	Active channel priority. Default Value: Undefined
7 : 4	PC	Active channel protection context. Default Value: Undefined

8.1.2 DW0_STATUS (continued)

2	B	Active channel, non-bufferable/bufferable access control: '0': non-bufferable '1': bufferable. Default Value: Undefined
1	NS	Active channel, secure/non-secure access control: '0': secure. '1': non-secure. Default Value: Undefined
0	P	Active channel, user/privileged access control: '0': user mode. '1': privileged mode. Default Value: Undefined

8.1.3 DW0_ACT_DESCR_CTL

Description: Active descriptor control

Address: 0x42270020

Retention: Not Retained

Bits	Name	Description

8.1.3 DW0_ACT_DESCR_CTL (continued)

31 : 0	DATA	Copy of DESCR_CTL of the currently active descriptor. [1:0] WAIT_FOR_DEACT Specifies whether the controller should wait for the input trigger to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controller with the agent that generated the trigger. This field is ONLY used at the completion of the transfer as specified by TR_IN. E.g., a TX FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the controller AND received by the agent. Furthermore, the agent's trigger may be delayed by a few cycles before it reaches the controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW controller performance. "0": Do not wait for trigger de-activation (for pulse sensitive triggers). "1": Wait for up to 4 cycles. "2": Wait for up to 16 cycles. "3": Wait indefinitely. This option may result in controller lockup if the trigger is not de-activated. [3:2] INTR_TYPE Specifies the input trigger type (not to be confused with the descriptor type): "0": A trigger results in the execution of a single transfer. The descriptor type can be single, 1D or 2D. "1": A trigger results in the execution of a single 1D transfer. - If the descriptor type is "single", the trigger results in the execution of a single transfer. - If the descriptor type is "1D" or "2D", the trigger results in the execution of a 1D transfer. "2": A trigger results in the execution of the current descriptor. "3": A trigger results in the execution of the current descriptor and continues (without requiring another input trigger) with the execution of the next descriptor using the next descriptor's information. [5:4] TR_OUT_TYPE Specifies when an output trigger is generated: "0": An output trigger is generated after a single transfer. "1": An output trigger is generated after a single 1D transfer. - If the descriptor type is "single", the output trigger is generated after a single transfer. - If the descriptor type is "1D", "CRC" or "2D", the output trigger is generated after the execution of a 1D transfer. "2": An output trigger is generated after the execution of the current descriptor. "3": An output trigger is generated after the execution of a descriptor list: after the execution of the current descriptor AND the current descriptor DESCR_NEXT_PTR.ADDR is '0'. [7:6] TR_IN_TYPE Specifies the input trigger type (not to be confused with the descriptor type): "0": A trigger results in the execution of a single transfer. The descriptor type can be single, 1D or 2D. "1": A trigger results in the execution of a single 1D transfer. - If the descriptor type is "single", the trigger results in the execution of a single transfer. - If the descriptor type is "1D" or "2D", the trigger results in the execution of a 1D transfer. "2": A trigger results in the execution of the current descriptor. "3": A trigger results in the execution of the current descriptor and continues (without requiring another input trigger) with the execution of the next descriptor using the next descriptor's information. [24] CH_DISABLE Specifies whether the channel is disabled or not after completion of the current descriptor (independent of the value of the DESCR_NEXT_PTR value): '0': Channel is not disabled. '1': Channel is disabled. Note: a disabled channel will ignore its input trigger. [26] SRC_TRANSFER_SIZE Specifies the bus transfer size to the source location: '0': As specified by DATA_SIZE. '1': Word (32 bits). Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element. [27] DST_TRANSFER_SIZE Specifies the bus transfer size to the destination location: '0': As specified by DATA_SIZE. '1': Word (32 bits). Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element. [29:28] DATA_SIZE Specifies the data element size: "0": Byte (8 bits). "1": Halfword (16 bits). "2": Word (32 bits). DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings: - DATA is 8 bit, SRC is 8 bit, DST is 8 bit. - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit. - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made "0"). - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made "0"). - DATA is 16 bit, SRC is 16 bit, DST is 16 bit. - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit. - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made "0"). - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made "0"). - DATA is 32 bit, SRC is 32 bit, DST is 32 bit. [31:30] DESCR_TYPE Specifies the descriptor type (not to be confused with the trigger type): "0": Single transfer. The DESCR_X_CTL and DESCR_Y_CTL registers are not present and DESCR_NEXT_PTR is at offset 0x0c. "1": 1D transfer. The DESCR_X_CTL register is present, the DESCR_Y_CTL is not present and DESCR_NEXT_PTR is at offset 0x10. A 1D transfer consists out of DESCR_X_CTL.X_COUNT single transfers. "2": 2D transfer. The DESCR_X_CTL and DESCR_Y_CTL registers are present and DESCR_NEXT_PTR is at offset 0x14. A 2D transfer consists of DESCR_X_CTL.X_COUNT*DESCR_Y_CTL.Y_COUNT single transfers. "3": CRC transfer. The DESCR_X_CTL register is present, theDESCR_Y_CTL is not present and DESCR_NEXT_PTR is at offset 0x10. A CRC transfer consists out of DESCR_X_CTL.X_COUNT single transfers. After the execution of the current descriptor, the DESCR_NEXT_PTR address is copied to the channel's CH_CURR_PTR address and CH_STATUS.X_IDX and CH_STATUS.Y_IDX are set to "0". Default Value: Undefined

8.1.4 DW0_ACT_DESCR_SRC

Description: Active descriptor source

Address: 0x42270024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	Copy of DESCR_DST of the currently active descriptor. Base address of destination location. Note: For a CRC transfer descriptor, this field should be programmed with the address of the CRC_LFSR_CTL register. The calculated CRC LFSR state is written to this address (through the CRYPTO AHB-Lite master interface) when the input trigger is processed. The write transfer will be submitted to the CPUSS and PERI protection schemes. Default Value: Undefined

8.1.6 DW0_ACT_DESCR_X_CTL

Description: Active descriptor X loop control

Address: 0x42270030

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	Copy of DESCR_X_CTL of the currently active descriptor. [11:0] SRC_X_INCR Specifies increment of source address for each X loop iteration (in multiples of SRC_TRANSFER_SIZE). This field is a signed number in the range [-2048, 2047]. If this field is "0", the source address is not incremented. This is useful for reading from RX FIFO structures. [23:12] DST_X_INCR Specifies increment of destination address for each X loop iteration (in multiples of DST_TRANSFER_SIZE). This field is a signed number in the range [-2048, 2047]. If this field is "0", the destination address is not incremented. This is useful for writing to TX FIFO structures. Note: this field is not used for CRC transfer descriptors and must be set to "0". [31:24] X_COUNT Number of iterations (minus 1) of the "X loop" (X_COUNT+1 is the number of single transfers in a 1D transfer). This field is an unsigned number in the range [0, 255], representing 1 through 256 iterations. For a single transfer descriptor type, descriptor will not have X_CTL. Default Value: Undefined

8.1.7 DW0_ACT_DESCR_Y_CTL

Description: Active descriptor Y loop control

Address: 0x42270034

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	POLYNOMIAL [31:24]							

Bits	Name	Description
31 : 0	POLYNOMIAL	CRC polynomial. The polynomial is represented WITHOUT the high order bit (this bit is always assumed '1'). The polynomial should be aligned/shifted such that the more significant bits (bit 31 and down) contain the polynomial and the less significant bits (bit 0 and up) contain padding '0's. Some frequently used polynomials: - CRC32: POLYNOMIAL is 0x04c11db7 (x^32 + x^26 + x^23 + x^22 + x^16 + x^12 + x^11 + x^10 + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1). - CRC16: POLYNOMIAL is 0x80050000 (x^16 + x^15 + x^2 + 1, shifted by 16 bit positions). - CRC16 CCITT: POLYNOMIAL is 0x10210000 (x^16 + x^12 + x^5 + 1, shifted by 16 bit positions). Default Value: 0

8.1.14 DW0_CRC_LFSR_CTL

Description: CRC LFSR control

Address: 0x42270130

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	LFSR32 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	LFSR32 [15:8]							

Bits	23	22	21	20	19	18	17	16

HW Access	RW							
Name	LFSR32 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	LFSR32 [31:24]							

Bits	Name	Description
31 : 0	LFSR32	State of a 32-bit Linear Feedback Shift Registers (LFSR) that is used to implement CRC. This register needs to be initialized by SW to provide the CRC seed value. The seed value should be aligned such that the more significant bits (bit 31 and down) contain the seed value and the less significant bits (bit 0 and up) contain padding '0's. Note that SW can write this field. This functionality can be used prevent information leakage (through either CRC_LFSR_CTL or CRC_REM_RESULT). Default Value: 0

8.1.15 DW0_CRC_REM_CTL

Description: CRC remainder control

Address: 0x42270140

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	REM_XOR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW

Name	REM [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	REM [31:24]							

Bits	Name	Description
31 : 0	REM	Remainder value. The alignment of the remainder depends on CRC_REM_CTL0.REM_REVERSE: '0': the more significant bits (bit 31 and down) contain the remainder. '1': the less significant bits (bit 0 and up) contain the remainder. Note: This field is combinatorially derived from CRC_LFSR_CTL.LFSR32, CRC_CTL.REM_REVERSE and CRC_REM_CTL.REM_XOR. Default Value: 0

8.1.17 DW0_CH_STRUCT0_CH_CTL

Description: Channel control

Address: 0x42278000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				Reserved	RW	RW	RW
HW Access	R				Reserved	R	R	R
Name	PC [7:4]				Reserved	B	NS	P

Bits	15	14	13	12	11	10	9	8

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	RW1C	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	Channel enable: '0': Disabled. The channel's trigger is ignored and the channel cannot be made pending and therefore cannot be made active. If a pending channel is disabled, the channel is made non pending. If the activate channel is disabled, the channel is de-activated (bus transactions are completed). '1': Enabled. SW sets this field to '1' to enable a specific channel. HW sets this field to '0' on an error interrupt cause (the specific error is specified by CH_STATUS.INTR_CAUSE). Default Value: 0
11	PREEMPTABLE	Specifies if the channel is preemptable. '0': Not preemptable. '1': Preemptable. This field allows higher priority pending channels (from a higher priority group; i.e. an active channel can NOT be preempted by a pending channel in the same priority group) to preempt the active channel in between "single transfers" (a 1D transfer consists out of X_COUNT single transfers; a 2D transfer consists out of X_COUNT*Y_COUNT single transfers). Preemption will NOT affect the pending status of channel. As a result, after completion of a higher priority activated channel, the current channel may be reactivated. Default Value: Undefined

8.1.17 DW0_CH_STRUCT0_CH_CTL (continued)

9 : 8	PRIO	Channel priority: "0": highest priority. "1" "2" "3": lowest priority. Channels with the same priority constitute a priority group. Priority decoding determines the highest priority pending channel. This channel is determined as follows. First, the highest priority group with pending channels is identified. Second, within this priority group, round robin arbitration is applied. Round robin arbitration (within a priority group) gives the highest priority to the lower channel indices (within the priority group). Default Value: 0
7 : 4	PC	Protection context. This field is set with the protection context of the transaction that writes this register; i.e. the 'write data' is ignored and instead the context is inherited from the write transaction (note the field attributes should be HW:RW, SW:R). All transactions for this channel uses the PC field for the protection context. Note: protection context (PC) is routed on "hauser" bus of the AHB5 bus. Default Value: Undefined
2	B	Non-bufferable/bufferable access control: '0': non-bufferable. '1': bufferable. This field is used to indicate to an AMBA bridge that a write transaction can complete without waiting for the destination to accept the write transaction data. All transactions for this channel uses the B field for the non-bufferable/bufferable access control ("hprot[2]"). Default Value: Undefined
1	NS	Secure/on-secure access control: '0': secure. '1': non-secure. This field is set with the secure/non-secure access control of the transaction that writes this register; i.e. the 'write data' is ignored and instead the access control is inherited from the write transaction (note the field attributes should be HW:RW, SW:R). All transactions for this channel use the NS field for the secure/non-secure access control ("hnonsec"). Default Value: Undefined
0	P	User/privileged access control: '0': user mode. '1': privileged mode. This field is set with the user/privileged access control of the transaction that writes this register; i.e. the 'write data' is ignored and instead the access control is inherited from the write transaction (note the field attributes should be HW:RW, SW:R). All transactions for this channel use the P field for the user/privileged access control ("hprot[1]"). Default Value: Undefined

8.1.18 DW0_CH_STRUCT0_CH_STATUS

Description: Channel status

Address: 0x42278004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				W			
Name	Reserved [7:4]				INTR_CAUSE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	W	Reserved						
Name	PENDING	Reserved [30:24]						

Bits	Name	Description
31	PENDING	Specifies pending DW channels; i.e. enabled channels whose trigger got activated. This field includes all channels that are in the pending state (not scheduled) or active state (scheduled and performing data transfer(s)). Default Value: 0
3 : 0	INTR_CAUSE	Specifies the source of the interrupt cause: "0": NO_INTR "1": COMPLETION "2": SRC_BUS_ERROR "3": DST_BUS_ERROR "4": SRC_MISAL "5": DST_MISAL "6": CURR_PTR_NULL "7": ACTIVE_CH_DISABLED "8": DESCR_BUS_ERROR "9"-"15": Not used. For error related interrupt causes (INTR_CAUSE is "2", "3", ..., "8"), the channel is disabled (HW sets CH_CTL.ENABLED to '0'). Default Value: Undefined

8.1.19 DW0_CH_STRUCT0_CH_IDX

Description: Channel current indices

Address: 0x42278008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	X_IDX [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	Y_IDX [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	Y_IDX	Specifies the Y loop index, with X_COUNT taken from the current descriptor. Note: HW sets this field to "0" when it updates the current descriptor pointer CH_CURR_PTR with DESCR_NEXT_PTR after execution of the current descriptor. Note: SW should set this field to "0" when it updates CH_CURR_PTR. Default Value: Undefined
7 : 0	X_IDX	Specifies the X loop index. In the range of [0, X_COUNT], with X_COUNT taken from the current descriptor. Note: HW sets this field to "0" when it updates the current descriptor pointer CH_CURR_PTR with DESCR_NEXT_PTR after execution of the current descriptor. Note: SW should set this field to "0" when it updates CH_CURR_PTR. Default Value: Undefined

8.1.20 DW0_CH_STRUCT0_CH_CURR_PTR

Description: Channel current descriptor pointer

Address: 0x4227800C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW						Reserved	
HW Access	RW						Reserved	
Name	ADDR [7:2]						Reserved [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	ADDR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	ADDR [31:24]							

Bits	Name	Description
31 : 2	ADDR	Address of current descriptor. When this field is "0", there is no valid descriptor. Note: HW updates the current descriptor pointer CH_CURR_PTR with DESCR_NEXT_PTR after execution of the current descriptor. Note: Typically, when SW updates the current descriptor pointer CH_CURR_PTR, it also sets CH_IDX.X_IDX and CH_IDX.Y_IDX to "0". Default Value: Undefined

8.1.21 DW0_CH_STRUCT0_INTR

Description: Interrupt

Address: 0x42278010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1C
HW Access	Reserved							RW1S
Name	Reserved [7:1]							CH

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CH	Set to '1', when event (as specified by CH_STATUS.INTR_CAUSE) is detected. Write INTR.CH field with '1', to clear bit. Write INTR_SET.CH field with '1', to set bit. Default Value: 0

8.1.22 DW0_CH_STRUCT0_INTR_SET

Description: Interrupt set

Address: 0x42278014

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [7:1]							CH

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CH	Write INTR_SET field with '1' to set corresponding INTR.CH field (a write of '0' has no effect). Default Value: 0

8.1.23 DW0_CH_STRUCT0_INTR_MASK

Description: Interrupt mask

Address: 0x42278018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							CH

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CH	Mask for corresponding field in INTR register. Default Value: 0

8.1.24 DW0_CH_STRUCT0_INTR_MASKED

Description: Interrupt masked

Address: 0x4227801C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							CH

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CH	Logical and of corresponding INTR and INTR_MASK fields. Default Value: 0

8.1.25 DW0_CH_STRUCT0_TR_CMD

Description: Channel software trigger

Address: 0x42278028

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [7:1]							ACTIVATE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	ACTIVATE	Software trigger. When written with '1', a trigger is generated which sets 'trigger pending' (only if the channel is enabled). A read always returns a 0. Default Value: 0

9 Trigger Multiplexer registers

This section discusses the Trigger Multiplexer registers. It lists all the registers in mapping tables, in address order.

9.1 Register details

Register name	Address	Description
PERI0_TIMEOUT_CTL	0x42000200	Timeout control
PERI0_TR_CMD	0x42002000	Trigger command
PERI0_INFRA_CLK_FORCE	0x42002004	Infrastructure clock force enable
PERI0_GR0_SL_CTL	0x42004010	Slave control
PERI0_GR0_SL_CTL2	0x42004014	Slave control2
PERI0_GR1_CLOCK_CTL	0x42004040	Clock control
PERI0_GR1_SL_CTL	0x42004050	Slave control
PERI0_GR1_SL_CTL2	0x42004054	Slave control2
PERI0_GR2_CLOCK_CTL	0x42004080	Clock control. See PERI0_GR1_CLOCK_CTL for the details of bit fields.
PERI0_GR2_SL_CTL	0x42004090	Slave control
PERI0_GR2_SL_CTL2	0x42004094	Slave control2
PERI0_GR3_CLOCK_CTL	0x420040C0	Clock control. See PERI0_GR1_CLOCK_CTL for the details of bit fields.
PERI0_GR3_SL_CTL	0x420040D0	Slave control
PERI0_GR3_SL_CTL2	0x420040D4	Slave control2
PERI0_GR4_SL_CTL	0x42004110	Slave control. See PERI0_GR3_SL_CTL for the details of bit fields.
PERI0_GR4_SL_CTL2	0x42004114	Slave control2. See PERI0_GR3_SL_CTL2 for the details of bit fields.
PERI0_GR5_CLOCK_CTL	0x42004140	Clock control. See PERI0_GR1_CLOCK_CTL for the details of bit fields.
PERI0_GR5_SL_CTL	0x42004150	Slave control. See PERI0_GR3_SL_CTL for the details of bit fields.
PERI0_GR5_SL_CTL2	0x42004154	Slave control2. See PERI0_GR3_SL_CTL2 for the details of bit fields.
PERI0_TR_GR0_TR_CTL0	0x42008000	Trigger control register
PERI0_TR_GR0_TR_CTL1	0x42008004	Trigger control register. See PERI0_TR_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_GR0_TR_CTL2	0x42008008	Trigger control register. See PERI0_TR_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_GR0_TR_CTL3	0x4200800C	Trigger control register. See PERI0_TR_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_GR0_TR_CTL4	0x42008010	Trigger control register. See PERI0_TR_GR0_TR_CTL0 for the details of bit fields.

Trigger Multiplexer registers

PERI0_TR_GR0_TR_CTL5	0x42008014	Trigger control register. See PERI0_TR_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_GR0_TR_CTL6	0x42008018	Trigger control register. See PERI0_TR_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_GR0_TR_CTL7	0x4200801C	Trigger control register. See PERI0_TR_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_GR1_TR_CTL0	0x42008400	Trigger control register
PERI0_TR_GR1_TR_CTL1	0x42008404	Trigger control register. See PERI0_TR_GR1_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL0	0x42008800	Trigger control register
PERI0_TR_GR2_TR_CTL1	0x42008804	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL2	0x42008808	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL3	0x4200880C	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL4	0x42008810	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL5	0x42008814	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL6	0x42008818	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL7	0x4200881C	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL8	0x42008820	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL9	0x42008824	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL10	0x42008828	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL11	0x4200882C	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL12	0x42008830	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL13	0x42008834	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL14	0x42008838	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR2_TR_CTL15	0x4200883C	Trigger control register. See PERI0_TR_GR2_TR_CTL0 for the details of bit fields.
PERI0_TR_GR3_TR_CTL0	0x42008C00	Trigger control register. This is the starting address of a register bank containing 50 registers (PERI0_TR_GR3_TR_CTL0 to PERI0_TR_GR3_TR_CTL49).
PERI0_TR_GR4_TR_CTL0	0x42009000	Trigger control register

Trigger Multiplexer registers

PERI0_TR_GR4_TR_CTL1	0x42009004	Trigger control register. See PERI0_TR_GR4_TR_CTL0 for the details of bit fields.
PERI0_TR_GR5_TR_CTL0	0x42009400	Trigger control register
PERI0_TR_GR5_TR_CTL1	0x42009404	Trigger control register. See PERI0_TR_GR5_TR_CTL0 for the details of bit fields.
PERI0_TR_GR5_TR_CTL2	0x42009408	Trigger control register. See PERI0_TR_GR5_TR_CTL0 for the details of bit fields.
PERI0_TR_GR5_TR_CTL3	0x4200940C	Trigger control register. See PERI0_TR_GR5_TR_CTL0 for the details of bit fields.
PERI0_TR_1TO1_GR0_TR_CTL0	0x4200C000	Trigger control register
PERI0_TR_1TO1_GR0_TR_CTL1	0x4200C004	Trigger control register. See PERI0_TR_1TO1_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_1TO1_GR0_TR_CTL2	0x4200C008	Trigger control register. See PERI0_TR_1TO1_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_1TO1_GR0_TR_CTL3	0x4200C00C	Trigger control register. See PERI0_TR_1TO1_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_1TO1_GR0_TR_CTL4	0x4200C010	Trigger control register. See PERI0_TR_1TO1_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_1TO1_GR0_TR_CTL5	0x4200C014	Trigger control register. See PERI0_TR_1TO1_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_1TO1_GR0_TR_CTL6	0x4200C018	Trigger control register. See PERI0_TR_1TO1_GR0_TR_CTL0 for the details of bit fields.
PERI0_TR_1TO1_GR0_TR_CTL7	0x4200C01C	Trigger control register. See PERI0_TR_1TO1_GR0_TR_CTL0 for the details of bit fields.
PERI1_TIMEOUT_CTL	0x44000200	Timeout control. See PERI0_TIMEOUT_CTL for the details of bit fields.
PERI1_TR_CMD	0x44002000	Trigger command. See PERI0_TR_CMD for the details of bit fields.
PERI1_INFRA_CLK_FORCE	0x44002004	Infrastructure clock force enable. See PERI0_INFRA_CLK_FORCE for the details of bit fields.
PERI1_GR0_SL_CTL	0x44004010	Slave control
PERI1_GR0_SL_CTL2	0x44004014	Slave control2
PERI1_GR1_CLOCK_CTL	0x44004040	Clock control. See PERI0_GR1_CLOCK_CTL for the details of bit fields.
PERI1_GR1_SL_CTL	0x44004050	Slave control
PERI1_GR1_SL_CTL2	0x44004054	Slave control2
PERI1_GR2_SL_CTL	0x44004090	Slave control. See PERI0_GR2_SL_CTL for the details of bit fields.
PERI1_GR2_SL_CTL2	0x44004094	Slave control2. See PERI0_GR2_SL_CTL2 for the details of bit fields.
PERI1_GR3_CLOCK_CTL	0x440040C0	Clock control. See PERI0_GR1_CLOCK_CTL for the details of bit fields.
PERI1_GR3_SL_CTL	0x440040D0	Slave control

Trigger Multiplexer registers

PERI1_GR3_SL_CTL2	0x440040D4	Slave control2
PERI1_GR4_SL_CTL	0x44004110	Slave control. See PERI0_GR3_SL_CTL for the details of bit fields.
PERI1_GR4_SL_CTL2	0x44004114	Slave control2. See PERI0_GR3_SL_CTL2 for the details of bit fields.
PERI1_TR_GR0_TR_CTL0	0x44008000	Trigger control register
PERI1_TR_GR0_TR_CTL1	0x44008004	Trigger control register. See PERI1_TR_GR0_TR_CTL0 for the details of bit fields.
PERI1_TR_GR0_TR_CTL2	0x44008008	Trigger control register. See PERI1_TR_GR0_TR_CTL0 for the details of bit fields.
PERI1_TR_GR0_TR_CTL3	0x4400800C	Trigger control register. See PERI1_TR_GR0_TR_CTL0 for the details of bit fields.
PERI1_TR_GR0_TR_CTL4	0x44008010	Trigger control register. See PERI1_TR_GR0_TR_CTL0 for the details of bit fields.
PERI1_TR_GR0_TR_CTL5	0x44008014	Trigger control register. See PERI1_TR_GR0_TR_CTL0 for the details of bit fields.
PERI1_TR_GR1_TR_CTL0	0x44008400	Trigger control register
PERI1_TR_GR1_TR_CTL1	0x44008404	Trigger control register. See PERI1_TR_GR1_TR_CTL0 for the details of bit fields.
PERI1_TR_GR1_TR_CTL2	0x44008408	Trigger control register. See PERI1_TR_GR1_TR_CTL0 for the details of bit fields.
PERI1_TR_GR2_TR_CTL0	0x44008800	Trigger control register
PERI1_TR_GR2_TR_CTL1	0x44008804	Trigger control register. See PERI1_TR_GR2_TR_CTL0 for the details of bit fields.
PERI1_TR_GR2_TR_CTL2	0x44008808	Trigger control register. See PERI1_TR_GR2_TR_CTL0 for the details of bit fields.
PERI1_TR_GR2_TR_CTL3	0x4400880C	Trigger control register. See PERI1_TR_GR2_TR_CTL0 for the details of bit fields.
PERI1_TR_GR2_TR_CTL4	0x44008810	Trigger control register. See PERI1_TR_GR2_TR_CTL0 for the details of bit fields.
PERI1_TR_GR2_TR_CTL5	0x44008814	Trigger control register. See PERI1_TR_GR2_TR_CTL0 for the details of bit fields.

9.1.1 PERI0_TIMEOUT_CTL

Description: Timeout control

Address: 0x42000200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	TIMEOUT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	TIMEOUT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	HWRST_-DISABLE	Reserved [30:24]						

Bits	Name	Description
31	HWRST_DISABLE	This field provides control for HW to reset the slave that is causing the timeout to occur. 1 - no HW reset during timeout. 0 - HW resets the corresponding slave during timeout. This ensures the AHB bus not to be hung after a timeout has occurred. HW asserts the reset along with fault request (peri_gp'i'_mmio_timeout_vio_req) and holds it until fault acknowledge (mmio_peri_gp'i'_timeout_vio_ack) is received from centralized fault infrastructure. Note, SW needs to take care of the implication when clearing this bit when a HW reset has occurred as clearing this bit will cause HW reset de-assert. Note that peripheral group-0 slaves are excluded from timeout (Refer Timeout section in mxs-peri.1 BROS for more details). Default Value: 0
15 : 0	TIMEOUT	This field specifies a number of peripheral group root undivided (clk_group_root[i]) clock cycles. If an AHB-Lite bus transfer takes more than the specified number of cycles (timeout detection), the bus transfer is terminated with an AHB5 bus error and a timeout status is set. "0x0000"-"0xfffe": Number of peripheral group clock cycles. "0xffff": This value is the default/reset value and specifies that no timeout detection is performed: a bus transfer will never be terminated, and a interrupt will never be generated. Note that TIMEOUT_CTL.TIMEOUT[15:0] in clk_pclk0_root (clk_hf0) is used directly in peripheral group clock domain clk_group_root[i], even if clk_group_root[i] is async to clk_pclk0_root. This is on the assumption that this register is programmed once by SW, remain constant. Following SW programming restrictions apply to TIMEOUT_CTL.TIMEOUT[15:0]. SW should make sure that no other AHB transactions are initiated through PERI before programming this register. SW should make sure that write to TIMEOUT_CTL.TIMEOUT[15:0] is completed by doing a readback. Note that peripheral group-0 slaves are excluded from timeout (Refer Timeout section in mxs-peri.1 BROS for more details). Default Value: 0xFFFF

9.1.2 PERI0_TR_CMD

Description: Trigger command

Address: 0x42002000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	TR_SEL [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [15:13]			GROUP_SEL [12:8]				

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	RW	Reserved				
HW Access	RW1C	R	R	Reserved				
Name	ACTIVATE	OUT_SEL	TR_EDGE	Reserved [28:24]				

Bits	Name	Description
31	ACTIVATE	SW sets this field to '1' to activate (set to '1') a trigger as identified by TR_SEL, TR_EDGE and OUT_SEL. HW sets this field to '0' for edge sensitive triggers AFTER the selected trigger is activated for two clk_peri cycles. Note: when ACTIVATE is '1', SW should not modify the other register fields. SW MUST NOT set ACTIVATE bit to '1' while updating the other register bits simultaneously. At first the SW MUST update the other register bits as needed, and then set ACTIVATE to '1' with a new register write. Default Value: 0
30	OUT_SEL	Specifies whether trigger activation is for a specific input or output trigger of the trigger multiplexer. Activation of a specific input trigger, will result in activation of all output triggers that have the specific input trigger selected through their TR_CTL.TR_SEL field. Activation of a specific output trigger, will result in activation of the specified TR_SEL output trigger only. '0': TR_SEL selection and trigger activation is for an input trigger to the trigger multiplexer. '1': TR_SEL selection and trigger activation is for an output trigger from the trigger multiplexer. Note: this field is not used for trigger 1-to-1 groups. Default Value: 0
29	TR_EDGE	Specifies if the activated trigger is treated as a level sensitive or edge sensitive trigger. '0': level sensitive. The trigger reflects TR_CMD.ACTIVATE. '1': edge sensitive trigger. The trigger is activated for two clk_peri cycles. Default Value: 0
12 : 8	GROUP_SEL	Specifies the trigger group: "0"-"15": trigger multiplexer groups. "16"-"31": trigger 1-to-1 groups. Default Value: 0

9.1.2 PERI0_TR_CMD (continued)

7 : 0	TR_SEL	Specifies the activated trigger when ACTIVATE is '1'. If the specified trigger is not present, the trigger activation has no effect. Default Value: 0

9.1.3 PERI0_INFRA_CLK_FORCE

Description: Infrastructure clock force enable

Address: 0x42002004

Retention: Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	ENABLED	Slave Enable. Each bit indicates whether the respective slave is enabled. If the slave is disabled, its clock is gated off (constant "0"). Refer to the section "Peripheral Interconnect" within the "Bus Infrastructure" chapter of the PSOC™ Edge E8x2/E8x3/E8x5/E8x6 MCU architecture reference manual for the mapping between the SL_CTL.ENABLED bits and the MMIO slaves. Note: For peripheral group 0 slave 0,1, and 2 (the peripheral interconnect MMIO registers), this field is a constant '1' (SW: R): the slave can NOT be disabled. The peripheral IP that drives the Q-Channel back to Clock Controllers need to ensure that it has clock (usually driven by Clk_hf1~N that is only available after CPU configures their roots in the SRSS) to provide back the Q-Channel handshake, if not the deadlock situation will procure. To avoid deadlock mentioned above, all IPs in all groups other than group-0 are disabled (SL_CTL.ENABLED is set to '0') by default after POR (cold boot) (i.e. PERI HW hardcodes local parameter SL_CTL_DEFAULT to 32'hFFFFFFFF for group-0 and to 32'h00000000 for other groups (group-1 to group-15)). Once CPU is up and running & Clk_hf1~N configured, CPU can enable them. The SL_CTL.ENABLED are retained during DEEPSLEEP to avoid enabling configuration after wakeup. Default Value: 1023

9.1.5 PERI0_GR0_SL_CTL2

Description: Slave control2

Address: 0x42004014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	RST [7:0]							

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	INT8_DIV	Specifies a group clock divider (from the peripheral clock "clk_peri" to the group clock "clk_group[1/2/3/4/5/...15]"). Integer division by (1+INT8_DIV). Allows for integer divisions in the range [1, 256]. Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode. Default Value: 0

9.1.7 PERI0_GR1_SL_CTL

Description: Slave control

Address: 0x42004050

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	DBG_FREEZE_EN	Specifies if the output trigger is blocked in debug mode. When set high tr_dbg_freeze will block the output trigger generation. Default Value: 0
9	TR_EDGE	Specifies if the (inverted) output trigger is treated as a level sensitive or edge sensitive trigger. '0': level sensitive. '1': edge sensitive trigger. The (inverted) output trigger duration needs to be at least 2 cycles on the consumer clock. the(inverted) output trigger is synchronized to the consumer clock and a two cycle pulse is generated on the consumer clock. Default Value: 0
8	TR_INV	Specifies if the output trigger is inverted. Default Value: 0
7 : 0	TR_SEL	Specifies input trigger. This field is typically set during the setup of a chip use case scenario. Changing this field while activated triggers are present on the input triggers may result in unpredictable behavior. Note that input trigger 0 (default value) is typically connected to a constant signal level of '0', and as a result will not cause HW activation of the output trigger. Default Value: 0

SW Access	Reserved			RW	Reserved		RW	RW
HW Access	Reserved			R	Reserved		R	R
Name	Reserved [15:13]			DBG_-FREEZE_EN	Reserved [11:10]		TR_EDGE	TR_INV

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	DBG_FREEZE_EN	Specifies if the output trigger is blocked in debug mode. When set high tr_dbg_freeze will block the output trigger generation. Default Value: 0
9	TR_EDGE	Specifies if the (inverted) output trigger is treated as a level sensitive or edge sensitive trigger. '0': level sensitive. '1': edge sensitive trigger. The (inverted) output trigger duration needs to be at least 2 cycles on the consumer clock. the(inverted) output trigger is synchronized to the consumer clock and a two cycle pulse is generated on the consumer clock. Default Value: 0
8	TR_INV	Specifies if the output trigger is inverted. Default Value: 0
7 : 0	TR_SEL	Specifies input trigger. This field is typically set during the setup of a chip use case scenario. Changing this field while activated triggers are present on the input triggers may result in unpredictable behavior. Note that input trigger 0 (default value) is typically connected to a constant signal level of '0', and as a result will not cause HW activation of the output trigger. Default Value: 0

9.1.19 PERI0_TR_1TO1_GR0_TR_CTL0

Description: Trigger control register

Address: 0x4200C000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							TR_SEL

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	ENABLED	Slave Enable. Each bit indicates whether the respective slave is enabled. If the slave is disabled, its clock is gated off (constant "0"). Refer to the section "Peripheral Interconnect" within the "Bus Infrastructure" chapter of the PSOC™ Edge E8x2/E8x3/E8x5/E8x6 MCU architecture reference manual for the mapping between the SL_CTL.ENABLED bits and the MMIO slaves. Note: For peripheral group 0 slave 0,1, and 2 (the peripheral interconnect MMIO registers), this field is a constant '1' (SW: R): the slave can NOT be disabled. The peripheral IP that drives the Q-Channel back to Clock Controllers need to ensure that it has clock (usually driven by Clk_hf1~N that is only available after CPU configures their roots in the SRSS) to provide back the Q-Channel handshake, if not the deadlock situation will procure. To avoid deadlock mentioned above, all IPs in all groups other than group-0 are disabled (SL_CTL.ENABLED is set to '0') by default after POR (cold boot) (i.e. PERI HW hardcodes local parameter SL_CTL_DEFAULT to 32'hFFFFFFFF for group-0 and to 32'h00000000 for other groups (group-1 to group-15)). Once CPU is up and running & Clk_hf1~N configured, CPU can enable them. The SL_CTL.ENABLED are retained during DEEPSLEEP to avoid enabling configuration after wakeup. Default Value: 15

9.1.21 PERI1_GR0_SL_CTL2

Description: Slave control2

Address: 0x44004014

Retention: Retained

Bits	7	6	5	4	3	2	1	0

10 Program and Debug Interface registers

This section discusses the Program and Debug Interface registers. It lists all the registers in mapping tables, in address order.

10.1 Register details

Register name	Address	Description
DEBUG600_VERSION	0x42430000	IP Version Information
CM33_SCS_ICTR	0xE000E004	Interrupt Controller Type Register
CM33_SCS_ACTLR	0xE000E008	Auxiliary Control Register
CM33_SCS_SYST_CSR	0xE000E010	SysTick Control and Status Register
CM33_SCS_SYST_RVR	0xE000E014	SysTick Reload Value Register
CM33_SCS_SYST_CVR	0xE000E018	SysTick Current Value Register
CM33_SCS_SYST_CALIB	0xE000E01C	SysTick Calibration value Register
CM33_SCS_NVIC_ISER0	0xE000E100	Interrupt Set-Enable Registers
CM33_SCS_NVIC_ISER1	0xE000E104	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER2	0xE000E108	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER3	0xE000E10C	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER4	0xE000E110	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER5	0xE000E114	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER6	0xE000E118	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER7	0xE000E11C	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER8	0xE000E120	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER9	0xE000E124	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER10	0xE000E128	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER11	0xE000E12C	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER12	0xE000E130	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER13	0xE000E134	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.

Program and Debug Interface registers

Register name	Address	Description
CM33_SCS_NVIC_ISER14	0xE000E138	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ISER15	0xE000E13C	Interrupt Set-Enable Registers. See CM33_SCS_NVIC_ISER0 for the details of bit fields.
CM33_SCS_NVIC_ICER0	0xE000E180	Interrupt Clear-Enable Registers
CM33_SCS_NVIC_ICER1	0xE000E184	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER2	0xE000E188	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER3	0xE000E18C	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER4	0xE000E190	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER5	0xE000E194	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER6	0xE000E198	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER7	0xE000E19C	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER8	0xE000E1A0	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER9	0xE000E1A4	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER10	0xE000E1A8	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER11	0xE000E1AC	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER12	0xE000E1B0	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER13	0xE000E1B4	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER14	0xE000E1B8	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ICER15	0xE000E1BC	Interrupt Clear-Enable Registers. See CM33_SCS_NVIC_ICER0 for the details of bit fields.
CM33_SCS_NVIC_ISPR0	0xE000E200	Interrupt Set-Pending Registers
CM33_SCS_NVIC_ISPR1	0xE000E204	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR2	0xE000E208	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR3	0xE000E20C	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.

Program and Debug Interface registers

Register name	Address	Description
CM33_SCS_NVIC_ISPR4	0xE000E210	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR5	0xE000E214	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR6	0xE000E218	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR7	0xE000E21C	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR8	0xE000E220	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR9	0xE000E224	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR10	0xE000E228	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR11	0xE000E22C	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR12	0xE000E230	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR13	0xE000E234	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR14	0xE000E238	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ISPR15	0xE000E23C	Interrupt Set-Pending Registers. See CM33_SCS_NVIC_ISPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR0	0xE000E280	Interrupt Clear-Pending Registers
CM33_SCS_NVIC_ICPR1	0xE000E284	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR2	0xE000E288	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR3	0xE000E28C	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR4	0xE000E290	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR5	0xE000E294	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR6	0xE000E298	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR7	0xE000E29C	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR8	0xE000E2A0	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR9	0xE000E2A4	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.

Program and Debug Interface registers

Register name	Address	Description
CM33_SCS_NVIC_ICPR10	0xE000E2A8	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR11	0xE000E2AC	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR12	0xE000E2B0	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR13	0xE000E2B4	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR14	0xE000E2B8	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_ICPR15	0xE000E2BC	Interrupt Clear-Pending Registers. See CM33_SCS_NVIC_ICPR0 for the details of bit fields.
CM33_SCS_NVIC_IABR0	0xE000E300	Interrupt Active Bit Registers
CM33_SCS_NVIC_IABR1	0xE000E304	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR2	0xE000E308	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR3	0xE000E30C	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR4	0xE000E310	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR5	0xE000E314	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR6	0xE000E318	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR7	0xE000E31C	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR8	0xE000E320	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR9	0xE000E324	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR10	0xE000E328	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR11	0xE000E32C	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR12	0xE000E330	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR13	0xE000E334	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR14	0xE000E338	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.
CM33_SCS_NVIC_IABR15	0xE000E33C	Interrupt Active Bit Registers. See CM33_SCS_NVIC_IABR0 for the details of bit fields.

Program and Debug Interface registers

Register name	Address	Description
CM33_SCS_NVIC_ITNS0	0xE000E380	Interrupt Target Non-secure Registers
CM33_SCS_NVIC_ITNS1	0xE000E384	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS2	0xE000E388	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS3	0xE000E38C	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS4	0xE000E390	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS5	0xE000E394	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS6	0xE000E398	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS7	0xE000E39C	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS8	0xE000E3A0	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS9	0xE000E3A4	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS10	0xE000E3A8	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS11	0xE000E3AC	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS12	0xE000E3B0	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS13	0xE000E3B4	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS14	0xE000E3B8	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_ITNS15	0xE000E3BC	Interrupt Target Non-secure Registers. See CM33_SCS_NVIC_ITNS0 for the details of bit fields.
CM33_SCS_NVIC_IPR0	0xE000E400	Interrupt Priority Registers. This is the starting address of a register bank containing 120 registers (CM33_SCS_NVIC_IPR0 to CM33_SCS_NVIC_IPR119).
CM33_SCS_CPUID	0xE000ED00	CPUID Base Register
CM33_SCS_VTOR	0xE000ED08	Vector Table Offset Register
CM33_SCS_AIRCR	0xE000ED0C	Application Interrupt and Reset Control Register
CM33_SCS_SCR	0xE000ED10	System Control Register
CM33_SCS_CCR	0xE000ED14	Configuration and Control Register
CM33_SCS_DFSR	0xE000ED30	Debug Fault Status Register
CM33_SCS_ID_PFR0	0xE000ED40	Processor Feature Register 0
CM33_SCS_ID_PFR1	0xE000ED44	Processor Feature Register 1

Program and Debug Interface registers

Register name	Address	Description
CM33_SCS_ID_DFR0	0xE000ED48	Debug Feature Register 0
CM33_SCS_ID_AFR0	0xE000ED4C	Auxiliary Feature Register 0
CM33_SCS_ID_MMFR0	0xE000ED50	Memory Model Feature Register 0
CM33_SCS_ID_MMFR1	0xE000ED54	Memory Model Feature Register 1
CM33_SCS_ID_MMFR2	0xE000ED58	Memory Model Feature Register 2
CM33_SCS_ID_MMFR3	0xE000ED5C	Memory Model Feature Register 3
CM33_SCS_ID_ISAR0	0xE000ED60	Instruction Set Attributes Register 0
CM33_SCS_ID_ISAR1	0xE000ED64	Instruction Set Attributes Register 1
CM33_SCS_ID_ISAR2	0xE000ED68	Instruction Set Attributes Register 2
CM33_SCS_ID_ISAR3	0xE000ED6C	Instruction Set Attributes Register 3
CM33_SCS_ID_ISAR4	0xE000ED70	Instruction Set Attributes Register 4
CM33_SCS_CLIDR	0xE000ED78	Cache Level ID Register
CM33_SCS_CTR	0xE000ED7C	Cache Type Register
CM33_SCS_CPACR	0xE000ED88	Coprocessor Access Control Register
CM33_SCS_NSACR	0xE000ED8C	Non-secure Access Control Register
CM33_SCS_MPU_TYPE	0xE000ED90	MPU Type Register
CM33_SCS_MPU_CTRL	0xE000ED94	MPU Control Register
CM33_SCS_MPU_RNR	0xE000ED98	MPU Region Number Register
CM33_SCS_MPU_RBAR	0xE000ED9C	MPU Region Base Address Register
CM33_SCS_MPU_RLAR	0xE000EDA0	MPU Region Limit Address Register
CM33_SCS_MPU_RBAR_A1	0xE000EDA4	MPU alias registers
CM33_SCS_MPU_RLAR_A1	0xE000EDA8	MPU alias registers
CM33_SCS_MPU_RBAR_A2	0xE000EDAC	MPU alias registers
CM33_SCS_MPU_RLAR_A2	0xE000EDB0	MPU alias registers
CM33_SCS_MPU_RBAR_A3	0xE000EDB4	MPU alias registers
CM33_SCS_MPU_RLAR_A3	0xE000EDB8	MPU alias registers
CM33_SCS_MPU_MAIR0	0xE000EDC0	MPU Memory Attribute Indirection Register 0
CM33_SCS_MPU_MAIR1	0xE000EDC4	MPU Memory Attribute Indirection Register 1
CM33_SCS_SAU_CTRL	0xE000EDD0	SAU Control Register
CM33_SCS_SAU_TYPE	0xE000EDD4	SAU Type Register
CM33_SCS_SAU_RNR	0xE000EDD8	SAU Region Number Register
CM33_SCS_SAU_RBAR	0xE000EDDC	SAU Region Base Address Register
CM33_SCS_SAU_RLAR	0xE000EDE0	SAU Region Limit Address Register
CM33_SCS_DHCSR	0xE000EDF0	Debug Halting Control and Status Register
CM33_SCS_DCRSR	0xE000EDF4	Debug Core Register Selector Register
CM33_SCS_DCRDR	0xE000EDF8	Debug Core Register Data Register
CM33_SCS_DEMCR	0xE000EDFC	Debug Exception and Monitor Control Register
CM33_SCS_DAUTHCTRL	0xE000EE04	Debug Authentication Control Register
CM33_SCS_DSCSR	0xE000EE08	Debug Security Control and Status Register

Program and Debug Interface registers

Register name	Address	Description
CM33_SCS_FPCCR	0xE000EF34	FP Context Control Register
CM33_SCS_FPCAR	0xE000EF38	FP Context Control Register
CM33_SCS_FPDSCR	0xE000EF3C	FP Context Control Register
CM33_SCS_MVFR0	0xE000EF40	Media and VFP Feature Register 0
CM33_SCS_MVFR1	0xE000EF44	Media and VFP Feature Register 1
CM33_SCS_MVFR2	0xE000EF48	Media and VFP Feature Register 2
CM33_SCS_DAUTHSTATUS	0xE000EFB8	Debug Authentication Status Register
CM33_SCS_DEVARCH	0xE000EFBC	CoreSight Device Architecture Register
CM33_SCS_PIDR4	0xE000EFD0	Peripheral Identification Register 4
CM33_SCS_PIDR5	0xE000EFD4	Peripheral Identification Register 5
CM33_SCS_PIDR6	0xE000EFD8	Peripheral Identification Register 6
CM33_SCS_PIDR7	0xE000EFDC	Peripheral Identification Register 7
CM33_SCS_PIDR0	0xE000EFE0	Peripheral Identification Register 0
CM33_SCS_PIDR1	0xE000EFE4	Peripheral Identification Register 1
CM33_SCS_PIDR2	0xE000EFE8	Peripheral Identification Register 2
CM33_SCS_PIDR3	0xE000EFEC	Peripheral Identification Register 3
CM33_SCS_CIDR0	0xE000EFF0	Component Identification Register 0
CM33_SCS_CIDR1	0xE000EFF4	Component Identification Register 1
CM33_SCS_CIDR2	0xE000EFF8	Component Identification Register 2
CM33_SCS_CIDR3	0xE000EFFC	Component Identification Register 3
CM33_TRC_CTI_CTICONTROL	0xE0080000	CTI Control Register
CM33_TRC_CTI_CTIINTACK	0xE0080010	CTI Interrupt Acknowledge Register
CM33_TRC_CTI_CTIAPPSET	0xE0080014	CTI Application Trigger Set Register
CM33_TRC_CTI_CTIAPPCLEAR	0xE0080018	CTI Application Trigger Clear Register
CM33_TRC_CTI_CTIAPPPULSE	0xE008001C	CTI Application Pulse Register
CM33_TRC_CTI_CTIINEN0	0xE0080020	CTI Trigger to Channel Enable Registers
CM33_TRC_CTI_CTIINEN1	0xE0080024	CTI Trigger to Channel Enable Registers. See CM33_TRC_CTI_CTIINEN0 for the details of bit fields.
CM33_TRC_CTI_CTIINEN2	0xE0080028	CTI Trigger to Channel Enable Registers. See CM33_TRC_CTI_CTIINEN0 for the details of bit fields.
CM33_TRC_CTI_CTIINEN3	0xE008002C	CTI Trigger to Channel Enable Registers. See CM33_TRC_CTI_CTIINEN0 for the details of bit fields.
CM33_TRC_CTI_CTIINEN4	0xE0080030	CTI Trigger to Channel Enable Registers. See CM33_TRC_CTI_CTIINEN0 for the details of bit fields.
CM33_TRC_CTI_CTIINEN5	0xE0080034	CTI Trigger to Channel Enable Registers. See CM33_TRC_CTI_CTIINEN0 for the details of bit fields.
CM33_TRC_CTI_CTIINEN6	0xE0080038	CTI Trigger to Channel Enable Registers. See CM33_TRC_CTI_CTIINEN0 for the details of bit fields.
CM33_TRC_CTI_CTIINEN7	0xE008003C	CTI Trigger to Channel Enable Registers. See CM33_TRC_CTI_CTIINEN0 for the details of bit fields.

Program and Debug Interface registers

Register name	Address	Description
CM33_TRC_CTI_CTIOUTEN0	0xE00800A0	CTI Channel to Trigger Enable Registers
CM33_TRC_CTI_CTIOUTEN1	0xE00800A4	CTI Channel to Trigger Enable Registers. See CM33_TRC_CTI_CTIOUTEN0 for the details of bit fields.
CM33_TRC_CTI_CTIOUTEN2	0xE00800A8	CTI Channel to Trigger Enable Registers. See CM33_TRC_CTI_CTIOUTEN0 for the details of bit fields.
CM33_TRC_CTI_CTIOUTEN3	0xE00800AC	CTI Channel to Trigger Enable Registers. See CM33_TRC_CTI_CTIOUTEN0 for the details of bit fields.
CM33_TRC_CTI_CTIOUTEN4	0xE00800B0	CTI Channel to Trigger Enable Registers. See CM33_TRC_CTI_CTIOUTEN0 for the details of bit fields.
CM33_TRC_CTI_CTIOUTEN5	0xE00800B4	CTI Channel to Trigger Enable Registers. See CM33_TRC_CTI_CTIOUTEN0 for the details of bit fields.
CM33_TRC_CTI_CTIOUTEN6	0xE00800B8	CTI Channel to Trigger Enable Registers. See CM33_TRC_CTI_CTIOUTEN0 for the details of bit fields.
CM33_TRC_CTI_CTIOUTEN7	0xE00800BC	CTI Channel to Trigger Enable Registers. See CM33_TRC_CTI_CTIOUTEN0 for the details of bit fields.
CM33_TRC_CTI_CTITRIGINSTATUS	0xE0080130	CTI Trigger In Status Register
CM33_TRC_CTI_CTITRIGOUTSTATUS	0xE0080134	CTI Trigger Out Status Register
CM33_TRC_CTI_CTICHINSTATUS	0xE0080138	CTI Channel In Status Register
CM33_TRC_CTI_CTICHOUTSTATUS	0xE008013C	CTI Channel Out Status Register
CM33_TRC_CTI_CTIGATE	0xE0080140	Enable CTI Channel Gate Register

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	MAJOR	IP Major Revision Number Default Value: Undefined
7 : 0	MINOR	IP Minor Revision Number Default Value: Undefined

10.1.2 CM33_SCS_ICTR

Description: Interrupt Controller Type Register

Address: 0xE000E004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Shows the number of interrupt lines that the NVIC supports Total number of interrupt lines in groups of 32: 0b0000 = 1...32 0b0001 = 33...64 0b0010 = 65...96 0b0011 = 97...128 0b0100 = 129...160 0b0101 = 161...192 0b0110 = 193...224 0b0111 = 225...256 0b1000 = 257...288 0b1001 = 289...320 0b1010 = 321...352 0b1011 = 353...384 0b1100 = 385...416 0b1101 = 417...448 0b1110 = 449...480 Default Value: 0x0000000X

10.1.3 CM33_SCS_ACTLR

Description: Auxiliary Control Register

Address: 0xE000E008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer the following ARM documents for details about CPU register descriptions: ARMv8-M : https://developer.arm.com/documentation/ddi0553/latest/ CM33 TRM - ACTLR : https://developer.arm.com/documentation/100230/0100/System-Control/Auxiliary-Control-Register Default Value: 0

10.1.4 CM33_SCS_SYST_CSR

Description: SysTick Control and Status Register

Address: 0xE000E010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8

HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer "D2.2.189 SYST_CSR, SysTick Control and Status Register" in ARMv8-M architecture spec: https://developer.arm.com/documentation/ddi0553/latest/ Default Value: 0

10.1.5 CM33_SCS_SYST_RVR

Description: SysTick Reload Value Register

Address: 0xE000E014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer "D2.2.191 SYST_RVR, SysTick Reload Value Register" in ARMv8-M architecture spec: https://developer.arm.com/documentation/ddi0553/latest/ Default Value: 0

10.1.6 CM33_SCS_SYST_CVR

Description: SysTick Current Value Register

Address: 0xE000E018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer "D2.2.190 SYST_CVR, SysTick Current Value Register" in ARMv8-M architecture spec: https://developer.arm.com/documentation/ddi0553/latest/ Default Value: 0

10.1.7 CM33_SCS_SYST_CALIB

Description: SysTick Calibration value Register

Address: 0xE000E01C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer "D2.2.188 SYST_CALIB, SysTick Calibration Value Register" in ARMv8-M architecture spec: https://developer.arm.com/documentation/ddi0553/latest/ Default Value: 0

10.1.8 CM33_SCS_NVIC_ISER0

Description: Interrupt Set-Enable Registers

Address: 0xE000E100

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer CM33 TRM - CPUID: https://developer.arm.com/documentation/100230/0100/System-Control/CPUID-Base-Register Default Value: 0x410FD214

10.1.16 CM33_SCS_VTOR

Description: Vector Table Offset Register

Address: 0xE000ED08

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Table offset. Bits [31:7] of the vector table address for the selected Security state. It is IMPLEMENTATION DEFINED whether any of the TBLOFF bits are WI. This field resets to an IMPLEMENTATION DEFINED value on a Warm reset. Default Value: 0

10.1.17 CM33_SCS_AIRCR

Description: Application Interrupt and Reset Control Register

Address: 0xE000ED0C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	INTACK	Acknowledges the corresponding CTITRIGOUT output: 1 = CTITRIGOUT is acknowledged and is cleared when MAPTRIGOUT is LOW. 0 = no effect. There is one bit of the register for each CTITRIGOUT output. Default Value: 0

10.1.84 CM33_TRC_CTI_CTIAPPSET

Description: CTI Application Trigger Set Register

Address: 0xE0080014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				APPSET [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	APPSET	Setting a bit HIGH generates a channel event for the selected channel. Read: 0 = application trigger inactive (reset) 1 = application trigger active. Write: 0 = no effect 1 = generate channel event. There is one bit of the register for each channel. Default Value: 0

10.1.85 CM33_TRC_CTI_CTIAPPCLEAR

Description: CTI Application Trigger Clear Register

Address: 0xE0080018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				W			
HW Access	Reserved				R			
Name	Reserved [7:4]				APPCLEAR [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	APPCLEAR	Clears corresponding bits in the CTIAPPSET register. 1 = application trigger disabled in the CTIAPPSET register 0 = no effect. There is one bit of the register for each channel. Default Value: 0

10.1.86 CM33_TRC_CTI_CTIAPPPULSE

Description: CTI Application Pulse Register

Address: 0xE008001C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				W			
HW Access	Reserved				R			
Name	Reserved [7:4]				APPULSE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	APPULSE	Setting a bit HIGH generates a channel event pulse for the selected channel. Write: 1 = channel event pulse generated for one CTICLK period 0 = no effect. There is one bit of the register for each channel. Default Value: 0

10.1.87 CM33_TRC_CTI_CTIINEN0

Description: CTI Trigger to Channel Enable Registers

Address: 0xE0080020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				TRIGINEN [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TRIGINEN	Enables a cross trigger event to the corresponding channel when an CTITRIGIN is activated. 1 = enables the CTITRIGIN signal to generate an event on the respective channel of the CTM. There is one bit of the register for each of the four channels. For example in register CTIINEN0, TRIGINEN[0] set to 1 enables CTITRIGIN onto channel 0. 0 = disables the CTITRIGIN signal from generating an event on the respective channel of the CTM. Default Value: 0

10.1.88 CM33_TRC_CTI_CTIOUTEN0

Description: CTI Channel to Trigger Enable Registers

Address: 0xE00800A0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				TRIGOUTEN [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TRIGOUTEN	Changing the value of this bit from a 0 to a 1 enables a channel event for the corresponding channel to generate an CTITRIGOUT output: 0 = the channel input (CTICHIN) from the CTM is not routed to the CTITRIGOUT output 1 = the channel input (CTICHIN) from the CTM is routed to the CTITRIGOUT output. There is one bit for each of the four channels. For example in register CTIOUTEN0, enabling bit 0 enables CTICHIN[0] to cause a trigger event on the CTITRIGOUT[0] output. Default Value: 0

10.1.89 CM33_TRC_CTI_CTITRIGINSTATUS

Description: CTI Trigger In Status Register

Address: 0xE0080130

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	TRIGINSTATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	TRIGINSTATUS	Shows the status of the CTITRIGIN inputs: 1 = CTITRIGIN is active 0 = CTITRIGIN is inactive. Because the register provides a view of the raw CTITRIGIN inputs, the reset value is unknown. There is one bit of the register for each trigger input. Default Value: 0

10.1.90 CM33_TRC_CTI_CTITRIGOUTSTATUS

Description: CTI Trigger Out Status Register

Address: 0xE0080134

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	TRIGOUTSTATUS [7:0]							

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3	CTIGATEEN3	Enable CTICHOUT3. Set to 0 to disable channel propagation. Default Value: 1
2	CTIGATEEN2	Enable CTICHOUT2. Set to 0 to disable channel propagation. Default Value: 1
1	CTIGATEEN1	Enable CTICHOUT1. Set to 0 to disable channel propagation. Default Value: 1
0	CTIGATEEN0	Enable CTICHOUT0. Set to 0 to disable channel propagation. Default Value: 1

10.1.94 CM33_TRC_CTI_ASICCTL

Description: External Multiplexor Control Register

Address: 0xE0080144

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ASICCTL [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	ASICCTL	Implementation-defined ASIC control, value written to the register is output on ASICCTL[7:0]. If external multiplexing of trigger signals is implemented then the number of multiplexed signals on each trigger must be reflected within the Device ID Register. This is done within a Verilog define EXTMUXNUM. See ECT CoreSight defined registers on page 4-28. Default Value: 0

10.1.95 CM33_TRC_CTI_ITCHINACK

Description: ITCHINACK Register

Address: 0xE0080EDC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				W			
HW Access	Reserved				R			
Name	Reserved [7:4]				CTCHINACK [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	CTCHINACK	Set the value of the CTCHINACK outputs Default Value: 0

10.1.96 CM33_TRC_CTI_ITTRIGINACK

Description: ITTRIGINACK Register

Address: 0xE0080EE0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access	R							
Name	CTTRIGINACK [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	CTTRIGINACK	Set the value of the CTTRIGINACK outputs Default Value: 0

10.1.97 CM33_TRC_CTI_ITCHOUT

Description: ITCHOUT Register

Address: 0xE0080EE4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				W			
HW Access	Reserved				R			
Name	Reserved [7:4]				CTCHOUT [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	CTCHIN	Read the values of the CTCHIN inputs Default Value: 0

10.1.102 CM33_TRC_CTI_ITTRIGIN

Description: ITTRIGIN Register

Address: 0xE0080EF8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	CTTRIGIN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	CTTRIGIN	Read the values of the CTTRIGIN inputs Default Value: 0

10.1.103 CM33_TRC_CTI_ITCTRL

Description: Integration Mode Control Register

Address: 0xE0080F00

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							MODE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	MODE	When set, the component enters integration mode, enabling topology detection or integration testing to be performed. At reset the component must enter functional mode. If no integration functionality is implemented, this register must read as zero. Default Value: 0

10.1.104 CM33_TRC_CTI_CLAIMSET

Description: Claim Tag Set Register

Address: 0xE0080FA0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW1S			
HW Access	Reserved				R			
Name	Reserved [7:4]				TAG [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TAG	A bit programmable register bank which sets the Claim Tag Value. A read will return a logic 1 for all implemented locations. Default Value: 0xF

10.1.105 CM33_TRC_CTI_CLAIMCLR

Description: Claim Tag Clear Register

Address: 0xE0080FA4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW1C			
HW Access	Reserved				R			
Name	Reserved [7:4]				TAG [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TAG	A bit programmable register bank that is zero at reset. Default Value: 0

10.1.106 CM33_TRC_CTI_LAR

Description: Lock Access Register

Address: 0xE0080FB0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	KEY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	KEY [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	KEY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	KEY [31:24]							

Bits	Name	Description
31 : 0	KEY	Write Access Code. A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access. If LSR[2] is set, then only bits [7:0] of this register are implemented and lock access is obtained by consecutively writing 0xC5, 0xAC, 0xCE, 0x55. Bits [31:8] are unused and any writes to them ignored. Default Value: 0

10.1.107 CM33_TRC_CTI_LSR

Description: Lock Status Register

Address: 0xE0080FB4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R	R	R
HW Access	Reserved					W	W	W
Name	Reserved [7:3]					nTT	SLK	SLI

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	nTT	This component implements an 32-bit Lock Access Register. Default Value: 0
1	SLK	The values of this bit mean: 0 = Access permitted. 1 = Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted Default Value: 1
0	SLI	Indicates that a lock control mechanism exists for this device Default Value: 1

10.1.108 CM33_TRC_CTI_AUTHSTATUS

Description: Authentication Status Register

Address: 0xE0080FB8

Retention: Retained

HW Access	R							
Name	RES0_3 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	RES0_3 [31:24]							

Bits	Name	Description
31 : 11	RES0_3	RESERVED Default Value: 0
10 : 8	MEMWIDTH	This value is twice ATB_DATA_WIDTH. 0x3 Memory interface databus is 64-bits wide. (ATB_-DATA_WIDTH= 32bit) 0x4 Memory interface databus is 128-bits wide. (ATB_DATA_WIDTH= 64bit) 0x5 Memory interface databus is 256-bits wide. (ATB_DATA_WIDTH= 128bit) Default Value: 0
7 : 6	CONFIGTYPE	Returns 0x2, indicating ETF configuration Default Value: 0x2
5	CLKSCHEME	RAM Clocking Scheme. This value indicates the TMC RAM clocking scheme used, that is, whether the TMC RAM operates synchronously or asynchronously to the TMC clock. Fixed to 0 indicating that TMC RAM clock is synchronous to the clk input Default Value: 0
4 : 0	ATBINPORTCOUNT	Hidden Level of ATB input multiplexing. This value indicates the type/ number of ATB multiplex-ing present on the input ATB. Fixed to 0x00 indicating that no multiplexing is present. Default Value: 0

10.1.214 CM33_CSS600_TPIU_ITOUTCTR

Description: Integration Test Output Control Register

Address: 0xE008EEFC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	W							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	W							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	W							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Default Value: 0

10.1.215 CM33_CSS600_TPIU_ITCTRL

Description: Integration Mode Control Register

Address: 0xE008EF00

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [7:2]						MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1 : 0	MODE	Specifies the current mode for the TPIU: 0b00 Normal mode. 0b01 Integration test mode. 0b10 Integration data test mode. 0b11 Reserved. In integration data test mode, the trace output is disabled, and data can be read directly from each input port using the integration data registers. Default Value: 0

10.1.216 CM33_CSS600_TPIU_CLAIMSET

Description: Claim Tag Set Register

Address: 0xE008EFA0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW1S			
HW Access	Reserved				R			
Name	Reserved [7:4]				TAG [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TAG	A bit programmable register bank which sets the Claim Tag Value. A read will return a logic 1 for all implemented locations. Default Value: 0xF

10.1.217 CM33_CSS600_TPIU_CLAIMCLR

Description: Claim Tag Clear Register

Address: 0xE008EFA4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW1C			
HW Access	Reserved				R			
Name	Reserved [7:4]				TAG [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TAG	A bit programmable register bank that is zero at reset Default Value: 0

10.1.218 CM33_CSS600_TPIU_AUTHSTATUS

Description: Authentication Status Register

Address: 0xE008EFB8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				W			
Name	Reserved [7:4]				TAG [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TAG	Default Value: 0

10.1.219 CM33_CSS600_TPIU_DEVARCH

Description: Device Architecture Register

Address: 0xE008EFBC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				W			
Name	Reserved [7:4]				TAG [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	TAG	Default Value: 0

10.1.220 CM33_CSS600_TPIU_DEVID

Description: Device ID

Address: 0xE008EFC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer "B.3.10 Device Configuration Register" in ARMv8-M architecture spec: https://developer.arm.com/documentation/ddi0553/latest/ Default Value: 0x00000020

10.1.221 CM33_CSS600_TPIU_DEVTYPE

Description: Device Type Identifier Register

Address: 0xE008EFCC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Refer "B.3.11 Device Type Identifier Register" in ARMv8-M architecture spec: https://developer.arm.com/documentation/ddi0553/latest/ Default Value: 0x11

10.1.222 CM33_CSS600_TPIU_PIDR4

Description: Peripheral Identification Register 4

Address: 0xE008EFD0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R

11 Protection Units registers

This section discusses the Peripheral Protection Control (PPC) registers. It lists all the registers in mapping tables, in address order.

