21 : 16	CM_TFR_ST_STS	Active Controller Transfer State Status. This bit is only valid when this I3C Device is functioning the Active Controller, and indicates the state of current transfer currently executing by the I3C block. Values: 0x0: IDLE (Controller is Idle state, waiting for commands from application or Target initated In-band Interrupt) 0x1: START Generation State. 0x2: RESTART Generation State. 0x3: STOP Generation State. 0x4: START Hold Generation for the Target Initiated START State. 0x5: Broadcast Write Address Header(7'h7E,W) Generation State. 0x6: Broadcast Read Address Header(7'h7E,R) Generation State. 0x7: Dynamic Address Assignment State. 0x8: Target Address Generation State. 0xB: CCC Byte Generation State. 0xC: HDR Command Generation State. 0xD: Write Data Transfer State. 0xE: Read Data Transfer State. 0xF: In-Band Interrupt (TIR) Read Data State. 0x10: In-Band Interrupt Auto-Disable State 0x11: HDR-DDR CRC Data Generation/Receive State. 0x12: Clock Extension State. 0x13: Halt State. Default Value: 0x0
13 : 8	CM_TFR_STS	Transfer Type Status. Indicates the type of transfer currently executing by the I3C block. When functioning as the Active Controller, possible values are: 0x0: IDLE (Block is in Idle state, waiting for commands from application or Target initated In-band Interrupt) 0x1: Broadcast CCC Write Transfer. 0x2: Directed CCC Write Transfer. 0x3: Directed CCC Read Transfer. 0x4: ENTDAA Address Assignment Transfer. 0x5: SETDASA Address Assignment Transfer. 0x6: Private I3C SDR Write Transfer. 0x7: Private I3C SDR Read Transfer. 0x8: Private I2C SDR Write Transfer. 0x9: Private I2C SDR Read Transfer. 0xA: Private HDR Ternary Symbol (TS) Write Transfer. 0xB: Private HDR Ternary Symbol (TS) Read Transfer. 0xC: Private HDR Double-Data Rate (DDR) Write Transfer. 0xD: Private HDR Double-Data Rate (DDR) Read Transfer. 0xE: Servicing In-Band Interrupt Transfer. 0xF: Halt state (Block is in Halt State, waiting for the application to resume through DEVICE_CTRL Register) When functioning as a Target, possible values are: 0x0: IDLE (Block is in Idle state) 0x1: Hot-Join transfer state 0x2: IBI transfer state 0x3: Controller write transfer ongoing 0x4: Read data prefetch state 0x5: Controller read transfer ongoing 0x6: Bock is controller in Halt State waiting for resume from application Default Value: 0x0
2	ACTIVE_CONTROLLER	This Bit is used to check whether the block is currently the Active Controller or not. The Active Controller is the Controller that owns the SCL line. Values: 0x0: Secondary Controller is not the Active Controller and needs to request to be the Active Controller before initiating any transfer on the line. 0x1: Secondary Controller is the Active Controller and can initiate transfers on the line. Default Value: 0x0

19.1.18 I3C_CORE_PRESENT_STATE (continued)

1	SDA_LINE_SIGNAL_LEVEL	This bit is only valid when this I3C Device is functioning the Active Controller, and is used for debug and error recovery. This bit reflects the value of the SDA line as observed inside the block (after input synchronization). Default Value: 0x1
0	SCL_LINE_SIGNAL_LEVEL	This bit is only valid when this I3C Device is functioning the Active Controller, and is used for debug and error recovery. This bit reflects the value of the SCL line as observed inside the block (after input synchronization). Default Value: 0x1

19.1.19 I3C_CORE_CCC_DEVICE_STATUS

Description: Device Operating Status Register.

Address: 0x42A50058

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R		R	Reserved	R			
HW Access	RW		RW	Reserved	RW			
Name	ACTIVITY_MODE [7:6]		PROTO-COL_ERR	Reserved	PENDING_INTR [3:0]

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
13	FRAME_ERROR	Frame Error This bit is only valid when this I3C Device is functioning as a Target, and is set when a private write request initiated by the Active Controller has a frame error in HDR-DDR/HDR-TSP/TSL mode. This is cleared only after the Active Controller reads the device status through GETSTATUS_C-CC. Default Value: 0x0
12	BUFFER_NOT_AVAIL	Buffer not available This bit is only valid when this I3C Device is functioning as a Target, and is set when a private write request initiated by the Active Controller is NACKED because of RX buffer not having RX-_BUF_THLD number of empty locations or Response buffer being full. In SDR mode of operation this is cleared when the Active Controller issues GETSTATUS CCC or upon space becoming available in the buffer and the successful completion of the next write transfer. In HDR mode of operation it is cleared only when the Active Controller issues GETSTATUS CCC. Default Value: 0x0

19.1.19 I3C_CORE_CCC_DEVICE_STATUS (continued)

11	DATA_NOT_READY	Data not ready This bit is only valid when this I3C Device is functioning as a Target, and is set when private a private read request initiated by the Active Controller is NACKED because of any of the following conditions Command FIFO Empty. Transmit FIFO threshold is not met. Response FIFO Full. This bit is cleared when the Active Controller issues GETSTATUS CCC or upon successful completion of the subsequent read transfer. Default Value: 0x0
10	OVERFLOW_ERR	Overflow Error This bit is only valid when this I3C Device is functioning as a Target, and is set when an overflow error condition is detected during a private write transfer initiated by the Active Controller. This is cleared only after the Active Controller reads the Device Status through GETSTATUS CCC. Default Value: 0x0
9	TARGET_BUSY	Target Busy This bit is set if any change is made by the Active Controller to the MRL register or occurance of any error. It is cleared after Target application resumes the block operation by writing to the RESUME bit of the DEVICE_CONTROL register. Default Value: 0x0
8	UNDERFLOW_ERR	Underflow error This bit is only valid when this I3C Device is functioning as a Target, and is set when terminates a private read transfer initiated by the Active Controller is terminated by the device because of unavailability of data in the transmit buffer. This bit is cleared only after the Active Controller reads the Device Status through a GETSTATUS CCC. Default Value: 0x0
7 : 6	ACTIVITY_MODE	Pending Interrupt This field reflects the value from I3C.CCC_GETSTATUS.ACT_MODE. Default Value: 0x0
5	PROTOCOL_ERR	Protocol Error This bit is only valid when this I3C Device is functioning as a Target, and is set when a Parity/CRC error is encountered during a private write transfer initiated by the Active Controller. Default Value: 0x0
3 : 0	PENDING_INTR	Pending Interrupt This field reflects the value from I3C.CCC_GETSTATUS.PENDING_INT. Default Value: 0x0

19.1.20 I3C_CORE_DEVICE_ADDR_TABLE_POINTER

Description: Pointer for Device Address Table

Address: 0x42A5005C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	P_DEV_ADDR_TABLE_START_ADDR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	P_DEV_ADDR_TABLE_START_ADDR [15:8]							

Bits	23	22	21	20	19	18	17	16

SW Access	Reserved	RW				R		
HW Access	Reserved	RW				R		
Name	Reserved	PRESENT_DEV_CHAR_TABLE_INDX [22:19]				DEV_CHAR_TABLE_DEPTH [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
22 : 19	PRESENT_DEV_CHAR_TABLE_INDX	Current index of the Device Characteristics Table. This field returns the current location of Device Characteristics Table index. Initially, this index points to 0. Once the complete characteristics information of a Target device is written into Device Characteristics Table during ENTDAA, this index increments by 1. The first winning device information is stored in Device Characteristics Table index 0, the second winning device information in index 1, and so on. If required, this index can be used to override the location, where characteristic information of Target devices on the I3C bus are written during ENTDAA. Hence, this field is useful only when the device is functioning as the Active Controller. During DEFTGTS CCC, the index always starts from 0. When the device is functioning as a Target, this field is read-only. Default Value: 0x0
18 : 12	DEV_CHAR_TABLE_DEPTH	Depth of Device Characteristics Table in the internal memory. Default Value: 0x2C
11 : 0	P_DEV_CHAR_TABLE_START_ADDR	Start Address of the Device Characteristics Table in the internal memory. Default Value: 0x200

19.1.22 I3C_CORE_VENDOR_SPECIFIC_REG_POINTER

Description: Pointer for Vendor Specific Registers.

Address: 0x42A5006C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	P_VENDOR_REG_START_ADDR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	P_VENDOR_REG_START_ADDR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	P_VENDOR_REG_START_ADDR	Start Address of Vendor specific registers. Default Value: 0xB0

19.1.23 I3C_CORE_TGT_MIPI_ID_VALUE

Description: I3C MIPI Manufacturer ID Register

Address: 0x42A50070

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							RW
HW Access	R							R
Name	TGT_MIPI_MFG_ID [7:1]							TGT_PROV_ID_SEL

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	TGT_MIPI_MFG_ID [15:8]							

Bits	23	22	21	20	19	18	17	16

HW Access	R							
Name	TGT_PART_ID [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	TGT_PART_ID [31:24]							

Bits	Name	Description
31 : 16	TGT_PART_ID	Specifies the Part ID of this I3C block (PID[31:16]). Default Value: 0x0
15 : 12	TGT_INST_ID	Specifies the MIPI Instance ID of this I3C block (Provisioned ID [15:12]). Default Value: 0x0
11 : 0	TGT_PID_DCR	Specifies the last 12 bit of the MIPI Provisioned ID of this I3C block (Provisioned ID [11:0]). Default Value: 0x0

19.1.25 I3C_CORE_TGT_CHAR_CTRL

Description: I3C Target Characteristic Register.

Address: 0x42A50078

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW	R	R	R	R	RW
HW Access	R		R	R	R	R	R	R
Name	DEVICE_ROLE [7:6]		HDR_CA-PABLE	BRIDGE_ID ENTIFIER	OFFLINE_-CAPABLE	IBI_PAY-LOAD	IBI_RE-QUEST_-CAPABLE	MAX_-DATA_-SPEED_LI MIT

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	DCR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	HDR_CAP [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	HDR_CAP	Default Value: 0x1
15 : 8	DCR	I3C Device Characteristic Regster (DCR) Value Default Value: 0x0
7 : 6	DEVICE_ROLE	Device Role field in Bus Characteristic Register (BCR[7:6]). This bit is set by default as 0x1 (device has Controller capabilities) and the application is not expected to change it. However, if the application chooses to operate the device as a Target-only device (no controlelr capability), then the Device Role can be overwritten as Target-only. Values: 0x0: I3C Target 0x1: I3C Controller capable The field is Reset to its default value upon HW/SW Reset. SW must program the values again after issuing reset. Default Value: 0x1
5	HDR_CAPABLE	SDR Only or SDR and HDR Capable field in Bus Characteristic Register (BCR[5]). This bit can be modified by the application if it does not want to advertize the Target's HDR capability to the Active Controller. The field is Reset to its default value upon HW/SW Reset. SW must program the values again after issuing reset. Default Value: 0x1
4	BRIDGE_IDENTIFIER	Default Value: 0x0
3	OFFLINE_CAPABLE	Default Value: 0x0

19.1.25 I3C_CORE_TGT_CHAR_CTRL (continued)

2	IBI_PAYLOAD	Default Value: 0x1
1	IBI_REQUEST_CAPABLE	Default Value: 0x1
0	MAX_DATA_SPEED_LIMIT	Max Data Speed Limitation field in Bus Characteristic Register (BCR[0]). Specifies whether or not this I3C device has a maximum data speed limitation. If this bit is set to 0, controller NACK's the GETMXDS CCC sent by the Active Controller. If this bit is set to 1, controller returns the data in MAX_DATA_SPEED and MAX_READ_TURNAROUND register in response the GETMXDS CCC sent by the Active Controller. The field is reset to its default value upon HW/SW Reset. SW must program the values again after issuing reset. Default Value: 0x1

19.1.26 I3C_CORE_TGT_MAX_LEN

Description: I3C Max Write/Read Length Register.

Address: 0x42A5007C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access	R							
Name	MXDS_MAX_RD_TURN [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 0	MXDS_MAX_RD_TURN	Specifies the maximum read turnaround time (in microseconds (us)) of this I3C device. Default Value: 0x0

19.1.28 I3C_CORE_MAX_DATA_SPEED

Description: Maximum Data Speed Register

Address: 0x42A50084

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW	RW		
HW Access	Reserved				R	R		
Name	Reserved [7:4]				MXDS_DEF_BYTE_-SUPPORT	MXDS_MAX_WR_SPEED [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [15:11]					MXDS_MAX_RD_SPEED [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW	RW		
HW Access	Reserved				R	R		
Name	Reserved [23:20]				MXDS_STO P_PERMIT	MXDS_CLK_DATA_TURN [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved					RW	RW	
HW Access	Reserved					R	R	
Name	Reserved [31:27]					MXDS_SET_ACTIVI-TY_STATE	MXDS_ACTIVITY_STATE [25:24]	

Bits	Name	Description
26	MXDS_SET_ACTIVI-TY_STATE	This bit indicates whether the Active Controller should set the Bus to the Activity State indicated in bits 25:24 before handing the Controller Role off to this I3C Device as part of the normal flow. Values: - 0x0 (SET_ACIVITY_STATE_0): The controller will not set the Bus to any Activity state. - 0x1 (SET_ACIVITY_STATE_1): The controller will set the Bus to any Activity state based on the value in 25:24 field of register Default Value: 0x0
25 : 24	MXDS_ACTIVITY_STATE	This 2-bit integer indicates whether this I3C Device initially acts with a given Activity State, after becoming Active Controller on the Bus according to the Controller handoff flow Values: - 0x0 (ACIVITY_STATE_0): Acts as Activity state 0. - 0x1 (ACIVITY_STATE_1): Acts as Activity state 1. - 0x2 (ACIVITY_STATE_2): Acts as Activity state 2. - 0x3 (ACIVITY_STATE_3): Acts as Activity state 3 Default Value: 0x0
19	MXDS_STOP_PERMIT	Specifies the stop support between write and read Values: - 0x0 (STOP_PERMIT_0): Stop after write will cancel the read. - 0x1 (STOP_PERMIT_1): Target permits the write and read to be seperated by a STOP Default Value: 0x0

19.1.28 I3C_CORE_MAX_DATA_SPEED (continued)

18 : 16	MXDS_CLK_-DATA_TURN	Specifies the clock to data turnaround time (Tsco parameter) of this I3C Target device. Values: 0x0 : 8ns 0x1 : 9ns 0x2 : 10ns 0x3 : 11ns 0x4 : 12ns > 0x4: Reserved/user Defined Default Value: 0x0
10 : 8	MXDS_MAX_RD_SPEED	Specifies the Maximum Sustained Data Rate for non-CCC messages sent by this I3C Target device to the Active Controller. Values: 0x0 : 12.5MHz 0x1 : 8MHZ 0x2 : 6MHz 0x3 : 4MHz 0x4 : 2MHz > 0x4: Reserved/User Defined Default Value: 0x0
3	MXDS_DEF_BYTE_SUP-PORT	Specifies the defining byte support of GETMXDS CCC Values: - 0x0 (DEF_BYTE_0): Defining byte is not supported for GETMXDS CCC. - 0x1 (DEF_BYTE_1): Defining byte is supported for GETMXDS CCC Default Value: 0x0
2 : 0	MXDS_MAX_WR_SPEED	Specifies the Maximum Sustained Data Rate for non-CCC messages sent by the Active Controller to this I3C Target device. Values: 0x0 : 12.5MHz 0x1 : 8MHZ 0x2 : 6MHz 0x3 : 4MHz 0x4 : 2MHz > 0x4: Reserved for future use by MIPI Alliance Default Value: 0x0

19.1.29 I3C_CORE_TGT_INTR_REQ

Description: Target Interrupt Request Register

Address: 0x42A5008C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	Reserved		RW	RW	RW		RW
HW Access	R	Reserved		R	RW	RW		RW
Name	CE3_RECOVERY	Reserved [6:5]		TS	CR	TIR_CTRL [2:1]		TIR

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	MDB [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	TIR_DATA_LENGTH [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	TIR_DATA_LENGTH	TIR Data Length This field should be programmed by the Target application to give the data length for the payload data other than the MDB byte. This field is only applicable when BCR[2] is set indicating that TIR supports payload data. Only a maximum of 4 bytes of TIR payload is supported. Default Value: 0x0
15 : 8	MDB	Mandatory Data Byte This field gives the mandatory data byte which is required to be transmitted after the Active Controller ACKs the Target address during TIR transfer. This field is only applicable when BCR[2] is set indicating that TIR supports payload data. Default Value: 0x0
7	CE3_RECOVERY	Recovery from CE3 error. When the conditions for entering CE3 error are met (expiry of application running timer and TGT_INTR_REQ[TIR] is not set to '0'), the user will program this bit for recovering from CE3 error. Upon receiving this bit, the Target will move to Controller Mode (update PRESENT_STATE.ACTIVE_CONTROLLER bit to 1) and generate a START (also clear the TGT_INTR_REQ[TIR]) and continue in generating 0x7E followed by STOP. This bit is auto cleared by the Controller after the completion of recovery and moved to Active Controller mode. Default Value: 0x0

19.1.29 I3C_CORE_TGT_INTR_REQ (continued)

4	TS	Support for Asynchronous Time Stamp (Mode-0). Enabling this bit will allow the Target to capture the Time_x0002_Stamp from external input signal 'async0_ts_cntr' during T_C1 and T_C2 markers and append it along with the Payload data. NOTE: This bit is valid only if TGT_INTR_REQ[MDB] and TGT_INTR_REQ[TIR] bits are set to '1'. Default Value: 0x0
3	CR	Controller Role Request When set, the block attempts to issue the request to become the Active Controller on the I3C bus. Once that is issued and the Active Controller accepts (ACK), or if the block is unable to issue the request, then the block clears this bit automatically and updates the IBI_STS field. If NACK response is received for the request, the block reattempts the CR upon detecting the next START condition from the Active Controller or after the Bus Available time. Once set, the application cannot clear this bit. Default Value: 0x0
2 : 1	TIR_CTRL	Target Interrupt Request Control Values: 0x0: Indicates source of TIR data to be from the registers. 0x1: Pull SDA line low and release SDA after sampling SCL low (pulled by controller). Used for CE3 recovery during Controller Handover procedure. Default Value: 0x0
0	TIR	Target Interrupt Request When set, the Target Controller attempts to issue the TIR on the I3C bus. Once issued and when the Active Controller accepts (ACK), or if the block is unable to issue the TIR, then the block clears this bit automatically and updates the IBI_STS field. If the NACK response is received for the TIR, the block reattempts the TIR upon detecting the next START condition from the Active Controller or after the Bus Available Time. Once set, the application cannot clear this bit. Default Value: 0x0

19.1.30 I3C_CORE_TGT_TIR_DATA

Name	TIR_DATA_BYTE3 [31:24]							

Bits	Name	Description
31 : 24	TIR_DATA_BYTE3	Target Interrupt Request Data Byte0 This register TGT_TIR_DATA containing four bytes of TIR Data will be in effect only when TIR_CTRL field in TGT_INTR_REQ is programmed to 00 00 provided the data length is up to 4. This field holds the first byte of TIR DATA that will be passed after the MDB when TIR is initiated by the application on writing into TIR bit in TGT_INTR_REQ Register. Default Value: 0x0
23 : 16	TIR_DATA_BYTE2	Target Interrupt Request Data Byte0 This register TGT_TIR_DATA containing four bytes of TIR Data will be in effect only when TIR_CTRL field in TGT_INTR_REQ is programmed to 00 00 provided the data length is up to 3. This field holds the first byte of TIR DATA that will be passed after the MDB when TIR is initiated by the application on writing into TIR bit in TGT_INTR_REQ Register. Default Value: 0x0
15 : 8	TIR_DATA_BYTE1	Target Interrupt Request Data Byte0 This register TGT_TIR_DATA containing four bytes of TIR Data will be in effect only when TIR_CTRL field in TGT_INTR_REQ is programmed to 00 00 provided the data length is up to 2. This field holds the first byte of TIR DATA that will be passed after the MDB when TIR is initiated by the application on writing into TIR bit in TGT_INTR_REQ Register. Default Value: 0x0

19.1.30 I3C_CORE_TGT_TIR_DATA (continued)

7 : 0	TIR_DATA_BYTE0	Target Interrupt Request Data Byte0 This register TGT_TIR_DATA containing four bytes of TIR Data will be in effect only when TIR_CTRL field in TGT_INTR_REQ is programmed to 00 00 provided the data length is up to 1. This field holds the first byte of TIR DATA that will be passed after the MDB when TIR is initiated by the application on writing into TIR bit in TGT_INTR_REQ Register. Default Value: 0x0

19.1.31 I3C_CORE_TGT_IBI_RESP

Description: Target IBI Response Register

Address: 0x42A50098

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	
HW Access	Reserved						RW	
Name	Reserved [7:2]						IBI_STS [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	TIR_RESP_DATA_LENGTH [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	TIR_RESP_DATA_LENGTH [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 8	TIR_RESP_- DATA_LENGTH	Data Length for TIR Response The value in this filed will indicate the number of bytes remaining that was not transmitted because of the Active Controller early terminating the TIR transfer Default Value: 0x0
1 : 0	IBI_STS	IBI Completion Status This field is common for TIR and CR IBIs. Values: 0x00: Reserved 0x01: IBI accepted by the Active Controller (ACK response received) 0x10: Controller Early Terminate (only for TIR with Data). 0x11: IBI Not Attempted Default Value: 0x0

19.1.32 I3C_CORE_DEVICE_CTRL_EXTENDED

Description: Device Control Extended Register

Address: 0x42A500B0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW	RW	Reserved	RW	
HW Access	Reserved			R	R	Reserved	RW	
Name	Reserved [7:5]			DEEP-_SLEEP_-CAP	GETAC-CCR_ACK_CTRL	Reserved	DEV_OPERATION_-MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
4	DEEP_SLEEP_CAP	This bit indicates the Deep Sleep capability of the Secondary Controller Device. Values: 0x0: This Device shall remain active and continue to monitor the I3C Bus to listen for these Broadcast CCCs, and shall not enter a deep sleep state from which it must be re-synchronized by the Active Controller before it can accept the Controller Role. 0x1: This Device may enter a deep sleep state during which it may miss some Broadcast DEFTGTS and DEFGRPA CCCs sent by the Active Controller. It will require re-synchronization upon re-entering a normal operating state,before it can accept the Controller Role with the GETACCCR CCC. Default Value: 0x0
3	GETACCCR_ACK_CTRL	In Target mode of operation, this bit serves as a control to ACK/NACK the GETACCCR CCC from the Active Controller. Values: 0x0: ACK GETACCCR CCC 0x1: NACK GETACCCR CCC Default Value: 0x0
1 : 0	DEV_OPERATION_-MODE	This bit is used to select the initial device role before the block is enabled. This field should only be written before the I3C block is enabled This field is automatically updated by the block once the a role change takes place. Values: 0x0: Primary Controller (starts as the Active Controller and initializes/configures the I3C bus) 0x1: Secondary Controller (starts as a Target, but can become the Active Controller) Default Value: 0x1

19.1.33 I3C_CORE_SCL_I3C_OD_TIMING

Description: SCL I3C Open Drain Timing Register

Address: 0x42A500B4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	I3C_OD_LCNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	I3C_OD_HCNT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	I3C_OD_HCNT	I3C Open Drain High Count. SCL open-drain High count (I3C) for I3C transfers targeted to I3C devices. Default Value: 0xA
7 : 0	I3C_OD_LCNT	I3C Open Drain Low Count. SCL Open-drain low count for I3C transfers targeted to I3C devices. Default Value: 0x10

19.1.34 I3C_CORE_SCL_I3C_PP_TIMING

Description: SCL I3C Push Pull Timing Register

Address: 0x42A500B8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	I3C_PP_LCNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	I3C_PP_HCNT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	I3C_PP_HCNT	I3C Push Pull High Count. SCL push-pull High count for I3C transfers targeted to I3C devices. Default Value: 0xA
7 : 0	I3C_PP_LCNT	I3C Push Pull Low Count. SCL Push-pull low count for I3C transfers targeted to I3C devices. Default Value: 0xA

19.1.35 I3C_CORE_SCL_I2C_FM_TIMING

Description: SCL I2C Fast Mode Timing Register

Address: 0x42A500BC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	I2C_FM_LCNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	I2C_FM_LCNT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	I2C_FM_HCNT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	I2C_FM_HCNT [31:24]							

Bits	Name	Description
31 : 16	I2C_FM_HCNT	I2C Fast Mode High Count The SCL open-drain high count timing for I2C fast mode transfers. Default Value: 0x10
15 : 0	I2C_FM_LCNT	I2C Fast Mode Low Count The SCL open-drain low count timing for I2C fast mode transfers. Default Value: 0x10

19.1.36 I3C_CORE_SCL_I2C_FMP_TIMING

Description: SCL I2C Fast Mode Plus Timing Register

Address: 0x42A500C0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	I2C_FMP_LCNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	I2C_FMP_LCNT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	I2C_FMP_HCNT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	I2C_FMP_HCNT	I2C Fast Mode Plus High Count The SCL open-drain high count timing for I2C fast mode plus transfers. Default Value: 0x10
15 : 0	I2C_FMP_LCNT	I2C Fast Mode Plus Low Count The SCL open-drain low count timing for I2C fast mode plus transfers. Default Value: 0x10

19.1.37 I3C_CORE_SCL_EXT_LCNT_TIMING

Description: SCL Extended Low Count Timing Register.

Address: 0x42A500C8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	I3C_EXT_LCNT_1 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	I3C_EXT_LCNT_2 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	I3C_EXT_LCNT_3 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	I3C_EXT_LCNT_4 [31:24]							

Bits	Name	Description
31 : 24	I3C_EXT_LCNT_4	I3C Extended Low Count Register 4 SDR4 uses this register field for determining the extended SCL low phase. Default Value: 0x20
23 : 16	I3C_EXT_LCNT_3	I3C Extended Low Count Register 3 SDR3 uses this register field for determining the extended SCL low phase. Default Value: 0x20
15 : 8	I3C_EXT_LCNT_2	I3C Extended Low Count Register 2 SDR2 uses this register field for determining the extended SCL low phase. Default Value: 0x20
7 : 0	I3C_EXT_LCNT_1	I3C Extended Low Count Register 1 SDR1 uses this register field for determining the extended SCL low phase. Default Value: 0x20

19.1.38 I3C_CORE_SCL_EXT_TERMN_LCNT_TIMING

Description: SCL Termination Bit Low Count Timing Register

Address: 0x42A500CC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				I3C_EXT_TERMN_LCNT [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW				Reserved			
HW Access	R				Reserved			
Name	STOP_HLD_CNT [31:28]				Reserved [27:24]			

Bits	Name	Description
31 : 28	STOP_HLD_CNT	STOP HOLD Count. Stop Hold Count in terms of core_clks which is used for generation of Stop Hold generation in Controller Mode. Default Value: 0x1
3 : 0	I3C_EXT_TERMN_LCNT	I3C Read Termination Bit Low count. Extended I3C Read Termination Bit low count for I3C Read transfers. Effective Termination-Bit Low Period is derived based on the SDR speed as shown below. SDR0 speed: I3C_PP_LCNT + I3C_EXT_TERMN_LCNT SDR1 speed: I3C_EXT_LCNT_1 + I3C_EXT_TERMN_LCNT SDR2 speed: I3C_EXT_LCNT_2 + I3C_EXT_TERMN_LCNT SDR3 speed: I3C_EXT_LCNT_3 + I3C_EXT_TERMN_LCNT SDR4 speed: I3C_EXT_LCNT_4 + I3C_EXT_TERMN_LCNT Default Value: 0x0

19.1.39 I3C_CORE_SDA_HOLD_SWITCH_DLY_TIMING

Description: SDA Hold and Mode Switch Delay Timing Register

Address: 0x42A500D0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [7:3]					SDA_OD_PP_SWITCH_DLY [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [15:11]					SDA_PP_OD_SWITCH_DLY [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [23:19]					SDA_TX_HOLD [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
18 : 16	SDA_TX_HOLD	This field controls the hold time (in terms of the CORE_CLK cycles) of the transmit data (SDA) with respect to the SCL edge in FM, FM+, SDR and DDR speed mode of operations. The valid values are 0x1 to 0x7. Others are Reserved. Default Value: 0x1
10 : 8	SDA_P-P_OD_SWITCH_DLY	This field is used to delay the sda_oe with respect to sda_out (in terms of the core clock period) while switching the transfer from PP1 (Push-Pull Mode SDA=1) to OD1 (Open- Drain SDA=1). The valid value can range from 0 to 4. Others are Reserved. Default Value: 0x0
2 : 0	SDA_OD_P-P_SWITCH_DLY	This field is used to delay the sda_oe with respect to sda_out while switching the transfer from OD1 (Open-Drain Mode SDA=1) to PP1 (Push-Pull Mode SDA=1). The valid value can range from 0 to 4. Others are reserved. Default Value: 0x0

19.1.40 I3C_CORE_BUS_FREE_AVAIL_TIMING

Description: Bus Free and Available Timing Register

Address: 0x42A500D4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	BUS_FREE_TIME [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	BUS_FREE_TIME [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	BUS_AVAILABLE_TIME [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	BUS_AVAILABLE_TIME [31:24]							

Bits	Name	Description
31 : 16	BUS_AVAILABLE_TIME	Bus Available Count Value This register field is used only When functioning as a Target. This field is used by the block to initiate an IBI after the STOP condition. Default Value: 0x20
15 : 0	BUS_FREE_TIME	I3C Bus Free Count Value This register field is used only when functioning as the Active Controller. In a Pure Bus System, this field represents the tCAS parameter. In a Mixed Bus system, this field is expected to be programmed to tLOW of I2C Timing. Default Value: 0x20

19.1.41 I3C_CORE_BUS_IDLE_TIMING

Description: Bus Idle Timing Register

Address: 0x42A500D8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	BUS_IDLE_TIME [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	BUS_IDLE_TIME [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				BUS_IDLE_TIME [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19 : 0	BUS_IDLE_TIME	Bus Idle Count Value This field is used by the block to initiate a Hot-Join request if the dynamic address is not valid. Default Value: 0x20

19.1.42 I3C_CORE_SCL_LOW_CTR_EXT_TIMEOUT

Description: SCL LOW Controller Timeout

Address: 0x42A500DC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SCL_LOW_CTR_TIMEOUT_COUNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	SCL_LOW_CTR_TIMEOUT_COUNT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	SCL_LOW_CTR_TIMEOUT_COUNT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [31:26]						SCL_LOW_CTR_TIME-OUT_COUNT [25:24]	

Bits	Name	Description
25 : 0	SCL_LOW_CTR_TIME-OUT_COUNT	This count defines the number of core clock periods to count for generation of the SCL Low Bus Reset Pattern. Default Value: 0x3567E0

19.1.43 I3C_CORE_RELEASE_SDA_TIMING

Description: Release SDA count value.