For more details on Memory Protection Controller (MPC) registers of different memories present in the MCU, see the following chapters:

- **SRAM Controller registers**
- **System-on-Chip Memory (SoCMEM) registers**
- **Non-Volatile Memory (NVM) registers**
- **Serial Memory Interface (SMIF) registers**

For details on Master Control and Protection Context registers, see the following chapter:

- **CPU Sub System (CPUSS) registers**

11.1 Register details

Register name	Address	Description
PPC0_PPC_CTL	0x42020000	PPC Control Registers
PPC0_PPC_LOCK_MASK	0x4202000C	Locked Mask
PPC0_PPC_PC_MASK0	0x42021000	Protection Context Mask. This is the starting address of a register bank containing 319 registers (PPC0_PPC_PC_MASK0 to PPC0_PPC_PC_MASK318).
PPC0_PPC_NS_ATT0	0x42022000	Non-secure attribute
PPC0_PPC_NS_ATT1	0x42022004	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT2	0x42022008	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT3	0x4202200C	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT4	0x42022010	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT5	0x42022014	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT6	0x42022018	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT7	0x4202201C	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT8	0x42022020	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_NS_ATT9	0x42022024	Non-secure attribute. See PPC0_PPC_NS_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT0	0x42022400	Secure Privilege Attribute

Protection Units registers

Register name	Address	Description
PPC0_PPC_S_P_ATT1	0x42022404	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT2	0x42022408	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT3	0x4202240C	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT4	0x42022410	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT5	0x42022414	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT6	0x42022418	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT7	0x4202241C	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT8	0x42022420	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_S_P_ATT9	0x42022424	Secure Privilege Attribute. See PPC0_PPC_S_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT0	0x42024000	Non-secure Privilege Attribute
PPC0_PPC_NS_P_ATT1	0x42024004	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT2	0x42024008	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT3	0x4202400C	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT4	0x42024010	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT5	0x42024014	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT6	0x42024018	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT7	0x4202401C	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT8	0x42024020	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_NS_P_ATT9	0x42024024	Non-secure Privilege Attribute. See PPC0_PPC_NS_P_ATT0 for the details of bit fields.
PPC0_PPC_R_ADDR0	0x42025000	Region Address

Protection Units registers

Register name	Address	Description
PPC0_PPC_R_ADDR1	0x42025004	Region Address

11.2 Registers default values

The table lists the address order of the default values of PPC0_PPC_R_ADDRx and PPC1_PPC_R_ADDRx register corresponding to the various PPC instances in the MCU.

Register Name	Address of the register	Default value of register
PPC0_PPC_R_ADDR0	0x42025000	0x10800000
PPC0_PPC_R_ADDR1	0x42025004	0x10801004
PPC0_PPC_R_ADDR2	0x42025008	0x10801010
PPC0_PPC_R_ADDR3	0x4202500C	0x10801020
PPC0_PPC_R_ADDR4	0x42025010	0x10801030
PPC0_PPC_R_ADDR5	0x42025014	0x10801044
PPC0_PPC_R_ADDR6	0x42025018	0x10801050
PPC0_PPC_R_ADDR7	0x4202501C	0x10801008
PPC0_PPC_R_ADDR8	0x42025020	0x10801018
PPC0_PPC_R_ADDR9	0x42025024	0x10801028
PPC0_PPC_R_ADDR10	0x42025028	0x10801038
PPC0_PPC_R_ADDR11	0x4202502C	0x10801048
PPC0_PPC_R_ADDR12	0x42025030	0x10801058
PPC0_PPC_R_ADDR13	0x42025034	0x10802000
PPC0_PPC_R_ADDR14	0x42025038	0x10808000
PPC0_PPC_R_ADDR15	0x4202503C	0x10809000

11.3.1 PPC0_PPC_CTL

Description: PPC Control Registers

Address: 0x42020000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							RESP_CFG

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	RESP_CFG	Response Configuration. This field configures the security violation response. 0 - Read-Zero Write Ignore (RZWI) 1 - Bus Error Default Value: 0

11.3.2 PPC0_PPC_LOCK_MASK

Description: Locked Mask

Address: 0x4202000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1S							
HW Access	R							
Name	LOCK_MASK [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	LOCK_MASK	A mask that indicates which protection contexts are 'locked'. Once locked, a protection context cannot be unlocked until the next reset or power cycle. Bit i specifies the locked status for protection context i. 0: The protection context is unlocked. 1: The protection context is locked. When a PC is locked, the PPC_PC_MASK, PPC_NS_ATT and PPC_S_P_ATT register bits for peripheral regions to which this PC has access can no longer be modified (PPC_NS_P_ATT is not subject to these restrictions). The one exception to this is that PPC_PC_MASK bits associated with other protection contexts that are not themselves locked can still be cleared (but not set). Default Value: 0

11.3.3 PPC0_PPC_PC_MASK0

Description: Protection Context Mask

Address: 0x42021000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	PC_MASK [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	PC_MASK	A mask that indicates which protection contexts have access to a peripheral region. Bit i specifies the access for protection context i. 0: The protection context has no access to this region. 1: The protection context has access to this region, subject to secure and privilege attribute constraints setup in PPC_NS_ATT, PPC_S_P_ATT, PPC_NS_P_ATT registers) Default Value: 255

11.3.4 PPC0_PPC_NS_ATT0

Description: Non-secure attribute

Address: 0x42022000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	NS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	NS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	NS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	NS [31:24]							

Bits	Name	Description
31 : 0	NS	Non-Secure. Each bit indicates whether access to a peripheral region must be secure or non-secure: IF SECURITY_AWARE=0 0 - allow only secure access to respective peripheral region. 1 - allow only non-secure access to respective peripheral region. IF SECURITY_AWARE=1 0 - allow only secure access to respective peripheral region. 1 - allows both secure and non-secure access to respective peripheral region. (Note that, depending on this setting the privilege access requirement for this region is specified in the corresponding PPC_S_P_ATT or PPC_NS_P_ATT register) Default Value: 0

11.3.5 PPC0_PPC_S_P_ATT0

Description: Secure Privilege Attribute

Address: 0x42022400

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	S_P [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	S_P [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	S_P [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	S_P [31:24]							

Bits	Name	Description
31 : 0	S_P	Secure Privilege. Each bit indicates whether access to a secure peripheral region requires privilege: 0 - allow only secure privileged access to respective peripheral region. 1 - allow only secure unprivileged or privileged access to respective peripheral region. Default Value: 0

11.3.6 PPC0_PPC_NS_P_ATT0

Description: Non-secure Privilege Attribute

Address: 0x42024000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	NS_P [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	NS_P [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	NS_P [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	NS_P [31:24]							

Bits	Name	Description
31 : 0	NS_P	Non-Secure Privilege. Each bit indicates whether access to a non-secure peripheral region requires privilege: 0 - allow only non-secure privileged access to respective peripheral region. 1 - allow only non-secure unprivileged or privileged access to respective peripheral region. Default Value: 0

11.3.7 PPC0_PPC_R_ADDR0

Description: Region Address

Address: 0x42025000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R						Reserved	
HW Access	W						Reserved	
Name	R_ADDR [7:2]						Reserved [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	R_ADDR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	R_ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	R_ADDR [31:24]							

Bits	Name	Description
31 : 2	R_ADDR	This field specifies the base address of the peripheral region. The region size is defined by R_ATTR.R_SIZE. A region of n Bytes mus be n Byte aligned. Therefore, some of the lesser significant address bits of ADDR must be '0's. E.g., a 64KB address region (R_SIZE is "15") must be 64 KByte aligned, and R_ADDR[13:0] must be '0's. Default Value: 276824064

11.3.8 PPC0_PPC_R_ATT0

Description: Region Attribute

Address: 0x42026000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	PC_MASK	A mask that indicates which protection contexts have access to a peripheral region. Bit i specifies the access for protection context i. 0: The protection context has no access to this region. 1: The protection context has access to this region, subject to secure and privilege attribute constraints setup in PPC_NS_ATT, PPC_S_P_ATT, PPC_NS_P_ATT registers) Default Value: 255

11.3.26 PPC1_PPC_NS_ATT0

Description: Non-secure attribute

Address: 0x44022000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	NS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	NS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	NS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	NS [31:24]							

Bits	Name	Description
31 : 0	NS	Non-Secure. Each bit indicates whether access to a peripheral region must be secure or non-secure: IF SECURITY_AWARE=0 0 - allow only secure access to respective peripheral region. 1 - allow only non-secure access to respective peripheral region. IF SECURITY_AWARE=1 0 - allow only secure access to respective peripheral region. 1 - allows both secure and non-secure access to respective peripheral region. (Note that, depending on this setting the privilege access requirement for this region is specified in the corresponding PPC_S_P_ATT or PPC_NS_P_ATT register) Default Value: 0

11.3.27 PPC1_PPC_S_P_ATT0

Description: Secure Privilege Attribute

Address: 0x44022400

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	S_P [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	S_P [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	S_P [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	S_P [31:24]							

Bits	Name	Description
31 : 0	S_P	Secure Privilege. Each bit indicates whether access to a secure peripheral region requires privilege: 0 - allow only secure privileged access to respective peripheral region. 1 - allow only secure unprivileged or privileged access to respective peripheral region. Default Value: 0

11.3.28 PPC1_PPC_NS_P_ATT0

Description: Non-secure Privilege Attribute

Address: 0x44024000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	NS_P [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	NS_P [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	NS_P [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	NS_P [31:24]							

Bits	Name	Description
31 : 0	NS_P	Non-Secure Privilege. Each bit indicates whether access to a non-secure peripheral region requires privilege: 0 - allow only non-secure privileged access to respective peripheral region. 1 - allow only non-secure unprivileged or privileged access to respective peripheral region. Default Value: 0

11.1.29 PPC1_PPC_R_ADDR0

Description: Region Address

Address: 0x44025000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R						Reserved	
HW Access	W						Reserved	
Name	R_ADDR [7:2]						Reserved [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	R_ADDR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	R_ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	R_ADDR [31:24]							

Bits	Name	Description
31 : 2	R_ADDR	This field specifies the base address of the peripheral region. The region size is defined by R_ATTR.R_SIZE. A region of n Bytes mus be n Byte aligned. Therefore, some of the lesser significant address bits of ADDR must be '0's. E.g., a 64KB address region (R_SIZE is "15") must be 64 KByte aligned, and R_ADDR[13:0] must be '0's. Default Value: 285212672

12 Cryptographic Accelerator registers

This section discusses the CRYPTO registers. It lists all the registers in mapping tables, in address order.

12.1 Register details

Register name	Address	Description
CRYPTO_CTL	0x42440000	Control
CRYPTO_RAM_PWR_CTL	0x42440008	SRAM power control
CRYPTO_RAM_PWR_DELAY_CTL	0x4244000C	SRAM power delay control
CRYPTO_ERROR_STATUS0	0x42440020	Error status 0
CRYPTO_ERROR_STATUS1	0x42440024	Error status 1
CRYPTO_INTR	0x42440100	Interrupt register
CRYPTO_INTR_SET	0x42440104	Interrupt set register
CRYPTO_INTR_MASK	0x42440108	Interrupt mask register
CRYPTO_INTR_MASKED	0x4244010C	Interrupt masked register
CRYPTO_PR_LFSR_CTL0	0x42440200	Pseudo random LFSR control 0
CRYPTO_PR_LFSR_CTL1	0x42440204	Pseudo random LFSR control 1
CRYPTO_PR_LFSR_CTL2	0x42440208	Pseudo random LFSR control 2
CRYPTO_PR_MAX_CTL	0x4244020C	Pseudo random maximum control
CRYPTO_PR_CMD	0x42440210	Pseudo random command
CRYPTO_PR_RESULT	0x42440218	Pseudo random result
CRYPTO_TR_CTL0	0x42440280	True random control 0
CRYPTO_TR_CTL1	0x42440284	True random control 1
CRYPTO_TR_CTL2	0x42440288	True random control 2
CRYPTO_TR_STATUS	0x4244028C	True random status
CRYPTO_TR_CMD	0x42440290	True random command
CRYPTO_TR_RESULT	0x42440298	True random result
CRYPTO_TR_GARO_CTL	0x424402A0	True random GARO control
CRYPTO_TR_FIRO_CTL	0x424402A4	True random FIRO control
CRYPTO_TR_MON_CTL	0x424402C0	True random monitor control
CRYPTO_TR_MON_CMD	0x424402C8	True random monitor command
CRYPTO_TR_MON_RC_CTL	0x424402D0	True random monitor RC control
CRYPTO_TR_MON_RC_STATUS0	0x424402D8	True random monitor RC status 0
CRYPTO_TR_MON_RC_STATUS1	0x424402DC	True random monitor RC status 1
CRYPTO_TR_MON_AP_CTL	0x424402E0	True random monitor AP control
CRYPTO_TR_MON_AP_STATUS0	0x424402E8	True random monitor AP status 0
CRYPTO_TR_MON_AP_STATUS1	0x424402EC	True random monitor AP status 1
CRYPTO_STATUS	0x42441004	Status
CRYPTO_INSTR_FF_CTL	0x42441040	Instruction FIFO control

Cryptographic Accelerator registers

Register name	Address	Description
CRYPTO_INSTR_FF_STATUS	0x42441044	Instruction FIFO status
CRYPTO_INSTR_FF_WR	0x42441048	Instruction FIFO write
CRYPTO_LOAD0_FF_STATUS	0x424410C0	Load 0 FIFO status
CRYPTO_LOAD1_FF_STATUS	0x424410D0	Load 1 FIFO status
CRYPTO_STORE_FF_STATUS	0x424410F0	Store FIFO status
CRYPTO_AES_CTL	0x42441100	AES control
CRYPTO_RESULT	0x42441180	Result
CRYPTO_CRC_CTL	0x42441400	CRC control
CRYPTO_CRC_DATA_CTL	0x42441410	CRC data control
CRYPTO_CRC_POL_CTL	0x42441420	CRC polynomial control
CRYPTO_CRC_REM_CTL	0x42441440	CRC remainder control
CRYPTO_CRC_REM_RESULT	0x42441448	CRC remainder result
CRYPTO_VU_CTL0	0x42441480	Vector unit control 0
CRYPTO_VU_CTL1	0x42441484	Vector unit control 1
CRYPTO_VU_CTL2	0x42441488	Vector unit control 2
CRYPTO_VU_STATUS	0x42441490	Vector unit status
CRYPTO_VU_RF_DATA0	0x424414C0	Vector unit register-file
CRYPTO_VU_RF_DATA1	0x424414C4	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA2	0x424414C8	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA3	0x424414CC	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA4	0x424414D0	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA5	0x424414D4	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA6	0x424414D8	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA7	0x424414DC	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA8	0x424414E0	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA9	0x424414E4	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA10	0x424414E8	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA11	0x424414EC	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA12	0x424414F0	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.

Cryptographic Accelerator registers

Register name	Address	Description
CRYPTO_VU_RF_DATA13	0x424414F4	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA14	0x424414F8	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_VU_RF_DATA15	0x424414FC	Vector unit register-file. See CRYPTO_VU_RF_DATA0 for the details of bit fields.
CRYPTO_DEV_KEY_ADDR0_CTL	0x42442000	Device key address 0 control
CRYPTO_DEV_KEY_ADDR0	0x42442004	Device key address 0
CRYPTO_DEV_KEY_ADDR1_CTL	0x42442020	Device key address 1 control
CRYPTO_DEV_KEY_ADDR1	0x42442024	Device key address 1 control
CRYPTO_DEV_KEY_STATUS	0x42442080	Device key status
CRYPTO_DEV_KEY_CTL0	0x42442100	Device key control 0
CRYPTO_DEV_KEY_CTL1	0x42442120	Device key control 1
CRYPTO_MEM_BUFF0	0x42448000	Memory buffer. This is the starting address of a register bank containing 1024 registers (CRYPTO_MEM_BUFF0 to CRYPTO_MEM_BUFF1023).

12.1.1 CRYPTO_CTL

Description: Control

Address: 0x42440000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				Reserved		RW	RW
HW Access	R				Reserved		R	R
Name	PC [7:4]				Reserved [3:2]		NS	P

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	IP enable: '0': Disabled. All non-retention registers (command and status registers, instruct FIFO, internal component state machines) are reset to their default value when the IP is disabled. All retention registers retain their value when the IP is disabled. '1': Enabled. When the IP is enabled, the IP register buffer is set to "0". Default Value: 0 **0x0: DISABLED :** **0x1: ENABLED :**
7 : 4	PC	Protection context. This field is set with the protection context of the transaction that writes this register; i.e. the context is inherited from the write transaction and not specified by the transaction write data. All IP master transactions use the PC field for the protection context. There is one exception: the LOAD_DEV_KEY instruction IP master transactions are always performed with protection context "0". Default Value: 0
1	NS	Secure/on-secure access control: '0': secure. '1': non-secure. This field is set with the secure/non-secure access control of the transaction that writes this register; i.e. the access control is inherited from the write transaction and not specified by the transaction write data. All IP master transactions use the NS field for the secure/non-secure access control ("hprot[4]"). Default Value: 1

12.1.1 CRYPTO_CTL (continued)

0	P	User/privileged access control: '0': user mode. '1': privileged mode. This field is set with the user/privileged access control of the transaction that writes this register; i.e. the access control is inherited from the write transaction and not specified by the transaction write data. All IP master transactions use the P field for the user/privileged access control ("hprot[1]"). Default Value: 0

12.1.2 CRYPTO_RAM_PWR_CTL

Description: SRAM power control

Address: 0x42440008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [7:2]						PWR_MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1 : 0	PWR_MODE	Set power mode for memory buffer SRAM. Default Value: 3 **0x0: OFF :** Turn OFF the SRAM. This will turn OFF both array and periphery power of the SRAM and SRAM memory contents are lost. **0x1: RESERVED :** undefined **0x2: RETAINED :** Keep SRAM in Retained mode. This will turn OFF the SRAM periphery power, but array power is ON to retain memory contents. The SRAM contents will be retained in DeepSleep/DeepSleep-RAM system power mode. **0x3: ENABLED :** Enable SRAM for regular operation. The SRAM contents will be retained in DeepSleep/DeepSleep-RAM system power mode.

12.1.3 CRYPTO_RAM_PWR_DELAY_CTL

Description: SRAM power delay control

Address: 0x4244000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	UP [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [15:10]						UP [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	UP	Number clock cycles delay needed after power domain power up Default Value: 0x96

12.1.4 CRYPTO_ERROR_STATUS0

Description: Error status 0

Address: 0x42440020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	DATA32 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	DATA32 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	DATA32 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	DATA32 [31:24]							

Bits	Name	Description
31 : 0	DATA32	Specifies error description information. - For INSTR_OPC_ERROR/ INSTR_CC_ERROR/ INSTR_DEV_KEY_ERROR: - Violating instruction (from instruction FIFO). - For BUS_ERROR: - Violating transfer, address. Default Value: Undefined

12.1.5 CRYPTO_ERROR_STATUS1

Description: Error status 1

Address: 0x42440024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	DATA24 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	DATA24 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	DATA24 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved				R		
HW Access	RW	Reserved				RW		
Name	VALID	Reserved [30:27]				IDX [26:24]		

Bits	Name	Description
31	VALID	Specifies if ERROR_STATUS0 and ERROR_STATUS1 specify valid error information. No new error information is captured as long as VALID is '1'; i.e. the error information of the first detected error is NOT overwritten. Default Value: 0
26 : 24	IDX	Error source: "0": INSTR_OPC_ERROR (instruction FIFO decoder error). "1": INSTR_CC_ERROR (instruction FIFO decoder, VU CC error). "2": BUS_ERROR (bus master interface AHB-Lite bus error). "3": TR_AP_DETECT_ERROR. "4": TR_RC_DETECT_ERROR. "5": INSTR_DEV_KEY_ERROR. "6"-"7": Undefined. Default Value: Undefined
23 : 0	DATA24	Specifies error description information. - For BUS_ERROR: - Violating transfer, read attribute (DATA[0]). - Violating transfer, size attribute (DATA[5:4]). "0": 8-bit transfer, "1": 16 bits transfer, "2": 32-bit transfer. Default Value: Undefined

12.1.6 CRYPTO_INTR

Description: Interrupt register

Address: 0x42440100

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW1C	RW1C	RW1C	RW1C	RW1C
HW Access	Reserved			RW1S	RW1S	RW1S	RW1S	RW1S
Name	Reserved [7:5]			PR_-DATA_AVAILABLE	TR_-DATA_AVAILABLE	TR_INITIALIZED	INSTR_FF_OVERFLOW	INSTR_FF_LEVEL

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved		RW1C	RW1C	RW1C	RW1C	RW1C	RW1C
HW Access	Reserved		RW1S	RW1S	RW1S	RW1S	RW1S	RW1S
Name	Reserved [23:22]		INSTR_DEV_KEY_ERROR	TR_RC_-DETECT_ERROR	TR_AP_DETECT_ERROR	BUS_ERROR	INSTR_CC_ERROR	INSTR_OPC_ERROR

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
21	INSTR_DEV_KEY_ERROR	This interrupt cause is activated (HW sets the field to '1') when the LOAD_DEV_KEY instruction tries to load a device key whose DEV_KEY_ADDR_CTL.VALID or DEV_KEY_CTL.ALLOWED is set to '0'. Default Value: 0
20	TR_RC_DETECT_ERROR	This interrupt cause is activated (HW sets the field to '1') when the true random number generator monitor adaptive proportion test detects a disproportionate occurrence of a specific bit value. Default Value: 0
19	TR_AP_DETECT_ERROR	This interrupt cause is activated (HW sets the field to '1') when the true random number generator monitor adaptive proportion test detects a repetition of a specific bit value. Default Value: 0
18	BUS_ERROR	This interrupt cause is activated (HW sets the field to '1') when a AHB-Lite bus error is observed on the AHB-Lite master interface. When the interrupt cause is activated, HW sets INSTR_FF_CTL.CLEAR to '1'. Default Value: 0
17	INSTR_CC_ERROR	This interrupt cause is activated (HW sets the field to '1') when the instruction decoder encounters an instruction with a non-defined condition code. This error is only generated for VU instructions. When the interrupt cause is activated, HW sets INSTR_FF_CTL.CLEAR to '1'. Default Value: 0

12.1.6 CRYPTO_INTR (continued)

16	INSTR_OPC_ERROR	This interrupt cause is activated (HW sets the field to '1') when the instruction decoder encounters an instruction with a non-defined operation code (opcode). When the interrupt cause is activated, HW sets INSTR_FF_CTL.CLEAR to '1'. Default Value: 0
4	PR_DATA_AVAILABLE	This interrupt cause is activated (HW sets the field to '1') when the pseudo random number generator has generated a data value. Default Value: 0
3	TR_DATA_AVAILABLE	This interrupt cause is activated (HW sets the field to '1') when the true random number generator has generated a data value of the specified bit size. Default Value: 0
2	TR_INITIALIZED	This interrupt cause is activated (HW sets the field to '1') when the true random number generator is initialized. Default Value: 0
1	INSTR_FF_OVERFLOW	This interrupt cause is activated (HW sets the field to '1') when the instruction FIFO overflows (an attempt is made to write to a full FIFO). Default Value: 0
0	INSTR_FF_LEVEL	This interrupt cause is activated (HW sets the field to '1') when the instruction FIFO event is activated. Default Value: 0

12.1.7 CRYPTO_INTR_SET

Description: Interrupt set register

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	LFSR32 [31:24]							

Bits	Name	Description
31 : 0	LFSR32	State of a 32-bit Linear Feedback Shift Registers (LFSR) that is used to generate a pseudo random bit sequence. This register needs to be initialized by SW. The initialization value should be different from "0". The three PR_LFSR_CTL registers represents the state of a 32-bit, 31-bit and 29-bit LFSR. Individually, these LFSRs generate a pseudo random bit sequence that repeats itself after (2^32)-1, (2^31)-1 and (2^29)-1 bits. The numbers (2^32)-1, (2^31)-1 and (2^29)-1 are relatively prime (their greatest common denominator is "1"). The three bit sequence are combined (XOR'd) into a single bitstream to create a pseudo random bit sequence that repeats itself after ((2^32)-1) * ((2^31)-1) * ((2*29)-1) bits. The following polynomials are used: - 32-bit irreducible polynomial: x^32+x^30+x^26+x^25+1. - 31-bit irreducible polynomial: x^31+x^28+1. - 29-bit irreducible polynomial: x^29+x^27+1. Default Value: 0xD8959BC9

12.1.11 CRYPTO_PR_LFSR_CTL1

HW Access	R							
Name	RED_CLOCK_DIV [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	INIT_DELAY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved		RW	RW	Reserved			RW
HW Access	Reserved		R	R	Reserved			R
Name	Reserved [31:30]		STOP_ON_RC_DETECT	STOP_ON_AP_DETECT	Reserved [27:25]			VON_NEUMANN_CORR

Bits	Name	Description
29	STOP_ON_RC_DETECT	Specifies if TRNG functionality is stopped on a repetition count test detection (when HW sets INTR.TR_RC_DETECT to '1'): '0': Functionality is NOT stopped. '1': Functionality is stopped (TR_CTL1 fields are set to '0' by HW). Default Value: 0
28	STOP_ON_AP_DETECT	Specifies if TRNG functionality is stopped on an adaptive proportion test detection (when HW sets INTR.TR_AP_DETECT to '1'): '0': Functionality is NOT stopped. '1': Functionality is stopped (TR_CTL1 fields are set to '0' by HW). Default Value: 0
24	VON_NEUMANN_CORR	Specifies if the "von Neumann corrector" is disabled or enabled: '0': disabled. '1': enabled. The "von Neumann corrector" post-processes the reduced bits to remove a '0' or '1' bias. The corrector operates on reduced bit pairs ("oldest bit, newest bit"): "00": no bit is produced. "01": '0' bit is produced (oldest bit). "10": '1' bit is produced (oldest bit). "11": no bit is produced. Note that the corrector produces bits at a random pace and at a frequency that is 1/4 of the reduced bit frequency (reduced bits are processed in pairs, and half of the pairs do NOT produce a bit). Default Value: 0

12.1.16 CRYPTO_TR_CTL0 (continued)

23 : 16	INIT_DELAY	Specifies an initialization delay: number of removed/dropped samples before reduced bits are generated. This field should be programmed in the range [1, 255]. After starting the oscillators, at least the first 2 samples should be removed/dropped to clear the state of internal synchronizers. In addition, it is advised to drop at least the second 2 samples from the oscillators (to circumvent the semi-predictable oscillator startup behavior). This result in the default field value of "3". Field encoding is as follows: "0": 1 sample is dropped. "1": 2 samples are dropped. ... "255": 256 samples are dropped. The TR_INITIALIZED interrupt cause is set to '1', when the initialization delay is passed. Default Value: 3
15 : 8	RED_CLOCK_DIV	Specifies the clock divider that is used to produce reduced bits. "0": 1 reduced bit is produced for each sample. "1": 1 reduced bit is produced for each 2 samples. ... "255": 1 reduced bit is produced for each 256 samples. The reduced bits are considered random bits and shifted into TR_RESULT0.DATA32. Default Value: 0
7 : 0	SAMPLE_CLOCK_DIV	Specifies the clock divider that is used to sample oscillator data. This clock divider is wrt. "clk_sys". "0": sample clock is "clk_sys". "1": sample clock is "clk_sys"/2. ... "255": sample clock is "clk_sys"/256. Default Value: 0

12.1.17 CRYPTO_TR_CTL1

HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RW	RW
HW Access	Reserved						R	RW1S
Name	Reserved [23:18]						BLOCK	CLEAR

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17	BLOCK	This field specifies the behavior when an instruction is written to a full FIFO (INSTR_FIFO_WR MMIO register): '0': The write is ignored/dropped and the INTR.INSTR_FF_OVERFLOW interrupt cause is set to '1'. '1': The write is blocked, resulting in AHB-Lite wait states and the INTR.INSTR_FF_OVERFLOW interrupt cause is set to '1' (this cause may be masked out). The instruction is written to the FIFO as soon as a FIFO entry becomes available. The maximum time is roughly the time of the execution of the slowest/longest instruction. Note that this setting may "lock up" /stall the CPU. When the CPU is "locked up"/stalled it can not respond to any system interrupts. As a result, the interrupt latency is increased. Note that this may not be an issue if the associated CPU is only performing cryptography functionality, e.g. the CM0+ during boot time. Default Value: 1
16	CLEAR	When '1', the instruction FIFO is cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. HW sets this field to '1' on when a INSTR_OPC_ERROR, INSTR_CC_ERROR or BUS_ERROR interrupt cause is activated. Default Value: 0
2 : 0	EVENT_LEVEL	Event level. When the number of entries in the instruction FIFO is less than the amount of this field, an event is generated: - "event" = INSTR_FF_STATUS.USED < EVENT_LEVEL. Default Value: 0

12.1.34 CRYPTO_INSTR_FF_STATUS

Description: Instruction FIFO status

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	REM [31:24]							

Bits	Name	Description
31 : 0	REM	Remainder value. The alignment of the remainder depends on CRC_REM_CTL0.REM_REVERSE: '0': the more significant bits (bit 31 and down) contain the remainder. '1': the less significant bits (bit 0 and up) contain the remainder. Note: This field is combinatorially derived from CRC_LFSR_CTL.LFSR32, CRC_REM_CTL0.REM_REVERSE and CRC_REM_CTL1.REM_XOR. Default Value: 0

12.1.46 CRYPTO_VU_CTL0

Description: Vector unit control 0

Address: 0x42441480

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							ALWAYS_EXECUTE

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	ALWAYS_EXECUTE	Specifies if a conditional instruction is executed or not, when its condition code evaluates to false/'0'. '0': The instruction is NOT executed. As a result, the instruction may be handled faster than when it is executed. '1': The instruction is executed, but the execution result (including status field information) is not reflected in the IP. The instruction is handled just as fast as when it is executed. Note: a conditional instruction with a condition code that evaluates to false/'0' does not affect the architectural state: VU_STATUS fields, memory or register-file data. Note: Always execution is useful to prevent/complicate differential timing and differential power attacks. Default Value: 0

12.1.47 CRYPTO_VU_CTL1

Description: Vector unit control 1

Address: 0x42441484

Retention: Retained

Bits	7	6	5	4	3	2	1	0

HW Access	R							
Name	ADDR24 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDR24 [31:24]							

Bits	Name	Description
31 : 8	ADDR24	Specifies the memory address for the vector unit operand memory region. The register-file registers provide 13-bit word offsets within this memory region. Given ADDR[31:8], VU_VTL2.MASK[14:8] and a 13-bit word offset offset[14:2], a vector operand memory address VU_OPERAND_ADDR[31:0] is calculated as follows: - VU_OPERAND_ADDR[31:15] = ADDR[31:15] - VU_OPERAND_ADDR[14:8] = (ADDR[14:8] & MASK[14:8]) | (offset[14:8] & ~MASK[14:8]) - VU_OPERAND_ADDR[7:2] = offset[7:2] - VU_OPERAND_ADDR[1:0] = 0 (always word aligned) The vector unit operand memory region uses either the IP's memory buffer or system memory. For best performance, the IP's memory buffer should be used and ADDR should be set to MEM_BUFF and MASK should specify the IP memory buffer size. If a vector operand memory address is mapped on a memory hole, read accesses return a "0" and write accesses are ignored Note: The base address of the IP internal memory buffer is equal to IP_ADDR + MEM_BUFF where. - IP_ADDR is the top-level design time parameter. - MEM_BUFF is address offset value for MEM_BUFF MMIO register.. Default Value: 0

12.1.48 CRYPTO_VU_CTL2

Description: Vector unit control 2

Address: 0x42441488

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	LOADED	Specifies if a device key is present in the IP register buffer blocks 4 and 5. HW sets this field to '1' on successful completion of a LOAD_DEV_KEY instruction. HW clears this field to '0' when a CLEAR instruction is executed (the CLEAR instruction also sets the IP register buffer to "0"). Default Value: 0

12.1.56 CRYPTO_DEV_KEY_CTL0

Description: Device key control 0

Address: 0x42442100

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							ALLOWED

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	ALLOWED	Specifies if a LOAD_DEV_KEY instruction is allowed to use the device key in memory: '0': Not allowed. '1': Allowed. Note: For successful completion of a LOAD_DEV_KEY instruction, both the associated DEV_KEY_ADDR_CTL.VALID and DEV_KEY_CTL.ALLOWED fields must be '1'. On successful instruction completion, DEV_KEY_STATUS.LOADED is set to '1'. On unsuccessful completion, the instruction FIFO is cleared and the IP is locked; an Active reset or an IP reset (CTL.ENABLED), which reinitializes the IP, is required. Note: A LOAD_DEV_KEY loads the device key from memory with protection context "0". Default Value: 0

12.1.57 CRYPTO_DEV_KEY_CTL1

Description: Device key control 1

Address: 0x42442120

Retention: Not Retained

13 Device Power Modes registers

This section discusses the Device power modes registers. It lists all the registers in mapping tables, in address order.

13.1 Register details

Register name	Address	Description
PWRMODE_PD0_PD_SENSE	0x42410000	Dependency Sense Register
PWRMODE_PD0_PD_SPT	0x42410004	Dependency Support Register
PWRMODE_PD1_PD_SENSE	0x42410010	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD1_PD_SPT	0x42410014	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD2_PD_SENSE	0x42410020	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD2_PD_SPT	0x42410024	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD3_PD_SENSE	0x42410030	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD3_PD_SPT	0x42410034	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD4_PD_SENSE	0x42410040	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD4_PD_SPT	0x42410044	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD5_PD_SENSE	0x42410050	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD5_PD_SPT	0x42410054	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD6_PD_SENSE	0x42410060	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD6_PD_SPT	0x42410064	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD7_PD_SENSE	0x42410070	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD7_PD_SPT	0x42410074	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD8_PD_SENSE	0x42410080	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD8_PD_SPT	0x42410084	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD9_PD_SENSE	0x42410090	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.

Device Power Modes registers

Register name	Address	Description
PWRMODE_PD9_PD_SPT	0x42410094	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD10_PD_SENSE	0x424100A0	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD10_PD_SPT	0x424100A4	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD11_PD_SENSE	0x424100B0	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD11_PD_SPT	0x424100B4	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD12_PD_SENSE	0x424100C0	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD12_PD_SPT	0x424100C4	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD13_PD_SENSE	0x424100D0	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD13_PD_SPT	0x424100D4	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD14_PD_SENSE	0x424100E0	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD14_PD_SPT	0x424100E4	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PD15_PD_SENSE	0x424100F0	Dependency Sense Register. See PWRMODE_PD0_PD_SENSE for the details of bit fields.
PWRMODE_PD15_PD_SPT	0x424100F4	Dependency Support Register. See PWRMODE_PD0_PD_SPT for the details of bit fields.
PWRMODE_PPU_MAIN_PPU_PWPR	0x42411000	Power Policy Register
PWRMODE_PPU_MAIN_PPU_PMER	0x42411004	Power Mode Emulation Register
PWRMODE_PPU_MAIN_PPU_PWSR	0x42411008	Power Status Register
PWRMODE_PPU_MAIN_PPU_DISR	0x42411010	Device Interface Input Current Status Register
PWRMODE_PPU_MAIN_PPU_MISR	0x42411014	Miscellaneous Input Current Status Register
PWRMODE_PPU_MAIN_PPU_STSR	0x42411018	Stored Status Register
PWRMODE_PPU_MAIN_PPU_UNLK	0x4241101C	Unlock register
PWRMODE_PPU_MAIN_PPU_PWCR	0x42411020	Power Configuration Register
PWRMODE_PPU_MAIN_PPU_PTCR	0x42411024	Power Mode Transition Configuration Register
PWRMODE_PPU_MAIN_PPU_IMR	0x42411030	Interrupt Mask Register
PWRMODE_PPU_MAIN_PPU_AIMR	0x42411034	Additional Interrupt Mask Register
PWRMODE_PPU_MAIN_PPU_ISR	0x42411038	Interrupt Status Register
PWRMODE_PPU_MAIN_PPU_AISR	0x4241103C	Additional Interrupt Status Register
PWRMODE_PPU_MAIN_PPU_IESR	0x42411040	Input Edge Sensitivity Register
PWRMODE_PPU_MAIN_PPU_OPSR	0x42411044	Operating Mode Active Edge Sensitivity Register

Device Power Modes registers

Register name	Address	Description
PWRMODE_PPU_MAIN_PPU_FUNRR	0x42411050	Functional Retention RAM Configuration Register
PWRMODE_PPU_MAIN_PPU_FULRR	0x42411054	Full Retention RAM Configuration Register
PWRMODE_PPU_MAIN_PPU_MEMRR	0x42411058	Memory Retention RAM Configuration Register
PWRMODE_PPU_MAIN_PPU_EDTR0	0x42411160	Power Mode Entry Delay Register 0
PWRMODE_PPU_MAIN_PPU_EDTR1	0x42411164	Power Mode Entry Delay Register 1
PWRMODE_PPU_MAIN_PPU_DCDR0	0x42411170	Device Control Delay Configuration Register 0
PWRMODE_PPU_MAIN_PPU_DCDR1	0x42411174	Device Control Delay Configuration Register 1
PWRMODE_PPU_MAIN_PPU_IDR0	0x42411FB0	PPU Identification Register 0

PWRMODE_PPU_MAIN_PPU_IIDR	0x42411FC8	Implementation Identification Register
PWRMODE_PPU_MAIN_PPU_AIDR	0x42411FCC	Architecture Identification Register
PWRMODE_CLK_SELECT	0x42412000	Clock Selection for Power Mode Components
PWRMODE_PDCM_HWSTAT_IN	0x42412004	PPU Status input
PWRMODE_PDCM_PD_PRESENT	0x42412008	Mask for whether a PD is present in the PDCM
PWRMODE_PPU_PD1_PWPR	0x42413000	Power Policy Register
PWRMODE_PPU_PD1_PMER	0x42413004	Power Mode Emulation Register. See PWRMODE_PPU_MAIN_PPU_PMER for the details of bit fields.
PWRMODE_PPU_PD1_PWSR	0x42413008	Power Status Register. See PWRMODE_PPU_MAIN_PPU_PWSR for the details of bit fields.
PWRMODE_PPU_PD1_DISR	0x42413010	Device Interface Input Current Status Register. See PWRMODE_PPU_MAIN_PPU_DISR for the details of bit fields.
PWRMODE_PPU_PD1_MISR	0x42413014	Miscellaneous Input Current Status Register. See PWRMODE_PPU_MAIN_PPU_MISR for the details of bit fields.
PWRMODE_PPU_PD1_STSR	0x42413018	Stored Status Register. See PWRMODE_PPU_MAIN_PPU_STSR for the details of bit fields.
PWRMODE_PPU_PD1_UNLK	0x4241301C	Unlock register. See PWRMODE_PPU_MAIN_PPU_UNLK for the details of bit fields.
PWRMODE_PPU_PD1_PWCR	0x42413020	Power Configuration Register. See PWRMODE_PPU_MAIN_PPU_PWCR for the details of bit fields.
PWRMODE_PPU_PD1_PTCR	0x42413024	Power Mode Transition Configuration Register. See PWRMODE_PPU_MAIN_PPU_PTCR for the details of bit fields.
PWRMODE_PPU_PD1_IMR	0x42413030	Interrupt Mask Register. See PWRMODE_PPU_MAIN_PPU_IMR for the details of bit fields.

Device Power Modes registers

Register name	Address	Description
PWRMODE_PPU_PD1_AIMR	0x42413034	Additional Interrupt Mask Register. See PWRMODE_PPU_MAIN_PPU_AIMR for the details of bit fields.
PWRMODE_PPU_PD1_ISR	0x42413038	Interrupt Status Register. See PWRMODE_PPU_MAIN_PPU_ISR for the details of bit fields.
PWRMODE_PPU_PD1_AISR	0x4241303C	Additional Interrupt Status Register. See PWRMODE_PPU_MAIN_PPU_AISR for the details of bit fields.
PWRMODE_PPU_PD1_IESR	0x42413040	Input Edge Sensitivity Register. See PWRMODE_PPU_MAIN_PPU_IESR for the details of bit fields.
PWRMODE_PPU_PD1_OPSR	0x42413044	Operating Mode Active Edge Sensitivity Register. See PWRMODE_PPU_MAIN_PPU_OPSR for the details of bit fields.
PWRMODE_PPU_PD1_FUNRR	0x42413050	Functional Retention RAM Configuration Register. See PWRMODE_PPU_MAIN_PPU_FUNRR for the details of bit fields.
PWRMODE_PPU_PD1_FULRR	0x42413054	Full Retention RAM Configuration Register. See PWRMODE_PPU_MAIN_PPU_FULRR for the details of bit fields.
PWRMODE_PPU_PD1_MEMRR	0x42413058	Memory Retention RAM Configuration Register. See PWRMODE_PPU_MAIN_PPU_MEMRR for the details of bit fields.
PWRMODE_PPU_PD1_EDTR0	0x42413160	Power Mode Entry Delay Register 0. See PWRMODE_PPU_MAIN_PPU_EDTR0 for the details of bit fields.
PWRMODE_PPU_PD1_EDTR1	0x42413164	Power Mode Entry Delay Register 1. See PWRMODE_PPU_MAIN_PPU_EDTR1 for the details of bit fields.
PWRMODE_PPU_PD1_DCDR0	0x42413170	Device Control Delay Configuration Register 0. See PWRMODE_PPU_MAIN_PPU_DCDR0 for the details of bit fields.
PWRMODE_PPU_PD1_DCDR1	0x42413174	Device Control Delay Configuration Register 1. See PWRMODE_PPU_MAIN_PPU_DCDR1 for the details of bit fields.
PWRMODE_PPU_PD1_IDR0	0x42413FB0	PPU Identification Register 0. See PWRMODE_PPU_MAIN_PPU_IDR0 for the details of bit fields.
PWRMODE_PPU_PD1_IDR1	0x42413FB4	PPU Identification Register 1. See PWRMODE_PPU_MAIN_PPU_IDR1 for the details of bit fields.
PWRMODE_PPU_PD1_IIDR	0x42413FC8	Implementation Identification Register. See PWRMODE_PPU_MAIN_PPU_IIDR for the details of bit fields.

Device Power Modes registers

Register name	Address	Description
PWRMODE_PPU_PD1_AIDR	0x42413FCC	Architecture Identification Register. See PWRMODE_PPU_MAIN_PPU_AIDR for the details of bit fields.
PWRMODE_PD0_CTRL_PD_CTL	0x42414000	Power Domain Control
PWRMODE_PD0_CTRL_PD_PWR_UP_DELAY	0x42414004	Active switch weak enable to active switch strong enable delay
PWRMODE_PD1_CTRL_PD_CTL	0x42415000	Power Domain Control. See PWRMODE_PD0_CTRL_PD_CTL for the details of bit fields.
PWRMODE_PD1_CTRL_PD_PWR_UP_DELAY	0x42415004	Active switch weak enable to active switch strong enable delay. See PWRMODE_PD0_CTRL_PD_PWR_UP_DELAY for the details of bit fields.

13.1.1 PWRMODE_PD0_PD_SENSE

Description: Dependency Sense Register

Address: 0x42410000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	PD_ON [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	PD_ON [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	PD_ON	Each bit *indicates whether PD is directly kept on when PD is on. Indirect dependency is still possible if multiple direct dependencies work together to create a transitive relationship. For example, if PD1 depends upon PD2; and PD2 dpends upon PD3; then PD1 indirectly depends upon PD3 regardless of whether there is a direct dependency from PD3 to PD1. Some bits are implemented as constants, and some bits are implemented as user-configurable registers. Refer to PD_SPT register to see how each bit is implemented. Default Value: X*

13.1.2 PWRMODE_PD0_PD_SPT

Description: Dependency Support Register

Address: 0x42410004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PD_FORCE_ON [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	PD_FORCE_ON [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	PD_CONFIG_ON [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	PD_CONFIG_ON [31:24]							

Bits	Name	Description
31 : 16	PD_CONFIG_ON	Each bit *indicates whether PD can be configured on when PD is on. Default Value: X*
15 : 0	PD_FORCE_ON	Each bit *indicates whether PD is always kept on when PD is on for sense bits that are not configurable. For configurable bits, this indicates the reset value of the configurable bit. Default Value: X*

13.1.3 PWRMODE_PPU_MAIN_PPU_PWPR

Description: Power Policy Register

Address: 0x42411000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				PWR_POLICY [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW	Reserved			RW
HW Access	Reserved			R	Reserved			R
Name	Reserved [15:13]			LOCK_EN	Reserved [11:9]			PWR_DY-N_EN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				OP_POLICY [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [31:25]							OP_DY-N_EN

Bits	Name	Description
24	OP_DYN_EN	Reserved Default Value: 0x0
19 : 16	OP_POLICY	Reserved Default Value: 0x0
12	LOCK_EN	Reserved Default Value: 0x0
8	PWR_DYN_EN	Power mode dynamic transition enable. For main PPU, keep this bit 1. Default Value: 0x1
3 : 0	PWR_POLICY	Power mode policy. When static power mode transitions are enabled, PWR_DYN_EN is set to 0, this is the target power mode for the PPU. When dynamic power mode transitions are enabled, PWR_DYN_EN is set to 1, this is the minimum power mode for the PPU. This PPU supports the following modes: OFF(0), MEM_RET(2), FULL_RET(5), ON(8). Do not use WARM_RST(9) or other unsupported modes. Default Value: 0x8

13.1.4 PWRMODE_PPU_MAIN_PPU_PMER

Description: Power Mode Emulation Register

Address: 0x42411004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							EMU_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	EMU_EN	Reserved Default Value: 0x0

13.1.5 PWRMODE_PPU_MAIN_PPU_PWSR

Description: Power Status Register

Address: 0x42411008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [7:4]				PWR_STATUS [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			R	Reserved			R
HW Access	Reserved			RW	Reserved			RW
Name	Reserved [15:13]			LOCK_STA-TUS	Reserved [11:9]			PWR_DY-N_STATUS

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				R			
HW Access	Reserved				RW			
Name	Reserved [23:20]				OP_STATUS [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [31:25]							OP_DY-N_STATUS

Bits	Name	Description
24	OP_DYN_STATUS	Reserved Default Value: 0x0
19 : 16	OP_STATUS	Reserved Default Value: 0x0
12	LOCK_STATUS	Reserved Default Value: 0x0
8	PWR_DYN_STATUS	Power mode dynamic transition status. When set to 1 power mode dynamic transitions are enabled. There might be a delay in dynamic transitions becoming active or inactive if the PPU is transitioning when PWR_DYN_EN is programmed. Default Value: 0x0
3 : 0	PWR_STATUS	Power mode status. These bits reflect the current power mode of the PPU. See PPU_PWPR.PWR_POLICY for power mode enumeration. Default Value: 0x0

13.1.6 PWRMODE_PPU_MAIN_PPU_DISR

Description: Device Interface Input Current Status Register

Address: 0x42411010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	PWR_DEVACTIVE_STATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					R		
HW Access	Reserved					RW		
Name	Reserved [15:11]					PWR_DEVACTIVE_STATUS [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	OP_DEVACTIVE_STATUS [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVE_STATUS	Reserved Default Value: 0x0
10 : 0	PWR_DEVACTIVE_STATUS	Status of the power mode DEVACTIVE inputs. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 0 is for Q-channel device 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0

13.1.7 PWRMODE_PPU_MAIN_PPU_MISR

Description: Miscellaneous Input Current Status Register

Address: 0x42411014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							PCSMPAC-CEPT_STA-TUS

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	DEVACCEPT_STATUS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	DEVDENY_STATUS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	DEVDENY_STATUS	Status of the device interface DEVDENY inputs. There is one bit for each device interface DEVQDENY. For example, bit 16 is for Q-Channel 0 DEVQDENY, and bit 17 for Q-Channel 1 DEVQDENY. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
15 : 8	DEVACCEPT_STATUS	Status of the device interface DEVACCEPT inputs. There is one bit for each device interface DEVQACCEPTn. For example, bit 8 is for Q-Channel 0 DEVQACCEPTn and bit 9 for Q-Channel 1 DEVQACCEPTn. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x0
0	PCSMPACCEPT_STA-TUS	The status of the PCSMPACCEPT input. Default Value: 0x0

13.1.8 PWRMODE_PPU_MAIN_PPU_STSR

Description: Stored Status Register

Address: 0x42411018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	STORED_DEVDENY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	STORED_DEVDENY	Status of the DEVDENY signals from the last device interface Q-Channel transition. For Q-Channel: There is one bit for each device interface DEVQDENY. For example, bit 0 is for Q-Channel 0 DEVQDENY, and bit 1 for Q-Channel 1 DEVQDENY. Refer to PPU_DISR.PWR_DEVACTIVE_STATUS for device enumeration. Default Value: 0x0

13.1.9 PWRMODE_PPU_MAIN_PPU_UNLK

Description: Unlock register

Address: 0x4241101C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							UNLOCK

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	UNLOCK	Reserved Default Value: 0x0

13.1.10 PWRMODE_PPU_MAIN_PPU_PWCR

Description: Power Configuration Register

Address: 0x42411020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DEVREQEN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	PWR_DEVACTIVEEN [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [23:19]					PWR_DEVACTIVEEN [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	OP_DEVACTIVEEN [31:24]							

Bits	Name	Description
31 : 24	OP_DEVACTIVEEN	Reserved Default Value: 0x00
18 : 8	PWR_DEVACTIVEEN	These bits enable the power mode DEVACTIVE inputs. When a bit is to 1 the related DEVACTIVE input is enabled, when set to 0 it is disabled. All available bits are reset to 1. There is one bit for each device interface Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE, and bit 9 for the Q-Channel 1 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x001
7 : 0	DEVREQEN	When set to 1 enables the device interface handshake for transitions. All available bits are reset to 1. There is one bit for each device interface channel. For example, bit 0 is for Q-Channel 0, and bit 1 is for Q-Channel 1. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x01

13.1.11 PWRMODE_PPU_MAIN_PPU_PTCR

Description: Power Mode Transition Configuration Register

Address: 0x42411024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						DBG_RE-COV_POR ST_EN	WARM_RS T_DEVREQ EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	DBG_RE-COV_PORST_EN	Reserved Default Value: 0x0
0	WARM_RST_DEVREQEN	Transition behavior between ON and WARM_RST. This bit should not be modified when the PPU is in WARM_RST, or if the PPU is performing a transition, otherwise PPU behavior is UN-PREDICTABLE. 0: The PPU does not perform a device interface handshake when transitioning between ON and WARM_RST. 1: The PPU performs a device interface handshake when transitioning between ON and WARM_RST. This disables all Q-Channels for this transition. Default Value: 0x0

13.1.12 PWRMODE_PPU_MAIN_PPU_IMR

Description: Interrupt Mask Register

Address: 0x42411030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW	RW	RW	RW	RW	RW
HW Access	Reserved		R	R	R	R	R	R
Name	Reserved [7:6]		LOCKED_IRQ_MASK	EMU_DENY_IRQ_MASK	EMU_ACCEPT_IRQ_MASK	STA_DENY_IRQ_MASK	STA_ACCEPT_IRQ_MASK	STA_POLICY_TRN_IRQ_MASK

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5	LOCKED_IRQ_MASK	Reserved Default Value: 0x0
4	EMU_DENY_IRQ_MASK	Reserved Default Value: 0x0
3	EMU_ACCEPT_IRQ_MASK	Reserved Default Value: 0x0
2	STA_DENY_IRQ_MASK	Static transition denial event mask. Default Value: 0x0
1	STA_ACCEPT_IRQ_MASK	Static transition acceptance event mask. For main PPU, keep this bit 1 to mask the event, otherwise the interrupt may trigger a wakeup. Default Value: 0x1
0	STA_POLICY_TRN_IRQ_MASK	Static full policy transition completion event mask. For main PPU, this bit has no function because no static transitions are supported (see PWPR.PWR_DYN_EN). Default Value: 0x0

13.1.13 PWRMODE_PPU_MAIN_PPU_AIMR

Description: Additional Interrupt Mask Register

Address: 0x42411034

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW	RW	RW	RW	RW
HW Access	Reserved			R	R	R	R	R
Name	Reserved [7:5]			STA_POLICY_OP_IRQ_MASK	STA_POLICY_PWR_IRQ_MASK	DYN_DENY_IRQ_MASK	DYN_ACCEPT_IRQ_MASK	UNSPT_POLICY_IRQ_MASK

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C							
HW Access	R							
Name	OP_ACTIVE_EDGE_IRQ [31:24]							

Bits	Name	Description
31 : 24	OP_ACTIVE_EDGE_IRQ	Indicates which operating mode DEVPACTIVE inputs caused the input edge event. When operating modes are not supported this field is reserved. Default Value: 0x0
18 : 8	PWR_ACTIVE_EDGE_IRQ	Indicates which power mode DEVACTIVE inputs caused the input edge event. Bits for unused channels are the MSBs and are reserved. There is one bit for each device Q-Channel DEVQACTIVE. For example, bit 8 is for the Q-Channel 0 DEVQACTIVE. Refer to PPU_IDR0.DEVCHAN for device channel enumeration. Default Value: 0x00
7	OTHER_IRQ	Indicates there is an interrupt event pending in the Additional Interrupt Status Register (PPU_AISR). Default Value: 0x0
5	LOCKED_IRQ	Reserved Default Value: 0x0
4	EMU_DENY_IRQ	Reserved Default Value: 0x0
3	EMU_ACCEPT_IRQ	Reserved Default Value: 0x0
2	STA_DENY_IRQ	Static transition denial event status. Default Value: 0x0
1	STA_ACCEPT_IRQ	Static transition acceptance event status. Default Value: 0x0

13.1.14 PWRMODE_PPU_MAIN_PPU_ISR (continued)

0	STA_POLICY_TRN_IRQ	Static full policy transition completion event status. Default Value: 0x0

13.1.15 PWRMODE_PPU_MAIN_PPU_AISR

Description: Additional Interrupt Status Register

Address: 0x4241103C

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	OFF_MEM_RET_TRANS	OFF to MEM_RET direct transition. Indicates if direct transitions from OFF to MEM_RET and from OFF_EMU to MEM_RET_EMU are supported. Default Value: 0x0
10	OP_ACTIVE	Operating mode use model for dynamic transitions. 0: Ladder use model. 1: Independent use model. When operating modes are not supported (PPU_IDR0.NUM_OPMODE==0), this field is reserved. Default Value: 0x0
9	STA_POLI-CY_OP_IRQ_SPT	Operating policy transition completion event status. Default Value: 0x0
8	STA_POLICY_P-WR_IRQ_SPT	Power policy transition completion event status. Default Value: 0x0
6	FUNC_RET_RAM_REG	Indicates if the PPU_FUNRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
5	FULL_RET_RAM_REG	Indicates if the PPU_FULRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0
4	MEM_RET_RAM_REG	Indicates if the PPU_MEMRR register is present or reserved. 0: Reserved. 1: Present. Default Value: 0x0

13.1.26 PWRMODE_PPU_MAIN_PPU_IDR1 (continued)

2	LOCK_SPT	Lock and the lock interrupt event are supported. Default Value: 0x0
1	SW_DEV_DEL_SPT	Software device delay control configuration support. Default Value: 0x0
0	PWR_MODE_EN-TRY_DEL_SPT	Power mode entry delay support. Default Value: 0x0

13.1.27 PWRMODE_PPU_MAIN_PPU_IIDR

Description: Implementation Identification Register

Address: 0x42411FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0

3 : 0	ARCH_REV_MINOR	0x1 - PPU Architecture minor revision 1. Other Values - Reserved. Default Value: 0x1

13.1.29 PWRMODE_CLK_SELECT

Description: Clock Selection for Power Mode Components

Address: 0x42412000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	CLK_PWR_DIV [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [23:18]						CLK_PWR_MUX [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17 : 16	CLK_PWR_MUX	Selects a source for the clock used by power control components. Note that not all products support all clock sources. Selecting a clock source that is not supported will result in undefined behavior. It takes four cycles of the originally selected clock to switch away from it. Do not disable the original clock during this time. Default Value: 0 **0x0: IHO :** IHO - Internal High-speed Oscillator **0x1: IMO :** IMO - Internal R/C Oscillator **0x2: RESERVED :** reserved
7 : 0	CLK_PWR_DIV	clk_pwr is generated by dividing the CLK_PWR_MUX selection by (CLK_PWR_DIV+1). Default Value: 4

13.1.30 PWRMODE_PDCM_HWSTAT_IN

Description: PPU Status input

Address: 0x42412004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	PPU_HWSTAT_ON [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	PPU_HWSTAT_ON [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	PPU_HWSTAT_ON	Each bit represents the PPU 'ON' Status of connected PPU. 1: PPU is ON Default Value: x

13.1.31 PWRMODE_PDCM_PD_PRESENT

Description: Mask for whether a PD is present in the PDCM

Address: 0x42412008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	PRESENT [7:0]							

Bits	15	14	13	12	11	10	9	8

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	PRESENT	Mask for whether a PD is present in the PDCM Default Value: x

13.1.32 PWRMODE_PPU_PD1_PWPR

Description: Power Policy Register

Address: 0x42413000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				PWR_POLICY [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW	Reserved			RW
HW Access	Reserved			R	Reserved			R
Name	Reserved [15:13]			LOCK_EN	Reserved [11:9]			PWR_DYN_EN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				OP_POLICY [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [31:25]							OP_DYN_EN

Bits	Name	Description
24	OP_DYN_EN	Reserved Default Value: 0x0
19 : 16	OP_POLICY	Reserved Default Value: 0x0
12	LOCK_EN	Reserved Default Value: 0x0
8	PWR_DYN_EN	Power mode dynamic transition enable. For main PPU, keep this bit 1. Default Value: 0x1
3 : 0	PWR_POLICY	Power mode policy. When static power mode transitions are enabled, PWR_DYN_EN is set to 0, this is the target power mode for the PPU. When dynamic power mode transitions are enabled, PWR_DYN_EN is set to 1, this is the minimum power mode for the PPU. This PPU supports the following modes: OFF(0), MEM_RET(2), FULL_RET(5), ON(8). Do not use WARM_RST(9) or other unsupported modes. Default Value: 0x0

13.1.33 PWRMODE_PD0_CTRL_PD_CTL

Description: Power Domain Control

Address: 0x42414000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							BLEED_EN

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	MEM_COUNT_LOAD	Load value for counter running on clk_pwr (10MHz) providing the timing from weak MEM switch enable to strong MEM switch enable. Default is 5 for ~500ns Default Value: 0
7 : 0	COUNT_LOAD	Load value for counter running on clk_pwr (10MHz) providing the timing from weak ACTIVE switch enable to strong ACTIVE switch enable. Default is 5 for ~500ns Default Value: 5

14 System Resources Subsystem (SRSS) registers

This section discusses the SRSS registers. It lists all the registers in mapping tables, in address order.

14.1 Register details

Register name	Address	Description
CLK_DSI_SELECT0	0x42400100	Clock DSI Select Register
CLK_DSI_SELECT1	0x42400104	Clock DSI Select Register. See CLK_DSI_SELECT0 for the details of bit fields.
CLK_DSI_SELECT2	0x42400108	Clock DSI Select Register. See CLK_DSI_SELECT0 for the details of bit fields.
CLK_DSI_SELECT3	0x4240010C	Clock DSI Select Register. See CLK_DSI_SELECT0 for the details of bit fields.
CLK_DSI_SELECT4	0x42400110	Clock DSI Select Register. See CLK_DSI_SELECT0 for the details of bit fields.
CLK_DSI_SELECT5	0x42400114	Clock DSI Select Register. See CLK_DSI_SELECT0 for the details of bit fields.
CLK_OUTPUT_FAST	0x42400140	Fast Clock Output Select Register
CLK_OUTPUT_SLOW	0x42400144	Slow Clock Output Select Register
CLK_CAL_CNT1	0x42400148	Clock Calibration Counter 1
CLK_CAL_CNT2	0x4240014C	Clock Calibration Counter 2
SRSS_INTR	0x42400200	SRSS Interrupt Register
SRSS_INTR_SET	0x42400204	SRSS Interrupt Set Register
SRSS_INTR_MASK	0x42400208	SRSS Interrupt Mask Register
SRSS_INTR_MASKED	0x4240020C	SRSS Interrupt Masked Register
SRSS_AINTR	0x42400300	SRSS Additional Interrupt Register
SRSS_AINTR_SET	0x42400304	SRSS Additional Interrupt Set Register
SRSS_AINTR_MASK	0x42400308	SRSS Additional Interrupt Mask Register
SRSS_AINTR_MASKED	0x4240030C	SRSS Additional Interrupt Masked Register
PWR_LVD_STATUS	0x42400340	High Voltage / Low Voltage Detector (HVLVD) Status Register
BOOT_DLM_CTL	0x42400404	Debug Control Register
BOOT_DLM_CTL2	0x42400408	Debug Control Register 2
BOOT_DLM_STATUS	0x4240040C	Debug Status Register
RES_SOFT_CTL	0x42400410	Soft Reset Trigger Register
BOOT_STATUS	0x42400418	Boot Execution Status Register
BOOT_ENTRY	0x42400430	Warm Boot Entry Address
PWR_HIB_DATA0	0x42400800	Hibernate Data Register. This is the starting address of a register bank containing 32 registers (PWR_HIB_DATA0 to PWR_HIB_DATA31).
PWR_HIB_WAKE_CTL	0x424008A0	Hibernate Wakeup Mask Register
PWR_HIB_WAKE_CTL2	0x424008A4	Hibernate Wakeup Polarity Register

System Resources Subsystem (SRSS) registers

Register name	Address	Description
PWR_HIB_WAKE_CAUSE	0x424008AC	Hibernate Wakeup Cause Register
TST_XRES_SECURE	0x42400914	SECURE TEST and FIRMWARE TEST Key control register
PWR_CTL	0x42401000	Power Mode Control
PWR_CTL2	0x42401004	Power Mode Control 2
PWR_HIBERNATE	0x42401008	HIBERNATE Mode Register
PWR_LVD_CTL	0x42401020	High Voltage / Low Voltage Detector (HVLVD) Configuration Register
CLK_PATH_SELECT0	0x42401200	Clock Path Select Register
CLK_PATH_SELECT1	0x42401204	Clock Path Select Register. See CLK_PATH_SELECT0 for the details of bit fields.
CLK_PATH_SELECT2	0x42401208	Clock Path Select Register. See CLK_PATH_SELECT0 for the details of bit fields.
CLK_PATH_SELECT3	0x4240120C	Clock Path Select Register. See CLK_PATH_SELECT0 for the details of bit fields.
CLK_PATH_SELECT4	0x42401210	Clock Path Select Register. See CLK_PATH_SELECT0 for the details of bit fields.
CLK_PATH_SELECT5	0x42401214	Clock Path Select Register. See CLK_PATH_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT0	0x42401240	Clock Root Select Register
CLK_ROOT_SELECT1	0x42401244	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT2	0x42401248	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT3	0x4240124C	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT4	0x42401250	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT5	0x42401254	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT6	0x42401258	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT7	0x4240125C	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT8	0x42401260	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT9	0x42401264	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT10	0x42401268	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT11	0x4240126C	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.

System Resources Subsystem (SRSS) registers

Register name	Address	Description
CLK_ROOT_SELECT12	0x42401270	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_ROOT_SELECT13	0x42401274	Clock Root Select Register. See CLK_ROOT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT0	0x42401280	Clock Root Direct Select Register
CLK_DIRECT_SELECT1	0x42401284	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT2	0x42401288	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT3	0x4240128C	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT4	0x42401290	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT5	0x42401294	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT6	0x42401298	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT7	0x4240129C	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT8	0x424012A0	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT9	0x424012A4	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT10	0x424012A8	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT11	0x424012AC	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT12	0x424012B0	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_DIRECT_SELECT13	0x424012B4	Clock Root Direct Select Register. See CLK_DIRECT_SELECT0 for the details of bit fields.
CLK_SELECT	0x42401300	Clock selection register
CLK_MF_SELECT	0x42401304	Medium Frequency Clock Select Register
CLK_ECO_PRESCALE	0x42401320	ECO Prescaler Configuration Register
CLK_IHO_CONFIG	0x42401344	IHO Configuration Register
CLK_ECO_CONFIG	0x42401360	ECO Configuration Register
CLK_ECO_CONFIG2	0x42401364	ECO Configuration Register 2
CLK_ECO_STATUS	0x42401368	ECO Status Register
CLK_PILO_CONFIG	0x42401370	Precision ILO Configuration Register
CLK_PILO_STATUS	0x42401374	Precision ILO Status Register
CLK_WCO_CONFIG	0x42401390	WCO Configuration Register
CLK_WCO_STATUS	0x42401394	WCO Status Register

System Resources Subsystem (SRSS) registers

Register name	Address	Description
CSV_HF_CSV0_REF_CTL	0x42401400	Clock Supervision Reference Control
CSV_HF_CSV0_REF_LIMIT	0x42401404	Clock Supervision Reference Limits
CSV_HF_CSV0_MON_CTL	0x42401408	Clock Supervision Monitor Control
CSV_HF_CSV1_REF_CTL	0x42401410	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV1_REF_LIMIT	0x42401414	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV1_MON_CTL	0x42401418	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV2_REF_CTL	0x42401420	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV2_REF_LIMIT	0x42401424	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV2_MON_CTL	0x42401428	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV3_REF_CTL	0x42401430	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV3_REF_LIMIT	0x42401434	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV3_MON_CTL	0x42401438	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV4_REF_CTL	0x42401440	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV4_REF_LIMIT	0x42401444	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV4_MON_CTL	0x42401448	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV5_REF_CTL	0x42401450	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV5_REF_LIMIT	0x42401454	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV5_MON_CTL	0x42401458	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV6_REF_CTL	0x42401460	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV6_REF_LIMIT	0x42401464	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV6_MON_CTL	0x42401468	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV7_REF_CTL	0x42401470	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV7_REF_LIMIT	0x42401474	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.

Register name	Address	Description
CSV_HF_CSV7_MON_CTL	0x42401478	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV8_REF_CTL	0x42401480	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV8_REF_LIMIT	0x42401484	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV8_MON_CTL	0x42401488	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV9_REF_CTL	0x42401490	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV9_REF_LIMIT	0x42401494	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV9_MON_CTL	0x42401498	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV10_REF_CTL	0x424014A0	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV10_REF_LIMIT	0x424014A4	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV10_MON_CTL	0x424014A8	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV11_REF_CTL	0x424014B0	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV11_REF_LIMIT	0x424014B4	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV11_MON_CTL	0x424014B8	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV12_REF_CTL	0x424014C0	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV12_REF_LIMIT	0x424014C4	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV12_MON_CTL	0x424014C8	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_HF_CSV13_REF_CTL	0x424014D0	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_HF_CSV13_REF_LIMIT	0x424014D4	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.
CSV_HF_CSV13_MON_CTL	0x424014D8	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_REF_SEL	0x42401500	Select CSV Reference clock for Active domain
CSV_REF_CSV_REF_CTL	0x42401510	Clock Supervision Reference Control. See CSV_HF_CSV0_REF_CTL for the details of bit fields.
CSV_REF_CSV_REF_LIMIT	0x42401514	Clock Supervision Reference Limits. See CSV_HF_CSV0_REF_LIMIT for the details of bit fields.

System Resources Subsystem (SRSS) registers

Register name	Address	Description
CSV_REF_CSV_MON_CTL	0x42401518	Clock Supervision Monitor Control. See CSV_HF_CSV0_MON_CTL for the details of bit fields.
CSV_LF_REF_SEL	0x42401520	Select CSV Reference clock for LF clock
CSV_LF_CSV_REF_CTL	0x42401530	Clock Supervision Reference Control
CSV_LF_CSV_REF_LIMIT	0x42401534	Clock Supervision Reference Limits
CSV_LF_CSV_MON_CTL	0x42401538	Clock Supervision Monitor Control
CLK_DPLL_LP0_CONFIG	0x42401600	DPLL_LP Configuration Register
CLK_DPLL_LP0_CONFIG2	0x42401604	DPLL_LP Configuration Register 2
CLK_DPLL_LP0_CONFIG3	0x42401608	DPLL_LP Configuration Register 3
CLK_DPLL_LP0_CONFIG4	0x4240160C	DPLL_LP Configuration Register 4
CLK_DPLL_LP0_CONFIG5	0x42401610	DPLL_LP Configuration Register 5
CLK_DPLL_LP0_STATUS	0x42401614	DPLL_LP Status Register
CLK_DPLL_LP1_CONFIG	0x42401620	DPLL_LP Configuration Register. See CLK_DPLL_LP0_CONFIG for the details of bit fields.
CLK_DPLL_LP1_CONFIG2	0x42401624	DPLL_LP Configuration Register 2. See CLK_DPLL_LP0_CONFIG2 for the details of bit fields.
CLK_DPLL_LP1_CONFIG3	0x42401628	DPLL_LP Configuration Register 3. See CLK_DPLL_LP0_CONFIG3 for the details of bit fields.
CLK_DPLL_LP1_CONFIG4	0x4240162C	DPLL_LP Configuration Register 4. See CLK_DPLL_LP0_CONFIG4 for the details of bit fields.
CLK_DPLL_LP1_CONFIG5	0x42401630	DPLL_LP Configuration Register 5. See CLK_DPLL_LP0_CONFIG5 for the details of bit fields.
CLK_DPLL_LP1_STATUS	0x42401634	DPLL_LP Status Register. See CLK_DPLL_LP0_STATUS for the details of bit fields.
CLK_DPLL_HP0_CONFIG	0x42401800	DPLL_HP Configuration Register
CLK_DPLL_HP0_CONFIG2	0x42401804	DPLL_HP Configuration Register 2
CLK_DPLL_HP0_CONFIG3	0x42401808	DPLL_HP Configuration Register 3
CLK_DPLL_HP0_CONFIG4	0x4240180C	DPLL_HP Configuration Register 4
CLK_DPLL_HP0_CONFIG5	0x42401810	DPLL_HP Configuration Register 5
CLK_DPLL_HP0_TRIGMOD	0x42401814	DPLL_HP Trigmod SSCG Register
CLK_DPLL_HP0_TRIGMOD2	0x42401818	DPLL_HP Trigmod2 SSCG Register
CLK_DPLL_HP0_STATUS	0x4240181C	DPLL_HP Status Register
CLK_DPLL_HP0_DUTYCAL_CTRL	0x42401820	DPLL_HP_User DUTYCAL Control Register
RES_CAUSE	0x42401BD0	Reset Cause Observation Register
RES_CAUSE2	0x42401BD4	Reset Cause Observation Register 2
RES_PXRES_CTL	0x42401BE4	Programmable XRES Control Register
RES_CAUSE_EXTEND	0x42401C04	Extended Reset Cause Observation Register
PWR_CBUCK_CTL	0x42401C10	Core Buck Control Register
PWR_CBUCK_CTL2	0x42401C14	Core Buck Control Register 2
PWR_CBUCK_DPSLP_CTL	0x42401C1C	Core Buck Deepsleep Control Register

System Resources Subsystem (SRSS) registers

Register name	Address	Description
PWR_CBUCK_STATUS	0x42401C20	Core Buck Status Register
PWR_RETLDO_CTL	0x42401C24	RETLDO Control Register
PWR_SRAMLDO_CTL	0x42401C28	SRAMLDO Control Register
PWR_MISCLDO_CTL	0x42401C30	MISCLDO Control Register
DECODED_LCS_DATA	0x42401D00	Decoded Life Cycle Stage Data Register
PWR_TRIM_PMU_CTL0	0x42402110	PMU Trim Register 0
CLK_TRIM_ECO_CTL	0x42403020	ECO Trim Register
RAM_TRIM_TRIM_RAM_CTL0	0x42404000	Trim Register for RAM Type 0
RAM_TRIM_TRIM_RAM_CTL1	0x42404004	Trim Register for RAM Type 0. See RAM_TRIM_TRIM_RAM_CTL0 for the details of bit fields.
RAM_TRIM_TRIM_RAM_CTL2	0x42404008	Trim Register for RAM Type 0
RAM_TRIM_TRIM_RAM_CTL3	0x4240400C	Trim Register for RAM Type 0. See RAM_TRIM_TRIM_RAM_CTL2 for the details of bit fields.
RAM_TRIM_TRIM_RAM_CTL4	0x42404010	Trim Register for RAM Type 0. See RAM_TRIM_TRIM_RAM_CTL2 for the details of bit fields.
RAM_TRIM_TRIM_RAM_CTL5	0x42404014	Trim Register for RAM Type 0. See RAM_TRIM_TRIM_RAM_CTL2 for the details of bit fields.
RAM_TRIM_TRIM_RAM_CTL6	0x42404018	Trim Register for RAM Type 0
RAM_TRIM_TRIM_RAM_CTL7	0x4240401C	Trim Register for RAM Type 0. See RAM_TRIM_TRIM_RAM_CTL6 for the details of bit fields.
RAM_TRIM_TRIM_RAM_CTL8	0x42404020	Trim Register for RAM Type 0
WDT_CTL	0x4240C000	Watchdog Counter Control Register (Type A)
WDT_CNT	0x4240C004	Watchdog Counter Count Register (Type A)
WDT_MATCH	0x4240C008	Watchdog Counter Match Register (Type A)
WDT_MATCH2	0x4240C00C	Watchdog Counter Match Register 2 (Type A)
MCWDT_CNTLOW0	0x4240D004	Multi-Counter Watchdog Sub-counters 0/1
MCWDT_CNTHIGH0	0x4240D008	Multi-Counter Watchdog Sub-counter 2
MCWDT_MATCH0	0x4240D00C	Multi-Counter Watchdog Counter Match Register
MCWDT_CONFIG0	0x4240D010	Multi-Counter Watchdog Counter Configuration
MCWDT_CTL0	0x4240D014	Multi-Counter Watchdog Counter Control
MCWDT_INTR0	0x4240D018	Multi-Counter Watchdog Counter Interrupt Register
MCWDT_INTR_SET0	0x4240D01C	Multi-Counter Watchdog Counter Interrupt Set Register
MCWDT_INTR_MASK0	0x4240D020	Multi-Counter Watchdog Counter Interrupt Mask Register
MCWDT_INTR_MASKED0	0x4240D024	Multi-Counter Watchdog Counter Interrupt Masked Register
MCWDT_LOCK0	0x4240D028	Multi-Counter Watchdog Counter Lock Register
MCWDT_LOWER_LIMIT0	0x4240D02C	Multi-Counter Watchdog Counter Lower Limit Register
PERI_PCLK1_GR1_DIV_CMD	0x4240D044	Multi-Counter Watchdog Sub-counters 0/1. See MCWDT_CNTLOW0 for the details of bit fields.
PERI_PCLK1_GR1_CLOCK_CTL0	0x4240D048	Multi-Counter Watchdog Sub-counter 2. See MCWDT_CNTHIGH0 for the details of bit fields.

Register name	Address	Description
MCWDT_MATCH1	0x4240D04C	Multi-Counter Watchdog Counter Match Register. See MCWDT_MATCH0 for the details of bit fields.
MCWDT_CONFIG1	0x4240D050	Multi-Counter Watchdog Counter Configuration. See MCWDT_CONFIG0 for the details of bit fields.
MCWDT_CTL1	0x4240D054	Multi-Counter Watchdog Counter Control. See MCWDT_CTL0 for the details of bit fields.
MCWDT_INTR1	0x4240D058	Multi-Counter Watchdog Counter Interrupt Register. See MCWDT_INTR0 for the details of bit fields.
MCWDT_INTR_SET1	0x4240D05C	Multi-Counter Watchdog Counter Interrupt Set Register. See MCWDT_INTR_SET0 for the details of bit fields.
MCWDT_INTR_MASK1	0x4240D060	Multi-Counter Watchdog Counter Interrupt Mask Register. See MCWDT_INTR_MASK0 for the details of bit fields.
MCWDT_INTR_MASKED1	0x4240D064	Multi-Counter Watchdog Counter Interrupt Masked Register. See MCWDT_INTR_MASKED0 for the details of bit fields.
MCWDT_LOCK1	0x4240D068	Multi-Counter Watchdog Counter Lock Register. See MCWDT_LOCK0 for the details of bit fields.
MCWDT_LOWER_LIMIT1	0x4240D06C	Multi-Counter Watchdog Counter Lower Limit Register. See MCWDT_LOWER_LIMIT0 for the details of bit fields.
PERI_PCLK1_GR1_DIV_CMD	0x44042000	Divider command
PERI_PCLK1_GR1_CLOCK_CTL0	0x44042C00	Clock control
PERI_PCLK1_GR1_CLOCK_CTL1	0x44042C04	Clock control. See PERI_PCLK1_GR1_CLOCK_CTL0 for the details of bit fields.
PERI_PCLK1_GR1_CLOCK_CTL2	0x44042C08	Clock control. See PERI_PCLK1_GR1_CLOCK_CTL0 for the details of bit fields.
PERI_PCLK1_GR1_DIV_16_5_CTL0	0x44043800	Divider control (for 16.5 divider)
PERI_PCLK1_GR1_DIV_16_5_CTL1	0x44043804	Divider control (for 16.5 divider). See PERI_PCLK1_GR1_DIV_16_5_CTL0 for the details of bit fields.
PERI_PCLK1_GR1_DIV_16_5_CTL2	0x44043808	Divider control (for 16.5 divider). See PERI_PCLK1_GR1_DIV_16_5_CTL0 for the details of bit fields.
PERI_PCLK1_GR2_DIV_CMD	0x44044000	Divider command. See PERI_PCLK1_GR1_DIV_CMD for the details of bit fields.
PERI_PCLK1_GR2_CLOCK_CTL0	0x44044C00	Clock control
PERI_PCLK1_GR2_DIV_8_CTL0	0x44045000	Divider control (for 8.0 divider)
PERI_PCLK1_GR3_DIV_CMD	0x44046000	Divider command. See PERI_PCLK1_GR1_DIV_CMD for the details of bit fields.
PERI_PCLK1_GR3_CLOCK_CTL0	0x44046C00	Clock control. See PERI_PCLK1_GR2_CLOCK_CTL0 for the details of bit fields.
PERI_PCLK1_GR3_DIV_8_CTL0	0x44047000	Divider control (for 8.0 divider). See PERI_PCLK1_GR2_DIV_8_CTL0 for the details of bit fields.

14.1.1 CLK_DSI_SELECT0

Description: Clock DSI Select Register

Address: 0x42400100

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [7:5]			DSI_MUX [4:0]				

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
4 : 0	DSI_MUX	Selects a DSI source or low frequency clock for use in a clock path. The output of this mux can be selected for clock PATH *using CLK_SELECT_PATH register. Using the output of this mux as HFCLK source will result in undefined behavior. It can be used to clocks to DSI or as reference inputs for the FLL/PLL, subject to the frequency limits of those circuits. This mux is not glitch free, so do not change the selection while it is an actively selected clock. Default Value: 0* **0x0: DSI_OUT0 :** DSI0 - dsi_out[0] **0x1: DSI_OUT1 :** DSI1 - dsi_out[1] **0x2: DSI_OUT2 :** DSI2 - dsi_out[2] **0x3: DSI_OUT3 :** DSI3 - dsi_out[3] **0x4: DSI_OUT4 :** DSI4 - dsi_out[4]

14.1.1 CLK_DSI_SELECT0 (continued)

0x5: DSI_OUT5 :

DSI5 - dsi_out[5]

0x6: DSI_OUT6 :

DSI6 - dsi_out[6]

DSI15 - dsi_out[15]

0x10: ILO :

ILO - Internal Low-speed Oscillator #0

0x11: WCO :

WCO - Watch-Crystal Oscillator

0x12: ALTLF :

ALTLF - Alternate Low-Frequency Clock

14.1.1 CLK_DSI_SELECT0 (continued)

0x13: PILO :

PILO - Precision Internal Low-speed Oscillator

14.1.2 CLK_OUTPUT_FAST

Description: Fast Clock Output Select Register

Address: 0x42400140

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	PATH_SEL0 [7:4]				FAST_SEL0 [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [15:12]				HFCLK_SEL0 [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	RW				RW			
HW Access	R				R			
Name	PATH_SEL1 [23:20]				FAST_SEL1 [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [31:28]				HFCLK_SEL1 [27:24]			

Bits	Name	Description
27 : 24	HFCLK_SEL1	Selects a HFCLK tree for use in fast clock output #1 logic Default Value: 0
23 : 20	PATH_SEL1	Selects a clock path to use in fast clock output #1 logic. Default Value: 0
19 : 16	FAST_SEL1	Select signal for fast clock output #1 Default Value: 0 **0x0: NC :** Disabled - output is 0. For power savings, clocks are blocked before entering any muxes, including PATH_SEL1 and HFCLK_SEL1. **0x1: HFSRC_0 :** IHO - Internal High-speed Oscillator **0x2: HFSRC_1 :** EXTCLK - External Clock Pin **0x3: HFSRC_2 :** ECO - External-Crystal Oscillator (Product Specific)

14.1.2 CLK_OUTPUT_FAST (continued)

0x4: HFSRC_3 :

IMO - Internal R/C Oscillator (Product Specific)

0x5: HFSRC_4 :

ALTHF0 - Alternate High-Frequency clock input (product-specific clock)

0x6: HFSRC_5 :

ALTHF1 - Alternate High-Frequency clock input (product-specific clock)

0x7: HFSRC_6 :

Reserved

0x8: TIMERCLK :

Timer clock. It is grouped with the fast clocks because it may be a gated version of a fast clock, and therefore may have a short high pulse.

0x9: PATH_SEL1 :

Selects the clock path chosen by PATH_SEL1 field

0xa: HFCLK_SEL1 :

Selects the output of the HFCLK_SEL1 mux

0xb: SLOW_SEL1 :

Selects the output of CLK_OUTPUT_SLOW.SLOW_SEL1

0xc: PWR :

clk_pwr: used for PPU and related components

11 : 8	HFCLK_SEL0	Selects a HFCLK tree for use in fast clock output #0 Default Value: 0
7 : 4	PATH_SEL0	Selects a clock path to use in fast clock output #0 logic. Default Value: 0
3 : 0	FAST_SEL0	Select signal for fast clock output #0 Default Value: 0

0x0: NC :

Disabled - output is 0. For power savings, clocks are blocked before entering any muxes, including PATH_SEL0 and HFCLK_SEL0.

0x1: HFSRC_0 :

IHO - Internal High-speed Oscillator

0x2: HFSRC_1 :

EXTCLK - External Clock Pin

14.1.2 CLK_OUTPUT_FAST (continued)

0x3: HFSRC_2 :

ECO - External-Crystal Oscillator (Product Specific)

0x4: HFSRC_3 :

IMO - Internal R/C Oscillator (Product Specific)

0x5: HFSRC_4 :

ALTHF0 - Alternate High-Frequency clock input (product-specific clock)

0x6: HFSRC_5 :

ALTHF1 - Alternate High-Frequency clock input (product-specific clock)

0x7: HFSRC_6 :

Reserved

0x8: TIMERCLK :

Timer clock. It is grouped with the fast clocks because it may be a gated version of a fast clock, and therefore may have a short high pulse.

0x9: PATH_SEL0 :

Selects the clock path chosen by PATH_SEL0 field

0xa: HFCLK_SEL0 :

Selects the output of the HFCLK_SEL0 mux

0xb: SLOW_SEL0 :

Selects the output of CLK_OUTPUT_SLOW.SLOW_SEL0

0xc: PWR :

clk_pwr: used for PPU and related components

14.1.3 CLK_OUTPUT_SLOW

Description: Slow Clock Output Select Register

Address: 0x42400144

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	SLOW_SEL1 [7:4]				SLOW_SEL0 [3:0]			

Bits	15	14	13	12	11	10	9	8

Name	Reserved [31:24]							

Bits	Name	Description
7 : 4	SLOW_SEL1	Select signal for slow clock output #1 Default Value: 0 **0x0: NC :** Disabled - output is 0. For power savings, clocks are blocked before entering any muxes. **0x1: ILO :** Internal Low Speed Oscillator (ILO) **0x2: WCO :** Watch-Crystal Oscillator (WCO) **0x3: CLK_RTC :** Root of the RTC clock tree **0x4: ALTLF :** Alternate low-frequency clock input to SRSS (ALTLF)

14.1.3 CLK_OUTPUT_SLOW (continued)

0x5: LFCLK :

Root of the low-speed clock tree (LFCLK)

0x6: IMO :

Internal Main Oscillator (IMO). This is grouped with the slow clocks so it can be observed during DEEPSLEEP entry/exit.

0x7: SLPCTRL :

Sleep Controller clock (SLPCTRL). This is grouped with the slow clocks so it can be observed during DEEPSLEEP entry/exit.

0x8: PILO :

Precision Internal Low Speed Oscillator (PILO)

0x9: ECO_PRESCALER :

ECO Prescaler (ECO_PRESCALER)

0xa: MF :

Medium Frequency clock tree (MF)

0xb: Reserved1 :

Reserved

0xc: Reserved2 :

Reserved

0xd: Reserved3 :

Reserved

3 : 0	SLOW_SEL0	Select signal for slow clock output #0 Default Value: 0

0x0: NC :

Disabled - output is 0. For power savings, clocks are blocked before entering any muxes.

0x1: ILO :

Internal Low Speed Oscillator (ILO)

0x2: WCO :

Watch-Crystal Oscillator (WCO)

0x3: CLK_RTC :

Root of the RTC clock tree

14.1.3 CLK_OUTPUT_SLOW (continued)

0x4: ALTLF :

Alternate low-frequency clock input to SRSS (ALTLF)

0x5: LFCLK :

Root of the low-speed clock tree (LFCLK)

0x6: IMO :

Internal Main Oscillator (IMO). This is grouped with the slow clocks so it can be observed during DEEPSLEEP entry/exit.

0x7: SLPCTRL :

Sleep Controller clock (SLPCTRL). This is grouped with the slow clocks so it can be observed during DEEPSLEEP entry/exit.

0x8: PILO :

Precision Internal Low Speed Oscillator (PILO)

0x9: ECO_PRESCALER :

ECO Prescaler (ECO_PRESCALER)

14.1.4 CLK_CAL_CNT1

Description: Clock Calibration Counter 1

Address: 0x42400148

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	CAL_COUNTER1 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	CAL_COUNTER1 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	CAL_COUNTER1 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	RW	Reserved				
HW Access	W	W	R	Reserved				
Name	CAL_COUNTER_DONE	CAL_CLK1_PRESENT	CAL_RESET	Reserved [28:24]				

Bits	Name	Description
31	CAL_COUNTER_DONE	Status bit indicating that the internal counter #1 is finished counting and CLK_CAL_CNT2.COUNTER stopped counting up Default Value: 1
30	CAL_CLK1_PRESENT	Status bit indicating that a posedge was detected by counter #1 (does not apply when CLK_CAL_TEST.CAL_WINDOW_SEL = 1). If this bit never asserts, there is no clock on counter #1 and CAL_COUNTER_DONE will stay low indefinitely. This can be recovered with CAL_RESET. Default Value: 0
29	CAL_RESET	Reset clock calibration logic for window mode. This can be used to recover from unexpected conditions, such as no clock present on counter #1. When entering window mode, set this bit, then set CLK_CAL_TEST.CAL_WINDOW_SEL=1, then clear this bit. It takes 3 clock cycles for this reset to propagate. A new calibration cannot start during this time. Default Value: 0
23 : 0	CAL_COUNTER1	Down-counter clocked on fast clock output #0 (see CLK_OUTPUT_FAST). This register always reads as zero. Counting starts internally when this register is written with a nonzero value. CAL_COUNTER_DONE goes immediately low to indicate that the counter has started and will be asserted when the counters are done. Do not write this field unless CAL_COUNTER_DONE==1. Both clocks must be running or the measurement will not complete, and this case can be recovered using CAL_RESET. Default Value: 0

14.1.5 CLK_CAL_CNT2

Description: Clock Calibration Counter 2

Address: 0x4240014C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	CAL_COUNTER2 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	CAL_COUNTER2 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	CAL_COUNTER2 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 0	CAL_COUNTER2	Up-counter clocked on fast clock output #1 (see CLK_OUTPUT_FAST). When CLK_-CAL_CNT1.CAL_COUNTER_DONE==1, the counter is stopped and can be read by SW. Do not read this value unless CAL_COUNTER_DONE==1. The expected final value is related to the ratio of clock frequencies used for the two counters and the value loaded into counter 1: CLK_-CAL_CNT2.COUNTER=(F_cnt2/F_cnt1)*(CLK_CAL_CNT1.COUNTER) Default Value: 0

14.1.6 SRSS_INTR

Description: SRSS Interrupt Register

Address: 0x42400200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW1C	Reserved				RW1C
HW Access	Reserved		A	Reserved				A
Name	Reserved [7:6]		CLK_CAL	Reserved [4:1]				WDT_-MATCH

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW1C
HW Access	Reserved							A
Name	Reserved [15:9]							CSV_LF

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	AINTR	Reserved [30:24]						

Bits	Name	Description
31	AINTR	See additional interrupts in SRSS_AINTR. Default Value: 0
8	CSV_LF	CSV_LF Interrupt Request. This bit is set when LFCLK is below or above the expected limit Default Value: 0
5	CLK_CAL	Clock calibration counter is done. This field is reset during DEEPSLEEP mode. Default Value: 0
0	WDT_MATCH	WDT Interrupt Request. This bit is set each time WDT_COUNTR==WDT_MATCH. W1C also feeds the watch dog. Missing 2 interrupts in a row will generate a reset. Due to internal synchronization, it takes 2 SYSCLK cycles to update after a W1C. Default Value: 0

14.1.7 SRSS_INTR_SET

Description: SRSS Interrupt Set Register

Address: 0x42400204

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW1S	Reserved				RW1S
HW Access	Reserved		A	Reserved				A
Name	Reserved [7:6]		CLK_CAL	Reserved [4:1]				WDT_-MATCH

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [15:9]							CSV_LF

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	CSV_LF	Set interrupt for CSV_LF Default Value: 0
5	CLK_CAL	Set interrupt for clock calibration counter done. This field is reset during DEEPSLEEP mode. Default Value: 0
0	WDT_MATCH	Set interrupt for low voltage detector WDT_MATCH Default Value: 0

14.1.8 SRSS_INTR_MASK

Description: SRSS Interrupt Mask Register

Address: 0x42400208

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW	Reserved				RW
HW Access	Reserved		R	Reserved				R
Name	Reserved [7:6]		CLK_CAL	Reserved [4:1]				WDT_-MATCH

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							CSV_LF

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	CSV_LF	Mask for interrupt for CSV_LF Default Value: 0
5	CLK_CAL	Mask for clock calibration done Default Value: 0
0	WDT_MATCH	Mask for watchdog timer. Clearing this bit will not forward the interrupt to the CPU. It will not, however, disable the WDT reset generation on 2 missed interrupts. When WDT resets the chip, it also internally pends an interrupt that survives the reset. To prevent unintended ISR execution, clear SRSS_INTR.WDT_MATCH before setting this bit. Default Value: 0

14.1.9 SRSS_INTR_MASKED

Description: SRSS Interrupt Masked Register

Address: 0x4240020C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		R	Reserved				R
HW Access	Reserved		RW	Reserved				RW

SW Access	RW	RW	RW	Reserved				
HW Access	A	A	A	Reserved				
Name	WFA	RESET	IN-PUT_AVAIL	Reserved [28:24]				

Bits	Name	Description
31	WFA	Wait for Action. Set by BootROM when it waits for application or debug certificate to be loaded into the RAM. The bit must be cleared to continue BootROM operation. It is used by the Sys-AP. Default Value: 0
30	RESET	Request the device reset after RAM application complete input parameters processing. This bit is analyzed with APP_INPUT_AVAIL so to take effect write both. 0 - No action, the device waits for input parameters. 1 - Reset the device after input parameters processing complete. Default Value: 0
29	INPUT_AVAIL	Notify RAM application that input parameters are valid for processing: 0 - the input parameters are not available. 1 - the input parameters are available (ready) for processing. Default Value: 0

14.1.15 BOOT_DLM_CTL (continued)

3 : 0	REQUEST	Set by Sys-AP or the user application to request BootROM for to execute the request after software reset (this encoding assumes singe request). This field survives some resets, including a system reset: 0x0: There is no request to BootROM (default value). The BootROM follows regular boot flow. 0x1: BootROM set DEBUG_WFA and waits for RAM application and input parameters (optional) in system RAM. After DEBUG_WFA is cleared the BootROM validate RAM application. If validation completed successfully BootROM launches RAM application, otherwise BootROM reports error in TST_DEBUG_STATUS register and continue boot. 0x2: BootROM set DEBUG_WFA and and waits for debug certificate in system RAM. After DEBUG_WFA is cleared the BootROM validates debug certificate. If validation completed successfully BootROM applies AP_CLT setting from certificate, otherwise BootROM reports error in TST_DEBUG_STATUS register. The boot continue independently from certificate validation result. 0x3: BootROM copies RAM application from the staging area and validates it. If validation completed successfully BootROM launches RAM application, otherwise BootROM reports error in TST_DEBUG_STATUS register and continue boot. 0x4: BootROM copies debug certificate from the staging area and validates it. If validation completed successfully BootROM applies AP_CLT setting from certificate, otherwise BootROM reports error in TST_DEBUG_STATUS register. The boot continue independently from certificate validation status. 0x5: Reserved (keep BWC with cyw208289). There is support for opening RAM application debug in PC=0 using certificate. 0x6: Request to higher level firmware (launched upon BootROM completion) to stage RAM application into the staging area. This request is ignored by the BootROM. Others reserved for future use. If set BootROM reports error. Default Value: 0

14.1.16 BOOT_DLM_CTL2

Description: Debug Control Register 2

Address: 0x42400408

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	APP_CTL [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	APP_CTL [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	APP_CTL [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	APP_CTL [31:24]							

Bits	Name	Description
31 : 0	APP_CTL	Address of application descriptor or debug certificate depends on DEBUG_TST_CTL.REQUEST. The application descriptor provides info about RAM application and its parameters layout in the staging area to BootROM and RAM application itself Default Value: 0

14.1.17 BOOT_DLM_STATUS

Description: Debug Status Register

Address: 0x4240040C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [31:24]							

Bits	Name	Description
31 : 0	DEBUG_STATUS	RAM application execution status or debug certificate validation status depends on DEBUG_TST_CTL.REQUEST. This status can be read by the debugger using Sys-AP or user application when RAM application completes with system reset. This field survives some resets, including a system reset Default Value: 0

14.1.18 RES_SOFT_CTL

Description: Soft Reset Trigger Register

Address: 0x42400410

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							R
Name	Reserved [7:1]							TRIGGER_-SOFT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	TRIGGER_SOFT	Triggers a soft reset. The reset clears this bit. Default Value: 0

14.1.19 BOOT_STATUS

Description: Boot Execution Status Register

Address: 0x42400418

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	DEBUG_STATUS [31:24]							

Bits	Name	Description
31 : 0	DEBUG_STATUS	Boot execution status. This status register can be used for communication between ROM_BOOT and User Application. This status can be read by the debugger using Sys-AP or User Application. This field survives some resets, including a system reset. It specifies if the Boot SW launched next application successfully. Following are the BOOT status codes: - Boot Success status: 0x0D50B002 - OEM Policy HASH Invalid : 0xBAF0002B - DLM Package Invalid : 0xBAF00073 - Debug Token Valid : 0x0D500081 - Debug Token Invalid : 0xBAF00082 - Debug Policy Invalid : 0xBAF00083 - OEM Policy Invalid : 0xBAF00085 - Extended Boot Image Invalid : 0xBAF00090 - BASE_RT_SERVICE Invalid : 0xBAF00091 - SE_RT_SERVICE Invalid : 0xBAF00092 Default Value: 0

14.1.20 BOOT_ENTRY

Description: Warm Boot Entry Address

Address: 0x42400430

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	WARM_BOOT_ENTRY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	WARM_BOOT_ENTRY [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	WARM_BOOT_ENTRY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	WARM_BOOT_ENTRY [31:24]							

Bits	Name	Description
31 : 0	WARM_BOOT_ENTRY	Warm boot entry point. This status register can be used for communication between 2 software application before/after DS-RAM or soft reset. This field survives low voltage resets, including a system reset. Default Value: 0

14.1.21 DECODED_LCS_DATA

Description: Decoded Life Cycle Stage Data Register

Address: 0x42400440

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R		R		R		R	
HW Access	RW		RW		RW		RW	
Name	N_CODE [7:6]		S_CODE [5:4]		P_CODE [3:2]		K_CODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				R		R	
HW Access	Reserved				RW		RW	
Name	Reserved [15:12]				B_CODE [11:10]		R_CODE [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
11 : 10	B_CODE	Indicates status of LCS "B" bit. 00=Unprogrammed, 11=Valid, 10/01=Invalid Default Value: 2
9 : 8	R_CODE	Indicates status of LCS "R" bit. 00=Unprogrammed, 11=Valid, 10/01=Invalid Default Value: 2
7 : 6	N_CODE	Indicates status of LCS "N" bit*. 00=Unprogrammed, 11=Valid, 10/01=Invalid. Will be '00' if R_CODE is set in RMA LCS Default Value: 2
5 : 4	S_CODE	Indicates status of LCS "S" bit*. 00=Unprogrammed, 11=Valid, 10/01=Invalid. Will be '11' if R_CODE is set in RMA LCS Default Value: 2
3 : 2	P_CODE	Indicates status of LCS "P" bit*. 00=Unprogrammed, 11=Valid, 10/01=Invalid. Will be '11' if R_CODE is set in RMA LCS Default Value: 2
1 : 0	K_CODE	Indicates status of LCS "K" bit. 00=Unprogrammed, 11=Valid, 10/01=Invalid Default Value: 2

14.1.22 PWR_HIB_WAKE_CTL

Description: Hibernate Wakeup Mask Register

Address: 0x424008A0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				A			
Name	Reserved [7:4]				HIB_WAKE_SRC [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved					
HW Access	A	A	Reserved					
Name	HIB_WAKE_WDT	HIB_WAKE_RTC	Reserved [29:24]					

Bits	Name	Description
31	HIB_WAKE_WDT	When set, HIBERNATE will wakeup for a pending WDT interrupt. Default Value: 0
30	HIB_WAKE_RTC	When set, HIBERNATE will wakeup for a pending RTC interrupt. Default Value: 0
3 : 0	HIB_WAKE_SRC	When set, HIBERNATE will wakeup for the assigned source The number and assignment of HIBERNATE wakeup sources are product-specific. Default Value: 0

14.1.23 PWR_HIB_WAKE_CTL2

Description: Hibernate Wakeup Polarity Register

Address: 0x424008A4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				A			
Name	Reserved [7:4]				HIB_WAKE_SRC [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	HIB_WAKE_SRC	Each bit selects the polarity for the corresponding HIBERNATE wakeup source. The number and assignment of wakeup sources are product-specific. 0: Wakes when unmasked input is 0. 1: Wakes when unmasked input is 1. Default Value: 0

14.1.24 PWR_HIB_WAKE_CAUSE

Description: Hibernate Wakeup Cause Register

Address: 0x424008AC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW1C			
HW Access	Reserved				A			
Name	Reserved [7:4]				HIB_WAKE_SRC [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C	RW1C	Reserved					
HW Access	A	A	Reserved					
Name	HIB_WAKE_WDT	HIB_WAKE_RTC	Reserved [29:24]					

Bits	Name	Description
31	HIB_WAKE_WDT	Indicates WDT wakeup cause. The WDT interrupt must be cleared before this bit can be cleared. Default Value: 0
30	HIB_WAKE_RTC	Indicates RTC wakeup cause. The RTC interrupt must be cleared before this bit can be cleared. Default Value: 0
3 : 0	HIB_WAKE_SRC	Each bit indicates a HIBERNATE wakeup cause. The number and assigment of wakeup sources are product-specific. For each bit, writing a 1 clears the cause flag. Default Value: 0

14.1.25 TST_XRES_SECURE

Description: SECURE TEST and FIRMWARE TEST Key control register

Address: 0x42400914

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DATA8 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [15:12]				FW_WR [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				SECURE_WR [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	R	R	Reserved				
HW Access	R	RW	RW	Reserved				
Name	SECURE_-DISABLE	SE-CURE_KEY_OK	FW_KEY_OK	Reserved [28:24]				

Bits	Name	Description
31	SECURE_DISABLE	Disables the SECURE TEST key entry capability until next reset. Must not be set in the same write when any of the above *_WR bits are set or toggling. Default Value: 0
30	SECURE_KEY_OK	Indicates that the 32-bit SECURE TEST key is observing the correct key. Secure key is not reset, but it will establish low after a deep power cycle that causes it to lose its written state. Default Value: 0
29	FW_KEY_OK	Indicates that the 32-bit FIRMWARE TEST key is observing the correct key. Firmware key is re-set by (A)XRES and STRUCT_XRES. Default Value: 0
19 : 16	SECURE_WR	Latch enables for each of the 4 bytes in the 32-bit SECURE TEST key. Must be toggled high and then low while keeping DATA8 to the correct value. Default Value: 0
11 : 8	FW_WR	Latch enables for each of the 4 bytes in the 32-bit FIRMWARE TEST key. Must be toggled high and then low while keeping DATA8 to the correct value. Default Value: 0
7 : 0	DATA8	Data byte to be set into either SECURE TEST or FIRMWARE TEST key. Must not be changed in the same write that is toggling any of the *_WR bits below, Default Value: 0

14.1.26 PWR_CTL

Description: Power Mode Control

Address: 0x42401000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		R	R	Reserved			
HW Access	Reserved		RW	RW	Reserved			
Name	Reserved [7:6]		LP-M_READY	DEBUG_-SESSION	Reserved [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5	LPM_READY	Indicates whether certain low power functions are ready. The low current circuits take longer to startup after XRES, HIBERNATE wakeup, or supply supervision reset wakeup than the normal mode circuits. HIBERNATE mode may be entered regardless of this bit. 0: If a low power circuit operation is requested, it will stay in its normal operating mode until it is ready. If DEEPSLEEP is requested by all processors WFI/WFE, the device will instead enter SLEEP. When low power circuits are ready, device will automatically enter the originally requested mode. 1: Normal operation. DEEPSLEEP and low power circuits operate as requested in other registers. Default Value: 0
4	DEBUG_SESSION	Indicates whether a debug session is active (CDBGPWRUPREQ signal is 1) Default Value: 0 **0x0: NO_SESSION :** No debug session active **0x1: SESSION_ACTIVE :** Debug session is active. Power modes behave differently to keep the debug session active, and current consumption may be higher than datasheet specification.

14.1.27 PWR_CTL2

Description: Power Mode Control 2

Address: 0x42401004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved		R	RW	Reserved		R	Reserved
HW Access	Reserved		RW	A	Reserved		RW	Reserved
Name	Reserved [23:22]		REFSYS-_VREF-BUF_OK	REFSYS-_VBUF_DIS	Reserved [19:18]		REFSYS-_VREF_OK	Reserved

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C	RW1C	Reserved	RW	RW	Reserved	R	Reserved
HW Access	A	A	Reserved	A	A	Reserved	RW	Reserved
Name	FREEZE_DPSLP_PD1	FREEZE_DPSLP	Reserved	BGREF_LPMODE	POR-BOD_LP-MODE	Reserved	REFSYS-_IREF_OK	Reserved

Bits	Name	Description
31	FREEZE_DPSLP_PD1	Controls whether mode and state of GPIOs and SIOs in Power Domain 1 are frozen. This is intended to be used as part of the DEEPSLEEP-RAM and DEEPSLEEP-OFF entry and exit sequences. It is set by HW when PD1 enters DEEPSLEEP-RAM and DEEPSLEEP-OFF modes. Writing a 1 clears freeze and GPIOs and SIOs resume normal operation. Default Value: 1
30	FREEZE_DPSLP	Controls whether mode and state of GPIOs and SIOs in Power Domain 0 are frozen. This is intended to be used as part of the DEEPSLEEP-RAM and DEEPSLEEP-OFF entry and exit sequences. It is set by HW when PD0 enters DEEPSLEEP-RAM and DEEPSLEEP-OFF modes. Writing a 1 clears freeze and GPIOs and SIOs resume normal operation. Default Value: 0
28	BGREF_LPMODE	Control the circuit-level power mode of the Bandgap Reference circuits for DEEPSLEEP. This register is only reset by XRES, HIBERNATE wakeup, or supply supervision reset. This requires CLK_LF to be operating properly, and it is SW's responsibility to ensure CLK_LF is correctly configured. Note that CLK_LF may be sourced from WCO, ILO, or PILO. When changing back to continuous operation, keep CLK_LF enabled for at least 5 cycles after clearing this bit to allow for internal synchronization. The setting is ignored during ACTIVE mode. 0: Bandgap Reference uses the normal settings. 1: Bandgap Reference uses the low power sample and hold circuits. Default Value: 0

14.1.27 PWR_CTL2 (continued)

27	PORBOD_LPMODE	Control the power mode of the POR/BOD circuits in DEEPSLEEP modes. The value in this register is ignored and normal mode is used until LPM_READY==1. This register is only reset by XRES, HIBERNATE wakeup, or supply supervision reset. 0: POR/BOD circuits operate in normal mode during DEEPSLEEP. 1: POR/BOD circuits operate in low power mode during DEEPSLEEP. Response time is reduced to save current. Default Value: 0
25	REFSYS_IREF_OK	Indicates that the current reference is ready. Due to synchronization delays, it may take two IHO clock cycles for hardware to clear this bit after asserting REFI_DIS=1. Default Value: 0
21	REFSYS_VREFBUF_OK	Indicates that the voltage reference buffer is ready. Due to synchronization delays, it may take two IHO clock cycles for hardware to clear this bit after asserting REFVBUF_DIS=1. Default Value: 0
20	REFSYS_VBUF_DIS	Disable the voltage reference buffer. Firmware should only disable the buffer when there is no connected circuit that is using it. SRSS circuits that require it are the DPLL and ECO. A particular product may have circuits outside the SRSS that use the buffer. This register is only reset by XRES, HIBERNATE wakeup, or supply supervision reset. Default Value: 0
17	REFSYS_VREF_OK	Indicates that the normal mode of the voltage reference is ready. Default Value: 0

14.1.28 PWR_HIBERNATE

Description: HIBERNATE Mode Register

Address: 0x42401008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	TOKEN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	UNLOCK [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW				RW	RW	RW	Reserved
HW Access	A				A	A	A	Reserved
Name	POLARITY_HIBPIN [23:20]				MASK_HIB-WDT	MASK_HI-BALARM	FREEZE	Reserved

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW1S	RW	Reserved	RW			
HW Access	A	R	A	Reserved	A			
Name	HIBER-NATE	HIBER-NATE_DIS-ABLE	SENSE_-MODE	Reserved	MASK_HIBPIN [27:24]			

Bits	Name	Description
31	HIBERNATE	Firmware sets this bit to enter HIBERNATE mode. The system will enter HIBERNATE mode immediately after writing to this bit and will wakeup only in response to XRES or WAKEUP. Both UNLOCK and FREEZE must have been set correctly in a previous write operations. Otherwise, it will not enter HIBERNATE. External supplies must have been stable for 250us before entering HIBERNATE mode. Default Value: 0
30	HIBERNATE_DISABLE	Hibernate disable bit. 0: Normal operation, HIBERNATE works as described 1: Further writes to this register are ignored Note: This bit is a write-once bit until the next reset. Avoid changing any other bits in this register while disabling HIBERNATE mode. Also, it is recommended to clear the UNLOCK code, if it was previously written.. Default Value: 0
29	SENSE_MODE	Power mode when wakeups are sensitive. The default of this field is 0 for software compatibility with other products. It is recommended to set this field to 1 for new/updated software. 0: Wakeups are sensitive only during HIBERNATE mode. A wakeup pulse that comes just before HIBERNATE entry may be missed. Backward compatible. 1: Wakeups are sensitive in HIBERNATE and higher modes. Before entering HIBERNATE, software must clear all unmasked, pending wakeups in PWR_HIB_WAKE_CAUSE register. An unmasked, pending wakeup causes HIBERNATE wakeup, even if it was pending from before HIBERNATE entry. This prevents missed wakeups. Default Value: 0

14.1.28 PWR_HIBERNATE (continued)

27 : 24	MASK_HIBPIN	Reserved. Default Value: 0
23 : 20	POLARITY_HIBPIN	Reserved. Default Value: 0
19	MASK_HIBWDT	Reserved. Default Value: 0
18	MASK_HIBALARM	Reserved. Default Value: 0
17	FREEZE	Controls whether mode and state of GPIOs and SIOs in the system are frozen. This is intended to be used as part of the HIBERNATE entry and exit sequences. When entering HIBERNATE mode, the first write instructs DEEPSLEEP peripherals that they cannot ignore the upcoming freeze command. This occurs even in the illegal condition where UNLOCK is not set. If UNLOCK and HIBERNATE are properly set, the IOs actually freeze on the second write. Supply supervision is disabled during HIBERNATE mode. HIBERNATE peripherals ignore resets (excluding XRES) while FREEZE==1. Default Value: 0
15 : 8	UNLOCK	This byte must be set to 0x3A for FREEZE or HIBERNATE fields to operate. Any other value in this register will cause FREEZE/HIBERNATE to have no effect, except as noted in the FREEZE description. Default Value: 0
7 : 0	TOKEN	Contains a 8-bit token that is retained through a HIBERNATE/WAKEUP sequence that can be used by firmware to differentiate WAKEUP from a general RESET event. Note that waking up from HIBERNATE using XRES,or a WDT reset will reset this register. Default Value: 0

14.1.29 PWR_LVD_CTL

Description: High Voltage / Low Voltage Detector (HVLVD) Configuration Register

Address: 0x42401020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	RW	Reserved		RW			
HW Access	R	R	Reserved		R			
Name	HVLVD_EN	HVLVD_D-PSLP_EN	Reserved [5:4]		HVLVD_TRIPSEL [3:0]

HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW	RW	
HW Access	Reserved					R	R	
Name	Reserved [23:19]					HVLVD_AC-TION	HVLVD_EDGE_SEL [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
18	HVLVD_ACTION	Action taken when the threshold is crossed in the programmed directions(s) Default Value: 0 **0x0: INTERRUPT :** Generate an interrupt **0x1: FAULT :** Generate a fault
17 : 16	HVLVD_EDGE_SEL	Sets which edge(s) will trigger an action when the threshold is crossed. Default Value: 0 **0x0: DISABLE :** Disabled **0x1: RISING :** Rising edge

14.1.29 PWR_LVD_CTL (continued)

		0x2: FALLING : Falling edge **0x3: BOTH :** Both rising and falling edges
7	HVLVD_EN	Enable HVLVD voltage monitor. Do not change other HVLVD settings when enabled. Default Value: 0
6	HVLVD_DPSLP_EN	1 = Enable HVLVD voltage monitor during Deepsleep if HVLVD_EN=1, but the response will be slowed to save power. 0 = HVLVD does not function during DEEPSLEEP, but it automatically returns to its configured setting after DEEPSLEEP wakeup. Default Value: 0
3 : 0	HVLVD_TRIPSEL	Threshold selection for HVLVD. Disable the detector (HVLVD_EN=0) before changing the threshold. 0: rise=2.78V (nom), fall=2.75V (nom) 1: rise=2.88V (nom), fall=2.85V (nom) 2: rise=2.98V (nom), fall=2.95V (nom) 3: rise=3.08V (nom), fall=3.05V (nom) 4: rise=3.18V (nom), fall=3.15V (nom) Default Value: 0

14.1.30 CLK_PATH_SELECT0

Description: Clock Path Select Register

Address: 0x42401200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [7:3]					PATH_MUX [2:0]		

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	A	Reserved						
Name	ENABLE	Reserved [30:24]						

Bits	Name	Description
31	ENABLE	Enable for this clock root. All clock roots default to disabled (ENABLE==0) except HFCLK0, which cannot be disabled. Default Value: 0
11 : 8	ROOT_DIV	Selects predivider value for this clock root and DSI input. This divider is after DIRECT_MUX. For products with DSI, the output of this mux is routed to DSI for use as a signal. For products with clock supervision, the output of this mux is the monitored clock for CSV_HF. Default Value: 0 **0x0: NO_DIV :** Transparent mode, feed through selected clock source w/o dividing. **0x1: DIV_BY_2 :** Divide selected clock source by 2 **0x2: DIV_BY_3 :** Divide selected clock source by 3 **0x3: DIV_BY_4 :** Divide selected clock source by 4

14.1.31 CLK_ROOT_SELECT0 (continued)

Divide selected clock source by 15

0xf: DIV_BY_16 :

Divide selected clock source by 16

14.1.31 CLK_ROOT_SELECT0 (continued)

3 : 0	ROOT_MUX	Selects a clock path for HFCLK and SRSS DSI input . The output of this mux goes to the direct mux (see CLK_DIRECT_SELECT). Use CLK_SELECT_PATH[i] to configure the desired path. The number of clock paths is product-specific, and selecting an unimplemented path is not supported. Some paths may have PLL available (product-specific), and the control and bypass mux selections of these are in other registers. Configure a PLL using the related CLK_PLL_CONFIG[k] register. Note that not all products support all clock sources. Selecting a clock source that is not supported will result in undefined behavior. It takes four cycles of the originally selected clock to switch away from it. Do not disable the original clock during this time. When switching to a different clock source, ensure that the ROOT_DIV is set to an appropriate value BEFORE changing the ROOT_MUX to avoid a temporary over/under-shoot in clock frequency that will occur if both fields are changed at the same time. Default Value: 0 **0x0: PATH0 :** Select PATH0 **0x1: PATH1 :** Select PATH1 **0x2: PATH2 :** Select PATH2 **0x3: PATH3 :** Select PATH3 **0x4: PATH4 :** Select PATH4 **0x5: PATH5 :** Select PATH5 **0x6: PATH6 :** Select PATH6 **0x7: PATH7 :** Select PATH7 **0x8: PATH8 :** Select PATH8 **0x9: PATH9 :** Select PATH9 **0xa: PATH10 :** Select PATH10

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2 : 0	LFCLK_SEL	Select source for LFCLK. Note that not all products support all clock sources. Selecting a clock source that is not supported will result in undefined behavior. Writes to this field are ignored unless the WDT is unlocked using WDT_LOCK register. It takes four cycles of the originally selected clock to switch away from it. Do not disable the original clock during this time. Default Value: 0 **0x0: PILO :** PILO - Precision ILO, if present. **0x1: WCO :** WCO - Watch-Crystal Oscillator. Requires properly configured (including external watch crystal, if used), if present **0x2: ALTLF :** ALTLF - Alternate Low-Frequency Clock. Capability is product-specific **0x3: ECO_PRESCALER :** ECO_PRESCALER - External-Crystal Oscillator after prescaling, if present. Does not work in DEEPSLEEP or HIBERNATE modes. Intended for applications that operate in ACTIVE/SLEEP modes only. This option is only valid when ECO is present in the product. User must ensure that the CLK_ECO_PRESCALE is configured to generate a 32KHz clock when using this option.

14.1.33 CLK_SELECT (continued)

0x4: ILO :

ILO - Internal Low-speed Oscillator, if present

14.1.34 CLK_MF_SELECT

Description: Medium Frequency Clock Select Register

Address: 0x42401304

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [7:3]					MFCLK_SEL [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	MFCLK_DIV [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLE	Reserved [30:24]						

Bits	Name	Description
31	ENABLE	Enable for MFCLK (clk_mf). When disabling clk_mf, do not disable the source until after 5 clk_mf periods. clk_mf continues to operate in DEEPSLEEP for compatible sources. Firmware must disable clk_mf before entering DEEPSLEEP if the source is not compatible with DEEPSLEEP mode. Default Value: 0
15 : 8	MFCLK_DIV	Divide selected clock source by (1+MFCLK_DIV). The output of this divider is MFCLK (clk_mf). Allows for integer divisions in the range [1, 256]. Do not change this setting while ENABLE==1. Default Value: 0
2 : 0	MFCLK_SEL	Select source for MFCLK (clk_mf). Note that not all products support all clock sources. Selecting a clock source that is not supported results in undefined behavior. Default Value: 4 **0x0: IMO :** Internal Main Oscillator (IMO). DEEPSLEEP compatibility is product-specific. See CLK_IMO_CONFIG for capability of this product. **0x1: ILO :** ILO - Internal Low-speed Oscillator. **0x2: WCO :** WCO - Watch-Crystal Oscillator, if present.

14.1.34 CLK_MF_SELECT (continued)

0x3: ALTLF :

ALTLF - Alternate Low-Frequency Clock. Capability is product-specific

0x4: PILO :

PILO - Precision ILO, if present.

0x5: ECO_PRESCALER :

ECO_PRESCALER - External-Crystal Oscillator, if present, after prescaling in CLK_ECO_PRESCALE. Intended for applications that operate in ACTIVE/SLEEP modes only. Does not work in DEEPSLEEP mode.

0x6: IHO :

IHO clock. MFCLK_DIV should be >0 to achieve MF frequency. DEEPSLEEP compatibility is product-specific. See CLK_IHO_CONFIG for capability of this product.

0x7: RESERVED2 :

Reserved

14.1.35 CLK_ECO_PRESCALE

Description: ECO Prescaler Configuration Register

Address: 0x42401320

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							ECO_DIV_ ENABLED

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ECO_FRAC_DIV [15:8]							

Bits	23	22	21	20	19	18	17	16

HW Access	R							
Name	ECO_INT_DIV [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [31:26]						ECO_INT_DIV [25:24]	

Bits	Name	Description
25 : 16	ECO_INT_DIV	10-bit integer value allows for ECO frequencies up to 33.55MHz. Subtract one from the desired divide value when writing this field. For example, to divide by 1, write ECO_INT_DIV=0. Do not change this setting when ECO Prescaler is enabled. Default Value: 0
15 : 8	ECO_FRAC_DIV	8-bit fractional value, sufficient to get prescaler output within the +/-65ppm calibration range. Do not change this setting when ECO Prescaler is enabled. Default Value: 0
0	ECO_DIV_ENABLED	ECO prescaler enabled. HW sets this field to '1' as a result of an CLK_ECO_CONFIG.ECO_DIV_ENABLE command. HW sets this field to '0' as a result on a CLK_ECO_CONFIG.ECO_DIV_DISABLE command. ECO prescaler is incompatible with DEEPSLEEP modes, and firmware must disable it before entering DEEPSLEEP. Default Value: 0

14.1.36 CLK_IHO_CONFIG

Description: IHO Configuration Register

Address: 0x42401344

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	IHO_TRIM_FREQ [7:0]

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved		RW	RW	Reserved		
HW Access	R	Reserved		RW1C	RW1C	Reserved		
Name	ECO_EN	Reserved [30:29]		ECO_DIV_ENABLE	ECO_DIV_-DISABLE	Reserved [26:24]		

Bits	Name	Description
31	ECO_EN	Master enable for ECO oscillator. Configure the settings in CLK_ECO_CONFIG2 to work with the selected crystal, before enabling ECO. Default Value: 0
28	ECO_DIV_ENABLE	ECO prescaler enable command (mutually exclusive with ECO_DIV_DISABLE). ECO Prescaler only works in ACTIVE and SLEEP modes. SW sets this field to '1' to enable the divider and HW sets this field to '0' to indicate that divider enabling has completed. When the divider is enabled, its integer and fractional counters are initialized to "0". If a divider is to be re-enabled using different integer and fractional divider values, the SW should follow these steps: 0: Disable the divider using the ECO_DIV_DISABLE field. 1: Configure CLK_ECO_PRESCALE registers. 2: Enable the divider using the ECO_DIV_ENABLE field. HW sets the ECO_DIV_ENABLE field to '0' when the enabling is performed and HW set CLK_ECO_PRESCALER.ENABLED to '1' when the enabling is performed. Default Value: 0
27	ECO_DIV_DISABLE	ECO prescaler disable command (mutually exclusive with ECO_DIV_ENABLE). SW sets this field to '1' and HW sets this field to '0'. HW sets ECO_DIV_DISABLE field to '0' immediately and HW sets CLK_ECO_PRESCALE.ECO_DIV_EN field to '0' immediately. Default Value: 0

14.1.38 CLK_ECO_CONFIG2

Description: ECO Configuration Register 2

Address: 0x42401364

Retention: Retained

Name	Reserved [7:4]				WCO_EN	Reserved [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved		RW		Reserved	RW		
HW Access	Reserved		A		Reserved	A		
Name	Reserved [15:14]		PRESCALER [13:12]		Reserved	CLK_RTC_SEL [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	RW				Reserved			RW
HW Access	A				Reserved			A
Name	WCO_TRIM_GAIN [23:20]				Reserved [19:17]			WCO_BY-PASS

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved						RW	
HW Access	Reserved						A	
Name	Reserved [31:26]						WCO_CTRL_PWRMOD [25:24]	

Bits	Name	Description
25 : 24	WCO_CTRL_PWRMOD	If the BAK (RTC) is the selected source for WDT, Writes to this field are ignored unless the WDT is unlocked using WDT_LOCK register. WCO power mode control: 00: low power mode(agc on); 01: high power mode (agc off) ; 10: reserved 11: high power startup mode (agc_off intially then turns on) Default Value: 0
23 : 20	WCO_TRIM_GAIN	main amplifier gain control. Please use S22SRSSA_WCO_CALCULATOR to obtain appropriate value for the attached crystal. Writes to this field are ignored unless the WDT is unlocked using WDT_LOCK register Default Value: 0xC
16	WCO_BYPASS	Configures the WCO for different board-level connections to the WCO pins. For example, this can be used to connect an external watch crystal oscillator instead of a watch crystal. In all cases, the two related GPIO pins (WCO input and output pins) must be configured as analog connections using GPIO registers, and they must be hooked at the board level as described below. Configure this field before enabling the WCO, and do not change this setting when WCO_EN=1. Also if the BAK (RTC) is the selected source for WDT, Writes to this field are ignored unless the WDT is unlocked using WDT_LOCK register. 0: Watch crystal. Connect a 32.768 kHz watch crystal between WCO input and output pins. 1: Clock signal, either a square wave or sine wave. See PRESCALER field for connection information. Default Value: 0

14.1.42 CLK_WCO_CONFIG (continued)

13 : 12	PRESCALER	Prescaler for real time clock used when WCO_BYPASS=1 and CLK_SEL = WCO. Configure this field before enabling the WCO, and do not change this setting when WCO_EN=1. Also if the BAK (RTC) is the selected source for WDT, Writes to this field are ignored unless the WDT is unlocked using WDT_LOCK register. 0: 32768 Hz square wave. Connect a 32768 Hz square wave to WCO input pin (XIP). Do not connect WCO output pin (XOP). 1: 60 Hz sine wave. Connect an AC-coupled sine wave to WCO input pin. Do not connect the WCO output pin at the board level. 2: 50 Hz sine wave. Connect an AC-couple sine wave to WCO input pin. Do not connect the WCO output pin at the board level. 3: reserved Default Value: 0
10 : 8	CLK_RTC_SEL	Clock select for RTC clock. If the BAK (RTC) is the selected source for WDT, Writes to this field are ignored unless the WDT is unlocked using WDT_LOCK register. Selecting a clock that is not running results in unpredictable behavior. Default Value: 0 **0x0: WCO :** Watch-crystal oscillator input, available in Active, DeepSleep and Hibernate. **0x1: ALTBAK :** This allows to use the LFCLK selection as an alternate backup domain clock. Note that LFCLK is only available in Active and DeepSleep power modes. Note that LFCLK clock glitches can propagate into the RTC logic when the clock is stopped. For this reason, if the WCO, PILO or ILO is intended as the clock source then choose it directly instead of routing through LFCLK. **0x2: ILO :** Internal Low frequency Oscillator, available in Active, DeepSleep, and Hibernate. With this option selected, ILO reset is suppressed in XRES/Hibernate modes. **0x3: PILO :** Precision internal low-speed oscillator, available in Active, DeepSleep, and Hibernate. With this option selected, PILO reset is suppressed in XRES/Hibernate modes. **0x4: RESERVED :** Reserved
3	WCO_EN	Watch-crystal oscillator (WCO) enable. If there is an RTC write in progress and WCO is the clock source for clk_rtc when this bit is cleared, the WCO will be internally kept on until the write completes. After enabling the WCO software must wait until CLK_WCO_STATUS.WCO_OK=1 before configuring any component that depends on clk_lf/clk_rtc, like for example RTC or WDTs. If the BAK (RTC) is the selected source for WDT, writes to this field are ignored unless the WDT is unlocked using WDT_LOCK register. Default Value: 0

14.1.43 CLK_WCO_STATUS

Description: WCO Status Register

HW Access	R	R	Reserved					
Name	CSV_EN	CSV_ACTION	Reserved [29:24]					

Bits	Name	Description
31	CSV_EN	Enables clock supervision, both frequency and loss. CSV in Active domain: Clock supervision is reset during DeepSleep and Hibernate modes. When enabled it begins operating automatically after a DeepSleep wakeup, but it must be reconfigured after Hibernate wakeup. CSV in DeepSleep domain: Clock supervision is reset during Hibernate mode. It must be reconfigured after Hibernate wakeup. A CSV error detection is reported to the Fault structure, or instead it can generate a power reset. Default Value: 0
30	CSV_ACTION	Specifies the action taken when an anomaly is detected on the monitored clock. CSV in DeepSleep domain always do a Fault report (which also wakes up the system). Default Value: 0 **0x0: FAULT :** Generate a fault **0x1: RESET :** Cause a power reset. This should only be used for clk_hf0.