Address: 0x42A500EC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	RELEASE_SDA_TIME [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	RELEASE_SDA_TIME [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				RELEASE_SDA_TIME [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19 : 0	RELEASE_SDA_TIME	Release SDA count value This field is used in the target mode of operation to release the SDA line if SCL is not changing for a prescribed amount of time programmed in this register (RELEASE_SDA_TIME * (in terms of the core clock/pclk period). Default Value: 0x4E20

19.1.44 I3C_CORE_EXT_TX_DATA_PORT_0

Description: DWC_mipi_i3c Directed read Vendor-specific CCC 0 TX Data Port Register

Address: 0x42A50130

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access	R							
Name	EXT_TX_DATA_PORT_0 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	W							
HW Access	R							
Name	EXT_TX_DATA_PORT_0 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	W							
HW Access	R							
Name	EXT_TX_DATA_PORT_0 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	W							
HW Access	R							
Name	EXT_TX_DATA_PORT_0 [31:24]							

Bits	Name	Description
31 : 0	EXT_TX_DATA_PORT_0	Transmit Data Port for Directed Read Vendor CCC 0. This port is mapped to the Directed Read Vendor CCC 0 Tx_x0002_Data Buffer. The transmit data should always be packed as 4-byte aligned data words and written to the Transmit Data Port register. If the Command length is not aligned to 4-bytes, then the additional bytes are ignored. Default Value: 0x0

19.1.45 I3C_CORE_EXT_TX_DATA_PORT_1

Description: DWC_mipi_i3c Directed read Vendor-specific CCC 1 TX Data Port Register

Address: 0x42A50134

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access	R							
Name	EXT_TX_DATA_PORT_1 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	W

Bits	Name	Description
31	LEGACY_I2C_DEVICE	Legacy I2C Device Values: 0x0: Device is an I3C Device 0x1: Device is a Legacy I2C Device Default Value: Undefined
30 : 29	DEV_NACK_RE-TRY_CNT	This field is used to set the Device NACK Retry count for the particular device. If the Device NACKs for the device address, the block automatically retries the transfer until this count expires. If the Target NACKs for the mentioned number of retries, then the block generates an error response and moves to the Halt state. This feature is used for Retry Model for the following features mentioned in the I3C Specification: => Retry Model for Direct GET CCC Commands => The incoming TIR-IBI matches with the Target address initated by the Active Controller Default Value: Undefined
23 : 16	DEV_DYNAMIC_ADDR	Device Dynamic Address with parity. This field consists of a Dynamic Address and a Parity Bit. The LSBs [22:16] consist of the Dynamic Address to be assigned for the winning I3C device when using ENTDAA command. The MSB [23] is the odd parity of the 7-bit Dynamic Address used for ENTDAA address assignment (~XOR(DEV_DYNAMIC_ADDR[22:16]) Default Value: Undefined

19.1.99 I3C_CORE_DEV_ADDR_TABLE_LOC1 (continued)

15	TS	Marker for Timestamping IBI for specific device. Whether IBI was timestamped or not is provided in IBI Status Descriptor. Default Value: Undefined
14	CR_REJECT	In-Band Controller Request Reject field is used to control, per device, whether to accept Controller Request from Devices. Values: 0x0: Accept: ACK the Controller Request 0x1: Reject: NACK the Controller Request and send auto disable CCC. Default Value: Undefined
13	TIR_REJECT	In-Band Target Interrupt Request Reject This field is used when operating as the Active Controller to control, per device, whether to accept Target Interrupt request from this device. Values: 0x0: Accept: ACK the TIR 0x1: Reject: NACK the TIR and send auto disable CCC. Default Value: Undefined
12	IBI_WITH_DATA	Mandatory one or more data bytes follow the accepted IBI from the device. Data byte continuation is indicated by T-Bit. Values: 0x0: IBI Without Mandatory Byte 0x1: IBI with one or more Mandatory Bytes. Default Value: Undefined
11	IBI_PEC_EN	Packet Error Check enabled for accepted IBI from the device. PEC byte is appended at the end of IBI data from the device. This bit controls whether PEC check should be performed for IBI data from device. This bit also controls whether PEC byte has to be send for auto disable CCC when the block NACKs the IBI. Values: 0x0: Packet Error Check disabled for IBI 0x1: Packet Error Check enabled for IBI Default Value: Undefined
6 : 0	DEV_STATIC_ADDR	Device Static Address. Default Value: Undefined

Bits	Name	Description
31	LEGACY_I2C_DEVICE	Legacy I2C Device Values: 0x0: Device is a Legacy I2C Device 0x1: Device is an I3C Device Default Value: Undefined
30 : 29	DEV_NACK_RE-TRY_CNT	This field is used to set the Device NACK Retry count for the particular device. If the Device NACKs for the device address, the block automatically retries the transfer until this count expires. If the Target NACKs for the mentioned number of retries, then the block generates an error response and moves to the Halt state. This feature is used for Retry Model for the following features mentioned in the I3C Specification: => Retry Model for Direct GET CCC Commands => The incoming TIR-IBI matches with the Target address initated by the Active Controller Default Value: Undefined
23 : 16	DEV_DYNAMIC_ADDR	Device Dynamic Address with parity. This field consists of a Dynamic Address and a Parity Bit. The LSBs [22:16] consist of the Dynamic Address to be assigned for the winning I3C device when using ENTDAA command. The MSB [23] is the odd parity of the 7-bit Dynamic Address used for ENTDAA address assignment (~XOR(DEV_DYNAMIC_ADDR[22:16]) Default Value: Undefined

19.1.105 I3C_CORE_DEV_ADDR_TABLE_LOC7 (continued)

15	TS	Marker for Timestamping IBI for specific device. Whether IBI was timestamped or not is provided in IBI Status Descriptor. Default Value: Undefined
14	CR_REJECT	In-Band Controller Request Reject field is used to control, per device, whether to accept Controller Request from Devices. Values: 0x0: Accept: ACK the Controller Request 0x1: Reject: NACK the Controller Request and send auto disable CCC. Default Value: Undefined
13	TIR_REJECT	In-Band Target Interrupt Request Reject This field is used when operating as the Active Controller to control, per device, whether to accept Target Interrupt request from this device. Values: 0x0: Accept: ACK the TIR 0x1: Reject: NACK the TIR and send auto disable CCC. Default Value: Undefined
12	IBI_WITH_DATA	Mandatory one or more data bytes follow the accepted IBI from the device. Data byte continuation is indicated by T-Bit. Values: 0x0: IBI Without Mandatory Byte 0x1: IBI with one or more Mandatory Bytes. Default Value: Undefined
11	IBI_PEC_EN	Packet Error Check enabled for accepted IBI from the device. PEC byte is appended at the end of IBI data from the device. This bit controls whether PEC check should be performed for IBI data from device. This bit also controls whether PEC byte has to be send for auto disable CCC when the block NACKs the IBI. Values: 0x0: Packet Error Check disabled for IBI 0x1: Packet Error Check enabled for IBI Default Value: Undefined
6 : 0	DEV_STATIC_ADDR	Device Static Address. Default Value: Undefined

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	I3C Block Pre-Enable When disabled, all write accesses to the I3C configuration registeres are ignored. Enable this preior to starting the configuration of the I3C block. Values: 0x0: Disable the I3C block 0x1: Pre-Enable the I3C block Default Value: 0

19.1.111 I3C_TGT_STATUS

Description: This register provides additional status information when functioning as a Target.

Address: 0x42A50418

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							WAKEUP

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [15:9]							I2C_GLITCH_FIL-TER_EN

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	IBI_PAYLOAD_SIZE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	IBI_PAYLOAD_SIZE	IBI Payload Size This field provides the application with the expected IBI Payload Size as configured by in the I3C bus by the Active Controller via the SETMRL CCC. Default Value: 1
8	I2C_GLITCH_FILTER_EN	Default Value: 1
0	WAKEUP	Target wakeup signal This field is only valid when functioning as a Target. Default Value: 0

19.1.112 I3C_CCC_GETSTATUS

Description: This register provides additional information on GETSTATUS CCCs received when functioning as a Target.

Address: 0x42A50424

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				PENDING_INT [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [31:26]						ACT_MODE [25:24]	

Bits	Name	Description
25 : 24	ACT_MODE	Target activity mode for GETSTATUS CCC. This bit is only valid when functioning as a Target. The value is propagated to the I3C Target and providing in response to an incoming GETSTATUS CCC with Format 1 (LSB bits 7:6). Default Value: 0
19 : 16	PENDING_INT	Pending interrupt info for GETSTATUS CCC. This bit is only valid when functioning as a Target. The value is propagated to the I3C Target and providing in response to an incoming GETSTATUS CCC with Format 1 (LSB bits 3:0). Default Value: 0

19.1.113 I3C_TIMING_CNT_CTRL

Description: Controls the Counter used for timestamping I3C-relevant events, especially when communicating with Asynchronous Timing Control Mode 0 enabled.

Address: 0x42A5042C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW1C	Reserved					
HW Access	R	RW	Reserved					
Name	CNT_EN-ABLE	CNT_RE-SET	Reserved [29:24]					

Bits	Name	Description
31	CNT_ENABLE	Enable the counter Default Value: 0
30	CNT_RESET	Resets the counter. This bit is automatically set to 0 after the reset is applied. Default Value: 0

19.1.114 I3C_TIMING_CNT0

Description: Most Significant Bits of the Counter

Address: 0x42A50430

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_MSB [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_MSB [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_MSB [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_MSB [31:24]							

Bits	Name	Description
31 : 0	TIMING_COUNTER_MSB	Most-Significant Bits of the timing counter used for I3C timing control. In Target mode, these bits shall be ignored because the counter is only 16 bit. Default Value: 0

19.1.115 I3C_TIMING_CNT1

Description: Least Significant Bits of the Counter

Address: 0x42A50434

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_LSB [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_LSB [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_LSB [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	TIMING_COUNTER_LSB [31:24]							

Bits	Name	Description
31 : 0	TIMING_COUNTER_LSB	Least-Significant Bits of the timing counter used for I3C timing control In Target mode, bits 31:16 shall be ignored because the counter is only 16 bit. Default Value: 0

20 Pulse Density Modulation- Pulse Code Modulation (PDM-PCM) Converter registers

This section discusses the PDM- PCM converter registers. It lists all the registers in mapping tables, in address order.

20.1 Register details

Register name	Address	Description
PDM0_CTL	0x44400000	Control
PDM0_CTL_CLR	0x44400004	Control clear
PDM0_CTL_SET	0x44400008	Control set
PDM0_CLOCK_CTL	0x44400010	Clock control
PDM0_ROUTE_CTL	0x44400020	Route control
PDM0_TEST_CTL	0x44400030	Test control
PDM0_FIR0_COEFF0	0x44400100	FIR 0 coefficients 0
PDM0_FIR0_COEFF1	0x44400104	FIR 0 coefficients 1
PDM0_FIR0_COEFF2	0x44400108	FIR 0 coefficients 2
PDM0_FIR0_COEFF3	0x4440010C	FIR 0 coefficients 3
PDM0_FIR0_COEFF4	0x44400110	FIR 0 coefficients 4
PDM0_FIR0_COEFF5	0x44400114	FIR 0 coefficients 5
PDM0_FIR0_COEFF6	0x44400118	FIR 0 coefficients 6
PDM0_FIR0_COEFF7	0x4440011C	FIR 0 coefficients 7
PDM0_FIR1_COEFF0	0x44400140	FIR 1 coefficients 0
PDM0_FIR1_COEFF1	0x44400144	FIR 1 coefficients 1
PDM0_FIR1_COEFF2	0x44400148	FIR 1 coefficients 2
PDM0_FIR1_COEFF3	0x4440014C	FIR 1 coefficients 3
PDM0_FIR1_COEFF4	0x44400150	FIR 1 coefficients 4
PDM0_FIR1_COEFF5	0x44400154	FIR 1 coefficients 5
PDM0_FIR1_COEFF6	0x44400158	FIR 1 coefficients 6
PDM0_FIR1_COEFF7	0x4440015C	FIR 1 coefficients 7
PDM0_FIR1_COEFF8	0x44400160	FIR 1 coefficients 8
PDM0_FIR1_COEFF9	0x44400164	FIR 1 coefficients 9
PDM0_FIR1_COEFF10	0x44400168	FIR 1 coefficients 10
PDM0_FIR1_COEFF11	0x4440016C	FIR 1 coefficients 11
PDM0_FIR1_COEFF12	0x44400170	FIR 1 coefficients 12
PDM0_FIR1_COEFF13	0x44400174	FIR 1 coefficients 13
PDM0_CH0_CTL	0x44408000	Control

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5 : 0	ACTIVE	Activate functionality (1 bit for each channel): '0': Reception disabled. The FIFO_OVERFLOW interrupt cause will not be activated. '1': Reception enabled. The FIFO_OVERFLOW interrupt may be activated (when an overflow event occurs). Note: This functionality is intended for startup purposes. Typically, the startup sequence is as follows: - global registers CLOCK_CTL, ROUTE_CTL, TEST_CTL, FIR*_COEFF* are initialized - One or more structures are enabled (structure specific CTL.ENABLED register field is set to '1'). - The structures are initialized (structure specific MMIO registers are written). - The structures are activated. This last step is performed by writing the CTL or CTL_SET MMIO registers, or on a rising edge ('0' to '1' transition) of a receiver's "tr_activate" input trigger. Note: on a rising edge ('0' to '1' transition) of a receiver's "tr_activate" input trigger, its associated CTL.ACTIVE field is set to '1'. This allows HW based synchronization of PDM receiver activation based on system triggers. Implementation note: the trigger is synchronized on the receiver clock with the receiver reset (this requires the receiver to be enabled; i.e. CTL.ENABLED is '1'). Note: if CTL_CLR.ACTIVE[i] is written to '1' at the same time a rising edge of "tr_activate[i]" occurs, CTL.ACTIVE[i] is set to '1' (i.e. trigger takes precedence). Default Value: 0

20.1.2 PDM0_CTL_CLR

Description: Control clear

20.1.4 PDM0_CLOCK_CTL

Description: Clock control

Address: 0x44400010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	CLOCK_DIV [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [15:10]						CLOCK_SEL [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [23:17]							HALVE

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	HALVE	Halve rate sampling: '0': Full rate sampling. The PDM interface clock pdm_clk is as specified by CLOCK_DIV[]. Each captured PDM value is provided once to the CIC filter. '1': Halve rate sampling. The PDM interface clock clk_pdm is as specified by CLOCK_DIV[] divided by two (halve the frequency). Each PDM value is captured twice and provided twice to the CIC filter; i.e. the PDM value is repeated. Note: this field is provided to dynamically change the digital microphone's clock (pdm_clk) without affecting the PDM sample frequency towards the CIC filter. Halving the microphone clock results in lower system power consumption, but does lower audio quality. Default Value: 0 **0x0: FULL :** **0x1: HALVE :**
9 : 8	CLOCK_SEL	Interface clock clk_if selection: "0": SRSS clock clk_if_srss. "1": IOSS data input signal "pdm_data[0]". "2": IOSS data input signal "pdm_data[1]". "3": undefined. Note: when a data input signal is used as a clock source, it cannot be used as a data line. Note: the application is always required to program this field to a value different from the default. Default Value: 3 **0x0: SEL_SRSS_CLOCK :**

20.1.4 PDM0_CLOCK_CTL (continued)

		0x1: SEL_PDM_DATA0 :
		0x2: SEL_PDM_DATA1 :
		0x3: SEL_OR :
7 : 0	CLOCK_DIV	PDM interface clock divider (legal range [3, 255]). The PDM interface clock clk_pdm ("pdm_clk[]" output signals) is defined as pdm_clk = clk_if / (CLOCK_DIV + 1); i.e. each PDM interface clock cycle equals CLOCK_DIV + 1 clk_if clock cycles. CLOCK_DIV should be set to an odd value ([3, 5, ..., 255]), to ensure a 50/50% duty cycle PDM interface clock pdm_clk. "0-2": Illegal value. "3": pdm_clk frequency is 1/4 clk_if frequency (1 pdm_clk cycle consists of 4 clk_if cycles). "4": pdm_clk frequency is 1/5 clk_if frequency. Note: results in a non 50/50% duty cycle pdm_-clk). ... "255": pdm_clk frequency is 1/256 clk_if frequency. Default Value: 7
		0x3: DIV_BY_4 :
		0x4: DIV_BY_5 :
		0xff: DIV_BY_256 :

20.1.5 PDM0_ROUTE_CTL

Description: Route control

Address: 0x44400020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW					
HW Access	Reserved		R					
Name	Reserved [7:6]		DATA_SEL [5:0]					

Bits	15	14	13	12	11	10	9	8

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5 : 0	DATA_SEL	Specifies which IOSS data input signal "pdm_data[]" is routed to a specific PDM receiver. Each PDM receiver j has a dedicated 1-bit control field: PDM receiver j uses DATA_SEL[j]. The 1-bit field DATA_SEL[j] specification is as follows: '0': PDM receiver j uses data input signal "pdm_data[j]". '1': PDM receiver j uses data input signal "pdm_data[j ^ 1]" (the lower bit of the index is inverted). Routing the same data input signal to two PDM receivers allows for: - A single stereo digital microphone. - Two (mono) digital microphones that share a data line. E.g., if DATA_SEL is 0b00000010, PDM receivers 0 and 1 BOTH use "pdm_data[0]". Default Value: 0

20.1.6 PDM0_TEST_CTL

Description: Test control

Address: 0x44400030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DRIVE_DELAY_HI [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	DRIVE_DELAY_LO [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW				RW		RW	
HW Access	R				R		R	
Name	AUDIO_FREQ_DIV [23:20]				MODE_LO [19:18]		MODE_HI [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	CH_ENABLED [31:24]							

Bits	Name	Description
31 : 24	CH_ENABLED	Pattern generator enable (1 bit for each channel): '0' : disabled, the channel input is taken as normal from external pin pdm_data_in '1' : enabled, the channel input is taken from the pattern generator Note: the pattern generator output is routed to pdm_data_out for testing purposes Note: when all channels are disabled the pattern generator is switched off Default Value: 0
23 : 20	AUDIO_FREQ_DIV	Frequency division factor (legal range [3, 13]) to obtain audio frequency from the PDM clock frequency. This field determines the frequency of the sine wave generated by the pattern generator when MODE=3. The formula is below: Sine wave Frequency = PDM clock frequency / 2p*2^(AUDIO_FREQ_DIV) Example: when PDM clock frequency = 3.072 MHz the audio frequencies obtained for the various values of AUDIO_FREQ_DIV are shown below: "3" : 61.115 kHz "4" : 30.558 kHz "5" : 15.279 kHz "6" : 7.639 kHz "7" : 3.820 kHz "8" : 1.910 kHz "9" : 955 Hz "10" : 477 Hz "11" : 239 Hz "12" : 119 Hz "13" : 60 Hz Default Value: 7

20.1.6 PDM0_TEST_CTL (continued)

		0x3: DIV_PDM_FREQ_BY_2PI_x_8 : Example: 3.072 MHz/(2p*8) = 61.115 kHz **0x4: DIV_PDM_FREQ_BY_2PI_x_16 :** Example: 3.072 MHz/(2p*16) = 30.558 kHz **0xd: DIV_PDM_FREQ_BY_2PI_x_8192 :** Example: 3.072 MHz/(2p*8192) = 60 Hz
19 : 18	MODE_LO	Pattern generator mode on the low phase of the PDM interface clock. This field specifies the type of pattern driven by the generator: "0": constant 0's "1": constant 1's "2": alternating 0's and 1's (clock pattern) "3": sine wave Default Value: 3 **0x0: CONSTANT_0 :** **0x1: CONSTANT_1 :** **0x2: ALTERNATING :** **0x3: SINUSOID :**
17 : 16	MODE_HI	Pattern generator mode on the high phase of the PDM interface clock. This field specifies the type of PDM pattern driven by the generator: "0": constant 0's "1": constant 1's "2": alternating 0's and 1's (clock pattern) "3": sinusoid Default Value: 3 **0x0: CONSTANT_0 :** **0x1: CONSTANT_1 :** **0x2: ALTERNATING :** **0x3: SINUSOID :**
15 : 8	DRIVE_DELAY_LO	Interface drive delay on the low phase of the PDM interface clock. This field specifies when a PDM value is driven expressed in clk_if clock cycles. DRIVE_DELAY should be set in the range [0, IF_CTL.CLOCK_DIV]: "0": Drive PDM value 1 clk_if cycle after the rising edge of clk_pdm. "1": Drive PDM value 2 clk_if cycles after the rising edge of clk_pdm. ... "255": Drive PDM value 256 clk_if cycles after the rising edge of clk_pdm. Note: To drive on the falling edge of the PDM interface clock clk_pdm, DRIVE_DELAY should be set to IF_CTL.CLOCK_DIV/2. To drive on the rising edge of clk_pdm, DRIVE_DELAY should be set to IF_CTL.CLOCK_DIV. Default Value: 4 **0x0: DELAY_1 :** **0x1: DELAY_2 :**

20.1.6 PDM0_TEST_CTL (continued)

		0xff: DELAY_256 :
7 : 0	DRIVE_DELAY_HI	Interface drive delay on the high phase of the PDM interface clock. This field specifies when a PDM value is driven expressed in clk_if clock cycles. DRIVE_DELAY should be set in the range [0, IF_CTL.CLOCK_DIV]: "0": Drive PDM value 1 clk_if cycle after the rising edge of clk_pdm. "1": Drive PDM value 2 clk_if cycles after the rising edge of clk_pdm. ... "255": Drive PDM value 256 clk_if cycles after the rising edge of clk_pdm. Note: To drive on the falling edge of the PDM interface clock clk_pdm, DRIVE_DELAY should be set to IF_CTL.CLOCK_DIV/2. To drive on the rising edge of clk_pdm, DRIVE_DELAY should be set to IF_CTL.CLOCK_DIV. Default Value: 0 **0x0: DELAY_1 :** **0x1: DELAY_2 :** **0xff: DELAY_256 :**

Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	Receiver enable: '0': Disabled. If a receiver is disabled, all non-retained MMIO registers (e.g. the RX_FIFO_STATUS and INTR_RX registers) have their fields reset to their default value. '1': Enabled. Note: when all receivers are disabled, the SRAMs are driven into low power mode, if supported by the SRAM. When exiting such low power mode software needs to allow for a certain power up time before SRAM can be used, i.e. before ACTIVE can be asserted. The power up time is equivalent to the system SRAM power up time specified in the CPUSS.RAM_PWR_DELAY_CTL register. Default Value: 0
8	WORD_SIGN_EXTEND	Word extension: '0': zero extension. '1': sign extension. Default Value: 1 **0x0: ZERO_EXTEND :** **0x1: SIGN_EXTEND :**

20.1.29 PDM0_CH0_CTL (continued)

3 : 0	WORD_SIZE	PCM word size: "0": 8 bit. "1": 10 bit. "2": 12 bit. "3": 14 bit. "4": 16 bit. "5": 18 bit. "6": 20 bit. "7": 24 bit. "8": 32 bit. "9"-"15": Undefined. Default Value: 0 **0x0: SIZE_8 :** **0x1: SIZE_10 :** **0x2: SIZE_12 :** **0x3: SIZE_14 :** **0x4: SIZE_16 :** **0x5: SIZE_18 :** **0x6: SIZE_20 :** **0x7: SIZE_24 :** **0x8: SIZE_32 :**

20.1.30 PDM0_CH0_IF_CTL

Description: Interface control

Address: 0x44408010

Retention: Retained

Bits	7	6	5	4	3	2	1	0

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	SAMPLE_DELAY	Interface sample delay. This field specifies when a PDM value is captured, expressed in clk_if clock cycles. When CLOCK_CTL.HALVE=0: "0": Capture PDM value 1 clk_if cycle after the rising edge of clk_pdm. "1": Capture PDM value 2 clk_if cycles after the rising edge of clk_pdm. ... "255": Capture PDM value 256 clk_if cycles after the rising edge of clk_pdm. When CLOCK_CTL.HALVE=1: "0": Capture PDM value 1 and 2 clk_if cycles after the rising edge of clk_pdm. "1": Capture PDM value 3 and 4 clk_if cycles after the rising edge of clk_pdm. ... "255": Capture PDM value 511 and 512 clk_if cycles after the rising edge of clk_pdm. SAMPLE_DELAY should be set such that the clk_if capture edge is at the middle point between pdm_clk_out edges. Under ideal conditions the middle point is 1/4 of the PDM interface period for the first/even/left channel, and 3/4 of the PDM interface period for the second/odd/right channel, which corresponds to the following programmings: SAMPLE_DELAY(left)=((CLOCK_DIV+1)/4) - 1 SAMPLE_DELAY(right)=(3*(CLOCK_DIV+1)/4) - 1 In practice, due to the roundtrip delay, SAMPLE_DELAY may be set to a later point with respect to the ideal middle point. Note: in all cases a SAMPLE_DELAY value that brings the capture edge close to the pdm_clk_out edges should be avoided. Default Value: 3 **0x0: DELAY_1 :** **0x1: DELAY_2 :**

Bits	Name	Description
2 : 0	DECIM_CODE	CIC filter decimation. The CIC filter PCM frequency is a fraction of the PDM frequency: "0": CIC filter PCM frequency is 1/2 * PDM frequency. CIC PCM values are in the range [-0x10, 0x10]. "1": CIC filter PCM frequency is 1/4 * PDM frequency. CIC PCM values are in the range [-0x200, 0x200]. "2": CIC filter PCM frequency is 1/8 * PDM frequency. CIC PCM values are in the range [-0x4000, 0x4000]. "3": CIC filter PCM frequency is 1/16 * PDM frequency. CIC PCM values are in the range [-0x8:0000, 0x8:0000]. "4": CIC filter PCM frequency is 1/32 * PDM frequency. CIC PCM values are in the range [-0x100:0000, 0x100:0000]. "5"-"7": Illegal values. Note: The CIC filter functionality includes offsetting logic to ensure that "digital silence" on the PDM interface (an alternating pattern of '0', '1', '0', '1' ... PDM values) results in CIC filter PCM values of "0". Similarly, a pattern of '0', '0', '0', ... PDM values results in minimum CIC PCM value (-0x100:0000 when DECIMATION is "4") and a pattern of '1', '1', '1', ... PDM values results in maximum CIC PCM value (0x100:0000 when DECIMATION is "4"). Note: The IP's desired "clk_sys" frequency is a function of the PDM interface clock, the CIC filter decimation (CIC_CTL.DECIM_CODE[]) and the FIR filter decimation (FIR_CTL.DEC-IM_CODE[]). Default Value: 4 **0x0: DECIM_2 :** **0x1: DECIM_4 :**

20.1.31 PDM0_CH0_CIC_CTL (continued)

0x2: DECIM_8 :

0x3: DECIM_16 :

0x4: DECIM_32 :

This is the default value and the most realistic value (together with the value "3"). Typically, an overall decimation (or oversample rate (OSR)) of 64 is used, and this is achieved with the default CIC and FIR decimation values.

20.1.32 PDM0_CH0_FIR0_CTL

Description: FIR 0 control

Address: 0x44408018

Retention: Retained

Bits	Name	Description
8	IF_OVERFLOW	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0
4	FIR_OVERFLOW	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0
2	FIFO_UNDERFLOW	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0
1	FIFO_OVERFLOW	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0
0	FIFO_TRIGGER	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0

21 Inter- IC Sound Bus (I2S) registers

This section discusses the I2S registers. It lists all the registers in mapping tables, in address order.

21.1 Register details

Register name	Address	Description
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_CTL	0x44418000	TX control
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_IF_CTL	0x44418010	TX interface control
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_CH_CTL	0x44418014	TX channel control
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_TEST_CTL	0x44418020	TX test control
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_ROUTE_CTL	0x44418024	TX route control
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_CTL	0x44418080	TX FIFO control
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_STATUS	0x44418084	TX FIFO status
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_WR	0x44418088	TX FIFO write
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX	0x444180C0	Interrupt
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_SET	0x444180C4	Interrupt set
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_MASK	0x444180C8	Interrupt mask
TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_MASKED	0x444180CC	Interrupt masked
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_CTL	0x44418100	RX control
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_IF_CTL	0x44418110	RX interface control
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_CH_CTL	0x44418114	RX channel control
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_TEST_CTL	0x44418120	RX test control
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_ROUTE_CTL	0x44418124	RX route control
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_CTL	0x44418180	RX FIFO control
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_STATUS	0x44418184	RX FIFO status
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_RD	0x44418188	RX FIFO read

Inter- IC Sound Bus (I2S) registers

Register name	Address	Description
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_RD_SILENT	0x4441818C	RX FIFO silent read
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_INTR_RX	0x444181C0	Interrupt
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_INTR_RX_SET	0x444181C4	Interrupt set
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_INTR_RX_MASK	0x444181C8	Interrupt mask
TDM0_TDM_STRUCT0_TDM_RX_STRUCT_INTR_RX_MASKED	0x444181CC	Interrupt masked
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_CTL	0x44418200	TX control. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_IF_CTL	0x44418210	TX interface control. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_IF_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_CH_CTL	0x44418214	TX channel control. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_CH_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_TEST_CTL	0x44418220	TX test control. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_TEST_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_ROUTE_CTL	0x44418224	TX route control. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_ROUTE_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_FIFO_CTL	0x44418280	TX FIFO control. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_FIFO_STATUS	0x44418284	TX FIFO status. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_STATUS for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_TX_FIFO_WR	0x44418288	TX FIFO write. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_WR for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_INTR_TX	0x444182C0	Interrupt. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_INTR_TX_SET	0x444182C4	Interrupt set. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_SET for the details of bit fields.

Inter- IC Sound Bus (I2S) registers

Register name	Address	Description
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_INTR_TX_MASK	0x444182C8	Interrupt mask. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_MASK for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_TX_STRUCT_INTR_TX_MASKED	0x444182CC	Interrupt masked. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_MASKED for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_CTL	0x44418300	RX control. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_IF_CTL	0x44418310	RX interface control. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_IF_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_CH_CTL	0x44418314	RX channel control. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_CH_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_TEST_CTL	0x44418320	RX test control. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_TEST_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_ROUTE_CTL	0x44418324	RX route control. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_ROUTE_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_FIFO_CTL	0x44418380	RX FIFO control. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_CTL for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_FIFO_STATUS	0x44418384	RX FIFO status. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_STATUS for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_FIFO_RD	0x44418388	RX FIFO read. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_RD for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_RX_FIFO_RD_SILENT	0x4441838C	RX FIFO silent read. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_RD_SILENT for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_INTR_RX	0x444183C0	Interrupt. See TDM0_TDM_STRUCT0_TDM_RX_STRUCT_INTR_RX for the details of bit fields.

Inter- IC Sound Bus (I2S) registers

Register name	Address	Description
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_INTR_RX_SET	0x444183C4	Interrupt set. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_SET for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_INTR_RX_MASK	0x444183C8	Interrupt mask. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_MASK for the details of bit fields.
TDM0_TDM_STRUCT1_TDM_RX_STRUCT_INTR_RX_MASKED	0x444183CC	Interrupt masked. See TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_MASKED for the details of bit fields.

21.1.1 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_CTL

Description: TX control

Address: 0x44418000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				WORD_SIZE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved		RW		Reserved			
HW Access	Reserved		R		Reserved			
Name	Reserved [15:14]		FORMAT [13:12]		Reserved [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [23:17]							MS

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	Transmitter (TX) enable: '0': Disabled. All non-retained MMIO registers (e.g. the TX_FIFO_STATUS and INTR_TX registers) have their fields reset to their default value. '1': Enabled. Note: when all transmitters and receivers are disabled, the SRAMs are driven into low power mode, if supported by the SRAM. When exiting such low power mode software needs to allow for a certain power up time before SRAM can be used, i.e. before ACTIVE can be asserted. Default Value: 0
16	MS	Master/slave setting: '0': Slave. - Externally driven signals: "tdm_tx_sck_in" and frame sync "tdm_tx_fsync_in" '1': Master. - Interface clock "clk_if" is used to generate transmitter "tdm_tx_sck_out" and transmitter "tdm_tx_fsync_out". Default Value: 1 **0x0: SLAVE :** **0x1: MASTER :**
13 : 12	FORMAT	Format: "0": Left-aligned delayed. "1": Left-aligned. "2": Right-aligned delayed. "3": Right-aligned. Default Value: 0

21.1.1 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_CTL (continued)

		0x0: LEFT_DELAYED :
		0x1: LEFT :
		0x2: RIGHT_DELAYED :
		0x3: RIGHT :
3 : 0	WORD_SIZE	PCM word size: "0": 8 bit. "1": 10 bit. "2": 12 bit. "3": 14 bit. "4": 16 bit. "5": 18 bit. "6": 20 bit. "7": 24 bit. "8": 32 bit. "9"-"15": Undefined. Default Value: 0
		0x0: SIZE_8 :
		0x1: SIZE_10 :
		0x2: SIZE_12 :
		0x3: SIZE_14 :
		0x4: SIZE_16 :
		0x5: SIZE_18 :
		0x6: SIZE_20 :
		0x7: SIZE_24 :
		0x8: SIZE_32 :

21.1.2 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_IF_CTL

Description: TX interface control

Address: 0x44418010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	CLOCK_DIV [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW	Reserved	RW	RW	Reserved	RW		
HW Access	R	Reserved	R	R	Reserved	R		
Name	FSYNC_-FORMAT	Reserved	FSYN-C_POLARI-TY	SCK_PO-LARITY	Reserved	CLOCK_SEL [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [23:21]			CH_NR [20:16]				

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved		RW				
HW Access	R	Reserved		R				
Name	I2S_MODE	Reserved [30:29]		CH_SIZE [28:24]				

Bits	Name	Description
31	I2S_MODE	I2S mode setting: '0': TDM mode. '1': I2S mode. Default Value: 0 **0x0: TDM :** **0x1: I2S :**
28 : 24	CH_SIZE	Channel size: "0"-"2": Undefined/illegal. "3": 4 bits. ... "31": 32 bits. Note: if TX_CTL.WORD_SIZE is greater than CH_SIZE, the more significant bits of the word are transmitted and the lesser significant bits of the word are dropped. Default Value: 31 **0x0: SIZE_1 :** **0x1: SIZE_2 :** **0x1f: SIZE_32 :**

21.1.2 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_IF_CTL (continued)

20 : 16	CH_NR	Number of channels in the frame: "0": Undefined/illegal. "1": 2 channels. "2": 3 channels. ... "31": 32 channels. Note: the field value should be less than CH_NR (the number of support channels). Note: the TX_CH_CTL.CH_EN fields can be used to enable/disable indvidual channels. Default Value: 1
15	FSYNC_FORMAT	Channel synchronization pulse format: '0': Duration of a single bit period. '1': Duration of the first channel. Default Value: 1 **0x0: BIT_PERIOD :** **0x1: CH_PERIOD :**
13	FSYNC_POLARITY	Channel synchronization polarity: '0': Channel synchronization signal is used "as is". '1': Channel synchronization signal is inverted. Note: Used in BOTH master and slave configurations. Default Value: 0
12	SCK_POLARITY	Clock polarity: '0': Clock signal is used "as is". '1': Clock signal is inverted. Note: Used in BOTH master and slave configurations. Default Value: 0
10 : 8	CLOCK_SEL	Interface clock "clk_if" selection: "0": SRSS clock clk_if_srss[0]. "1": SRSS clock clk_if_srss[1]. "2": SRSS clock clk_if_srss[2]. "3": SRSS clock clk_if_srss[3]. "4": Master interface clock "tdm_tx_mck_in". "5"-"7": undefined. Note: the application is always required to program this field to a value different from the default. Default Value: 7 **0x0: SEL_SRSS_CLOCK0 :** **0x1: SEL_SRSS_CLOCK1 :** **0x2: SEL_SRSS_CLOCK2 :** **0x3: SEL_SRSS_CLOCK3 :** **0x4: SEL_TDM_TX_MCK_IN :**
7 : 0	CLOCK_DIV	Interface clock divider (legal range [1, 255]). The TDM interface "tdm_tx_sck_out" output signal is defined as clk_if / (CLOCK_DIV + 1). CLOCK_DIV should be set to an odd value ({1, 3, 5, ..., 255}), to ensure a 50/50% duty cycle clock. Note: Used in master configuration only. Default Value: 7 **0x0: DIV_BY_1 :** illegal **0x1: DIV_BY_2 :**

21.1.2 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_IF_CTL (continued)

0xff: DIV_BY_256 :

21.1.3 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_CH_CTL

Description: TX channel control

Address: 0x44418014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	CH_EN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	CH_EN	Channel enables: channel i is controlled by CH_EN[i]. '0': Disabled. The TX FIFO does not produce channel i words and the transmitted channel i words on the interface are not driven (the output enable of the "tdm_tx_sd_out" output signal is not driven). '1': Enabled. Note: Only bit 0 through TX_IF_CTL.CH_NR may be set to '1'; i.e. only channels that are present in the frame can be enabled. Default Value: 0

21.1.4 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_TEST_CTL

Description: TX test control

Address: 0x44418020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	Test mode enable. '0': Disabled. Functional mode. - Transmitter tx_sck_in = IOSS tdm_tx_sck_in. - Transmitter tx_fsync_in = IOSS tdm_tx_fsync_in. - Receiver rx_sd_in = IOSS tdm_rx_sd_in. '1': Enabled. Test mode (intended to be used with (slave transmitter, master receiver) configuration). - Transmitter tx_sck_in = Receiver tdm_rx_sck_out. - Transmitter tx_fsync_in = Receiver tdm_rx_fsync_out. - Receiver rx_sd_in = Transmitter tdm_tx_sd_out. Note: TX_TEST_CTL.ENABLED and RX_TEST_CTL.ENABLED should not be set to '1' simultaneously. Default Value: 0 **0x0: FUNCTIONAL :** **0x1: TEST :**

21.1.5 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_ROUTE_CTL

Description: TX route control

Address: 0x44418024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [7:2]						MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1 : 0	MODE	Controls routing to the TX slave signalling inputs (FSYNC/SCK): '0': TX slave signaling indipendent from RX signaling: - Transmitter tx_sck_in = IOSS tdm_tx_sck_in - Transmitter tx_fsync_in = IOSS tdm_tx_fsync_in '1': TX slave signalling inputs driven by RX Slave: - Transmitter tx_sck_in = IOSS tdm_rx_sck_in - Transmitter tx_fsync_in = IOSS tdm_rx_fsync_in '2': TX slave signalling inputs driven by RX Master: - Transmitter tx_sck_in = receiver tdm_rx_sck_out - Transmitter tx_fsync_in = receiver tdm_rx_fsync_out Note: MODE=0 is the default behaviour. MODE=1 or 2 is intended to allow the TX slave to share the same signaling used by the RX. This feature can be used to reduce the number of IO pins necessary to connect to an external codec supporting common TX/RX signaling. Note: when MODE=1 or 2, TX_TEST_CTL.ENABLED and RX_TEST_CTL.ENABLED should not be set to '1'. Default Value: 0 **0x0: TX_IN_DRIVEN_BY_IOSS_TX_IN :** **0x1: TX_IN_DRIVEN_BY_IOSS_RX_IN :** **0x2: TX_IN_DRIVEN_BY_RX_OUT :**

21.1.6 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_CTL

Description: TX FIFO control

Address: 0x44418080

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	RW						
HW Access	Reserved	R						
Name	Reserved	TRIGGER_LEVEL [6:0]						

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					R	R	R
Name	Reserved [23:19]					ACTIVE	FREEZE	MUTE

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
18	ACTIVE	Activate functionality: '0': Transmitter off. The FIFO_UNDERFLOW interrupt cause will not be activated. '1': Transmitter on. The FIFO_UNDERFLOW interrupt may be activated (when an underflow event occurs). Note: This functionality is intended for startup purposes. Default Value: 0
17	FREEZE	Freeze functionality: '0': HW uses TX FIFO data and advances the FIFO read pointer. '1': HW uses a constant PCM data value of "0" or the previous channel PCM data is replayed. Freeze does not advance the FIFO read pointer (the FIFO data is not used). Note: HW ensures that freeze functionality synchronizes on the first channel of a frame to ensure that PCM data of one channel is not misassigned to another channel. As a result, the freeze functionality can be activated at any time. Note: This functionality is intended for debugging purposes. Default Value: 0
16	MUTE	Mute functionality: '0': HW uses TX FIFO data. '1': HW uses a constant PCM data value of "0". Mute does advance the FIFO read pointer. Note: HW ensures that mute functionality synchronizes on the first channel of a frame to ensure that either all or none of the frame's channels are muted. Default Value: 0
6 : 0	TRIGGER_LEVEL	Trigger level. When the TX FIFO has less entries than the number of this field, a transmitter trigger event is generated: - INTR_TX.FIFO_TRIGGER = (# FIFO entries < TRIGGER_LEVEL) Default Value: 0

HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved	R						
HW Access	Reserved	W						
Name	Reserved	RD_PTR [22:16]						

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved	R						
HW Access	Reserved	W						
Name	Reserved	WR_PTR [30:24]						

Bits	Name	Description
30 : 24	WR_PTR	TX FIFO write pointer: FIFO location at which a new data is written by the hardware. Note: This functionality is intended for debugging purposes. Default Value: 0
22 : 16	RD_PTR	TX FIFO read pointer: FIFO location from which a data is read. Note: This functionality is intended for debugging purposes. Default Value: 0
7 : 0	USED	Number of used/occupied entries in the TX FIFO. The field value is in the range [0, 128]. When "0", the FIFO is empty. When "128", the FIFO is full. Default Value: 0 **0x0: EMPTY :** **0x0: USED_0 :** **0x1: USED_1 :** **0x80: FULL :** **0x80: USED_128 :**

21.1.8 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_TX_FIFO_WR

Description: TX FIFO write

Address: 0x44418088

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W							
HW Access	R							
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	W							
HW Access	R							
Name	DATA [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	W

Bits	31	30	29	28	27	26	25	24
SW Access	W							
HW Access	R							
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	Data (PCM sample) written to the TX FIFO. Writing adds the data to the TX FIFO; i.e. behavior is similar to that of a PUSH operation (TX_FIFO_STATUS.WR_PTR is incremented and TX_FIFO_STATUS.USED is incremented). The write data (DATA) should be right aligned when it is written to the FIFO entry (data[31:0]): - 8 bit, data[31:0] = DATA[7:0] << 24. - 10 bit, data[31:0] = DATA[9:0] << 22. - 12 bit, data[31:0] = DATA[11:0] << 20. - 14 bit, data[31:0] = DATA[13:0] << 18. - 16 bit, data[31:0] = DATA[15:0] << 16. - 18 bit, data[31:0] = DATA[17:0] << 14. - 20 bit, data[31:0] = DATA[19:0] << 12. - 24 bit, data[31:0] = DATA[23:0] << 8. - 32 bit, data[31:0] = DATA[31:0]. Note: Writing to a full TX FIFO activates INTR.TX_FIFO_OVERFLOW. Default Value: 0

21.1.9 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX

Description: Interrupt

Address: 0x444180C0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW1C	RW1C	RW1C
HW Access	Reserved					RW1S	RW1S	RW1S
Name	Reserved [7:3]					FIFO_UNDERFLOW	FIFO_OVERFLOW	FIFO_TRIGGER

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW1C
HW Access	Reserved							RW1S
Name	Reserved [15:9]							IF_UNDERFLOW

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	IF_UNDERFLOW	HW sets this field to '1', when PCM samples are not generated in time for the interface logic (interface underflow). This may be an indication that the IP system frequency is too low wrt. the interface frequency (a SW configuration error). The interface underflow is a non-recoverable error and requires SW disabling of the channel (a SW write to INTR_TX.IF_UNDERFLOW does not resolve the interface underflow). Note: This functionality is intended for debug purposes. Default Value: 0
2	FIFO_UNDERFLOW	HW sets this field to '1', when reading from an (almost) empty TX FIFO (TX_FIFO_STATUS.USED < "number of enabled channels per frame"). This is referred to as an underflow event. Note: HW ensures that either all or none of the frame's channels are transmitted. In a TX FIFO underflow situation, HW replays previous PCM data or uses a constant PCM data value of "0". Default Value: 0
1	FIFO_OVERFLOW	HW sets this field to '1', when writing to a full TX FIFO (TX_FIFO_STATUS.USED is "128"). Default Value: 0
0	FIFO_TRIGGER	HW sets this field to '1', when a TX trigger is generated. Default Value: 0

21.1.10 TDM0_TDM_STRUCT0_TDM_TX_STRUCT_INTR_TX_SET

Description: Interrupt set

Bits	Name	Description
31	ENABLED	Receiver (RX) enable: '0': Disabled. All non-retained MMIO registers (e.g. the RX_FIFO_STATUS and INTR_RX registers) have their fields reset to their default value. '1': Enabled. Note: when all transmitters and receivers are disabled, the SRAMs are driven into low power mode, if supported by the SRAM. When exiting such low power mode software needs to allow for a certain power up time before SRAM can be used, i.e. before ACTIVE can be asserted. Default Value: 0
16	MS	Master/slave setting: '0': Slave. - Externally driven signas: clock "tdm_rx_sck_in" and frame sync "tdm_rx_fsync_in". '1': Master. - Interface clock "clk_if" is used to generate receiver "tdm_rx_sck_out" and receiver "tdm_rx_fsync_out". Default Value: 0 **0x0: SLAVE :** **0x1: MASTER :**
13 : 12	FORMAT	Format: "0": Left-aligned delayed. "1": Left-aligned. "2": Right-aligned delayed. "3": Right-aligned. Default Value: 0

Name	Reserved [23:21]			CH_NR [20:16]				

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW		RW				
HW Access	R	R		R				
Name	I2S_MODE	LATE_CAPTURE [30:29]		CH_SIZE [28:24]				

Bits	Name	Description
31	I2S_MODE	I2S mode setting: '0': TDM mode. '1': I2S mode. Default Value: 0 **0x0: TDM :** **0x1: I2S :**
30 : 29	LATE_CAPTURE	Extra delay (in "rx_sck_out" cycles) for capturing "tdm_rx_sd_in": "0": no extra delay "1": 1 cycle extra delay "2": 2 cycles extra delay "3": 3 cycles extra delay Note: the value of this field pushes further out the capturing edges used by the receiver to sample "tdm_rx_sd_in". This function is intended to support very large round-trip delays in a master receiver configuration, where the delay at the receiver between "tdm_rx_fsync_out" and the arrival of the first bit on "tdm_rx_sd_in" is multiple clock cycles. Default Value: 0 **0x0: EXTRA_DELAY_0 :** **0x1: EXTRA_DELAY_1 :**

21.1.14 TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_IF_CTL (continued)

		0x2: EXTRA_DELAY_2 :
		0x3: EXTRA_DELAY_3 :
28 : 24	CH_SIZE	Channel size: "0"-"2": Undefined/illegal. "3": 4 bits. ... "31": 32 bits. Note: if RX_CTL.WORD_SIZE is greater than CH_SIZE, the lesser significant bits of the word are filled with '0's. Default Value: 31 **0x0: SIZE_1 :** **0x1: SIZE_2 :** **0x1f: SIZE_32 :**
20 : 16	CH_NR	Number of channels in the frame: "0": Undefined/illegal. "1": 2 channels. "2": 3 channels. ... "31": 32 channels. Note: the field value chould be less than CH_NR (the number of support channels). Note: the RX_CH_CTL.CH_EN fields can be used to enable/disable indvidual channels. Default Value: 1
15	FSYNC_FORMAT	Channel synchronization pulse format: '0': Duration of a single bit period. '1': Duration of the first channel. Default Value: 1 **0x0: BIT_PERIOD :** **0x1: CH_PERIOD :**
14	LATE_SAMPLE	Interface late sample sample delay: Slave configuration (RX_CTL.MS is '0'). '0': Sample PCM bit value on rising edge (SCK_POLARITY is '0') or falling edge (SCK_POLARITY is '1') of receiver "rx_sck_in". '1': Sample PCM bit value on falling edge (SCK_POLARITY is '0') or rising edge (SCK_POLARITY is '1') of receiver "rx_sck_in" (half a cycle delay). Master configuration (RX_CTL.MS is '1'). '0': Sample PCM bit value on rising edge (SCK_POLARITY is '0') or falling edge (SCK_POLARITY is '1') of receiver "rx_sck_out". '1': Sample PCM bit value on falling edge (SCK_POLARITY is '0') or rising edge (SCK_POLARITY is '1') of receiver "rx_sck_out" (half a cycle delay). Note: This field can be set to '1' when the roundtrip delay is large (typically) in a master receiver configuration. Default Value: 0 **0x0: RISING :** **0x1: FALLING :**
13	FSYNC_POLARITY	Channel synchronization polarity: '0': Channel synchronization signal is used "as is". '1': Channel synchronization signal is inverted. Note: Used in BOTH master and slave configurations. Default Value: 0

21.1.14 TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_IF_CTL (continued)

12	SCK_POLARITY	Clock polarity: '0': Clock signal is used "as is". '1': Clock signal is inverted. Note: Used in BOTH master and slave configurations. Default Value: 0
10 : 8	CLOCK_SEL	Interface clock "clk_if" selection: "0": SRSS clock clk_if_srss[0]. "1": SRSS clock clk_if_srss[1]. "2": SRSS clock clk_if_srss[2]. "3": SRSS clock clk_if_srss[3]. "4": Master interface clock "tdm_rx_mck_in". "5"-"7": undefined. Note: the application is always required to program this field to a value different from the default. Default Value: 7 **0x0: SEL_SRSS_CLOCK0 :** **0x1: SEL_SRSS_CLOCK1 :** **0x2: SEL_SRSS_CLOCK2 :** **0x3: SEL_SRSS_CLOCK3 :** **0x4: SEL_TDM_RX_MCK_IN :**
7 : 0	CLOCK_DIV	Interface clock divider (legal range [1, 255]). The TDM interface "tdm_rx_sck_out" output signals is defined as clk_if / (CLOCK_DIV + 1). CLOCK_DIV should be set to an odd value ({1, 3, 5, ..., 255}), to ensure a 50/50% duty cycle clock. Note: Used in master configuration only. Note: Due to delays in the IO SubSystem (specifically the IO cells), the maximum TDM interface clock "tdm_rx_sck_out" may be restricted. As a result, the maximum bitrate is less than the theoretical maximum (32 channels, 32 bits per channel and a high Fs of e.g. 48 kHz). This restriction is most applicable to the master, receiver configuration. Default Value: 7 **0x0: DIV_BY_1 :** illegal **0x1: DIV_BY_2 :** **0xff: DIV_BY_256 :**

21.1.15 TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_CH_CTL

Description: RX channel control

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved	R						
HW Access	Reserved	W						
Name	Reserved	WR_PTR [30:24]						

Bits	Name	Description
30 : 24	WR_PTR	RX FIFO write pointer: FIFO location at which a new data is written by the hardware. Note: This functionality is intended for debugging purposes. Default Value: 0
22 : 16	RD_PTR	RX FIFO read pointer: FIFO location from which a data is read. Note: This functionality is intended for debugging purposes. Default Value: 0
7 : 0	USED	Number of used/occupied entries in the RX FIFO. The field value is in the range [0, 128]. When "0", the FIFO is empty. When "128", the FIFO is full. Default Value: 0 **0x0: EMPTY :** **0x0: USED_0 :** **0x1: USED_1 :** **0x80: FULL :** **0x80: USED_128 :**

21.1.20 TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_RD

Description: RX FIFO read

Address: 0x44418188

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	DATA [31:24]							

Bits	Name	Description
31 : 0	DATA	Data (PCM sample) read from the RX FIFO. Reading removes the data from the RX FIFO; i.e. behavior is similar to that of a POP operation (RX_FIFO_STATUS.RD_PTR is incremented and RX_FIFO_STATUS.USED is decremented). The read data (DATA) is right aligned (unused bit positions follow the specified sign extension per RX_CTL.WORD_SIGN_EXTEND) when it is read from the FIFO entry (data[31:0]): - 8 bit, DATA[7:0] = data[31:24]. - 10 bit, DATA[9:0] = data[31:22]. - 12 bit, DATA[11:0] = data[31:20]. - 14 bit, DATA[13:0] = data[31:18]. - 16 bit, DATA[15:0] = data[31:16]. - 18 bit, DATA[17:0] = data[31:14]. - 20 bit, DATA[19:0] = data[31:12]. - 24 bit, DATA[23:0] = data[31:8]. - 32 bit, DATA[31:0] = data[31:0]. Note: Reading from an empty RX FIFO activates INTR_RX.FIFO_UNDERFLOW. Default Value: 0

21.1.21 TDM0_TDM_STRUCT0_TDM_RX_STRUCT_RX_FIFO_RD_SILENT

Description: RX FIFO silent read

Address: 0x4441818C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	IF_OVERFLOW	HW sets this field to '1', when PCM samples are generated too fast by the interface logic (interface overflow). This may be an indication that the IP system frequency is too low wrt. the interface frequency (a SW configuration error). The interface overflow is a non-recoverable error and requires SW disabling of the channel (a SW write to INTR_RX.IF_OVERFLOW does not resolve the interface underflow). Note: This functionality is intended for debug purposes. Default Value: 0
2	FIFO_UNDERFLOW	HW sets this field to '1', when reading from an empty RX FIFO (RX_FIFO_STATUS.USED is "0"). Default Value: 0
1	FIFO_OVERFLOW	HW sets this field to '1', when writing to a (almost) full RX FIFO (128 -RX_FIFO_STATUS.USED < "number of enabled channels per frame"). This is referred to as an overflow event. Note: HW ensures that either all or none of the frame's channels are received. In a RX FIFO overflow situation, HW discards received PCM data values. Default Value: 0
0	FIFO_TRIGGER	HW sets this field to '1', when a RX trigger is generated. Default Value: 0

21.1.23 TDM0_TDM_STRUCT0_TDM_RX_STRUCT_INTR_RX_SET

Description: Interrupt set

Address: 0x444181C4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW1S	RW1S	RW1S
HW Access	Reserved					A	A	A
Name	Reserved [7:3]					FIFO_UNDERFLOW	FIFO_OVERFLOW	FIFO_TRIGGER

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [15:9]							IF_OVERFLOW

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	IF_OVERFLOW	Write this field with '1' to set corresponding INTR_RX field (a write of '0' has no effect). Default Value: 0
2	FIFO_UNDERFLOW	Write this field with '1' to set corresponding INTR_RX field (a write of '0' has no effect). Default Value: 0
1	FIFO_OVERFLOW	Write this field with '1' to set corresponding INTR_RX field (a write of '0' has no effect). Default Value: 0
0	FIFO_TRIGGER	Write this field with '1' to set corresponding INTR_RX field (a write of '0' has no effect). Default Value: 0

21.1.24 TDM0_TDM_STRUCT0_TDM_RX_STRUCT_INTR_RX_MASK

Description: Interrupt mask

Address: 0x444181C8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					R	R	R
Name	Reserved [7:3]					FIFO_UNDERFLOW	FIFO_OVERFLOW	FIFO_TRIGGER

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							IF_OVERFLOW

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	IF_OVERFLOW	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0
2	FIFO_UNDERFLOW	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0
1	FIFO_OVERFLOW	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0
0	FIFO_TRIGGER	Logical AND of corresponding INTR_RX and INTR_RX_MASK fields. Default Value: 0

22 Serial Memory Interface (SMIF) registers

This section discusses the SMIF registers. It lists all the registers in mapping tables, in address order.

22.1 Register details

Register name	Address	Description
SMIF0_CACHE_BLOCK_HWPARAMS	0x44450000	Hardware Parameter register
SMIF0_CACHE_BLOCK_CTRL	0x44450010	Control Register
SMIF0_CACHE_BLOCK_NSEC_ACCESS	0x44450014	Non-secure access information
SMIF0_CACHE_BLOCK_MAINT_CTRL_ALL	0x44450020	Maintenance control for the entire cache
SMIF0_CACHE_BLOCK_MAINT_CTRL_LINES	0x44450024	Maintenance control for individual lines
SMIF0_CACHE_BLOCK_MAINT_STATUS	0x44450028	Maintenance status for the cache
SMIF0_CACHE_BLOCK_SECIRQSTAT	0x44450100	Secure Interrupt Request Status register
SMIF0_CACHE_BLOCK_SECIRQSCLR	0x44450104	Secure Interrupt Status Clear register
SMIF0_CACHE_BLOCK_SECIRQEN	0x44450108	Secure Interrupt Enable register
SMIF0_CACHE_BLOCK_SECIRQINFO1	0x4445010C	Secure transfer error information 1
SMIF0_CACHE_BLOCK_SECIRQINFO2	0x44450110	Secure transfer error information 2
SMIF0_CACHE_BLOCK_NSECIRQSTAT	0x44450140	Non-secure Interrupt Request Status register
SMIF0_CACHE_BLOCK_NSECIRQSCLR	0x44450144	Non-secure Interrupt Status Clear register
SMIF0_CACHE_BLOCK_NSECIRQEN	0x44450148	Non-secure Interrupt Enable register
SMIF0_CACHE_BLOCK_NSECIRQINFO1	0x4445014C	Non-secure transfer error information 1
SMIF0_CACHE_BLOCK_NSECIRQINFO2	0x44450150	Non-secure transfer error information 2
SMIF0_CACHE_BLOCK_SECHIT	0x44450300	Secure transfers Hit register
SMIF0_CACHE_BLOCK_SECMISS	0x44450304	Secure transfers Miss register
SMIF0_CACHE_BLOCK_SECSTATCTRL	0x44450308	Secure transfers statistic counters control
SMIF0_CACHE_BLOCK_NSECHIT	0x44450310	Non-secure transfers Hit register
SMIF0_CACHE_BLOCK_NSECMISS	0x44450314	Non-secure transfers Miss register
SMIF0_CACHE_BLOCK_NSECSTATCTRL	0x44450318	Non-secure transfers statistic counters control
SMIF0_CACHE_BLOCK_PMSVR0	0x44450600	Saved Value Register 0 - Secure Hit
SMIF0_CACHE_BLOCK_PMSVR1	0x44450604	Saved Value Register 1 - Secure Miss
SMIF0_CACHE_BLOCK_PMSVR2	0x44450608	Saved Value Register 2 - Non-secure Hit
SMIF0_CACHE_BLOCK_PMSVR3	0x4445060C	Saved Value Register 3 - Non-secure Miss
SMIF0_CACHE_BLOCK_PMSSSR	0x44450680	PMU Snapshot Status Register
SMIF0_CACHE_BLOCK_PMSSCR	0x444506F0	PMU Snapshot Capture Register
SMIF0_CACHE_BLOCK_PMSSRR	0x444506F4	PMU Snapshot Reset Register
SMIF0_CACHE_BLOCK_PIDR4	0x44450FD0	Peripheral ID 4
SMIF0_CACHE_BLOCK_PIDR5	0x44450FD4	Peripheral ID 5
SMIF0_CACHE_BLOCK_PIDR6	0x44450FD8	Peripheral ID 6
SMIF0_CACHE_BLOCK_PIDR7	0x44450FDC	Peripheral ID 7
SMIF0_CACHE_BLOCK_PIDR0	0x44450FE0	Peripheral ID 0

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CACHE_BLOCK_PIDR1	0x44450FE4	Peripheral ID 1
SMIF0_CACHE_BLOCK_PIDR2	0x44450FE8	Peripheral ID 2
SMIF0_CACHE_BLOCK_PIDR3	0x44450FEC	Peripheral ID 3
SMIF0_CACHE_BLOCK_CIDR0	0x44450FF0	Component ID 0
SMIF0_CACHE_BLOCK_CIDR1	0x44450FF4	Component ID 1
SMIF0_CACHE_BLOCK_CIDR2	0x44450FF8	Component ID 2
SMIF0_CACHE_BLOCK_CIDR3	0x44450FFC	Component ID 3
SMIF0_CACHE_BLOCK_MMIO_BYPASS_WI	0x44452000	Bypass wrap to increment conversion logic
SMIF0_CACHE_BLOCK_MMIO_MASTER_ID	0x44452004	The cache generates transactions (linefill and eviction Write-Back) that are marked with the value specified by MASTER_ID on hmaster_m.
SMIF0_CACHE_BLOCK_MMIO_DIS_CACHE_EN_MAINT	0x44452008	This signal turns on/off cache enable maintenance.
SMIF0_CACHE_BLOCK_MMIO_DIS_CACHE_DIS_MAINT	0x4445200C	This signal turns on/off cache disable maintenance.
SMIF0_CACHE_BLOCK_MMIO_APB_VIOLATION_RESP	0x44452010	This signal controls if the APB interface of cache responds with an error to illegal operations on the APB interface. Illegal operations on the APB interface include Writing with no full write strobe, Accessing non-word aligned addresses, Instruction accesses, Non-privileged accesses 1 - The Cache responds with an APB error. Read data is masked with zeros and write data is ignored. 0 - The Cache sends an OK response. Read data is masked with zeros and write data is ignored.
SMIF0_CACHE_BLOCK_MMIO_MMIO_ACTIVE_EN	0x44452014	SW control to put SMIF.6 in active or clock gated mode
SMIF0_CACHE_BLOCK_MMIO_POWER_ON_ENABLE	0x44452018	This signal configures the cache to enable the cache automatically after powerup.
SMIF0_CACHE_BLOCK_MMIO_MMIO_CACHE_RET_EN	0x4445201C	Controls if cache SRAMs are retained during DPSLP
SMIF0_CACHE_BLOCK_MMIO_DIS_PWR_DOWN_MAINT	0x44452020	This signal turns on/off powerdown maintenance.
SMIF0_CACHE_BLOCK_MMIO_REGION0_BASE	0x44452024	Region 0 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle
SMIF0_CACHE_BLOCK_MMIO_REGION0_LIMIT	0x44452028	Region 0 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CACHE_BLOCK_MMIO_REGION1_BASE	0x4445202C	Region 1 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle
SMIF0_CACHE_BLOCK_MMIO_REGION1_LIMIT	0x44452030	Region 1 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle
SMIF0_CACHE_BLOCK_MMIO_REGION2_BASE	0x44452034	Region 2 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle
SMIF0_CACHE_BLOCK_MMIO_REGION2_LIMIT	0x44452038	Region 2 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle
SMIF0_CACHE_BLOCK_MMIO_REGION3_BASE	0x4445203C	Region 3 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle
SMIF0_CACHE_BLOCK_MMIO_REGION3_LIMIT	0x44452040	Region 3 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CFG	0x44454000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system.
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CTRL	0x44454100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc)
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_MAX	0x44454104	Max value of block-based index register
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_CFG	0x44454108	Block size & initialization in progress
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_IDX	0x4445410C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_LUT	0x44454110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_CTRL	0x44454200	Control register with lock bit and auto-increment only

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_MAX	0x44454208	Max value of block-based index register for ROT
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG	0x4445420C	Same as BLK_CFG
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_IDX	0x44454210	Index of 8-block group accessed through ROT_BLK_LUT_*
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_PC	0x44454214	Protection context of 8-block group accesses through ROT_BLK_LUT
SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG	0x44454218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC
SMIF0_CORE_CTL	0x44460000	Control
SMIF0_CORE_STATUS	0x44460004	Status
SMIF0_CORE_CTL2	0x44460008	Control 2
SMIF0_CORE_DLP_DELAY_TAP_SEL0	0x44460010	DLP Delay Tap Select Register 0
SMIF0_CORE_DLP_DELAY_TAP_SEL1	0x44460014	DLP Delay Tap Select Register 1
SMIF0_CORE_DLP_CTL	0x44460018	DLP Control Register
SMIF0_CORE_DLP_STATUS0	0x44460020	DLP Status Register 0
SMIF0_CORE_DLP_STATUS1	0x44460024	DLP Status Register 1
SMIF0_CORE_TX_CMD_FIFO_STATUS	0x44460044	Transmitter command FIFO status
SMIF0_CORE_TX_CMD_MMIO_FIFO_STATUS	0x44460048	Transmitter command MMIO FIFO status
SMIF0_CORE_TX_CMD_MMIO_FIFO_WR	0x44460050	Transmitter command MMIO FIFO write
SMIF0_CORE_TX_DATA_MMIO_FIFO_CTL	0x44460080	Transmitter data MMIO FIFO control
SMIF0_CORE_TX_DATA_FIFO_STATUS	0x44460084	Transmitter data FIFO status
SMIF0_CORE_TX_DATA_MMIO_FIFO_STATUS	0x44460088	Transmitter data MMIO FIFO status
SMIF0_CORE_TX_DATA_MMIO_FIFO_WR1	0x44460090	Transmitter data MMIO FIFO write
SMIF0_CORE_TX_DATA_MMIO_FIFO_WR2	0x44460094	Transmitter data MMIO FIFO write
SMIF0_CORE_TX_DATA_MMIO_FIFO_WR4	0x44460098	Transmitter data MMIO FIFO write
SMIF0_CORE_TX_DATA_MMIO_FIFO_WR1ODD	0x4446009C	Transmitter data MMIO FIFO write
SMIF0_CORE_RX_DATA_MMIO_FIFO_CTL	0x444600C0	Receiver data MMIO FIFO control
SMIF0_CORE_RX_DATA_MMIO_FIFO_STATUS	0x444600C4	Receiver data MMIO FIFO status
SMIF0_CORE_RX_DATA_FIFO_STATUS	0x444600C8	Receiver data FIFO status
SMIF0_CORE_RX_DATA_MMIO_FIFO_RD1	0x444600D0	Receiver data MMIO FIFO read
SMIF0_CORE_RX_DATA_MMIO_FIFO_RD2	0x444600D4	Receiver data MMIO FIFO read
SMIF0_CORE_RX_DATA_MMIO_FIFO_RD4	0x444600D8	Receiver data MMIO FIFO read
SMIF0_CORE_RX_DATA_MMIO_FIFO_RD1_SILENT	0x444600E0	Receiver data MMIO FIFO silent read
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_CMD	0x44460200	Cryptography command
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_ADDR	0x44460204	Cryptography base address
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_MASK	0x44460208	Cryptography mask

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION	0x4446020C	Cryptography subregion disable
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0	0x44460220	Cryptography input 0
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1	0x44460224	Cryptography input 1
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2	0x44460228	Cryptography input 2
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3	0x4446022C	Cryptography input 3
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY0	0x44460240	Cryptography key 0
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY1	0x44460244	Cryptography key 1
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY2	0x44460248	Cryptography key 2
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY3	0x4446024C	Cryptography key 3
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT0	0x44460260	Cryptography output 0
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT1	0x44460264	Cryptography output 1
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT2	0x44460268	Cryptography output 2
SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT3	0x4446026C	Cryptography output 3
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_CMD	0x44460280	Cryptography command. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_CMD for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_ADDR	0x44460284	Cryptography base address. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_ADDR for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_MASK	0x44460288	Cryptography mask. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_MASK for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_SUBREGION	0x4446028C	Cryptography subregion disable. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_INPUT0	0x444602A0	Cryptography input 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_INPUT1	0x444602A4	Cryptography input 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_INPUT2	0x444602A8	Cryptography input 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_INPUT3	0x444602AC	Cryptography input 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_KEY0	0x444602C0	Cryptography key 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY0 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO1_CRYPTO_KEY1	0x444602C4	Cryptography key 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY1 for the details of bit fields.

SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_INPUT0	0x444603A0	Cryptography input 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_INPUT1	0x444603A4	Cryptography input 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_INPUT2	0x444603A8	Cryptography input 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_INPUT3	0x444603AC	Cryptography input 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_KEY0	0x444603C0	Cryptography key 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY0 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_KEY1	0x444603C4	Cryptography key 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY1 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_KEY2	0x444603C8	Cryptography key 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY2 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_KEY3	0x444603CC	Cryptography key 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY3 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT0	0x444603E0	Cryptography output 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT0 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT1	0x444603E4	Cryptography output 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT1 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT2	0x444603E8	Cryptography output 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT2 for the details of bit fields.
SMIF0_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT3	0x444603EC	Cryptography output 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT3 for the details of bit fields.
SMIF0_CORE_INTR	0x444607C0	Interrupt register
SMIF0_CORE_INTR_SET	0x444607C4	Interrupt set register
SMIF0_CORE_INTR_MASK	0x444607C8	Interrupt mask register
SMIF0_CORE_INTR_MASKED	0x444607CC	Interrupt masked register
SMIF0_CORE_DLL_IDAC	0x444607D8	DLL IDAC (when DLL runs in open loop, selects the delay of the delay line)
SMIF0_CORE_DLL_IVR	0x444607DC	DLL IVR (Contol Output Voltage of internal Voltage Regulator)
SMIF0_CORE_DEVICE0_CTL	0x44460800	Control
SMIF0_CORE_DEVICE0_ADDR	0x44460808	Device region base address

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_DEVICE0_MASK	0x4446080C	Device region mask
SMIF0_CORE_DEVICE0_ADDR_CTL	0x44460820	Address control
SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG	0x44460828	RX capture configuration
SMIF0_CORE_DEVICE0_RD_CMD_CTL	0x44460840	Read command control
SMIF0_CORE_DEVICE0_RD_ADDR_CTL	0x44460844	Read address control
SMIF0_CORE_DEVICE0_RD_MODE_CTL	0x44460848	Read mode control
SMIF0_CORE_DEVICE0_RD_DUMMY_CTL	0x4446084C	Read dummy control
SMIF0_CORE_DEVICE0_RD_DATA_CTL	0x44460850	Read data control
SMIF0_CORE_DEVICE0_RD_BOUND_CTL	0x44460858	Read boundary control
SMIF0_CORE_DEVICE0_WR_CMD_CTL	0x44460860	Write command control
SMIF0_CORE_DEVICE0_WR_ADDR_CTL	0x44460864	Write address control
SMIF0_CORE_DEVICE0_WR_MODE_CTL	0x44460868	Write mode control
SMIF0_CORE_DEVICE0_WR_DUMMY_CTL	0x4446086C	Write dummy control
SMIF0_CORE_DEVICE0_WR_DATA_CTL	0x44460870	Write data control
SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0	0x44460878	HB FW Calibration Delay Tap Select 0
SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1	0x4446087C	HB FW Calibration Delay Tap Select 1
SMIF0_CORE_DEVICE1_CTL	0x44460880	Control. See SMIF0_CORE_DEVICE0_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_ADDR	0x44460888	Device region base address. See SMIF0_CORE_DEVICE0_ADDR for the details of bit fields.
SMIF0_CORE_DEVICE1_MASK	0x4446088C	Device region mask. See SMIF0_CORE_DEVICE0_MASK for the details of bit fields.
SMIF0_CORE_DEVICE1_ADDR_CTL	0x444608A0	Address control. See SMIF0_CORE_DEVICE0_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_RX_CAPTURE_CONFIG	0x444608A8	RX capture configuration. See SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG for the details of bit fields.
SMIF0_CORE_DEVICE1_RD_CMD_CTL	0x444608C0	Read command control. See SMIF0_CORE_DEVICE0_RD_CMD_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_RD_ADDR_CTL	0x444608C4	Read address control. See SMIF0_CORE_DEVICE0_RD_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_RD_MODE_CTL	0x444608C8	Read mode control. See SMIF0_CORE_DEVICE0_RD_MODE_CTL for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_DEVICE1_RD_DUMMY_CTL	0x444608CC	Read dummy control. See SMIF0_CORE_DEVICE0_RD_DUMMY_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_RD_DATA_CTL	0x444608D0	Read data control. See SMIF0_CORE_DEVICE0_RD_DATA_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_RD_BOUND_CTL	0x444608D8	Read boundary control. See SMIF0_CORE_DEVICE0_RD_BOUND_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_WR_CMD_CTL	0x444608E0	Write command control. See SMIF0_CORE_DEVICE0_WR_CMD_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_WR_ADDR_CTL	0x444608E4	Write address control. See SMIF0_CORE_DEVICE0_WR_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_WR_MODE_CTL	0x444608E8	Write mode control. See SMIF0_CORE_DEVICE0_WR_MODE_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_WR_DUMMY_CTL	0x444608EC	Write dummy control. See SMIF0_CORE_DEVICE0_WR_DUMMY_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_WR_DATA_CTL	0x444608F0	Write data control. See SMIF0_CORE_DEVICE0_WR_DATA_CTL for the details of bit fields.
SMIF0_CORE_DEVICE1_HB_FW_DEL_TAP_SEL_0	0x444608F8	HB FW Calibration Delay Tap Select 0. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0 for the details of bit fields.
SMIF0_CORE_DEVICE1_HB_FW_DEL_TAP_SEL_1	0x444608FC	HB FW Calibration Delay Tap Select 1. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1 for the details of bit fields.
SMIF0_CORE_DEVICE2_CTL	0x44460900	Control. See SMIF0_CORE_DEVICE0_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_ADDR	0x44460908	Device region base address. See SMIF0_CORE_DEVICE0_ADDR for the details of bit fields.
SMIF0_CORE_DEVICE2_MASK	0x4446090C	Device region mask. See SMIF0_CORE_DEVICE0_MASK for the details of bit fields.
SMIF0_CORE_DEVICE2_ADDR_CTL	0x44460920	Address control. See SMIF0_CORE_DEVICE0_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_RX_CAPTURE_CONFIG	0x44460928	RX capture configuration. See SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_DEVICE2_RD_CMD_CTL	0x44460940	Read command control. See SMIF0_CORE_DEVICE0_RD_CMD_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_RD_ADDR_CTL	0x44460944	Read address control. See SMIF0_CORE_DEVICE0_RD_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_RD_MODE_CTL	0x44460948	Read mode control. See SMIF0_CORE_DEVICE0_RD_MODE_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_RD_DUMMY_CTL	0x4446094C	Read dummy control. See SMIF0_CORE_DEVICE0_RD_DUMMY_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_RD_DATA_CTL	0x44460950	Read data control. See SMIF0_CORE_DEVICE0_RD_DATA_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_RD_BOUND_CTL	0x44460958	Read boundary control. See SMIF0_CORE_DEVICE0_RD_BOUND_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_WR_CMD_CTL	0x44460960	Write command control. See SMIF0_CORE_DEVICE0_WR_CMD_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_WR_ADDR_CTL	0x44460964	Write address control. See SMIF0_CORE_DEVICE0_WR_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_WR_MODE_CTL	0x44460968	Write mode control. See SMIF0_CORE_DEVICE0_WR_MODE_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_WR_DUMMY_CTL	0x4446096C	Write dummy control. See SMIF0_CORE_DEVICE0_WR_DUMMY_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_WR_DATA_CTL	0x44460970	Write data control. See SMIF0_CORE_DEVICE0_WR_DATA_CTL for the details of bit fields.
SMIF0_CORE_DEVICE2_HB_FW_DEL_TAP_SEL_0	0x44460978	HB FW Calibration Delay Tap Select 0. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0 for the details of bit fields.
SMIF0_CORE_DEVICE2_HB_FW_DEL_TAP_SEL_1	0x4446097C	HB FW Calibration Delay Tap Select 1. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1 for the details of bit fields.
SMIF0_CORE_DEVICE3_CTL	0x44460980	Control. See SMIF0_CORE_DEVICE0_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_ADDR	0x44460988	Device region base address. See SMIF0_CORE_DEVICE0_ADDR for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_DEVICE3_MASK	0x4446098C	Device region mask. See SMIF0_CORE_DEVICE0_MASK for the details of bit fields.
SMIF0_CORE_DEVICE3_ADDR_CTL	0x444609A0	Address control. See SMIF0_CORE_DEVICE0_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_RX_CAPTURE_CONFIG	0x444609A8	RX capture configuration. See SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG for the details of bit fields.
SMIF0_CORE_DEVICE3_RD_CMD_CTL	0x444609C0	Read command control. See SMIF0_CORE_DEVICE0_RD_CMD_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_RD_ADDR_CTL	0x444609C4	Read address control. See SMIF0_CORE_DEVICE0_RD_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_RD_MODE_CTL	0x444609C8	Read mode control. See SMIF0_CORE_DEVICE0_RD_MODE_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_RD_DUMMY_CTL	0x444609CC	Read dummy control. See SMIF0_CORE_DEVICE0_RD_DUMMY_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_RD_DATA_CTL	0x444609D0	Read data control. See SMIF0_CORE_DEVICE0_RD_DATA_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_RD_BOUND_CTL	0x444609D8	Read boundary control. See SMIF0_CORE_DEVICE0_RD_BOUND_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_WR_CMD_CTL	0x444609E0	Write command control. See SMIF0_CORE_DEVICE0_WR_CMD_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_WR_ADDR_CTL	0x444609E4	Write address control. See SMIF0_CORE_DEVICE0_WR_ADDR_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_WR_MODE_CTL	0x444609E8	Write mode control. See SMIF0_CORE_DEVICE0_WR_MODE_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_WR_DUMMY_CTL	0x444609EC	Write dummy control. See SMIF0_CORE_DEVICE0_WR_DUMMY_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_WR_DATA_CTL	0x444609F0	Write data control. See SMIF0_CORE_DEVICE0_WR_DATA_CTL for the details of bit fields.
SMIF0_CORE_DEVICE3_HB_FW_DEL_TAP_SEL_0	0x444609F8	HB FW Calibration Delay Tap Select 0. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_DEVICE3_HB_FW_DEL_TAP_SEL_1	0x444609FC	HB FW Calibration Delay Tap Select 1. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1 for the details of bit fields.
SMIF0_CORE_AXI_MPC0_CFG	0x44463000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CFG for the details of bit fields.
SMIF0_CORE_AXI_MPC0_CTRL	0x44463100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc). See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CTRL for the details of bit fields.
SMIF0_CORE_AXI_MPC0_BLK_MAX	0x44463104	Max value of block-based index register. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_MAX for the details of bit fields.
SMIF0_CORE_AXI_MPC0_BLK_CFG	0x44463108	Block size & initialization in progress. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_CFG for the details of bit fields.
SMIF0_CORE_AXI_MPC0_BLK_IDX	0x4446310C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc). See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_IDX for the details of bit fields.
SMIF0_CORE_AXI_MPC0_BLK_LUT	0x44463110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_LUT for the details of bit fields.
SMIF0_CORE_AXI_MPC0_ROT_CTRL	0x44463200	Control register with lock bit and auto-increment only. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_CTRL for the details of bit fields.
SMIF0_CORE_AXI_MPC0_ROT_BLK_MAX	0x44463208	Max value of block-based index register for ROT. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_MAX for the details of bit fields.
SMIF0_CORE_AXI_MPC0_ROT_BLK_CFG	0x4446320C	Same as BLK_CFG. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG for the details of bit fields.
SMIF0_CORE_AXI_MPC0_ROT_BLK_IDX	0x44463210	Index of 8-block group accessed through ROT_BLK_LUT_*. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_IDX for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_AXI_MPC0_ROT_BLK_PC	0x44463214	Protection context of 8-block group accesses through ROT_BLK_LUT. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_PC for the details of bit fields.
SMIF0_CORE_AXI_MPC0_ROT_BLK_LUT	0x44463218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG for the details of bit fields.
SMIF0_CORE_SMIF_HSIOM_SMIF_PRT0_PORT_SEL0	0x44464000	Port selection 0
SMIF0_CORE_SMIF_HSIOM_SMIF_PRT0_PORT_SEL1	0x44464004	Port selection 1
SMIF0_CORE_SMIF_HSIOM_SMIF_PRT1_PORT_SEL0	0x44464010	Port selection 0
SMIF0_CORE_SMIF_HSIOM_SMIF_PRT2_PORT_SEL0	0x44464020	Port selection 0
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT	0x44470000	Port output data register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_CLR	0x44470004	Port output data clear register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_SET	0x44470008	Port output data set register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_INV	0x4447000C	Port output data invert register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_IN	0x44470010	Port input state register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR	0x44470014	Port interrupt status register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_MASK	0x44470018	Port interrupt mask register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_MASKED	0x4447001C	Port interrupt masked status register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_SET	0x44470020	Port interrupt set register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_CFG	0x44470040	Port interrupt configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG	0x44470044	Port configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_IN	0x44470048	Port input buffer configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_OUT	0x4447004C	Port output buffer configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_SLEW_EXT	0x44470064	Port output buffer slew extension configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT0	0x44470068	Port output buffer drive sel extension configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT1	0x4447006C	Port output buffer drive sel extension configuration register

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_OUT	0x44470080	Port output data register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_OUT_CLR	0x44470084	Port output data clear register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_CLR for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_OUT_SET	0x44470088	Port output data set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_SET for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_OUT_INV	0x4447008C	Port output data invert register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_INV for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_IN	0x44470090	Port input state register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR	0x44470094	Port interrupt status register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASK	0x44470098	Port interrupt mask register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASKED	0x4447009C	Port interrupt masked status register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_SET	0x444700A0	Port interrupt set register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_CFG	0x444700C0	Port interrupt configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG	0x444700C4	Port configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG_IN	0x444700C8	Port input buffer configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG_OUT	0x444700CC	Port output buffer configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG_SLEW_EXT	0x444700E4	Port output buffer slew extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_SLEW_EXT for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG_DRIVE_EXT0	0x444700E8	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG_DRIVE_EXT1	0x444700EC	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_OUT	0x44470100	Port output data register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_OUT_CLR	0x44470104	Port output data clear register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_CLR for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_OUT_SET	0x44470108	Port output data set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_SET for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_OUT_INV	0x4447010C	Port output data invert register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_INV for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_IN	0x44470110	Port input state register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_INTR	0x44470114	Port interrupt status register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_INTR_MASK	0x44470118	Port interrupt mask register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_INTR_MASKED	0x4447011C	Port interrupt masked status register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_INTR_SET	0x44470120	Port interrupt set register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_INTR_CFG	0x44470140	Port interrupt configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG	0x44470144	Port configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG_IN	0x44470148	Port input buffer configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG_OUT	0x4447014C	Port output buffer configuration register
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG_SLEW_EXT	0x44470164	Port output buffer slew extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_SLEW_EXT for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG_DRIVE_EXT0	0x44470168	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG_DRIVE_EXT1	0x4447016C	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_INTR_CAUSE00	0x44478000	Interrupt port cause register 0
SMIF0_CORE_SMIF_GPIO_INTR_CAUSE01	0x44478004	Interrupt port cause register 0. See SMIF0_CORE_SMIF_GPIO_INTR_CAUSE00 for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_INTR_CAUSE02	0x44478008	Interrupt port cause register 0. See SMIF0_CORE_SMIF_GPIO_INTR_CAUSE00 for the details of bit fields.
SMIF0_CORE_SMIF_GPIO_VDD_ACTIVE	0x44478010	Extern power supply detection register
SMIF0_CORE_SMIF_GPIO_VDD_INTR	0x44478014	Supply detection interrupt register
SMIF0_CORE_SMIF_GPIO_VDD_INTR_MASK	0x44478018	Supply detection interrupt mask register
SMIF0_CORE_SMIF_GPIO_VDD_INTR_MASKED	0x4447801C	Supply detection interrupt masked register
SMIF0_CORE_SMIF_GPIO_VDD_INTR_SET	0x44478020	Supply detection interrupt set register

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CACHE_BLOCK_HWPARAMS	0x44490000	Hardware Parameter register. See SMIF0_CACHE_BLOCK_HWPARAMS for the details of bit fields.
SMIF1_CACHE_BLOCK_CTRL	0x44490010	Control Register. See SMIF0_CACHE_BLOCK_CTRL for the details of bit fields.
SMIF1_CACHE_BLOCK_NSEC_ACCESS	0x44490014	Non-secure access information. See SMIF0_CACHE_BLOCK_NSEC_ACCESS for the details of bit fields.
SMIF1_CACHE_BLOCK_MAINT_CTRL_ALL	0x44490020	Maintenance control for the entire cache. See SMIF0_CACHE_BLOCK_MAINT_CTRL_ALL for the details of bit fields.
SMIF1_CACHE_BLOCK_MAINT_CTRL_LINES	0x44490024	Maintenance control for individual lines. See SMIF0_CACHE_BLOCK_MAINT_CTRL_LINES for the details of bit fields.
SMIF1_CACHE_BLOCK_MAINT_STATUS	0x44490028	Maintenance status for the cache. See SMIF0_CACHE_BLOCK_MAINT_STATUS for the details of bit fields.
SMIF1_CACHE_BLOCK_SECIRQSTAT	0x44490100	Secure Interrupt Request Status register. See SMIF0_CACHE_BLOCK_SECIRQSTAT for the details of bit fields.
SMIF1_CACHE_BLOCK_SECIRQSCLR	0x44490104	Secure Interrupt Status Clear register. See SMIF0_CACHE_BLOCK_SECIRQSCLR for the details of bit fields.
SMIF1_CACHE_BLOCK_SECIRQEN	0x44490108	Secure Interrupt Enable register. See SMIF0_CACHE_BLOCK_SECIRQEN for the details of bit fields.
SMIF1_CACHE_BLOCK_SECIRQINFO1	0x4449010C	Secure transfer error information 1. See SMIF0_CACHE_BLOCK_SECIRQINFO1 for the details of bit fields.
SMIF1_CACHE_BLOCK_SECIRQINFO2	0x44490110	Secure transfer error information 2. See SMIF0_CACHE_BLOCK_SECIRQINFO2 for the details of bit fields.
SMIF1_CACHE_BLOCK_NSECIRQSTAT	0x44490140	Non-secure Interrupt Request Status register. See SMIF0_CACHE_BLOCK_NSECIRQSTAT for the details of bit fields.
SMIF1_CACHE_BLOCK_NSECIRQSCLR	0x44490144	Non-secure Interrupt Status Clear register. See SMIF0_CACHE_BLOCK_NSECIRQSCLR for the details of bit fields.
SMIF1_CACHE_BLOCK_NSECIRQEN	0x44490148	Non-secure Interrupt Enable register. See SMIF0_CACHE_BLOCK_NSECIRQEN for the details of bit fields.
SMIF1_CACHE_BLOCK_NSECIRQINFO1	0x4449014C	Non-secure transfer error information 1. See SMIF0_CACHE_BLOCK_NSECIRQINFO1 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CACHE_BLOCK_NSECIRQINFO2	0x44490150	Non-secure transfer error information 2. See SMIF0_CACHE_BLOCK_NSECIRQINFO2 for the details of bit fields.
SMIF1_CACHE_BLOCK_SECHIT	0x44490300	Secure transfers Hit register. See SMIF0_CACHE_BLOCK_SECHIT for the details of bit fields.
SMIF1_CACHE_BLOCK_SECMISS	0x44490304	Secure transfers Miss register. See SMIF0_CACHE_BLOCK_SECMISS for the details of bit fields.
SMIF1_CACHE_BLOCK_SECSTATCTRL	0x44490308	Secure transfers statistic counters control. See SMIF0_CACHE_BLOCK_SECSTATCTRL for the details of bit fields.
SMIF1_CACHE_BLOCK_NSECHIT	0x44490310	Non-secure transfers Hit register. See SMIF0_CACHE_BLOCK_NSECHIT for the details of bit fields.
SMIF1_CACHE_BLOCK_NSECMISS	0x44490314	Non-secure transfers Miss register. See SMIF0_CACHE_BLOCK_NSECMISS for the details of bit fields.
SMIF1_CACHE_BLOCK_NSECSTATCTRL	0x44490318	Non-secure transfers statistic counters control. See SMIF0_CACHE_BLOCK_NSECSTATCTRL for the details of bit fields.
SMIF1_CACHE_BLOCK_PMSVR0	0x44490600	Saved Value Register 0 - Secure Hit. See SMIF0_CACHE_BLOCK_PMSVR0 for the details of bit fields.
SMIF1_CACHE_BLOCK_PMSVR1	0x44490604	Saved Value Register 1 - Secure Miss. See SMIF0_CACHE_BLOCK_PMSVR1 for the details of bit fields.
SMIF1_CACHE_BLOCK_PMSVR2	0x44490608	Saved Value Register 2 - Non-secure Hit. See SMIF0_CACHE_BLOCK_PMSVR2 for the details of bit fields.
SMIF1_CACHE_BLOCK_PMSVR3	0x4449060C	Saved Value Register 3 - Non-secure Miss. See SMIF0_CACHE_BLOCK_PMSVR3 for the details of bit fields.
SMIF1_CACHE_BLOCK_PMSSSR	0x44490680	PMU Snapshot Status Register. See SMIF0_CACHE_BLOCK_PMSSSR for the details of bit fields.
SMIF1_CACHE_BLOCK_PMSSCR	0x444906F0	PMU Snapshot Capture Register. See SMIF0_CACHE_BLOCK_PMSSCR for the details of bit fields.
SMIF1_CACHE_BLOCK_PMSSRR	0x444906F4	PMU Snapshot Reset Register. See SMIF0_CACHE_BLOCK_PMSSRR for the details of bit fields.
SMIF1_CACHE_BLOCK_PIDR4	0x44490FD0	Peripheral ID 4. See SMIF0_CACHE_BLOCK_PIDR4 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CACHE_BLOCK_PIDR5	0x44490FD4	Peripheral ID 5. See SMIF0_CACHE_BLOCK_PIDR5 for the details of bit fields.
SMIF1_CACHE_BLOCK_PIDR6	0x44490FD8	Peripheral ID 6. See SMIF0_CACHE_BLOCK_PIDR6 for the details of bit fields.
SMIF1_CACHE_BLOCK_PIDR7	0x44490FDC	Peripheral ID 7. See SMIF0_CACHE_BLOCK_PIDR7 for the details of bit fields.
SMIF1_CACHE_BLOCK_PIDR0	0x44490FE0	Peripheral ID 0. See SMIF0_CACHE_BLOCK_PIDR0 for the details of bit fields.
SMIF1_CACHE_BLOCK_PIDR1	0x44490FE4	Peripheral ID 1. See SMIF0_CACHE_BLOCK_PIDR1 for the details of bit fields.
SMIF1_CACHE_BLOCK_PIDR2	0x44490FE8	Peripheral ID 2. See SMIF0_CACHE_BLOCK_PIDR2 for the details of bit fields.
SMIF1_CACHE_BLOCK_PIDR3	0x44490FEC	Peripheral ID 3. See SMIF0_CACHE_BLOCK_PIDR3 for the details of bit fields.
SMIF1_CACHE_BLOCK_CIDR0	0x44490FF0	Component ID 0. See SMIF0_CACHE_BLOCK_CIDR0 for the details of bit fields.
SMIF1_CACHE_BLOCK_CIDR1	0x44490FF4	Component ID 1. See SMIF0_CACHE_BLOCK_CIDR1 for the details of bit fields.
SMIF1_CACHE_BLOCK_CIDR2	0x44490FF8	Component ID 2. See SMIF0_CACHE_BLOCK_CIDR2 for the details of bit fields.
SMIF1_CACHE_BLOCK_CIDR3	0x44490FFC	Component ID 3. See SMIF0_CACHE_BLOCK_CIDR3 for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_BYPASS_WI	0x44492000	Bypass wrap to increment conversion logic. See SMIF0_CACHE_BLOCK_MMIO_BYPASS_WI for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_MASTER_ID	0x44492004	The cache generates transactions (linefill and eviction Write-Back) that are marked with the value specified by MASTER_ID on hmaster_m. See SMIF0_CACHE_BLOCK_MMIO_MASTER_ID for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_DIS_CACHE_EN_MAINT	0x44492008	This signal turns on/off cache enable maintenance. See SMIF0_CACHE_BLOCK_MMIO_DIS_CACHE_EN_MAINT for the details of bit fields.

Register name	Address	Description
SMIF1_CACHE_BLOCK_MMIO_DIS_CACHE_DIS_MAINT	0x4449200C	This signal turns on/off cache disable maintenance. See SMIF0_CACHE_BLOCK_MMIO_DIS_CACHE_DIS_MAINT for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_APB_VIOLATION_RESP	0x44492010	This signal controls if the APB interface of cache responds with an error to illegal operations on the APB interface. Illegal operations on the APB interface include Writing with no full write strobe, Accessing non-word aligned addresses, Instruction accesses, Non-privileged accesses 1 - The Cache responds with an APB error. Read data is masked with zeros and write data is ignored. 0 - The Cache sends an OK response. Read data is masked with zeros and write data is ignored. See SMIF0_CACHE_BLOCK_MMIO_APB_VIOLATION_RESP for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_MMIO_ACTIVE_EN	0x44492014	SW control to put SMIF.6 in active or clock gated mode. See SMIF0_CACHE_BLOCK_MMIO_MMIO_ACTIVE_EN for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_POWER_ON_ENABLE	0x44492018	This signal configures the cache to enable the cache automatically after powerup. See SMIF0_CACHE_BLOCK_MMIO_POWER_ON_ENABLE for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_MMIO_CACHE_RET_EN	0x4449201C	Controls if cache SRAMs are retained during DPSLP. See SMIF0_CACHE_BLOCK_MMIO_MMIO_CACHE_RET_EN for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_DIS_PWR_DOWN_MAINT	0x44492020	This signal turns on/off powerdown maintenance. See SMIF0_CACHE_BLOCK_MMIO_DIS_PWR_DOWN_MAINT for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_REGION0_BASE	0x44492024	Region 0 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION0_BASE for the details of bit fields.