14.1.44 CSV_HF_CSV0_REF_CTL (continued)

15 : 0	CSV_STARTUP	Startup delay time -1 (in reference clock cycles), after enable or DeepSleep wakeup, from reference clock start to monitored clock start. At a minimum (both clocks running): STARTUP >= (PERIOD +3) * FREQ_RATIO - UPPER, with FREQ_RATIO = (Reference frequency / Monitored frequency) On top of that the actual clock startup delay and the margin for accuracy of both clocks must be added. Default Value: 0

SW Access	RW	Reserved	RW		RW	Reserved		
HW Access	R	Reserved	R		R	Reserved		
Name	ENABLE	Reserved	BYPASS_SEL [29:28]		PLL_DCO_-MODE	Reserved [26:24]		

Bits	Name	Description
31	ENABLE	Master enable for PLL. Setup FEEDBACK_DIV, REFERENCE_DIV, and OUTPUT_DIV at least one cycle before setting ENABLE=1. fOUT = (FEEDBACK_DIV + FRAC_EN*FRAC_DIV/2^24) * (fREF / REFERENCE_DIV) / (OUT-PUT_DIV) 0: Block is disabled. When the PLL disables, hardware controls the bypass mux as described in BYPASS_SEL, before disabling the PLL circuit. 1: Block is enabled Default Value: 0
29 : 28	BYPASS_SEL	Bypass mux located just after PLL output. This selection is glitch-free and can be changed while the PLL is running. When changing BYPASS_SEL, do not turn off the reference clock or PLL clock for five cycles (whichever is slower). Default Value: 0 **0x0: AUTO :** Automatic using lock indicator. When unlocked, automatically selects PLL reference input (by-pass mode). When locked, automatically selects PLL output. If ENABLE=0, automatically selects PLL reference input. **0x1: LOCKED_OR_NOTHING :** Similar to AUTO, except the clock is gated off when unlocked. This is compatible with clock su-pervision, because the supervisors allow no clock during startup (until a timeout occurs), and the clock targets the proper frequency whenever it is running. If ENABLE=0, no clock is output.

14.1.52 CLK_DPLL_LP0_CONFIG (continued)

		0x2: PLL_BYPASS : Select PLL reference input (bypass mode). Ignores lock indicator **0x3: PLL_OUT :** Select PLL output. Ignores lock indicator. If ENABLE=0, no clock is output.
27	PLL_DCO_MODE	dco_mode='0' DCO freq 160-310MHz , '1' - DCO freq 310-480MHz Default Value: 0
20 : 16	OUTPUT_DIV	Control bits for Output divider. Set the divide value before enabling the PLL, and do not change it while PLL is enabled. 0: illegal (undefined behavior) 1: divide by 1. Suitable for direct usage as HFCLK source. 2: divide by 2. Suitable for direct usage as HFCLK source. ... 16: divide by 16. Suitable for direct usage as HFCLK source. >16: illegal (undefined behavior) Default Value: 2
12 : 8	REFERENCE_DIV	Control bits for reference divider. Set the divide value before enabling the PLL, and do not change it while PLL is enabled. 0: illegal (undefined behavior) 1: divide by 1 ... 16: divide by 16 others: illegal (undefined behavior) Default Value: 1
7 : 0	FEEDBACK_DIV	Control bits for feedback divider. Set the divide value before enabling the PLL, and do not change it while PLL is enabled. 0-15: illegal (undefined behavior) 16: divide by 16 ... 200: divide by 200 >200: illegal (undefined behavior) Default Value: 22

14.1.53 CLK_DPLL_LP0_CONFIG2

Description: DPLL_LP Configuration Register 2

Address: 0x42401604

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW			Reserved			
HW Access	R	R			Reserved			
Name	FRAC_EN	FRAC_DITHER_EN [30:28]			Reserved [27:24]			

Bits	Name	Description
31	FRAC_EN	Enables fractional division mode. Default Value: 0
30 : 28	FRAC_DITHER_EN	Enables dithering during fractional operation. 3'b000: disables dithering; 3'b001: enables dithering; others: reserved Default Value: 0
23 : 0	FRAC_DIV	Control bits for fractional divider. This value is interpreted as a fraction of the PFD frequency, i.e. fPFD * (FRAC_DIV/2^24). This field can be dynamically updated within the 1000ppm control limit. It takes up to 115 AHB cycles to transfer the setting to the PLL, and writes that occur faster may be silently ignored and require the application to write again after the previous update has finished. Reading the register returns the accepted value. The PLL will start targeting the new value, but it may take significant time (milliseconds) to stabilize at the new average value. Do not change the FRAC_DIV setting while the PLL is initially locking. Default Value: 0

14.1.54 CLK_DPLL_LP0_CONFIG3

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	UNLOCK_OCCURRED	This bit sets whenever the PLL Lock bit goes low, and stays set until cleared by firmware. Note: When disabling DPLL via register write, UNLOCK_OCCURRED will set. Therefore, after enabling DPLL and DPLL successfully locks, FW should clear UNLOCK_OCCURRED flag to prevent a false positive that would indicate that DPLL erroneously unlocked. Default Value: 0
0	LOCKED	PLL Lock Indicator Default Value: 0

14.1.60 CLK_DPLL_HP0_CONFIG

Description: DPLL_HP Configuration Register

Address: 0x42401800

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	PLL_FREQ_NDIV_INT_SEL [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved	RW			Reserved	RW		
HW Access	Reserved	R			Reserved	R		
Name	Reserved	PLL_FREQ_KDIV_SEL [14:12]			Reserved	PLL_FREQ_PDIV_SEL [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved	RW		Reserved			
HW Access	R	Reserved	R		Reserved			
Name	ENABLE	Reserved	BYPASS_SEL [29:28]		Reserved [27:24]			

Bits	Name	Description
31	ENABLE	Master enable for PLL. Setup PLL for integer, fract or SCSG at least one cycle before setting ENABLE=1. 0: Block is disabled. When the PLL disables, hardware controls the bypass mux as described in BYPASS_SEL, before disabling the PLL circuit. 1: Block is enabled Default Value: 0
29 : 28	BYPASS_SEL	Bypass mux located just after PLL output. This selection is glitch-free and can be changed while the PLL is running. When changing BYPASS_SEL, do not turn off the reference clock or PLL clock for five cycles (whichever is slower). Default Value: 0 **0x0: AUTO :** Automatic using lock indicator. When unlocked, automatically selects PLL reference input (bypass mode). When locked, automatically selects PLL output. If ENABLE=0, automatically selects PLL reference input. **0x1: LOCKED_OR_NOTHING :** Similar to AUTO, except the clock is gated off when unlocked. This is compatible with clock supervision, because the supervisors allow no clock during startup (until a timeout occurs), and the clock targets the proper frequency whenever it is running. If ENABLE=0, no clock is output. **0x2: PLL_BYPASS :** Select PLL reference input (bypass mode). Ignores lock indicator

14.1.60 CLK_DPLL_HP0_CONFIG (continued)

		0x3: PLL_OUT : Select PLL output. Ignores lock indicator. If ENABLE=0, no clock is output.
14 : 12	PLL_FREQ_KDIV_SEL	K-divider division factor (K = kdiv_sel_i + 1) Default Value: 1
10 : 8	PLL_FREQ_PDIV_SEL	P-divider division factor (P = pdiv_sel_i + 1) (Cannot be changed on the fly when the PLL is enabled) Default Value: 0
7 : 0	PLL_FREQ_NDIV_INT_SEL	N-divider division factor (N = ndiv_sel_i + 1) (Cannot be changed on the fly when the PLL is enabled) Default Value: 19

14.1.61 CLK_DPLL_HP0_CONFIG2

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
11	RESET_MCWDT3	Multi-Counter Watchdog timer reset #3. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
10	RESET_MCWDT2	Multi-Counter Watchdog timer reset #2. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
9	RESET_MCWDT1	Multi-Counter Watchdog timer reset #1. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
8	RESET_MCWDT0	Multi-Counter Watchdog timer reset #0. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
6	RESET_SOFT2	CPU[2] requested a system reset through it's SYSRESETREQ. This can be done via a debugger probe or in firmware. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
5	RESET_SOFT1	CPU[1] requested a system reset through it's SYSRESETREQ. This can be done via a debugger probe or in firmware. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0

14.1.69 RES_CAUSE (continued)

4	RESET_SOFT	CPU[0] requested a system reset through it's SYSRESETREQ. This can be done via a debugger probe or in firmware. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
3	RESET_TC_DBGRESET	Test controller or debugger asserted reset. This asserts low-voltage resets including the debug domain. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
2	RESET_DPSLP_FAULT	Reserved Default Value: 0
1	RESET_ACT_FAULT	Fault logging system requested a reset from its Active logic. This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). Default Value: 0
0	RESET_WDT	A basic WatchDog Timer (WDT) reset has occurred since last power cycle. ULP products: This is a low-voltage cause bit that hardware clears when the low-voltage supply is initialized (see comments above). For products that support high-voltage cause detection, this bit blocks recording of other high-voltage cause bits, except RESET_PORVDDD, or *XRES. Hardware clears this bit during POR. This bit is not blocked by other HV cause bits. Default Value: 0

14.1.70 RES_CAUSE2

Description: Reset Cause Observation Register 2

Address: 0x42401BD4

Retention: Retained

HW Access	Reserved	A	Reserved	A	A	Reserved	A	A
Name	Reserved	RESET_OVDVCCD	Reserved	RESET_BODVBAT	RESET_BODVCCD	Reserved	RESET_BODVDDD	RESET_XRES

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved	RW1C	RW1C	RW1C	Reserved			
HW Access	Reserved	A	A	A	Reserved			
Name	Reserved	RESET_PORVDDD	RESET_STRUCT_XRES	RESET_PXRES	Reserved [27:24]			

Bits	Name	Description
30	RESET_PORVDDD	Indicator that a POR occurred. This is a high-voltage cause bit, and hardware clears the other bits when this one is set. It does not block further recording of other high-voltage causes. Default Value: 1
29	RESET_STRUCT_XRES	Structural reset was asserted. This is a high-voltage cause bit that blocks recording of other high-voltage cause bits, except RESET_PORVDDD, *XRES, or WDT. Hardware clears this bit during POR. This bit is not blocked by other HV cause bits. Default Value: 0
28	RESET_PXRES	PXRES triggered. This is a high-voltage cause bit that blocks recording of other high-voltage cause bits, except RESET_PORVDDD, *XRES, or WDT. Hardware clears this bit during POR. This bit is not blocked by other HV cause bits. Default Value: 0
22	RESET_OVDVCCD	Overvoltage detection on the internal core VCCD supply. This is a high-voltage cause bit that blocks recording of other high-voltage cause bits, except RESET_PORVDDD, *XRES, or WDT. Hardware clears this bit during POR. Default Value: 0
20	RESET_BODVBAT	External VBAT supply crossed brown-out limit. Note that this cause will only be observable as long as the VDDD supply does not go below the POR (power on reset) detection limit. Below this limit it is not possible to reliably retain information in the device. This is a high-voltage cause bit that blocks recording of other high-voltage cause bits, except RESET_PORVDDD, *XRES, or WDT. Hardware clears this bit during POR. Default Value: 0

14.1.72 RES_CAUSE_EXTEND (continued)

19	RESET_BODVCCD	Internal VCCD core supply crossed the brown-out limit. Note that this detector will detect gross issues with the internal core supply, but may not catch all brown-out conditions. Functional and timing supervision (CSV, WDT) is provided to create fully failsafe internal crash detection. This is a high-voltage cause bit that blocks recording of other high-voltage cause bits, except RESET_PORVDDD, *XRES, or WDT. Hardware clears this bit during POR. Default Value: 0
17	RESET_BODVDDD	External VDDD supply crossed brown-out limit. Note that this cause will only be observable as long as the VDDD supply does not go below the POR (power on reset) detection limit. Below this limit it is not possible to reliably retain information in the device. This is a high-voltage cause bit that blocks recording of other high-voltage cause bits, except RESET_PORVDDD, *XRES, or WDT. Hardware clears this bit during POR. Default Value: 0
16	RESET_XRES	External XRES pin was asserted. This is a high-voltage cause bit that blocks recording of other high-voltage cause bits, except RESET_PORVDDD, or WDT. Hardware clears this bit during POR. This bit is not blocked by other HV cause bits. Default Value: 0

14.1.73 PWR_CBUCK_CTL

Description: Core Buck Control Register

Address: 0x42401C10

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW				
HW Access	Reserved			A				
Name	Reserved [7:5]			CBUCK_VSEL [4:0]				

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW				
HW Access	Reserved			A				
Name	Reserved [15:13]			CBUCK_MODE [12:8]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12 : 8	CBUCK_MODE	CBUCK mode. Low ripple (high power) modes are intended for analog that needs low ripple. Low power mode is suitable for digital processing. The CBUCK mode is defined as = {mode*_sr_mode, mode*_sr_hp_submode[1:0], mode*_sr_lp_submode[1:0]} The actual CBUCK mode is the maximum of this setting and the settings of all enabled step-down regulators. 0x11: HP,Hysteretic PFM, High-Low (default Active) 0x01: LP,Hysteretic PFM, High-Low (default DeepSleep) Default Value: 1
4 : 0	CBUCK_VSEL	Voltage output selection. This register is only reset by XRES, HIBERNATE wakeup, or supply supervision reset. The actual CBUCK voltage is the maximum of this setting and the settings for selected mode (see PWR_BUCK_CTL.MODE). These settings follow the formula (0.58+0.02*CBUCK_VSEL). 0: 0.58V, 1: 0.60V, 2: 0.62V, 3: 0.64V, 4: 0.66V, 5: 0.68V, 6: 0.70V, 7: 0.72V, 8: 0.74V, 9: 0.76V, 10: 0.78V, 11: 0.80V, 12: 0.82V, 13: 0.84V, 14: 0.86V, 15: 0.88V, 16: 0.90V, 17: 0.92V, 18: 0.94V, 19: 0.96V, 20: 0.98V, 21: 1.00V, 22: 1.02V, 23: 1.04V, 24: 1.06V, 25: 1.08V, 26: 1.10V, 27: 1.12V, 28: 1.14V, 29: 1.16V, 30: 1.18V, 31: 1.20V. Default Value: 11

14.1.74 PWR_CBUCK_CTL2

Description: Core Buck Control Register 2

Address: 0x42401C14

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [7:2]						CBUCK_PROFILE [1:0]	

Bits	15	14	13	12	11	10	9	8

SW Access	RW	RW1C	Reserved					
HW Access	R	A	Reserved					
Name	RE-SERVED_CTL	RE-SERVED_CTL2	Reserved [29:24]					

Bits	Name	Description
31	RESERVED_CTL	Reserved. Set to 0. Default Value: 0
30	RESERVED_CTL2	Reserved. Set to 0. Default Value: 0
1 : 0	CBUCK_PROFILE	Selects between CBUCK mode profiles. When CBUCK_USE_SETTING=1, PWR_CBUCK_CTL settings are included in the harmonization and the maximum of the respective mode is used. 00: Mode0: VSEL=0.8V; MODE= HP,Hysteretic PFM, High-Low (17) 01: Mode1: VSEL=0.7V; MODE=17 10: Mode2: VSEL=0.9V; MODE=17 11: Forces the CBUCK to use the settings in PWR_CBUCK_CTL register, ignoring the other hardware requests. This can be used as part of a firmware algorithm to change the voltage of an regulator. This bit is cleared by any reset]. Default Value: 0

14.1.75 PWR_CBUCK_DPSLP_CTL

Description: Core Buck Deepsleep Control Register

Address: 0x42401C1C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW				
HW Access	Reserved			A				
Name	Reserved [7:5]			CBUCK_DPSLP_VSEL [4:0]				

Bits	15	14	13	12	11	10	9	8

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	CBUCK_DPSLP_OVERRIDE	Reserved [30:24]						

Bits	Name	Description
31	CBUCK_DPSLP_OVERRIDE	Causes the settings in CBUCK_DPSLP_VSEL and CBUCK_DPSLP_MODE in this register to be used during DEEPSLEEP. Can be used to override the normal hardware voltage behavior of 0.7V and LP, LP,Hysteretic PFM, High-Low (default DeepSleep) Default Value: 0
12 : 8	CBUCK_DPSLP_MODE	CBUCK mode. Low ripple (high power) modes are intended for analog that needs low ripple. Low power mode is suitable for digital processing. The CBUCK mode is defined as = {mode*_sr_mode, mode*_sr_hp_submode[1:0], mode*_sr_lp_submode[1:0]} CBUCK_DPSLP_OVERRIDE=1 will casue these settings to be used during DEEPSLEEP mode. 0x11: HP,Hysteretic PFM, High-Low (default Active) 0x01: LP,Hysteretic PFM, High-Low (default DeepSleep) Default Value: 1
4 : 0	CBUCK_DPSLP_VSEL	Voltage output selection for DEEPSLEEP. CBUCK_DPSLP_OVERRIDE=1 will casue these settings to be used during DEEPSLEEP mode. This register is only reset by XRES, HIBERNATE wakeup, or supply supervision reset. These settings follow the formula (0.58+0.02*CBUCK_VSEL). 0: 0.58V, 1: 0.60V, 2: 0.62V, 3: 0.64V, 4: 0.66V, 5: 0.68V, 6: 0.70V, 7: 0.72V, 8: 0.74V, 9: 0.76V, 10: 0.78V, 11: 0.80V, 12: 0.82V, 13: 0.84V, 14: 0.86V, 15: 0.88V, 16: 0.90V, 17: 0.92V, 18: 0.94V, 19: 0.96V, 20: 0.98V, 21: 1.00V, 22: 1.02V, 23: 1.04V, 24: 1.06V, 25: 1.08V, 26: 1.10V, 27: 1.12V, 28: 1.14V, 29: 1.16V, 30: 1.18V, 31: 1.20V. Default Value: 11

14.1.76 PWR_CBUCK_STATUS

Description: Core Buck Status Register

Address: 0x42401C20

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	R

Bits	23	22	21	20	19	18	17	16
SW Access	RW		RW			Reserved	RW	
HW Access	R		R			Reserved	R	
Name	PLL_FRAC_ORDER [23:22]		LDO_PERI_TRIM [21:19]			Reserved	PLL_DCO_SD_SEL [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW						RW
HW Access	R	R						R
Name	EN-ABLE_CNT	ISOLATE_CNT [30:25]						ISOLATE_N

Bits	Name	Description
31	ENABLE_CNT	Enable for the PLL hardware sequencer. 0: Disables the hardware sequencer. When disabling the PLL, first deselect it using .BYPASS_-SEL=PLL_REF, wait at least six PLL clock cycles, and then disable it with .ENABLE=0. Before entering DEEPSLEEP, firmware must switch to another clock source and disable the PLL. 1: Enables the hardware sequencer. The sequencer handles all PLL enable/disable transitions, including around DEEPSLEEP entry/exit. Default Value: 1
30 : 25	ISOLATE_CNT	Terminal count for the stabilization counter handles PLL_ISOLATE_N Default Value: 0x7
24	ISOLATE_N	Manual isolation control for PLL . This field is ignored when ENABLE_CNT==1. When controlling manually, de-assert >= 3us after ENABLE=1. Assertion can happen in cycle just before EN-ABLE=0. 0: Isolate outputs 1: Do not isolate outputs Default Value: 0
23 : 22	PLL_FRAC_ORDER	Order of the delta-sigma modulator used for fractional mode. 00: 4th order 01: 3rd order 10: 2nd order 11: 1st order Default Value: 0x3

14.1.82 CLK_TRIM_DPLL_LP0_DPLL_LP_CTL (continued)

21 : 19	LDO_PERI_TRIM	pll ldo peripheri voltage trim 0 0.906V 1 0.786V 2 0.846V 3 0.876V 4 0.936V 5 0.966V 6: 0.995V 7: 1.05V Default Value: 0
17 : 16	PLL_DCO_SD_SEL	00': disable, '01' first order SigmaDelta enabled;'10' third order SigmaDelta enabled;'11' Sigma delta first order enable - with dco_clk/4 Default Value: 0
14 : 12	LDO_DCO_TRIM	Trim for PLL local regulator for DCO 0 0.906V 1 0.786V 2 0.846V 3 0.876V 4 0.936V 5 0.966V 6: 0.995V 7: 1.05V Default Value: 0
10	PLL_SAR_FSM_EN	SAR FSM enable. Always set to 1 for functional mode. This register was kept in the design (and moved to hidden trim register) to increase coverage on the hard IP, and could be removed once the hard IP input is removed. Default Value: 0x1
9	SAR_DIS_FAST	Disable Successive Approximation Register during locking for fast lock, used when code write=1. 0: Use SAR. 1: Disable SAR. Default Value: 0
8	SAR_DIS_COLD	Disable Successive Approximation Register during locking for cold lock, used when code write=0. 0: Use SAR. 1: Disable SAR. Default Value: 0
7 : 4	SAR_CYCLE_STOP_-FAST	Successive Approximation Register (SAR) configuration for fast lock, used when code write=1. Ignored when SAR_DIS==1. 0x1...0xB: Number of cycles until SAR stops. others: illegal Default Value: 0x1
3 : 0	SAR_CY-CLE_STOP_COLD	Successive Approximation Register (SAR) configuration for cold lock, used when code write=0. Ignored when SAR_DIS==1. 0x1...0xB: Number of cycles until SAR stops. others: illegal Default Value: 0x3

14.1.83 CLK_TRIM_DPLL_LP0_DPLL_LP_CTL3

Description: DPLL LP Trim Register 3

Address: 0x42403208

HW Access	Reserved				R			
Name	Reserved [31:28]				LOCK_WAIT_RISE_FAST [27:24]			

Bits	Name	Description
27 : 20	LOCK_WAIT_RISE_FAST	Wait time from when static phase error is within the lock window until lock signal asserts, for fast lock, used when code write=1. 0: Illegal 1: 1 PFD clocks 2: 2 PFD clocks ... 255: 255 PFD clocks Optimal settings f, MHz Wait Time, clocks --------- ---------- 4-->5 16 5-->6 17 6-->7 16 7-->8 13 8-->9 17 9-->10 21 Default Value: 0x3

14.1.84 CLK_TRIM_DPLL_LP0_DPLL_LP_CTL4 (continued)

11 : 4	LOCK_WAIT_RISE_COLD	Wait time from when static phase error is within the lock window until lock signal asserts, for cold lock, used when code write=0. 0: Illegal 1: 1 PFD clocks 2: 2 PFD clocks ... 255: 255 PFD clocks Optimal settings f, MHz Wait Time, clocks --------- ---------- 4-->5 53 5-->6 73 6-->7 85 7-->8 91 8-->9 104 9-->10 117 Notes: For initial DPLL locking or when DPLL Fast Lock is disabled (PLL_DIS_FAST_LOCK=1), user must program DPLL_CTL4.LOCK_WAIT_RISE using appropriate value for "Without Code Write" for corresponding frequency range. Default Value: 0x8
1 : 0	LOCK_WAIT_FALL	Wait time from when static phase error is within the lock window until lock signal asserts. 0: 0 PFD clocks 1: 2 PFD clocks 2: 3 PFD clocks 3: 4 PFD clocks Default Value: 0

14.1.85 CLK_TRIM_DPLL_LP0_DPLL_LP_TEST4

Description: DPLL LP Test Register 4

Address: 0x4240321C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	PLL_USER_DCO_CODE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW	RW	Reserved			RW		
HW Access	A	R	Reserved			A		
Name	PLL_READ_EN	PLL_DIS_-FAST_LOCK	Reserved [13:11]			PLL_USER_DCO_CODE [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	RW	Reserved	RW					
HW Access	R	Reserved	R					
Name	PHASE_ACC_US-ER_WRITE_FRACT	Reserved	PHASE_ACC_USER_WRITE_INT [21:16]					

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [31:29]			PHASE_ACC_USER_WRITE_FRACT [28:24]				

Bits	Name	Description
28 : 23	PHASE_ACC_US-ER_WRITE_FRACT	reduce KI,KP coefficient during PLL deepsleep wakeup fract. Default Value: 0x10
21 : 16	PHASE_ACC_US-ER_WRITE_INT	Reduce KI,KP coefficient during PLL deepsleep wakeup integer. Default Value: 0x10
15	PLL_READ_EN	This bit is a self clear bit. The FW writes 1 to get an updated value in PLL_USER_D-CO_CODE.HW will self clear this bit to indicate that the PLL_USER_DCO_CODE be read. Default Value: 0
14	PLL_DIS_FAST_LOCK	0: Enables DPLL Fast Lock 1: Disables DPLL Fast Lock When PLL_DIS_FAST_LOCK=0, if DPLL successfully locks prior to a DEEPSLEEP entry: - HW will read the DCO code before DEEPSLEEP entry, then write the DCO code upon DEEP-SLEEP exit, to reduce DPLL lock time. - FW must follow the procedure described under DPLL_LP_CTL4.LOCK_WAIT_RISE Notes: 2 Default Value: 0
10 : 0	PLL_USER_DCO_CODE	FW can read the code saved by the DPLL before deepsleep.Use PLL_READ_EN to get updated DCO_CODE from the DPLL: To read properly please refer to PLL_USER_D-CO_CODE_RD_EN/PLL_READ_EN. Before any read, FW should check first that PLL_READ_EN is 0. To account for Clock Domain Crossings, FW should wait at least 3 CLK_IMO cycles (3*125ns=375ns) between SW write and SW read operation. Default Value: 0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW		Reserved					
HW Access	A		Reserved					
Name	WDT_LOCK [31:30]		Reserved [29:24]					

Bits	Name	Description
31 : 30	WDT_LOCK	Prohibits writing to WDT_*, CLK_ILO_CONFIG, CLK_SELECT.LFCLK_SEL, and CLK_TRIM_ILO_CTL registers when not equal 0. Requires at least two different writes to unlock. A change in WDT_LOCK takes effect beginning with the next write cycle. Note that this field is 2 bits to force multiple writes only. It represents only a single write protect signal protecting all those registers at the same time. WDT will lock on any reset. This field is not retained during DEEPSLEEP or HIBERNATE mode, so the WDT will be locked after wakeup from these modes. Default Value: 3 **0x0: NO_CHG :** No effect **0x1: CLR0 :** Clears bit 0 **0x2: CLR1 :** Clears bit 1 **0x3: SET01 :** Sets both bits 0 and 1

14.1.90 WDT_CTL (continued)

5 : 4	WDT_CLK_SEL	Select source for WDT. Not all products support all clock sources. Selecting a clock source that is not supported will result in undefined behavior. Writes to this field are ignored unless the WDT is unlock using WDT_LOCK register. It takes four cycles of the originally selected clock to switch away from it. Do not disable the original clock during this time. Default Value: 1 **0x0: ILO :** ILO - Internal Low-speed Oscillator, if present. With this option selected, ILO reset is suppressed in Hibernate mode. **0x1: PILO :** PILO - Precision ILO. If present. With this option selected, PILO reset is suppressed in Hibernate mode. **0x2: RTC :** RTC - Selected clk_rtc source, if present. This choice is not recommended for applications that rely upon the watchdog timer for safety or security, unless the product supports clock supervision of clk_rtc (CSV_RTC). Generation of clk_rtc is not protected by WDT_LOCK and is in a different memory region with potentially different security attributes.
0	WDT_EN	Enable this watchdog timer. This field is retained during DEEPSLEEP and HIBERNATE modes. Default Value: 1

14.1.91 WDT_CNT

Description: Watchdog Counter Count Register (Type A)

Address: 0x4240C004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A

Name	Reserved [23:22]		COUNTER [21:16]					

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
21 : 0	COUNTER	Current value of WDT Counter. The write feature of this register is for verification purpose, have no synchronization, and can only be applied when the WDT is fully off. When writing, the value is updated immediately in the WDT counter, but it will read back as the old value until this register resynchronizes just after the negedge of selected WDT clock. Writes will be ignored if they occur when the WDT is enabled. Default Value: 0

14.1.92 WDT_MATCH

Description: Watchdog Counter Match Register (Type A)

Address: 0x4240C008

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Name	Reserved [23:22]		MATCH [21:16]					

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
21 : 0	MATCH	Match value for Watchdog counter. Every time WDT_COUNTER reaches MATCH an interrupt is generated. Two unserviced interrupts will lead to a system reset (i.e. at the third match). Default Value: 4096

14.1.93 WDT_MATCH2

Description: Watchdog Counter Match Register 2 (Type A)

Address: 0x4240C00C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
4 : 0	IGNORE_BITS_ABOVE	The number of bits to be considered for matching starting from LSb of the register. Bit indices above this setting are NOT checked against MATCH. This value provides control over the time-to-reset of the watchdog (which happens after 3 successive matches). The four LSBs cannot be ignored for matching. Settings <3 behave like a setting of 3. If the setting is higher than the number of bits in the WDT counter, all actual bits in the counter are matched. Default Value: 31

14.1.94 MCWDT_CNTLOW0

Description: Multi-Counter Watchdog Sub-counters 0/1

Address: 0x4240D004

Retention: Retained

Name	WDT_-MATCH1_2	WDT_CAR-RY1_2	WDT_LOWER_MODE1 [13:12]		WDT_CAS-CADE1_2	WDT_-CLEAR1	WDT_MODE1 [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [23:17]							WDT_-MODE2

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [31:29]			WDT_BITS2 [28:24]				

Bits	Name	Description
28 : 24	WDT_BITS2	Bit to observe for WDT_INT2: 0: Assert after bit0 of WDT_CTR2 toggles (one int every tick) ... 31: Assert after bit31 of WDT_CTR2 toggles (one int every 2^31 ticks) Default Value: 0
16	WDT_MODE2	Watchdog Counter 2 Mode. Default Value: 0 **0x0: NOTHING :** Free running counter with no interrupt requests **0x1: INT :** Free running counter with interrupt request that occurs one LFCLK cycle after the specified bit in CTR2 toggles (see WDT_BITS2).
15	WDT_MATCH1_2	Specifies matching behavior when WDT_CASCADE1_2==1. When WDT_CASCADE1_2==0, this bit is not used and match is based on counter 2 alone. 0: Match based on counter 2 alone. 1: Match based on counter 2 and counter 1 matching simultaneously. Default Value: 0

14.1.97 MCWDT_CONFIG0 (continued)

14	WDT_CARRY1_2	Carry out behavior that applies when WDT_CASCADE1_2==1. This bit is not used when WDT_-CASCADE1_2==0. 0: carry out on counter 1 match. 1: carry out on counter 1 roll-over. Default Value: 0
13 : 12	WDT_LOWER_MODE1	Watchdog Counter Action on service before lower limit. The lower limit action for counter 1 is ignored if this counter is cascaded into counter 2 (WDT_CASCADE1_2 = 1) Default Value: 0 **0x0: NOTHING :** Do nothing **0x1: INT :** Assert WDT_INTx **0x2: RESET :** Assert WDT Reset
11	WDT_CASCADE1_2	Cascade Watchdog Counters 1,2. Counter 2 increments the cycle after WDT_CTR1=WDT_-MATCH1. It is allowed to cascade all three WDT counters. 0: Independent counters 1: Cascaded counters. When cascading all three counters, WDT_CLEAR1 must be 1. Default Value: 0
10	WDT_CLEAR1	Clear Watchdog Counter when WDT_CTR1==WDT_MATCH1. In other words WDT_CTR1 divides LFCLK by (WDT_MATCH1+1). 0: Free running counter 1: Clear on match. In this mode, the minimum legal setting of WDT_MATCH1 is 1. Default Value: 0
9 : 8	WDT_MODE1	Watchdog Counter Action on Match. Action is taken on the next increment after the values match (WDT_CTR1=WDT_MATCH1). Default Value: 0 **0x0: NOTHING :** Do nothing **0x1: INT :** Assert WDT_INTx **0x2: RESET :** Assert WDT Reset **0x3: INT_THEN_RESET :** Assert WDT_INTx, assert WDT Reset after 3rd unhandled interrupt
7	WDT_MATCH0_1	Specifies matching behavior when WDT_CASCADE0_1==1. When WDT_CASCADE0_1==0, this bit is not used and match is based on counter 1 alone. 0: Match based on counter 1 alone. 1: Match based on counter 1 and counter 0 matching simultaneously. Default Value: 0

14.1.97 MCWDT_CONFIG0 (continued)

6	WDT_CARRY0_1	Carry out behavior that applies when WDT_CASCADE0_1==1. This bit is not used when WDT_-CASCADE0_1==0. 0: carry out on counter 0 match. 1: carry out on counter 0 roll-over. Default Value: 0
5 : 4	WDT_LOWER_MODE0	Watchdog Counter Action on service before lower limit. Default Value: 0 **0x0: NOTHING :** Do nothing **0x1: INT :** Assert WDT_INTx **0x2: RESET :** Assert WDT Reset
3	WDT_CASCADE0_1	Cascade Watchdog Counters 0,1. Counter 1 increments the cycle after WDT_CTR0=WDT_-MATCH0. 0: Independent counters 1: Cascaded counters Default Value: 0
2	WDT_CLEAR0	Clear Watchdog Counter when WDT_CTR0=WDT_MATCH0. In other words WDT_CTR0 divides LFCLK by (WDT_MATCH0+1). 0: Free running counter 1: Clear on match. In this mode, the minimum legal setting of WDT_MATCH0 is 1. Default Value: 0
1 : 0	WDT_MODE0	Watchdog Counter Action on Match. Action is taken on the next increment after the values match (WDT_CTR0=WDT_MATCH0). Default Value: 0 **0x0: NOTHING :** Do nothing **0x1: INT :** Assert WDT_INTx **0x2: RESET :** Assert WDT Reset **0x3: INT_THEN_RESET :** Assert WDT_INTx, assert WDT Reset after 3rd unhandled interrupt

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [15:10]						TYPE_SEL [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	PA_DIV_SEL [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved				RW	
HW Access	RW1C	RW1C	Reserved				R	
Name	ENABLE	DISABLE	Reserved [29:26]				PA_TYPE_SEL [25:24]	

Bits	Name	Description
31	ENABLE	Clock divider enable command (mutually exclusive with DISABLE). Typically, SW sets this field to '1' to enable a divider and HW sets this field to '0' to indicate that divider enabling has completed. When a divider is enabled, its integer and fractional (if present) counters are initialized to "0". If a divider is to be re-enabled using different integer and fractional divider values, the SW should follow these steps: 0: Disable the divider using the DIV_CMD.DISABLE field. 1: Configure the divider's DIV_XXX_CTL register. 2: Enable the divider using the DIV_CMD_ENABLE field. The DIV_SEL and TYPE_SEL fields specify which divider is to be enabled. The enabled divider may be phase aligned to either "clk_pclk_root[i]" (typical usage) or to ANY enabled divider. The PA_DIV_SEL and PA_TYPE_SEL fields specify the reference divider. The HW sets the ENABLE field to '0' when the enabling is performed and the HW set the DIV_XXX_CTL.EN field of the divider to '1' when the enabling is performed. Note that enabling with phase alignment to a low frequency divider takes time. E.g. To align to a divider that generates a clock of "clk_pclk_root[i]"/n (with n being the integer divider value INT_DIV+1), up to n cycles may be required to perform alignment. Phase alignment to "clk_pclk_root[i]" takes affect immediately. SW can set this field to '0' during phase alignment to abort the enabling process. Default Value: 0

14.1.105 PERI_PCLK1_GR1_DIV_CMD (continued)

30	DISABLE	Clock divider disable command (mutually exclusive with ENABLE). SW sets this field to '1' and HW sets this field to '0'. The DIV_SEL and TYPE_SEL fields specify which divider is to be disabled. The HW sets the DISABLE field to '0' immediately and the HW sets the DIV_XXX_CTL.EN field of the divider to '0' immediately. Default Value: 0
25 : 24	PA_TYPE_SEL	Specifies the divider type of the divider to which phase alignment is performed for the clock enable command: 0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3
23 : 16	PA_DIV_SEL	(PA_TYPE_SEL, PA_DIV_SEL) specifies the divider to which phase alignment is performed for the clock enable command. Any enabled divider can be used as reference. This allows all dividers to be aligned with each other, even when they are enabled at different times. If PA_DIV_SEL is "255" and PA_TYPE_SEL is "3", "clk_pclk_root[i]" is used as reference. Default Value: 255
9 : 8	TYPE_SEL	Specifies the divider type of the divider on which the command is performed: 0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3
7 : 0	DIV_SEL	(TYPE_SEL, DIV_SEL) specifies the divider on which the command (DISABLE/ENABLE) is performed. If DIV_SEL is "255" and TYPE_SEL is "3" (default/reset value), no divider is specified and no clock signal(s) are generated. Default Value: 255

Name	Reserved [31:24]							

Bits	Name	Description
9 : 8	TYPE_SEL	Specifies divider type: 0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3
1 : 0	DIV_SEL	Specifies one of the dividers of the divider type specified by TYPE_SEL. If DIV_SEL is "255" and TYPE_SEL is "3" (default/reset value), no divider is specified and no clock control signal(s) are generated. When transitioning a clock between two out-of-phase dividers, spurious clock control signals may be generated for one "clk_pclk_root[i]" cycle during this transition. These clock control signals may cause a single clock period that is smaller than any of the two divider periods. To prevent these spurious clock signals, the clock multiplexer can be disconnected (DIV_SEL is "255" and TYPE_SEL is "3") for a transition time that is larger than the smaller of the two divider periods. Default Value: 3

14.1.107 PERI_PCLK1_GR1_DIV_16_5_CTL0

Description: Divider control (for 16.5 divider)

Address: 0x44043800

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 8	INT16_DIV	Integer division by (1+INT16_DIV). Allows for integer divisions in the range [1, 65,536]. Note: combined with fractional division, this divider type allows for a division in the range [1, 65,536 31/32] in 1/32 increments. For the generation of a divided clock, the division range is restricted to [2, 65,536 31/32]. For the generation of a 50/50% duty cycle divided clock, the division range is restricted to [2, 65,536]. Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode. Default Value: 0
7 : 3	FRAC5_DIV	Fractional division by (FRAC5_DIV/32). Allows for fractional divisions in the range [0, 31/32]. Note that fractional division results in clock jitter as some clock periods may be 1 "clk_pclk_-root[i]" cycle longer than other clock periods. Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode. Default Value: 0
0	EN	Divider enabled. HW sets this field to '1' as a result of an ENABLE command. HW sets this field to '0' as a result on a DISABLE command. Note that this field is retained. As a result, the divider does NOT have to be re-enabled after transitioning from DeepSleep to Active power mode. Default Value: 0

Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	INT8_DIV	Integer division by (1+INT8_DIV). Allows for integer divisions in the range [1, 256]. Note: this type of divider does NOT allow for a fractional division. For the generation of a divided clock, the integer division range is restricted to [2, 256]. For the generation of a 50/50% duty cycle digital divided clock, the integer division range is restricted to even numbers in the range [2, 256]. The generation of a 50/50 % duty cycle analog divided clock has no restrictions. Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode. Default Value: 0
0	EN	Divider enabled. HW sets this field to '1' as a result of an ENABLE command. HW sets this field to '0' as a result on a DISABLE command. Note that this field is retained. As a result, the divider does NOT have to be re-enabled after transitioning from DeepSleep to Active power mode. Default Value: 0

15 Real-Time Clock (RTC) registers

This section discusses the RTC registers. It lists all the registers in mapping tables, in address order.

15.1 Register details

Register name	Address	Description
RTC_RTC_RW	0x42420008	RTC Read Write register
RTC_CAL_CTL	0x4242000C	Oscillator calibration for absolute frequency
RTC_STATUS	0x42420010	Status
RTC_RTC_TIME	0x42420014	Calendar Seconds, Minutes, Hours, Day of Week
RTC_RTC_DATE	0x42420018	Calendar Day of Month, Month, Year
RTC_ALM1_TIME	0x4242001C	Alarm 1 Seconds, Minute, Hours, Day of Week
RTC_ALM1_DATE	0x42420020	Alarm 1 Day of Month, Month
RTC_ALM2_TIME	0x42420024	Alarm 2 Seconds, Minute, Hours, Day of Week
RTC_ALM2_DATE	0x42420028	Alarm 2 Day of Month, Month
RTC_INTR	0x4242002C	Interrupt request register
RTC_INTR_SET	0x42420030	Interrupt set request register
RTC_INTR_MASK	0x42420034	Interrupt mask register
RTC_INTR_MASKED	0x42420038	Interrupt masked request register
RTC_RESET	0x42420048	RTC reset register
RTC_BREG_SET00	0x42421000	Backup register region 0
RTC_BREG_SET01	0x42421004	Backup register region 0. See RTC_BREG_SET00 for the details of bit fields.
RTC_BREG_SET02	0x42421008	Backup register region 0. See RTC_BREG_SET00 for the details of bit fields.
RTC_BREG_SET03	0x4242100C	Backup register region 0. See RTC_BREG_SET00 for the details of bit fields.
RTC_BREG_SET10	0x42421010	Backup register region 1
RTC_BREG_SET11	0x42421014	Backup register region 1. See RTC_BREG_SET10 for the details of bit fields.
RTC_BREG_SET12	0x42421018	Backup register region 1. See RTC_BREG_SET10 for the details of bit fields.
RTC_BREG_SET13	0x4242101C	Backup register region 1. See RTC_BREG_SET10 for the details of bit fields.
RTC_BREG_SET20	0x42421020	Backup register region 2
RTC_BREG_SET21	0x42421024	Backup register region 2. See RTC_BREG_SET20 for the details of bit fields.
RTC_BREG_SET22	0x42421028	Backup register region 2. See RTC_BREG_SET20 for the details of bit fields.
RTC_BREG_SET23	0x4242102C	Backup register region 2. See RTC_BREG_SET20 for the details of bit fields.

Real-Time Clock (RTC) registers

Register name	Address	Description
RTC_BREG_SET24	0x42421030	Backup register region 2. See RTC_BREG_SET20 for the details of bit fields.
RTC_BREG_SET25	0x42421034	Backup register region 2. See RTC_BREG_SET20 for the details of bit fields.
RTC_BREG_SET26	0x42421038	Backup register region 2. See RTC_BREG_SET20 for the details of bit fields.
RTC_BREG_SET27	0x4242103C	Backup register region 2. See RTC_BREG_SET20 for the details of bit fields.

15.1.1 RTC_RTC_RW

Description: RTC Read Write register

Address: 0x42420008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						A	A
Name	Reserved [7:2]						WRITE	READ

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	WRITE	Write bit Only when this bit is set can the RTC registers be written to (otherwise writes are ignored). This bit cannot be set if the RTC is still busy with a previous update (see RTC_BUSY bit) or if the Read bit is set or getting set. The user writes to the RTC user registers, when the Write bit is cleared by the user then the user registers content is copied to the actual RTC registers. Only user RTC registers that were written to will get copied, others will not be affected. When the SECONDS field is updated then TICKS will also be reset (WDT is not affected). When the Write bit is cleared by a reset (brown out/DeepSleep) then the RTC update will be ignored/lost. Do not set the Write bit if the RTC if the RTC is still busy with a previous update (see RTC_BUSY). Do not set the Write bit at the same time that the Read bit is cleared. Default Value: 0
0	READ	Read bit When this bit is set the RTC registers will be copied to user registers and frozen so that a coherent RTC value can safely be read. The RTC will keep on running. Do not set the read bit if the RTC is still busy with a previous update (see RTC_BUSY bit) or if the Write bit is set. Do not set the Read bit at the same time that the Write bit is cleared. Default Value: 0

15.1.2 RTC_CAL_CTL

Description: Oscillator calibration for absolute frequency

Address: 0x4242000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	RW	RW					
HW Access	Reserved	A	A					
Name	Reserved	CALIB_-SIGN	CALIB_VAL [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RW	
HW Access	Reserved						A	
Name	Reserved [23:18]						CAL_COMP_PER_MIN [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved	RW		Reserved			
HW Access	A	Reserved	A		Reserved			
Name	CAL_OUT	Reserved	CAL_SEL [29:28]		Reserved [27:24]			

Bits	Name	Description
31	CAL_OUT	Output enable for wave signal for calibration. This allows calibration wave to be used to calculate required CALIB_VAL to be written. Default Value: 0
29 : 28	CAL_SEL	Select calibration wave output signal Default Value: 0 **0x0: CAL512 :** 512Hz wave, not affected by calibration setting (not supported for 50/60Hz input clock: CTL.PRESCALER!=0) **0x1: RESERVED :** reserved **0x2: CAL2 :** 2Hz wave, includes the effect of the calibration setting, (not supported for 50/60Hz input clock: CTL.PRESCALER!=0) **0x3: CAL1 :** 1Hz wave, includes the effect of the calibration setting (supported for all input clocks)

15.1.2 RTC_CAL_CTL (continued)

17 : 16	CAL_COMP_PER_MIN	Select how many time calibration is performed per minute per step of 64 , each time a 64 step is added or substracted one unit 2/4/8/16*CALIB_VAL is substracted. Default Value: 0 **0x0: 2 :** Calibration of 64 each is performed twice per minute for 2*CALIB_VAL per hour **0x1: 4 :** Calibration of 64 each is performed four times per minute for 2*CALIB_VAL per hour **0x2: 8 :** Calibration of 64 each is performed eight times per minute for 2*CALIB_VAL per hour **0x3: 16 :** Ca6libration of 64 each is performed sixteen times per minute for 2*CALIB_VAL per hour
6	CALIB_SIGN	Calibration sign: 0= Negative sign: remove pulses (it takes more clock ticks to count one second) 1= Positive sign: add pulses (it takes less clock ticks to count one second) Default Value: 0
5 : 0	CALIB_VAL	Calibration value for absolute frequency (at a fixed temperature). Each step causes 128 ticks to be added or removed each hour. Effectively that means that each step is 1.085ppm (= 128/(60*60*32,768)) when CAL_COMP_PER_MIN is set at default value. Positive values 0x01-0x3c (1..60) add pulses, negative values remove pulses, thus giving a range of +/-65.1 ppm (limited by 60 minutes per hour, not the range of this field) when CAL_-COMP_PER_MIN is set at default value . Calibration is performed hourly, starting at 59 minutes and 59 seconds, and applied as 64 ticks every 30 seconds until there have been 2*CALIB_VAL adjustments when CAL_COM-P_PER_MIN is set at default value . Default Value: 0

15.1.3 RTC_STATUS

Description: Status

Address: 0x42420010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Name	ALM_EN	Reserved [30:24]						

Bits	Name	Description
31	ALM_EN	Master enable for alarm 2. 0: Alarm 2 is disabled. Fields for date and time are ignored. 1: Alarm 2 is enabled. Alarm triggers whenever the new date and time matches all the enabled date and time fields, which can happen more than once depending on configuration. If none of the date and time fields are enabled, then this alarm triggers once every second. Default Value: 0
15	ALM_MON_EN	Alarm Month enable: 0=ignore, 1=match Default Value: 0
11 : 8	ALM_MON	Alarm Month, 1-12 Default Value: 1
7	ALM_DATE_EN	Alarm Day of the Month enable: 0=ignore, 1=match Default Value: 0
4 : 0	ALM_DATE	Alarm Day of the Month, 1-31 Leap Year corrected Default Value: 1

15.1.10 RTC_INTR

Description: Interrupt request register

Address: 0x4242002C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW1C	RW1C	RW1C
HW Access	Reserved					RW1S	RW1S	RW1S
Name	Reserved [7:3]					CENTURY	ALARM2	ALARM1

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CENTURY	Century overflow interrupt Default Value: 0
1	ALARM2	Alarm 2 Interrupt Default Value: 0
0	ALARM1	Alarm 1 Interrupt Default Value: 0

15.1.11 RTC_INTR_SET

Description: Interrupt set request register

Address: 0x42420030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW1S	RW1S	RW1S
HW Access	Reserved					A	A	A
Name	Reserved [7:3]					CENTURY	ALARM2	ALARM1

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CENTURY	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0
1	ALARM2	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0
0	ALARM1	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0

15.1.12 RTC_INTR_MASK

Description: Interrupt mask register

Address: 0x42420034

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					R	R	R
Name	Reserved [7:3]					CENTURY	ALARM2	ALARM1

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CENTURY	Mask bit for corresponding bit in interrupt request register. Default Value: 0
1	ALARM2	Mask bit for corresponding bit in interrupt request register. Default Value: 0
0	ALARM1	Mask bit for corresponding bit in interrupt request register. Default Value: 0

15.1.13 RTC_INTR_MASKED

Description: Interrupt masked request register

Address: 0x42420038

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R	R	R
HW Access	Reserved					RW	RW	RW
Name	Reserved [7:3]					CENTURY	ALARM2	ALARM1

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CENTURY	Logical and of corresponding request and mask bits. Default Value: 0
1	ALARM2	Logical and of corresponding request and mask bits. Default Value: 0
0	ALARM1	Logical and of corresponding request and mask bits. Default Value: 0

15.1.14 RTC_RESET

Description: RTC reset register

Address: 0x42420048

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	Reserved						
HW Access	A	Reserved						
Name	RESET	Reserved [30:24]						

Bits	Name	Description
31	RESET	Writing 1 to this register resets the backup logic. Hardware clears it when the reset is complete. After setting this register, firmware should confirm it reads as 0 before attempting to write other backup registers. Default Value: 0

15.1.15 RTC_BREG_SET00

Description: Backup register region 0

Address: 0x42421000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	BREG [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	BREG [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	BREG [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	BREG [31:24]							

Bits	Name	Description
31 : 0	BREG	Backup memory that contains application-specific data. Memory is retained on VDDD supply. Default Value: 0

15.1.16 RTC_BREG_SET10

Description: Backup register region 1

Address: 0x42421010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	BREG [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	BREG [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	BREG [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	BREG [31:24]							

Bits	Name	Description
31 : 0	BREG	Backup memory that contains application-specific data. Memory is retained on VDDD supply. Default Value: 0

15.1.17 RTC_BREG_SET20

Description: Backup register region 2

Address: 0x42421020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	BREG [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	A							
Name	BREG [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	A							
Name	BREG [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	BREG [31:24]							

Bits	Name	Description
31 : 0	BREG	Backup memory that contains application-specific data. Memory is retained on VDDD supply. Default Value: 0

16 I/O Subsystem registers

This section discusses the I/O Subsystem registers. It lists all the registers in mapping tables, in address order.

16.1 Register details

Register name	Address	Description
HSIOM_PRT0_PORT_SEL0	0x42800000	Port selection 0
HSIOM_PRT1_PORT_SEL0	0x42800010	Port selection 0
HSIOM_PRT1_PORT_SEL1	0x42800014	Port selection 1
HSIOM_PRT2_PORT_SEL0	0x42800020	Port selection 0
HSIOM_PRT3_PORT_SEL0	0x42800030	Port selection 0. See HSIOM_PRT0_PORT_SEL0 for the details of bit fields.
HSIOM_PRT4_PORT_SEL0	0x42800040	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT4_PORT_SEL1	0x42800044	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT5_PORT_SEL0	0x42800050	Port selection 0. See HSIOM_PRT2_PORT_SEL0 for the details of bit fields.
HSIOM_PRT6_PORT_SEL0	0x42800060	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT6_PORT_SEL1	0x42800064	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT7_PORT_SEL0	0x42800070	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT7_PORT_SEL1	0x42800074	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT8_PORT_SEL0	0x42800080	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT8_PORT_SEL1	0x42800084	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT9_PORT_SEL0	0x42800090	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT10_PORT_SEL0	0x428000A0	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT10_PORT_SEL1	0x428000A4	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT11_PORT_SEL0	0x428000B0	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT11_PORT_SEL1	0x428000B4	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT12_PORT_SEL0	0x428000C0	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.

Register name	Address	Description
HSIOM_PRT12_PORT_SEL1	0x428000C4	Port selection 1
HSIOM_PRT13_PORT_SEL0	0x428000D0	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT13_PORT_SEL1	0x428000D4	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT14_PORT_SEL0	0x428000E0	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT14_PORT_SEL1	0x428000E4	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT15_PORT_SEL0	0x428000F0	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT15_PORT_SEL1	0x428000F4	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT16_PORT_SEL0	0x42800100	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT16_PORT_SEL1	0x42800104	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT17_PORT_SEL0	0x42800110	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT17_PORT_SEL1	0x42800114	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT18_PORT_SEL0	0x42800120	Port selection 0. See HSIOM_PRT0_PORT_SEL0 for the details of bit fields.
HSIOM_PRT19_PORT_SEL0	0x42800130	Port selection 0. See HSIOM_PRT0_PORT_SEL0 for the details of bit fields.
HSIOM_PRT20_PORT_SEL0	0x42800140	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT20_PORT_SEL1	0x42800144	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_PRT21_PORT_SEL0	0x42800150	Port selection 0. See HSIOM_PRT1_PORT_SEL0 for the details of bit fields.
HSIOM_PRT21_PORT_SEL1	0x42800154	Port selection 1. See HSIOM_PRT1_PORT_SEL1 for the details of bit fields.
HSIOM_SECURE_PRT0_NONSECURE_MASK	0x42801000	Non-Secure Mask
HSIOM_SECURE_PRT1_NONSECURE_MASK	0x42801010	Non-Secure Mask
HSIOM_SECURE_PRT2_NONSECURE_MASK	0x42801020	Non-Secure Mask
HSIOM_SECURE_PRT3_NONSECURE_MASK	0x42801030	Non-Secure Mask. See HSIOM_SECURE_PRT0_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT4_NONSECURE_MASK	0x42801040	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
HSIOM_SECURE_PRT5_NONSECURE_MASK	0x42801050	Non-Secure Mask. See HSIOM_SECURE_PRT2_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT6_NONSECURE_MASK	0x42801060	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT7_NONSECURE_MASK	0x42801070	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT8_NONSECURE_MASK	0x42801080	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT9_NONSECURE_MASK	0x42801090	Non-Secure Mask
HSIOM_SECURE_PRT10_NONSECURE_MASK	0x428010A0	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT11_NONSECURE_MASK	0x428010B0	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT12_NONSECURE_MASK	0x428010C0	Non-Secure Mask
HSIOM_SECURE_PRT13_NONSECURE_MASK	0x428010D0	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT14_NONSECURE_MASK	0x428010E0	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT15_NONSECURE_MASK	0x428010F0	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT16_NONSECURE_MASK	0x42801100	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT17_NONSECURE_MASK	0x42801110	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT18_NONSECURE_MASK	0x42801120	Non-Secure Mask. See HSIOM_SECURE_PRT0_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT19_NONSECURE_MASK	0x42801130	Non-Secure Mask. See HSIOM_SECURE_PRT0_NONSECURE_MASK for the details of bit fields.
HSIOM_SECURE_PRT20_NONSECURE_MASK	0x42801140	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
HSIOM_SECURE_PRT21_NONSECURE_MASK	0x42801150	Non-Secure Mask. See HSIOM_SECURE_PRT1_NONSECURE_MASK for the details of bit fields.
HSIOM_AMUX_SPLIT_CTL0	0x42802000	AMUX splitter cell control
HSIOM_AMUX_SPLIT_CTL1	0x42802004	AMUX splitter cell control. See HSIOM_AMUX_SPLIT_CTL0 for the details of bit fields.
HSIOM_AMUX_SPLIT_CTL2	0x42802008	AMUX splitter cell control. See HSIOM_AMUX_SPLIT_CTL0 for the details of bit fields.
HSIOM_AMUX_SPLIT_CTL3	0x4280200C	AMUX splitter cell control. See HSIOM_AMUX_SPLIT_CTL0 for the details of bit fields.
HSIOM_AMUX_SPLIT_CTL4	0x42802010	AMUX splitter cell control. See HSIOM_AMUX_SPLIT_CTL0 for the details of bit fields.
HSIOM_AMUX_SPLIT_CTL5	0x42802014	AMUX splitter cell control. See HSIOM_AMUX_SPLIT_CTL0 for the details of bit fields.
HSIOM_AMUX_SPLIT_CTL6	0x42802018	AMUX splitter cell control. See HSIOM_AMUX_SPLIT_CTL0 for the details of bit fields.
GPIO_PRT0_OUT	0x42810000	Port output data register
GPIO_PRT0_OUT_CLR	0x42810004	Port output data clear register
GPIO_PRT0_OUT_SET	0x42810008	Port output data set register
GPIO_PRT0_OUT_INV	0x4281000C	Port output data invert register
GPIO_PRT0_IN	0x42810010	Port input state register
GPIO_PRT0_INTR	0x42810014	Port interrupt status register
GPIO_PRT0_INTR_MASK	0x42810018	Port interrupt mask register
GPIO_PRT0_INTR_MASKED	0x4281001C	Port interrupt masked status register
GPIO_PRT0_INTR_SET	0x42810020	Port interrupt set register
GPIO_PRT0_INTR_CFG	0x42810040	Port interrupt configuration register
GPIO_PRT0_CFG	0x42810044	Port configuration register
GPIO_PRT0_CFG_IN	0x42810048	Port input buffer configuration register
GPIO_PRT0_CFG_OUT	0x4281004C	Port output buffer configuration register
GPIO_PRT0_CFG_SLEW_EXT	0x42810064	Port output buffer slew extension configuration register
GPIO_PRT0_CFG_DRIVE_EXT0	0x42810068	Port output buffer drive sel extension configuration register
GPIO_PRT0_CFG_DRIVE_EXT1	0x4281006C	Port output buffer drive sel extension configuration register
GPIO_PRT0_CFG_OUT3	0x42810070	Port output buffer configuration register 3

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT1_OUT	0x42810080	Port output data register
GPIO_PRT1_OUT_CLR	0x42810084	Port output data clear register
GPIO_PRT1_OUT_SET	0x42810088	Port output data set register
GPIO_PRT1_OUT_INV	0x4281008C	Port output data invert register
GPIO_PRT1_IN	0x42810090	Port input state register
GPIO_PRT1_INTR	0x42810094	Port interrupt status register
GPIO_PRT1_INTR_MASK	0x42810098	Port interrupt mask register
GPIO_PRT1_INTR_MASKED	0x4281009C	Port interrupt masked status register
GPIO_PRT1_INTR_SET	0x428100A0	Port interrupt set register
GPIO_PRT1_INTR_CFG	0x428100C0	Port interrupt configuration register
GPIO_PRT1_CFG	0x428100C4	Port configuration register
GPIO_PRT2_OUT	0x42810100	Port output data register
GPIO_PRT2_OUT_CLR	0x42810104	Port output data clear register
GPIO_PRT2_OUT_SET	0x42810108	Port output data set register
GPIO_PRT2_OUT_INV	0x4281010C	Port output data invert register
GPIO_PRT2_IN	0x42810110	Port input state register
GPIO_PRT2_INTR	0x42810114	Port interrupt status register
GPIO_PRT2_INTR_MASK	0x42810118	Port interrupt mask register
GPIO_PRT2_INTR_MASKED	0x4281011C	Port interrupt masked status register
GPIO_PRT2_INTR_SET	0x42810120	Port interrupt set register
GPIO_PRT2_INTR_CFG	0x42810140	Port interrupt configuration register
GPIO_PRT2_CFG	0x42810144	Port configuration register
GPIO_PRT2_CFG_IN	0x42810148	Port input buffer configuration register
GPIO_PRT2_CFG_OUT	0x4281014C	Port output buffer configuration register
GPIO_PRT2_CFG_SLEW_EXT	0x42810164	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT2_CFG_DRIVE_EXT0	0x42810168	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT2_CFG_DRIVE_EXT1	0x4281016C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT2_CFG_OUT3	0x42810170	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT3_OUT	0x42810180	Port output data register. See GPIO_PRT0_OUT for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT3_OUT_CLR	0x42810184	Port output data clear register. See GPIO_PRT0_OUT_CLR for the details of bit fields.
GPIO_PRT3_OUT_SET	0x42810188	Port output data set register. See GPIO_PRT0_OUT_SET for the details of bit fields.
GPIO_PRT3_OUT_INV	0x4281018C	Port output data invert register. See GPIO_PRT0_OUT_INV for the details of bit fields.
GPIO_PRT3_IN	0x42810190	Port input state register. See GPIO_PRT0_IN for the details of bit fields.
GPIO_PRT3_INTR	0x42810194	Port interrupt status register. See GPIO_PRT0_INTR for the details of bit fields.
GPIO_PRT3_INTR_MASK	0x42810198	Port interrupt mask register. See GPIO_PRT0_INTR_MASK for the details of bit fields.
GPIO_PRT3_INTR_MASKED	0x4281019C	Port interrupt masked status register. See GPIO_PRT0_INTR_MASKED for the details of bit fields.
GPIO_PRT3_INTR_SET	0x428101A0	Port interrupt set register. See GPIO_PRT0_INTR_SET for the details of bit fields.
GPIO_PRT3_INTR_CFG	0x428101C0	Port interrupt configuration register. See GPIO_PRT0_INTR_CFG for the details of bit fields.
GPIO_PRT3_CFG	0x428101C4	Port configuration register. See GPIO_PRT0_CFG for the details of bit fields.
GPIO_PRT3_CFG_IN	0x428101C8	Port input buffer configuration register. See GPIO_PRT0_CFG_IN for the details of bit fields.
GPIO_PRT3_CFG_OUT	0x428101CC	Port output buffer configuration register
GPIO_PRT3_CFG_SLEW_EXT	0x428101E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT3_CFG_DRIVE_EXT0	0x428101E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT3_CFG_DRIVE_EXT1	0x428101EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT3_CFG_OUT3	0x428101F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT3_CFG_RES	0x428101F4	Port resistor configuration register 3
GPIO_PRT4_OUT	0x42810200	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT4_OUT_CLR	0x42810204	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT4_OUT_SET	0x42810208	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.
GPIO_PRT4_OUT_INV	0x4281020C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT4_IN	0x42810210	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT4_INTR	0x42810214	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT4_INTR_MASK	0x42810218	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT4_INTR_MASKED	0x4281021C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT4_INTR_SET	0x42810220	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT4_INTR_CFG	0x42810240	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT4_CFG	0x42810244	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT5_OUT	0x42810280	Port output data register. See GPIO_PRT2_OUT for the details of bit fields.
GPIO_PRT5_OUT_CLR	0x42810284	Port output data clear register. See GPIO_PRT2_OUT_CLR for the details of bit fields.
GPIO_PRT5_OUT_SET	0x42810288	Port output data set register. See GPIO_PRT2_OUT_SET for the details of bit fields.
GPIO_PRT5_OUT_INV	0x4281028C	Port output data invert register. See GPIO_PRT2_OUT_INV for the details of bit fields.
GPIO_PRT5_IN	0x42810290	Port input state register. See GPIO_PRT2_IN for the details of bit fields.
GPIO_PRT5_INTR	0x42810294	Port interrupt status register. See GPIO_PRT2_INTR for the details of bit fields.
GPIO_PRT5_INTR_MASK	0x42810298	Port interrupt mask register. See GPIO_PRT2_INTR_MASK for the details of bit fields.
GPIO_PRT5_INTR_MASKED	0x4281029C	Port interrupt masked status register. See GPIO_PRT2_INTR_MASKED for the details of bit fields.
GPIO_PRT5_INTR_SET	0x428102A0	Port interrupt set register. See GPIO_PRT2_INTR_SET for the details of bit fields.
GPIO_PRT5_INTR_CFG	0x428102C0	Port interrupt configuration register. See GPIO_PRT2_INTR_CFG for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT5_CFG	0x428102C4	Port configuration register. See GPIO_PRT2_CFG for the details of bit fields.
GPIO_PRT5_CFG_IN	0x428102C8	Port input buffer configuration register. See GPIO_PRT2_CFG_IN for the details of bit fields.
GPIO_PRT5_CFG_OUT	0x428102CC	Port output buffer configuration register. See GPIO_PRT2_CFG_OUT for the details of bit fields.
GPIO_PRT5_CFG_SLEW_EXT	0x428102E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT5_CFG_DRIVE_EXT0	0x428102E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT5_CFG_DRIVE_EXT1	0x428102EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT5_CFG_OUT3	0x428102F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT6_OUT	0x42810300	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT6_OUT_CLR	0x42810304	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.
GPIO_PRT6_OUT_SET	0x42810308	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.
GPIO_PRT6_OUT_INV	0x4281030C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT6_IN	0x42810310	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT6_INTR	0x42810314	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT6_INTR_MASK	0x42810318	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT6_INTR_MASKED	0x4281031C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT6_INTR_SET	0x42810320	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT6_INTR_CFG	0x42810340	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT6_CFG	0x42810344	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT6_CFG_IN	0x42810348	Port input buffer configuration register
GPIO_PRT6_CFG_OUT	0x4281034C	Port output buffer configuration register
GPIO_PRT6_CFG_SLEW_EXT	0x42810364	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT6_CFG_DRIVE_EXT0	0x42810368	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT6_CFG_DRIVE_EXT1	0x4281036C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT6_CFG_OUT3	0x42810370	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT7_OUT	0x42810380	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT7_OUT_CLR	0x42810384	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.
GPIO_PRT7_OUT_SET	0x42810388	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.
GPIO_PRT7_OUT_INV	0x4281038C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT7_IN	0x42810390	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT7_INTR	0x42810394	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT7_INTR_MASK	0x42810398	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT7_INTR_MASKED	0x4281039C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT7_INTR_SET	0x428103A0	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT7_INTR_CFG	0x428103C0	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT7_CFG	0x428103C4	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT7_CFG_IN	0x428103C8	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT7_CFG_OUT	0x428103CC	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT7_CFG_SLEW_EXT	0x428103E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT7_CFG_DRIVE_EXT0	0x428103E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT7_CFG_DRIVE_EXT1	0x428103EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT7_CFG_OUT3	0x428103F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT8_OUT	0x42810400	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT8_OUT_CLR	0x42810404	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.
GPIO_PRT8_OUT_SET	0x42810408	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.
GPIO_PRT8_OUT_INV	0x4281040C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT8_IN	0x42810410	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT8_INTR	0x42810414	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT8_INTR_MASK	0x42810418	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT8_INTR_MASKED	0x4281041C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT8_INTR_SET	0x42810420	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT8_INTR_CFG	0x42810440	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT8_CFG	0x42810444	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT8_CFG_IN	0x42810448	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT8_CFG_OUT	0x4281044C	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT8_CFG_SLEW_EXT	0x42810464	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT8_CFG_DRIVE_EXT0	0x42810468	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT8_CFG_DRIVE_EXT1	0x4281046C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT8_CFG_OUT3	0x42810470	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT9_OUT	0x42810480	Port output data register
GPIO_PRT9_OUT_CLR	0x42810484	Port output data clear register
GPIO_PRT9_OUT_SET	0x42810488	Port output data set register
GPIO_PRT9_OUT_INV	0x4281048C	Port output data invert register
GPIO_PRT9_IN	0x42810490	Port input state register
GPIO_PRT9_INTR	0x42810494	Port interrupt status register
GPIO_PRT9_INTR_MASK	0x42810498	Port interrupt mask register
GPIO_PRT9_INTR_MASKED	0x4281049C	Port interrupt masked status register
GPIO_PRT9_INTR_SET	0x428104A0	Port interrupt set register
GPIO_PRT9_INTR_CFG	0x428104C0	Port interrupt configuration register
GPIO_PRT9_CFG	0x428104C4	Port configuration register
GPIO_PRT9_CFG_IN	0x428104C8	Port input buffer configuration register
GPIO_PRT9_CFG_OUT	0x428104CC	Port output buffer configuration register
GPIO_PRT9_CFG_SLEW_EXT	0x428104E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT9_CFG_DRIVE_EXT0	0x428104E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT9_CFG_DRIVE_EXT1	0x428104EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT9_CFG_OUT3	0x428104F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT10_OUT	0x42810500	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT10_OUT_CLR	0x42810504	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.
GPIO_PRT10_OUT_SET	0x42810508	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.
GPIO_PRT10_OUT_INV	0x4281050C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT10_IN	0x42810510	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT10_INTR	0x42810514	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT10_INTR_MASK	0x42810518	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT10_INTR_MASKED	0x4281051C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT10_INTR_SET	0x42810520	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT10_INTR_CFG	0x42810540	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT10_CFG	0x42810544	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT10_CFG_IN	0x42810548	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT10_CFG_OUT	0x4281054C	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.
GPIO_PRT10_CFG_SLEW_EXT	0x42810564	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT10_CFG_DRIVE_EXT0	0x42810568	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT10_CFG_DRIVE_EXT1	0x4281056C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT10_CFG_OUT3	0x42810570	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT11_OUT	0x42810580	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT11_OUT_CLR	0x42810584	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT11_OUT_SET	0x42810588	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.
GPIO_PRT11_OUT_INV	0x4281058C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT11_IN	0x42810590	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT11_INTR	0x42810594	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT11_INTR_MASK	0x42810598	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT11_INTR_MASKED	0x4281059C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT11_INTR_SET	0x428105A0	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT11_INTR_CFG	0x428105C0	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT11_CFG	0x428105C4	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT11_CFG_IN	0x428105C8	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT11_CFG_OUT	0x428105CC	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.
GPIO_PRT11_CFG_SLEW_EXT	0x428105E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT11_CFG_DRIVE_EXT0	0x428105E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT11_CFG_DRIVE_EXT1	0x428105EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT11_CFG_OUT3	0x428105F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT12_OUT	0x42810600	Port output data register
GPIO_PRT12_OUT_CLR	0x42810604	Port output data clear register
GPIO_PRT12_OUT_SET	0x42810608	Port output data set register
GPIO_PRT12_OUT_INV	0x4281060C	Port output data invert register
GPIO_PRT12_IN	0x42810610	Port input state register

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT12_INTR	0x42810614	Port interrupt status register
GPIO_PRT12_INTR_MASK	0x42810618	Port interrupt mask register
GPIO_PRT12_INTR_MASKED	0x4281061C	Port interrupt masked status register
GPIO_PRT12_INTR_SET	0x42810620	Port interrupt set register
GPIO_PRT12_INTR_CFG	0x42810640	Port interrupt configuration register
GPIO_PRT12_CFG	0x42810644	Port configuration register
GPIO_PRT12_CFG_IN	0x42810648	Port input buffer configuration register
GPIO_PRT12_CFG_OUT	0x4281064C	Port output buffer configuration register
GPIO_PRT12_CFG_SLEW_EXT	0x42810664	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT12_CFG_DRIVE_EXT0	0x42810668	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT12_CFG_DRIVE_EXT1	0x4281066C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT12_CFG_OUT3	0x42810670	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT13_OUT	0x42810680	Port output data register
GPIO_PRT13_OUT_CLR	0x42810684	Port output data clear register
GPIO_PRT13_OUT_SET	0x42810688	Port output data set register
GPIO_PRT13_OUT_INV	0x4281068C	Port output data invert register
GPIO_PRT13_IN	0x42810690	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT13_INTR	0x42810694	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT13_INTR_MASK	0x42810698	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT13_INTR_MASKED	0x4281069C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT13_INTR_SET	0x428106A0	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT13_INTR_CFG	0x428106C0	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT13_CFG	0x428106C4	Port configuration register

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT13_CFG_IN	0x428106C8	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT13_CFG_OUT	0x428106CC	Port output buffer configuration register
GPIO_PRT13_CFG_SLEW_EXT	0x428106E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT13_CFG_DRIVE_EXT0	0x428106E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT13_CFG_DRIVE_EXT1	0x428106EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT13_CFG_OUT3	0x428106F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT14_OUT	0x42810700	Port output data register. See GPIO_PRT13_OUT for the details of bit fields.
GPIO_PRT14_OUT_CLR	0x42810704	Port output data clear register. See GPIO_PRT13_OUT_CLR for the details of bit fields.
GPIO_PRT14_OUT_SET	0x42810708	Port output data set register. See GPIO_PRT13_OUT_SET for the details of bit fields.
GPIO_PRT14_OUT_INV	0x4281070C	Port output data invert register. See GPIO_PRT13_OUT_INV for the details of bit fields.
GPIO_PRT14_IN	0x42810710	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT14_INTR	0x42810714	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT14_INTR_MASK	0x42810718	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT14_INTR_MASKED	0x4281071C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT14_INTR_SET	0x42810720	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT14_INTR_CFG	0x42810740	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT14_CFG	0x42810744	Port configuration register. See GPIO_PRT13_CFG for the details of bit fields.

Register name	Address	Description
GPIO_PRT14_CFG_IN	0x42810748	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT14_CFG_OUT	0x4281074C	Port output buffer configuration register. See GPIO_PRT13_CFG_OUT for the details of bit fields.
GPIO_PRT14_CFG_SLEW_EXT	0x42810764	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT14_CFG_DRIVE_EXT0	0x42810768	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT14_CFG_DRIVE_EXT1	0x4281076C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT14_CFG_OUT3	0x42810770	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT15_OUT	0x42810780	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT15_OUT_CLR	0x42810784	Port output data clear register. See GPIO_PRT13_OUT_CLR for the details of bit fields.
GPIO_PRT15_OUT_SET	0x42810788	Port output data set register. See GPIO_PRT13_OUT_SET for the details of bit fields.
GPIO_PRT15_OUT_INV	0x4281078C	Port output data invert register. See GPIO_PRT13_OUT_INV for the details of bit fields.
GPIO_PRT15_IN	0x42810790	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT15_INTR	0x42810794	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT15_INTR_MASK	0x42810798	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT15_INTR_MASKED	0x4281079C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT15_INTR_SET	0x428107A0	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT15_INTR_CFG	0x428107C0	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT15_CFG	0x428107C4	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT15_CFG_IN	0x428107C8	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT15_CFG_OUT	0x428107CC	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.
GPIO_PRT15_CFG_SLEW_EXT	0x428107E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT15_CFG_DRIVE_EXT0	0x428107E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT15_CFG_DRIVE_EXT1	0x428107EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT15_CFG_OUT3	0x428107F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT16_OUT	0x42810800	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT16_OUT_CLR	0x42810804	Port output data clear register. See GPIO_PRT13_OUT_CLR for the details of bit fields.
GPIO_PRT16_OUT_SET	0x42810808	Port output data set register. See GPIO_PRT13_OUT_SET for the details of bit fields.
GPIO_PRT16_OUT_INV	0x4281080C	Port output data invert register. See GPIO_PRT13_OUT_INV for the details of bit fields.
GPIO_PRT16_IN	0x42810810	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT16_INTR	0x42810814	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT16_INTR_MASK	0x42810818	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT16_INTR_MASKED	0x4281081C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT16_INTR_SET	0x42810820	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT16_INTR_CFG	0x42810840	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT16_CFG	0x42810844	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT16_CFG_IN	0x42810848	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT16_CFG_OUT	0x4281084C	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.
GPIO_PRT16_CFG_SLEW_EXT	0x42810864	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT16_CFG_DRIVE_EXT0	0x42810868	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT16_CFG_DRIVE_EXT1	0x4281086C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT16_CFG_OUT3	0x42810870	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT17_OUT	0x42810880	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT17_OUT_CLR	0x42810884	Port output data clear register. See GPIO_PRT13_OUT_CLR for the details of bit fields.
GPIO_PRT17_OUT_SET	0x42810888	Port output data set register. See GPIO_PRT13_OUT_SET for the details of bit fields.
GPIO_PRT17_OUT_INV	0x4281088C	Port output data invert register. See GPIO_PRT13_OUT_INV for the details of bit fields.
GPIO_PRT17_IN	0x42810890	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT17_INTR	0x42810894	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT17_INTR_MASK	0x42810898	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT17_INTR_MASKED	0x4281089C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT17_INTR_SET	0x428108A0	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT17_INTR_CFG	0x428108C0	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT17_CFG	0x428108C4	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT17_CFG_IN	0x428108C8	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT17_CFG_OUT	0x428108CC	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.
GPIO_PRT17_CFG_SLEW_EXT	0x428108E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT17_CFG_DRIVE_EXT0	0x428108E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT17_CFG_DRIVE_EXT1	0x428108EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT17_CFG_OUT3	0x428108F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT18_IN	0x42810910	Port input state register. See GPIO_PRT0_IN for the details of bit fields.
GPIO_PRT18_INTR	0x42810914	Port interrupt status register. See GPIO_PRT0_INTR for the details of bit fields.
GPIO_PRT18_INTR_MASK	0x42810918	Port interrupt mask register. See GPIO_PRT0_INTR_MASK for the details of bit fields.
GPIO_PRT18_INTR_MASKED	0x4281091C	Port interrupt masked status register. See GPIO_PRT0_INTR_MASKED for the details of bit fields.
GPIO_PRT18_INTR_SET	0x42810920	Port interrupt set register. See GPIO_PRT0_INTR_SET for the details of bit fields.
GPIO_PRT18_INTR_CFG	0x42810940	Port interrupt configuration register. See GPIO_PRT0_INTR_CFG for the details of bit fields.
GPIO_PRT18_CFG	0x42810944	Port configuration register
GPIO_PRT18_CFG_IN	0x42810948	Port input buffer configuration register. See GPIO_PRT0_CFG_IN for the details of bit fields.
GPIO_PRT18_CFG_SLEW_EXT	0x42810964	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT18_CFG_DRIVE_EXT0	0x42810968	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT18_CFG_DRIVE_EXT1	0x4281096C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT18_CFG_OUT3	0x42810970	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT19_IN	0x42810990	Port input state register. See GPIO_PRT0_IN for the details of bit fields.
GPIO_PRT19_INTR	0x42810994	Port interrupt status register. See GPIO_PRT0_INTR for the details of bit fields.
GPIO_PRT19_INTR_MASK	0x42810998	Port interrupt mask register. See GPIO_PRT0_INTR_MASK for the details of bit fields.
GPIO_PRT19_INTR_MASKED	0x4281099C	Port interrupt masked status register. See GPIO_PRT0_INTR_MASKED for the details of bit fields.
GPIO_PRT19_INTR_SET	0x428109A0	Port interrupt set register. See GPIO_PRT0_INTR_SET for the details of bit fields.
GPIO_PRT19_INTR_CFG	0x428109C0	Port interrupt configuration register. See GPIO_PRT0_INTR_CFG for the details of bit fields.
GPIO_PRT19_CFG	0x428109C4	Port configuration register. See GPIO_PRT18_CFG for the details of bit fields.
GPIO_PRT19_CFG_IN	0x428109C8	Port input buffer configuration register. See GPIO_PRT0_CFG_IN for the details of bit fields.
GPIO_PRT19_CFG_SLEW_EXT	0x428109E4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT19_CFG_DRIVE_EXT0	0x428109E8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT19_CFG_DRIVE_EXT1	0x428109EC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT19_CFG_OUT3	0x428109F0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT20_OUT	0x42810A00	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT20_OUT_CLR	0x42810A04	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT20_OUT_SET	0x42810A08	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.
GPIO_PRT20_OUT_INV	0x42810A0C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT20_IN	0x42810A10	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT20_INTR	0x42810A14	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT20_INTR_MASK	0x42810A18	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT20_INTR_MASKED	0x42810A1C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT20_INTR_SET	0x42810A20	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT20_INTR_CFG	0x42810A40	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT20_CFG	0x42810A44	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT20_CFG_IN	0x42810A48	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT20_CFG_OUT	0x42810A4C	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.
GPIO_PRT20_CFG_SLEW_EXT	0x42810A64	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT20_CFG_DRIVE_EXT0	0x42810A68	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT20_CFG_DRIVE_EXT1	0x42810A6C	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT20_CFG_OUT3	0x42810A70	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3 for the details of bit fields.
GPIO_PRT21_OUT	0x42810A80	Port output data register. See GPIO_PRT1_OUT for the details of bit fields.
GPIO_PRT21_OUT_CLR	0x42810A84	Port output data clear register. See GPIO_PRT1_OUT_CLR for the details of bit fields.
GPIO_PRT21_OUT_SET	0x42810A88	Port output data set register. See GPIO_PRT1_OUT_SET for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
GPIO_PRT21_OUT_INV	0x42810A8C	Port output data invert register. See GPIO_PRT1_OUT_INV for the details of bit fields.
GPIO_PRT21_IN	0x42810A90	Port input state register. See GPIO_PRT1_IN for the details of bit fields.
GPIO_PRT21_INTR	0x42810A94	Port interrupt status register. See GPIO_PRT1_INTR for the details of bit fields.
GPIO_PRT21_INTR_MASK	0x42810A98	Port interrupt mask register. See GPIO_PRT1_INTR_MASK for the details of bit fields.
GPIO_PRT21_INTR_MASKED	0x42810A9C	Port interrupt masked status register. See GPIO_PRT1_INTR_MASKED for the details of bit fields.
GPIO_PRT21_INTR_SET	0x42810AA0	Port interrupt set register. See GPIO_PRT1_INTR_SET for the details of bit fields.
GPIO_PRT21_INTR_CFG	0x42810AC0	Port interrupt configuration register. See GPIO_PRT1_INTR_CFG for the details of bit fields.
GPIO_PRT21_CFG	0x42810AC4	Port configuration register. See GPIO_PRT1_CFG for the details of bit fields.
GPIO_PRT21_CFG_IN	0x42810AC8	Port input buffer configuration register. See GPIO_PRT6_CFG_IN for the details of bit fields.
GPIO_PRT21_CFG_OUT	0x42810ACC	Port output buffer configuration register. See GPIO_PRT6_CFG_OUT for the details of bit fields.
GPIO_PRT21_CFG_SLEW_EXT	0x42810AE4	Port output buffer slew extension configuration register. See GPIO_PRT0_CFG_SLEW_EXT for the details of bit fields.
GPIO_PRT21_CFG_DRIVE_EXT0	0x42810AE8	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
GPIO_PRT21_CFG_DRIVE_EXT1	0x42810AEC	Port output buffer drive sel extension configuration register. See GPIO_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
GPIO_PRT21_CFG_OUT3	0x42810AF0	Port output buffer configuration register 3. See GPIO_PRT0_CFG_OUT3_ for the details of bit fields.
GPIO_SEC_INTR_CAUSE0	0x42817000	Secure Interrupt port cause register 0
GPIO_INTR_CAUSE0	0x42818000	Interrupt port cause register 0
GPIO_VDD_ACTIVE	0x42818010	Extern power supply detection register
GPIO_VDD_INTR	0x42818014	Supply detection interrupt register
GPIO_VDD_INTR_MASK	0x42818018	Supply detection interrupt mask register
GPIO_VDD_INTR_MASKED	0x4281801C	Supply detection interrupt masked register
GPIO_VDD_INTR_SET	0x42818020	Supply detection interrupt set register

I/O Subsystem registers

Register name	Address	Description
GPIO_VDD_MODE_SEL	0x42818024	Supply mode select for 3.3V domains
SMARTIO_PRT11_CTL	0x42820B00	Control register
SMARTIO_PRT11_SYNC_CTL	0x42820B10	Synchronization control register
SMARTIO_PRT11_LUT_SEL0	0x42820B20	LUT component input selection
SMARTIO_PRT11_LUT_SEL1	0x42820B24	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT11_LUT_SEL2	0x42820B28	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT11_LUT_SEL3	0x42820B2C	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT11_LUT_SEL4	0x42820B30	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT11_LUT_SEL5	0x42820B34	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT11_LUT_SEL6	0x42820B38	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT11_LUT_SEL7	0x42820B3C	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT11_LUT_CTL0	0x42820B40	LUT component control register
SMARTIO_PRT11_LUT_CTL1	0x42820B44	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT11_LUT_CTL2	0x42820B48	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT11_LUT_CTL3	0x42820B4C	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT11_LUT_CTL4	0x42820B50	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT11_LUT_CTL5	0x42820B54	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT11_LUT_CTL6	0x42820B58	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
SMARTIO_PRT11_LUT_CTL7	0x42820B5C	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT11_DU_SEL	0x42820BC0	Data unit component input selection
SMARTIO_PRT11_DU_CTL	0x42820BC4	Data unit component control register
SMARTIO_PRT11_DATA	0x42820BF0	Data register
SMARTIO_PRT17_CTL	0x42821100	Control register. See SMARTIO_PRT11_CTL for the details of bit fields.
SMARTIO_PRT17_SYNC_CTL	0x42821110	Synchronization control register. See SMARTIO_PRT11_SYNC_CTL for the details of bit fields.
SMARTIO_PRT17_LUT_SEL0	0x42821120	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_SEL1	0x42821124	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_SEL2	0x42821128	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_SEL3	0x4282112C	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_SEL4	0x42821130	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_SEL5	0x42821134	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_SEL6	0x42821138	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_SEL7	0x4282113C	LUT component input selection. See SMARTIO_PRT11_LUT_SEL0 for the details of bit fields.
SMARTIO_PRT17_LUT_CTL0	0x42821140	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT17_LUT_CTL1	0x42821144	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT17_LUT_CTL2	0x42821148	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.

I/O Subsystem registers

Register name	Address	Description
SMARTIO_PRT17_LUT_CTL3	0x4282114C	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT17_LUT_CTL4	0x42821150	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT17_LUT_CTL5	0x42821154	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT17_LUT_CTL6	0x42821158	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT17_LUT_CTL7	0x4282115C	LUT component control register. See SMARTIO_PRT11_LUT_CTL0 for the details of bit fields.
SMARTIO_PRT17_DU_SEL	0x428211C0	Data unit component input selection. See SMARTIO_PRT11_DU_SEL for the details of bit fields.
SMARTIO_PRT17_DU_CTL	0x428211C4	Data unit component control register. See SMARTIO_PRT11_DU_CTL for the details of bit fields.
SMARTIO_PRT17_DATA	0x428211F0	Data register. See SMARTIO_PRT11_DATA for the details of bit fields.

16.1.1 HSIOM_PRT0_PORT_SEL0

Description: Port selection 0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	OUT1	IO set output for pin 1 Default Value: 0
0	OUT0	IO set output for pin 0: '0': Output state not affected. '1': Output state set to '1'. Default Value: 0

16.1.15 GPIO_PRT0_OUT_INV

Description: Port output data invert register

Address: 0x4281000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						A	A
Name	Reserved [7:2]						OUT1	OUT0

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	OUT1	IO invert output for pin 1 Default Value: 0
0	OUT0	IO invert output for pin 0: '0': Output state not affected. '1': Output state inverted ('0' => '1', '1' => '0'). Default Value: 0

16.1.16 GPIO_PRT0_IN

Description: Port input state register

Address: 0x42810010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	R
HW Access	Reserved						W	W
Name	Reserved [7:2]						IN1	IN0

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [15:9]							FLT_IN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	FLT_IN	Reads of this register return the logical state of the filtered pin as selected in the IN-TR_CFG.FLT_SEL register. Default Value: 0
1	IN1	IO pin state for pin 1 Default Value: 0
0	IN0	IO pin state for pin 0 '0': Low logic level present on pin. '1': High logic level present on pin. Default Value: 0

16.1.17 GPIO_PRT0_INTR

Description: Port interrupt status register

Address: 0x42810014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW1C	RW1C
HW Access	Reserved						A	A
Name	Reserved [7:2]						EDGE1	EDGE0

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW1C
HW Access	Reserved							A
Name	Reserved [15:9]							FLT_EDGE

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						R	R
HW Access	Reserved						W	W
Name	Reserved [23:18]						IN_IN1	IN_IN0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [31:25]							FLT_IN_IN

Bits	Name	Description
24	FLT_IN_IN	Filtered pin state for pin selected by INTR_CFG.FLT_SEL Default Value: 0
17	IN_IN1	IO pin state for pin 1 Default Value: 0
16	IN_IN0	IO pin state for pin 0 Default Value: 0
8	FLT_EDGE	Edge detected on filtered pin selected by INTR_CFG.FLT_SEL Default Value: 0
1	EDGE1	Edge detect for IO pin 1 Default Value: 0
0	EDGE0	Edge detect for IO pin 0 '0': No edge was detected on pin. '1': An edge was detected on pin. Default Value: 0

16.1.18 GPIO_PRT0_INTR_MASK

Description: Port interrupt mask register

Address: 0x42810018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						EDGE1	EDGE0

Bits	15	14	13	12	11	10	9	8

HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	IN_EN1	Enables the input buffer for IO pin 1 Default Value: 0
6 : 4	DRIVE_MODE1	The GPIO drive mode for IO pin 1 Default Value: 0 **0x0: CFG3_EN :** **0x1: RESERVED :** **0x2: PULLUP :** **0x3: PULLDOWN :** **0x4: OD_DRIVESLOW :** **0x5: OD_DRIVESHIGH :** **0x6: STRONG :** **0x7: PULLUP_DOWN :**

16.1.22 GPIO_PRT0_CFG (continued)

3	IN_EN0	Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue. '0': Input buffer disabled '1': Input buffer enabled Default Value: 0
2 : 0	DRIVE_MODE0	The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus. Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0'). Note: D_OUT, D_OUT_EN are pins of GPIO cell. Default Value: 0 **0x0: CFG3_EN :** Enables CFG_OUT3.bit[3:0] to control Port Pin 0 drive mode configuration. **0x1: RESERVED :** This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases. For GPIO & UDB/DSI peripherals: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Strong pull up When D_OUT_EN = 0: D_OUT = '0': High impedance D_OUT = '1': High impedance For peripherals other than GPIO & UDB/DSI: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Strong pull up When OUT_EN = 0: D_OUT = '0': High impedance D_OUT = '1': High impedance **0x2: PULLUP :** Resistive pull up For GPIO & UDB/DSI peripherals: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Weak/resistive pull up When D_OUT_EN = 0: D_OUT = '0': High impedance D_OUT = '1': High impedance For peripherals other than GPIO & UDB/DSI: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Strong pull up When D_OUT_EN = 0: D_OUT = '0': Weak/resistive pull up D_OUT = '1': Weak/resistive pull up

16.1.22 GPIO_PRT0_CFG (continued)

0x3: PULLDOWN :

Resistive pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull down

0x4: OD_DRIVESLOW :

Open drain, drives low
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': High Impedance
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x5: OD_DRIVESHIGH :

Open drain, drives high
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': High Impedance
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

16.1.22 GPIO_PRT0_CFG (continued)

0x6: STRONG :

Strong D_OUTput buffer
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x7: PULLUP_DOWN :

Pull up or pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = '0':
GPIO_DSI_OUT = '0': Weak/resistive pull down
GPIO_DSI_OUT = '1': Weak/resistive pull up
where "GPIO_DSI_OUT" is a function of PORT_SEL, OUT & DSI_DATA_OUT.
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull up

		0x0: CFG3_EN :
		0x1: RESERVED :
		0x2: PULLUP :
		0x3: PULLDOWN :
		0x4: OD_DRIVESLOW :
		0x5: OD_DRIVESHIGH :
		0x6: STRONG :
		0x7: PULLUP_DOWN :
7	IN_EN1	Enables the input buffer for IO pin 1 Default Value: 0

16.1.39 GPIO_PRT1_CFG (continued)

6 : 4	DRIVE_MODE1	The GPIO drive mode for IO pin 1 Default Value: 0 **0x0: CFG3_EN :** **0x1: RESERVED :** **0x2: PULLUP :** **0x3: PULLDOWN :** **0x4: OD_DRIVESLOW :** **0x5: OD_DRIVESHIGH :** **0x6: STRONG :** **0x7: PULLUP_DOWN :**
3	IN_EN0	Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue. '0': Input buffer disabled '1': Input buffer enabled Default Value: 0
2 : 0	DRIVE_MODE0	The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus. Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0'). Note: D_OUT, D_OUT_EN are pins of GPIO cell. Default Value: 0 **0x0: CFG3_EN :** Enables CFG_OUT3.bit[3:0] to control Port Pin 0 drive mode configuration. **0x1: RESERVED :** This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases. For GPIO & UDB/DSI peripherals: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Strong pull up When D_OUT_EN = 0: D_OUT = '0': High impedance D_OUT = '1': High impedance For peripherals other than GPIO & UDB/DSI: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Strong pull up When OUT_EN = 0: D_OUT = '0': High impedance D_OUT = '1': High impedance

16.1.39 GPIO_PRT1_CFG (continued)

0x2: PULLUP :

Resistive pull up
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Weak/resistive pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull up
D_OUT = '1': Weak/resistive pull up

0x3: PULLDOWN :

Resistive pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull down

0x4: OD_DRIVESLOW :

Open drain, drives low
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': High Impedance
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

16.1.39 GPIO_PRT1_CFG (continued)

0x5: OD_DRIVESHIGH :

Open drain, drives high
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
 D_OUT = '0': High Impedance
 D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
 D_OUT = '0': High impedance
 D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
 D_OUT = '0': Strong pull down
 D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
 D_OUT = '0': High Impedance
 D_OUT = '1': High Impedance

0x6: STRONG :

Strong D_OUTput buffer
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
 D_OUT = '0': Strong pull down
 D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
 D_OUT = '0': High impedance
 D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
 D_OUT = '0': Strong pull down
 D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
 D_OUT = '0': High Impedance
 D_OUT = '1': High Impedance

0x7: PULLUP_DOWN :

Pull up or pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = '0':
 GPIO_DSI_OUT = '0': Weak/resistive pull down
 GPIO_DSI_OUT = '1': Weak/resistive pull up
where "GPIO_DSI_OUT" is a function of PORT_SEL, OUT & DSI_DATA_OUT.
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
 D_OUT = '0': Strong pull down
 D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
 D_OUT = '0': Weak/resistive pull down
 D_OUT = '1': Weak/resistive pull up

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3	IN_EN0	Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue. '0': Input buffer disabled '1': Input buffer enabled Default Value: 0
2 : 0	DRIVE_MODE0	The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus. Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0'). Note: D_OUT, D_OUT_EN are pins of GPIO cell. Default Value: 0 **0x0: CFG3_EN :** Enables CFG_OUT3.bit[3:0] to control Port Pin 0 drive mode configuration.

16.1.50 GPIO_PRT2_CFG (continued)

0x1: RESERVED :

This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases.
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance

0x2: PULLUP :

Resistive pull up
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Weak/resistive pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull up
D_OUT = '1': Weak/resistive pull up

0x3: PULLDOWN :

Resistive pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull down

16.1.50 GPIO_PRT2_CFG (continued)

0x4: OD_DRIVESLOW :

Open drain, drives low
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': High Impedance
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x5: OD_DRIVESHIGH :

Open drain, drives high
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': High Impedance
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x6: STRONG :

Strong D_OUTput buffer
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

16.1.50 GPIO_PRT2_CFG (continued)

0x7: PULLUP_DOWN :

Pull up or pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = '0':
GPIO_DSI_OUT = '0': Weak/resistive pull down
GPIO_DSI_OUT = '1': Weak/resistive pull up
where "GPIO_DSI_OUT" is a function of PORT_SEL, OUT & DSI_DATA_OUT.
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull up

Name	DRIVE_SEL7 [31:30]		DRIVE_SEL6 [29:28]		DRIVE_SEL5 [27:26]		DRIVE_SEL4 [25:24]	

Bits	Name	Description
31 : 30	DRIVE_SEL7	Sets the GPIO drive strength for IO pin 7 Default Value: 0
29 : 28	DRIVE_SEL6	Sets the GPIO drive strength for IO pin 6 Default Value: 0
27 : 26	DRIVE_SEL5	Sets the GPIO drive strength for IO pin 5 Default Value: 0
25 : 24	DRIVE_SEL4	Sets the GPIO drive strength for IO pin 4 Default Value: 0
23 : 22	DRIVE_SEL3	Sets the GPIO drive strength for IO pin 3 Default Value: 0
21 : 20	DRIVE_SEL2	Sets the GPIO drive strength for IO pin 2 Default Value: 0
19 : 18	DRIVE_SEL1	Sets the GPIO drive strength for IO pin 1 Default Value: 0
17 : 16	DRIVE_SEL0	Sets the GPIO drive strength for IO pin 0 (Not using these register for PSOC™ Edge devices. CFG_DRIVE_EXT0 & CFG_DRIVE_EXT1 are used for drive strength settings) Default Value: 0 **0x0: DRIVE_SEL_ZERO :** **0x1: DRIVE_SEL_ONE :**

16.1.56 GPIO_PRT6_CFG_OUT (continued)

0x2: DRIVE_SEL_TWO :

0x3: DRIVE_SEL_THREE :

7	SLOW7	Enables slow slew rate for IO pin 7 Default Value: 0
6	SLOW6	Enables slow slew rate for IO pin 6 Default Value: 0
5	SLOW5	Enables slow slew rate for IO pin 5 Default Value: 0
4	SLOW4	Enables slow slew rate for IO pin 4 Default Value: 0
3	SLOW3	Enables slow slew rate for IO pin 3 Default Value: 0
2	SLOW2	Enables slow slew rate for IO pin 2 Default Value: 0
1	SLOW1	Enables slow slew rate for IO pin 1 Default Value: 0
0	SLOW0	Slow represents speed of operation. Slow = 0. Normal operation with 10 to 50 MHz. CFG_SLEW_EXT register is used for slew settings when slow = 0. Slow =1. I2C fast mode operation Default Value: 0

16.1.57 GPIO_PRT9_OUT

Description: Port output data register

Address: 0x42810480

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW	RW	RW	RW
HW Access	Reserved				RW	RW	RW	RW
Name	Reserved [7:4]				OUT3	OUT2	OUT1	OUT0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15	IN_EN3	Enables the input buffer for IO pin 3 Default Value: 0
14 : 12	DRIVE_MODE3	The GPIO drive mode for IO pin 3 Default Value: 0 **0x0: CFG3_EN :** **0x1: RESERVED :** **0x2: PULLUP :** **0x3: PULLDOWN :** **0x4: OD_DRIVESLOW :** **0x5: OD_DRIVESHIGH :** **0x6: STRONG :** **0x7: PULLUP_DOWN :**
11	IN_EN2	Enables the input buffer for IO pin 2 Default Value: 0

16.1.67 GPIO_PRT9_CFG (continued)

10 : 8	DRIVE_MODE2	The GPIO drive mode for IO pin 2 Default Value: 0 **0x0: CFG3_EN :** **0x1: RESERVED :** **0x2: PULLUP :** **0x3: PULLDOWN :** **0x4: OD_DRIVESLOW :** **0x5: OD_DRIVESHIGH :** **0x6: STRONG :** **0x7: PULLUP_DOWN :**
7	IN_EN1	Enables the input buffer for IO pin 1 Default Value: 0
6 : 4	DRIVE_MODE1	The GPIO drive mode for IO pin 1 Default Value: 0 **0x0: CFG3_EN :** **0x1: RESERVED :** **0x2: PULLUP :** **0x3: PULLDOWN :** **0x4: OD_DRIVESLOW :** **0x5: OD_DRIVESHIGH :** **0x6: STRONG :** **0x7: PULLUP_DOWN :**
3	IN_EN0	Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue. '0': Input buffer disabled '1': Input buffer enabled Default Value: 0
2 : 0	DRIVE_MODE0	The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus. Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0'). Note: D_OUT, D_OUT_EN are pins of GPIO cell. Default Value: 0

16.1.67 GPIO_PRT9_CFG (continued)

0x0: CFG3_EN :

Enables CFG_OUT3.bit[3:0] to control Port Pin 0 drive mode configuration.

0x1: RESERVED :

This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases.
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance

0x2: PULLUP :

Resistive pull up
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Weak/resistive pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull up
D_OUT = '1': Weak/resistive pull up

0x3: PULLDOWN :

Resistive pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull down

16.1.67 GPIO_PRT9_CFG (continued)

0x4: OD_DRIVESLOW :

Open drain, drives low
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': High Impedance
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x5: OD_DRIVESHIGH :

Open drain, drives high
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': High Impedance
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x6: STRONG :

Strong D_OUTput buffer
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

16.1.67 GPIO_PRT9_CFG (continued)

0x7: PULLUP_DOWN :

Pull up or pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = '0':
GPIO_DSI_OUT = '0': Weak/resistive pull down
GPIO_DSI_OUT = '1': Weak/resistive pull up
where "GPIO_DSI_OUT" is a function of PORT_SEL, OUT & DSI_DATA_OUT.
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull up

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 22	DRIVE_SEL3	Sets the GPIO drive strength for IO pin 3 Default Value: 0
21 : 20	DRIVE_SEL2	Sets the GPIO drive strength for IO pin 2 Default Value: 0
19 : 18	DRIVE_SEL1	Sets the GPIO drive strength for IO pin 1 Default Value: 0
17 : 16	DRIVE_SEL0	Sets the GPIO drive strength for IO pin 0 (Not using these register for PSOC™ Edge devices. CFG_DRIVE_EXT0 & CFG_DRIVE_EXT1 are used for drive strength settings) Default Value: 0 **0x0: DRIVE_SEL_ZERO :** **0x1: DRIVE_SEL_ONE :** **0x2: DRIVE_SEL_TWO :** **0x3: DRIVE_SEL_THREE :**
3	SLOW3	Enables slow slew rate for IO pin 3 Default Value: 0
2	SLOW2	Enables slow slew rate for IO pin 2 Default Value: 0

16.1.69 GPIO_PRT9_CFG_OUT (continued)

1	SLOW1	Enables slow slew rate for IO pin 1 Default Value: 0
0	SLOW0	Slow represents speed of operation. Slow = 0. Normal operation with 10 to 50 MHz. CFG_SLEW_EXT register is used for slew settings when slow = 0. Slow =1. I2C fast mode operation Default Value: 0

16.1.70 GPIO_PRT12_OUT

Description: Port output data register

Address: 0x42810600

Retention: Retained

		0x0: CFG3_EN :
		0x1: RESERVED :
		0x2: PULLUP :
		0x3: PULLDOWN :
		0x4: OD_DRIVESLOW :
		0x5: OD_DRIVESHIGH :
		0x6: STRONG :
		0x7: PULLUP_DOWN :
3	IN_EN0	Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue. '0': Input buffer disabled '1': Input buffer enabled Default Value: 0
2 : 0	DRIVE_MODE0	The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus. Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0'). Note: D_OUT, D_OUT_EN are pins of GPIO cell. Default Value: 0
		0x0: CFG3_EN : Enables CFG_OUT3.bit[3:0] to control Port Pin 0 drive mode configuration.

16.1.80 GPIO_PRT12_CFG (continued)

0x1: RESERVED :

This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases.
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance

0x2: PULLUP :

Resistive pull up
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Weak/resistive pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull up
D_OUT = '1': Weak/resistive pull up

0x3: PULLDOWN :

Resistive pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull down

16.1.80 GPIO_PRT12_CFG (continued)

0x4: OD_DRIVESLOW :

Open drain, drives low
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': High Impedance
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x5: OD_DRIVESHIGH :

Open drain, drives high
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': High Impedance
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x6: STRONG :

Strong D_OUTput buffer
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

16.1.80 GPIO_PRT12_CFG (continued)

0x7: PULLUP_DOWN :

Pull up or pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = '0':
GPIO_DSI_OUT = '0': Weak/resistive pull down
GPIO_DSI_OUT = '1': Weak/resistive pull up
where "GPIO_DSI_OUT" is a function of PORT_SEL, OUT & DSI_DATA_OUT.
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull up

16.1.81 GPIO_PRT12_CFG_IN

Description: Port input buffer configuration register

'0': Port has no pending interrupt '1': Port has pending interrupt Default Value: 0

16.1.92 GPIO_VDD_ACTIVE

Description: Extern power supply detection register

Address: 0x42818010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							VDDIO_ACTIVE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	Reserved					
HW Access	W	W	Reserved					
Name	VDDD_ACTIVE	VDDA_ACTIVE	Reserved [29:24]					

Bits	Name	Description
31	VDDD_ACTIVE	This bit indicates presence of the VDDD supply. This bit will always read-back 1. The VDDD supply has robust brown-out protection monitoring and it is not possible to read back this register without a valid supply. (This bit is used in certain test-modes to observe the brown-out detector status.) Default Value: 1
30	VDDA_ACTIVE	Same as VDDIO_ACTIVE for the analog supply VDDA. Default Value: 0
0	VDDIO_ACTIVE	Indicates presence or absence of VDDIO supplies (i.e. other than VDDD, VDDA) on the device (supplies are numbered 0..n-1). Note that VDDIO supplies have basic (crude) supply detectors only. If separate, robust, brown-out detection is desired on IO supplies, on-chip or off-chip analog resources need to provide it. For these bits to work reliable, the supply must be within valid spec range (per datasheet) or held at ground. Any in-between voltage has an undefined result. '0': Supply is not present '1': Supply is present When multiple VDDIO supplies are present, they will be assigned in alphanumeric ascending order to these bits during implementation. For example "vddusb, vddio_0, vddio_a, vbackup, vddio_r, vddio_1" are present then they will be assigned to these bits as below: 0: vbackup, 1: vddio_0, 2: vddio_1, 3: vddio_a, 4: vddio_r, 5: vddusb" Default Value: 0

16.1.93 GPIO_VDD_INTR

Description: Supply detection interrupt register

Address: 0x42818014

Retention: Retained

Bits	Name	Description
31	VDDD_ACTIVE	Same as VDDIO_ACTIVE for the digital supply VDDD. Default Value: 0
30	VDDA_ACTIVE	Same as VDDIO_ACTIVE for the analog supply VDDA. Default Value: 0
0	VDDIO_ACTIVE	Masks supply interrupt on VDDIO. '0': VDDIO interrupt forwarding disabled '1': VDDIO interrupt forwarding enabled Default Value: 0

16.1.95 GPIO_VDD_INTR_MASKED

Description: Supply detection interrupt masked register

Address: 0x4281801C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							VDDIO_ACTIVE

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	MODE_SEL	Applicable if domain is 3.3V only, no impact to 1.8V domains This bit will be used to turn-off PGND bias circuit to save power. 1 - Corresponding 3.3V IO domain is in 3.3V mode 0 - Corresponding 3.3V IO domain is in 1.8V mode Default Value: 1

16.1.98 SMARTIO_PRT11_CTL

Description: Control register

Address: 0x42820B00

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	BYPASS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [15:13]			CLOCK_SRC [12:8]				

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved					RW	RW
HW Access	R	Reserved					R	R
Name	ENABLED	Reserved [30:26]					PIPE-LINE_EN	HLD_OVR

Bits	Name	Description
31	ENABLED	Enable for programmable IO. Should only be set to '1' when the programmable IO is completely configured: '0': Disabled (signals are bypassed; behavior as if BYPASS is 0xFF). When disabled, the fabric (data unit and LUTs) reset is activated. If the IP is disabled: - The PIPELINE_EN register field should be set to '1', to ensure low power consumption by preventing combinatorial loops. - The CLOCK_SRC register field should be set to "20"-"30" (clock is constant '0'), to ensure low power consumption. '1': Enabled. Once enabled, it takes 3 "clk_fabric" clock cycles till the fabric reset is de-activated and the fabric becomes fully functional. This ensures that the IO pins' input synchronizer states are flushed when the fabric is fully functional. Default Value: 0
25	PIPELINE_EN	Enable for pipeline register: '0': Disabled (register is bypassed). '1': Enabled. Default Value: 1

16.1.98 SMARTIO_PRT11_CTL (continued)

24	HLD_OVR	IO cell hold override functionality. In DeepSleep power mode, the HSIOM holds the IO cell output and output enable signals if Active functionality is connected to the IO pads. This is undesirable if the SMARTIO is supposed to deliver DeepSleep output functionality on these IO pads. This field is used to control the hold override functionality from the SMARTIO: '0': The HSIOM controls the IO cell hold override functionality ("hsiom_hld_ovr"). '1': The SMARTIO controls the IO cel hold override functionality: - In bypass mode (ENABLED is '0' or BYPASS[i] is '1'), the HSIOM control is used. - In NON bypass mode (ENABLED is '1' and BYPASS[i] is '0'), the SMARTIO sets hold override to "pwr_hld_ovr_hib" to enable SMARTIO functionality in DeepSleep power mode (but disables it in Hibernate or Stop power mode). Default Value: Undefined
12 : 8	CLOCK_SRC	Clock ("clk_fabric") and reset ("rst_fabric_n") source selection: "0": io_data_in[0]/'1'. ... "7": io_data_in[7]/'1'. "8": chip_data[0]/'1'. ... "15": chip_data[7]/'1'. "16": clk_smartio/rst_sys_act_n. Used for both Active functionality synchronous logic on "clk_smartio". This selection is intended for synchronous operation on a PCLK specified clock frequency ("clock_smartio_pos_en"). Note that the fabric's clocked elements are frequency aligned, but NOT phase aligned to "clk_sys". "17": clk_smartio/rst_sys_dpslp_n. Used for both DeepSleep functionality synchronous logic on "clk_smartio" (note that "clk_smartio" is NOT available in DeepSleep and Hibernate power modes). This selection is intended for synchronous operation on a PCLK specified clock frequency ("clock_smartio_pos_en"). Note that the fabric's clocked elements are frequency aligned, but NOT phase aligned to "clk_sys". "18": Same as "17". Note that the M0S8 SMARTIO version used the Hibernate reset for this value, but the MXS40 SMARTIO version does not support Hibernate functionality. "19": clk_lf/rst_lf_dpslp_n (note that "clk_lf" is available in DeepSleep power mode). This selection is intended for synchronous operation on"clk_lf". Note that the fabric's clocked elements are frequency aligned, but NOT phase aligned to other "clk_lf" clocked elements. "20"-"30": Clock source is constant '0'. Any of these clock sources should be selected when the IP is disabled to ensure low power consumption. "31": asynchronous mode/'1'. Select this when clockless operation is configured. NOTE: Two positive edges of the selected clock are required for the block to be enabled (to deactivate reset). In asynchronous (clockless) mode clk_sys is used to enable the block, but is not available for clocking. Default Value: 0x14
7 : 0	BYPASS	Bypass of the programmable IO, one bit for each IO pin: BYPASS[i] is for IO pin i. When ENABLED is '1', this field is used. When ENABLED is '0', this field is NOT used and SMARTIO fabric is always bypassed. '0': No bypass (programmable SMARTIO fabric is exposed). '1': Bypass (programmable SMARTIOIO fabric is hidden). Default Value: Undefined

16.1.99 SMARTIO_PRT11_SYNC_CTL

Description: Synchronization control register

Address: 0x42820B10

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	IO_SYNC_EN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R

17 Timer, Counter, PWM (TCPWM) registers

This section discusses the TCPWM registers. It lists all the registers in mapping tables, in address order.