Register name	Address	Description
SMIF1_CACHE_BLOCK_MMIO_REGION0_LIMIT	0x44492028	Region 0 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION0_LIMIT for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_REGION1_BASE	0x4449202C	Region 1 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION1_BASE for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_REGION1_LIMIT	0x44492030	Region 1 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION1_LIMIT for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_REGION2_BASE	0x44492034	Region 2 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION2_BASE for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_REGION2_LIMIT	0x44492038	Region 2 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION2_LIMIT for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_REGION3_BASE	0x4449203C	Region 3 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION3_BASE for the details of bit fields.
SMIF1_CACHE_BLOCK_MMIO_REGION3_LIMIT	0x44492040	Region 3 Attributes - register 1; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle. See SMIF0_CACHE_BLOCK_MMIO_REGION3_LIMIT for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CFG	0x44494000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CFG for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CTRL	0x44494100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc). See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CTRL for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_MAX	0x44494104	Max value of block-based index register. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_MAX for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_CFG	0x44494108	Block size & initialization in progress. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_CFG for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_IDX	0x4449410C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc). See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_IDX for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_LUT	0x44494110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_LUT for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_CTRL	0x44494200	Control register with lock bit and auto-increment only. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_CTRL for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_MAX	0x44494208	Max value of block-based index register for ROT. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_MAX for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG	0x4449420C	Same as BLK_CFG. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_IDX	0x44494210	Index of 8-block group accessed through ROT_BLK_LUT_*. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_IDX for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_PC	0x44494214	Protection context of 8-block group accesses through ROT_BLK_LUT. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_PC for the details of bit fields.
SMIF1_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_LUT	0x44494218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG for the details of bit fields.
SMIF1_CORE_CTL	0x444A0000	Control. See SMIF0_CORE_CTL for the details of bit fields.
SMIF1_CORE_STATUS	0x444A0004	Status. See SMIF0_CORE_STATUS for the details of bit fields.
SMIF1_CORE_CTL2	0x444A0008	Control 2. See SMIF0_CORE_CTL2 for the details of bit fields.
SMIF1_CORE_DLP_DELAY_TAP_SEL0	0x444A0010	DLP Delay Tap Select Register 0. See SMIF0_CORE_DLP_DELAY_TAP_SEL0 for the details of bit fields.
SMIF1_CORE_DLP_DELAY_TAP_SEL1	0x444A0014	DLP Delay Tap Select Register 1. See SMIF0_CORE_DLP_DELAY_TAP_SEL1 for the details of bit fields.
SMIF1_CORE_DLP_CTL	0x444A0018	DLP Control Register. See SMIF0_CORE_DLP_CTL for the details of bit fields.
SMIF1_CORE_DLP_STATUS0	0x444A0020	DLP Status Register 0. See SMIF0_CORE_DLP_STATUS0 for the details of bit fields.
SMIF1_CORE_DLP_STATUS1	0x444A0024	DLP Status Register 1. See SMIF0_CORE_DLP_STATUS1 for the details of bit fields.
SMIF1_CORE_TX_CMD_FIFO_STATUS	0x444A0044	Transmitter command FIFO status. See SMIF0_CORE_TX_CMD_FIFO_STATUS for the details of bit fields.
SMIF1_CORE_TX_CMD_MMIO_FIFO_STATUS	0x444A0048	Transmitter command MMIO FIFO status. See SMIF0_CORE_TX_CMD_MMIO_FIFO_STATUS for the details of bit fields.
SMIF1_CORE_TX_CMD_MMIO_FIFO_WR	0x444A0050	Transmitter command MMIO FIFO write. See SMIF0_CORE_TX_CMD_MMIO_FIFO_WR for the details of bit fields.
SMIF1_CORE_TX_DATA_MMIO_FIFO_CTL	0x444A0080	Transmitter data MMIO FIFO control. See SMIF0_CORE_TX_DATA_MMIO_FIFO_CTL for the details of bit fields.
SMIF1_CORE_TX_DATA_FIFO_STATUS	0x444A0084	Transmitter data FIFO status. See SMIF0_CORE_TX_DATA_FIFO_STATUS for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_TX_DATA_MMIO_FIFO_STATUS	0x444A0088	Transmitter data MMIO FIFO status. See SMIF0_CORE_TX_DATA_MMIO_FIFO_STATUS for the details of bit fields.
SMIF1_CORE_TX_DATA_MMIO_FIFO_WR1	0x444A0090	Transmitter data MMIO FIFO write. See SMIF0_CORE_TX_DATA_MMIO_FIFO_WR1 for the details of bit fields.
SMIF1_CORE_TX_DATA_MMIO_FIFO_WR2	0x444A0094	Transmitter data MMIO FIFO write. See SMIF0_CORE_TX_DATA_MMIO_FIFO_WR2 for the details of bit fields.
SMIF1_CORE_TX_DATA_MMIO_FIFO_WR4	0x444A0098	Transmitter data MMIO FIFO write. See SMIF0_CORE_TX_DATA_MMIO_FIFO_WR4 for the details of bit fields.
SMIF1_CORE_TX_DATA_MMIO_FIFO_WR1ODD	0x444A009C	Transmitter data MMIO FIFO write. See SMIF0_CORE_TX_DATA_MMIO_FIFO_WR1ODD for the details of bit fields.
SMIF1_CORE_RX_DATA_MMIO_FIFO_CTL	0x444A00C0	Receiver data MMIO FIFO control. See SMIF0_CORE_RX_DATA_MMIO_FIFO_CTL for the details of bit fields.
SMIF1_CORE_RX_DATA_MMIO_FIFO_STATUS	0x444A00C4	Receiver data MMIO FIFO status. See SMIF0_CORE_RX_DATA_MMIO_FIFO_STATUS for the details of bit fields.
SMIF1_CORE_RX_DATA_FIFO_STATUS	0x444A00C8	Receiver data FIFO status. See SMIF0_CORE_RX_DATA_FIFO_STATUS for the details of bit fields.
SMIF1_CORE_RX_DATA_MMIO_FIFO_RD1	0x444A00D0	Receiver data MMIO FIFO read. See SMIF0_CORE_RX_DATA_MMIO_FIFO_RD1 for the details of bit fields.
SMIF1_CORE_RX_DATA_MMIO_FIFO_RD2	0x444A00D4	Receiver data MMIO FIFO read. See SMIF0_CORE_RX_DATA_MMIO_FIFO_RD2 for the details of bit fields.
SMIF1_CORE_RX_DATA_MMIO_FIFO_RD4	0x444A00D8	Receiver data MMIO FIFO read. See SMIF0_CORE_RX_DATA_MMIO_FIFO_RD4 for the details of bit fields.
SMIF1_CORE_RX_DATA_MMIO_FIFO_RD1_SILENT	0x444A00E0	Receiver data MMIO FIFO silent read. See SMIF0_CORE_RX_DATA_MMIO_FIFO_RD1_SILENT for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_CMD	0x444A0200	Cryptography command. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_CMD for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_ADDR	0x444A0204	Cryptography base address. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_ADDR for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_MASK	0x444A0208	Cryptography mask. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_MASK for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION	0x444A020C	Cryptography subregion disable. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0	0x444A0220	Cryptography input 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1	0x444A0224	Cryptography input 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2	0x444A0228	Cryptography input 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3	0x444A022C	Cryptography input 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_KEY0	0x444A0240	Cryptography key 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_KEY1	0x444A0244	Cryptography key 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_KEY2	0x444A0248	Cryptography key 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_KEY3	0x444A024C	Cryptography key 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT0	0x444A0260	Cryptography output 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT1	0x444A0264	Cryptography output 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT2	0x444A0268	Cryptography output 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT3	0x444A026C	Cryptography output 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_CMD	0x444A0280	Cryptography command. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_CMD for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_ADDR	0x444A0284	Cryptography base address. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_ADDR for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_MASK	0x444A0288	Cryptography mask. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_MASK for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_SUBREGION	0x444A028C	Cryptography subregion disable. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_INPUT0	0x444A02A0	Cryptography input 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_INPUT1	0x444A02A4	Cryptography input 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_INPUT2	0x444A02A8	Cryptography input 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_INPUT3	0x444A02AC	Cryptography input 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_KEY0	0x444A02C0	Cryptography key 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_KEY1	0x444A02C4	Cryptography key 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_KEY2	0x444A02C8	Cryptography key 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_KEY3	0x444A02CC	Cryptography key 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_OUTPUT0	0x444A02E0	Cryptography output 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_OUTPUT1	0x444A02E4	Cryptography output 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_OUTPUT2	0x444A02E8	Cryptography output 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO1_CRYPTO_OUTPUT3	0x444A02EC	Cryptography output 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_CMD	0x444A0300	Cryptography command. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_CMD for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_ADDR	0x444A0304	Cryptography base address. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_ADDR for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_MASK	0x444A0308	Cryptography mask. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_MASK for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_SUBREGION	0x444A030C	Cryptography subregion disable. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_INPUT0	0x444A0320	Cryptography input 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_INPUT1	0x444A0324	Cryptography input 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_INPUT2	0x444A0328	Cryptography input 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_INPUT3	0x444A032C	Cryptography input 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_KEY0	0x444A0340	Cryptography key 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_KEY1	0x444A0344	Cryptography key 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_KEY2	0x444A0348	Cryptography key 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_KEY3	0x444A034C	Cryptography key 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_OUTPUT0	0x444A0360	Cryptography output 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_OUTPUT1	0x444A0364	Cryptography output 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_OUTPUT2	0x444A0368	Cryptography output 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO2_CRYPTO_OUTPUT3	0x444A036C	Cryptography output 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT3 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_CMD	0x444A0380	Cryptography command. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_CMD for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_ADDR	0x444A0384	Cryptography base address. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_ADDR for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_MASK	0x444A0388	Cryptography mask. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_MASK for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_SUBREGION	0x444A038C	Cryptography subregion disable. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_INPUT0	0x444A03A0	Cryptography input 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_INPUT1	0x444A03A4	Cryptography input 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_INPUT2	0x444A03A8	Cryptography input 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_INPUT3	0x444A03AC	Cryptography input 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_INPUT3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_KEY0	0x444A03C0	Cryptography key 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_KEY1	0x444A03C4	Cryptography key 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_KEY2	0x444A03C8	Cryptography key 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY2 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_KEY3	0x444A03CC	Cryptography key 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_KEY3 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT0	0x444A03E0	Cryptography output 0. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT0 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT1	0x444A03E4	Cryptography output 1. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT1 for the details of bit fields.
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT2	0x444A03E8	Cryptography output 2. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT2 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_CRYPTO3_CRYPTO_OUTPUT3	0x444A03EC	Cryptography output 3. See SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_OUTPUT3 for the details of bit fields.
SMIF1_CORE_INTR	0x444A07C0	Interrupt register. See SMIF0_CORE_INTR for the details of bit fields.
SMIF1_CORE_INTR_SET	0x444A07C4	Interrupt set register. See SMIF0_CORE_INTR_SET for the details of bit fields.
SMIF1_CORE_INTR_MASK	0x444A07C8	Interrupt mask register. See SMIF0_CORE_INTR_MASK for the details of bit fields.
SMIF1_CORE_INTR_MASKED	0x444A07CC	Interrupt masked register. See SMIF0_CORE_INTR_MASKED for the details of bit fields.
SMIF1_CORE_DLL_IDAC	0x444A07D8	DLL IDAC (when DLL runs in open loop, selects the delay of the delay line). See SMIF0_CORE_DLL_IDAC for the details of bit fields.
SMIF1_CORE_DLL_IVR	0x444A07DC	DLL IVR (Contol Output Voltage of internal Voltage Regulator). See SMIF0_CORE_DLL_IVR for the details of bit fields.
SMIF1_CORE_DEVICE0_CTL	0x444A0800	Control. See SMIF0_CORE_DEVICE0_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_ADDR	0x444A0808	Device region base address. See SMIF0_CORE_DEVICE0_ADDR for the details of bit fields.
SMIF1_CORE_DEVICE0_MASK	0x444A080C	Device region mask. See SMIF0_CORE_DEVICE0_MASK for the details of bit fields.
SMIF1_CORE_DEVICE0_ADDR_CTL	0x444A0820	Address control. See SMIF0_CORE_DEVICE0_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_RX_CAPTURE_CONFIG	0x444A0828	RX capture configuration. See SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG for the details of bit fields.
SMIF1_CORE_DEVICE0_RD_CMD_CTL	0x444A0840	Read command control. See SMIF0_CORE_DEVICE0_RD_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_RD_ADDR_CTL	0x444A0844	Read address control. See SMIF0_CORE_DEVICE0_RD_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_RD_MODE_CTL	0x444A0848	Read mode control. See SMIF0_CORE_DEVICE0_RD_MODE_CTL for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_DEVICE0_RD_DUMMY_CTL	0x444A084C	Read dummy control. See SMIF0_CORE_DEVICE0_RD_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_RD_DATA_CTL	0x444A0850	Read data control. See SMIF0_CORE_DEVICE0_RD_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_RD_BOUND_CTL	0x444A0858	Read boundary control. See SMIF0_CORE_DEVICE0_RD_BOUND_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_WR_CMD_CTL	0x444A0860	Write command control. See SMIF0_CORE_DEVICE0_WR_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_WR_ADDR_CTL	0x444A0864	Write address control. See SMIF0_CORE_DEVICE0_WR_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_WR_MODE_CTL	0x444A0868	Write mode control. See SMIF0_CORE_DEVICE0_WR_MODE_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_WR_DUMMY_CTL	0x444A086C	Write dummy control. See SMIF0_CORE_DEVICE0_WR_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_WR_DATA_CTL	0x444A0870	Write data control. See SMIF0_CORE_DEVICE0_WR_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0	0x444A0878	HB FW Calibration Delay Tap Select 0. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0 for the details of bit fields.
SMIF1_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1	0x444A087C	HB FW Calibration Delay Tap Select 1. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1 for the details of bit fields.
SMIF1_CORE_DEVICE1_CTL	0x444A0880	Control. See SMIF0_CORE_DEVICE0_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_ADDR	0x444A0888	Device region base address. See SMIF0_CORE_DEVICE0_ADDR for the details of bit fields.
SMIF1_CORE_DEVICE1_MASK	0x444A088C	Device region mask. See SMIF0_CORE_DEVICE0_MASK for the details of bit fields.
SMIF1_CORE_DEVICE1_ADDR_CTL	0x444A08A0	Address control. See SMIF0_CORE_DEVICE0_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_RX_CAPTURE_CONFIG	0x444A08A8	RX capture configuration. See SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_DEVICE1_RD_CMD_CTL	0x444A08C0	Read command control. See SMIF0_CORE_DEVICE0_RD_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_RD_ADDR_CTL	0x444A08C4	Read address control. See SMIF0_CORE_DEVICE0_RD_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_RD_MODE_CTL	0x444A08C8	Read mode control. See SMIF0_CORE_DEVICE0_RD_MODE_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_RD_DUMMY_CTL	0x444A08CC	Read dummy control. See SMIF0_CORE_DEVICE0_RD_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_RD_DATA_CTL	0x444A08D0	Read data control. See SMIF0_CORE_DEVICE0_RD_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_RD_BOUND_CTL	0x444A08D8	Read boundary control. See SMIF0_CORE_DEVICE0_RD_BOUND_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_WR_CMD_CTL	0x444A08E0	Write command control. See SMIF0_CORE_DEVICE0_WR_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_WR_ADDR_CTL	0x444A08E4	Write address control. See SMIF0_CORE_DEVICE0_WR_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_WR_MODE_CTL	0x444A08E8	Write mode control. See SMIF0_CORE_DEVICE0_WR_MODE_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_WR_DUMMY_CTL	0x444A08EC	Write dummy control. See SMIF0_CORE_DEVICE0_WR_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_WR_DATA_CTL	0x444A08F0	Write data control. See SMIF0_CORE_DEVICE0_WR_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE1_HB_FW_DEL_TAP_SEL_0	0x444A08F8	HB FW Calibration Delay Tap Select 0. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0 for the details of bit fields.
SMIF1_CORE_DEVICE1_HB_FW_DEL_TAP_SEL_1	0x444A08FC	HB FW Calibration Delay Tap Select 1. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1 for the details of bit fields.
SMIF1_CORE_DEVICE2_CTL	0x444A0900	Control. See SMIF0_CORE_DEVICE0_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_ADDR	0x444A0908	Device region base address. See SMIF0_CORE_DEVICE0_ADDR for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_DEVICE2_MASK	0x444A090C	Device region mask. See SMIF0_CORE_DEVICE0_MASK for the details of bit fields.
SMIF1_CORE_DEVICE2_ADDR_CTL	0x444A0920	Address control. See SMIF0_CORE_DEVICE0_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_RX_CAPTURE_CONFIG	0x444A0928	RX capture configuration. See SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG for the details of bit fields.
SMIF1_CORE_DEVICE2_RD_CMD_CTL	0x444A0940	Read command control. See SMIF0_CORE_DEVICE0_RD_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_RD_ADDR_CTL	0x444A0944	Read address control. See SMIF0_CORE_DEVICE0_RD_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_RD_MODE_CTL	0x444A0948	Read mode control. See SMIF0_CORE_DEVICE0_RD_MODE_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_RD_DUMMY_CTL	0x444A094C	Read dummy control. See SMIF0_CORE_DEVICE0_RD_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_RD_DATA_CTL	0x444A0950	Read data control. See SMIF0_CORE_DEVICE0_RD_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_RD_BOUND_CTL	0x444A0958	Read boundary control. See SMIF0_CORE_DEVICE0_RD_BOUND_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_WR_CMD_CTL	0x444A0960	Write command control. See SMIF0_CORE_DEVICE0_WR_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_WR_ADDR_CTL	0x444A0964	Write address control. See SMIF0_CORE_DEVICE0_WR_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_WR_MODE_CTL	0x444A0968	Write mode control. See SMIF0_CORE_DEVICE0_WR_MODE_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_WR_DUMMY_CTL	0x444A096C	Write dummy control. See SMIF0_CORE_DEVICE0_WR_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_WR_DATA_CTL	0x444A0970	Write data control. See SMIF0_CORE_DEVICE0_WR_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE2_HB_FW_DEL_TAP_SEL_0	0x444A0978	HB FW Calibration Delay Tap Select 0. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_DEVICE2_HB_FW_DEL_TAP_SEL_1	0x444A097C	HB FW Calibration Delay Tap Select 1. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1 for the details of bit fields.
SMIF1_CORE_DEVICE3_CTL	0x444A0980	Control. See SMIF0_CORE_DEVICE0_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_ADDR	0x444A0988	Device region base address. See SMIF0_CORE_DEVICE0_ADDR for the details of bit fields.
SMIF1_CORE_DEVICE3_MASK	0x444A098C	Device region mask. See SMIF0_CORE_DEVICE0_MASK for the details of bit fields.
SMIF1_CORE_DEVICE3_ADDR_CTL	0x444A09A0	Address control. See SMIF0_CORE_DEVICE0_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_RX_CAPTURE_CONFIG	0x444A09A8	RX capture configuration. See SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG for the details of bit fields.
SMIF1_CORE_DEVICE3_RD_CMD_CTL	0x444A09C0	Read command control. See SMIF0_CORE_DEVICE0_RD_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_RD_ADDR_CTL	0x444A09C4	Read address control. See SMIF0_CORE_DEVICE0_RD_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_RD_MODE_CTL	0x444A09C8	Read mode control. See SMIF0_CORE_DEVICE0_RD_MODE_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_RD_DUMMY_CTL	0x444A09CC	Read dummy control. See SMIF0_CORE_DEVICE0_RD_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_RD_DATA_CTL	0x444A09D0	Read data control. See SMIF0_CORE_DEVICE0_RD_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_RD_BOUND_CTL	0x444A09D8	Read boundary control. See SMIF0_CORE_DEVICE0_RD_BOUND_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_WR_CMD_CTL	0x444A09E0	Write command control. See SMIF0_CORE_DEVICE0_WR_CMD_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_WR_ADDR_CTL	0x444A09E4	Write address control. See SMIF0_CORE_DEVICE0_WR_ADDR_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_WR_MODE_CTL	0x444A09E8	Write mode control. See SMIF0_CORE_DEVICE0_WR_MODE_CTL for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_DEVICE3_WR_DUMMY_CTL	0x444A09EC	Write dummy control. See SMIF0_CORE_DEVICE0_WR_DUMMY_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_WR_DATA_CTL	0x444A09F0	Write data control. See SMIF0_CORE_DEVICE0_WR_DATA_CTL for the details of bit fields.
SMIF1_CORE_DEVICE3_HB_FW_DEL_TAP_SEL_0	0x444A09F8	HB FW Calibration Delay Tap Select 0. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_0 for the details of bit fields.
SMIF1_CORE_DEVICE3_HB_FW_DEL_TAP_SEL_1	0x444A09FC	HB FW Calibration Delay Tap Select 1. See SMIF0_CORE_DEVICE0_HB_FW_DEL_TAP_SEL_1 for the details of bit fields.
SMIF1_CORE_AXI_MPC0_CFG	0x444A3000	Config register with error response, RegionID PPC_MPC_MAIN is the security owner PC. The error response configuration is located in CFG.RESPONSE, only one such configuration exists applying to all protection contexts in the system. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CFG for the details of bit fields.
SMIF1_CORE_AXI_MPC0_CTRL	0x444A3100	Control register with lock bit and auto-increment only (Separate CTRL for each PC depends on access_pc). See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_CTRL for the details of bit fields.
SMIF1_CORE_AXI_MPC0_BLK_MAX	0x444A3104	Max value of block-based index register. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_MAX for the details of bit fields.
SMIF1_CORE_AXI_MPC0_BLK_CFG	0x444A3108	Block size & initialization in progress. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_CFG for the details of bit fields.
SMIF1_CORE_AXI_MPC0_BLK_IDX	0x444A310C	Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc). See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_IDX for the details of bit fields.
SMIF1_CORE_AXI_MPC0_BLK_LUT	0x444A3110	NS status for 32 blocks at BLK_IDX with PC=<access_pc>. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_LUT for the details of bit fields.
SMIF1_CORE_AXI_MPC0_ROT_CTRL	0x444A3200	Control register with lock bit and auto-increment only. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_CTRL for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_AXI_MPC0_ROT_BLK_MAX	0x444A3208	Max value of block-based index register for ROT. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_MAX for the details of bit fields.
SMIF1_CORE_AXI_MPC0_ROT_BLK_CFG	0x444A320C	Same as BLK_CFG. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG for the details of bit fields.
SMIF1_CORE_AXI_MPC0_ROT_BLK_IDX	0x444A3210	Index of 8-block group accessed through ROT_BLK_LUT_*. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_IDX for the details of bit fields.
SMIF1_CORE_AXI_MPC0_ROT_BLK_PC	0x444A3214	Protection context of 8-block group accesses through ROT_BLK_LUT. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_PC for the details of bit fields.
SMIF1_CORE_AXI_MPC0_ROT_BLK_LUT	0x444A3218	(R,W,NS) bits for 8 blocks at ROT_BLK_IDX for PC=ROT_BKL_PC. See SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_CFG for the details of bit fields.
SMIF1_CORE_SMIF_HSIOM_SMIF_PRT0_PORT_SEL0	0x444A4000	Port selection 0. See SMIF0_CORE_SMIF_HSIOM_SMIF_PRT0_PORT_SEL0 for the details of bit fields.
SMIF1_CORE_SMIF_HSIOM_SMIF_PRT0_PORT_SEL1	0x444A4004	Port selection 1. See SMIF0_CORE_SMIF_HSIOM_SMIF_PRT0_PORT_SEL1 for the details of bit fields.
SMIF1_CORE_SMIF_HSIOM_SMIF_PRT1_PORT_SEL0	0x444A4010	Port selection 0. See SMIF0_CORE_SMIF_HSIOM_SMIF_PRT1_PORT_SEL0 for the details of bit fields.
SMIF1_CORE_SMIF_HSIOM_SMIF_PRT2_PORT_SEL0	0x444A4020	Port selection 0. See SMIF0_CORE_SMIF_HSIOM_SMIF_PRT2_PORT_SEL0 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_OUT	0x444B0000	Port output data register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_OUT_CLR	0x444B0004	Port output data clear register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_CLR for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_OUT_SET	0x444B0008	Port output data set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_SET for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_OUT_INV	0x444B000C	Port output data invert register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_INV for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_IN	0x444B0010	Port input state register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_IN for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_INTR	0x444B0014	Port interrupt status register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_INTR_MASK	0x444B0018	Port interrupt mask register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_MASK for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_INTR_MASKED	0x444B001C	Port interrupt masked status register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_MASKED for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_INTR_SET	0x444B0020	Port interrupt set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_SET for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_INTR_CFG	0x444B0040	Port interrupt configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_INTR_CFG for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_CFG	0x444B0044	Port configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_CFG_IN	0x444B0048	Port input buffer configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_IN for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_CFG_OUT	0x444B004C	Port output buffer configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_OUT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_CFG_SLEW_EXT	0x444B0064	Port output buffer slew extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_SLEW_EXT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT0	0x444B0068	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT1	0x444B006C	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_OUT	0x444B0080	Port output data register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_OUT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_OUT_CLR	0x444B0084	Port output data clear register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_CLR for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_OUT_SET	0x444B0088	Port output data set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_SET for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_OUT_INV	0x444B008C	Port output data invert register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_INV for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_IN	0x444B0090	Port input state register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_IN for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_INTR	0x444B0094	Port interrupt status register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASK	0x444B0098	Port interrupt mask register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASK for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASKED	0x444B009C	Port interrupt masked status register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASKED for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_INTR_SET	0x444B00A0	Port interrupt set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_SET for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_INTR_CFG	0x444B00C0	Port interrupt configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_CFG for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_CFG	0x444B00C4	Port configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_CFG_IN	0x444B00C8	Port input buffer configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG_IN for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_CFG_OUT	0x444B00CC	Port output buffer configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG_OUT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_CFG_SLEW_EXT	0x444B00E4	Port output buffer slew extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_SLEW_EXT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_CFG_DRIVE_EXT0	0x444B00E8	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT1_CFG_DRIVE_EXT1	0x444B00EC	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_OUT	0x444B0100	Port output data register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_OUT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_OUT_CLR	0x444B0104	Port output data clear register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_CLR for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_OUT_SET	0x444B0108	Port output data set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_SET for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_OUT_INV	0x444B010C	Port output data invert register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_OUT_INV for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_IN	0x444B0110	Port input state register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_IN for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_INTR	0x444B0114	Port interrupt status register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_INTR_MASK	0x444B0118	Port interrupt mask register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASK for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_INTR_MASKED	0x444B011C	Port interrupt masked status register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_MASKED for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_INTR_SET	0x444B0120	Port interrupt set register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_SET for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_INTR_CFG	0x444B0140	Port interrupt configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_INTR_CFG for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_CFG	0x444B0144	Port configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_CFG_IN	0x444B0148	Port input buffer configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG_IN for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_CFG_OUT	0x444B014C	Port output buffer configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT2_CFG_OUT for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_CFG_SLEW_EXT	0x444B0164	Port output buffer slew extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_SLEW_EXT for the details of bit fields.

Serial Memory Interface (SMIF) registers

Register name	Address	Description
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_CFG_DRIVE_EXT0	0x444B0168	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT0 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_SMIF_PRT2_CFG_DRIVE_EXT1	0x444B016C	Port output buffer drive sel extension configuration register. See SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG_DRIVE_EXT1 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_INTR_CAUSE00	0x444B8000	Interrupt port cause register 0. See SMIF0_CORE_SMIF_GPIO_INTR_CAUSE00 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_INTR_CAUSE01	0x444B8004	Interrupt port cause register 0. See SMIF0_CORE_SMIF_GPIO_INTR_CAUSE00 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_INTR_CAUSE02	0x444B8008	Interrupt port cause register 0. See SMIF0_CORE_SMIF_GPIO_INTR_CAUSE00 for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_VDD_ACTIVE	0x444B8010	Extern power supply detection register. See SMIF0_CORE_SMIF_GPIO_VDD_ACTIVE for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_VDD_INTR	0x444B8014	Supply detection interrupt register. See SMIF0_CORE_SMIF_GPIO_VDD_INTR for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_VDD_INTR_MASK	0x444B8018	Supply detection interrupt mask register. See SMIF0_CORE_SMIF_GPIO_VDD_INTR_MASK for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_VDD_INTR_MASKED	0x444B801C	Supply detection interrupt masked register. See SMIF0_CORE_SMIF_GPIO_VDD_INTR_MASKED for the details of bit fields.
SMIF1_CORE_SMIF_GPIO_VDD_INTR_SET	0x444B8020	Supply detection interrupt set register. See SMIF0_CORE_SMIF_GPIO_VDD_INTR_SET for the details of bit fields.

22.1.1 SMIF0_CACHE_BLOCK_HWPARAMS

Description: Hardware Parameter register

Address: 0x44450000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R	R	R	
HW Access	Reserved				R	R	R	
Name	Reserved [7:4]				SNAP-SHOTTING	XOM	ENDIANNESS [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	CACHE_MEM_SIZE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	MASTER_ID [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	Reserved		R	R	R	R
HW Access	R	R	Reserved		R	R	R	R
Name	AHB_VIO-LA-TION_RES P	APB_VIO-LA-TION_RES P	Reserved [29:28]		POW-ER_ON_EN ABLE	DIS_P-WR_DOWN _MAINT	DIS_-CACHE_DI S_MAINT	DIS_-CACHE_EN _MAINT

Bits	Name	Description
31	AHB_VIOLATION_RESP	Respond with error (1) or RAZ/WI (0) for illegal AHB operations (eg. XOM). Fixed to 0 if XOM render parameter is OFF Default Value: 0
30	APB_VIOLATION_RESP	Respond with error (1) or RAZ/WI (0) for illegal APB operations. These are transfers that are any of: non-privileged, instruction, unaligned or incomplete write strobes Default Value: 1
27	POWER_ON_ENABLE	Value of the input configuration port that controls whether the cache should be enabled automatically after power up Default Value: 0
26	DIS_PWR_DOWN_-MAINT	Value of the input configuration port that controls the function to disable automatic clean at power down Default Value: 0
25	DIS_CACHE_DIS_MAINT	Value of the input configuration port that controls the function to disable automatic maintenance at disabling the cache Default Value: 0
24	DIS_CACHE_EN_MAINT	Value of the input configuration port that controls the function to disable automatic maintenance at enabling the cache Default Value: 1
23 : 16	MASTER_ID	The cache generates transactions with this ID Default Value: 30

22.1.1 SMIF0_CACHE_BLOCK_HWPARAMS (continued)

15 : 8	CACHE_MEM_SIZE	Cache memory size in address bits. The actual size is this value to the power of 2 (11->2KB,..,16->64KB) Default Value: 15
3	SNAPSHOTTING	SNAPSHOTTING supported 1-ON, 0-OFF Default Value: 1
2	XOM	XOM supported 1-ON, 0-OFF Default Value: 0
1 : 0	ENDIANNESS	The endianness of the module 0 - LE, 1 - BE8, 2 - BE32 Default Value: 0

22.1.2 SMIF0_CACHE_BLOCK_CTRL

Description: Control Register

Address: 0x44450010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved							
Name	Reserved [7:2]						FORCE_WT	ENABLE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							
Name	Reserved [15:9]							DENY_POWERDOWN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					RW	RW	RW
HW Access	Reserved							
Name	Reserved [23:19]					ALLOW_NSEC_NSECSTAT	ALLOW_NSEC_MAINT_LINES	ALLOW_NSEC_ENABLE_READ

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
18	ALLOW_NSEC_NSECSTAT	Allow non-secure to read and control non-secure statistics counter registers and receive saturation interrupt Default Value: 0
17	ALLOW_NSEC_MAINT_LINES	Allow non-secure to trigger maintenance (only for lines and only non-secure views of cache lines) Default Value: 0
16	ALLOW_NSEC_ENABLE_READ	Allow non-secure to see if the cache is enabled Default Value: 0
8	DENY_POWERDOWN	When set, power-down LPI requests are denied. Does not affect clock LPI requests. Default Value: 0
1	FORCE_WT	Force Write-Through policy Default Value: 0
0	ENABLE	Enable cache (1-enabled, 0-disabled) Default Value: 0

22.1.3 SMIF0_CACHE_BLOCK_NSEC_ACCESS

Description: Non-secure access information

Address: 0x44450014

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							
Name	Reserved [7:1]							CACHE_ENABLED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved					R	R	R
HW Access	Reserved							
Name	Reserved [23:19]					NSEC_NSECSTAT_ALLOWED	NSEC_MAINT_LINES_ALLOWED	NSEC_ENABLE_READ_ALLOWED

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
18	NSEC_NSECSTAT_ALLOWED	Non-secure is allowed to read and control non-secure statistics counters and receives saturation interrupt Default Value: 0
17	NSEC_MAINT_LINES_ALLOWED	Non-secure is allowed to trigger maintenance (only for lines) Default Value: 0
16	NSEC_ENABLE_READ_ALLOWED	Non-secure is allowed to see the cache enabled state Default Value: 0
0	CACHE_ENABLED	Enable cache (1-enabled, 0-disabled). Only valid if bit NSEC_ENABLE_READ_ALLOWED is set Default Value: 0

22.1.4 SMIF0_CACHE_BLOCK_MAINT_CTRL_ALL

Description: Maintenance control for the entire cache

Address: 0x44450020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						W	W
HW Access	Reserved							
Name	Reserved [7:2]						TRIG_IN-VALI-DATE_ALL	TRIG_-CLEAN_ALL

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	TRIG_INVALIDATE_ALL	Trigger Invalidate on all cache (can be used together with cleaning) Default Value: 0
0	TRIG_CLEAN_ALL	Trigger Cleaning on all cache (can be used together with invalidate) Default Value: 0

22.1.5 SMIF0_CACHE_BLOCK_MAINT_CTRL_LINES

Description: Maintenance control for individual lines

Address: 0x44450024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W			Reserved		W	W	W
HW Access				Reserved				
Name	ADDR [7:5]			Reserved [4:3]		SECURITY	TRIG_IN-VALIDATE	TRIG_-CLEAN

Bits	15	14	13	12	11	10	9	8
SW Access	W							
HW Access								
Name	ADDR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	W							
HW Access								
Name	ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	W							
HW Access								
Name	ADDR [31:24]							

Bits	Name	Description
31 : 5	ADDR	Address to look up in the cache and perform invalidate or cleaning on matching cache line. Use bits [31:5] of the address. Default Value: 0
2	SECURITY	Cache maintenance is performed on the secure or non-secure view of the address. (It is possible to have both the secure and non-secure views of the same address allocated in the cache.) 0 - Secure, 1 - Non-secure; For non-secure accesses, this is ignored, and the non-secure is selected always Default Value: 0
1	TRIG_INVALIDATE	Trigger Invalidate on addressed cache line Default Value: 0
0	TRIG_CLEAN	Trigger Cleaning on addressed cache line Default Value: 0

22.1.6 SMIF0_CACHE_BLOCK_MAINT_STATUS

Description: Maintenance status for the cache

Address: 0x44450028

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				R	R	R	R
HW Access	Reserved							
Name	Reserved [7:4]				ONGO-ING_P-WR_MAINT	ONGO-ING_MAINT	ONGO-IN-G_EN_DIS	CACHE_EN ABLED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							R
HW Access	Reserved							
Name	Reserved [15:9]							CACHE_IS _CLEAN

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	CACHE_IS_CLEAN	Reading 1 means the cache doesnt have dirty data. Default Value: 0
3	ONGOING_PWR_MAINT	Reading 1 means a full cache cleaning operation is in progress triggered by a power down request. Default Value: 0
2	ONGOING_MAINT	Reading 1 means a cache maintenance operation is in progress (clean and/or invalidate or enable/disable). Default Value: 0
1	ONGOING_EN_DIS	Ongoing Enable or Disable. Reading 1 means the cache is in progress of being disabled or enabled and the CACHE_ENABLED bit will change when done. Default Value: 0
0	CACHE_ENABLED	Cache enable status. Reading 1 means the cache is enabled, 0 the cache is disabled Default Value: 0

22.1.7 SMIF0_CACHE_BLOCK_SECIRQSTAT

Description: Secure Interrupt Request Status register

Address: 0x44450100

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	R	R	R	R	R	R	R
HW Access	Reserved							
Name	Reserved	NSE-CURE_CNT_SAT	SE-CURE_CNT_SAT	TR_ERR	MAINT_IGNORED	MAINT_-DONE	DISABLE_-DONE	ENABLE_-DONE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
6	NSECURE_CNT_SAT	Non-secure statistics counters saturated and stopped (when ALLOW_NSEC_NSECSTAT is not set) Default Value: 0
5	SECURE_CNT_SAT	Secure statistics counters saturated and stopped Default Value: 0
4	TR_ERR	Secure transaction error on master side (any bus error, data type access to XOM) Default Value: 0
3	MAINT_IGNORED	Secure software attempted maintenance or enable/disable of cache while such an operation was already in progress and the new request was ignored. Default Value: 0
2	MAINT_DONE	Manual maintenance operation (clean and/or invalidate) started by secure software finished Default Value: 0
1	DISABLE_DONE	Disable operation completed, cache is bypassed Default Value: 0
0	ENABLE_DONE	Enable operation completed, cache is operational Default Value: 0

22.1.8 SMIF0_CACHE_BLOCK_SECIRQSCLR

Description: Secure Interrupt Status Clear register

Address: 0x44450104

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved	W	W	W	W	W	W	W
HW Access	Reserved

Name	Reserved [31:24]							

Bits	Name	Description
0	DIS_CACHE_EN_MAINT	The dis_cache_en_maint port determines if the AHB Cache starts the predefined cache maintenance before the cache enable command would take effect. dis_cache_en_maint = 1 The AHB Cache does not start any maintenance before applying the cache enable command. Caution If cache enable maintenance is disabled, the software must manage the AHB Cache. It must invalidate the content before cache enable if: - The cache RAMs have not been invalidated after the last power cycle. - The content is not valid anymore. Otherwise the data in the cacheable regions is corrupted. dis_cache_en_maint = 0, The AHB Cache starts invalidate all maintenance before it applies the cache enable command that it has received on the APB interface. While the cache enable maintenance is running, the AHB Cache works as if it were disabled. The traffic is not affected. When the invalidation is completed, the next NSEQ transaction on the AHB slave interface is looked up in the cache according to its transaction attributes. The status of ongoing enable or disable related maintenance can be read at MAINT_STATUS.ONGOING_EN_DIS status register bit. The effective enabled or disabled status can be read at MAINT_STATUS.CACHE_ENABLED status register bit. Default Value: 1

22.1.45 SMIF0_CACHE_BLOCK_MMIO_DIS_CACHE_DIS_MAINT

Description: This signal turns on/off cache disable maintenance.