17.1 Register details

Register name	Address	Description
TCPWM0_GRP0_CNT0_CTRL	0x42860000	Counter control register
TCPWM0_GRP0_CNT0_STATUS	0x42860004	Counter status register
TCPWM0_GRP0_CNT0_COUNTER	0x42860008	Counter count register
TCPWM0_GRP0_CNT0_CC0	0x42860010	Counter compare/capture 0 register
TCPWM0_GRP0_CNT0_CC0_BUFF	0x42860014	Counter buffered compare/capture 0 register
TCPWM0_GRP0_CNT0_PERIOD	0x42860020	Counter period register
TCPWM0_GRP0_CNT0_PERIOD_BUFF	0x42860024	Counter buffered period register
TCPWM0_GRP0_CNT0_DT	0x42860030	Counter PWM dead time register
TCPWM0_GRP0_CNT0_TR_CMD	0x42860040	Counter trigger command register
TCPWM0_GRP0_CNT0_TR_IN_SEL0	0x42860044	Counter input trigger selection register 0
TCPWM0_GRP0_CNT0_TR_IN_SEL1	0x42860048	Counter input trigger selection register 1
TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL	0x4286004C	Counter input trigger edge selection register
TCPWM0_GRP0_CNT0_TR_PWM_CTRL	0x42860050	Counter trigger PWM control register
TCPWM0_GRP0_CNT0_TR_OUT_SEL	0x42860054	Counter output trigger selection register
TCPWM0_GRP0_CNT0_INTR	0x42860070	Interrupt request register
TCPWM0_GRP0_CNT0_INTR_SET	0x42860074	Interrupt set request register
TCPWM0_GRP0_CNT0_INTR_MASK	0x42860078	Interrupt mask register
TCPWM0_GRP0_CNT0_INTR_MASKED	0x4286007C	Interrupt masked request register
TCPWM0_GRP0_CNT1_CTRL	0x42860080	Counter control register. See TCPWM0_GRP0_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT1_STATUS	0x42860084	Counter status register. See TCPWM0_GRP0_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP0_CNT1_COUNTER	0x42860088	Counter count register. See TCPWM0_GRP0_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP0_CNT1_CC0	0x42860090	Counter compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP0_CNT1_CC0_BUFF	0x42860094	Counter buffered compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT1_PERIOD	0x428600A0	Counter period register. See TCPWM0_GRP0_CNT0_PERIOD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP0_CNT1_PERIOD_BUFF	0x428600A4	Counter buffered period register. See TCPWM0_GRP0_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT1_DT	0x428600B0	Counter PWM dead time register. See TCPWM0_GRP0_CNT0_DT for the details of bit fields.
TCPWM0_GRP0_CNT1_TR_CMD	0x428600C0	Counter trigger command register. See TCPWM0_GRP0_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP0_CNT1_TR_IN_SEL0	0x428600C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP0_CNT1_TR_IN_SEL1	0x428600C8	Counter input trigger selection register 1. See TCPWM0_GRP0_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP0_CNT1_TR_IN_EDGE_SEL	0x428600CC	Counter input trigger edge selection register. See TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP0_CNT1_TR_PWM_CTRL	0x428600D0	Counter trigger PWM control register. See TCPWM0_GRP0_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT1_TR_OUT_SEL	0x428600D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP0_CNT1_INTR	0x428600F0	Interrupt request register. See TCPWM0_GRP0_CNT0_INTR for the details of bit fields.
TCPWM0_GRP0_CNT1_INTR_SET	0x428600F4	Interrupt set request register. See TCPWM0_GRP0_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP0_CNT1_INTR_MASK	0x428600F8	Interrupt mask register. See TCPWM0_GRP0_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP0_CNT1_INTR_MASKED	0x428600FC	Interrupt masked request register. See TCPWM0_GRP0_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP0_CNT2_CTRL	0x42860100	Counter control register. See TCPWM0_GRP0_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT2_STATUS	0x42860104	Counter status register. See TCPWM0_GRP0_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP0_CNT2_COUNTER	0x42860108	Counter count register. See TCPWM0_GRP0_CNT0_COUNTER for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP0_CNT2_CC0	0x42860110	Counter compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP0_CNT2_CC0_BUFF	0x42860114	Counter buffered compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT2_PERIOD	0x42860120	Counter period register. See TCPWM0_GRP0_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP0_CNT2_PERIOD_BUFF	0x42860124	Counter buffered period register. See TCPWM0_GRP0_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT2_DT	0x42860130	Counter PWM dead time register. See TCPWM0_GRP0_CNT0_DT for the details of bit fields.
TCPWM0_GRP0_CNT2_TR_CMD	0x42860140	Counter trigger command register. See TCPWM0_GRP0_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP0_CNT2_TR_IN_SEL0	0x42860144	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP0_CNT2_TR_IN_SEL1	0x42860148	Counter input trigger selection register 1. See TCPWM0_GRP0_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP0_CNT2_TR_IN_EDGE_SEL	0x4286014C	Counter input trigger edge selection register. See TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP0_CNT2_TR_PWM_CTRL	0x42860150	Counter trigger PWM control register. See TCPWM0_GRP0_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT2_TR_OUT_SEL	0x42860154	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP0_CNT2_INTR	0x42860170	Interrupt request register. See TCPWM0_GRP0_CNT0_INTR for the details of bit fields.
TCPWM0_GRP0_CNT2_INTR_SET	0x42860174	Interrupt set request register. See TCPWM0_GRP0_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP0_CNT2_INTR_MASK	0x42860178	Interrupt mask register. See TCPWM0_GRP0_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP0_CNT2_INTR_MASKED	0x4286017C	Interrupt masked request register. See TCPWM0_GRP0_CNT0_INTR_MASKED for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP0_CNT3_CTRL	0x42860180	Counter control register. See TCPWM0_GRP0_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT3_STATUS	0x42860184	Counter status register. See TCPWM0_GRP0_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP0_CNT3_COUNTER	0x42860188	Counter count register. See TCPWM0_GRP0_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP0_CNT3_CC0	0x42860190	Counter compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP0_CNT3_CC0_BUFF	0x42860194	Counter buffered compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT3_PERIOD	0x428601A0	Counter period register. See TCPWM0_GRP0_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP0_CNT3_PERIOD_BUFF	0x428601A4	Counter buffered period register. See TCPWM0_GRP0_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT3_DT	0x428601B0	Counter PWM dead time register. See TCPWM0_GRP0_CNT0_DT for the details of bit fields.
TCPWM0_GRP0_CNT3_TR_CMD	0x428601C0	Counter trigger command register. See TCPWM0_GRP0_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP0_CNT3_TR_IN_SEL0	0x428601C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP0_CNT3_TR_IN_SEL1	0x428601C8	Counter input trigger selection register 1. See TCPWM0_GRP0_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP0_CNT3_TR_IN_EDGE_SEL	0x428601CC	Counter input trigger edge selection register. See TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP0_CNT3_TR_PWM_CTRL	0x428601D0	Counter trigger PWM control register. See TCPWM0_GRP0_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT3_TR_OUT_SEL	0x428601D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP0_CNT3_INTR	0x428601F0	Interrupt request register. See TCPWM0_GRP0_CNT0_INTR for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP0_CNT3_INTR_SET	0x428601F4	Interrupt set request register. See TCPWM0_GRP0_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP0_CNT3_INTR_MASK	0x428601F8	Interrupt mask register. See TCPWM0_GRP0_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP0_CNT3_INTR_MASKED	0x428601FC	Interrupt masked request register. See TCPWM0_GRP0_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP0_CNT4_CTRL	0x42860200	Counter control register. See TCPWM0_GRP0_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT4_STATUS	0x42860204	Counter status register. See TCPWM0_GRP0_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP0_CNT4_COUNTER	0x42860208	Counter count register. See TCPWM0_GRP0_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP0_CNT4_CC0	0x42860210	Counter compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP0_CNT4_CC0_BUFF	0x42860214	Counter buffered compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT4_PERIOD	0x42860220	Counter period register. See TCPWM0_GRP0_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP0_CNT4_PERIOD_BUFF	0x42860224	Counter buffered period register. See TCPWM0_GRP0_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT4_DT	0x42860230	Counter PWM dead time register. See TCPWM0_GRP0_CNT0_DT for the details of bit fields.
TCPWM0_GRP0_CNT4_TR_CMD	0x42860240	Counter trigger command register. See TCPWM0_GRP0_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP0_CNT4_TR_IN_SEL0	0x42860244	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP0_CNT4_TR_IN_SEL1	0x42860248	Counter input trigger selection register 1. See TCPWM0_GRP0_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP0_CNT4_TR_IN_EDGE_SEL	0x4286024C	Counter input trigger edge selection register. See TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP0_CNT4_TR_PWM_CTRL	0x42860250	Counter trigger PWM control register. See TCPWM0_GRP0_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT4_TR_OUT_SEL	0x42860254	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP0_CNT4_INTR	0x42860270	Interrupt request register. See TCPWM0_GRP0_CNT0_INTR for the details of bit fields.
TCPWM0_GRP0_CNT4_INTR_SET	0x42860274	Interrupt set request register. See TCPWM0_GRP0_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP0_CNT4_INTR_MASK	0x42860278	Interrupt mask register. See TCPWM0_GRP0_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP0_CNT4_INTR_MASKED	0x4286027C	Interrupt masked request register. See TCPWM0_GRP0_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP0_CNT5_CTRL	0x42860280	Counter control register. See TCPWM0_GRP0_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT5_STATUS	0x42860284	Counter status register. See TCPWM0_GRP0_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP0_CNT5_COUNTER	0x42860288	Counter count register. See TCPWM0_GRP0_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP0_CNT5_CC0	0x42860290	Counter compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP0_CNT5_CC0_BUFF	0x42860294	Counter buffered compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT5_PERIOD	0x428602A0	Counter period register. See TCPWM0_GRP0_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP0_CNT5_PERIOD_BUFF	0x428602A4	Counter buffered period register. See TCPWM0_GRP0_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT5_DT	0x428602B0	Counter PWM dead time register. See TCPWM0_GRP0_CNT0_DT for the details of bit fields.
TCPWM0_GRP0_CNT5_TR_CMD	0x428602C0	Counter trigger command register. See TCPWM0_GRP0_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP0_CNT5_TR_IN_SEL0	0x428602C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP0_CNT5_TR_IN_SEL1	0x428602C8	Counter input trigger selection register 1. See TCPWM0_GRP0_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP0_CNT5_TR_IN_EDGE_SEL	0x428602CC	Counter input trigger edge selection register. See TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP0_CNT5_TR_PWM_CTRL	0x428602D0	Counter trigger PWM control register. See TCPWM0_GRP0_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT5_TR_OUT_SEL	0x428602D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP0_CNT5_INTR	0x428602F0	Interrupt request register. See TCPWM0_GRP0_CNT0_INTR for the details of bit fields.
TCPWM0_GRP0_CNT5_INTR_SET	0x428602F4	Interrupt set request register. See TCPWM0_GRP0_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP0_CNT5_INTR_MASK	0x428602F8	Interrupt mask register. See TCPWM0_GRP0_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP0_CNT5_INTR_MASKED	0x428602FC	Interrupt masked request register. See TCPWM0_GRP0_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP0_CNT6_CTRL	0x42860300	Counter control register. See TCPWM0_GRP0_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT6_STATUS	0x42860304	Counter status register. See TCPWM0_GRP0_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP0_CNT6_COUNTER	0x42860308	Counter count register. See TCPWM0_GRP0_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP0_CNT6_CC0	0x42860310	Counter compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP0_CNT6_CC0_BUFF	0x42860314	Counter buffered compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT6_PERIOD	0x42860320	Counter period register. See TCPWM0_GRP0_CNT0_PERIOD for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP0_CNT6_PERIOD_BUFF	0x42860324	Counter buffered period register. See TCPWM0_GRP0_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT6_DT	0x42860330	Counter PWM dead time register. See TCPWM0_GRP0_CNT0_DT for the details of bit fields.
TCPWM0_GRP0_CNT6_TR_CMD	0x42860340	Counter trigger command register. See TCPWM0_GRP0_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP0_CNT6_TR_IN_SEL0	0x42860344	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP0_CNT6_TR_IN_SEL1	0x42860348	Counter input trigger selection register 1. See TCPWM0_GRP0_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP0_CNT6_TR_IN_EDGE_SEL	0x4286034C	Counter input trigger edge selection register. See TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP0_CNT6_TR_PWM_CTRL	0x42860350	Counter trigger PWM control register. See TCPWM0_GRP0_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT6_TR_OUT_SEL	0x42860354	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP0_CNT6_INTR	0x42860370	Interrupt request register. See TCPWM0_GRP0_CNT0_INTR for the details of bit fields.
TCPWM0_GRP0_CNT6_INTR_SET	0x42860374	Interrupt set request register. See TCPWM0_GRP0_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP0_CNT6_INTR_MASK	0x42860378	Interrupt mask register. See TCPWM0_GRP0_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP0_CNT6_INTR_MASKED	0x4286037C	Interrupt masked request register. See TCPWM0_GRP0_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP0_CNT7_CTRL	0x42860380	Counter control register. See TCPWM0_GRP0_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT7_STATUS	0x42860384	Counter status register. See TCPWM0_GRP0_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP0_CNT7_COUNTER	0x42860388	Counter count register. See TCPWM0_GRP0_CNT0_COUNTER for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP0_CNT7_CC0	0x42860390	Counter compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP0_CNT7_CC0_BUFF	0x42860394	Counter buffered compare/capture 0 register. See TCPWM0_GRP0_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT7_PERIOD	0x428603A0	Counter period register. See TCPWM0_GRP0_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP0_CNT7_PERIOD_BUFF	0x428603A4	Counter buffered period register. See TCPWM0_GRP0_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP0_CNT7_DT	0x428603B0	Counter PWM dead time register. See TCPWM0_GRP0_CNT0_DT for the details of bit fields.
TCPWM0_GRP0_CNT7_TR_CMD	0x428603C0	Counter trigger command register. See TCPWM0_GRP0_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP0_CNT7_TR_IN_SEL0	0x428603C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP0_CNT7_TR_IN_SEL1	0x428603C8	Counter input trigger selection register 1. See TCPWM0_GRP0_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP0_CNT7_TR_IN_EDGE_SEL	0x428603CC	Counter input trigger edge selection register. See TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP0_CNT7_TR_PWM_CTRL	0x428603D0	Counter trigger PWM control register. See TCPWM0_GRP0_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP0_CNT7_TR_OUT_SEL	0x428603D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP0_CNT7_INTR	0x428603F0	Interrupt request register. See TCPWM0_GRP0_CNT0_INTR for the details of bit fields.
TCPWM0_GRP0_CNT7_INTR_SET	0x428603F4	Interrupt set request register. See TCPWM0_GRP0_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP0_CNT7_INTR_MASK	0x428603F8	Interrupt mask register. See TCPWM0_GRP0_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP0_CNT7_INTR_MASKED	0x428603FC	Interrupt masked request register. See TCPWM0_GRP0_CNT0_INTR_MASKED for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT0_CTRL	0x42868000	Counter control register
TCPWM0_GRP1_CNT0_STATUS	0x42868004	Counter status register
TCPWM0_GRP1_CNT0_COUNTER	0x42868008	Counter count register
TCPWM0_GRP1_CNT0_CC0	0x42868010	Counter compare/capture 0 register
TCPWM0_GRP1_CNT0_CC0_BUFF	0x42868014	Counter buffered compare/capture 0 register
TCPWM0_GRP1_CNT0_CC1	0x42868018	Counter compare/capture 1 register
TCPWM0_GRP1_CNT0_CC1_BUFF	0x4286801C	Counter buffered compare/capture 1 register
TCPWM0_GRP1_CNT0_PERIOD	0x42868020	Counter period register
TCPWM0_GRP1_CNT0_PERIOD_BUFF	0x42868024	Counter buffered period register
TCPWM0_GRP1_CNT0_DT	0x42868030	Counter PWM dead time register
TCPWM0_GRP1_CNT0_TR_CMD	0x42868040	Counter trigger command register
TCPWM0_GRP1_CNT0_TR_IN_SEL0	0x42868044	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT0_TR_IN_SEL1	0x42868048	Counter input trigger selection register 1
TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL	0x4286804C	Counter input trigger edge selection register
TCPWM0_GRP1_CNT0_TR_PWM_CTRL	0x42868050	Counter trigger PWM control register
TCPWM0_GRP1_CNT0_TR_OUT_SEL	0x42868054	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT0_INTR	0x42868070	Interrupt request register
TCPWM0_GRP1_CNT0_INTR_SET	0x42868074	Interrupt set request register
TCPWM0_GRP1_CNT0_INTR_MASK	0x42868078	Interrupt mask register
TCPWM0_GRP1_CNT0_INTR_MASKED	0x4286807C	Interrupt masked request register
TCPWM0_GRP1_CNT1_CTRL	0x42868080	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT1_STATUS	0x42868084	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT1_COUNTER	0x42868088	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT1_CC0	0x42868090	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT1_CC0_BUFF	0x42868094	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT1_CC1	0x42868098	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT1_CC1_BUFF	0x4286809C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT1_PERIOD	0x428680A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT1_PERIOD_BUFF	0x428680A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT1_DT	0x428680B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT1_TR_CMD	0x428680C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT1_TR_IN_SEL0	0x428680C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT1_TR_IN_SEL1	0x428680C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT1_TR_IN_EDGE_SEL	0x428680CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT1_TR_PWM_CTRL	0x428680D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT1_TR_OUT_SEL	0x428680D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT1_INTR	0x428680F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT1_INTR_SET	0x428680F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT1_INTR_MASK	0x428680F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT1_INTR_MASKED	0x428680FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT2_CTRL	0x42868100	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT2_STATUS	0x42868104	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT2_COUNTER	0x42868108	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT2_CC0	0x42868110	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT2_CC0_BUFF	0x42868114	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT2_CC1	0x42868118	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT2_CC1_BUFF	0x4286811C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT2_PERIOD	0x42868120	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT2_PERIOD_BUFF	0x42868124	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT2_DT	0x42868130	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT2_TR_CMD	0x42868140	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT2_TR_IN_SEL0	0x42868144	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT2_TR_IN_SEL1	0x42868148	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT2_TR_IN_EDGE_SEL	0x4286814C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT2_TR_PWM_CTRL	0x42868150	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT2_TR_OUT_SEL	0x42868154	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT2_INTR	0x42868170	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT2_INTR_SET	0x42868174	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT2_INTR_MASK	0x42868178	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT2_INTR_MASKED	0x4286817C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT3_CTRL	0x42868180	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT3_STATUS	0x42868184	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT3_COUNTER	0x42868188	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT3_CC0	0x42868190	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT3_CC0_BUFF	0x42868194	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT3_CC1	0x42868198	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT3_CC1_BUFF	0x4286819C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT3_PERIOD	0x428681A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT3_PERIOD_BUFF	0x428681A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT3_DT	0x428681B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT3_TR_CMD	0x428681C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT3_TR_IN_SEL0	0x428681C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT3_TR_IN_SEL1	0x428681C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT3_TR_IN_EDGE_SEL	0x428681CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT3_TR_PWM_CTRL	0x428681D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT3_TR_OUT_SEL	0x428681D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT3_INTR	0x428681F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT3_INTR_SET	0x428681F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT3_INTR_MASK	0x428681F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT3_INTR_MASKED	0x428681FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT4_CTRL	0x42868200	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT4_STATUS	0x42868204	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT4_COUNTER	0x42868208	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT4_CC0	0x42868210	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT4_CC0_BUFF	0x42868214	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT4_CC1	0x42868218	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT4_CC1_BUFF	0x4286821C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT4_PERIOD	0x42868220	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT4_PERIOD_BUFF	0x42868224	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT4_DT	0x42868230	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT4_TR_CMD	0x42868240	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT4_TR_IN_SEL0	0x42868244	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT4_TR_IN_SEL1	0x42868248	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT4_TR_IN_EDGE_SEL	0x4286824C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT4_TR_PWM_CTRL	0x42868250	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT4_TR_OUT_SEL	0x42868254	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT4_INTR	0x42868270	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT4_INTR_SET	0x42868274	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT4_INTR_MASK	0x42868278	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT4_INTR_MASKED	0x4286827C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT5_CTRL	0x42868280	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT5_STATUS	0x42868284	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT5_COUNTER	0x42868288	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT5_CC0	0x42868290	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT5_CC0_BUFF	0x42868294	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT5_CC1	0x42868298	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT5_CC1_BUFF	0x4286829C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT5_PERIOD	0x428682A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT5_PERIOD_BUFF	0x428682A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT5_DT	0x428682B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT5_TR_CMD	0x428682C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT5_TR_IN_SEL0	0x428682C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT5_TR_IN_SEL1	0x428682C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT5_TR_IN_EDGE_SEL	0x428682CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT5_TR_PWM_CTRL	0x428682D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT5_TR_OUT_SEL	0x428682D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT5_INTR	0x428682F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT5_INTR_SET	0x428682F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT5_INTR_MASK	0x428682F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT5_INTR_MASKED	0x428682FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT6_CTRL	0x42868300	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT6_STATUS	0x42868304	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT6_COUNTER	0x42868308	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT6_CC0	0x42868310	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT6_CC0_BUFF	0x42868314	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT6_CC1	0x42868318	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT6_CC1_BUFF	0x4286831C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT6_PERIOD	0x42868320	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT6_PERIOD_BUFF	0x42868324	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT6_DT	0x42868330	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT6_TR_CMD	0x42868340	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT6_TR_IN_SEL0	0x42868344	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT6_TR_IN_SEL1	0x42868348	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT6_TR_IN_EDGE_SEL	0x4286834C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT6_TR_PWM_CTRL	0x42868350	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT6_TR_OUT_SEL	0x42868354	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT6_INTR	0x42868370	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT6_INTR_SET	0x42868374	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT6_INTR_MASK	0x42868378	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT6_INTR_MASKED	0x4286837C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT7_CTRL	0x42868380	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT7_STATUS	0x42868384	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT7_COUNTER	0x42868388	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT7_CC0	0x42868390	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT7_CC0_BUFF	0x42868394	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT7_CC1	0x42868398	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT7_CC1_BUFF	0x4286839C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT7_PERIOD	0x428683A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT7_PERIOD_BUFF	0x428683A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT7_DT	0x428683B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT7_TR_CMD	0x428683C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT7_TR_IN_SEL0	0x428683C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT7_TR_IN_SEL1	0x428683C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT7_TR_IN_EDGE_SEL	0x428683CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT7_TR_PWM_CTRL	0x428683D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT7_TR_OUT_SEL	0x428683D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT7_INTR	0x428683F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT7_INTR_SET	0x428683F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT7_INTR_MASK	0x428683F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT7_INTR_MASKED	0x428683FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT8_CTRL	0x42868400	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT8_STATUS	0x42868404	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT8_COUNTER	0x42868408	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT8_CC0	0x42868410	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT8_CC0_BUFF	0x42868414	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT8_CC1	0x42868418	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT8_CC1_BUFF	0x4286841C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT8_PERIOD	0x42868420	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT8_PERIOD_BUFF	0x42868424	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT8_DT	0x42868430	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT8_TR_CMD	0x42868440	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT8_TR_IN_SEL0	0x42868444	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT8_TR_IN_SEL1	0x42868448	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT8_TR_IN_EDGE_SEL	0x4286844C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT8_TR_PWM_CTRL	0x42868450	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT8_TR_OUT_SEL	0x42868454	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT8_INTR	0x42868470	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT8_INTR_SET	0x42868474	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT8_INTR_MASK	0x42868478	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT8_INTR_MASKED	0x4286847C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT9_CTRL	0x42868480	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT9_STATUS	0x42868484	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT9_COUNTER	0x42868488	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT9_CC0	0x42868490	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT9_CC0_BUFF	0x42868494	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT9_CC1	0x42868498	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT9_CC1_BUFF	0x4286849C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT9_PERIOD	0x428684A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT9_PERIOD_BUFF	0x428684A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT9_DT	0x428684B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT9_TR_CMD	0x428684C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT9_TR_IN_SEL0	0x428684C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT9_TR_IN_SEL1	0x428684C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT9_TR_IN_EDGE_SEL	0x428684CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT9_TR_PWM_CTRL	0x428684D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT9_TR_OUT_SEL	0x428684D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT9_INTR	0x428684F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT9_INTR_SET	0x428684F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT9_INTR_MASK	0x428684F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT9_INTR_MASKED	0x428684FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT10_CTRL	0x42868500	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT10_STATUS	0x42868504	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT10_COUNTER	0x42868508	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT10_CC0	0x42868510	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT10_CC0_BUFF	0x42868514	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT10_CC1	0x42868518	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT10_CC1_BUFF	0x4286851C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT10_PERIOD	0x42868520	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT10_PERIOD_BUFF	0x42868524	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT10_DT	0x42868530	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT10_TR_CMD	0x42868540	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT10_TR_IN_SEL0	0x42868544	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT10_TR_IN_SEL1	0x42868548	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT10_TR_IN_EDGE_SEL	0x4286854C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT10_TR_PWM_CTRL	0x42868550	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT10_TR_OUT_SEL	0x42868554	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT10_INTR	0x42868570	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT10_INTR_SET	0x42868574	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT10_INTR_MASK	0x42868578	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT10_INTR_MASKED	0x4286857C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT11_CTRL	0x42868580	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT11_STATUS	0x42868584	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT11_COUNTER	0x42868588	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT11_CC0	0x42868590	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT11_CC0_BUFF	0x42868594	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT11_CC1	0x42868598	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT11_CC1_BUFF	0x4286859C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT11_PERIOD	0x428685A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT11_PERIOD_BUFF	0x428685A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT11_DT	0x428685B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT11_TR_CMD	0x428685C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT11_TR_IN_SEL0	0x428685C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT11_TR_IN_SEL1	0x428685C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT11_TR_IN_EDGE_SEL	0x428685CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT11_TR_PWM_CTRL	0x428685D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT11_TR_OUT_SEL	0x428685D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT11_INTR	0x428685F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT11_INTR_SET	0x428685F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT11_INTR_MASK	0x428685F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT11_INTR_MASKED	0x428685FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT12_CTRL	0x42868600	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT12_STATUS	0x42868604	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT12_COUNTER	0x42868608	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT12_CC0	0x42868610	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT12_CC0_BUFF	0x42868614	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT12_CC1	0x42868618	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT12_CC1_BUFF	0x4286861C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT12_PERIOD	0x42868620	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT12_PERIOD_BUFF	0x42868624	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT12_DT	0x42868630	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT12_TR_CMD	0x42868640	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT12_TR_IN_SEL0	0x42868644	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT12_TR_IN_SEL1	0x42868648	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT12_TR_IN_EDGE_SEL	0x4286864C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT12_TR_PWM_CTRL	0x42868650	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT12_TR_OUT_SEL	0x42868654	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT12_INTR	0x42868670	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT12_INTR_SET	0x42868674	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT12_INTR_MASK	0x42868678	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT12_INTR_MASKED	0x4286867C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT13_CTRL	0x42868680	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT13_STATUS	0x42868684	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT13_COUNTER	0x42868688	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT13_CC0	0x42868690	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT13_CC0_BUFF	0x42868694	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT13_CC1	0x42868698	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT13_CC1_BUFF	0x4286869C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT13_PERIOD	0x428686A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT13_PERIOD_BUFF	0x428686A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT13_DT	0x428686B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT13_TR_CMD	0x428686C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT13_TR_IN_SEL0	0x428686C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT13_TR_IN_SEL1	0x428686C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT13_TR_IN_EDGE_SEL	0x428686CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT13_TR_PWM_CTRL	0x428686D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT13_TR_OUT_SEL	0x428686D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT13_INTR	0x428686F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT13_INTR_SET	0x428686F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT13_INTR_MASK	0x428686F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT13_INTR_MASKED	0x428686FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT14_CTRL	0x42868700	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT14_STATUS	0x42868704	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT14_COUNTER	0x42868708	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT14_CC0	0x42868710	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT14_CC0_BUFF	0x42868714	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT14_CC1	0x42868718	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT14_CC1_BUFF	0x4286871C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT14_PERIOD	0x42868720	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT14_PERIOD_BUFF	0x42868724	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT14_DT	0x42868730	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT14_TR_CMD	0x42868740	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT14_TR_IN_SEL0	0x42868744	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT14_TR_IN_SEL1	0x42868748	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT14_TR_IN_EDGE_SEL	0x4286874C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT14_TR_PWM_CTRL	0x42868750	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT14_TR_OUT_SEL	0x42868754	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT14_INTR	0x42868770	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT14_INTR_SET	0x42868774	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT14_INTR_MASK	0x42868778	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT14_INTR_MASKED	0x4286877C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT15_CTRL	0x42868780	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT15_STATUS	0x42868784	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT15_COUNTER	0x42868788	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT15_CC0	0x42868790	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT15_CC0_BUFF	0x42868794	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT15_CC1	0x42868798	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT15_CC1_BUFF	0x4286879C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT15_PERIOD	0x428687A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT15_PERIOD_BUFF	0x428687A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT15_DT	0x428687B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT15_TR_CMD	0x428687C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT15_TR_IN_SEL0	0x428687C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT15_TR_IN_SEL1	0x428687C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT15_TR_IN_EDGE_SEL	0x428687CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT15_TR_PWM_CTRL	0x428687D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT15_TR_OUT_SEL	0x428687D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT15_INTR	0x428687F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT15_INTR_SET	0x428687F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT15_INTR_MASK	0x428687F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT15_INTR_MASKED	0x428687FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT16_CTRL	0x42868800	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT16_STATUS	0x42868804	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT16_COUNTER	0x42868808	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT16_CC0	0x42868810	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT16_CC0_BUFF	0x42868814	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT16_CC1	0x42868818	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT16_CC1_BUFF	0x4286881C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT16_PERIOD	0x42868820	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT16_PERIOD_BUFF	0x42868824	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT16_DT	0x42868830	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT16_TR_CMD	0x42868840	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT16_TR_IN_SEL0	0x42868844	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT16_TR_IN_SEL1	0x42868848	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT16_TR_IN_EDGE_SEL	0x4286884C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT16_TR_PWM_CTRL	0x42868850	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT16_TR_OUT_SEL	0x42868854	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT16_INTR	0x42868870	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT16_INTR_SET	0x42868874	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT16_INTR_MASK	0x42868878	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT16_INTR_MASKED	0x4286887C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT17_CTRL	0x42868880	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT17_STATUS	0x42868884	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT17_COUNTER	0x42868888	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT17_CC0	0x42868890	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT17_CC0_BUFF	0x42868894	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT17_CC1	0x42868898	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT17_CC1_BUFF	0x4286889C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT17_PERIOD	0x428688A0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT17_PERIOD_BUFF	0x428688A4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT17_DT	0x428688B0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT17_TR_CMD	0x428688C0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT17_TR_IN_SEL0	0x428688C4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT17_TR_IN_SEL1	0x428688C8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT17_TR_IN_EDGE_SEL	0x428688CC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT17_TR_PWM_CTRL	0x428688D0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT17_TR_OUT_SEL	0x428688D4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT17_INTR	0x428688F0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT17_INTR_SET	0x428688F4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT17_INTR_MASK	0x428688F8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT17_INTR_MASKED	0x428688FC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT18_CTRL	0x42868900	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT18_STATUS	0x42868904	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT18_COUNTER	0x42868908	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT18_CC0	0x42868910	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT18_CC0_BUFF	0x42868914	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT18_CC1	0x42868918	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT18_CC1_BUFF	0x4286891C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT18_PERIOD	0x42868920	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT18_PERIOD_BUFF	0x42868924	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT18_DT	0x42868930	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT18_TR_CMD	0x42868940	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT18_TR_IN_SEL0	0x42868944	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT18_TR_IN_SEL1	0x42868948	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT18_TR_IN_EDGE_SEL	0x4286894C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT18_TR_PWM_CTRL	0x42868950	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT18_TR_OUT_SEL	0x42868954	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT18_INTR	0x42868970	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT18_INTR_SET	0x42868974	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT18_INTR_MASK	0x42868978	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT18_INTR_MASKED	0x4286897C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT19_CTRL	0x42868980	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT19_STATUS	0x42868984	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT19_COUNTER	0x42868988	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT19_CC0	0x42868990	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT19_CC0_BUFF	0x42868994	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT19_CC1	0x42868998	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT19_CC1_BUFF	0x4286899C	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT19_PERIOD	0x428689A0	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT19_PERIOD_BUFF	0x428689A4	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT19_DT	0x428689B0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT19_TR_CMD	0x428689C0	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT19_TR_IN_SEL0	0x428689C4	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT19_TR_IN_SEL1	0x428689C8	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT19_TR_IN_EDGE_SEL	0x428689CC	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT19_TR_PWM_CTRL	0x428689D0	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT19_TR_OUT_SEL	0x428689D4	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT19_INTR	0x428689F0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT19_INTR_SET	0x428689F4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT19_INTR_MASK	0x428689F8	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT19_INTR_MASKED	0x428689FC	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT20_CTRL	0x42868A00	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT20_STATUS	0x42868A04	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT20_COUNTER	0x42868A08	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT20_CC0	0x42868A10	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT20_CC0_BUFF	0x42868A14	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT20_CC1	0x42868A18	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT20_CC1_BUFF	0x42868A1C	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT20_PERIOD	0x42868A20	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT20_PERIOD_BUFF	0x42868A24	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT20_DT	0x42868A30	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT20_TR_CMD	0x42868A40	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT20_TR_IN_SEL0	0x42868A44	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT20_TR_IN_SEL1	0x42868A48	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT20_TR_IN_EDGE_SEL	0x42868A4C	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT20_TR_PWM_CTRL	0x42868A50	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT20_TR_OUT_SEL	0x42868A54	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT20_INTR	0x42868A70	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT20_INTR_SET	0x42868A74	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT20_INTR_MASK	0x42868A78	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT20_INTR_MASKED	0x42868A7C	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT21_CTRL	0x42868A80	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT21_STATUS	0x42868A84	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT21_COUNTER	0x42868A88	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT21_CC0	0x42868A90	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT21_CC0_BUFF	0x42868A94	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT21_CC1	0x42868A98	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT21_CC1_BUFF	0x42868A9C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT21_PERIOD	0x42868AA0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT21_PERIOD_BUFF	0x42868AA4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT21_DT	0x42868AB0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT21_TR_CMD	0x42868AC0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT21_TR_IN_SEL0	0x42868AC4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT21_TR_IN_SEL1	0x42868AC8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT21_TR_IN_EDGE_SEL	0x42868ACC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT21_TR_PWM_CTRL	0x42868AD0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT21_TR_OUT_SEL	0x42868AD4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT21_INTR	0x42868AF0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT21_INTR_SET	0x42868AF4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT21_INTR_MASK	0x42868AF8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT21_INTR_MASKED	0x42868AFC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT22_CTRL	0x42868B00	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT22_STATUS	0x42868B04	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT22_COUNTER	0x42868B08	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT22_CC0	0x42868B10	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT22_CC0_BUFF	0x42868B14	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT22_CC1	0x42868B18	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT22_CC1_BUFF	0x42868B1C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT22_PERIOD	0x42868B20	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT22_PERIOD_BUFF	0x42868B24	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT22_DT	0x42868B30	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT22_TR_CMD	0x42868B40	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT22_TR_IN_SEL0	0x42868B44	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT22_TR_IN_SEL1	0x42868B48	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT22_TR_IN_EDGE_SEL	0x42868B4C	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT22_TR_PWM_CTRL	0x42868B50	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT22_TR_OUT_SEL	0x42868B54	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.
TCPWM0_GRP1_CNT22_INTR	0x42868B70	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT22_INTR_SET	0x42868B74	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT22_INTR_MASK	0x42868B78	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT22_INTR_MASKED	0x42868B7C	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.
TCPWM0_GRP1_CNT23_CTRL	0x42868B80	Counter control register. See TCPWM0_GRP1_CNT0_CTRL for the details of bit fields.

Register name	Address	Description
TCPWM0_GRP1_CNT23_STATUS	0x42868B84	Counter status register. See TCPWM0_GRP1_CNT0_STATUS for the details of bit fields.
TCPWM0_GRP1_CNT23_COUNTER	0x42868B88	Counter count register. See TCPWM0_GRP1_CNT0_COUNTER for the details of bit fields.
TCPWM0_GRP1_CNT23_CC0	0x42868B90	Counter compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0 for the details of bit fields.
TCPWM0_GRP1_CNT23_CC0_BUFF	0x42868B94	Counter buffered compare/capture 0 register. See TCPWM0_GRP1_CNT0_CC0_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT23_CC1	0x42868B98	Counter compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1 for the details of bit fields.
TCPWM0_GRP1_CNT23_CC1_BUFF	0x42868B9C	Counter buffered compare/capture 1 register. See TCPWM0_GRP1_CNT0_CC1_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT23_PERIOD	0x42868BA0	Counter period register. See TCPWM0_GRP1_CNT0_PERIOD for the details of bit fields.
TCPWM0_GRP1_CNT23_PERIOD_BUFF	0x42868BA4	Counter buffered period register. See TCPWM0_GRP1_CNT0_PERIOD_BUFF for the details of bit fields.
TCPWM0_GRP1_CNT23_DT	0x42868BB0	Counter PWM dead time register. See TCPWM0_GRP1_CNT0_DT for the details of bit fields.
TCPWM0_GRP1_CNT23_TR_CMD	0x42868BC0	Counter trigger command register. See TCPWM0_GRP1_CNT0_TR_CMD for the details of bit fields.
TCPWM0_GRP1_CNT23_TR_IN_SEL0	0x42868BC4	Counter input trigger selection register 0. See TCPWM0_GRP0_CNT0_TR_IN_SEL0 for the details of bit fields.
TCPWM0_GRP1_CNT23_TR_IN_SEL1	0x42868BC8	Counter input trigger selection register 1. See TCPWM0_GRP1_CNT0_TR_IN_SEL1 for the details of bit fields.
TCPWM0_GRP1_CNT23_TR_IN_EDGE_SEL	0x42868BCC	Counter input trigger edge selection register. See TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL for the details of bit fields.
TCPWM0_GRP1_CNT23_TR_PWM_CTRL	0x42868BD0	Counter trigger PWM control register. See TCPWM0_GRP1_CNT0_TR_PWM_CTRL for the details of bit fields.
TCPWM0_GRP1_CNT23_TR_OUT_SEL	0x42868BD4	Counter output trigger selection register. See TCPWM0_GRP0_CNT0_TR_OUT_SEL for the details of bit fields.

Timer, Counter, PWM (TCPWM) registers

Register name	Address	Description
TCPWM0_GRP1_CNT23_INTR	0x42868BF0	Interrupt request register. See TCPWM0_GRP1_CNT0_INTR for the details of bit fields.
TCPWM0_GRP1_CNT23_INTR_SET	0x42868BF4	Interrupt set request register. See TCPWM0_GRP1_CNT0_INTR_SET for the details of bit fields.
TCPWM0_GRP1_CNT23_INTR_MASK	0x42868BF8	Interrupt mask register. See TCPWM0_GRP1_CNT0_INTR_MASK for the details of bit fields.
TCPWM0_GRP1_CNT23_INTR_MASKED	0x42868BFC	Interrupt masked request register. See TCPWM0_GRP1_CNT0_INTR_MASKED for the details of bit fields.

17.1.1 TCPWM0_GRP0_CNT0_CTRL

Description: Counter control register

Address: 0x42860000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	Reserved	RW
HW Access	Reserved					R	Reserved	R
Name	Reserved [7:3]					AUTO_RELOAD_PERIOD	Reserved	AUTO_RELOAD_CC0

HW Access	Reserved		R		Reserved	R	R	
Name	Reserved [23:22]		QUAD_ENCODING_MODE [21:20]		Reserved	ONE_SHOT	UP_DOWN_MODE [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved			RW		
HW Access	R	R	Reserved			R		
Name	ENABLED	DBG_FREEZE_EN	Reserved [29:27]			MODE [26:24]		

Bits	Name	Description
31	ENABLED	Counter enable. '0': counter disabled. '1': counter enabled. Counter static configuration information (e.g. CTRL.MODE, all TR_IN_SEL, TR_IN_EDGE_SEL, TR_PWM_CTRL and TR_OUT_SEL register fields) should only be modified when the counter is disabled. When a counter is disabled, command and status information associated to the counter is cleared by HW, this includes: - the associated counter triggers in the CMD register are set to '0'. - the counter's interrupt cause fields in counter's INTR register. - the counter's status fields in counter's STATUS register.. - the counter's trigger outputs ("tr_out0" and tr_out1"). - the counter's line outputs ("line_out" and "line_compl_out"). Default Value: 0
30	DBG_FREEZE_EN	Specifies the counter behavior in debug mode. '0': The counter operation continues in debug mode. '1': The counter operation freezes in debug mode. Default Value: 0
26 : 24	MODE	Counter mode. Default Value: 0

17.1.1 TCPWM0_GRP0_CNT0_CTRL (continued)

0x0: TIMER :

Timer mode

0x1: Reserved1 :

N/A

0x2: CAPTURE :

Capture mode

0x3: QUAD :

Quadrature mode
Different encoding modes can be selected by QUAD_ENCODING_MODE including up/down count functionality.
Different counter range, reload value and capture behavior can be selected by QUAD_RANGE_-MODE (overloaded field UP_DOWN_MODE).

0x4: PWM :

Pulse width modulation (PWM) mode

0x5: PWM_DT :

PWM with deadtime insertion mode

0x6: PWM_PR :

Pseudo random pulse width modulation

0x7: SR :

Shift register mode.

21 : 20	QUAD_ENCODING_-MODE	In QUAD mode this field selects the quadrature encoding mode (X1/X2/X4) or the Up / Down rotary counting mode. In PWM, PWM_DT and PWM_PR modes, these two bits can be used to invert "dt_line_out" and "dt_line_compl_out". Inversion is the last step in generation of "dt_line_out" and "dt_line_compl_out"; i.e. a disabled output line "dt_line_out" has the value QUAD_ENCODING_MODE[0] and a disabled output line "dt_line_compl_out" has the value QUAD_ENCODING_MODE[1]. Default Value: 0

0x0: X1 :

X1 encoding (QUAD mode)
This encoding is identical with an up / down counting functionality of the following way: Rising edges of input phiA increment or decrement the counter depending on the state of input phiB (direction input).

0x1: X2 :

X2 encoding (QUAD mode)

0x2: X4 :

X4 encoding (QUAD mode)

17.1.1 TCPWM0_GRP0_CNT0_CTRL (continued)

		0x3: UP_DOWN : Up / Down rotary counting mode. Input phiA increments the counter, input phiB decrements the counter. The trigger edge detection settings apply. **0x1: INV_OUT :** When bit 0 is '1', QUADRATURE_ENCODING_MODE[0] inverts "dt_line_out" (PWM/PWM_DT modes) **0x2: INV_COMPL_OUT :** When bit 1 is '1', QUADRATURE_ENCODING_MODE[1] inverts "dt_line_compl_out" (PWM/PWM_DT modes)
18	ONE_SHOT	When '0', counter runs continuous. When '1', counter is turned off by hardware when a terminal count event is generated. Default Value: 0
17 : 16	UP_DOWN_MODE	Determines counter direction. In QUAD mode this field acts as QUAD_RANGE_MODE field selecting between different counter range, reload value and compare / capture behavior. Default Value: 0 **0x0: COUNT_UP :** Count up (to PERIOD). An overflow event is generated when the counter changes from a state in which COUNTER equals PERIOD. A terminal count event is generated when the counter changes from a state in which COUNTER equals PERIOD. **0x1: COUNT_DOWN :** Count down (to "0"). An underflow event is generated when the counter changes from a state in which COUNTER equals "0". A terminal count event is generated when the counter changes from a state in which COUNTER equals "0". **0x2: COUNT_UPDN1 :** Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter changes from a state in which COUNTER equals PERIOD. An underflow event is generated when the counter changes from a state in which COUNTER equals "0". A terminal count event is generated when the counter changes from a state in which COUNTER equals "0". **0x3: COUNT_UPDN2 :** Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter changes from a state in which COUNTER equals PERIOD. An underflow event is generated when the counter changes from a state in which COUNTER equals "0". A terminal count event is generated when the counter changes from a state in which COUNTER equals "0" AND when the counter changes from a state in which COUNTER equals PERIOD (this counter direction can be used for PWM functionality with asymmetrical updates).

17.1.1 TCPWM0_GRP0_CNT0_CTRL (continued)

0x0: QUAD_RANGE0 :

In QUAD mode this setting selects the QUAD_RANGE0 mode with the following behavior:
- COUNTER range is between 0x0000 and 0xFFFF / 0xFFFFFFFF (for GRP_CNT_WIDTH = 16 / 32)
- on reload / index event:
 - CC0 is copied to CC0_BUFF
 - COUNTER is copied to CC0
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - tc and cc0_match events are generated
- when COUNTER is 0x0000 or 0xFFFF / 0xFFFFFFFF:
 - CC0 is copied to CC0_BUFF
 - COUNTER (0x0000 or 0xFFFF / 0xFFFFFFFF) is copied to CC0
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - cc0_match event is generated

0x1: QUAD_RANGE0_CMP :

In QUAD mode this setting selects the QUAD_RANGE0_CMP mode with the following behavior:
- COUNTER range is between 0x0000 and 0xFFFF / 0xFFFFFFFF (for GRP_CNT_WIDTH = 16 / 32)
- the capture0 event acts as 2nd reload / index event
- on reload / index event:
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - when 'capture on index' is selected (AUTO_RELOAD_PERIOD=0):
 - tc event is generated
 - PERIOD is copied to PERIOD_BUFF
 - COUNTER is copied to PERIOD
- when COUNTER is 0x0000 or 0xFFFF / 0xFFFFFFFF:
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - when 'capture on wrap-around' is selected (AUTO_RELOAD_PERIOD=1):
 - tc event is generated
 - PERIOD is copied to PERIOD_BUFF
 - COUNTER (0x0000 or 0xFFFF / 0xFFFFFFFF) is copied to PERIOD
- 1 or 2 compare functions (depending on CC1_PRESENT) available

This mode is to a certain extend backward compatible with previous TCPWM quadrature behavior but allows a compare function during quadrature decoding using the CC0/CC_BUFF registers and the cc0_match event. Because of that the PERIOD/PERIOD_BUFF registers are used instead of CC0/CC_BUFF registers to capture COUNTER at reload / index event or wrap-around.

17.1.1 TCPWM0_GRP0_CNT0_CTRL (continued)

0x2: QUAD_RANGE1_CAPT :

In QUAD mode this setting selects the QUAD_RANGE1_CAPT mode with the following behavior:
- COUNTER range is between 0x0000 and PERIOD
- on reload / index event:
 - COUNTER is set to 0x0000
 - tc event is generated
- when COUNTER is 0x0000 and decrementing:
 - COUNTER is set to PERIOD
 - tc event is generated
- when COUNTER equals PERIOD and is incrementing:
 - COUNTER is set to 0x0000
 - tc event is generated
- 1 or 2 capture functions (depending on CC1_PRESENT) available
- on capture0 / capture1 event:
 - CC0 / CC1 is copied to CC0_BUFF / CC1_BUFF
 - COUNTER value is copied to CC0

It allows that the COUNTER register reflects the current angle position of the rotary encoder, i.e. no MOD or SUB calculations need to be done in SW on the COUNTER value to get the current angle position. This allows a DMA copy of the angle position from the COUNTER register. However, a disadvantage of this mode is that fast sequences of tc interrupts can occur (when encoder moves back and forth around start position). It is recommended to not use the tc interrupt in this mode.

0x3: QUAD_RANGE1_CMP :

In QUAD mode this setting selects the QUAD_RANGE1_CMP mode.
The behavior is the same as for QUAD_RANGE1_CAPT mode described above with the only difference that 1 or 2 compare functions (depending on CC1_PRESENT) are available instead of 1 or 2 capture functions.

13 : 12	PWM_DISABLE_MODE	Specifies the behavior of the PWM outputs "line_out" and "line_compl_out" while the TCPWM counter is disabled (CTL.ENABLED='0') or stopped. Note: The output signal of this selection can be further modified by the immediate kill logic and line_out polarity settings (CTRL.QUAD_ENCODING_MODE). Default Value: 0

0x0: Z :

When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are NOT driven by the TCPWM. Instead the port default level configuration applies, e.g. "Z" (high impedance).
Note: This is realized by driving the TCPWM output "line_out_en" to 0.
When the counter is stopped upon a stop event the PWM outputs are deactivated (to the polarity defined by CTL.QUAD_ENCODING_MODE).

0x1: RETAIN :

When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are driven by the TCPWM.
When the counter is disabled or stopped upon a stop event the PWM outputs are retained (keep their previous levels).
While the counter is disabled or stopped the PWM outputs can be changed via LINE_SEL (when parameter GRP_SMC_PRESENT = 1).

0x2: L :

When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are driven by the TCPWM.
When the counter is disabled or stopped upon a stop event the PWM output "line_out" is driven as a fixed '0' and the PWM output "line_compl_out" is driven as a fixed '1'.

17.1.1 TCPWM0_GRP0_CNT0_CTRL (continued)

		0x3: H : When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are driven by the TCPWM. When the counter is disabled or stopped upon a stop event the PWM output "line_out" is driven as a fixed '1' and the PWM output "line_compl_out" is driven as a fixed '0'.
10	PWM_SYNC_KILL	Specifies asynchronous/synchronous kill behavior: '1': synchronous kill mode: the kill event disables the "dt_line_out" and "dt_line_compl_out" signals till the next terminal count event (synchronous kill). In synchronous kill mode, STOP_EDGE should be RISING_EDGE. '0': asynchronous kill mode: the kill event only disables the "dt_line_out" and "dt_line_compl_out" signals when present. In asynchronous kill mode, STOP_EDGE should be NO_EDGE_DET. This field has a function in PWM and PWM_DT modes only. This field is only used when PWM_STOP_ON_KILL is '0'. Default Value: 0
9	PWM_STOP_ON_KILL	Specifies whether the counter stops on a kill events: '0': kill event does NOT stop counter. '1': kill event stops counter. This field has a function in PWM, PWM_DT and PWM_PR modes only. Default Value: 0
8	PWM_IMM_KILL	Specifies whether the kill event immediately deactivates the "dt_line_out" and "dt_line_compl_out" signals or with the next module clock ("active count" pre-scaled "clk_counter"). '0': synchronous kill activation. Deactivates the "dt_line_out" and "dt_line_compl_out" signals with the next module clock ("active count" pre-scaled "clk_counter"). '1': immediate kill activation. Immediately deactivates the "dt_line_out" and "dt_line_compl_out" signals. This field has a function in PWM, PWM_DT and PWM_PR modes only. Default Value: 0
2	AUTO_RELOAD_PERIOD	Specifies switching of the PERIOD and buffered PERIOD values. This field has a function in PWM and PWM_DT modes. '0': never switch. '1': switch on a terminal count event with and actively pending switch event. In QUAD mode, QUAD_RANGE0_CMP range mode this field is used to select the index / wrap-around capture function. '0': Captures on index (reload) event. The counter value is copied to the PERIOD register on an index (reload) event. '1': Captures when COUNTER equals 0 or 0xffff. The counter value is copied to the PERIOD register when COUNTER equals 0 or 0xffff. Default Value: 0
0	AUTO_RELOAD_CC0	Specifies switching of the CC0 and buffered CC0 values. This field has a function in TIMER, QUAD (QUAD_RANGE0_CMP, QUAD_RANGE1_CMP range modes), SR, PWM, PWM_DT and PWM_PR modes. Timer, QUAD, SR modes: '0': never switch. '1': switch on a compare match 0 event. PWM, PWM_DT, PWM_PR modes: '0: never switch. '1': switch on a terminal count event with an actively pending switch event. Default Value: 0

17.1.2 TCPWM0_GRP0_CNT0_STATUS

Description: Counter status register

Address: 0x42860004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	R	R	R	Reserved			R
HW Access	RW	RW	RW	RW	Reserved			RW

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	DT_CNT_L	Generic 8-bit counter field. In PWM_DT mode, this counter is used for dead time insertion (8bit dead time counter or low byte of 16-bit dead time counter). In all other modes, this counter is used for pre-scaling the selected counter clock. PWM_DT mode can NOT use prescaled clock functionality. Default Value: 0
15	RUNNING	When '0', the counter is NOT running. When '1', the counter is running. This field is used to indicate that the counter is running after a start/reload event and that the counter is stopped after a stop event. When a running counter operation is paused in debug state (see CTRL.DBG_PAUSE) then the RUNNING bit is still '1'. Default Value: 0
11	LINE_COMPL_OUT	Indicates the actual level of the complementary PWM line output signal. Default Value: 0
10	LINE_OUT	Indicates the actual level of the PWM line output signal. Default Value: 0
8	TR_START	Indicates the actual level of the selected start trigger. Default Value: 0
7	TR_STOP	Indicates the actual level of the selected stop trigger. Default Value: 0
6	TR_RELOAD	Indicates the actual level of the selected reload trigger. Default Value: 0

17.1.2 TCPWM0_GRP0_CNT0_STATUS (continued)

5	TR_COUNT	Indicates the actual level of the selected count trigger. Default Value: 1
4	TR_CAPTURE0	Indicates the actual level of the selected capture 0 trigger. Default Value: 0
0	DOWN	When '0', counter is counting up. When '1', counter is counting down. In QUAD mode, this field indicates the direction of the latest counter change: '0' when last incremented and '1' when last decremented. Default Value: 0

17.1.3 TCPWM0_GRP0_CNT0_COUNTER

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	PERIOD [31:24]							

Bits	Name	Description
31 : 0	PERIOD	Additional buffer for counter PERIOD register. In PWM_PR mode PEROD_BUFF defines the LFSR polynomial. Each bit represents a tap of the shift register which can be feed back to the MSB via an XOR tree. Examples for GRP_CNT_WIDTH = 16: - Maximum length 16bit LFSR - polynomial x^16 + x^14 + x^13 + x^11 + 1 - taps 0,2,3,5 -> PERIOD = 0x002d - period is 2^16-1 = 65535 cycles - Maximum length 8bit LFSR: - polynomial x^8 + x^6 + x^5 + x^4 + 1 - taps 8,10,11,12 (realized in 8 MSBs of 16bit LFSR) - period is 2^8-1 = 255 cycles In SR mode PERIOD_BUFF defines which tap of the shift register generates the PWM output signals. For a delay of n cycles (from capture event to PWM output) the bit CNT_WIDTH-n should be set to '1'. For a shift register function only one tap should be use, i.e. a one-hot value must be written to PERIOD_BUFF. If multiple bits in PERIOD_BUFF are set then the taps are XOR combined. Default Value: 4294967295

17.1.8 TCPWM0_GRP0_CNT0_DT

Description: Counter PWM dead time register

Address: 0x42860030

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	DT_LINE_OUT_L	In PWM_DT mode, this field is used to determine the low byte of the dead time before activating the PWM line output signal "line_out": amount of dead time cycles in the counter clock domain. In all other modes, the lower 3 bits of this field determine pre-scaling of the selected counter clock. Note: This field determines the low byte of the 16-bit dead time before activating "line_out" when parameter GRP_AMC_PRESENT for advanced motor control is set to 1. Otherwise the dead time is only 8 bit wide and the same dead time specified by this DT_LINE_OUT_L field is used before activating "line_out" and "line_compl_out". Default Value: 0 **0x0: DIVBY1 :** Divide by 1 (other-than-PWM_DT mode) **0x1: DIVBY2 :** Divide by 2 (other-than-PWM_DT mode) **0x2: DIVBY4 :** Divide by 4 (other-than-PWM_DT mode) **0x3: DIVBY8 :** Divide by 8 (other-than-PWM_DT mode)

17.1.8 TCPWM0_GRP0_CNT0_DT (continued)

0x4: DIVBY16 :

Divide by 16 (other-than-PWM_DT mode)

0x5: DIVBY32 :

Divide by 32 (other-than-PWM_DT mode)

0x6: DIVBY64 :

Divide by 64 (other-than-PWM_DT mode)

0x7: DIVBY128 :

Divide by 128 (other-than-PWM_DT mode)

17.1.9 TCPWM0_GRP0_CNT0_TR_CMD

Description: Counter trigger command register

Address: 0x42860040

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
4	START	SW start trigger. For HW behavior, see COUNTER_CAPTURE0 field. Default Value: 0
3	STOP	SW stop trigger. For HW behavior, see COUNTER_CAPTURE0 field. Default Value: 0
2	RELOAD	SW reload trigger. For HW behavior, see COUNTER_CAPTURE0 field. Default Value: 0
0	CAPTURE0	SW capture 0 trigger. When written with '1', a capture 0 trigger is generated and the HW sets the field to '0' when the SW trigger has taken effect. It should be noted that the HW operates on the counter frequency. If the counter is disabled through CTRL.ENABLED, the field is immediately set to '0'. Default Value: 0

17.1.10 TCPWM0_GRP0_CNT0_TR_IN_SEL0

Description: Counter input trigger selection register 0

Address: 0x42860044

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [7:5]			CAPTURE0_SEL [4:0]				

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [15:13]			COUNT_SEL [12:8]				

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [23:21]			RELOAD_SEL [20:16]				

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [31:29]			STOP_SEL [28:24]				

Bits	Name	Description
28 : 24	STOP_SEL	Selects one of the 256 input triggers as a stop trigger. In PWM, PWM_DT and PWM_PR modes, this is the kill trigger. In these modes, the kill trigger is used to either temporarily block the PWM outputs (PWM_STOP_ON_KILL is '0') or stop the functionality (PWM_STOP_ON_KILL is '1'). For the PWM and PWM_DT modes, the blocking of the output signals can be asynchronous (STOP_EDGE should be NO_EDGE_DET) in which case the blocking is as long as the trigger is '1' or synchronous (STOP_EDGE should be RISING_EDGE) in which case it extends till the next terminal count event. Default Value: 0
20 : 16	RELOAD_SEL	Selects one of the 256 input triggers as a reload trigger. In QUAD mode, this is the index or revolution pulse. In these modes, it will update the counter with 0x8000 (counter midpoint) or 0x0000 depending on the QUAD_RANGE_MODE. Default Value: 0
12 : 8	COUNT_SEL	Selects one of the 256 input triggers as a count trigger. In QUAD mode, this is the first phase (phi A). Default setting selects input trigger 1, which is always '1'. Note: In the modes: TIMER, CAPTURE, PWM, PWM_DT, and SR, If the counter is externally triggered (COUNT_SEL > 1), an external trigger will be required for each TR_CMD to execute. For example, a write to TR_CMD.START will not start the counter until the trigger selected by COUNT_SEL asserts. The next trigger will increment the counter since the counter is now running. This goes for all TR_CMD fields. Default Value: 1

17.1.10 TCPWM0_GRP0_CNT0_TR_IN_SEL0 (continued)

4 : 0	CAPTURE0_SEL	Selects one of the up to 256 input triggers as a capture0 trigger. Input trigger 0 is always '0' and input trigger 1 is always '1'. If existing, the one-to-one trigger inputs "tr_one_cnt_in" (different to each counter) are selected by setting 2 and above. The settings above are used for the general purpose trigger inputs "tr_all_cnt_in" connected to all counters selected. In the PWM, PWM_DT and PWM_PR modes this trigger is used to switch the values if the compare and period registers with their buffer counterparts. Default Value: 0

17.1.11 TCPWM0_GRP0_CNT0_TR_IN_SEL1

Description: Counter input trigger selection register 1

Address: 0x42860048

Retention: Retained

Bits	Name	Description
9 : 8	START_EDGE	A start event will start the counter; i.e. the counter will become running. Starting does NOT enable the counter. A start event will not initialize the counter whereas the reload event does. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
7 : 6	STOP_EDGE	A stop event, will stop the counter; i.e. it will no longer be running. Stopping will NOT disable the counter. Default Value: 3

17.1.12 TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL (continued)

		0x0: RISING_EDGE : Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
5 : 4	RELOAD_EDGE	A reload event will initialize the counter. When counting up, the counter is initialized to "0". When counting down, the counter is initialized with PERIOD. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
3 : 2	COUNT_EDGE	A counter event will increase or decrease the counter by '1'. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
1 : 0	CAPTURE0_EDGE	A capture 0 event will copy the counter value into the CC0 register. Default Value: 3

17.1.12 TCPWM0_GRP0_CNT0_TR_IN_EDGE_SEL (continued)

0x0: RISING_EDGE :

Rising edge. Any rising edge generates an event.

0x1: FALLING_EDGE :

Falling edge. Any falling edge generates an event.

0x2: ANY_EDGE :

Rising AND falling edge. Any odd amount of edges generates an event.

0x3: NO_EDGE_DET :

No edge detection, use trigger as is.

17.1.13 TCPWM0_GRP0_CNT0_TR_PWM_CTRL

Description: Counter trigger PWM control register

Address: 0x42860050

Retention: Retained

SW Access	RW	RW	Reserved			RW		
HW Access	R	R	Reserved			R		
Name	ENABLED	DBG_-FREEZE_EN	Reserved [29:27]			MODE [26:24]		

Bits	Name	Description
31	ENABLED	Counter enable. '0': counter disabled. '1': counter enabled. Counter static configuration information (e.g. CTRL.MODE, all TR_IN_SEL, TR_IN_EDGE_-SEL, TR_PWM_CTRL and TR_OUT_SEL register fields) should only be modified when the counter is disabled. When a counter is disabled, command and status information associated to the counter is cleared by HW, this includes: - the associated counter triggers in the CMD register are set to '0'. - the counter's interrupt cause fields in counter's INTR register. - the counter's status fields in counter's STATUS register.. - the counter's trigger outputs ("tr_out0" and tr_out1"). - the counter's line outputs ("line_out" and "line_compl_out"). Default Value: 0
30	DBG_FREEZE_EN	Specifies the counter behavior in debug mode. '0': The counter operation continues in debug mode. '1': The counter operation freezes in debug mode. Default Value: 0
26 : 24	MODE	Counter mode. Default Value: 0

17.1.19 TCPWM0_GRP1_CNT0_CTRL (continued)

0x0: TIMER :

Timer mode

0x1: Reserved1 :

N/A

0x2: CAPTURE :

Capture mode

0x3: QUAD :

Quadrature mode
Different encoding modes can be selected by QUAD_ENCODING_MODE including up/down count functionality.
Different counter range, reload value and capture behavior can be selected by QUAD_RANGE_-MODE (overloaded field UP_DOWN_MODE).

0x4: PWM :

Pulse width modulation (PWM) mode

0x5: PWM_DT :

PWM with deadtime insertion mode

0x6: PWM_PR :

Pseudo random pulse width modulation

0x7: SR :

Shift register mode.

21 : 20	QUAD_ENCODING_-MODE	In QUAD mode this field selects the quadrature encoding mode (X1/X2/X4) or the Up / Down rotary counting mode. In PWM, PWM_DT and PWM_PR modes, these two bits can be used to invert "dt_line_out" and "dt_line_compl_out". Inversion is the last step in generation of "dt_line_out" and "dt_line_compl_out"; i.e. a disabled output line "dt_line_out" has the value QUAD_ENCODING_MODE[0] and a disabled output line "dt_line_compl_out" has the value QUAD_ENCODING_MODE[1]. Default Value: 0

0x0: X1 :

X1 encoding (QUAD mode)
This encoding is identical with an up / down counting functionality of the following way: Rising edges of input phiA increment or decrement the counter depending on the state of input phiB (direction input).

0x1: X2 :

X2 encoding (QUAD mode)

0x2: X4 :

X4 encoding (QUAD mode)

17.1.19 TCPWM0_GRP1_CNT0_CTRL (continued)

		0x3: UP_DOWN : Up / Down rotary counting mode. Input phiA increments the counter, input phiB decrements the counter. The trigger edge detection settings apply. **0x1: INV_OUT :** When bit 0 is '1', QUADRATURE_ENCODING_MODE[0] inverts "dt_line_out" (PWM/PWM_DT modes) **0x2: INV_COMPL_OUT :** When bit 1 is '1', QUADRATURE_ENCODING_MODE[1] inverts "dt_line_compl_out" (PWM/PWM_DT modes)
18	ONE_SHOT	When '0', counter runs continuous. When '1', counter is turned off by hardware when a terminal count event is generated. Default Value: 0
17 : 16	UP_DOWN_MODE	Determines counter direction. In QUAD mode this field acts as QUAD_RANGE_MODE field selecting between different counter range, reload value and compare / capture behavior. Default Value: 0 **0x0: COUNT_UP :** Count up (to PERIOD). An overflow event is generated when the counter changes from a state in which COUNTER equals PERIOD. A terminal count event is generated when the counter changes from a state in which COUNTER equals PERIOD. **0x1: COUNT_DOWN :** Count down (to "0"). An underflow event is generated when the counter changes from a state in which COUNTER equals "0". A terminal count event is generated when the counter changes from a state in which COUNTER equals "0". **0x2: COUNT_UPDN1 :** Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter changes from a state in which COUNTER equals PERIOD. An underflow event is generated when the counter changes from a state in which COUNTER equals "0". A terminal count event is generated when the counter changes from a state in which COUNTER equals "0". **0x3: COUNT_UPDN2 :** Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter changes from a state in which COUNTER equals PERIOD. An underflow event is generated when the counter changes from a state in which COUNTER equals "0". A terminal count event is generated when the counter changes from a state in which COUNTER equals "0" AND when the counter changes from a state in which COUNTER equals PERIOD (this counter direction can be used for PWM functionality with asymmetrical updates).

17.1.19 TCPWM0_GRP1_CNT0_CTRL (continued)

0x0: QUAD_RANGE0 :

In QUAD mode this setting selects the QUAD_RANGE0 mode with the following behavior:
- COUNTER range is between 0x0000 and 0xFFFF / 0xFFFFFFFF (for GRP_CNT_WIDTH = 16 / 32)
- on reload / index event:
 - CC0 is copied to CC0_BUFF
 - COUNTER is copied to CC0
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - tc and cc0_match events are generated
- when COUNTER is 0x0000 or 0xFFFF / 0xFFFFFFFF:
 - CC0 is copied to CC0_BUFF
 - COUNTER (0x0000 or 0xFFFF / 0xFFFFFFFF) is copied to CC0
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - cc0_match event is generated

0x1: QUAD_RANGE0_CMP :

In QUAD mode this setting selects the QUAD_RANGE0_CMP mode with the following behavior:
- COUNTER range is between 0x0000 and 0xFFFF / 0xFFFFFFFF (for GRP_CNT_WIDTH = 16 / 32)
- the capture0 event acts as 2nd reload / index event
- on reload / index event:
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - when 'capture on index' is selected (AUTO_RELOAD_PERIOD=0):
 - tc event is generated
 - PERIOD is copied to PERIOD_BUFF
 - COUNTER is copied to PERIOD
- when COUNTER is 0x0000 or 0xFFFF / 0xFFFFFFFF:
 - COUNTER is set to midpoint (0x8000 / 0x80000000)
 - when 'capture on wrap-around' is selected (AUTO_RELOAD_PERIOD=1):
 - tc event is generated
 - PERIOD is copied to PERIOD_BUFF
 - COUNTER (0x0000 or 0xFFFF / 0xFFFFFFFF) is copied to PERIOD
- 1 or 2 compare functions (depending on CC1_PRESENT) available

This mode is to a certain extend backward compatible with previous TCPWM quadrature behavior but allows a compare function during quadrature decoding using the CC0/CC_BUFF registers and the cc0_match event. Because of that the PERIOD/PERIOD_BUFF registers are used instead of CC0/CC_BUFF registers to capture COUNTER at reload / index event or wrap-around.

17.1.19 TCPWM0_GRP1_CNT0_CTRL (continued)

0x2: QUAD_RANGE1_CAPT :

In QUAD mode this setting selects the QUAD_RANGE1_CAPT mode with the following behavior:
- COUNTER range is between 0x0000 and PERIOD
- on reload / index event:
 - COUNTER is set to 0x0000
 - tc event is generated
- when COUNTER is 0x0000 and decrementing:
 - COUNTER is set to PERIOD
 - tc event is generated
- when COUNTER equals PERIOD and is incrementing:
 - COUNTER is set to 0x0000
 - tc event is generated
- 1 or 2 capture functions (depending on CC1_PRESENT) available
- on capture0 / capture1 event:
 - CC0 / CC1 is copied to CC0_BUFF / CC1_BUFF
 - COUNTER value is copied to CC0

It allows that the COUNTER register reflects the current angle position of the rotary encoder, i.e. no MOD or SUB calculations need to be done in SW on the COUNTER value to get the current angle position. This allows a DMA copy of the angle position from the COUNTER register. However, a disadvantage of this mode is that fast sequences of tc interrupts can occur (when encoder moves back and forth around start position). It is recommended to not use the tc interrupt in this mode.

0x3: QUAD_RANGE1_CMP :

In QUAD mode this setting selects the QUAD_RANGE1_CMP mode.
The behavior is the same as for QUAD_RANGE1_CAPT mode described above with the only difference that 1 or 2 compare functions (depending on CC1_PRESENT) are available instead of 1 or 2 capture functions.

13 : 12 PWM_DISABLE_MODE

Specifies the behavior of the PWM outputs "line_out" and "line_compl_out" while the TCPWM counter is disabled (CTL.ENABLED='0') or stopped.
Note: The output signal of this selection can be further modified by the immediate kill logic and line_out polarity settings (CTRL.QUAD_ENCODING_MODE).
Default Value: 0

0x0: Z :

When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are NOT driven by the TCPWM. Instead the port default level configuration applies, e.g. "Z" (high impedance).
Note: This is realized by driving the TCPWM output "line_out_en" to 0.
When the counter is stopped upon a stop event the PWM outputs are deactivated (to the polarity defined by CTL.QUAD_ENCODING_MODE).

0x1: RETAIN :

When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are driven by the TCPWM.
When the counter is disabled or stopped upon a stop event the PWM outputs are retained (keep their previous levels).
While the counter is disabled or stopped the PWM outputs can be changed via LINE_SEL (when parameter GRP_SMC_PRESENT = 1).

0x2: L :

When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are driven by the TCPWM.
When the counter is disabled or stopped upon a stop event the PWM output "line_out" is driven as a fixed '0' and the PWM output "line_compl_out" is driven as a fixed '1'.

17.1.19 TCPWM0_GRP1_CNT0_CTRL (continued)

		0x3: H : When the counter is disabled the PWM outputs "line_out" and "line_compl_out" are driven by the TCPWM. When the counter is disabled or stopped upon a stop event the PWM output "line_out" is driven as a fixed '1' and the PWM output "line_compl_out" is driven as a fixed '0'.
10	PWM_SYNC_KILL	Specifies asynchronous/synchronous kill behavior: '1': synchronous kill mode: the kill event disables the "dt_line_out" and "dt_line_compl_out" signals till the next terminal count event (synchronous kill). In synchronous kill mode, STOP_EDGE should be RISING_EDGE. '0': asynchronous kill mode: the kill event only disables the "dt_line_out" and "dt_line_compl_out" signals when present. In asynchronous kill mode, STOP_EDGE should be NO_EDGE_DET. This field has a function in PWM and PWM_DT modes only. This field is only used when PWM_STOP_ON_KILL is '0'. Default Value: 0
9	PWM_STOP_ON_KILL	Specifies whether the counter stops on a kill events: '0': kill event does NOT stop counter. '1': kill event stops counter. This field has a function in PWM, PWM_DT and PWM_PR modes only. Default Value: 0
8	PWM_IMM_KILL	Specifies whether the kill event immediately deactivates the "dt_line_out" and "dt_line_compl_out" signals or with the next module clock ("active count" pre-scaled "clk_counter"). '0': synchronous kill activation. Deactivates the "dt_line_out" and "dt_line_compl_out" signals with the next module clock ("active count" pre-scaled "clk_counter"). '1': immediate kill activation. Immediately deactivates the "dt_line_out" and "dt_line_compl_out" signals. This field has a function in PWM, PWM_DT and PWM_PR modes only. Default Value: 0
7	CC1_MATCH_DOWN_EN	Enables / disables the compare match 1 event generation (COUNTER equals CC0 register) when counting down (STATUS.DOWN = 1) in CNT_UPDN1/2 mode. '0': compare match 1 event generation disabled when counting down '1': compare match 1 event generation enabled when counting down This field has a function in PWM and PWM_DT modes only. Default Value: 1
6	CC1_MATCH_UP_EN	Enables / disables the compare match 1 event generation (COUNTER equals CC0 register) when counting up (STATUS.DOWN = 0) in CNT_UPDN1/2 mode. '0': compare match 1 event generation disabled when counting up '1': compare match 1 event generation enabled when counting up This field has a function in PWM and PWM_DT modes only. Default Value: 1
5	CC0_MATCH_DOWN_EN	Enables / disables the compare match 0 event generation (COUNTER equals CC0 register) when counting down (STATUS.DOWN = 1) in CNT_UPDN1/2 mode. '0': compare match 0 event generation disabled when counting down '1': compare match 0 event generation enabled when counting down This field has a function in PWM and PWM_DT modes only. Default Value: 1
4	CC0_MATCH_UP_EN	Enables / disables the compare match 0 event generation (COUNTER equals CC0 register) when counting up (STATUS.DOWN = 0) in CNT_UPDN1/2 mode. '0': compare match 0 event generation disabled when counting up '1': compare match 0 event generation enabled when counting up This field has a function in PWM and PWM_DT modes only. Default Value: 1

17.1.19 TCPWM0_GRP1_CNT0_CTRL (continued)

2	AUTO_RELOAD_PERIOD	Specifies switching of the PERIOD and buffered PERIOD values. This field has a function in PWM and PWM_DT modes. '0': never switch. '1': switch on a terminal count event with and actively pending switch event. In QUAD mode, QUAD_RANGE0_CMP range mode this field is used to select the index / wrap-around capture function. '0': Captures on index (reload) event. The counter value is copied to the PERIOD register on an index (reload) event. '1': Captures when COUNTER equals 0 or 0xffff. The counter value is copied to the PERIOD register when COUNTER equals 0 or 0xffff. Default Value: 0
1	AUTO_RELOAD_CC1	Specifies switching of the CC1 and buffered CC1 values. This field has a function in TIMER, QUAD (QUAD_RANGE0_CMP, QUAD_RANGE1_CMP range modes), SR, PWM, PWM_DT and PWM_PR modes. Timer, QUAD, SR modes: '0': never switch. '1': switch on a compare match 1 event. PWM, PWM_DT, PWM_PR modes: '0: never switch. '1': switch on a terminal count event with an actively pending switch event. Default Value: 0
0	AUTO_RELOAD_CC0	Specifies switching of the CC0 and buffered CC0 values. This field has a function in TIMER, QUAD (QUAD_RANGE0_CMP, QUAD_RANGE1_CMP range modes), SR, PWM, PWM_DT and PWM_PR modes. Timer, QUAD, SR modes: '0': never switch. '1': switch on a compare match 0 event. PWM, PWM_DT, PWM_PR modes: '0: never switch. '1': switch on a terminal count event with an actively pending switch event. Default Value: 0

17.1.20 TCPWM0_GRP1_CNT0_STATUS

Description: Counter status register

Address: 0x42868004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	R	R	R	Reserved			R
HW Access	RW	RW	RW	RW	Reserved			RW
Name	TR_STOP	TR_RE-LOAD	TR_COUNT	TR_CAP-TURE0	Reserved [3:1]			DOWN

Bits	15	14	13	12	11	10	9	8
SW Access	R	Reserved			R	R	R	R
HW Access	RW	Reserved			RW	RW	RW	RW
Name	RUNNING	Reserved [14:12]			LINE_COM-PL_OUT	LINE_OUT	TR_CAP-TURE1	TR_START

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	DT_CNT_L [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	DT_CNT_H [31:24]							

Bits	Name	Description
31 : 24	DT_CNT_H	High byte of 16-bit dead time counter. In PWM_DT mode, this counter is used for dead time insertion. In all other modes, this field has no effect. Note: This field only exists when parameter GRP_AMC_PRESENT for advanced motor control is set to 1. Otherwise the dead time is only 8bit wide and the only the field DT_CNT_L is used as dead time counter. Default Value: 0
23 : 16	DT_CNT_L	Generic 8-bit counter field. In PWM_DT mode, this counter is used for dead time insertion (8bit dead time counter or low byte of 16-bit dead time counter). In all other modes, this counter is used for pre-scaling the selected counter clock. PWM_DT mode can NOT use prescaled clock functionality. Default Value: 0
15	RUNNING	When '0', the counter is NOT running. When '1', the counter is running. This field is used to indicate that the counter is running after a start/reload event and that the counter is stopped after a stop event. When a running counter operation is paused in debug state (see CTRL.DBG_PAUSE) then the RUNNING bit is still '1'. Default Value: 0
11	LINE_COMPL_OUT	Indicates the actual level of the complementary PWM line output signal. Default Value: 0
10	LINE_OUT	Indicates the actual level of the PWM line output signal. Default Value: 0

17.1.20 TCPWM0_GRP1_CNT0_STATUS (continued)

9	TR_CAPTURE1	Indicates the actual level of the selected capture 1 trigger. Default Value: 0
8	TR_START	Indicates the actual level of the selected start trigger. Default Value: 0
7	TR_STOP	Indicates the actual level of the selected stop trigger. Default Value: 0
6	TR_RELOAD	Indicates the actual level of the selected reload trigger. Default Value: 0
5	TR_COUNT	Indicates the actual level of the selected count trigger. Default Value: 1
4	TR_CAPTURE0	Indicates the actual level of the selected capture 0 trigger. Default Value: 0
0	DOWN	When '0', counter is counting up. When '1', counter is counting down. In QUAD mode, this field indicates the direction of the latest counter change: '0' when last incremented and '1' when last decremented. Default Value: 0

17.1.21 TCPWM0_GRP1_CNT0_COUNTER

Description: Counter count register

Address: 0x42868008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	COUNTER [7:0]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	PERIOD	Additional buffer for counter PERIOD register. In PWM_PR mode PEROD_BUFF defines the LFSR polynomial. Each bit represents a tap of the shift register which can be feed back to the MSB via an XOR tree. Examples for GRP_CNT_WIDTH = 16: - Maximum length 16bit LFSR - polynomial x^16 + x^14 + x^13 + x^11 + 1 - taps 0,2,3,5 -> PERIOD = 0x002d - period is 2^16-1 = 65535 cycles - Maximum length 8bit LFSR: - polynomial x^8 + x^6 + x^5 + x^4 + 1 - taps 8,10,11,12 (realized in 8 MSBs of 16bit LFSR) - period is 2^8-1 = 255 cycles In SR mode PERIOD_BUFF defines which tap of the shift register generates the PWM output signals. For a delay of n cycles (from capture event to PWM output) the bit CNT_WIDTH-n should be set to '1'. For a shift register function only one tap should be use, i.e. a one-hot value must be written to PERIOD_BUFF. If multiple bits in PERIOD_BUFF are set then the taps are XOR combined. Default Value: 65535

17.1.28 TCPWM0_GRP1_CNT0_DT

Description: Counter PWM dead time register

Address: 0x42868030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DT_LINE_OUT_L [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	DT_LINE_OUT_H [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	DT_LINE_COMPL_OUT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	DT_LINE_COMPL_OUT [31:24]							

Bits	Name	Description
31 : 16	DT_LINE_COMPL_OUT	In PWM_DT mode, this field is used to determine the dead time before activating the complementary PWM line output signal "line_compl_out": amount of dead time cycles in the counter clock domain. In all other modes, this field has no effect. Note: This field only exists when parameter GRP_AMC_PRESENT for advanced motor control is set to 1. Otherwise the dead time is only 8 bit wide and the same dead time specified by field DT_LINE_OUT_L is used before activating "line_out" and "line_compl_out". Default Value: 0
15 : 8	DT_LINE_OUT_H	In PWM_DT mode, this field is used to determine the high byte of the dead time before activating the PWM line output signal "line_out": amount of dead time cycles in the counter clock domain. In all other modes, this field has no effect. Note: This field only exists when parameter GRP_AMC_PRESENT for advanced motor control is set to 1. Otherwise the dead time is only 8 bit wide and the same dead time specified by field DT_LINE_OUT_L is used before activating "line_out" and "line_compl_out". Default Value: 0
7 : 0	DT_LINE_OUT_L	In PWM_DT mode, this field is used to determine the low byte of the dead time before activating the PWM line output signal "line_out": amount of dead time cycles in the counter clock domain. In all other modes, the lower 3 bits of this field determine pre-scaling of the selected counter clock. Note: This field determines the low byte of the 16-bit dead time before activating "line_out" when parameter GRP_AMC_PRESENT for advanced motor control is set to 1. Otherwise the dead time is only 8 bit wide and the same dead time specified by this DT_LINE_OUT_L field is used before activating "line_out" and "line_compl_out". Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
11 : 10	CAPTURE1_EDGE	A capture 1 event will copy the counter value into the CC1 register. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
9 : 8	START_EDGE	A start event will start the counter; i.e. the counter will become running. Starting does NOT enable the counter. A start event will not initialize the counter whereas the reload event does. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event.

17.1.31 TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL (continued)

		0x1: FALLING_EDGE : Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
7 : 6	STOP_EDGE	A stop event, will stop the counter; i.e. it will no longer be running. Stopping will NOT disable the counter. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
5 : 4	RELOAD_EDGE	A reload event will initialize the counter. When counting up, the counter is initialized to "0". When counting down, the counter is initialized with PERIOD. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
3 : 2	COUNT_EDGE	A counter event will increase or decrease the counter by '1'. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event.

17.1.31 TCPWM0_GRP1_CNT0_TR_IN_EDGE_SEL (continued)

		0x1: FALLING_EDGE : Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
1 : 0	CAPTURE0_EDGE	A capture 0 event will copy the counter value into the CC0 register. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: ANY_EDGE :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.

17.1.32 TCPWM0_GRP1_CNT0_TR_PWM_CTRL

Description: Counter trigger PWM control register

Address: 0x42868050

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW		RW		RW	
HW Access	R		R		R		R	
Name	CC1_MATCH_MODE [7:6]		UNDERFLOW_MODE [5:4]		OVERFLOW_MODE [3:2]		CC0_MATCH_MODE [1:0]	

Bits	15	14	13	12	11	10	9	8

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 6	CC1_MATCH_MODE	Determines the effect of a compare match 1 event (COUNTER equals CC1 register) on the "line_out" output signals. Default Value: 3 **0x0: SET :** Set to '1' **0x1: CLEAR :** Set to '0' **0x2: INVERT :** Invert **0x3: NO_CHANGE :** No Change
5 : 4	UNDERFLOW_MODE	Determines the effect of a counter underflow event (COUNTER reaches "0") on the "line_out" output signals. Default Value: 3

17.1.32 TCPWM0_GRP1_CNT0_TR_PWM_CTRL (continued)

		0x0: SET : Set to '1' **0x1: CLEAR :** Set to '0' **0x2: INVERT :** Invert **0x3: NO_CHANGE :** No Change
3 : 2	OVERFLOW_MODE	Determines the effect of a counter overflow event (COUNTER reaches PERIOD) on the "line_out" output signals. Default Value: 3 **0x0: SET :** Set to '1' **0x1: CLEAR :** Set to '0' **0x2: INVERT :** Invert **0x3: NO_CHANGE :** No Change
1 : 0	CC0_MATCH_MODE	Determines the effect of a compare match 0 event (COUNTER equals CC0 register) on the "line_out" output signals. Note that INVERT is especially useful for center aligned pulse width modulation. To generate a duty cycle of 0%, the counter CC0 register should be set to "0". For a 100% duty cycle, the counter CC0 register should be set to larger than the counter PERIOD register. Default Value: 3 **0x0: SET :** Set to '1' **0x1: CLEAR :** Set to '0' **0x2: INVERT :** Invert **0x3: NO_CHANGE :** No Change

17.1.33 TCPWM0_GRP1_CNT0_INTR

Description: Interrupt request register

Address: 0x42868070

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW1C	RW1C	RW1C
HW Access	Reserved					RW1S	RW1S	RW1S
Name	Reserved [7:3]					CC1_-MATCH	CC0_-MATCH	TC

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CC1_MATCH	Counter matches CC1 register event. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
1	CC0_MATCH	Counter matches CC0 register event. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
0	TC	Terminal count event. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0

17.1.34 TCPWM0_GRP1_CNT0_INTR_SET

Description: Interrupt set request register

Address: 0x42868074

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW1S	RW1S	RW1S
HW Access	Reserved					A	A	A
Name	Reserved [7:3]					CC1_-MATCH	CC0_-MATCH	TC

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CC1_MATCH	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0
1	CC0_MATCH	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0
0	TC	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0

17.1.35 TCPWM0_GRP1_CNT0_INTR_MASK

Description: Interrupt mask register

Address: 0x42868078

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					R	R	R
Name	Reserved [7:3]					CC1_-MATCH	CC0_-MATCH	TC

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CC1_MATCH	Mask bit for corresponding bit in interrupt request register. Default Value: 0
1	CC0_MATCH	Mask bit for corresponding bit in interrupt request register. Default Value: 0
0	TC	Mask bit for corresponding bit in interrupt request register. Default Value: 0

17.1.36 TCPWM0_GRP1_CNT0_INTR_MASKED

Description: Interrupt masked request register

Address: 0x4286807C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R	R	R
HW Access	Reserved					W	W	W
Name	Reserved [7:3]					CC1_-MATCH	CC0_-MATCH	TC

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	CC1_MATCH	Logical and of corresponding request and mask bits. Default Value: 0
1	CC0_MATCH	Logical and of corresponding request and mask bits. Default Value: 0
0	TC	Logical and of corresponding request and mask bits. Default Value: 0

18 Serial Communication Block (SCB) registers

This section discusses the SCB registers. It lists all the registers in mapping tables, in address order.

18.1 Register details

Register name	Address	Description
SCB0_CTRL	0x42990000	Generic control
SCB0_STATUS	0x42990004	Generic status
SCB0_CMD_RESP_CTRL	0x42990008	Command/response control
SCB0_CMD_RESP_STATUS	0x4299000C	Command/response status
SCB0_SPI_CTRL	0x42990020	SPI control
SCB0_SPI_STATUS	0x42990024	SPI status
SCB0_SPI_TX_CTRL	0x42990028	SPI transmitter control
SCB0_SPI_RX_CTRL	0x4299002C	SPI receiver control
SCB0_I2C_CTRL	0x42990060	I2C control
SCB0_I2C_STATUS	0x42990064	I2C status
SCB0_I2C_M_CMD	0x42990068	I2C master command
SCB0_I2C_S_CMD	0x4299006C	I2C slave command
SCB0_I2C_CFG	0x42990070	I2C configuration
SCB0_I2C_STRETCH_CTRL	0x42990074	I2C stretch control
SCB0_I2C_STRETCH_STATUS	0x42990078	I2C stretch status
SCB0_TX_CTRL	0x42990200	Transmitter control
SCB0_TX_FIFO_CTRL	0x42990204	Transmitter FIFO control
SCB0_TX_FIFO_STATUS	0x42990208	Transmitter FIFO status
SCB0_TX_FIFO_WR	0x42990240	Transmitter FIFO write
SCB0_RX_CTRL	0x42990300	Receiver control
SCB0_RX_FIFO_CTRL	0x42990304	Receiver FIFO control
SCB0_RX_FIFO_STATUS	0x42990308	Receiver FIFO status
SCB0_RX_MATCH	0x42990310	Slave address and mask
SCB0_RX_FIFO_RD	0x42990340	Receiver FIFO read
SCB0_RX_FIFO_RD_SILENT	0x42990344	Receiver FIFO read silent
SCB0_EZ_DATA0	0x42990400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB0_EZ_DATA0 to SCB0_EZ_DATA255).
SCB0_INTR_CAUSE	0x42990E00	Active clocked interrupt signal
SCB0_INTR_I2C_EC	0x42990E80	Externally clocked I2C interrupt request
SCB0_INTR_I2C_EC_MASK	0x42990E88	Externally clocked I2C interrupt mask
SCB0_INTR_I2C_EC_MASKED	0x42990E8C	Externally clocked I2C interrupt masked
SCB0_INTR_SPI_EC	0x42990EC0	Externally clocked SPI interrupt request
SCB0_INTR_SPI_EC_MASK	0x42990EC8	Externally clocked SPI interrupt mask

Register name	Address	Description
SCB0_INTR_I2C_EC_MASKED	0x42990ECC	Externally clocked SPI interrupt masked
SCB0_INTR_M	0x42990F00	Master interrupt request
SCB0_INTR_M_SET	0x42990F04	Master interrupt set request
SCB0_INTR_M_MASK	0x42990F08	Master interrupt mask
SCB0_INTR_M_MASKED	0x42990F0C	Master interrupt masked request
SCB0_INTR_S	0x42990F40	Slave interrupt request
SCB0_INTR_S_SET	0x42990F44	Slave interrupt set request
SCB0_INTR_S_MASK	0x42990F48	Slave interrupt mask
SCB0_INTR_S_MASKED	0x42990F4C	Slave interrupt masked request
SCB0_INTR_TX	0x42990F80	Transmitter interrupt request
SCB0_INTR_TX_SET	0x42990F84	Transmitter interrupt set request
SCB0_INTR_TX_MASK	0x42990F88	Transmitter interrupt mask
SCB0_INTR_TX_MASKED	0x42990F8C	Transmitter interrupt masked request
SCB0_INTR_RX	0x42990FC0	Receiver interrupt request
SCB0_INTR_RX_SET	0x42990FC4	Receiver interrupt set request
SCB0_INTR_RX_MASK	0x42990FC8	Receiver interrupt mask
SCB0_INTR_RX_MASKED	0x42990FCC	Receiver interrupt masked request
SCB2_CTRL	0x429A0000	Generic control
SCB2_SPI_CTRL	0x429A0020	SPI control
SCB2_SPI_STATUS	0x429A0024	SPI status
SCB2_SPI_TX_CTRL	0x429A0028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB2_SPI_RX_CTRL	0x429A002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB2_UART_CTRL	0x429A0040	UART control
SCB2_UART_TX_CTRL	0x429A0044	UART transmitter control
SCB2_UART_RX_CTRL	0x429A0048	UART receiver control
SCB2_UART_RX_STATUS	0x429A004C	UART receiver status
SCB2_UART_FLOW_CTRL	0x429A0050	UART flow control
SCB2_I2C_CTRL	0x429A0060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB2_I2C_STATUS	0x429A0064	I2C status
SCB2_I2C_M_CMD	0x429A0068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB2_I2C_S_CMD	0x429A006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB2_I2C_CFG	0x429A0070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB2_I2C_STRETCH_CTRL	0x429A0074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB2_I2C_STRETCH_STATUS	0x429A0078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB2_TX_CTRL	0x429A0200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB2_TX_FIFO_CTRL	0x429A0204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB2_TX_FIFO_STATUS	0x429A0208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB2_TX_FIFO_WR	0x429A0240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB2_RX_CTRL	0x429A0300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB2_RX_FIFO_CTRL	0x429A0304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB2_RX_FIFO_STATUS	0x429A0308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB2_RX_MATCH	0x429A0310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB2_RX_FIFO_RD	0x429A0340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB2_RX_FIFO_RD_SILENT	0x429A0344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB2_EZ_DATA0	0x429A0400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB2_EZ_DATA0 to SCB2_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB2_INTR_CAUSE	0x429A0E00	Active clocked interrupt signal
SCB2_INTR_M	0x429A0F00	Master interrupt request
SCB2_INTR_M_SET	0x429A0F04	Master interrupt set request
SCB2_INTR_M_MASK	0x429A0F08	Master interrupt mask
SCB2_INTR_M_MASKED	0x429A0F0C	Master interrupt masked request
SCB2_INTR_S	0x429A0F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB2_INTR_S_SET	0x429A0F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB2_INTR_S_MASK	0x429A0F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB2_INTR_S_MASKED	0x429A0F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB2_INTR_TX	0x429A0F80	Transmitter interrupt request
SCB2_INTR_TX_SET	0x429A0F84	Transmitter interrupt set request
SCB2_INTR_TX_MASK	0x429A0F88	Transmitter interrupt mask

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB2_INTR_TX_SET	0x429A0F8C	Transmitter interrupt masked request
SCB2_INTR_RX	0x429A0FC0	Receiver interrupt request
SCB2_INTR_RX_SET	0x429A0FC4	Receiver interrupt set request
SCB2_INTR_RX_MASK	0x429A0FC8	Receiver interrupt mask
SCB2_INTR_RX_MASKED	0x429A0FCC	Receiver interrupt masked request
SCB3_CTRL	0x429B0000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB3_SPI_CTRL	0x429B0020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB3_SPI_STATUS	0x429B0024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB3_SPI_TX_CTRL	0x429B0028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB3_SPI_RX_CTRL	0x429B002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB3_UART_CTRL	0x429B0040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB3_UART_TX_CTRL	0x429B0044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB3_UART_RX_CTRL	0x429B0048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB3_UART_RX_STATUS	0x429B004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB3_UART_FLOW_CTRL	0x429B0050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB3_I2C_CTRL	0x429B0060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB3_I2C_STATUS	0x429B0064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB3_I2C_M_CMD	0x429B0068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB3_I2C_S_CMD	0x429B006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB3_I2C_CFG	0x429B0070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB3_I2C_STRETCH_CTRL	0x429B0074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB3_I2C_STRETCH_STATUS	0x429B0078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB3_TX_CTRL	0x429B0200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB3_TX_FIFO_CTRL	0x429B0204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB3_TX_FIFO_STATUS	0x429B0208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.

Register name	Address	Description
SCB3_TX_FIFO_WR	0x429B0240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB3_RX_CTRL	0x429B0300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB3_RX_FIFO_CTRL	0x429B0304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB3_RX_FIFO_STATUS	0x429B0308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB3_RX_MATCH	0x429B0310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB3_RX_FIFO_RD	0x429B0340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB3_RX_FIFO_RD_SILENT	0x429B0344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB3_EZ_DATA0	0x429B0400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB3_EZ_DATA0 to SCB3_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB3_INTR_CAUSE	0x429B0E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB3_INTR_M	0x429B0F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB3_INTR_M_SET	0x429B0F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB3_INTR_M_MASK	0x429B0F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB3_INTR_M_MASKED	0x429B0F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB3_INTR_S	0x429B0F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB3_INTR_S_SET	0x429B0F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB3_INTR_S_MASK	0x429B0F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB3_INTR_S_MASKED	0x429B0F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB3_INTR_TX	0x429B0F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB3_INTR_TX_SET	0x429B0F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB3_INTR_TX_MASK	0x429B0F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.

Register name	Address	Description
SCB3_INTR_TX_MASKED	0x429B0F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB3_INTR_RX	0x429B0FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB3_INTR_RX_SET	0x429B0FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB3_INTR_RX_MASK	0x429B0FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB3_INTR_RX_MASKED	0x429B0FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB4_CTRL	0x429C0000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB4_SPI_CTRL	0x429C0020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB4_SPI_STATUS	0x429C0024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB4_SPI_TX_CTRL	0x429C0028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB4_SPI_RX_CTRL	0x429C002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB4_UART_CTRL	0x429C0040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB4_UART_TX_CTRL	0x429C0044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB4_UART_RX_CTRL	0x429C0048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB4_UART_RX_STATUS	0x429C004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB4_UART_FLOW_CTRL	0x429C0050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB4_I2C_CTRL	0x429C0060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB4_I2C_STATUS	0x429C0064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB4_I2C_M_CMD	0x429C0068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB4_I2C_S_CMD	0x429C006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB4_I2C_CFG	0x429C0070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB4_I2C_STRETCH_CTRL	0x429C0074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB4_I2C_STRETCH_STATUS	0x429C0078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB4_TX_CTRL	0x429C0200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.

Register name	Address	Description
SCB4_TX_FIFO_CTRL	0x429C0204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB4_TX_FIFO_STATUS	0x429C0208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB4_TX_FIFO_WR	0x429C0240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB4_RX_CTRL	0x429C0300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB4_RX_FIFO_CTRL	0x429C0304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB4_RX_FIFO_STATUS	0x429C0308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB4_RX_MATCH	0x429C0310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB4_RX_FIFO_RD	0x429C0340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB4_RX_FIFO_RD_SILENT	0x429C0344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB4_EZ_DATA0	0x429C0400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB4_EZ_DATA0 to SCB4_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB4_INTR_CAUSE	0x429C0E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB4_INTR_M	0x429C0F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB4_INTR_M_SET	0x429C0F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB4_INTR_M_MASK	0x429C0F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB4_INTR_M_MASKED	0x429C0F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB4_INTR_S	0x429C0F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB4_INTR_S_SET	0x429C0F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB4_INTR_S_MASK	0x429C0F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB4_INTR_S_MASKED	0x429C0F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB4_INTR_TX	0x429C0F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.

Register name	Address	Description
SCB4_INTR_TX_SET	0x429C0F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB4_INTR_TX_MASK	0x429C0F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB4_INTR_TX_MASKED	0x429C0F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB4_INTR_RX	0x429C0FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB4_INTR_RX_SET	0x429C0FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB4_INTR_RX_MASK	0x429C0FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB4_INTR_RX_MASKED	0x429C0FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB5_CTRL	0x429D0000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB5_SPI_CTRL	0x429D0020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB5_SPI_STATUS	0x429D0024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB5_SPI_TX_CTRL	0x429D0028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB5_SPI_RX_CTRL	0x429D002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB5_UART_CTRL	0x429D0040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB5_UART_TX_CTRL	0x429D0044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB5_UART_RX_CTRL	0x429D0048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB5_UART_RX_STATUS	0x429D004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB5_UART_FLOW_CTRL	0x429D0050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB5_I2C_CTRL	0x429D0060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB5_I2C_STATUS	0x429D0064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB5_I2C_M_CMD	0x429D0068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB5_I2C_S_CMD	0x429D006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB5_I2C_CFG	0x429D0070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB5_I2C_STRETCH_CTRL	0x429D0074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.

Register name	Address	Description
SCB5_I2C_STRETCH_STATUS	0x429D0078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB5_TX_CTRL	0x429D0200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB5_TX_FIFO_CTRL	0x429D0204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB5_TX_FIFO_STATUS	0x429D0208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB5_TX_FIFO_WR	0x429D0240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB5_RX_CTRL	0x429D0300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB5_RX_FIFO_CTRL	0x429D0304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB5_RX_FIFO_STATUS	0x429D0308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB5_RX_MATCH	0x429D0310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB5_RX_FIFO_RD	0x429D0340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB5_RX_FIFO_RD_SILENT	0x429D0344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB5_EZ_DATA0	0x429D0400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB5_EZ_DATA0 to SCB5_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB5_INTR_CAUSE	0x429D0E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB5_INTR_M	0x429D0F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB5_INTR_M_SET	0x429D0F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB5_INTR_M_MASK	0x429D0F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB5_INTR_M_MASKED	0x429D0F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB5_INTR_S	0x429D0F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB5_INTR_S_SET	0x429D0F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB5_INTR_S_MASK	0x429D0F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.

Register name	Address	Description
SCB5_INTR_S_MASKED	0x429D0F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB5_INTR_TX	0x429D0F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB5_INTR_TX_SET	0x429D0F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB5_INTR_TX_MASK	0x429D0F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB5_INTR_TX_MASKED	0x429D0F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB5_INTR_RX	0x429D0FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB5_INTR_RX_SET	0x429D0FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB5_INTR_RX_MASK	0x429D0FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB5_INTR_RX_MASKED	0x429D0FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB6_CTRL	0x429E0000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB6_SPI_CTRL	0x429E0020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB6_SPI_STATUS	0x429E0024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB6_SPI_TX_CTRL	0x429E0028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB6_SPI_RX_CTRL	0x429E002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB6_UART_CTRL	0x429E0040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB6_UART_TX_CTRL	0x429E0044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB6_UART_RX_CTRL	0x429E0048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB6_UART_RX_STATUS	0x429E004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB6_UART_FLOW_CTRL	0x429E0050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB6_I2C_CTRL	0x429E0060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB6_I2C_STATUS	0x429E0064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB6_I2C_M_CMD	0x429E0068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB6_I2C_S_CMD	0x429E006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB6_I2C_CFG	0x429E0070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB6_I2C_STRETCH_CTRL	0x429E0074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB6_I2C_STRETCH_STATUS	0x429E0078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB6_TX_CTRL	0x429E0200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB6_TX_FIFO_CTRL	0x429E0204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB6_TX_FIFO_STATUS	0x429E0208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB6_TX_FIFO_WR	0x429E0240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB6_RX_CTRL	0x429E0300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB6_RX_FIFO_CTRL	0x429E0304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB6_RX_FIFO_STATUS	0x429E0308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB6_RX_MATCH	0x429E0310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB6_RX_FIFO_RD	0x429E0340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB6_RX_FIFO_RD_SILENT	0x429E0344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB6_EZ_DATA0	0x429E0400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB6_EZ_DATA0 to SCB6_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB6_INTR_CAUSE	0x429E0E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB6_INTR_M	0x429E0F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB6_INTR_M_SET	0x429E0F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB6_INTR_M_MASK	0x429E0F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB6_INTR_M_MASKED	0x429E0F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB6_INTR_S	0x429E0F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB6_INTR_S_SET	0x429E0F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB6_INTR_S_MASK	0x429E0F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB6_INTR_S_MASKED	0x429E0F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB6_INTR_TX	0x429E0F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB6_INTR_TX_SET	0x429E0F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB6_INTR_TX_MASK	0x429E0F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB6_INTR_TX_MASKED	0x429E0F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB6_INTR_RX	0x429E0FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB6_INTR_RX_SET	0x429E0FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB6_INTR_RX_MASK	0x429E0FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB6_INTR_RX_MASKED	0x429E0FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB7_CTRL	0x429F0000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB7_SPI_CTRL	0x429F0020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB7_SPI_STATUS	0x429F0024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB7_SPI_TX_CTRL	0x429F0028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB7_SPI_RX_CTRL	0x429F002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB7_UART_CTRL	0x429F0040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB7_UART_TX_CTRL	0x429F0044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB7_UART_RX_CTRL	0x429F0048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB7_UART_RX_STATUS	0x429F004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB7_UART_FLOW_CTRL	0x429F0050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB7_I2C_CTRL	0x429F0060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB7_I2C_STATUS	0x429F0064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.

Register name	Address	Description
SCB7_I2C_M_CMD	0x429F0068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB7_I2C_S_CMD	0x429F006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB7_I2C_CFG	0x429F0070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB7_I2C_STRETCH_CTRL	0x429F0074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB7_I2C_STRETCH_STATUS	0x429F0078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB7_TX_CTRL	0x429F0200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB7_TX_FIFO_CTRL	0x429F0204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB7_TX_FIFO_STATUS	0x429F0208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB7_TX_FIFO_WR	0x429F0240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB7_RX_CTRL	0x429F0300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB7_RX_FIFO_CTRL	0x429F0304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB7_RX_FIFO_STATUS	0x429F0308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB7_RX_MATCH	0x429F0310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB7_RX_FIFO_RD	0x429F0340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB7_RX_FIFO_RD_SILENT	0x429F0344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB7_EZ_DATA0	0x429F0400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB7_EZ_DATA0 to SCB7_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB7_INTR_CAUSE	0x429F0E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB7_INTR_M	0x429F0F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB7_INTR_M_SET	0x429F0F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB7_INTR_M_MASK	0x429F0F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.

Register name	Address	Description
SCB7_INTR_M_MASKED	0x429F0F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB7_INTR_S	0x429F0F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB7_INTR_S_SET	0x429F0F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB7_INTR_S_MASK	0x429F0F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB7_INTR_S_MASKED	0x429F0F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB7_INTR_TX	0x429F0F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB7_INTR_TX_SET	0x429F0F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB7_INTR_TX_MASK	0x429F0F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB7_INTR_TX_MASKED	0x429F0F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB7_INTR_RX	0x429F0FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB7_INTR_RX_SET	0x429F0FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB7_INTR_RX_MASK	0x429F0FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB7_INTR_RX_MASKED	0x429F0FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB8_CTRL	0x42A00000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB8_SPI_CTRL	0x42A00020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB8_SPI_STATUS	0x42A00024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB8_SPI_TX_CTRL	0x42A00028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB8_SPI_RX_CTRL	0x42A0002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB8_UART_CTRL	0x42A00040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB8_UART_TX_CTRL	0x42A00044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB8_UART_RX_CTRL	0x42A00048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB8_UART_RX_STATUS	0x42A0004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB8_UART_FLOW_CTRL	0x42A00050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB8_I2C_CTRL	0x42A00060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB8_I2C_STATUS	0x42A00064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB8_I2C_M_CMD	0x42A00068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB8_I2C_S_CMD	0x42A0006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB8_I2C_CFG	0x42A00070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB8_I2C_STRETCH_CTRL	0x42A00074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB8_I2C_STRETCH_STATUS	0x42A00078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB8_TX_CTRL	0x42A00200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB8_TX_FIFO_CTRL	0x42A00204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB8_TX_FIFO_STATUS	0x42A00208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB8_TX_FIFO_WR	0x42A00240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB8_RX_CTRL	0x42A00300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB8_RX_FIFO_CTRL	0x42A00304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB8_RX_FIFO_STATUS	0x42A00308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB8_RX_MATCH	0x42A00310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB8_RX_FIFO_RD	0x42A00340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB8_RX_FIFO_RD_SILENT	0x42A00344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB8_EZ_DATA0	0x42A00400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB8_EZ_DATA0 to SCB8_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB8_INTR_CAUSE	0x42A00E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB8_INTR_M	0x42A00F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB8_INTR_M_SET	0x42A00F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB8_INTR_M_MASK	0x42A00F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB8_INTR_M_MASKED	0x42A00F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB8_INTR_S	0x42A00F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB8_INTR_S_SET	0x42A00F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB8_INTR_S_MASK	0x42A00F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB8_INTR_S_MASKED	0x42A00F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB8_INTR_TX	0x42A00F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB8_INTR_TX_SET	0x42A00F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB8_INTR_TX_MASK	0x42A00F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB8_INTR_TX_MASKED	0x42A00F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB8_INTR_RX	0x42A00FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB8_INTR_RX_SET	0x42A00FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB8_INTR_RX_MASK	0x42A00FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB8_INTR_RX_MASKED	0x42A00FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB9_CTRL	0x42A10000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB9_SPI_CTRL	0x42A10020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB9_SPI_STATUS	0x42A10024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB9_SPI_TX_CTRL	0x42A10028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB9_SPI_RX_CTRL	0x42A1002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB9_UART_CTRL	0x42A10040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB9_UART_TX_CTRL	0x42A10044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB9_UART_RX_CTRL	0x42A10048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB9_UART_RX_STATUS	0x42A1004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB9_UART_FLOW_CTRL	0x42A10050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB9_I2C_CTRL	0x42A10060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB9_I2C_STATUS	0x42A10064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB9_I2C_M_CMD	0x42A10068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB9_I2C_S_CMD	0x42A1006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB9_I2C_CFG	0x42A10070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB9_I2C_STRETCH_CTRL	0x42A10074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB9_I2C_STRETCH_STATUS	0x42A10078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB9_TX_CTRL	0x42A10200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB9_TX_FIFO_CTRL	0x42A10204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB9_TX_FIFO_STATUS	0x42A10208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB9_TX_FIFO_WR	0x42A10240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB9_RX_CTRL	0x42A10300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB9_RX_FIFO_CTRL	0x42A10304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB9_RX_FIFO_STATUS	0x42A10308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB9_RX_MATCH	0x42A10310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB9_RX_FIFO_RD	0x42A10340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB9_RX_FIFO_RD_SILENT	0x42A10344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB9_EZ_DATA0	0x42A10400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB9_EZ_DATA0 to SCB9_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.

Register name	Address	Description
SCB9_INTR_CAUSE	0x42A10E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB9_INTR_M	0x42A10F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB9_INTR_M_SET	0x42A10F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB9_INTR_M_MASK	0x42A10F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB9_INTR_M_MASKED	0x42A10F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB9_INTR_S	0x42A10F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB9_INTR_S_SET	0x42A10F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB9_INTR_S_MASK	0x42A10F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB9_INTR_S_MASKED	0x42A10F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB9_INTR_TX	0x42A10F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB9_INTR_TX_SET	0x42A10F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB9_INTR_TX_MASK	0x42A10F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB9_INTR_TX_MASKED	0x42A10F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB9_INTR_RX	0x42A10FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB9_INTR_RX_SET	0x42A10FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB9_INTR_RX_MASK	0x42A10FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB9_INTR_RX_MASKED	0x42A10FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB10_CTRL	0x42A20000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB10_SPI_CTRL	0x42A20020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB10_SPI_STATUS	0x42A20024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB10_SPI_TX_CTRL	0x42A20028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB10_SPI_RX_CTRL	0x42A2002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB10_UART_CTRL	0x42A20040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB10_UART_TX_CTRL	0x42A20044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB10_UART_RX_CTRL	0x42A20048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB10_UART_RX_STATUS	0x42A2004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB10_UART_FLOW_CTRL	0x42A20050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB10_I2C_CTRL	0x42A20060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB10_I2C_STATUS	0x42A20064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB10_I2C_M_CMD	0x42A20068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB10_I2C_S_CMD	0x42A2006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB10_I2C_CFG	0x42A20070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB10_I2C_STRETCH_CTRL	0x42A20074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB10_I2C_STRETCH_STATUS	0x42A20078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB10_TX_CTRL	0x42A20200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB10_TX_FIFO_CTRL	0x42A20204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB10_TX_FIFO_STATUS	0x42A20208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB10_TX_FIFO_WR	0x42A20240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB10_RX_CTRL	0x42A20300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB10_RX_FIFO_CTRL	0x42A20304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB10_RX_FIFO_STATUS	0x42A20308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB10_RX_MATCH	0x42A20310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB10_RX_FIFO_RD	0x42A20340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB10_RX_FIFO_RD_SILENT	0x42A20344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.

Register name	Address	Description
SCB10_EZ_DATA0	0x42A20400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB10_EZ_DATA0 to SCB10_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB10_INTR_CAUSE	0x42A20E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB10_INTR_M	0x42A20F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB10_INTR_M_SET	0x42A20F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB10_INTR_M_MASK	0x42A20F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB10_INTR_M_MASKED	0x42A20F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB10_INTR_S	0x42A20F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB10_INTR_S_SET	0x42A20F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB10_INTR_S_MASK	0x42A20F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB10_INTR_S_MASKED	0x42A20F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB10_INTR_TX	0x42A20F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB10_INTR_TX_SET	0x42A20F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB10_INTR_TX_MASK	0x42A20F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB10_INTR_TX_MASKED	0x42A20F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB10_INTR_RX	0x42A20FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB10_INTR_RX_SET	0x42A20FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB10_INTR_RX_MASK	0x42A20FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB10_INTR_RX_MASKED	0x42A20FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB11_CTRL	0x42A30000	Generic control. See SCB2_CTRL for the details of bit fields.
SCB11_SPI_CTRL	0x42A30020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB11_SPI_STATUS	0x42A30024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB11_SPI_TX_CTRL	0x42A30028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB11_SPI_RX_CTRL	0x42A3002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB11_UART_CTRL	0x42A30040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB11_UART_TX_CTRL	0x42A30044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB11_UART_RX_CTRL	0x42A30048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB11_UART_RX_STATUS	0x42A3004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB11_UART_FLOW_CTRL	0x42A30050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB11_I2C_CTRL	0x42A30060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB11_I2C_STATUS	0x42A30064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB11_I2C_M_CMD	0x42A30068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB11_I2C_S_CMD	0x42A3006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB11_I2C_CFG	0x42A30070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB11_I2C_STRETCH_CTRL	0x42A30074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB11_I2C_STRETCH_STATUS	0x42A30078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB11_TX_CTRL	0x42A30200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB11_TX_FIFO_CTRL	0x42A30204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB11_TX_FIFO_STATUS	0x42A30208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB11_TX_FIFO_WR	0x42A30240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB11_RX_CTRL	0x42A30300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB11_RX_FIFO_CTRL	0x42A30304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.
SCB11_RX_FIFO_STATUS	0x42A30308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB11_RX_MATCH	0x42A30310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.

Register name	Address	Description
SCB11_RX_FIFO_RD	0x42A30340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB11_RX_FIFO_RD_SILENT	0x42A30344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB11_EZ_DATA0	0x42A30400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB11_EZ_DATA0 to SCB11_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB11_INTR_CAUSE	0x42A30E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB11_INTR_M	0x42A30F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB11_INTR_M_SET	0x42A30F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB11_INTR_M_MASK	0x42A30F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB11_INTR_M_MASKED	0x42A30F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB11_INTR_S	0x42A30F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB11_INTR_S_SET	0x42A30F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB11_INTR_S_MASK	0x42A30F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB11_INTR_S_MASKED	0x42A30F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB11_INTR_TX	0x42A30F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB11_INTR_TX_SET	0x42A30F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB11_INTR_TX_MASK	0x42A30F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB11_INTR_TX_MASKED	0x42A30F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB11_INTR_RX	0x42A30FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB11_INTR_RX_SET	0x42A30FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.
SCB11_INTR_RX_MASK	0x42A30FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB11_INTR_RX_MASKED	0x42A30FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.
SCB1_CTRL	0x42D00000	Generic control. See SCB2_CTRL for the details of bit fields.

Register name	Address	Description
SCB1_SPI_CTRL	0x42D00020	SPI control. See SCB2_SPI_CTRL for the details of bit fields.
SCB1_SPI_STATUS	0x42D00024	SPI status. See SCB2_SPI_STATUS for the details of bit fields.
SCB1_SPI_TX_CTRL	0x42D00028	SPI transmitter control. See SCB0_SPI_TX_CTRL for the details of bit fields.
SCB1_SPI_RX_CTRL	0x42D0002C	SPI receiver control. See SCB0_SPI_RX_CTRL for the details of bit fields.
SCB1_UART_CTRL	0x42D00040	UART control. See SCB2_UART_CTRL for the details of bit fields.
SCB1_UART_TX_CTRL	0x42D00044	UART transmitter control. See SCB2_UART_TX_CTRL for the details of bit fields.
SCB1_UART_RX_CTRL	0x42D00048	UART receiver control. See SCB2_UART_RX_CTRL for the details of bit fields.
SCB1_UART_RX_STATUS	0x42D0004C	UART receiver status. See SCB2_UART_RX_STATUS for the details of bit fields.
SCB1_UART_FLOW_CTRL	0x42D00050	UART flow control. See SCB2_UART_FLOW_CTRL for the details of bit fields.
SCB1_I2C_CTRL	0x42D00060	I2C control. See SCB0_I2C_CTRL for the details of bit fields.
SCB1_I2C_STATUS	0x42D00064	I2C status. See SCB2_I2C_STATUS for the details of bit fields.
SCB1_I2C_M_CMD	0x42D00068	I2C master command. See SCB0_I2C_M_CMD for the details of bit fields.
SCB1_I2C_S_CMD	0x42D0006C	I2C slave command. See SCB0_I2C_S_CMD for the details of bit fields.
SCB1_I2C_CFG	0x42D00070	I2C configuration. See SCB0_I2C_CFG for the details of bit fields.
SCB1_I2C_STRETCH_CTRL	0x42D00074	I2C stretch control. See SCB0_I2C_STRETCH_CTRL for the details of bit fields.
SCB1_I2C_STRETCH_STATUS	0x42D00078	I2C stretch status. See SCB0_I2C_STRETCH_STATUS for the details of bit fields.
SCB1_TX_CTRL	0x42D00200	Transmitter control. See SCB0_TX_CTRL for the details of bit fields.
SCB1_TX_FIFO_CTRL	0x42D00204	Transmitter FIFO control. See SCB0_TX_FIFO_CTRL for the details of bit fields.
SCB1_TX_FIFO_STATUS	0x42D00208	Transmitter FIFO status. See SCB0_TX_FIFO_STATUS for the details of bit fields.
SCB1_TX_FIFO_WR	0x42D00240	Transmitter FIFO write. See SCB0_TX_FIFO_WR for the details of bit fields.
SCB1_RX_CTRL	0x42D00300	Receiver control. See SCB0_RX_CTRL for the details of bit fields.
SCB1_RX_FIFO_CTRL	0x42D00304	Receiver FIFO control. See SCB0_RX_FIFO_CTRL for the details of bit fields.

Register name	Address	Description
SCB1_RX_FIFO_STATUS	0x42D00308	Receiver FIFO status. See SCB0_RX_FIFO_STATUS for the details of bit fields.
SCB1_RX_MATCH	0x42D00310	Slave address and mask. See SCB0_RX_MATCH for the details of bit fields.
SCB1_RX_FIFO_RD	0x42D00340	Receiver FIFO read. See SCB0_RX_FIFO_RD for the details of bit fields.
SCB1_RX_FIFO_RD_SILENT	0x42D00344	Receiver FIFO read silent. See SCB0_RX_FIFO_RD_SILENT for the details of bit fields.
SCB1_EZ_DATA0	0x42D00400	Memory buffer. This is the starting address of a register bank containing 256 registers (SCB1_EZ_DATA0 to SCB1_EZ_DATA255). See SCB0_EZ_DATA0 for the details of bit fields.
SCB1_INTR_CAUSE	0x42D00E00	Active clocked interrupt signal. See SCB2_INTR_CAUSE for the details of bit fields.
SCB1_INTR_M	0x42D00F00	Master interrupt request. See SCB2_INTR_M for the details of bit fields.
SCB1_INTR_M_SET	0x42D00F04	Master interrupt set request. See SCB2_INTR_M_SET for the details of bit fields.
SCB1_INTR_M_MASK	0x42D00F08	Master interrupt mask. See SCB2_INTR_M_MASK for the details of bit fields.
SCB1_INTR_M_MASKED	0x42D00F0C	Master interrupt masked request. See SCB2_INTR_M_MASKED for the details of bit fields.
SCB1_INTR_S	0x42D00F40	Slave interrupt request. See SCB0_INTR_S for the details of bit fields.
SCB1_INTR_S_SET	0x42D00F44	Slave interrupt set request. See SCB0_INTR_S_SET for the details of bit fields.
SCB1_INTR_S_MASK	0x42D00F48	Slave interrupt mask. See SCB0_INTR_S_MASK for the details of bit fields.
SCB1_INTR_S_MASKED	0x42D00F4C	Slave interrupt masked request. See SCB0_INTR_S_MASKED for the details of bit fields.
SCB1_INTR_TX	0x42D00F80	Transmitter interrupt request. See SCB2_INTR_TX for the details of bit fields.
SCB1_INTR_TX_SET	0x42D00F84	Transmitter interrupt set request. See SCB2_INTR_TX_SET for the details of bit fields.
SCB1_INTR_TX_MASK	0x42D00F88	Transmitter interrupt mask. See SCB2_INTR_TX_MASK for the details of bit fields.
SCB1_INTR_TX_MASKED	0x42D00F8C	Transmitter interrupt masked request. See SCB2_INTR_TX_MASKED for the details of bit fields.
SCB1_INTR_RX	0x42D00FC0	Receiver interrupt request. See SCB2_INTR_RX for the details of bit fields.
SCB1_INTR_RX_SET	0x42D00FC4	Receiver interrupt set request. See SCB2_INTR_RX_SET for the details of bit fields.

Serial Communication Block (SCB) registers

Register name	Address	Description
SCB1_INTR_RX_MASK	0x42D00FC8	Receiver interrupt mask. See SCB2_INTR_RX_MASK for the details of bit fields.
SCB1_INTR_RX_MASKED	0x42D00FCC	Receiver interrupt masked request. See SCB2_INTR_RX_MASKED for the details of bit fields.

18.1.1 SCB0_CTRL

Description: Generic control

Address: 0x42990000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				OVS [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	RW		Reserved	RW	Reserved	RW	RW	RW
HW Access	R		Reserved	R	Reserved	R	R	R
Name	MEM_WIDTH [15:14]		Reserved	CMD_RESP_MODE	Reserved	EZ_MODE	EC_OP_MODE	EC_AM_MODE

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [23:18]						BLOCK	ADDR_ACCEPT

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved		RW	Reserved		RW	
HW Access	R	Reserved		R	Reserved		R	
Name	ENABLED	Reserved [30:29]		EC_ACCESS	Reserved [27:26]		MODE [25:24]	

Bits	Name	Description
31	ENABLED	SCB block is enabled ('1') or not ('0'). The proper order in which to initialize SCB is as follows: - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL registers. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL register to enable SCB, select the specific operation mode and oversampling factor. Generally when this block is enabled, no control information should be changed. Changes should be made AFTER disabling this block, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the block is re-enabled. Note that disabling the block will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Specific to SPI master case, when SCB is idle, below registers can be changed without disabling SCB block, TX_CTRL TX_FIFO_CTRL RX_CTRL RX_FIFO_CTRL SPI_CTRL.SSEL, Default Value: 0

18.1.1 SCB0_CTRL (continued)

28	EC_ACCESS	EC_ACCESS is used to enable I2CS_EC or SPIS_EC access to internal EZ memory. 1: enable clk_scb 0: disable clk_scb Before going to deepsleep this field should be set to 1. when waking up from DeepSleep power mode, and PLL is locked (clk_scb is at expected frequency), this field should be set to 0. Default Value: 0
25 : 24	MODE	Mode of operation (3: Reserved) Default Value: 3 **0x0: I2C :** Inter-Integrated Circuits (I2C) mode. **0x1: SPI :** Serial Peripheral Interface (SPI) mode. **0x2: UART :** Universal Asynchronous Receiver/Transmitter (UART) mode.
17	BLOCK	Only used in externally clocked mode. If the externally clocked logic and the internal CPU accesses to EZ memory coincide/collide, this bit determines whether the CPU access should block and result in bus wait states ('BLOCK is 1') or not (BLOCK is '0'). IF BLOCK is '0' and the accesses collide, CPU read operations return 0xffff:ffff and CPU write operations are ignored. Colliding accesses are registered as interrupt causes: INTR_TX.BLOCKED and INTR_RX.BLOCKED. Default Value: 0
16	ADDR_ACCEPT	Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0'). In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when this bit is '1' for both I2C read and write transfers. In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO. Default Value: 0
15 : 14	MEM_WIDTH	Determines the number of bits per FIFO data element, depending on physical SRAM cell data width. Default Value: 1 **0x0: BYTE :** 8-bit FIFO data elements. This mode provides the biggest amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7]. **0x1: HALFWORD :** 16-bit FIFO data elements. TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 15]. **0x2: WORD :** 32-bit FIFO data elements. This mode provides the smallest amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH can be in a range of [0, 31]. **0x3: Reserved :** This setting is reserved. Do not use.

18.1.1 SCB0_CTRL (continued)

12	CMD_RESP_MODE	Determines CMD_RESP mode of operation: '0': CMD_RESP mode disabled. '1': CMD_RESP mode enabled (also requires EC_AM_MODE and EC_OP_MODE to be set to '1'). Default Value: 0
10	EZ_MODE	Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first. In UART mode this field should be '0'. Default Value: 0
9	EC_OP_MODE	This field specifies the clocking for the SCB block '0': Internally clocked mode '1': externally clocked mode In internally clocked mode, the serial interface protocols run off the SCB clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate). In UART mode this field should be '0'. Default Value: 0
8	EC_AM_MODE	This field specifies the clocking for the address matching (I2C) or slave selection detection logic (SPI) '0': Internally clocked mode '1': Externally clocked mode In internally clocked mode, the serial interface protocols run off the SCB clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. The clocking for the rest of the logic is determined by CTRL.EC_OP_MODE. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. In UART mode this field should be '0'. Default Value: 0

18.1.1 SCB0_CTRL (continued)

3 : 0	OVS	Serial interface bit period oversampling factor expressed in SCB clock cycles. Used for SPI and UART functionality. OVS + 1 SCB clock cycles constitute a single serial interface clock/bit cycle. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the low and high phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the low and high phase can differ by 1 SCB clock period. In SPI master mode, the valid range is [3, 15]. At an SCB frequency of 48 MHz, the maximum SPI bit rate is 12 Mbps, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock to SPI MISO input round trip delay is significant (multiple SPI output clock cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the SCB clock wrt. the SPI input clock (IF) on the interface to guarantee functional correct behavior. This requirement is expressed as a ratio: SCB clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE): - MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": SCB clock/IF clock >= 6. At a SCB frequency of 48 MHz, the maximum bit rate is 8 Mbps. - MEDIAN is '0' and external SPI master has "late MISO sample functionality": SCB clock/IF clock >= 3. At a SCB frequency of 48 MHz, the maximum bit rate is 16 Mbps. - MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": SCB clock/IF clock >= 8. At a SCB frequency of 48 MHz, the maximum bit rate is 6 Mbps. - MEDIAN is '1' and external SPI master has "late MISO sample functionality": SCB clock/IF clock >= 4. At a SCB frequency of 48 MHz, the maximum bit rate is 12 Mbps. As discussed earlier, the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account. In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15]. In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value: - 0: 16 times oversampling. SCB clock frequency of 16*115.2 KHz for 115.2 Kbps. SCB clock frequency of 16*57.6 KHz for 57.6 Kbps. SCB clock frequency of 16*38.4 KHz for 38.4 Kbps. SCB clock frequency of 16*19.2 KHz for 19.2 Kbps. SCB clock frequency of 16*9.6 KHz for 9.6 Kbps. SCB clock frequency of 16*2.4 KHz for 2.4 Kbps. SCB clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two SCB clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two SCB clock cycles and greater or equal than one SCB clock cycle may be detected by the receiver. Pulse widths less than one SCB clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The SCB clock (as provided by the programmable clock block) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required SCB clock frequency): - 0: 16 times oversampling. SCB clock frequency of 16*115.2 KHz for 115.2 Kbps. SCB clock frequency of 16*57.6 KHz for 57.6 Kbps. SCB clock frequency of 16*38.4 KHz for 38.4 Kbps. SCB clock frequency of 16*19.2 KHz for 19.2 Kbps. SCB clock frequency of 16*9.6 KHz for 9.6 Kbps. SCB clock frequency of 16*2.4 KHz for 2.4 Kbps. SCB clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. Low power mode, OVS field values (with the required SCB clock frequency): - 0: 16 times oversampling. SCB clock frequency of 16*115.2 KHz for 115.2 Kbps. - 1: 32 times oversampling. SCB clock frequency of 32*57.6 KHz for 57.6 Kbps. - 2: 48 times oversampling. SCB clock frequency of 48*38.4 KHz for 38.4 Kbps. - 3: 96 times oversampling. SCB clock frequency of 96*19.2 KHz for 19.2 Kbps. - 4: 192 times oversampling. SCB clock frequency of 192*9.6 KHz for 9.6 Kbps. - 5: 768 times oversampling. SCB clock frequency of 768*2.4 KHz for 2.4 Kbps. - 6: 1536 times oversampling. SCB clock frequency of 1536*1.2 KHz for 1.2 Kbps. - all other values are not used in low power mode. Default Value: 15

18.1.2 SCB0_STATUS

Description: Generic status

Address: 0x42990004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							EC_BUSY

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined

18.1.3 SCB0_CMD_RESP_CTRL

Description: Command/response control

Address: 0x42990008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	BASE_RD_ADDR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	BASE_WR_ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	BASE_WR_ADDR	I2C/SPI write base address for CMD_RESP mode. At the start of a write transfer this BASE_WR_ADDR is copied to CMD_RESP_STATUS.CURR_WR_ADDR. This field should not be modified during ongoing bus transfers. Default Value: 0
7 : 0	BASE_RD_ADDR	I2C/SPI read base address for CMD_RESP mode. At the start of a read transfer this BASE_RD_ADDR is copied to CMD_RESP_STATUS.CURR_RD_ADDR. This field should not be modified during ongoing bus transfers. Default Value: 0

18.1.4 SCB0_CMD_RESP_STATUS

Description: Command/response status

Address: 0x4299000C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	CURR_RD_ADDR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	CURR_WR_ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	Reserved					
HW Access	W	W	Reserved					
Name	CMD_RESP_EC_BUSY	CMD_RESP_EC_BUS_BUSY	Reserved [29:24]					

Bits	Name	Description
31	CMD_RESP_EC_BUSY	Indicates whether the CURR_RD_ADDR and CURR_WR_ADDR fields in this register are reliable (when CMD_RESP_EC_BUSY is '0') or not reliable (when CMD_RESP_EC_BUSY is '1'). Note: - When there is no ongoing bus transfer, CMD_RESP_EC_BUSY is '0' (reliable). - When there is a ongoing bus transfer, CMD_RESP_EC_BUSY is '0' (reliable), when the CURR_RD_ADDR and CURR_WR_ADDR are not being updated by the HW. - When there is a ongoing bus transfer, CMD_RESP_EC_BUSY is '1' (not reliable), when the CURR_RD_ADDR or CURR_WR_ADDR are being updated by the HW. Note that this update lasts one I2C clock cycle, or two SPI clock cycles. Default Value: Undefined
30	CMD_RESP_EC_BUS_BUSY	Indicates whether there is an ongoing bus transfer to the IP. '0': no ongoing bus transfer. '1': ongoing bus transfer. For SPI, the field is '1' when slave mode is selected. For I2C, the field is set to '1' at a I2C START/RESTART. In case of an address match, the field is set to '0' on a I2C STOP. In case of NO address match, the field is set to '0' after the failing address match. Default Value: Undefined

18.1.4 SCB0_CMD_RESP_STATUS (continued)

23 : 16	CURR_WR_ADDR	I2C/SPI write current address for CMD_RESP mode. HW increments the field after a write access to the memory buffer. However, when the last memory buffer address is reached, the address is NOT incremented (but remains at the maximum memory buffer address). The field is used to determine how many bytes have been written (# bytes = CURR_WR_ADDR - CMD_RESP_CTRL.BASE_WR_ADDR). This field is reliable when there is no bus transfer. This field is potentially unreliable when there is a ongoing bus transfer, i.e. when CMD_RESP_EC_BUSY is '0', the field is reliable. Default Value: Undefined
7 : 0	CURR_RD_ADDR	I2C/SPI read current address for CMD_RESP mode. HW increments the field after a read access to the memory buffer. However, when the last memory buffer address is reached, the address is NOT incremented (but remains at the maximum memory buffer address). The field is used to determine how many bytes have been read (# bytes = CURR_RD_ADDR - CMD_RESP_CTRL.BASE_RD_ADDR). This field is reliable when there is no bus transfer. This field is potentially unreliable when there is a ongoing bus transfer, i.e. when CMD_RESP_EC_BUSY is '0', the field is reliable. Default Value: Undefined

18.1.5 SCB0_SPI_CTRL

Description: SPI control

Address: 0x42990020

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved				RW		RW	
HW Access	Reserved				R		R	
Name	Reserved [31:28]				SSEL [27:26]		MODE [25:24]	

Bits	Name	Description
27 : 26	SSEL	Selects one of the four incoming/outgoing SPI slave select signals: - 0: Slave 0, SSEL[0]. - 1: Slave 1, SSEL[1]. - 2: Slave 2, SSEL[2]. - 3: Slave 3, SSEL[3]. SCB block should be disabled when changes are made to this field. Default Value: 0
25 : 24	MODE	Submode of SPI operation (3: Reserved). Default Value: 3 **0x0: SPI_MOTOROLA :** SPI Motorola submode. In master mode, when not transmitting data (Slave SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), Slave SELECT is inactive.