Address: 0x4445200C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							DIS_-CACHE_DIS_MAINT

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	DIS_CACHE_DIS_MAINT	The dis_cache_dis_maint determines if the AHB Cache starts the predefined cache maintenance before the cache disable command would take effect. dis_cache_dis_maint = 1 The AHB Cache drains the internal buffers but does not complete any other maintenance before applying the cache disable command. It only waits for any ongoing Burst on the AHB slave interface to finish. Caution If cache disable maintenance is disabled, the software must manage the AHB Cache. If there is any dirty data in the cache RAMs, the software must clean the cache before disable. Otherwise, the main memory is not updated. dis_cache_dis_maint = 0, The AHB Cache starts clean all maintenance before it applies the cache disable command that it has received on the APB interface. While this maintenance is running, the AHB Cache stalls the AHB slave interface. After accepting the disable command, the AHB Cache stalls the AHB traffic at the next NSEQ transaction on the AHB slave interface. Then it runs a clean all maintenance process and when it is completed the disable becomes effective and the AHB slave interface is released. The status of ongoing disable related maintenance can be read at MAINT_STATUS.ONGOING_EN_DIS status register bit. The effective enabled or disabled status can be read at MAINT_STATUS.CACHE_ENABLED status register bit. Default Value: 0

22.1.46 SMIF0_CACHE_BLOCK_MMIO_APB_VIOLATION_RESP

Description: This signal controls if the APB interface of cache responds with an error to illegal operations on the APB interface. Illegal operations on the APB interface include Writing with no full write strobe, Accessing non-word aligned addresses, Instruction accesses, Non-privileged accesses 1 - The Cache responds with an APB error. Read data is masked with zeros and write data is ignored. 0 - The Cache sends an OK response. Read data is masked with zeros and write data is ignored.

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	POWER_ON_ENABLE	The power_on_enable port can be set so that the AHB Cache is enabled when the LPI interfaces first reach QRUN state after reset. The cache enable bit is combinatorially driven from this bit. With a default of 0, cache comes up disabled upon cold start. Before enabling the cache, the SW should set this bit to 1 (if it intends to have the cache come-up enabled after power-down/power-up sequence). The expected behaviour here is that this bit is retained during cache power down and when cache is subsequently powered down and back up, this bit would drive the cache enable bit to 1, thereby automatically enabling the cache. If the SW wants to use the cache contents upon return from deep sleep, it should make sure to have set dis_cache_en_maint set to 1 prior to going into deep sleep. Setting dis_cache_en_maint to 1 has an effect of preventing a cache from doing a force invalidate of cache lines prior to enable. power_on_enable = 1 The cache is enabled automatically after powerup. This signal is affected by the dis_cache_en_maint. power_on_enable = 0 The cache waits for software to enable the cache through the APB programming interface. Default Value: 0

22.1.49 SMIF0_CACHE_BLOCK_MMIO_MMIO_CACHE_RET_EN

Description: Controls if cache SRAMs are retained during DPSLP

Address: 0x4445201C

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	DIS_PWR_DOWN_MAINT	The dis_pwr_down_maint port determines if the AHB Cache starts the predefined cache maintenance process before accepting a powerdown request. dis_pwr_down_maint = 1 If there is no deny condition, the AHB Cache merges any data from its internal buffers into the cache RAMs and accepts the power quiescence request immediately. dis_pwr_down_maint = 0 The AHB Cache checks the cache clean status whenever a power quiescence request is received through the power Q-Channel interface. If the cache status is clean and otherwise idle, then it accepts the quiescence request. If the cache status is dirty but otherwise idle, it starts a clean all maintenance process. The AHB Cache delays the response and only denies the request if a dirty line is actually found in the cache memory during the maintenance operation. During powerdown maintenance, any AHB activity that would cause a power quiescence request to be denied (except for the maintenance driven activity) results in the maintenance being aborted. Any subsequent quiescence request is denied while the maintenance is in progress. The status of the powerdown maintenance can be monitored - On the pwr_maintenance output port. This port is driven high only while this process is running. - By reading the MAINT_STATUS.ONGOING_PWR_MAINT status register bit. Default Value: 0

22.1.51 SMIF0_CACHE_BLOCK_MMIO_REGION0_BASE

Description: Region 0 Attributes - register 0; Region attributes shall be changed exclusively while the SMIF is disabled, and the XIP interfaces are idle

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	INIT_IN_PROGRESS	Reserved [30:24]						

Bits	Name	Description
31	INIT_IN_PROGRESS	During initialization INIT_IN_PROGRESS is '1' and MMIO register accesses to BLK_LUT is blocked (BLK_IDX increment is also ignored). The block attributes are retained in DeepSleep (and obviously Active) power mode. Initialization is only required from a power mode in which the block attributes are not retained. E.g., initialization is required for a cold boot (after a Power-on-Reset). HW initializes the block attributes: the NS attributes are set to '0' (secure), the R attributes are set to '1' (read access allowed) and the W attributes are set to '1' (write access allowed). During initialization, the MPC supports memory accesses (memory accesses are NOT blocked) with the initialization block attribute values as mentioned above. This e.g. allows MPC initialization to proceed in parallel with boot program memory accesses (as opposed to serializing the two), improving device boot time. Default Value: 1
3 : 0	BLOCK_SIZE	Block size of individually protected blocks (0: 32B, 1: 64B, ... up to 15: 1MB) Block size= (1<<(BLOCK_SIZE+5)) The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 12

22.1.63 SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_BLK_IDX

Description: Index of 32-block group accessed through BLK_LUT (Separate IDX for each PC depending on access_pc)

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	RW	Reserved						
Name	INIT_IN_PROGRESS	Reserved [30:24]						

Bits	Name	Description
31	INIT_IN_PROGRESS	During initialization INIT_IN_PROGRESS is '1' and MMIO register accesses to ROT_BLK_LUT is RAZWI. The block attributes are retained in DeepSleep (and obviously Active) power mode. Initialization is only required from a power mode in which the block attributes are not retained. E.g., initialization is required for a cold boot (after a Power-on-Reset). HW initializes the block attributes: the NS attributes are set to '0' (secure), the R attributes are set to '1' (read access allowed) and the W attributes are set to '1' (write access allowed). During initialization, the MPC supports memory accesses (memory accesses are NOT blocked) with the initialization block attribute values as mentioned above. This e.g. allows MPC initialization to proceed in parallel with boot program memory accesses (as opposed to serializing the two), improving device boot time. Default Value: 1
3 : 0	BLOCK_SIZE	Block size of individually protected blocks (0: 32B, 1: 64B, ...up to 15:1MB) Block size= (1<<(BLOCK_SIZE+5)) The number and size blocks in an MPC is design time configurable and for embedded memories defaults to covering the entire memory using 4kB blocks; see product datasheet for details on protection of external memories. Default Value: 12

22.1.68 SMIF0_CACHE_BLOCK_CACHEBLK_AHB_MPC0_ROT_BLK_IDX

Description: Index of 8-block group accessed through ROT_BLK_LUT_*

HW Access	R		R		Reserved	R		
Name	SELECT_HOLD_DELAY [23:22]		SELECT_SETUP_DELAY [21:20]		Reserved	DESELECT_DELAY [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved					RW	RW
HW Access	R	Reserved					R	R
Name	ENABLED	Reserved [30:26]					CLOCK_IF_SEL	BLOCK

Bits	Name	Description
31	ENABLED	SMIF core enable: '0': Disabled. All non-retention registers are reset to their default value when this SMIF core is disabled. When this SMIF core is disabled, the XIP accesses produce AHB-Lite bus errors and AXI error responses. '1': Enabled. Notes: - Before disabling or resetting this SMIF core, SW should ensure that this SMIF core is NOT busy (STATUS.BUSY is '0'), otherwise illegal interface transfers may occur. - After CTL.ENABLED is set to 1 it takes up to 20 clk_if cycles until the memory interface registers are realeased from reset. - The DLL is powered up when CTL.ENABLED is set to 1 (if CTL2.BYPASS_MODE is 0). In closed loop mode, it takes maximum 8us for the DLL to stabilize and lock to the freerunning PLL clock at which point STATUS.DLL_LOCKED and INTR.DLL_LOCK will be set. In open loop mode, the lock signal is asserted 261 clk_pll cycles after the DLL is enabled. Default Value: 0 **0x0: DISABLED :** **0x1: ENABLED :**
25	CLOCK_IF_SEL	Specifies the clock source for "clk_if". Must be 0 (clk_pll_normal) before entering DeepSleep; can be returned to 1 (clk_pll_direct) afterwards. '0': clk_pll_normal is used to create clk_if '1': clk_pll_direct is used to create clk_if Default Value: 0

22.1.71 SMIF0_CORE_CTL (continued)

24	BLOCK	Specifies what happens for MMIO interface read accesses to an empty RX data FIFO or to a full TX format/data FIFO. This field is not used for test controller accesses. Default Value: 0 **0x0: BUS_ERROR :** 0': Generate an AHB-Lite bus error. This option is useful when SW decides to use polling on STATUS.TR_BUSY to determine if a interface transfer is no longer busy (transfer is completed). This option adds SW complexity, but limits the number of AHB-Lite wait states (and limits ISR latency). **0x1: WAIT_STATES :** 1': Introduce wait states. This setting potentially locks up the AHB-Lite infrastructure and may increase the CPU interrupt latency.This option is useful when SW performs TX/RX data FIFO accesses immediately after a command is setup using the TX format FIFO. This option has low SW complexity, but may result in a significant number of AHB-Lite wait states (and may increase ISR latency). This can be particularly true if ARB_MODE=1 and an MMIO access must wait a potentially long time behind a XIP access.
23 : 22	SELECT_HOLD_DELAY	Specifies the duration between the last "spi_clk_out" falling edge and "spi_select_out[]" deactivating (going high) before considering any MDL delay due to CTL2.MDL_TAP_SEL. Add that delay to the below values, plus allow some margin for combinatorial variances between spi_select_out[] and spi_clk_out. i.e., if after adding the MDL delay the timing would barely meet the memory datasheet requirement then it is recommended to go to the next higher setting. These values apply for DDR mode, or SDR mode with CTL2.TX_SDR_EXTRA_SETUP=0. For SDR mode with CTL2.TX_SDR_EXTRA_SETUP=1 subtract 1 PLL clock cycle from these values. DDR or SDR mode is determined by the mode of the last phase of the transaction. "0": 1 memory interface clock cycle + CTL2.CLKOUT_DIV adjustment "1": 2 memory interface clock cycles + CTL2.CLKOUT_DIV adjustment "2": 3 memory interface clock cycles + CTL2.CLKOUT_DIV adjustment "3": 4 memory interface clock cycles + CTL2.CLKOUT_DIV adjustment For the following settings of CTL2.CLKOUT_DIV apply these adjustments to the above: 0 (DIV2): subtract 1 PLL clock cycle 1 (DIV4): no adjustment needed 2 (DIV8): add 2 PLL clock cycles 3 (DIV16): add 6 PLL clock cycles Default Value: 1
21 : 20	SELECT_SETUP_DELAY	Specifies the duration between "spi_select_out[]" activating (going low) to the first "spi_clk_out" rising edge before considering any MDL delay due to CTL2.MDL_TAP_SEL. Subtract that delay from the below values, plus allow some margin for combinatorial variances between spi_select_out[] and spi_clk_out. i.e., if after subtracting the MDL delay the timing would barely meet the memory datasheet requirement then it is recommended to go to the next higher setting. These values apply for DDR mode, or SDR mode with CTL2.TX_SDR_EXTRA_SETUP=0. For SDR mode with CTL2.TX_SDR_EXTRA_SETUP=1 add 1 PLL clock cycle to these values. DDR or SDR mode is determined by the mode of the first phase of the transaction. "0": 2 PLL clock cycles "1": 2 PLL clock cycles + 1 memory interface clock cycles "2": 2 PLL clock cycles + 2 memory interface clock cycles "3": 2 PLL clock cycles + 3 memory interface clock cycles Default Value: 1

22.1.71 SMIF0_CORE_CTL (continued)

18 : 16	DESELECT_DELAY	Specifies the minimum duration of SPI deselection ("spi_select_out[]" is high/'1') in between SPI transfers: "0": 1 memory interface clock cycle. "1": 2 memory interface clock cycles. "2": 3 memory interface clock cycles. "3": 4 memory interface clock cycles. "4": 5 memory interface clock cycles. "5": 6 memory interface clock cycles. "6": 7 memory interface clock cycles. "7": 8 memory interface clock cycles. During SPI deselection, "spi_select_out[]" are '1'/inactive, "spi_data_out[]" are '1' and "spi_-clk_out" is '0'/inactive. Default Value: 0
0	XIP_MODE	Mode of operation. Note: this field should only be changed when the IP is disabled or when STATUS.BUSY is '0' and SW should not be executing from the XIP interface or MMIO interface. Default Value: 0 **0x0: MMIO_MODE :** '0': MMIO mode. Individual MMIO accesses to TX and RX FIFOs are used to generate a sequence of SPI transfers. This mode of operation allows for large flexibility in terms of the SPI transfers that can be generated. **0x1: ARB_MODE :** "1': Arbitration mode. Arbitrates XIP vs. MMIO SPI/xSPI accesses such that any ongoing, pending, or "merged" transactions on XIP always take priority over any MMIO accesses to the device. However, if an MMIO access is in process it cannot be interrupted until it completes (as defined by sending the "last command" via TX_CMD_MMIO_FIFO_WR). If MMIO accesses are not happening at all, though, then the XIP accesses endure no extra arbitration latency.

22.1.72 SMIF0_CORE_STATUS

Description: Status

Address: 0x44460004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							DLL_LOCKED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	W	Reserved						
Name	BUSY	Reserved [30:24]						

Bits	Name	Description
31	BUSY	AHB Cache, AXI interface, cryptography, XIP, device interface, MPC (if present) initialization, or any other key logic busy in the IP: '0': not busy '1': busy When BUSY is '0', the IP can be safely disabled without: - the potential loss of transient write data. - the potential risk of aborting an inflight SPI device interface transfer. - disrupting MPC (if present) initialization When BUSY is '0', the mode of operation (ARB_MODE or MMIO_MODE) can be safely changed. Default Value: Undefined
0	DLL_LOCKED	DLL lock status signal 0: DLL not locked 1b: DLL locked (also set to 1b after entering open-loop mode) Once the reference clock to the DLL is stable and the DLL is powered (CTL.ENABLED=1), the DLL should lock within 8us. The lock time will also be incurred when transitioning from DeepSleep to Active. Wait another 4us beyond the lock indication before executing any transactions on the memory interface; the MDL and SDLs require that extra time after the lock indication to reach their final stable delay values. If the DLL suddenly becomes unlocked then the TX interface will be held in reset to prevent any further transactions to the memory. The block should be disabled (CTL.ENABLED=0) to reset all other non-retention registers. Any data in the internal FIFOs will be lost. The DLL suddenly unlocking is considered an unusual event that would only occur if the reference clock to the DLL had a sudden change in frequency, which should only happen at the direction of SW. When transitioning to DeepSleep the DLL will naturally unlock. However, upon returning to Active all non-retention registers are reset and thus disabling the block to enact that reset is not necessary. Default Value: Undefined

22.1.73 SMIF0_CORE_CTL2

Description: Control 2

Address: 0x44460008

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	TX_SDR_EXTRA_SETUP	Reserved [30:24]						

Bits	Name	Description
31	TX_SDR_EXTRA_SETUP	This field is only applicable in SDR transmit mode. 0: transmit data is launched nominally 1 PLL clock period ahead of the rising edge of the clock out to the memory 1: transmit data is launched nominally 2 PLL clock periods ahead of the rising edge of the clock out to the memory Default Value: 0
23 : 22	RX_CHASE_MARGIN	Determines how long the design should wait after sending the last clock out to the memory interface before "chase" clocks should be created internally to push remainder data in the interface pipeline into the RX FIFO. Lesser numbers allow for shorter deselect cycles between packets, but if the time is too short then the chase clocks will interfere with the normal capture clock from the last clock cycle from the memory interface (whether it is feedback or RWDS). So a proper balance must be struck. The default value is expected to work for all situations. Other values are there as a backup plan in case something more aggressive can be achieved or whether something even more conservative should be used. Default Value: 2

22.1.73 SMIF0_CORE_CTL2 (continued)

21 : 20	RX_CAPTURE_MODE	Determines the receive capture mode: 0: Normal SPI without DLP 1: Normal SPI with DLP 2: Hyperbus / xSPI / Octal SPI w/DQS When using RX_CAPTURE_MODE=2: 1) DEVICE.RX_CAPTURE_CONFIG.DDR_PIPELINE_POS_DAT must be set to 1 2) DEVICE.RX_CAPTURE_CONFIG.DDR_SWAP_BYTES MMIO programming is ignored, bytes are always swapped as if set to 1. Default Value: 0
19 : 18	DLL_SKIP_LSB	number of LSBs which are skipped for loop regulation 00b: 0 (default) 01b: 1 10b: 2 11b: 3 Default Value: 0
17 : 15	DLL_UNLOCK_VALUE	value for the unlock counter 000b: 8 001b: 16 (default) 010b: 24 011b: 32 100b: 64 101b: 128 110b: 256 111b: 1023 Default Value: 1
14 : 12	DLL_GATING_PERIOD	Gating period of the digital logic 000b: 2 clock cycles -- use only in burn-in 001b: 4 clock cycles -- don't use 010b: 8 clock cycles -- don't use 011b: 16 clock cycles 100b: 24 clock cycles 101b: 32 clock cycles (default) 110b: 40 clock cycles 111b: 48 clock cycles Default Value: 5
11 : 8	MDL_TAP_SEL	Determines the relative amount of delay through the MDL for the reference clock in terms of the number of tap delays. There are 16 MDL taps that evenly divide the reference clock period into 16 delay steps. Setting 0 constitutes 1 tap delay, setting 1 constitutes 2 tap delays, etc., setting 15 constitutes 16 tap delays (which is effectively a full MDL reference clock period). Tap delay 15 is only verified in openloop mode as it can't send data reliably in functional simulations. Default Value: 0
7	DLL_IGNORE_LOCK	When set to 1, is used to block the TX logic reset that is generated when the DLL unlocks. 0b: Reset the TX logic when DLL unlocks 1b: Ignore the DLL unlock, do not reset the TX logic Default Value: 0
6	DLL_MDL_BYPASS_-MODE	Bypass MDL only. Transmit clock is generated from clk_pll and transmit data is clocked with inverted clk_pll. DLL is enabled because SDL phases are needed for receive data. 0b: MDL is not bypassed 1b: MDL is bypassed Default Value: 0
5 : 4	CLKOUT_DIV	The clock out to the memory is a divided version of the MDL clock out: 0: divide by 2 1: divide by 4 2: divide by 8 3: divide by 16 Default Value: 0
3	DLL_BYPASS_MODE	Bypass DLL in lower frequencies 0b: DLL is enabled if CTL.EN = 1 and not bypassed 1b: DLL is disabled independent of CTL.EN and bypassed Default Value: 0

22.1.73 SMIF0_CORE_CTL2 (continued)

2	DLL_OPENLOOP_ENABLE	operate the DLL in open loop mode (frequency < 150MHz) 0b: DLL tries to lock (150MHz - 400MHz) (default) 1b: DLL runs in open loop. DLL does not try to lock when open loop mode is selected independent of the frequency of the input clock. Default Value: 0
1 : 0	DLL_SPEED_MODE	Set according to the PLL clock frequency that feeds the DLL: speed mode control speed mode control 00b: 150-192MHz (default) 01b: 193-245MHz 10b: 246-313MHz 11b: 314 - 400MHz Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [31:28]				DLP_WARNING_LEVEL [27:24]			

Bits	Name	Description
27 : 24	DLP_WARNING_LEVEL	Determines when the DLP_WARNING interrupt cause field is set: - DLP_WARNING is set when the number of delay line taps resulting to a correctly captured DLP is less than DLP_WARNING_LEVEL for at least one input data line Note: To provide a margin in both directions relatively to the selected middle tap at least 3 delay line taps have to result into a correctly captured DLP, i.e. the DLP_WARNING_LEVEL has to be set to greater or equal 3. Default Value: 0x3
19 : 16	DLP_SIZE	Size of data learning pattern as such: "0": 1 bit ... "15": 16 bit. If CTL2.RX_CAPTURE_MODE=1 then the DLP_SIZE+1 LSBs of the expected data learning pattern (DLP[DLP_SIZE:0]) are compared with the data learning pattern generated by the memory device and captured during the last latency / dummy cycles of a memory read transfer. Note: For DDR read data transfers the size of the DLP must be an even number, i.e. DLP_SIZE must be an odd number. Default Value: 0x7
15 : 0	DLP	Data Learning Pattern Default Value: 0x0000

22.1.77 SMIF0_CORE_DLP_STATUS0

Bits	Name	Description
28 : 24	DATA_BIT3	Same as the DATA_BIT0 description except for spi_data[3] Default Value: Undefined
20 : 16	DATA_BIT2	Same as the DATA_BIT0 description except for spi_data[2] Default Value: Undefined
12 : 8	DATA_BIT1	Same as the DATA_BIT0 description except for spi_data[1] Default Value: Undefined
4 : 0	DATA_BIT0	In SDR mode: Number of delay line taps for the IP's spi_data[0] (note the mapping of spi_data to IO in DEVICE.CTL.DATA_SEL) with correctly captured DLP in last read transaction. Legal values: 0 to 16. In DDR mode: Similar to SDR except the MSB and LSB data of the DDR pair are evaluated separately and this field reflects the least number of successful taps between those two evaluations. Default Value: Undefined

Bits	Name	Description

22.1.81 SMIF0_CORE_TX_CMD_MMIO_FIFO_WR (continued)

26 : 0	DATA27	Command data. The higher two bits DATA[26:24] specify the specific command "0"/TX: A SPI transfer always start with a TX command FIFO entry of the "TX" format. - DATA[23:20] specifies which of the four devices are selected. DATA[23:20] are directly mapped to "spi_select_out[3:0]". Two devices can be selected at the same time in dual-quad mode. - '0': device deselected - '1': device selected - DATA[19] specifies whether this is the last TX Byte; i.e. whether the "spi_select_out[3:0]" IO output signals are de-activated after the transfer. - "0": not the last TX byte - "1": the last TX byte - DATA[18] specifies the mode of transfer rate: - "0": SDR mode - "1": DDR mode - DATA[17:16] specifies the width of the data transfer: - "0": 1 bit/cycle (single data transfer). - "1": 2 bits/cycle (dual data transfer). - "2": 4 bits/cycle (quad data transfer). - "3": 8 bits/cycle (octal data transfer). - DATA[15:8] specifies the second transmitted Byte. This is only used (and must be specified) for octal data transfer with DDR mode, i.e. when DATA[17:16]="3" and DATA[18]="1". - DATA[7:0] specifies the transmitted Byte. "1"/TX_COUNT: The "TX_COUNT" command relies on the TX data FIFO to provide the transmitted bytes. - DATA[19] specifies whether this is the last command of a data transfer; i.e. whether the "spi_select_out[3:0]" IO output signals are de-activated after the transfer. - DATA[18] specifies the mode of transfer rate. - DATA[17:16] specifies the width of the transfer. - DATA[15:0] specifies the number of to be transmitted memory data units (minus 1). "0": 1 unit, "1": 2 units. For SPI (except octal SPI with DDR) one memory data unit is a byte, for octal SPI with DDR and Hyperbus one memory data unit is a 2-byte word. The number of used TX data FIFO entries (in TX_DATA_MMIO_FIFO_STATUS) = number of memory data units to be transmitted. "2"/RX_COUNT: The "RX_COUNT" command relies on the RX data FIFO to accept the received bytes. - DATA[19] specifies whether this is the last command of a data transfer; i.e. whether the "spi_select_out[3:0]" IO output signals are de-activated after the transfer. - DATA[18] specifies the mode of transfer rate. - DATA[17:16] specifies the width of the transfer. - DATA[15:0] specifies the number of to be received memory data units (minus 1). "0": 1 unit, "1": 2 units. For SPI (except octal SPI with DDR) one memory data unit is a byte, for octal SPI with DDR and Hyperbus one memory data unit is a 2-byte word. The number of used RX data FIFO entries (in RX_DATA_FIFO_STATUS) = number of memory data units to be received * 8 / data width (1, 2, 4, 8). The number of used RX data MMIO FIFO entries (in RX_DATA_MMIO_FIFO_STATUS) = number of bytes. "3"/DUMMY_COUNT: The "DUMMY_COUNT" command conveys dummy cycles. Dummy cycles are used to implement a Turn-Around time in which the SPI master changes from a transmitter driving the data lines to a receiver receiving on the same data lines. The "DUMMY_COUNT" command is ALWAYS considered to be NOT the last command of a SPI data transfer; i.e. it needs to be followed by another command. - DATA[23] specifies whether RWDS / DQS based capturing is enabled in the last dummy cycle, i.e. this needs to be set to '1' for read transactions to memory device using RWDS / DQS capturing scheme. - DATA[21] specifies whether the RWDS output signal should be driven starting in the last dummy cycle until DESELECT. This is needed for write transactions with RWDS (e.g. Hyperbus) before a TX_COUNT command. - DATA[20] specifies whether an active RWDS refresh indicator (captured with the previous rising memory clock output) causes to double the number of dummy cycles. This is used for the variable latency in HyperRAM. - DATA[18] specifies the mode of transfer rate. This is used for data learning and RWDS / DQS capturing. For XIP accesses this field is taken from DEVICE.RD_DATA_CTL.DDR_MODE. - DATA[17:16] specifies the width of the transfer. This is used for data learning and RWDS / DQS capturing. For XIP accesses this field is taken from DEVICE.RD_DATA_CTL.WIDTH. - DATA[15:0] specifies the number of dummy cycles (minus 1). In dummy cycles, the data lines are not driven. Notes: - If transmitting command, address and mode fields in SDR mode (driving data between falling edges of spihb_clk_out) and the memory is driving read data in DDR mode (based on memory type and transmitted command), then there must be at least 1 latency / dummy cycle specified (DUMMY_COUNT command must be present) to prevent controller and memory driving data signals at the same time. The same is true for the theoretical (practically irrelevant case) of transmitting at least one of the command, address and mode fields in DDR mode but receiving data from the memory in SDR mode. - When using the RWDS / DQS based capturing scheme (CTL2.RX_CAPTURE_MODE]), then there is a minimum number of latency / dummy cycles required (DUMMY_COUNT command must be present). For the Hyperbus protocol (DDR_CTL.SIZE3=7) at least 1 latency / dummy cycle has to be specified, for SPI with DQS capturing at least 2 latency / dummy cycles need to be selected (RD_DUMMY_CTL.SIZE5 > 0, exception see following note). - In case of falling edge RWDS / DQS capturing (CTL.CLOCK_IF_RX_SEL = "6") and SDR mode, SW should reduce the number of dummy cycles by 1 compared to the latency cycles required by the memory device. "4"/DESELECT: The "DESELECT" command de-activates the "spi"select_out[3:0] IO output signals. The "DESELECT" command is ALWAYS considered to be the last command of an SPI data transfer. It is used to finish the last transfer of merged continuous transfers. Default Value: 0

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	START	SW sets this field to '1' to start an AES-128 forward block cipher operation (on CRYPTO_INPUT0-3). HW sets this field to '0' to indicate that the operation has completed. Once completed, the result of the operation can be read from CRYPTO_OUTPUT0, ..., CRYPTO_OUTPUT3. The operation takes roughly 13 clk_mem clock cycles. This register is only applicable for MMIO accesses and only in MMIO_MODE. XIP accesses are encrypted on-the-fly in ARB_MODE and thus do not use this register. Because XIP has exclusive access to the crypto engine in ARB_MODE, MMIO encryption is not available in that mode. As such if encryption is needed for MMIO accesses in ARB_MODE that encryption must be done by other means (i.e., chip level crypto). Default Value: 0

22.1.97 SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_ADDR

Description: Cryptography base address

Address: 0x44460204

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Name	ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	ADDR [31:24]							

Bits	Name	Description
31 : 8	ADDR	Only applies to XIP accesses. Specifies the base address of the memory region that will have cryptography applied on XIP accesses with a unique key. If this region overlaps with another key's region, the lower numbered key is used (i.e., crypto key 0 has the highest priority). If the region is 2^m Bytes, ADDR MUST be a multiple of 2^m. The most significant bit fields are constants and set based on the SMIF_XIP_ADDR parameter. The most significant bits are identified on the SMIF_XIP_MASK parameter. E.g., if SMIF_XIP_MASK is 0xff00:0000 (16 MB XIP memory region), ADDR[31:24] = SMIF_XIP_ADDR[31:24]. Note that in order for cryptogrpahy to be applied the DEVICE.CTL.CRYPTO_EN must be set to 1 as well for any devices that share this region. Default Value: 0

22.1.98 SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_MASK

Description: Cryptography mask

Address: 0x44460208

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	MASK [31:24]							

Bits	Name	Description
31 : 8	MASK	Only applies to XIP accesses. Specifies the size of the memory region whose base address is determined by CRYPTO_ADDR. All '1' bits are used to compare the incoming transfer request address A[31:0] with the address as specified in CRYPTO_ADDR.ADDR: Address A is in the cryptography region when (A[31:8] & MASK[31:8]) == CRYPTO_ADDR.ADDR[31:8]. The most significant bit fields are constants and set to'1'. The most significant bits are identified on the SMIF_XIP_MASK parameter. E.g., if SMIF_XIP_MASK is 0xff00:0000 (16 MB XIP memory region), MASK[31:24] = 0xff. Default Value: 0

22.1.99 SMIF0_CORE_SMIF_CRYPTO0_CRYPTO_SUBREGION

Description: Cryptography subregion disable

Address: 0x4446020C

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7 : 0	SUBREGION_DISABLE	Only applies to XIP accesses. The cryptography region for this key as determined by CRYPTO_ADDR and CRYPTO_MASK is further divided into 8 equal subregions. e.g., if a 1 MB region is specified then the 8 subregions will be 128 KB. If SUBREGION_DISABLE=0 then cryptography will be performed on that subregion (assuming any associated DEVICE.CTL.CRYPTO_EN=1). Otherwise if SUBREGION_DISABLE=1 then cryptography is not applied. Note that setting all SUBREGION_DISABLE bits to 1 will effectively disable this key. The encryption decision and the associated key are locked in at the beginning of a memory access and will apply until the end of such atomic accesses. Therefore, it is the user's responsibility to ensure memory accesses do not span across (sub)regions that have different keys and/or crypto enabled/disabled differently across such (sub)regions. Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	DLL_UNLOCK	DLL unlock (edge detected) Default Value: 0
13	DLL_LOCK	DLL lock (edge detected) Default Value: 0
12	DLP_WARNING	Data Learning Warning (for at least one input data line less then DLP.DLP_WARNING_LEVEL delay line taps resulted in a correct DLP capturing when CTL2.RX_CAPTURE_MODE=1). This interrupt will be suppressed, though, if DLP_FAIL also occurs during the same DLP evaluation cycle. Default Value: 0
8	DLP_FAIL	Data Learning Failed (no DLP match found on at least one of the input data lines when CTL2.RX-_CAPTURE_MODE=1). Default Value: 0
5	RX_DATA_MMIO_FI-FO_UNDERFLOW	Activated on an AHB-Lite read transfer from the RX data MMIO FIFO (RX_DATA_MMIO_FI-FO_RD1, RX_DATA_MMIO_FIFO_RD2, RX_DATA_MMIO_FIFO_RD4) with not enough entries available. Only activated for NON test bus controller transfers. Default Value: 0
4	TX_DATA_FIFO_OVER-FLOW	Activated on an AHB-Lite write transfer to the TX data MMIO FIFO (TX_DATA_MMIO_FI-FO_WR1, TX_DATA_MMIO_FIFO_WR2, TX_DATA_MMIO_FIFO_WR4, TX_DATA_MMIO_FI-FO_WR1ODD) with not enough free entries available. Default Value: 0