18.1.5 SCB0_SPI_CTRL (continued)

		0x1: SPI_TI : SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), Slave SELECT is inactive; i.e. no pulse is generated. **0x2: SPI_NS :** SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), Slave SELECT is inactive.
14	SSEL_INTER_-FRAME_DEL	Indicates the SPI SELECT inter-dataframe delay (between SELECT deactivation and SELECT activation). '0': 1.5 SPI clock cycles '1': 2.5 SPI clock cycles Only applies in SPI MOTOROLA submode and when SPI_CTRL.SSEL_CONTINUOUS=0, CTRL.OVS>=3. above are ideal case at SCB block level, and there is inaccuracy of one clk_scb cycle. Default Value: 0
13	SSEL_HOLD_DEL	Indicates the SPI SELECT hold delay (between SPI clock edge to sample the last MOSI bit, and SELECT deactivation). '0': 0.75 SPI clock cycles '1': 1.75 SPI clock cycles Only applies in SPI MOTOROLA submode and when SCLK_CONTINUOUS=0, CTRL.OVS>=3. above are ideal case at SCB block level, and there is inaccuracy of one clk_scb cycle. Default Value: 0
12	SSEL_SETUP_DEL	Indicates the SPI SELECT setup delay (between SELECT activation and SCLK clock edge to sample the first MOSI bit). '0': 0.75 SPI clock cycles '1': 1.75 SPI clock cycles Only applies in SPI MOTOROLA submode and when SCLK_CONTINUOUS=0, CTRL.OVS>=3. above are ideal case at SCB block level, and there is inaccuracy of one clk_scb cycle. Default Value: 0
11	SSEL_POLARITY3	Slave select polarity. Default Value: 0
10	SSEL_POLARITY2	Slave select polarity. Default Value: 0
9	SSEL_POLARITY1	Slave select polarity. Default Value: 0
8	SSEL_POLARITY0	Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0

18.1.5 SCB0_SPI_CTRL (continued)

4	LATE_SAMPLE	Changes the SCLK edge on which MISO is captured in master mode, or MOSI is captured in slave mode. When '0', the default applies, for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK(CPOL is '0' and CPHA is '1'), for National Semiconductors on the rising edge of SCLK(CPOL is '0' and CPHA is '0'). When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). for master, applicable to all Motorola, TI and National Semiconductors flavors, and CPOL/CPHA timing mdoes. for slave, applicable to Motorola flavor only, and CPHA=0 timing modes only, and internally-clocked mode only. Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master. Default Value: 1
3	CPOL	Indicates the clock polarity. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured: - CPOL is '0': SCLK is '0' when not transmitting data. - CPOL is '1': SCLK is '1' when not transmitting data. Default Value: 0
2	CPHA	Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured: - Motorola mode 0. CPOL is '0', CPHA is '0': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is '0', CPHA is '1': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is '1', CPHA is '0': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is '1', CPHA is '1': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. In SPI Motorola submode, all four CPOL/CPHA modes are valid. in SPI NS submode, only CPOL=0 CPHA=0 mode is valid. in SPI TI submode, only CPOL=0 CPHA=1 mode is valid. Default Value: 0
1	SELECT_PRECEDE	Only used in SPI Texas Instruments' submode. When '1', the data frame start indication is a pulse on the Slave SELECT line that precedes the transfer of the first data frame bit. When '0', the data frame start indication is a pulse on the Slave SELECT line that coincides with the transfer of the first data frame bit. Default Value: 0

18.1.6 SCB0_SPI_STATUS

Description: SPI status

Address: 0x42990024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	R
HW Access	Reserved						W	W
Name	Reserved [7:2]						SPI_EC_BUSY	BUS_BUSY

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	SPI base EZ address. Address as provided by a SPI write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	SPI current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when SPI_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
1	SPI_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	SPI bus is busy. The bus is considered busy ('1') during an ongoing transaction. For Motorola and National submodes, the busy bit is '1', when the slave selection is activated. For TI submode, the busy bit is '1' from the time the preceding/coinciding slave select is activated for the first transmitted data frame, till the last MOSI/MISO bit of the last data frame is transmitted. Default Value: Undefined

18.1.7 SCB0_SPI_TX_CTRL

Description: SPI transmitter control

Address: 0x42990028

Retention: Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved							R
Name	Reserved [23:17]							LOOPBACK

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved					
HW Access	R	R	Reserved					
Name	MASTER_-MODE	SLAVE_-MODE	Reserved [29:24]					

Bits	Name	Description
31	MASTER_MODE	Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0
30	SLAVE_MODE	Slave mode enabled ('1') or not ('0'). Default Value: 0
16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0
15	S_NOT_READY_-DATA_NACK	For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1

18.1.9 SCB0_I2C_CTRL (continued)

14	S_NOT_READY_ADDR_NACK	This field is used during an address match or general call address in internally clocked mode Only used when: - EC_AM_MODE is '0', EC_OP_MODE is '0', S_GENERAL_IGNORE is '0] and non EZ mode. Functionality is as follows: - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode): - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. Functionality is as follows: - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the SCB clock is available (in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2).SCB clock is not present (in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the SCB clock is available). The logic will handle the ongoing transfer as soon as the clock is enabled. Default Value: 1
13	S_READY_DATA_ACK	When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'. Default Value: 1
12	S_READY_ADDR_ACK	When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'. Default Value: 1
11	S_GENERAL_IGNORE	When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure. Default Value: 1
9	M_NOT_READY_DATA_NACK	When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full). Default Value: 1
8	M_READY_DATA_ACK	When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full. Default Value: 1
7 : 4	LOW_PHASE_OVS	Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 SCB clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering. The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the SCB clock wrt. the regular (no stretching) interface (IF) low time to guarantee functionally correct behavior. With input signal median filtering, the IF low time should be >= 8 SCB clock cycles and <= 16 IP clock cycles. Without input signal median filtering, the IF low time should be >= 7 SCB clock cycles and <= 16 SCB clock cycles. in slave mode, this field is used to define number of clk_scb cycles for tSU-DAT timing (from ACK/NACK/data ready, to SCL rising edge (released from I2C slave clock stretching)) Default Value: 8
3 : 0	HIGH_PHASE_OVS	Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 SCB clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering. The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the SCB clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be >= 6 SCB clock cycles and <= 16 SCB clock cycles. Without input signal median filtering, the IF high time should be >= 5 SCB clock cycles and <= 16 SCB clock cycles. Default Value: 8

18.1.10 SCB0_I2C_STATUS

Description: I2C status

Address: 0x42990064

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
5	M_READ	I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/idle or transmitting START, REPEATED START, STOP or an address, this field is '0". Default Value: 0
4	S_READ	I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0". Default Value: 0
2	I2CS_IC_BUSY	Indicates whether the internally clocked slave logic is being accessed by external I2C master. --set at ADDR_MATCH --clear at START/RESET, STOP detection, or BUS_ERROR This bit can be used by SW to determine whether I2CS_IC is busy before entering DeepSleep. Default Value: 0
1	I2C_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_EZ_ADDR or CURR_EZ_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_EZ_ADDR and CURR_EZ_ADDR are reliable. Default Value: Undefined

18.1.10 SCB0_I2C_STATUS (continued)

0	BUS_BUSY	I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If SCB block is disabled, BUS_BUSY is '0'. After enabling the block, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period). For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions). For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0

18.1.11 SCB0_I2C_M_CMD

Description: I2C master command

Address: 0x42990068

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW	RW	RW	RW	RW
HW Access	Reserved			RW1C	RW1C	RW1C	RW1C	RW1C
Name	Reserved [7:5]			M_STOP	M_NACK	M_ACK	M_START_ ON_IDLE	M_START

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
4	M_STOP	When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. I2C_M_CMD.M_START has a higher priority than this command: in situations where both a STOP and a REPEATED START could be transmitted, M_START takes precedence over M_STOP. Default Value: 0
3	M_NACK	for I2C master, the NACKed byte should be properly received. it write the data byte, before ACK/ NACK decision. When '1', attempt to transmit a negative acknowledgement (NACK). if the reciever FIFO is full (the received data byte cannot be written), it stretch SCL(extend SCL low phase) until the receiver FIFO changes to not full, to write the last byte, then send out NACK. When this action is performed, the hardware sets this field to '0'. Default Value: 0
2	M_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0
1	M_START_ON_IDLE	When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0') . A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'. Default Value: 0

18.1.11 SCB0_I2C_M_CMD (continued)

0	M_START	When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'. Default Value: 0

18.1.12 SCB0_I2C_S_CMD

Description: I2C slave command

Address: 0x4299006C

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	S_TX_ONES_ON_EMP-TY	When '1', attempt to send ones when TX_FIFO is empty. Once hardware starts to send ones, it will continue send ones until NACK is received, regardless of TX_FIFO status (even if new data is written into TX_FIFO). This bit is used to avoid stretching SCL, which is not expected for some master devices. Default Value: 0
1	S_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is per-formed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). This command has a higher priority than I2C_S_CMD.S_ACK, I2C_C-TRL.S_READY_ADDR_ACK or I2C_CTRL.S_READY_DATA_ACK. Default Value: 0
0	S_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17	OPEN_DRAIN_SCL	Each IO cell "xxx" has two associated IP output signals "xxx_out_en" and "xxx_out". '0': Normal operation mode. Typically, this operation mode is used for IO cells that are connected to (board) wires/lines that are driven by a single IO cell. In this operation mode, for an IO cell "xxx" that is used as an output, the "xxx_out_en" output enable signal is typically constant '1' the "xxx_out" output is the outputted value. In other words, in normal operation mode, the "xxx_out" output is used to control the IO cell output value: "xxx_out" is '0' to drive an IO cell output value of '0' and "xxx_out" is '1' to drive an IO cell output value of '1'. '1': Open drain operation mode. Typically this operation mode is used for IO cells that are connected to (board) wires/lines that are driven by multiple IO cells (possibly on multiple chips). In this operation mode, for and IO cell "xxx" that is used as an output, the "xxx_out_en" output controls the outputted value. Typically, open drain operation mode drives low/'0' and the "xxx_out" output is constant '1'. In other words, in open drain operation mode, the "xxx_out_en" output is used to control the IO cell output value: in drive low/'0' mode: "xxx_out_en" is '1' (drive enabled) to drive an IO cell output value of '0' and "xxx_out_en" is '1' (drive disabled) to not drive an IO cell output value (another IO cell can drive the wire/line or a pull up results in a wire/line value '1'). this bit is applicable to I2C SCL only. I2C SDA always work in open-drain mode. this is not applicable to M0S8, which does not need special control in SCB for open-drain drive mode. Default Value: 1

18.1.16 SCB0_TX_CTRL (continued)

16	OPEN_DRAIN	Each IO cell "xxx" has two associated IP output signals "xxx_out_en" and "xxx_out". '0': Normal operation mode. Typically, this operation mode is used for IO cells that are connected to (board) wires/lines that are driven by a single IO cell. In this operation mode, for an IO cell "xxx" that is used as an output, the "xxx_out_en" output enable signal is typically constant '1' the "xxx_out" output is the outputted value. In other words, in normal operation mode, the "xxx_out" output is used to control the IO cell output value: "xxx_out" is '0' to drive an IO cell output value of '0' and "xxx_out" is '1' to drive an IO cell output value of '1'. '1': Open drain operation mode. Typically this operation mode is used for IO cells that are connected to (board) wires/lines that are driven by multiple IO cells (possibly on multiple chips). In this operation mode, for and IO cell "xxx" that is used as an output, the "xxx_out_en" output controls the outputted value. Typically, open drain operation mode drives low/'0' and the "xxx_out" output is constant '1'. In other words, in open drain operation mode, the "xxx_out_en" output is used to control the IO cell output value: in drive low/'0' mode: "xxx_out_en" is '1' (drive enabled) to drive an IO cell output value of '0' and "xxx_out_en" is '1' (drive disabled) to not drive an IO cell output value (another IO cell can drive the wire/line or a pull up results in a wire/line value '1'). The open drain mode is supported for: - UART mode, "uart_tx" IO cell. - SPI mode, "spi_miso" IO cell. this bit is not applicable to I2C mode, "i2c_scl" and "i2c_sda" IO cells. Default Value: 0
8	MSB_FIRST	Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1
4 : 0	DATA_WIDTH	Dataframe width, depending on CTRL.MEM_WIDTH. DATA_WIDTH + 1 is the amount of bits in a transmitted data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 31]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7

18.1.17 SCB0_TX_FIFO_CTRL

Description: Transmitter FIFO control

Address: 0x42990204

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17	FREEZE	When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0
16	CLEAR	When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0
6 : 0	TRIGGER_LEVEL	Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event INTR_TX.TRIGGER is generated. Default Value: 0

18.1.18 SCB0_TX_FIFO_STATUS

Description: Transmitter FIFO status

Address: 0x42990208

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved	W						
Name	Reserved	WR_PTR [30:24]						

Bits	Name	Description
30 : 24	WR_PTR	FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0
22 : 16	RD_PTR	FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0
15	SR_VALID	Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0
7 : 0	USED	Amount of entries in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR (EZ_DATA_NR/2). Default Value: 0

18.1.19 SCB0_TX_FIFO_WR

Description: Transmitter FIFO write

Address: 0x42990240

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	MASK	Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0
7 : 0	ADDR	Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). Default Value: 0

18.1.24 SCB0_RX_FIFO_RD

Description: Receiver FIFO read

Address: 0x42990340

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.MEM_WIDTH is "0", only DATA[7:0] are used and when CTRL.MEM_WIDTH is "1", only DATA[15:0] are used. This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register. A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined

18.1.25 SCB0_RX_FIFO_RD_SILENT

Description: Receiver FIFO read silent

Address: 0x42990344

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved				RW1S	RW1S	RW1S	RW1S
Name	Reserved [15:12]				SPI_BUS_ERROR	SPI_EZ_STOP	SPI_EZ_WRITE_STOP	I2C_BUS_ERROR

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW1C
HW Access	Reserved							RW1S
Name	Reserved [23:17]							I2C_RE-START

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	I2C_RESTART	I2C slave RESTART received. Set to '1', when REPEATED START event is detected. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. Default Value: 0
11	SPI_BUS_ERROR	SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0
10	SPI_EZ_STOP	SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0
9	SPI_EZ_WRITE_STOP	SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0
8	I2C_BUS_ERROR	I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0
7	I2C_GENERAL	I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected. Default Value: 0

18.1.38 SCB0_INTR_S (continued)

6	I2C_ADDR_MATCH	I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected. Default Value: 0
5	I2C_START	I2C slave START received. Set to '1', when START or REPEATED START event is detected. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL. Default Value: 0
4	I2C_STOP	I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address. The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd. Default Value: 0
3	I2C_WRITE_STOP	I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address. In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd. In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected). Default Value: 0
2	I2C_ACK	I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data). Default Value: 0
1	I2C_NACK	I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data). Default Value: 0
0	I2C_ARB_LOST	I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine aborts the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	BLOCKED	SW cannot get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0
6	UNDERFLOW	Attempt to read from an empty TX FIFO. This happens when SCB is ready to transfer data and EMPTY is '1'. Only used in FIFO mode. (Note: This bit may be set unintentionally, even if the FIFO is not empty. Workaround: Ignore the bit when the clock frequency of the AHB bus is greater than 3x the internal frequency of SCB and the FIFO is not empty) Default Value: 0
5	OVERFLOW	Attempt to write to a full TX FIFO. Only used in FIFO mode. Default Value: 0
4	EMPTY	TX FIFO is empty; i.e. it has 0 entries. Only used in FIFO mode. Default Value: 0
1	NOT_FULL	TX FIFO is not full. Dependent on CTRL.MEM_WIDTH: (FF_DATA_NR = EZ_DATA_NR/2) MEM_WIDTH is "0": # entries != FF_DATA_NR. MEM_WIDTH is "1": # entries != FF_DATA_NR/2. MEM_WIDTH is "2": # entries != FF_DATA_NR/4. Only used in FIFO mode. Default Value: 0

18.1.42 SCB0_INTR_TX (continued)

0	TRIGGER	Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.TRIGGER_LEVEL. Only used in FIFO mode. Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9	PARITY_ERROR	Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO. Default Value: 0
7	BLOCKED	SW cannot get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0
6	UNDERFLOW	Attempt to read from an empty RX FIFO. Only used in FIFO mode. Default Value: 0
5	OVERFLOW	Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd. Only used in FIFO mode. Default Value: 0
3	FULL	RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.MEM_WIDTH: (FF_DATA_NR = EZ_DATA_NR/2) MEM_WIDTH is "0": # entries == FF_DATA_NR. MEM_WIDTH is "1": # entries == FF_DATA_NR/2. MEM_WIDTH is "2": # entries == FF_DATA_NR/4. Only used in FIFO mode. Default Value: 0

18.1.46 SCB0_INTR_RX (continued)

2	NOT_EMPTY	RX FIFO is not empty. Only used in FIFO mode. Default Value: 0
0	TRIGGER	More entries in the RX FIFO than the value specified by RX_FIFO_CTRL.TRIGGER_LEVEL. Only used in FIFO mode. Default Value: 0

SW Access	RW	Reserved					RW	
HW Access	R	Reserved					R	
Name	ENABLED	Reserved [30:26]					MODE [25:24]	

Bits	Name	Description
31	ENABLED	SCB block is enabled ('1') or not ('0'). The proper order in which to initialize SCB is as follows: - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL registers. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL register to enable SCB, select the specific operation mode and oversampling factor. Generally when this block is enabled, no control information should be changed. Changes should be made AFTER disabling this block, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the block is re-enabled. Note that disabling the block will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Specific to SPI master case, when SCB is idle, below registers can be changed without disabling SCB block, TX_CTRL TX_FIFO_CTRL RX_CTRL RX_FIFO_CTRL SPI_CTRL.SSEL, Default Value: 0
25 : 24	MODE	Mode of operation (3: Reserved) Default Value: 3

18.1.50 SCB2_CTRL (continued)

		0x0: I2C : Inter-Integrated Circuits (I2C) mode. **0x1: SPI :** Serial Peripheral Interface (SPI) mode. **0x2: UART :** Universal Asynchronous Receiver/Transmitter (UART) mode.
16	ADDR_ACCEPT	Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0'). In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when this bit is '1' for both I2C read and write transfers. In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO. Default Value: 0
15 : 14	MEM_WIDTH	Determines the number of bits per FIFO data element, depending on physical SRAM cell data width. Default Value: 1 **0x0: BYTE :** 8-bit FIFO data elements. This mode provides the biggest amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX-_CTRL.DATA_WIDTH are restricted to [0, 7]. **0x1: HALFWORD :** 16-bit FIFO data elements. TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 15]. **0x2: WORD :** 32-bit FIFO data elements. This mode provides the smallest amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX-_CTRL.DATA_WIDTH can be in a range of [0, 31]. **0x3: Reserved :** This setting is reserved. Do not use.
10	EZ_MODE	Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first. In UART mode this field should be '0'. Default Value: 0

18.1.50 SCB2_CTRL (continued)

3 : 0	OVS	Serial interface bit period oversampling factor expressed in SCB clock cycles. Used for SPI and UART functionality. OVS + 1 SCB clock cycles constitute a single serial interface clock/bit cycle. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the low and high phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the low and high phase can differ by 1 SCB clock period. In SPI master mode, the valid range is [3, 15]. At an SCB frequency of 48 MHz, the maximum SPI bit rate is 12 Mbps, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock to SPI MISO input round trip delay is significant (multiple SPI output clock cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the SCB clock wrt. the SPI input clock (IF) on the interface to guarantee functional correct behavior. This requirement is expressed as a ratio: SCB clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE): - MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": SCB clock/IF clock >= 6. At a SCB frequency of 48 MHz, the maximum bit rate is 8 Mbps. - MEDIAN is '0' and external SPI master has "late MISO sample functionality": SCB clock/IF clock >= 3. At a SCB frequency of 48 MHz, the maximum bit rate is 16 Mbps. - MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": SCB clock/IF clock >= 8. At a SCB frequency of 48 MHz, the maximum bit rate is 6 Mbps. - MEDIAN is '1' and external SPI master has "late MISO sample functionality": SCB clock/IF clock >= 4. At a SCB frequency of 48 MHz, the maximum bit rate is 12 Mbps. As discussed earlier, the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account. In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15]. In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value: - 0: 16 times oversampling. SCB clock frequency of 16*115.2 KHz for 115.2 Kbps. SCB clock frequency of 16*57.6 KHz for 57.6 Kbps. SCB clock frequency of 16*38.4 KHz for 38.4 Kbps. SCB clock frequency of 16*19.2 KHz for 19.2 Kbps. SCB clock frequency of 16*9.6 KHz for 9.6 Kbps. SCB clock frequency of 16*2.4 KHz for 2.4 Kbps. SCB clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two SCB clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two SCB clock cycles and greater or equal than one SCB clock cycle may be detected by the receiver. Pulse widths less than one SCB clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The SCB clock (as provided by the programmable clock block) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required SCB clock frequency): - 0: 16 times oversampling. SCB clock frequency of 16*115.2 KHz for 115.2 Kbps. SCB clock frequency of 16*57.6 KHz for 57.6 Kbps. SCB clock frequency of 16*38.4 KHz for 38.4 Kbps. SCB clock frequency of 16*19.2 KHz for 19.2 Kbps. SCB clock frequency of 16*9.6 KHz for 9.6 Kbps. SCB clock frequency of 16*2.4 KHz for 2.4 Kbps. SCB clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. Low power mode, OVS field values (with the required SCB clock frequency): - 0: 16 times oversampling. SCB clock frequency of 16*115.2 KHz for 115.2 Kbps. - 1: 32 times oversampling. SCB clock frequency of 32*57.6 KHz for 57.6 Kbps. - 2: 48 times oversampling. SCB clock frequency of 48*38.4 KHz for 38.4 Kbps. - 3: 96 times oversampling. SCB clock frequency of 96*19.2 KHz for 19.2 Kbps. - 4: 192 times oversampling. SCB clock frequency of 192*9.6 KHz for 9.6 Kbps. - 5: 768 times oversampling. SCB clock frequency of 768*2.4 KHz for 2.4 Kbps. - 6: 1536 times oversampling. SCB clock frequency of 1536*1.2 KHz for 1.2 Kbps. - all other values are not used in low power mode. Default Value: 15

18.1.51 SCB2_SPI_CTRL

HW Access	R	Reserved			R		R	
Name	MASTER_-MODE	Reserved [30:28]			SSEL [27:26]		MODE [25:24]	

Bits	Name	Description
31	MASTER_MODE	Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0
27 : 26	SSEL	Selects one of the four incoming/outgoing SPI slave select signals: - 0: Slave 0, SSEL[0]. - 1: Slave 1, SSEL[1]. - 2: Slave 2, SSEL[2]. - 3: Slave 3, SSEL[3]. SCB block should be disabled when changes are made to this field. Default Value: 0
25 : 24	MODE	Submode of SPI operation (3: Reserved). Default Value: 3

18.1.51 SCB2_SPI_CTRL (continued)

		0x0: SPI_MOTOROLA : SPI Motorola submode. In master mode, when not transmitting data (Slave SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), Slave SELECT is inactive. **0x1: SPI_TI :** SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), Slave SELECT is inactive; i.e. no pulse is generated. **0x2: SPI_NS :** SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), Slave SELECT is inactive.
16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': No local loopback '1': the SPI master MISO line is connected to the SPI master MOSI line. In other words, in loop-back mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0
14	SSEL_INTER_-FRAME_DEL	Indicates the SPI SELECT inter-dataframe delay (between SELECT deactivation and SELECT activation). '0': 1.5 SPI clock cycles '1': 2.5 SPI clock cycles Only applies in SPI MOTOROLA submode and when SPI_CTRL.SSEL_CONTINUOUS=0, CTRL.OVS>=3. above are ideal case at SCB block level, and there is inaccuracy of one clk_scb cycle. Default Value: 0
13	SSEL_HOLD_DEL	Indicates the SPI SELECT hold delay (between SPI clock edge to sample the last MOSI bit, and SELECT deactivation). '0': 0.75 SPI clock cycles '1': 1.75 SPI clock cycles Only applies in SPI MOTOROLA submode and when SCLK_CONTINUOUS=0, CTRL.OVS>=3. above are ideal case at SCB block level, and there is inaccuracy of one clk_scb cycle. Default Value: 0
12	SSEL_SETUP_DEL	Indicates the SPI SELECT setup delay (between SELECT activation and SCLK clock edge to sample the first MOSI bit). '0': 0.75 SPI clock cycles '1': 1.75 SPI clock cycles Only applies in SPI MOTOROLA submode and when SCLK_CONTINUOUS=0, CTRL.OVS>=3. above are ideal case at SCB block level, and there is inaccuracy of one clk_scb cycle. Default Value: 0
11	SSEL_POLARITY3	Slave select polarity. Default Value: 0
10	SSEL_POLARITY2	Slave select polarity. Default Value: 0
9	SSEL_POLARITY1	Slave select polarity. Default Value: 0

18.1.51 SCB2_SPI_CTRL (continued)

8	SSEL_POLARITY0	Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0
5	SCLK_CONTINUOUS	Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0
4	LATE_SAMPLE	Changes the SCLK edge on which MISO is captured in master mode, or MOSI is captured in slave mode. When '0', the default applies, for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK(CPOL is '0' and CPHA is '1'), for National Semiconductors on the rising edge of SCLK(CPOL is '0' and CPHA is '0'). When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). for master, applicable to all Motorola, TI and National Semiconductors flavors, and CPOL/CPHA timing mdoes. for slave, applicable to Motorola flavor only, and CPHA=0 timing modes only, and internally-clocked mode only. Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master. Default Value: 1
3	CPOL	Indicates the clock polarity. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured: - CPOL is '0': SCLK is '0' when not transmitting data. - CPOL is '1': SCLK is '1' when not transmitting data. Default Value: 0
2	CPHA	Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured: - Motorola mode 0. CPOL is '0', CPHA is '0': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is '0', CPHA is '1': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is '1', CPHA is '0': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is '1', CPHA is '1': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. In SPI Motorola submode, all four CPOL/CPHA modes are valid. in SPI NS submode, only CPOL=0 CPHA=0 mode is valid. in SPI TI submode, only CPOL=0 CPHA=1 mode is valid. Default Value: 0
1	SELECT_PRECEDE	Only used in SPI Texas Instruments' submode. When '1', the data frame start indication is a pulse on the Slave SELECT line that precedes the transfer of the first data frame bit. When '0', the data frame start indication is a pulse on the Slave SELECT line that coincides with the transfer of the first data frame bit. Default Value: 0

18.1.51 SCB2_SPI_CTRL (continued)

0	SSEL_CONTINUOUS	Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field. When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection. When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data frames are sent out with slave deselection. Default Value: 0

18.1.52 SCB2_SPI_STATUS

Description: SPI status

Address: 0x429A0024

Retention: Not Retained

SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				BREAK_WIDTH [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [31:25]							BREAK_LEVEL

Bits	Name	Description
24	BREAK_LEVEL	0: low level pulse detection, like Break field in LIN protocol 1: high level pulse detection, like IFS field in CXPI protocol, or idle line state in UART Default Value: 0
19 : 16	BREAK_WIDTH	Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of 10+1 = 11 bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value. Default Value: 10

18.1.55 SCB2_UART_RX_CTRL (continued)

13	SKIP_START	Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit. Default Value: 0
12	LIN_MODE	Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minimum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Default Value: 0
10	MP_MODE	Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped. Default Value: 0
9	DROP_ON_FRAME_ERROR	Behavior when an error is detected in a start or stop period. When '0', received data is sent to the RX FIFO. When '1', received data is dropped and lost. Default Value: 0
8	DROP_ON_PARITY_ERROR	Behavior when a parity check fails. When '0', received data is sent to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field). Default Value: 0
6	POLARITY	Inverts incoming RX line signal. Inversion is after local loopback. This functionality is intended for IrDA receiver functionality. Default Value: 0
5	PARITY_ENABLED	Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware. Default Value: 0
4	PARITY	Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes. Default Value: 0
2 : 0	STOP_BITS	Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of half bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle time between data frames and the data frame value. Default Value: 2

18.1.56 SCB2_UART_RX_STATUS

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [31:26]						CTS_ENABLED	CTS_POLARITY

Bits	Name	Description
25	CTS_ENABLED	Enable use of CTS input signal by the UART transmitter: '0': Disabled. The UART transmitter ignores the CTS input signal and transmits when a data frame is available for transmission in the TX FIFO or the TX shift register. '1': Enabled. The UART transmitter uses CTS input signal to qualify the transmission of data. It transmits when CTS input signal is active and a data frame is available for transmission in the TX FIFO or the TX shift register. If UART_CTRL.LOOPBACK is '1', the CTS input signal is driven by the RTS output signal locally in SCB (both signals are subjected to signal polarity changes are indicated by RTS_POLARITY and CTS_POLARITY). Default Value: 0
24	CTS_POLARITY	Polarity of the CTS input signal '0': CTS is active low ; '1': CTS is active high; Default Value: 0
16	RTS_POLARITY	Polarity of the RTS output signal: '0': RTS is active low; '1': RTS is active high; During SCB reset (Hibernate system power mode), RTS output signal is '1'. This represents an inactive state assuming an active low polarity. Default Value: 0
6 : 0	TRIGGER_LEVEL	Trigger level. When the receiver FIFO has less entries than the amount of this field, a Ready To Send (RTS) output signal is activated. By setting this field to "0", flow control is effectively disabled (may be useful for debug purposes). Default Value: 0

18.1.58 SCB2_I2C_STATUS

Description: I2C status

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
5	M_READ	I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/idle or transmitting START, REPEATED START, STOP or an address, this field is '0". Default Value: 0
4	S_READ	I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0". Default Value: 0
2	I2CS_IC_BUSY	Indicates whether the internally clocked slave logic is being accessed by external I2C master. --set at ADDR_MATCH --clear at START/RESET, STOP detection, or BUS_ERROR This bit can be used by SW to determine whether I2CS_IC is busy before entering DeepSleep. Default Value: 0

18.1.58 SCB2_I2C_STATUS (continued)

0	BUS_BUSY	I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If SCB block is disabled, BUS_BUSY is '0'. After enabling the block, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period). For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions). For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0

Name	Reserved [31:24]							

Bits	Name	Description
10	UART_ARB_LOST	UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is useful when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
9	UART_DONE	UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO, and the last stop field is transmitted (both TX FIFO and transmit shifter register are empty). Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
8	UART_NACK	UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
6	UNDERFLOW	Attempt to read from an empty TX FIFO. This happens when SCB is ready to transfer data and EMPTY is '1'. Only used in FIFO mode. (Note: This bit may be set unintentionally, even if the FIFO is not empty. Workaround: Ignore the bit when the clock frequency of the AHB bus is greater than 3x the internal frequency of SCB and the FIFO is not empty) Default Value: 0
5	OVERFLOW	Attempt to write to a full TX FIFO. Only used in FIFO mode. Default Value: 0

18.1.64 SCB2_INTR_TX (continued)

4	EMPTY	TX FIFO is empty; i.e. it has 0 entries. Only used in FIFO mode. Default Value: 0
1	NOT_FULL	TX FIFO is not full. Dependent on CTRL.MEM_WIDTH: (FF_DATA_NR = EZ_DATA_NR/2) MEM_WIDTH is "0": # entries != FF_DATA_NR. MEM_WIDTH is "1": # entries != FF_DATA_NR/2. MEM_WIDTH is "2": # entries != FF_DATA_NR/4. Only used in FIFO mode. Default Value: 0
0	TRIGGER	Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.TRIGGER_LEVEL. Only used in FIFO mode. Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
11	BREAK_DETECT	Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
10	BAUD_DETECT	LIN baudrate detection is completed. The receiver software uses the UART_RX_STA-TUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guaran-tee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
9	PARITY_ERROR	Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO. Default Value: 0

18.1.68 SCB2_INTR_RX (continued)

8	FRAME_ERROR	Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error: Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received. Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received. A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_-FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames. Default Value: 0
6	UNDERFLOW	Attempt to read from an empty RX FIFO. Only used in FIFO mode. Default Value: 0
5	OVERFLOW	Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd. Only used in FIFO mode. Default Value: 0
3	FULL	RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.MEM_WIDTH: (FF_DATA_NR = EZ_DATA_NR/2) MEM_WIDTH is "0": # entries == FF_DATA_NR. MEM_WIDTH is "1": # entries == FF_DATA_NR/2. MEM_WIDTH is "2": # entries == FF_DATA_NR/4. Only used in FIFO mode. Default Value: 0
2	NOT_EMPTY	RX FIFO is not empty. Only used in FIFO mode. Default Value: 0
0	TRIGGER	More entries in the RX FIFO than the value specified by RX_FIFO_CTRL.TRIGGER_LEVEL. Only used in FIFO mode. Default Value: 0

19 Improved Inter-Integrated circuit (I3C) registers

This section discusses the I3C registers. It lists all the registers in mapping tables, in address order.

19.1 Register details

Register name	Address	Description
I3C_CORE_DEVICE_CTRL	0x42A50000	Device Control Register
I3C_CORE_DEVICE_ADDR	0x42A50004	Device Address Register
I3C_CORE_COMMAND_QUEUE_PORT	0x42A5000C	COMMAND_QUEUE_PORT
I3C_CORE_RESPONSE_QUEUE_PORT	0x42A50010	RESPONSE_QUEUE_PORT
I3C_CORE_TX_RX_DATA_PORT	0x42A50014	Transmit/Receive Data Port Register
I3C_CORE_IBI_QUEUE_DATA	0x42A50018	In-Band Interrupt Queue Data Register
I3C_CORE_QUEUE_THLD_CTRL	0x42A5001C	Queue Threshold Control Register
I3C_CORE_DATA_BUFFER_THLD_CTRL	0x42A50020	Data Buffer Threshold Control Register
I3C_CORE_IBI_QUEUE_CTRL	0x42A50024	IBI Queue Control Register
I3C_CORE_RESET_CTRL	0x42A50034	Reset Control Register
I3C_CORE_TGT_EVENT_STATUS	0x42A50038	Target Event Status Register
I3C_CORE_INTR_STATUS	0x42A5003C	Reset Control Register
I3C_CORE_INTR_STATUS_EN	0x42A50040	Interrupt Status Enable Register.
I3C_CORE_INTR_SIGNAL_EN	0x42A50044	Interrupt Signal Enable Register
I3C_CORE_INTR_FORCE	0x42A50048	Interrupt Force Enable Register
I3C_CORE_QUEUE_STATUS_LEVEL	0x42A5004C	Queue Status Level Register.
I3C_CORE_DATA_BUFFER_STATUS_LEVEL	0x42A50050	Data Buffer Status Level Register.
I3C_CORE_PRESENT_STATE	0x42A50054	Present State Register
I3C_CORE_CCC_DEVICE_STATUS	0x42A50058	Device Operating Status Register.
I3C_CORE_DEVICE_ADDR_TABLE_POINTER	0x42A5005C	Pointer for Device Address Table
I3C_CORE_DEV_CHAR_TABLE_POINTER	0x42A50060	Pointer for Device Characteristics Table
I3C_CORE_VENDOR_SPECIFIC_REG_POINTER	0x42A5006C	Pointer for Vendor Specific Registers.
I3C_CORE_TGT_MIPI_ID_VALUE	0x42A50070	I3C MIPI Manufacturer ID Register
I3C_CORE_TGT_PID_VALUE	0x42A50074	I3C Normal Provisional ID Register
I3C_CORE_TGT_CHAR_CTRL	0x42A50078	I3C Target Characteristic Register.
I3C_CORE_TGT_MAX_LEN	0x42A5007C	I3C Max Write/Read Length Register.
I3C_CORE_MAX_READ_TURNAROUND	0x42A50080	MXDS Maximum Read Turnaround Time.
I3C_CORE_MAX_DATA_SPEED	0x42A50084	Maximum Data Speed Register
I3C_CORE_TGT_INTR_REQ	0x42A5008C	Target Interrupt Request Register
I3C_CORE_TGT_TIR_DATA	0x42A50094	Target Interrupt Request Data Register
I3C_CORE_TGT_IBI_RESP	0x42A50098	Target IBI Response Register
I3C_CORE_DEVICE_CTRL_EXTENDED	0x42A500B0	Device Control Extended Register
I3C_CORE_SCL_I3C_OD_TIMING	0x42A500B4	SCL I3C Open Drain Timing Register

Improved Inter-Integrated circuit (I3C) registers

Register name	Address	Description
I3C_CORE_SCL_I3C_PP_TIMING	0x42A500B8	SCL I3C Push Pull Timing Register
I3C_CORE_SCL_I2C_FM_TIMING	0x42A500BC	SCL I2C Fast Mode Timing Register
I3C_CORE_SCL_I2C_FMP_TIMING	0x42A500C0	SCL I2C Fast Mode Plus Timing Register
I3C_CORE_SCL_EXT_LCNT_TIMING	0x42A500C8	SCL Extended Low Count Timing Register.
I3C_CORE_SCL_EXT_TERMN_LCNT_TIMING	0x42A500CC	SCL Termination Bit Low Count Timing Register
I3C_CORE_SDA_HOLD_SWITCH_DLY_TIMING	0x42A500D0	SDA Hold and Mode Switch Delay Timing Register
I3C_CORE_BUS_FREE_AVAIL_TIMING	0x42A500D4	Bus Free and Available Timing Register
I3C_CORE_BUS_IDLE_TIMING	0x42A500D8	Bus Idle Timing Register
I3C_CORE_SCL_LOW_CTR_EXT_TIMEOUT	0x42A500DC	SCL LOW Controller Timeout
I3C_CORE_RELEASE_SDA_TIMING	0x42A500EC	Release SDA count value.
I3C_CORE_EXT_TX_DATA_PORT_0	0x42A50130	DWC_mipi_i3c Directed read Vendor-specific CCC 0 TX Data Port Register
I3C_CORE_EXT_TX_DATA_PORT_1	0x42A50134	DWC_mipi_i3c Directed read Vendor-specific CCC 1 TX Data Port Register
I3C_CORE_EXT_TX_DATA_PORT_2	0x42A50138	DWC_mipi_i3c Directed read Vendor-specific CCC 2 TX Data Port Register
I3C_CORE_EXT_TX_DATA_PORT_3	0x42A5013C	DWC_mipi_i3c Directed read Vendor-specific CCC 3 TX Data Port Register
I3C_CORE_EXT_0_1_DATA_BUF_STS_LEVEL	0x42A50154	Vendor-specific CCC types 0 and 1 Data Buffer Status Level Register
I3C_CORE_EXT_2_3_DATA_BUF_STS_LEVEL	0x42A50158	Vendor-specific CCC types 2 and 3 Data Buffer Status Level Register
I3C_CORE_EXT_CMD_REG_0	0x42A50164	TID, CCC type value and Defining Byte of Vendor-specific CCC 0 Register
I3C_CORE_EXT_CMD_REG_1	0x42A50168	TID, CCC type value and Defining Byte of Vendor-specific CCC 1 Register
I3C_CORE_EXT_CMD_REG_2	0x42A5016C	TID, CCC type value and Defining Byte of Vendor-specific CCC 2 Register
I3C_CORE_EXT_CMD_REG_3	0x42A50170	TID, CCC type value and Defining Byte of Vendor-specific CCC 3 Register
I3C_CORE_EXT_TX_QUEUE_RESET_CTRL	0x42A50184	Individual Vendor CCC buffer reset.
I3C_CORE_DEV_CHAR_TABLE1_LOC1	0x42A50200	Device Characteristic Table Location-1 of Device1, MSB_PROVISIONAL_ID
I3C_CORE_DEV_CHAR_TABLE1_LOC2	0x42A50204	Device Characteristic Table Location-2 of Device1, LSB_PROVISIONAL_ID
I3C_CORE_DEV_CHAR_TABLE1_LOC3	0x42A50208	Device Characteristic Table Location-3 of Device1, BCR, DCR
I3C_CORE_DEV_CHAR_TABLE1_LOC4	0x42A5020C	Device Characteristic Table Location-4 of Device1, DEV_DYNAMIC_ADDR

Improved Inter-Integrated circuit (I3C) registers

Register name	Address	Description
I3C_CORE_DEV_CHAR_TABLE2_LOC1	0x42A50210	Device Characteristic Table Location-1 of Device2
I3C_CORE_DEV_CHAR_TABLE2_LOC2	0x42A50214	Device Characteristic Table Location-2 of Device2
I3C_CORE_DEV_CHAR_TABLE2_LOC3	0x42A50218	Device Characteristic Table Location-3 of Device2
I3C_CORE_DEV_CHAR_TABLE2_LOC4	0x42A5021C	Device Characteristic Table Location-4 of Device2
I3C_CORE_DEV_CHAR_TABLE3_LOC1	0x42A50220	Device Characteristic Table Location-1 of Device3
I3C_CORE_DEV_CHAR_TABLE3_LOC2	0x42A50224	Device Characteristic Table Location-2 of Device3
I3C_CORE_DEV_CHAR_TABLE3_LOC3	0x42A50228	Device Characteristic Table Location-3 of Device3
I3C_CORE_DEV_CHAR_TABLE3_LOC4	0x42A5022C	Device Characteristic Table Location-4 of Device3
I3C_CORE_DEV_CHAR_TABLE4_LOC1	0x42A50230	Device Characteristic Table Location-1 of Device4
I3C_CORE_DEV_CHAR_TABLE4_LOC2	0x42A50234	Device Characteristic Table Location-2 of Device4

Improved Inter-Integrated circuit (I3C) registers

Register name	Address	Description
I3C_CORE_DEV_ADDR_TABLE_LOC9	0x42A502E0	Device Address Table of Device9
I3C_CORE_DEV_ADDR_TABLE_LOC10	0x42A502E4	Device Address Table of Device10
I3C_CORE_DEV_ADDR_TABLE_LOC11	0x42A502E8	Device Address Table of Device11
I3C_CTRL	0x42A50400	I3C Block Control
I3C_TGT_STATUS	0x42A50418	This register provides additional status information when functioning as a Target.
I3C_CCC_GETSTATUS	0x42A50424	This register provides additional information on GETSTATUS CCCs received when functioning as a Target.
I3C_TIMING_CNT_CTRL	0x42A5042C	Controls the Counter used for timestamping I3C-relevant events, especially when communicating with Asynchronous Timing Control Mode 0 enabled.
I3C_TIMING_CNT0	0x42A50430	Most Significant Bits of the Counter
I3C_TIMING_CNT1	0x42A50434	Least Significant Bits of the Counter

19.1.1 I3C_CORE_DEVICE_CTRL

Description: Device Control Register

Address: 0x42A50000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	Reserved						RW
HW Access	R	Reserved						R
Name	I2C_TARGET_PRESENT	Reserved [6:1]						IBA_INCLUDE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							HOT_JOIN_CTRL

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	RW	Reserved	RW	RW	RW	
HW Access	RW	R	R	Reserved	R	R	R	
Name	ENABLE	RESUME	ABORT	Reserved	ADAPTIVE_I2C_I3C	TARGET_PEC_EN	IDLE_CNT_MULTPLIER [25:24]	

Bits	Name	Description
31	ENABLE	I3C Enable Controls whether or not I3C functionality is enabled. When functioning as the Active Controller, software can write to this register to request to disable the I3C block. However, the block may not get disabled immediately and is 'Disabled' after commands in the Command queue (if any) are executed leading to a STOP condition on the bus and Controller FSM is in IDLE state (as indicated by PRESENT_STATE Register). When functioning as a Target, software can write to this register to request to disable the I3C block. However, the disable happens after the ongoing transfer is completed on the I3C bus. Software can read back 1'b0 from this field once disabling of I3C is completed. After power on reset, the software can enable I3C Secondary Controller or Target functionality by programming this bit to 1'b1. However the I3C bus interface of the block will respond to transfer on the bus, only after it observes Bus Available condition for BUS_AVAILABLE_TIME*IDLE_CNT_MULTPLIER counts of pclk period. The successful completion of Enable/Disable of the block depends on availability of SCL to the controller at the time of performing this operation, and hence may not happen instantly. Values: 0x0: Disables the I3C controller. 0x1: Enables the I3C controller. Default Value: 0x0

19.1.1 I3C_CORE_DEVICE_CTRL (continued)

30	RESUME	I3C Resume This bit is used to resume the I3C block after it goes to the Halt state. When functioning as the Active Controller, the block goes to the halt state (as indicated in PRESENT_STATE Register) due to any type of error in the transfer (the type of error is indicated by ERR_STATUS field in the RESPONSE_QUEUE_PORT register). After the block goes to the Halt state, the application has to write 1'b1 to this bit to resume. This bit is auto-cleared once the block resumes the transfers by initiating the next command. When functioning as a Target, the block goes to the halt state due to following conditions: 1 => Any type of error in the transfer (the type of error is indicated by ERR_STATUS field in the RESPONSE_QUEUE_PORT register) 2 => MRL Register updated by the Active Controller through SETMRL CCC. After the device has gone to halt state, the application has to take necessary action to handle the error condition and then write 1'b1 to this bit to resume the controller. This bit is auto-cleared once the controller is ready to accept new transfers. Default Value: 0x0
29	ABORT	I3C Abort. This bit is only valid when this I3C Device is functioning as the Active Controller. This bit allows this device to relinquish the I3C Bus before completing the issued transfer. In response to an ABORT request, the Controller issues the STOP condition after the complete data byte is transferred or received. This bit is auto-cleared once the transfer is aborted and the controller issues a 'Transfer Abort' interrupt. Default Value: 0x0
27	ADAPTIVE_I2C_I3C	Hot-Join Control for Adaptive I2C/I3C Mode This bit is only valid when this I3C Device is functioning as a Target. In Adaptive Mode, this bit is used to enable some features of this target device. This bit is cleared automatically if the controller determines the mode as I3C. Values: 0x0: The device initiates a Hot-Join without determining the bus mode and assuming itself to be on I3C bus. 0x1: The device initiates a Hot-Join request only after it has switched to I3C mode of operation. Default Value: 0x0
26	TARGET_PEC_EN	Target Parity Error Check (PEC) Enable This bit is only valid when this I3C Device is functioning as a Target. Values: 0x0: PEC is disabled 0x1: PEC is enabled Default Value: 0x0
25 : 24	IDLE_CNT_MULTPLIER	Idle count multiplier. This bit is only valid when this I3C Device is functioning as a Target. After power-on reset, this Target is enabled only after it sees both SDA and SCL lines idle for a specified time. This idle time is calculated by multipliying IDLE_CNT_MULTPLIER with BUS_AVAILABLE_TIME field in the BUS_FREE_AVAIL_TIMING register. Values: 0x00: BUS_AVAILABLE_TIME * 1 0x01: BUS_AVAILABLE_TIME * 2 0x10: BUS_AVAILABLE_TIME * 4 0x11: BUS_AVAILABLE_TIME * 8 Default Value: 0x0
8	HOT_JOIN_CTRL	Hot-Join ACK/NACK Control This bit is only valid when this I3C Device is functioning as the Active Controller. This bit acts as a global control to ACK/NACK the Hot-Join request from the devices. The Active Controller ACK/NACKs the Hot-Join request from other devices connected on the I3C Bus, based on programming of this bit. Values: 0x0: ACK the Hot-Join request. 0x1: NACK and send broadcast CCC(auto-disable) to disable Hot-join. Default Value: 0x0
7	I2C_TARGET_PRESENT	Default Value: 0x0

19.1.1 I3C_CORE_DEVICE_CTRL (continued)

0	IBA_INCLUDE	I3C Broadcast Address Include. This bit is only valid when this I3C Device is functioning as the Active Controller. This bit is used to include the I3C broadcast address (0x7E) in private transfers. Note: If the I3C broadcast address is not included in private transfers, In-band Interrupts (IBI) driven from Targets might not win address arbitration and IBIs will get delayed. Values: 0x0: I3C Broadcast Address is not included in Private Transfers 0x1: I3C Broadcast Address is included in Private Transfers Default Value: 0x0

19.1.2 I3C_CORE_DEVICE_ADDR

Description: Device Address Register

Address: 0x42A50004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	RW						
HW Access	Reserved	R						
Name	Reserved	STATIC_ADDR [6:0]						

Bits	15	14	13	12	11	10	9	8
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	STAT-IC_AD-DR_VALID	Reserved [14:8]						

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved	RW						
HW Access	Reserved	R						
Name	Reserved	DYNAMIC_ADDR [22:16]						

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	DYNAM-IC_AD-DR_VALID	Reserved [30:24]						

Bits	Name	Description
31	DYNAMIC_ADDR_VALID	Dynamic Address Valid This bit is used to control whether the DYNAMIC_ADDR is valid or not. =>When functioning as the Primary Controller, the user/application must set this bit to 1 along with the DYNAMIC_ADDR. =>When functioning as a Target, the block sets this bit to 1 when the Active Controller assigns the Dynamic address during ENTDAA or SETDASA mechanism. + Values: 0x0: Dynamic Address is invalid 0x1: Dynamic Address is valid Default Value: 0x0
22 : 16	DYNAMIC_ADDR	Device Dynamic Address. This field is used to program the Device Dynamic Address. The block uses this address for I3C transfers. => When functioning as the Primary Controller, the user/application must program the Dynamic Address. => When functioning as a Target, the Active Controller assigns this address during ENTDAA or SETDASA procedures. Default Value: 0x0

19.1.2 I3C_CORE_DEVICE_ADDR (continued)

15	STATIC_ADDR_VALID	Static Address Valid. This field is only valid when this I3C Device is functioning as a Target. Values: 0x0: Static Address in STATIC_ADDR field is invalid 0x1: Static Address in STATIC_ADDR field is valid Default Value: 0x0
6 : 0	STATIC_ADDR	Device Static Address. This field is only valid when this I3C Device is functioning as a Target. The device uses this address to respond to SETDASA CCC Command to get the Dynamic Address if static address is valid (STATIC_ADDRESS_VALID must be set to 1). Default Value: 0x0

19.1.3 I3C_CORE_COMMAND_QUEUE_PORT

Description: COMMAND_QUEUE_PORT

Address: 0x42A5000C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access	RW							
Name	COMMAND [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	W							
HW Access	RW							
Name	COMMAND [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	W							
HW Access	RW							
Name	COMMAND [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	W							
HW Access	RW							
Name	COMMAND [31:24]							

Bits	Name	Description
31 : 0	COMMAND	32-bit Command Default Value: Undefined

19.1.4 I3C_CORE_RESPONSE_QUEUE_PORT

Description: RESPONSE_QUEUE_PORT

Address: 0x42A50010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	RESPONSE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	RESPONSE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	RESPONSE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	RESPONSE [31:24]							

Bits	Name	Description
31 : 0	RESPONSE	32-bit Response Default Value: 0x0

19.1.5 I3C_CORE_TX_RX_DATA_PORT

Description: Transmit/Receive Data Port Register

Address: 0x42A50014

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	TX_RX_DATA_PORT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	TX_RX_DATA_PORT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	TX_RX_DATA_PORT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	TX_RX_DATA_PORT [31:24]							

Bits	Name	Description
31 : 0	TX_RX_DATA_PORT	Transmit Data Port for write access and Receive Data Port for read access. This field is mapped to the TX Data Buffer when writing and to the RX Data Buffer when reading. The data is always packed in 4-byte aligned data words. If the command length is not aligned to the 4-bytes, then the additional data bytes have to be ignored. Default Value: 0x0

19.1.6 I3C_CORE_IBI_QUEUE_DATA

Description: In-Band Interrupt Queue Data Register

Address: 0x42A50018

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	IBI_DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	IBI_DATA [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	IBI_DATA [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	IBI_DATA [31:24]							

Bits	Name	Description
31 : 0	IBI_DATA	In-Band Interrupt Data This register is mapped to the IBI Queue. The IBI Data is always packed in 4-byte aligned and put to the IBI Queue. If the incoming data is not aligned to the 4-bytes, then there are unused bytes in the end location of the IBI transfer. Default Value: 0x0

19.1.7 I3C_CORE_QUEUE_THLD_CTRL

Description: Queue Threshold Control Register

Address: 0x42A5001C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	CMD_EMPTY_BUF_THLD [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	RESP_BUF_THLD [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	IBI_DATA_THLD [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	IBI_STATUS_THLD [31:24]							

Bits	Name	Description
31 : 24	IBI_STATUS_THLD	In-Band Interrupt Status Threshold Value. This field controls the number of IBI status entries (or greater) in the IBI queue that trigger the IBI_THLD_STAT interrupt. Every In Band Interrupt received (with or without Payload) by the block generates an IBI status. The application should program only valid values. NOTE: The valid value is only 0 if IBI with payload is selected in the configuration. Values: 0x0 <= N < 16: Interrupt will trigger when queue has N+1 valid entries. Default Value: 0x1
23 : 16	IBI_DATA_THLD	IBI Data Buffer Threshold Value This field represents the IBI data segment size in Dwords (4 bytes). The IBI_DATA_THLD field enables the slicing of the incoming IBI data and generate individual status and thereby promotes the cut-through operation in reading out the IBI data. Values: 0x1 <= N < IC_IBI_DATA_BUF_DEPTH Default Value: 0x1
15 : 8	RESP_BUF_THLD	Response Buffer Threshold Value. Controls the minimum number of valid entries in the Response Queue that trigger the RESP_READY_STAT_INTR interrupt. The application should programs only valid values. Values: 0x0 <= N < 8: Interrupt will trigger when queue has N+1 valid entries. Default Value: 0x1

19.1.7 I3C_CORE_QUEUE_THLD_CTRL (continued)

7 : 0	CMD_EMPTY_BUF_THLD	Command Buffer Empty Threshold Value Controls the minimum number of empty locations in the Command Queue that trigger the CMD_QUEUE_READY_STAT interrupt. The application should programs only valid values. Values: 0x0: Interrupt will trigger when the queue is completely empty 0x0 < N < 16: Interrupt will trigger when queue has N empty locations. Default Value: 0x1

19.1.8 I3C_CORE_DATA_BUFFER_THLD_CTRL

Description: Data Buffer Threshold Control Register

Address: 0x42A50020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [7:3]					TX_EMPTY_BUF_THLD [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [15:11]					RX_BUF_THLD [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [23:19]					TX_START_THLD [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [31:27]					RX_START_THLD [26:24]		

Bits	Name	Description
26 : 24	RX_START_THLD	Receive Start Threshold Value. When functioning as the Active Controller, when the controller is set up to initiate a read transfer, it waits until either one of the conditions are met before it initiates the read transfer on the I3C Interface. => Data length (as specified in the command) number of locations are empty in the Receive FIFO. => Threshold number of locations (or more) are empty in the Receive FIFO. When functioning as a Target, the block ACKs a write request from the Active Controller only if threshold number of empty locations(or more) are available in its receive buffer. The supported values for RX_START_THLD are: 0x0: Threshold of at least 1 empty entry 0x1: Threshold of at least 4 empty entries 0x2: Threshold of at least 8 empty entries 0x3: Threshold of at least 16 empty entries 0x4: Threshold of at least 32 empty entries 0x5: Threshold of at least 64 empty entries Default Value: 0x1

19.1.8 I3C_CORE_DATA_BUFFER_THLD_CTRL (continued)

18 : 16	TX_START_THLD	Transfer Start Threshold Value. When functioning as the Active Controller, when the Controller is set up to initiate a write transfer, it waits until either one of the following conditions are met before it initiates the write transfer on the I3C Interface. => Data length (as specified in the command) number of locations are filled in the TX FIFO. => Threshold number of entries (or more) are available in the TX FIFO When functioning as a Target, the Target ACKs a read request from the Active Controller only if either one of the following conditions are met. => Data length (as specified in the command) number of locations are filled in the Transmit FIFO => Threshold number of entries (or more) are available in the Transmit FIFO Supported values: 0x0: Threshold of at least 1 valid entry 0x1: Threshold of at least 4 valid entries 0x2: Threshold of at least 8 valid entries 0x3: Threshold of at least 16 valid entries 0x4: Threshold of at least 32 valid entries 0x5: Threshold of at least 64 valid entries Default Value: 0x1
10 : 8	RX_BUF_THLD	Receive Buffer Threshold Value. This field controls the number of valid entries (or above) in the RX FIFO that trigger the RX_THLD_STAT interrupt. If the programmed value is greater than the buffer depth, then threshold is set to IC_RX_BUF_DEPTH. Supported values: 0x0: Interrupt triggers with at least 1 valid entry 0x1: Interrupt triggers with at least 4 valid entries 0x2: Interrupt triggers with at least 8 valid entries 0x3: Interrupt triggers with at least 16 valid entries 0x4: Interrupt triggers with at least 32 valid entries 0x5: Interrupt triggers with at least 64 valid entries Default Value: 0x1
2 : 0	TX_EMPTY_BUF_THLD	Transmit Buffer Empty Threshold Value This field controls the number of empty locations (or above) in the TX FIFO that trigger the TX_THLD_STAT interrupt. If the programmed value is greater than the buffer depth, then threshold is set to IC_TX_BUF_DEPTH. Supported values: 0x0: Interrupt triggers with at least 1 empty entry 0x1: Interrupt triggers with at least 4 empty entries 0x2: Interrupt triggers with at least 8 empty entries 0x3: Interrupt triggers with at least 16 empty entries 0x4: Interrupt triggers with at least 32 empty entries 0x5: Interrupt triggers with at least 64 empty entries Default Value: 0x1

19.1.9 I3C_CORE_IBI_QUEUE_CTRL

Description: IBI Queue Control Register

Address: 0x42A50024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW	Reserved	RW	RW
HW Access	Reserved				R	Reserved	R	R
Name	Reserved [7:4]				NOTIFY_TIR_REJECTED	Reserved	NOTIFY_CR_REJECTED	NOTIFY_HJ_REJECTED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
3	NOTIFY_TIR_REJECTED	Notify Rejected Target Interrupt Request Control. This bit is only valid when this I3C Device is functioning the Active Controller, and is used to suppress reporting to the application about rejected Target Interrupt Request. Values: 0x0: Disables passing the IBI Status to the IBI FIFO (hence not notifying the application) when a Target Interrupt Request is NACKed and auto-disabled based on the IBI_TIR_REQ_REJECT Register. 0x1: Enables writing the IBI Status to the IBI FIFO (hence notifying the application) when a Target Interrupt Request is NACKed and auto-disabled based on the IBI_TIR_REQ_REJECT Register. Default Value: 0x0
1	NOTIFY_CR_REJECTED	Notify Rejected Controller Role Request (CR) Control. This bit is only valid when this I3C Device is functioning the Active Controller, and is used to suppress reporting to the application about Controller Role Request (CR) rejected. Values: 0x0: Disable passing the IBI Status to the IBI FIFO (hence not notifying the application) when a CR Request is NACKed and auto-disabled based on the IBI_CR_REQ_REJECT Register. 0x1: Enable writing the IBI Status to the IBI FIFO (hence notifying the application) when a CR Request is NACKed and auto-disabled based on the IBI_CR_REQ_REJECT Register. Default Value: 0x0

19.1.9 I3C_CORE_IBI_QUEUE_CTRL (continued)

0	NOTIFY_HJ_REJECTED	Notify Rejected Hot-Join Control. This bit is only valid when this I3C Device is functioning the Active Controller, and is used to suppress reporting to the application about Hot-Join request rejected (NACK and Auto Disable). Values: 0x0: Disable passing the IBI Status to the IBI FIFO (hence not notifying the application) when a HJ Request is NACKed and auto-disabled based on the DEVICE_CTRL.HOT_JOIN_CTRL. 0x1: Enable writing the IBI Status to the IBI FIFO (hence notifying the application) when a HJ Request is NACKed and auto-disabled based on the DEVICE_CTRL.HOT_JOIN_CTRL. Default Value: 0x0

19.1.10 I3C_CORE_RESET_CTRL

Description: Reset Control Register

Address: 0x42A50034

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW	RW	RW	RW	RW	RW
HW Access	Reserved		RW	RW	RW	RW	RW	RW
Name	Reserved [7:6]		IBI_-QUEUE_RST	RX_FIFO_RST	TX_FIFO_RST	RESP_-QUEUE_RST	CMD_-QUEUE_RST	SOFT_RST

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW			Reserved			
HW Access	RW	RW			Reserved			
Name	BUS_RESET	BUS_RESET_TYPE [30:28]			Reserved [27:24]			

Bits	Name	Description
31	BUS_RESET	Write 1'b1 to this bit to exercise Bus Reset Reset Pattern Generation based on Bus Reset Type selection. This bit is cleared automatically once the Bus Reset Pattern Generation is completed. Default Value: 0x0
30 : 28	BUS_RESET_TYPE	Type of bus reset triggered by the BUS_RESET field. Values: 0x0: Exit Pattern 0x1: Target Reset Pattern 0x6: SCL Low Pattern Others: Reserved Default Value: 0x0
5	IBI_QUEUE_RST	IBI Queue Software Reset. This bit is only valid when functioning as the Active Controller. Write 0x1 to this bit to exercise IBI Queue reset. This bit is cleared automatically once the IBI Queue reset is completed. Before the reset is completed, write accesses and read accesses to the other registers will return a bus error. Default Value: 0x0

19.1.10 I3C_CORE_RESET_CTRL (continued)

4	RX_FIFO_RST	Receive Buffer Software Reset. Write 0x1 to this bit to exercise Receive Buffer reset This bit is cleared automatically once the Receive buffer reset is completed. Before the reset is completed, write accesses and read accesses to the other registers will return a bus error. Default Value: 0x0
3	TX_FIFO_RST	Transmit Buffer Software Reset. Write 0x1 to this bit to exercise Transmit Buffer reset. This bit is cleared automatically once the Transmit Buffer reset is completed. Before the reset is completed, write accesses and read accesses to the other registers will return a bus error. Default Value: 0x0
2	RESP_QUEUE_RST	Response Queue Software Reset. Write 1'b1 to this bit to exercise Response Queue reset. This bit is cleared automatically once the Response Queue reset is completed. Before the reset is completed, write accesses and read accesses to the other registers will return a bus error. Default Value: 0x0
1	CMD_QUEUE_RST	Command Queue Software Reset. Write 0x1 to this bit to exercise Command Queue reset. This bit is cleared automatically once the Command Queue reset is completed. Before the reset is completed, write accesses and read accesses to the other registers will return a bus error. Default Value: 0x0
0	SOFT_RST	Core Software Reset. Write 0x1 to this bit to exercise software reset. This will trigger an internal procedure that resets all Buffers - RX, TX, CMD, and Response. This bit is cleared automatically once the core reset is completed. Before the reset is completed, write accesses and read accesses to the other registers will return a bus error. Default Value: 0x0

19.1.11 I3C_CORE_TGT_EVENT_STATUS

Description: Target Event Status Register

Address: 0x42A50038

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C	RW1C	R		RW	Reserved	R	R
HW Access	RW	RW	RW		R	Reserved	R	RW
Name	MWL_UP-DATED	MRL_UP-DATED	ACTIVITY_STATE [5:4]		HJ_EN	Reserved	CR_EN	TIR_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	MWL_UPDATED	MWL Updated Status. This bit indicates a SETMWL CCC is received by the Target. The updated MWL value can be read from TGT_MAX_LEN register. This status can be cleared by writing 0x1 to this field after reading the updated MWL. Default Value: 0x0
6	MRL_UPDATED	MRL Updated Status. This bit indicates a SETMRL CCC is received by the Target. The updated MRL value can be read from TGT_MAX_LEN register. This status can be cleared by writing 0x1 to this field after reading the updated MRL. Default Value: 0x0
5 : 4	ACTIVITY_STATE	Activity State Status This bit reflects the Activity State of this Target set by the Active Controller. Values: 0x0: ENTAS0 0x1: ENTAS1 0x2: ENTAS2 0x3: ENTAS3 Default Value: 0x0

19.1.11 I3C_CORE_TGT_EVENT_STATUS (continued)

3	HJ_EN	Hot-Join Interrupt Enable. This bit is only valid when this I3C Device is functioning as a Target, and reflects whether the Hot-Join Request Interrupts are allowed on the I3C bus or not. The Target application can choose to Disable HJ Capability of the Target controller (if selected) by setting this field to 0 before 'Enabling' the block. When done so, the Target will not initiate Hot Join and will take part in Address Assignment without initiating Hot Join. If this field is NOT set to 0 by the Target application, it can be set or cleared by the I3C Controller via ENEC or DISEC CCCs. Once Disabled by software, CCCs do not have any effect on this field. Default Value: 0x1
1	CR_EN	Controller Role Request (CR) Enable. This bit is only valid when this I3C Device is functioning as a Target, and reflects whether the controller can initiate the Controller Role Request (CR) on the I3C bus or not. Usually, this bit is set or cleared by the Active Controller through ENEC or DISEC CCC. Default Value: 0x1
0	TIR_EN	Target Interrupt Request Enable. This bit is only valid when this I3C Device is functioning as a Target, and reflects whether the block can initiate the TIR on the I3C bus or not. Usually, this bit is set or cleared by the Active Controller through ENEC or DISEC CCC. Default Value: 0x1

19.1.12 I3C_CORE_INTR_STATUS

Description: Reset Control Register

Address: 0x42A5003C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	RW1C	RW1C	R	R	R	R	R

HW Access	Reserved			RW1S	RW1S	Reserved	RW1S	RW1S
Name	Reserved [23:21]			EXT_CM-D_SENT_S TS	SDA_RE-LEASED_S TS	Reserved	TGT_RST_ PATTERN_-DET_STS	START_DE-T_STS

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
20	EXT_CMD_SENT_STS	EXT_CMD_REG_x has finished Status. This field is used only in target mode of operation. This interrupt is generated if Read Transfer has finished in the EXT_CMD_REG_x registers. This interrupt is cleared automatically when register EXT_CMD_VLD_STAT is read Default Value: 0x0
19	SDA_RELEASED_STS	SDA Released from Stuck state Status. This field is used only in target mode of operation. This interrupt is generated if the SCL was not changed for the prescribed amount of time defined by RELEASE_SDA_TIMING register. This bit can be cleared by writing 1'b1 Default Value: 0x0
17	TGT_RST_PATTERN_-DET_STS	Target Reset Pattern Detection Interrupt This field is used only when functioning as a Target. This interrupt is generated when the Target Reset pattern is detected. Default Value: 0x0

19.1.12 I3C_CORE_INTR_STATUS (continued)

16	START_DET_STS	START Detection Interrupt. This field is used only when functioning as a Target and indicates that a START has been detected. This interrupt is provided for the user/application (in CCR mode) to decide whether the NCR has taken over the ownership after the bus handover was completed successfully to move to Target mode. And to reset the reset action configured by the RSTACT CCC. This bit can be cleared by writing 1'b1. Default Value: 0x0
15	BUS_RESET_DONE_STS	Bus Reset Pattern Generation Done Status This field is used only when functioning as a Controller. This interrupt is generated when the requested Bus Reset Pattern Generation is completed. This bit can be cleared by writing 1'b1. Default Value: 0x0
13	BUSOWNER_UPDATED_STS	This interrupt is set when the block changes from being the Active Controller to a Secondary Controller/Target or vice versa. This bit can be cleared by writing 0x1. Default Value: 0x0
12	IBI_UPDATED_STS	IBI status is updated. This field is used only when functioning as a Target. It indicates that the IBI request initiated through TIR request register is addressed and status is updated. Default Value: 0x0
11	READ_REQ_RECV_STS	Read Request Received. This field is used only when functioning as a Target. Read Request received from the Active Controller when CMDQ is empty. This bit can be cleared by writing 0x1. Default Value: 0x0
10	DEFTGT_STS	Define Target CCC Received Status. This interrupt is generated if DEFTGTS CCC is received. This bit can be cleared by writing 0x1. Default Value: 0x0
9	TRANSFER_ERR_STS	Transfer Error Status. This interrupt is generated if any error occurs during transfer. The error type is specified in the response packet associated with the command (in ERR_STATUS field of RESPONSE_QUEUE_PORT register). This bit can be cleared by writing 0x1. Default Value: 0x0
8	DYN_ADDR_ASSGN_STS	Dynamic Address Assigned Status This field is used only in Target mode of operation. This interrupt is generated when the device's Dynamic Address is assigned through SETDASA, SETAASA, SETNEWDA or ENTDAA CCC. This bit can be cleared by writing 0x1 Default Value: 0x0
6	CCC_UPDATED_STS	CCC Table Updated Status. This field is used only when functioning as a Target. This interrupt is generated if any of the CCC registers are updated by the I3C Controller through CCC commands. This interrupt can be cleared by writing 0x1. Default Value: 0x0
5	TRANSFER_ABORT_STS	Transfer Abort Status. This field is used only when functioning as the Active Controller,. This interrupt is generated if the transfer is aborted. This interrupt can be cleared by writing 0x1. Default Value: 0x0

19.1.12 I3C_CORE_INTR_STATUS (continued)

4	RESP_READY_STS	Response Queue Ready Status. This interrupt is generated when number of entries in the response queue is greater than or equal to the threshold value specified by the RESP_BUF_THLD field in the QUEUE_THLD_CTRL register. This interrupt is cleared automatically when the number of entries in the response buffer is less than the threshold value specified. Default Value: 0x0
3	CMD_- QUEUE_READY_STS	Command Queue Ready. This interrupt is generated when number of empty locations in the command queue is greater than or equal to the threshold value specified by the CMD_EMPTY_BUF_THLD field in the QUEUE_THLD_CTRL register. This interrupt is cleared automatically when the number of empty locations in the command buffer is less than the threshold value specified. Default Value: 0x0
2	IBI_THLD_STS	IBI Buffer Threshold Status. This field is only used when the block is functioning as the Active Controller. This interrupt is generated when the number of entries in the IBI buffer is greater than or equal to the threshold value specified by the IBI_BUF_THLD field in the QUEUE_THLD_CTRL register. This interrupt is cleared automatically when the number of entries in IBI buffer is less than the threshold value specified. Default Value: 0x0
1	RX_THLD_STS	Receive Buffer Threshold Status. This interrupt is generated when number of entries in the receive buffer is greater than or equal to threshold value specified by the RX_BUF_THLD field in the DATA_BUFFER_THLD_CTRL register. This interrupt is cleared automatically when the number of entries in receive buffer is less than the threshold value specified. Default Value: 0x0
0	TX_THLD_STS	Transmit Buffer Threshold Status. This interrupt is generated when the number of empty locations in the transmit buffer is greater than or equal to the threshold value specified by the TX_EMPTY_BUF_THLD field in the DATA_BUFFER_THLD_CTRL register. This interrupt is cleared automatically when the number of empty locations in transmit buffer is less than threshold value specified. Default Value: 0x0

19.1.13 I3C_CORE_INTR_STATUS_EN

Description: Interrupt Status Enable Register.

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	RX_BUF_BLR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	RX_BUF_BLR	Receive Buffer Level Value. Contains the number of valid data entries in the receive Buffer. Default Value: 0x0
7 : 0	TX_BUF_EMPTY_LOC	Transmit Buffer Empty Level Value. Contains the number of empty locations in the transmit Buffer. Default Value: 0x40

19.1.18 I3C_CORE_PRESENT_STATE

Description: Present State Register

Address: 0x42A50054

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R	R	R
HW Access	Reserved					RW	RW	RW
Name	Reserved [7:3]					ACTIVE_-CONTROL-LER	SDA_LINE_SIG-NAL_LEV-EL	SCL_LINE_SIG-NAL_LEV-EL

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved		R					
HW Access	Reserved		RW					
Name	Reserved [15:14]		CM_TFR_STS [13:8]					

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved		R					
HW Access	Reserved		RW					
Name	Reserved [23:22]		CM_TFR_ST_STS [21:16]					

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved			R	R			
HW Access	Reserved			RW	RW			
Name	Reserved [31:29]			CONTROL-LER_IDLE	CMD_TID [27:24]			

Bits	Name	Description
28	CONTROLLER_IDLE	This bit is only valid when this I3C Device is functioning the Active Controller, and reflects whether the block is in the Idle state or not. This bit is set when all the Queues (Command , Response, IBI) and Buffers (Transmit and Receive) are empty and the Controller State machine is in Idle state. Values: 0x0 Controller is not in IDLE State 0x1 Controller is in IDLE State. Default Value: 0x1
27 : 24	CMD_TID	This field reflects the Transaction-ID of the current executing command. Default Value: 0x0