22.1.112 SMIF0_CORE_INTR (continued)

3	TX_CMD_FIFO_OVERFLOW	Activated on an AHB-Lite write transfer to the TX command MMIO FIFO (TX_CMD_MMIO_FIFO_WR) with not enough free entries available. Default Value: 0
2	XIP_ALIGNMENT_ERROR	Activated on a XIP access, when: - a write transfer is requested and - Dual-Quad SPI mode (selected device's ADDR_CTL.DIV2 is '1') is selected or - Octal SPI DDR mode (selected device's DATA_CTL.DDR_MODE = '1' and DATA_CTL.WIDTH = "3") or Hyperbus mode (selected device's ADDR_CTL.SIZE3 = "7") is selected without memory write byte masking (selected device's WR_DUMMY_CTL.RWDS_EN = '0') and - the AHB-Lite / AXI bus transfer address is not a multiple of "2" or - the requested AHB-Lite / AXI bus transfer size is NOT a multiple of "2". Additionally, it is activated on a XIP access when the selected memory device does not support write byte masking (WR_DUMMY_CTL.RWDS_EN=0) and an AXI transfer occurs with not all of the AXI write strobes ("wstrb") enabled according to the transfer size ("assize"). Note: In dual-quad SPI mode (ADDR_CTL.DIV is '1'), each memory device contributes a 4-bit nibble for read data or write data. Write accesses are only possible if the request address is a multiple of 2 and the number of requested Bytes is a multiple of 2. Octal SPI DDR mode or Hyperbus mode are 16-bit word based protocols, writing single bytes is only possible when write byte masking is supported (via RWDS). Read accesses are always possible by extending the transfer size and / or aligning the address as needed and discarding the non-relevant byte(s). Default Value: 0
1	TR_RX_REQ	Activated when a RX data MMIO FIFO trigger "tr_rx_req" is activated. Default Value: 0
0	TR_TX_REQ	Activated when a TX data MMIO FIFO trigger "tr_tx_req" is activated. Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	RW					
HW Access	R	R	R					
Name	ENABLED	TOTAL_-TIME-OUT_EN	TOTAL_TIMEOUT [29:24]					

Bits	Name	Description
31	ENABLED	Device enable: '0': Disabled. '1': Enabled. Default Value: 0
30	TOTAL_TIMEOUT_EN	Total transfer timeout enable. '0': Disabled. There is no limit for the total transfer time. The continuous transfer merge timeout for limiting the idle time of the memory interface still applies. '1': Enabled. The maximum total transfer time is limited by field TOTAL_TIMEOUT. Default Value: 0

22.1.118 SMIF0_CORE_DEVICE0_CTL (continued)

29 : 16	TOTAL_TIMEOUT	Total transfer timeout in clk_mem cycles. The counting of the total timout period is done in the XIP block using clk_mem cycles. It starts when the first command of a new (not merged) transaction is transferred to the TX command FIFO causing the interface logic to select the memory. After this period the memory device is deselected. This feature is needed for RAM devices requiring refresh cycles. The value needs to be derived from the RAMs maximum transaction length time (tCMS) minus the time of transferring 2x16byte data block (data granularity of the XIP ports is 16byte, 1 16byte block transfer outstanding, another available for merging). If the result in negative, MERGE_EN must be set to "0". Example: RAM device tCMS = 4us, interface clock frequency = 100MHz: total transfer timeout is 4us - 2x16x10ns = 3680ns. With clk_mem frequency of 200MHz the TOTAL_TIMEOUT value is 3680/5 = 736. Note: In the unlikely case that the total transfer timeout is used (usually for RAM devices) while the page boundary crossing latency generation is enabled via RD_BOUND_CTL.PRESENT (usually for FLASH devices) the additional time needs to taken into account. Default Value: 0
15	MERGE_EN	Continous transfer merge enable: '0': Disabled. No merging of transfers is done. Longest possible memory transfer is 16 Byte. '1': Enabled. Merging of continous transfers is done. This skips the overhead (command, address, mode, dummy cycles) for a continuous (linear sequential) transfer. Default Value: 0
14 : 12	MERGE_TIMEOUT	Continuous transfer merge timeout in clk_mem cycles. This limits the standby time of the memory interface, i.e. the time the memory device is selected but no data is transferred. The counting of the merge timeout period is done in the XIP block using clk_mem cycles. It starts when the last TX or RX byte is transferred to or from the data FIFOs. After this period the memory device is deselected. A later transfer, even from a continuous address, starts with the overhead phases (command, address, mode, dummy cycles). Default Value: 0 **0x0: _1_cycle :** Timeout after 1 clk_mem cycle. That means transfers will only be merged if the continuous transfer request is already available when the previous transfer is finished. **0x1: _16_cycles :** Timeout after 2^4 = 16 clk_mem cycles. At a clk_mem frequency of 200MHz this means 80ns. **0x2: _256_cycles :** Timeout after 2^8 = 256 clk_mem cycles. At a clk_mem frequency of 200MHz this means ~1.3us. **0x3: _4096_cycles :** Timeout after 2^12 = 4096 clk_mem cycles. At a clk_mem frequency of 200MHz this means ~20us. **0x4: _65536_cycles :** Timeout after 2^16 = 65536 clk_mem cycles. At a clk_mem frequency of 200MHz this means ~330us. **0x5: Reserved5 :** This setting is reserved. Do not use.

22.1.118 SMIF0_CORE_DEVICE0_CTL (continued)

		0x6: Reserved6 : This setting is reserved. Do not use. **0x7: Reserved7 :** This setting is reserved. Do not use.
9 : 8	DATA_SEL	Specifies the connection of the IP's data lines (spi_data[0], ..., spi_data[7]) to the device's data lines (SI/IO0, SO/IO1, IO2, IO3, IO4, IO5, IO6, IO7): "0": spi_data[0] = IO0, spi_data[1] = IO1, ..., spi_data[7] = IO7. This value is allowed for single, dual, quad, dual quad and octal SPI modes. This value must be used for the first device in dual quad SPI mode. This value must be used for octal SPI mode. "1": spi_data[2] = IO0, spi_data[3] = IO1. This value is only allowed for single and dual SPI modes. "2": spi_data[4] = IO0, spi_data[5] = IO1, ..., spi_data[7] = IO3. This value is only allowed for single, dual, quad and dual quad SPI modes. In dual quad SPI mode, this value must be used for the second device. "3": spi_data[6] = IO0, spi_data[7] = IO1. This value is only allowed for single and dual SPI modes. Default Value: 0
4	CRYPTO_EN	Cryptography on read/write accesses: '0': disabled. '1': enabled. This register should not be changed dynamically. Conditions 1. The same CRYPTO_EN setting should be used when a memory is read back after a write. 2. CRYPTO_EN should not be changed while IP is busy. Default Value: 0
0	WR_EN	Write enable: '0': write transfers are not allowed to this device. An attempt to write to this device results in an AHB-Lite bus error. '1': write transfers are allowed to this device. Default Value: 0

22.1.119 SMIF0_CORE_DEVICE0_ADDR

Description: Device region base address

Address: 0x44460808

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	ADDR [31:24]							

Bits	Name	Description
31 : 8	ADDR	Specifies the base address of the device region. If the device region is 2^m Bytes, ADDR MUST be a multiple of 2^m. In dual quad SPI data transfer, the two devices should have the same ADDR and MASK register settings. The device control information (ADDR_CTL, RD_CMD_CTL, etc.) are provided by the MMIO control registers of the device with the lowest index. The most significant bit fields are constants and set based on the SMIF_XIP_ADDR parameter. The most significant bits are identified on the SMIF_XIP_MASK parameter. E.g., if SMIF_X-IP_MASK is 0xff00:0000 (16 MB XIP memory region), ADDR[31:24] = SMIF_XIP_ADDR[31:24]. Default Value: Undefined

22.1.120 SMIF0_CORE_DEVICE0_MASK

Description: Device region mask

Address: 0x4446080C

Retention: Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW							
HW Access	A							
Name	MASK [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	A							
Name	MASK [31:24]							

Bits	Name	Description
31 : 8	MASK	Specifies the size of the device region. All '1' bits are used to compare the incoming transfer request address A[31:0] with the address as specified in ADDR.ADDR: Address A is in the device when (A[31:8] & MASK[31:8]) == ADDR.ADDR[31:8]. The most significant bit fields are constants and set to'1'. The most significant bits are identified on the SMIF_XIP_MASK parameter. E.g., if SMIF_XIP_MASK is 0xff00:0000 (16 MB XIP memory region), MASK[31:24] = 0xff. Note: a transfer request that is not in any device region results in an AHB-Lite bus error. Default Value: Undefined

22.1.121 SMIF0_CORE_DEVICE0_ADDR_CTL

Description: Address control

Address: 0x44460820

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW		
HW Access	Reserved					R		
Name	Reserved [7:3]					SIZE3 [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW

Name	Reserved [15:9]							DIV2

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	DIV2	Specifies if the AHB-Lite bus transfer address is divided by 2 or not: '0': No divide by 2. '1': Divide by 2. This functionality is used for read and write operation in XIP, dual quad SPI mode; i.e. this DIV2 must be set to '1' in dual quad SPI mode. If DIV2 is set to '1', the memory does not support write masking (WR_DUMMY_CTL.RWDS_EN = '0'), and in this configuration a write transfer is requested and the write transfer request address is NOT a multiple of 2 or the requested number of Bytes to be written is not a multiple of 2, the XIP_ALIGNMENT_ERROR interrupt cause is activated. Default Value: 0
2 : 0	SIZE3	Specifies the size of the XIP device address in Bytes: "0": 1 Byte address. "1": 2 Byte address. "2": 3 Byte address. "3": 4 Byte address. "4"-"6": These settings are reserved. Do not use. "7": 4 Byte address (spread over 5 bytes) according to Hyperbus protocol. The lower significant address Bytes of the transfer request are used as XIP address to the external device. Note that for dual quad SPI data transfer, the XIP transfer request address is divided by 2. Therefore, the XIP transfer request address needs to be a multiple of 2. If the address is NOT a multiple of 2, the XIP_ALIGNMENT_ERROR interrupt cause is activated. Note: If Hyperbus protocol is selected (SIZE3="7") then the WIDTH field must be set to "3" (octal data transfer) and the DDR_MODE field must be set to "1" (DDR mode) in the read/write command and address control registers, and the PRESENT field in read/write command control registers need be set to "1" (1 command byte). Default Value: 0

22.1.122 SMIF0_CORE_DEVICE0_RX_CAPTURE_CONFIG

Bits	Name	Description
31 : 30	PRESENT2	Presence of dummy cycles: '0': not present '1': present '2': present - Dummy cycles are doubled when RWDS refresh indicator is high during CA cycle. (HyperRAM variable latency mode) Notes: - If transmitting command, address and mode fields in SDR mode (driving data between falling edges of spihb_clk_out) and the memory is driving read data in DDR mode (based on memory type and transmitted command), then there must be at least 1 latency / dummy cycle specified (RD_DUMMY_CTL.PRESENT2 > 0') to prevent controller and memory driving data signals at the same time. The same is true for the theoretical (practically irrelevant case) of transmitting at least one of the command, address and mode fields in DDR mode but receiving data from the memory in SDR mode. - When using the RWDS / DQS based capturing scheme (CTL2.RX_CAPTURE_MODE), then there is a minimum number of latency / dummy cycles required (RD_DUMMY_CTL.PRESENT2 > 0). For the Hyperbus protocol (DDR_CTL.SIZE3=7) at least 1 latency / dummy cycle has to be specified, for SPI with DQS capturing at least 2 latency / dummy cycles need to be selected (RD_DUMMY_CTL.SIZE5 > 0, exception see following note). - In case of falling edge RWDS / DQS capturing (CTL2.RX_CAPTURE_MODE) and SDR mode, SW should reduce the number of dummy cycles by 1 compared to the latency cycles required by the memory device. -DDR read commands need at least one dummy cycle -For Hyperbus, set RD DUMMY_CTL.SIZE5=initial latency cycles-2 Default Value: 0

22.1.126 SMIF0_CORE_DEVICE0_RD_DUMMY_CTL (continued)

4 : 0	SIZE5	Number of dummy cycles (minus 1): "0": 1 cycles ... "31": 32 cycles. Note: this field specifies dummy cycles, not dummy Bytes! Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved		RW	Reserved			
HW Access	R	Reserved		R	Reserved			
Name	PRESENT	Reserved [30:29]		SUBSE-Q_BOUND_EN	Reserved [27:24]			

Bits	Name	Description
31	PRESENT	Presence of first page boundary latency cycles: '0': not present '1': present Default Value: 0
28	SUBSEQ_BOUND_EN	Enable subsequent page boundary latency cycles. '0': Disabled. The page crossing latency cycles are only generated when crossing the first page boundary (i.e. the first time when the SUB_PAGE_NRth sub page boundary is crossed, e.g. with 2 sub pages per page when the 2nd sub page boundary is crossed). '1': Enabled. The page crossing latency cycles are generated when crossing the first and subsequent page boundaries (i.e. every time when a SUB_PAGE_NRth sub page boundary is crossed, e.g. with 2 sub pages per page when the 2nd, 4th, 6th, ... sub page boundary is crossed). Note: This only applies when the number of base latency cycles (SIZE5+1) is greater than the size of a page (base_latency > page_size). Must be set to 0 otherwise. Default Value: 0
21 : 20	SUB_PAGE_NR	Specifies the number of sub pages per page. "0": 1 sub pages per page, i.e. page_size = sub_page_size "1": 2 sub pages per page, i.e. page_size = 2 x sub_page_size "2": 4 sub pages per page, i.e. page_size = 4 x sub_page_size "3": 8 sub pages per page, i.e. page_size = 8 x sub_page_size Default Value: 1

22.1.128 SMIF0_CORE_DEVICE0_RD_BOUND_CTL (continued)

17 : 16	SUB_PAGE_SIZE	Specifies the size of a memory sub page "sub_page_size". "0": sub_page_size = 8 words = 16 bytes (default). "1": sub_page_size = 16 words = 32 bytes. "2": sub_page_size = 32 words = 64 bytes. "3": sub_page_size = 64 words = 128 bytes. Default Value: 0

4 : 0	SIZE5	Number of base latency cycles (minus 1) used for calculating the number of fist page boundary crossing latency cycles:
		"0": base_latency = 1 cycles
		...
		"31": base_latency = 32 cycles.
		The actual latency cycles when crossing the first page boundary depend on the start address of the transaction and is calculated as follows:
		if ((page_size - base_latency) < Start_Addr & (sub_page_size - 1))
		{ ((Start_Addr & (sub_page_size - 1)) - page_size + base_latency) }
		else
		{ 0 }
		Default Value: 0

27	IN_EN6	Enables the input buffer for IO pin 6 Default Value: 0
26 : 24	DRIVE_MODE6	The GPIO drive mode for IO pin 6 Default Value: 0
23	IN_EN5	Enables the input buffer for IO pin 5 Default Value: 0
22 : 20	DRIVE_MODE5	The GPIO drive mode for IO pin 5 Default Value: 0
19	IN_EN4	Enables the input buffer for IO pin 4 Default Value: 0
18 : 16	DRIVE_MODE4	The GPIO drive mode for IO pin4 Default Value: 0
15	IN_EN3	Enables the input buffer for IO pin 3 Default Value: 0
14 : 12	DRIVE_MODE3	The GPIO drive mode for IO pin 3 Default Value: 0
11	IN_EN2	Enables the input buffer for IO pin 2 Default Value: 0

22.1.150 SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG (continued)

10 : 8	DRIVE_MODE2	The GPIO drive mode for IO pin 2 Default Value: 0
7	IN_EN1	Enables the input buffer for IO pin 1 Default Value: 0
6 : 4	DRIVE_MODE1	The GPIO drive mode for IO pin 1 Default Value: 0
3	IN_EN0	Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue. '0': Input buffer disabled '1': Input buffer enabled Default Value: 0
2 : 0	DRIVE_MODE0	The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus. Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0'). Note: D_OUT, D_OUT_EN are pins of GPIO cell. Default Value: 0 **0x0: CFG3_EN :** Enables CFG3.Bit 0 to control Port Pin 0. **0x1: RESERVED :** This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases. For GPIO & UDB/DSI peripherals: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Strong pull up When D_OUT_EN = 0: D_OUT = '0': High impedance D_OUT = '1': High impedance For peripherals other than GPIO & UDB/DSI: When D_OUT_EN = 1: D_OUT = '0': Strong pull down D_OUT = '1': Strong pull up When OUT_EN = 0: D_OUT = '0': High impedance D_OUT = '1': High impedance

22.1.150 SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG (continued)

0x2: PULLUP :

Resistive pull up
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Weak/resistive pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull up
D_OUT = '1': Weak/resistive pull up
Use this setting in PRT0_CFG for DATA. for SMIF functionality

0x3: PULLDOWN :

Resistive pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull down
Use this setting in PRT2_CFG for RWDS for SMIF functionality.

0x4: OD_DRIVESLOW :

Open drain, drives low
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': High Impedance
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

22.1.150 SMIF0_CORE_SMIF_GPIO_SMIF_PRT0_CFG (continued)

0x5: OD_DRIVESHIGH :

Open drain, drives high
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': High Impedance
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x6: STRONG :

Strong D_OUTput buffer
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance
Use this setting in PRT1_CFG for CLK for SMIF functionality.

0x7: PULLUP_DOWN :

Pull up or pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = '0':
GPIO_DSI_OUT = '0': Weak/resistive pull down
GPIO_DSI_OUT = '1': Weak/resistive pull up
where "GPIO_DSI_OUT" is a function of PORT_SEL, OUT & DSI_DATA_OUT.
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull up

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	IN_EN1	Enables the input buffer for IO pin 1 Default Value: 0
6 : 4	DRIVE_MODE1	The GPIO drive mode for IO pin 1 Default Value: 0
3	IN_EN0	Enables the input buffer for IO pin 0. This bit should be cleared when analog signals are present on the pin to avoid crowbar currents. The output buffer can be used to drive analog signals high or low without issue. '0': Input buffer disabled '1': Input buffer enabled Default Value: 0
2 : 0	DRIVE_MODE0	The GPIO drive mode for IO pin 0. Resistive pull-up and pull-down is selected in the drive mode. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the peripheral and HSIOM (HSIOM_PRT_SELx) is properly configured before turning the IO on here to avoid producing glitches on the bus. Note: that peripherals other than GPIO & UDB/DSI directly control both the output and output-enable of the output buffer (peripherals can drive strong 0 or strong 1 in any mode except OFF='0'). Note: D_OUT, D_OUT_EN are pins of GPIO cell. Default Value: 0 **0x0: CFG3_EN :** Enables CFG3.Bit 0 to control Port Pin 0.

22.1.163 SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG (continued)

0x1: RESERVED :

This mode is reserved and should not be used. No damage will occur if this mode is selected. The pin will generally perform the same as the STRONG drive mode although this is not guaranteed for all use cases.
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance

0x2: PULLUP :

Resistive pull up
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Weak/resistive pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull up
D_OUT = '1': Weak/resistive pull up
Use this setting in PRT0_CFG for DATA. for SMIF functionality

0x3: PULLDOWN :

Resistive pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull down
Use this setting in PRT2_CFG for RWDS for SMIF functionality.

22.1.163 SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG (continued)

0x4: OD_DRIVESLOW :

Open drain, drives low
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': High Impedance
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x5: OD_DRIVESHIGH :

Open drain, drives high
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': High Impedance
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance

0x6: STRONG :

Strong D_OUTput buffer
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High impedance
D_OUT = '1': High impedance
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': High Impedance
D_OUT = '1': High Impedance
Use this setting in PRT1_CFG for CLK for SMIF functionality.

22.1.163 SMIF0_CORE_SMIF_GPIO_SMIF_PRT1_CFG (continued)

0x7: PULLUP_DOWN :

Pull up or pull down
For GPIO & UDB/DSI peripherals:
When D_OUT_EN = '0':
GPIO_DSI_OUT = '0': Weak/resistive pull down
GPIO_DSI_OUT = '1': Weak/resistive pull up
where "GPIO_DSI_OUT" is a function of PORT_SEL, OUT & DSI_DATA_OUT.
For peripherals other than GPIO & UDB/DSI:
When D_OUT_EN = 1:
D_OUT = '0': Strong pull down
D_OUT = '1': Strong pull up
When D_OUT_EN = 0:
D_OUT = '0': Weak/resistive pull down
D_OUT = '1': Weak/resistive pull up

Bits	Name	Description
17 : 16	DRIVE_SEL0	Sets the GPIO drive strength for IO pin 0 Default Value: 0 **0x0: DRIVE_SEL_ZERO :** **0x1: DRIVE_SEL_ONE :** **0x2: DRIVE_SEL_TWO :** **0x3: DRIVE_SEL_THREE :**

22.1.176 SMIF0_CORE_SMIF_GPIO_INTR_CAUSE00

Description: Interrupt port cause register 0

Address: 0x44478000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	
HW Access	Reserved						W	
Name	Reserved [7:3]						PORT_INT [2:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2 : 0	PORT_INT	Each IO port has an associated bit field in this register. The bit field reflects the IO port's interrupt line (bit field i reflects "gpio_interrupts[i]" for IO port i). The register is used when the system uses a combined interrupt line "gpio_interrupt". The software ISR reads the register to determine which IO port(s) is responsible for the combined interrupt line. Once, the IO port(s) is determined, the IO port's GPIO_PRT_INTR register is read to determine the IO pin(s) in the IO port that caused the interrupt. '0': Port has no pending interrupt '1': Port has pending interrupt Default Value: 0

22.1.177 SMIF0_CORE_SMIF_GPIO_VDD_ACTIVE

Description: Extern power supply detection register

Address: 0x44478010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	Reserved					
HW Access	W	W	Reserved					
Name	VDDD_ACTIVE	VDDA_ACTIVE	Reserved [29:24]					

Bits	Name	Description
31	VDDD_ACTIVE	This bit indicates presence of the VDDD supply. This bit will always read-back 1. The VDDD supply has robust brown-out protection monitoring and it is not possible to read back this register without a valid supply. (This bit is used in certain test-modes to observe the brown-out detector status.) Default Value: 1
30	VDDA_ACTIVE	Same as VDDIO_ACTIVE for the analog supply VDDA. Default Value: 0

22.1.178 SMIF0_CORE_SMIF_GPIO_VDD_INTR

Description: Supply detection interrupt register

Address: 0x44478014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1C	RW1C	Reserved					
HW Access	A	A	Reserved					
Name	VDDD_ACTIVE	VDDA_ACTIVE	Reserved [29:24]					

Bits	Name	Description
31	VDDD_ACTIVE	The VDDD supply is always present during operation so a supply transition can not occur. This bit will always read back '1'. Default Value: 0
30	VDDA_ACTIVE	Same as VDDIO_ACTIVE for the analog supply VDDA. Default Value: 0

22.1.179 SMIF0_CORE_SMIF_GPIO_VDD_INTR_MASK

Description: Supply detection interrupt mask register

Address: 0x44478018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved					
HW Access	R	R	Reserved					
Name	VDDD_ACTIVE	VDDA_ACTIVE	Reserved [29:24]					

Bits	Name	Description
31	VDDD_ACTIVE	Same as VDDIO_ACTIVE for the digital supply VDDD. Default Value: 0
30	VDDA_ACTIVE	Same as VDDIO_ACTIVE for the analog supply VDDA. Default Value: 0

22.1.180 SMIF0_CORE_SMIF_GPIO_VDD_INTR_MASKED

Description: Supply detection interrupt masked register

Address: 0x4447801C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	Reserved					
HW Access	W	W	Reserved					
Name	VDDD_ACTIVE	VDDA_ACTIVE	Reserved [29:24]					

Bits	Name	Description
31	VDDD_ACTIVE	Same as VDDIO_ACTIVE for the digital supply VDDD. Default Value: 0
30	VDDA_ACTIVE	Same as VDDIO_ACTIVE for the analog supply VDDA. Default Value: 0

22.1.181 SMIF0_CORE_SMIF_GPIO_VDD_INTR_SET

Description: Supply detection interrupt set register

Address: 0x44478020

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	RW1S	Reserved					
HW Access	A	A	Reserved					
Name	VDDD_ACTIVE	VDDA_ACTIVE	Reserved [29:24]					

Bits	Name	Description
31	VDDD_ACTIVE	Same as VDDIO_ACTIVE for the digital supply VDDD. Default Value: 0
30	VDDA_ACTIVE	Same as VDDIO_ACTIVE for the analog supply VDDA. Default Value: 0

23 Secure Digital Host Controller (SDHC) registers

This section discusses the SDHC registers. It lists all the registers in mapping tables, in address order.

23.1 Register details

Register name	Address	Description
SDHC0_WRAP_CTL	0x44810000	Top level wrapper control
SDHC0_CORE_SDMASA_R	0x44811000	SDMA System Address register
SDHC0_CORE_BLOCKSIZE_R	0x44811004	Block Size register
SDHC0_CORE_BLOCKCOUNT_R	0x44811006	16-bit Block Count register
SDHC0_CORE_ARGUMENT_R	0x44811008	Argument register
SDHC0_CORE_XFER_MODE_R	0x4481100C	Transfer Mode register
SDHC0_CORE_CMD_R	0x4481100E	Command register
SDHC0_CORE_RESP01_R	0x44811010	Response Register 0/1
SDHC0_CORE_RESP23_R	0x44811014	Response Register 2/3
SDHC0_CORE_RESP45_R	0x44811018	Response Register 4/5
SDHC0_CORE_RESP67_R	0x4481101C	Response Register 6/7
SDHC0_CORE_BUF_DATA_R	0x44811020	Buffer Data Port Register
SDHC0_CORE_PSTATE_REG	0x44811024	Present State Register
SDHC0_CORE_HOST_CTRL1_R	0x44811028	Host Control 1 Register
SDHC0_CORE_PWR_CTRL_R	0x44811029	Power Control Register
SDHC0_CORE_BGAP_CTRL_R	0x4481102A	Block Gap Control Register
SDHC0_CORE_WUP_CTRL_R	0x4481102B	Wakeup Control Register
SDHC0_CORE_CLK_CTRL_R	0x4481102C	Clock Control Register
SDHC0_CORE_TOUT_CTRL_R	0x4481102E	Timeout Control Register
SDHC0_CORE_SW_RST_R	0x4481102F	Software Reset Register
SDHC0_CORE_NORMAL_INT_STAT_R	0x44811030	Normal Interrupt Status Register
SDHC0_CORE_ERROR_INT_STAT_R	0x44811032	Error Interrupt Status Register
SDHC0_CORE_NORMAL_INT_STAT_EN_R	0x44811034	Normal Interrupt Status Enable Register
SDHC0_CORE_ERROR_INT_STAT_EN_R	0x44811036	Error Interrupt Status Enable Register
SDHC0_CORE_NORMAL_INT_SIGNAL_EN_R	0x44811038	Normal Interrupt Signal Enable Register
SDHC0_CORE_ERROR_INT_SIGNAL_EN_R	0x4481103A	Error Interrupt Signal Enable Register
SDHC0_CORE_AUTO_CMD_STAT_R	0x4481103C	Auto CMD Status Register
SDHC0_CORE_HOST_CTRL2_R	0x4481103E	Host Control 2 Register
SDHC0_CORE_CAPABILITIES1_R	0x44811040	Capabilities 1 Register - 0 to 31

Secure Digital Host Controller (SDHC) registers

Register name	Address	Description
SDHC0_CORE_CAPABILITIES2_R	0x44811044	Capabilities Register - 32 to 63
SDHC0_CORE_CURR_CAPABILITIES1_R	0x44811048	Current Capabilities Register - 0 to 31
SDHC0_CORE_CURR_CAPABILITIES2_R	0x4481104C	Maximum Current Capabilities Register - 32 to 63
SDHC0_CORE_FORCE_AUTO_CMD_STAT_R	0x44811050	Force Event Register for Auto CMD Error Status register
SDHC0_CORE_FORCE_ERROR_INT_STAT_R	0x44811052	Force Event Register for Error Interrupt Status
SDHC0_CORE_ADMA_ERR_STAT_R	0x44811054	ADMA Error Status Register
SDHC0_CORE_ADMA_SA_LOW_R	0x44811058	ADMA System Address Register - Low
SDHC0_CORE_ADMA_ID_LOW_R	0x44811078	ADMA3 Integrated Descriptor Address Register - Low
SDHC0_CORE_HOST_CNTRL_VERS_R	0x448110FE	Host Controller Version
SDHC0_CORE_CQVER	0x44811180	Command Queuing Version register
SDHC0_CORE_CQCAP	0x44811184	Command Queuing Capabilities register
SDHC0_CORE_CQCFG	0x44811188	Command Queuing Configuration register
SDHC0_CORE_CQCTL	0x4481118C	Command Queuing Control register
SDHC0_CORE_CQIS	0x44811190	Command Queuing Interrupt Status register
SDHC0_CORE_CQISE	0x44811194	Command Queuing Interrupt Status Enable register
SDHC0_CORE_CQISGE	0x44811198	Command Queuing Interrupt signal enable register
SDHC0_CORE_CQIC	0x4481119C	Command Queuing Interrupt Coalescing register
SDHC0_CORE_CQTDLBA	0x448111A0	Command Queuing Task Descriptor List Base Address register
SDHC0_CORE_CQTDBR	0x448111A8	Command Queuing DoorBell register
SDHC0_CORE_CQTCN	0x448111AC	Command Queuing TaskClear Notification register
SDHC0_CORE_CQDQS	0x448111B0	Device queue status register
SDHC0_CORE_CQDPT	0x448111B4	Device pending tasks register
SDHC0_CORE_CQTCLR	0x448111B8	Command Queuing DoorBell register
SDHC0_CORE_CQSSC1	0x448111C0	CQ Send Status Configuration 1 register
SDHC0_CORE_CQSSC2	0x448111C4	CQ Send Status Configuration 2 register
SDHC0_CORE_CQCRDCT	0x448111C8	Command response for direct command register
SDHC0_CORE_CQRMEM	0x448111D0	Command response mode error mask register
SDHC0_CORE_CQTERRI	0x448111D4	CQ Task Error Information register
SDHC0_CORE_CQCRI	0x448111D8	CQ Command response index
SDHC0_CORE_CQCRA	0x448111DC	CQ Command response argument register
SDHC0_CORE_MSHC_VER_ID_R	0x44811500	MSHC version
SDHC0_CORE_MSHC_VER_TYPE_R	0x44811504	MSHC version type
SDHC0_CORE_MSHC_CTRL_R	0x44811508	MSHC Control register
SDHC0_CORE_MBIU_CTRL_R	0x44811510	MBIU Control register

Secure Digital Host Controller (SDHC) registers

Register name	Address	Description
SDHC0_CORE_EMMC_CTRL_R	0x4481152C	eMMC Control register
SDHC0_CORE_BOOT_CTRL_R	0x4481152E	eMMC Boot Control register
SDHC0_CORE_GP_IN_R	0x44811530	General Purpose Input register
SDHC0_CORE_GP_OUT_R	0x44811534	General Purpose Output register
SDHC1_WRAP_CTL	0x44820000	Top level wrapper control. See SDHC0_WRAP_CTL for the details of bit fields.
SDHC1_CORE_SDMASA_R	0x44821000	SDMA System Address register. See SDHC0_CORE_SDMASA_R for the details of bit fields.
SDHC1_CORE_BLOCKSIZE_R	0x44821004	Block Size register. See SDHC0_CORE_BLOCKSIZE_R for the details of bit fields.
SDHC1_CORE_BLOCKCOUNT_R	0x44821006	16-bit Block Count register. See SDHC0_CORE_BLOCKCOUNT_R for the details of bit fields.
SDHC1_CORE_ARGUMENT_R	0x44821008	Argument register. See SDHC0_CORE_ARGUMENT_R for the details of bit fields.
SDHC1_CORE_XFER_MODE_R	0x4482100C	Transfer Mode register. See SDHC0_CORE_XFER_MODE_R for the details of bit fields.
SDHC1_CORE_CMD_R	0x4482100E	Command register. See SDHC0_CORE_CMD_R for the details of bit fields.
SDHC1_CORE_RESP01_R	0x44821010	Response Register 0/1. See SDHC0_CORE_RESP01_R for the details of bit fields.
SDHC1_CORE_RESP23_R	0x44821014	Response Register 2/3. See SDHC0_CORE_RESP23_R for the details of bit fields.
SDHC1_CORE_RESP45_R	0x44821018	Response Register 4/5. See SDHC0_CORE_RESP45_R for the details of bit fields.
SDHC1_CORE_RESP67_R	0x4482101C	Response Register 6/7. See SDHC0_CORE_RESP67_R for the details of bit fields.
SDHC1_CORE_BUF_DATA_R	0x44821020	Buffer Data Port Register. See SDHC0_CORE_BUF_DATA_R for the details of bit fields.
SDHC1_CORE_PSTATE_REG	0x44821024	Present State Register. See SDHC0_CORE_PSTATE_REG for the details of bit fields.
SDHC1_CORE_HOST_CTRL1_R	0x44821028	Host Control 1 Register. See SDHC0_CORE_HOST_CTRL1_R for the details of bit fields.
SDHC1_CORE_PWR_CTRL_R	0x44821029	Power Control Register. See SDHC0_CORE_PWR_CTRL_R for the details of bit fields.
SDHC1_CORE_BGAP_CTRL_R	0x4482102A	Block Gap Control Register. See SDHC0_CORE_BGAP_CTRL_R for the details of bit fields.
SDHC1_CORE_WUP_CTRL_R	0x4482102B	Wakeup Control Register. See SDHC0_CORE_WUP_CTRL_R for the details of bit fields.
SDHC1_CORE_CLK_CTRL_R	0x4482102C	Clock Control Register. See SDHC0_CORE_CLK_CTRL_R for the details of bit fields.

Secure Digital Host Controller (SDHC) registers

Register name	Address	Description
SDHC1_CORE_TOUT_CTRL_R	0x4482102E	Timeout Control Register. See SDHC0_CORE_TOUT_CTRL_R for the details of bit fields.
SDHC1_CORE_SW_RST_R	0x4482102F	Software Reset Register. See SDHC0_CORE_SW_RST_R for the details of bit fields.
SDHC1_CORE_NORMAL_INT_STAT_R	0x44821030	Normal Interrupt Status Register. See SDHC0_CORE_NORMAL_INT_STAT_R for the details of bit fields.
SDHC1_CORE_ERROR_INT_STAT_R	0x44821032	Error Interrupt Status Register. See SDHC0_CORE_ERROR_INT_STAT_R for the details of bit fields.
SDHC1_CORE_NORMAL_INT_STAT_EN_R	0x44821034	Normal Interrupt Status Enable Register. See SDHC0_CORE_NORMAL_INT_STAT_EN_R for the details of bit fields.
SDHC1_CORE_ERROR_INT_STAT_EN_R	0x44821036	Error Interrupt Status Enable Register. See SDHC0_CORE_ERROR_INT_STAT_EN_R for the details of bit fields.
SDHC1_CORE_NORMAL_INT_SIGNAL_EN_R	0x44821038	Normal Interrupt Signal Enable Register. See SDHC0_CORE_NORMAL_INT_SIGNAL_EN_R for the details of bit fields.
SDHC1_CORE_ERROR_INT_SIGNAL_EN_R	0x4482103A	Error Interrupt Signal Enable Register. See SDHC0_CORE_ERROR_INT_SIGNAL_EN_R for the details of bit fields.
SDHC1_CORE_AUTO_CMD_STAT_R	0x4482103C	Auto CMD Status Register. See SDHC0_CORE_AUTO_CMD_STAT_R for the details of bit fields.
SDHC1_CORE_HOST_CTRL2_R	0x4482103E	Host Control 2 Register. See SDHC0_CORE_HOST_CTRL2_R for the details of bit fields.
SDHC1_CORE_CAPABILITIES1_R	0x44821040	Capabilities 1 Register - 0 to 31. See SDHC0_CORE_CAPABILITIES1_R for the details of bit fields.
SDHC1_CORE_CAPABILITIES2_R	0x44821044	Capabilities Register - 32 to 63. See SDHC0_CORE_CAPABILITIES2_R for the details of bit fields.
SDHC1_CORE_CURR_CAPABILITIES1_R	0x44821048	Current Capabilities Register - 0 to 31. See SDHC0_CORE_CURR_CAPABILITIES1_R for the details of bit fields.
SDHC1_CORE_CURR_CAPABILITIES2_R	0x4482104C	Maximum Current Capabilities Register - 32 to 63. See SDHC0_CORE_CURR_CAPABILITIES2_R for the details of bit fields.
SDHC1_CORE_FORCE_AUTO_CMD_STAT_R	0x44821050	Force Event Register for Auto CMD Error Status register. See SDHC0_CORE_FORCE_AUTO_CMD_STAT_R for the details of bit fields.

Secure Digital Host Controller (SDHC) registers

Register name	Address	Description
SDHC1_CORE_FORCE_ERROR_INT_STAT_R	0x44821052	Force Event Register for Error Interrupt Status. See SDHC0_CORE_FORCE_ERROR_INT_STAT_R for the details of bit fields.
SDHC1_CORE_ADMA_ERR_STAT_R	0x44821054	ADMA Error Status Register. See SDHC0_CORE_ADMA_ERR_STAT_R for the details of bit fields.
SDHC1_CORE_ADMA_SA_LOW_R	0x44821058	ADMA System Address Register - Low. See SDHC0_CORE_ADMA_SA_LOW_R for the details of bit fields.
SDHC1_CORE_ADMA_ID_LOW_R	0x44821078	ADMA3 Integrated Descriptor Address Register - Low. See SDHC0_CORE_ADMA_ID_LOW_R for the details of bit fields.
SDHC1_CORE_HOST_CNTRL_VERS_R	0x448210FE	Host Controller Version. See SDHC0_CORE_HOST_CNTRL_VERS_R for the details of bit fields.
SDHC1_CORE_CQVER	0x44821180	Command Queuing Version register. See SDHC0_CORE_CQVER for the details of bit fields.
SDHC1_CORE_CQCAP	0x44821184	Command Queuing Capabilities register. See SDHC0_CORE_CQCAP for the details of bit fields.
SDHC1_CORE_CQCFG	0x44821188	Command Queuing Configuration register. See SDHC0_CORE_CQCFG for the details of bit fields.
SDHC1_CORE_CQCTL	0x4482118C	Command Queuing Control register. See SDHC0_CORE_CQCTL for the details of bit fields.
SDHC1_CORE_CQIS	0x44821190	Command Queuing Interrupt Status register. See SDHC0_CORE_CQIS for the details of bit fields.
SDHC1_CORE_CQISE	0x44821194	Command Queuing Interrupt Status Enable register. See SDHC0_CORE_CQISE for the details of bit fields.
SDHC1_CORE_CQISGE	0x44821198	Command Queuing Interrupt signal enable register. See SDHC0_CORE_CQISGE for the details of bit fields.
SDHC1_CORE_CQIC	0x4482119C	Command Queuing Interrupt Coalescing register. See SDHC0_CORE_CQIC for the details of bit fields.
SDHC1_CORE_CQTDLBA	0x448211A0	Command Queuing Task Descriptor List Base Address register. See SDHC0_CORE_CQTDLBA for the details of bit fields.
SDHC1_CORE_CQTDBR	0x448211A8	Command Queuing DoorBell register. See SDHC0_CORE_CQTDBR for the details of bit fields.
SDHC1_CORE_CQTCN	0x448211AC	Command Queuing TaskClear Notification register. See SDHC0_CORE_CQTCN for the details of bit fields.
SDHC1_CORE_CQDQS	0x448211B0	Device queue status register. See SDHC0_CORE_CQDQS for the details of bit fields.
SDHC1_CORE_CQDPT	0x448211B4	Device pending tasks register. See SDHC0_CORE_CQDPT for the details of bit fields.
SDHC1_CORE_CQTCLR	0x448211B8	Command Queuing DoorBell register. See SDHC0_CORE_CQTCLR for the details of bit fields.

Secure Digital Host Controller (SDHC) registers

Register name	Address	Description
SDHC1_CORE_CQSSC1	0x448211C0	CQ Send Status Configuration 1 register. See SDHC0_CORE_CQSSC1 for the details of bit fields.
SDHC1_CORE_CQSSC2	0x448211C4	CQ Send Status Configuration 2 register. See SDHC0_CORE_CQSSC2 for the details of bit fields.
SDHC1_CORE_CQCRDCT	0x448211C8	Command response for direct command register. See SDHC0_CORE_CQCRDCT for the details of bit fields.
SDHC1_CORE_CQRMEM	0x448211D0	Command response mode error mask register. See SDHC0_CORE_CQRMEM for the details of bit fields.
SDHC1_CORE_CQTERRI	0x448211D4	CQ Task Error Information register. See SDHC0_CORE_CQTERRI for the details of bit fields.
SDHC1_CORE_CQCRI	0x448211D8	CQ Command response index. See SDHC0_CORE_CQCRI for the details of bit fields.
SDHC1_CORE_CQCRA	0x448211DC	CQ Command response argument register. See SDHC0_CORE_CQCRA for the details of bit fields.
SDHC1_CORE_MSHC_VER_ID_R	0x44821500	MSHC version. See SDHC0_CORE_MSHC_VER_ID_R for the details of bit fields.
SDHC1_CORE_MSHC_VER_TYPE_R	0x44821504	MSHC version type. See SDHC0_CORE_MSHC_VER_TYPE_R for the details of bit fields.
SDHC1_CORE_MSHC_CTRL_R	0x44821508	MSHC Control register. See SDHC0_CORE_MSHC_CTRL_R for the details of bit fields.
SDHC1_CORE_MBIU_CTRL_R	0x44821510	MBIU Control register. See SDHC0_CORE_MBIU_CTRL_R for the details of bit fields.
SDHC1_CORE_EMMC_CTRL_R	0x4482152C	eMMC Control register. See SDHC0_CORE_EMMC_CTRL_R for the details of bit fields.
SDHC1_CORE_BOOT_CTRL_R	0x4482152E	eMMC Boot Control register. See SDHC0_CORE_BOOT_CTRL_R for the details of bit fields.
SDHC1_CORE_GP_IN_R	0x44821530	General Purpose Input register. See SDHC0_CORE_GP_IN_R for the details of bit fields.
SDHC1_CORE_GP_OUT_R	0x44821534	General Purpose Output register. See SDHC0_CORE_GP_OUT_R for the details of bit fields.

23.1.1 SDHC0_WRAP_CTL

Description: Top level wrapper control

Address: 0x44810000

Name	ENABLE	Reserved [30:24]						

Bits	Name	Description
31	ENABLE	IP Enable: 0: IP disabled, RAM in DeepSleep, SDHC_CORE regs are inaccessible (any attempts to access will result in AHB Error responses), IP is NOT held in reset but the clocks are gated 1: IP enabled, normal operation Default Value: 0

23.1.2 SDHC0_CORE_SDMASA_R

Description: SDMA System Address register

Address: 0x44811000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	BLOCKCNT_SDMASA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	BLOCKCNT_SDMASA [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	BLOCKCNT_SDMASA [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	BLOCKCNT_SDMASA [31:24]							

Bits	Name	Description

23.1.2 SDHC0_CORE_SDMASA_R (continued)

31 : 0	BLOCKCNT_SDMASA	32-bit Block Count (SDMA System Address) - SDMA System Address (Host Version 4 Enable = 0): This register contains the system memory address for an SDMA transfer in the 32-bit addressing mode. When the Host Controller stops an SDMA transfer, this register points to the system address of the next contiguous data position. It can be accessed only if no transaction is executing. Reading this register during data transfers may return an invalid value. - 32-bit Block Count (Host Version 4 Enable = 1): From the Host Controller Version 4.10 specification, this register is redefined as 32-bit Block Count. The Host Controller decrements the block count of this register for every block transfer and the data transfer stops when the count reaches zero. This register must be accessed when no transaction is executing. Reading this register during data transfers may return invalid value. Following are the values for BLOCKCNT_SDMASA: - 0xFFFF_FFFF - 4G - 1 Block - ..... - 0x0000_0002 - 2 Blocks - 0x0000_0001 - 1 Block - 0x0000_0000 - Stop Count Note: - When Host Version 4 Enable = 0, SDMA uses this register as system address and hence Auto CMD23 cannot be used with SDMA since this register is assigned for Auto CMD23 as 32-bit Block Count register. -When Host Version 4 Enable = 1, SDMA uses ADMA system address register and this register is reassigned to 32-bit Block Count. This register must be programmed with a non-zero value for data transfer if the 32-bit Block count register is used instead of the 16-bit Block count register. SDMA may use Auto CMD23 if 32-bit Block Count register is used. Default Value: 0

23.1.3 SDHC0_CORE_BLOCKSIZE_R

Description: Block Size register

Address: 0x44811004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	XFER_BLOCK_SIZE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved	RW			RW			
HW Access	Reserved	R			R			
Name	Reserved	SDMA_BUF_BDARY [14:12]			XFER_BLOCK_SIZE [11:8]			

Bits	Name	Description
14 : 12	SDMA_BUF_BDARY	SDMA Buffer Boundary These bits specify the size of contiguous buffer in system memory. The SDMA transfer waits at every boundary specified by these fields and the Host Controller generates the DMA interrupt to request the Host Driver to update the SDMA System Address register. Values: - 0x0 (BYTES_4K): 4K bytes SDMA Buffer Boundary - 0x1 (BYTES_8K): 8K bytes SDMA Buffer Boundary - 0x2 (BYTES_16K): 16K bytes SDMA Buffer Boundary - 0x3 (BYTES_32K): 32K bytes SDMA Buffer Boundary - 0x4 (BYTES_64K): 64K bytes SDMA Buffer Boundary - 0x5 (BYTES_128K): 128K bytes SDMA Buffer Boundary - 0x6 (BYTES_256K): 256K bytes SDMA Buffer Boundary - 0x7 (BYTES_512K): 512K bytes SDMA Buffer Boundary Default Value: 0
11 : 0	XFER_BLOCK_SIZE	Transfer Block Size These bits specify the block size of data transfers. In case of memory, it is set to 512 bytes. It can be accessed only if no transaction is executing. Read operations during transfers may return an invalid value, and write operations are ignored. Following are the values for XFER_BLOCK_SIZE: - 0x1: 1 byte - 0x2: 2 bytes - 0x3: 3 bytes - ..... - 0x1FF: 511 byte - 0x200: 512 bytes - ..... - 0x800: 2048 bytes Note: This register must be programmed with a non-zero value for data transfer. Default Value: 0

23.1.4 SDHC0_CORE_BLOCKCOUNT_R

Description: 16-bit Block Count register

Address: 0x44811006

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	BLOCK_CNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	BLOCK_CNT [15:8]							

Bits	Name	Description
15 : 0	BLOCK_CNT	16-bit Block Count - If the Host Version 4 Enable bit is set 0 or the 16-bit Block Count register is set to non-zero, the 16-bit Block Count register is selected. - If the Host Version 4 Enable bit is set 1 and the 16-bit Block Count register is set to zero, the 32-bit Block Count register is selected. Following are the values for BLOCK_CNT: - 0x0: Stop Count - 0x1: 1 Block - 0x2: 2 Blocks - ... - ... - 0xFFFF: 65535 Blocks Note: For Host Version 4 Enable = 0, this register must be set to 0000h before programming the 32-bit block count register when Auto CMD23 is enabled for non-DMA and ADMA modes. Default Value: 0

23.1.5 SDHC0_CORE_ARGUMENT_R

Description: Argument register

Address: 0x44811008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ARGUMENT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ARGUMENT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	ARGUMENT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ARGUMENT [31:24]							

Bits	Name	Description
31 : 0	ARGUMENT	Command Argument These bits specify the SD/eMMC command argument that is specified in bits 39-8 of the Command format. Default Value: 0

23.1.6 SDHC0_CORE_XFER_MODE_R

Description: Transfer Mode register

Address: 0x4481100C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	RW	RW	RW	RW		RW	RW
HW Access	R	R	R	R	R		R	R
Name	RESP_ER-R_CH-K_ENABLE	RESP_-TYPE	MUL-TI_BLK_-SEL	DATA_X-FER_DIR	AUTO_CMD_ENABLE [3:2]		BLOCK_CO UNT_EN-ABLE	DMA_EN-ABLE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							RE-SP_INT_-DISABLE

Bits	Name	Description
8	RESP_INT_DISABLE	Response Interrupt Disable The Host Controller supports response check function to avoid overhead of response error check by the Host driver. Response types of only R1 and R5 can be checked by the Controller. If Host Driver checks the response error, set this bit to 0 and wait for Command Complete Interrupt and then check the response register. If the Host Controller checks the response error, set this bit to 1 and set the Response Error Check Enable bit to 1. The Command Complete Interrupt is disabled by this bit regardless of the Command Complete Signal Enable. Values: - 0x0 (ENABLED): Response Interrupt is enabled - 0x1 (DISABLED): Response Interrupt is disabled Default Value: 0
7	RESP_ERR_CHK_EN-ABLE	Response Error Check Enable The Host Controller supports response check function to avoid overhead of response error check by Host driver. Response types of only R1 and R5 can be checked by the Controller. If the Host Controller checks the response error, set this bit to 1 and set Response Interrupt Disable to 1. If an error is detected, the Response Error interrupt is generated in the Error Interrupt Status register. Note: - Response error check must not be enabled for any response type other than R1 and R5. Values: - 0x0 (DISABLED): Response Error Check is disabled - 0x1 (ENABLED): Response Error Check is enabled Default Value: 0

23.1.6 SDHC0_CORE_XFER_MODE_R (continued)

6	RESP_TYPE	Response Type R1/R5 This bit selects either R1 or R5 as a response type when the Response Error Check is selected. Error statuses checked in R1: - OUT_OF_RANGE - ADDRESS_ERROR - BLOCK_LEN_ERROR - WP_VIOLATION - CARD_IS_LOCKED - COM_CRC_ERROR - CARD_ECC_FAILED - CC_ERROR - ERROR Response Flags checked in R5: - COM_CRC_ERROR - ERROR - FUNCTION_NUMBER - OUT_OF_RANGE Values: - 0x0 (RESP_R1): R1 (Memory) - 0x1 (RESP_R5): R5 (SDIO) Default Value: 0
5	MULTI_BLK_SEL	Multi/Single Block Select This bit is set when issuing multiple-block transfer commands using the DAT line. If this bit is set to 0, it is not necessary to set the Block Count register. Default Value: 0
4	DATA_XFER_DIR	Data Transfer Direction Select This bit defines the direction of DAT line data transfers. This bit is set to 1 by the Host Driver to transfer data from the SD/eMMC card to the Host Controller and it is set to 0 for all other commands. Values: - 0x1 (READ): Read (Card to Host) - 0x0 (WRITE): Write (Host to Card) Default Value: 0
3 : 2	AUTO_CMD_ENABLE	Auto Command Enable This field determines use of Auto Command functions. Note: In SDIO, this field must be set as 00b (Auto Command Disabled). Values: - 0x0 (AUTO_CMD_DISABLED): Auto Command Disabled - 0x1 (AUTO_CMD12_ENABLED): Auto CMD12 Enable - 0x2 (AUTO_CMD23_ENABLED): Auto CMD23 Enable - 0x3 (AUTO_CMD_AUTO_SEL): Auto CMD Auto Select Default Value: 0
1	BLOCK_COUNT_ENABLE	Block Count Enable This bit is used to enable the Block Count register, which is relevant for multiple block transfers. If this bit is set to 0, the Block Count register is disabled, which is useful in executing an infinite transfer. The Host Driver must set this bit to 0 when ADMA is used. When 16-bit Block Count register is used, the Host Driver can set this bit to 0 in ADMA2 mode to enable larger data transfer than the maximum of 65535 block counts supported by the 16-bit Block Count register. Default Value: 0

23.1.6 SDHC0_CORE_XFER_MODE_R (continued)

0	DMA_ENABLE	DMA Enable This bit enables the DMA functionality. If this bit is set to 1, a DMA operation begins when the Host Driver writes to the Command register. You can select one of the DMA modes by using DMA Select in the Host Control 1 register. Values: - 0x1 (ENABLED): DMA Data transfer - 0x0 (DISABLED): No data transfer or Non-DMA data transfer Default Value: 0

23.1.7 SDHC0_CORE_CMD_R

Description: Command register

Address: 0x4481100E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW	RW	RW	RW	RW	
HW Access	R		R	R	R	R	R	
Name	CMD_TYPE [7:6]		DATA_PRE-SENT_SEL	CMD_IDX-_CHK_EN-ABLE	CM-D_CRC_CH K_ENABLE	SUB_CM-D_FLAG	RESP_TYPE_SELECT [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved		RW					
HW Access	Reserved		R					
Name	Reserved [15:14]		CMD_INDEX [13:8]					

Bits	Name	Description
13 : 8	CMD_INDEX	Command Index These bits are set to the command number that is specified in bits 45-40 of the Command Format. Default Value: 0
7 : 6	CMD_TYPE	Command Type These bits indicate the command type. Note: While issuing Abort CMD using CMD12/CMD52 or reset CMD using CMD0/CMD52, CMD_TYPE field shall be set to 0x3. Values: - 0x3 (ABORT_CMD): Abort - 0x2 (RESUME_CMD): Resume - 0x1 (SUSPEND_CMD): Suspend - 0x0 (NORMAL_CMD): Normal Default Value: 0
5	DATA_PRESENT_SEL	Data Present Select This bit is set to 1 to indicate that data is present and that the data is transferred using the DAT line. This bit is set to 0 in the following instances: - Command using the CMD line - Command with no data transfer but using busy signal on the DAT[0] line - Resume Command Values: - 0x0 (NO_DATA): No Data Present - 0x1 (DATA): Data Present Default Value: 0

23.1.7 SDHC0_CORE_CMD_R (continued)

4	CMD_IDX_CHK_ENABLE	Command Index Check Enable This bit enables the Host Controller to check the index field in the response to verify if it has the same value as the command index. If the value is not the same, it is reported as a Command Index error. Note: - Index Check enable must be set to 0 for the command with no response, R2 response, R3 response and R4 response. Values: - 0x0 (DISABLED): Disable - 0x1 (ENABLED): Enable Default Value: 0
3	CMD_CRC_CHK_ENABLE	Command CRC Check Enable This bit enables the Host Controller to check the CRC field in the response. If an error is detected, it is reported as a Command CRC error. Note: - CRC Check enable must be set to 0 for the command with no response, R3 response, and R4 response. Values: - 0x0 (DISABLED): Disable - 0x1 (ENABLED): Enable Default Value: 0
2	SUB_CMD_FLAG	Sub Command Flag This bit distinguishes between a main command and a sub command. Values: - 0x0 (MAIN): Main Command - 0x1 (SUB): Sub Command Default Value: 0
1 : 0	RESP_TYPE_SELECT	Response Type Select This bit indicates the type of response expected from the card. Values: - 0x0 (NO_RESP): No Response - 0x1 (RESP_LEN_136): Response Length 136 - 0x2 (RESP_LEN_48): Response Length 48 - 0x3 (RESP_LEN_48B): Response Length 48; Check Busy after response Default Value: 0

23.1.8 SDHC0_CORE_RESP01_R

Description: Response Register 0/1

Address: 0x44811010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	RESP01 [7:0]							

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	BUF_DATA [31:24]							

Bits	Name	Description
31 : 0	BUF_DATA	Buffer Data These bits enable access to the Host Controller packet buffer. Default Value: 0

23.1.13 SDHC0_CORE_PSTATE_REG

Description: Present State Register

Address: 0x44811024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				Reserved	R	R	R
HW Access	RW				Reserved	RW	RW	RW
Name	DAT_7_4 [7:4]				Reserved	DAT_LINE_ACTIVE	CMD_IN-HIBIT_DAT	CMD_IN-HIBIT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				R	R	R	R
HW Access	Reserved				RW	RW	RW	RW
Name	Reserved [15:12]				BUF_RD_ENABLE	BUF_WR_ENABLE	RD_X-FER_AC-TIVE	WR_X-FER_AC-TIVE

Bits	23	22	21	20	19	18	17	16
SW Access	R				R	R	R	R
HW Access	RW				RW	RW	RW	RW
Name	DAT_3_0 [23:20]				WR_PRO-TECT_SW_LVL	CARD_DE-TECT_PIN_LEVEL	CARD_STABLE	CARD_IN-SERTED

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved			R	R	Reserved	R	R
HW Access	Reserved			RW	RW	Reserved	RW	RW
Name	Reserved [31:29]			SUB_CM-D_STAT	CMD_IS-SU_ERR	Reserved	HOST_REG_VOL	CM-D_LINE_LVL

Bits	Name	Description
28	SUB_CMD_STAT	Sub Command Status This bit is used to distinguish between a main command and a sub command status. Values: - 0x0 (FALSE): Main Command Status - 0x1 (TRUE): Sub Command Status Default Value: 0
27	CMD_ISSU_ERR	Command Not Issued by Error This bit is set if a command cannot be issued after setting the command register due to an error except the Auto CMD12 error. Values: - 0x0 (FALSE): No error for issuing a command - 0x1 (TRUE): Command cannot be issued Default Value: 0

23.1.13 SDHC0_CORE_PSTATE_REG (continued)

25	HOST_REG_VOL	Host Regulator Voltage Stable This bit is used to check whether the host regulator voltage is stable for switching the voltage of UHS-I mode. This bit reflects the synchronized value of the host_reg_vol_stable signal. Values: - 0x0 (FALSE): Host Regulator Voltage is not stable - 0x1 (TRUE): Host Regulator Voltage is stable Default Value: 0
24	CMD_LINE_LVL	Command-Line Signal Level This bit is used to check the CMD line level to recover from errors and for debugging. These bits reflect the value of the sd_cmd_in signal. Default Value: 0
23 : 20	DAT_3_0	DAT[3:0] Line Signal Level This bit is used to check the DAT line level to recover from errors and for debugging. These bits reflect the value of the sd_dat_in (lower nibble) signal. Default Value: 0
19	WR_PROTECT_SW_LVL	Write Protect Switch Pin Level This bit is supported only for memory and combo cards. This bit reflects the synchronized value of the card_write_prot signal. Values: - 0x0 (FALSE): Write protected - 0x1 (TRUE): Write enabled Default Value: 0
18	CARD_DE-TECT_PIN_LEVEL	Card Detect Pin Level This bit reflects the inverse synchronized value of the card_detect_n signal. Values: - 0x0 (FALSE): No card present - 0x1 (TRUE): Card Present Default Value: 0
17	CARD_STABLE	Card Stable This bit indicates the stability of the Card Detect Pin Level. A card is not detected if this bit is set to 1 and the value of the CARD_INSERTED bit is 0. Values: - 0x0 (FALSE): Reset or Debouncing - 0x1 (TRUE): No Card or Inserted Default Value: 0
16	CARD_INSERTED	Card Inserted This bit indicates whether a card has been inserted. The Host Controller debounces this signal so that Host Driver need not wait for it to stabilize. Values: - 0x0 (FALSE): Reset, Debouncing, or No card - 0x1 (TRUE): Card Inserted Default Value: 0
11	BUF_RD_ENABLE	Buffer Read Enable This bit is used for non-DMA transfers. This bit is set if valid data exists in the Host buffer. Values: - 0x0 (DISABLED): Read disable - 0x1 (ENABLED): Read enable Default Value: 0

23.1.13 SDHC0_CORE_PSTATE_REG (continued)

10	BUF_WR_ENABLE	Buffer Write Enable This bit is used for non-DMA transfers. This bit is set if space is available for writing data. Values: - 0x0 (DISABLED): Write disable - 0x1 (ENABLED): Write enable Default Value: 0
9	RD_XFER_ACTIVE	Read Transfer Active This bit indicates whether a read transfer is active for SD/eMMC mode. Values: - 0x0 (INACTIVE): No valid data - 0x1 (ACTIVE): Transferring data Default Value: 0
8	WR_XFER_ACTIVE	Write Transfer Active This status indicates whether a write transfer is active for SD/eMMC mode. Values: - 0x0 (INACTIVE): No valid data - 0x1 (ACTIVE): Transferring data Default Value: 0
7 : 4	DAT_7_4	DAT[7:4] Line Signal Level This bit is used to check the DAT line level to recover from errors and for debugging. These bits reflect the value of the sd_dat_in (upper nibble) signal. Default Value: 0
2	DAT_LINE_ACTIVE	DAT Line Active (SD/eMMC Mode only) This bit indicates whether one of the DAT lines on the SD/eMMC bus is in use. In the case of read transactions, this bit indicates whether a read transfer is executing on the SD/eMMC bus. In the case of write transactions, this bit indicates whether a write transfer is executing on the SD/eMMC bus. For a command with busy, this status indicates whether the command executing busy is executing on an SD or eMMC bus. Values: - 0x0 (INACTIVE): DAT Line Inactive - 0x1 (ACTIVE): DAT Line Active Default Value: 0
1	CMD_INHIBIT_DAT	Command Inhibit (DAT) This bit is applicable for SD/eMMC mode and is generated if either DAT line active or Read transfer active is set to 1. If this bit is set to 0, it indicates that the Host Controller can issue subsequent SD/eMMC commands. Values: - 0x0 (READY): Can issue command which used DAT line - 0x1 (NOT_READY): Cannot issue command which used DAT line Default Value: 0

23.1.13 SDHC0_CORE_PSTATE_REG (continued)

0	CMD_INHIBIT	Command Inhibit (CMD) This bit indicates the following : - SD/eMMC mode: If this bit is set to 0, it indicates that the CMD line is not in use and the Host controller can issue an SD/eMMC command using the CMD line. This bit is set when the command register is written. This bit is cleared when the command response is received. This bit is not cleared by the response of auto CMD12/23 but cleared by the response of read/write command. Values: - 0x0 (READY): Host Controller is ready to issue a command - 0x1 (NOT_READY): Host Controller is not ready to issue a command Default Value: 0

23.1.14 SDHC0_CORE_HOST_CTRL1_R

Description: Host Control 1 Register

Address: 0x44811028

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	RW	RW	RW		RW	RW	RW
HW Access	R	R	R	R		R	R	R
Name	CARD_DE-TECT_SIG_SEL	CARD_DE-TECT_TEST_LVL	EXT_-DAT_XFER	DMA_SEL [4:3]		HIGH_-SPEED_EN	DAT_X-FER_WIDTH	LED_CTRL

Bits	Name	Description
7	CARD_DETECT_SIG_-SEL	Card Detect Signal Selection This bit selects a source for card detection. When the source for the card detection is switched, the interrupt must be disabled during the switching period. Values: - 0x1 (CARD_DT_TEST_LEVEL): Card Detect Test Level is selected (for test purpose) - 0x0 (card_detect_n): card_detect_n signal is selected (for normal use) Default Value: 0
6	CARD_DE-TECT_TEST_LVL	Card Detect Test Level This bit is enabled while the Card Detect Signal Selection is set to 1 and it indicates whether a card inserted or not. Values: - 0x1 (CARD_INSERTED): Card Inserted - 0x0 (No_CARD): No Card Default Value: 0
5	EXT_DAT_XFER	Extended Data Transfer Width This bit controls 8-bit bus width mode of embedded device. Values: - 0x1 (EIGHT_BIT): 8-bit Bus Width - 0x0 (DEFAULT): Bus Width is selected by the Data Transfer Width Default Value: 0
4 : 3	DMA_SEL	DMA Select This field is used to select the DMA type. When Host Version 4 Enable is 1 in Host Control 2 register: - 0x0 - SDMA is selected - 0x1 - Reserved - 0x2 - ADMA2 is selected - 0x3 - ADMA2 or ADMA3 is selected When Host Version 4 Enable is 0 in Host Control 2 register: - 0x0 - SDMA is selected - 0x1 - Reserved - 0x2 - 32-bit Address ADMA2 is selected - 0x3 - Reserved Values: - 0x0 (SDMA): SDMA is selected - 0x1 (RSVD_BIT): Reserved - 0x2 (ADMA2): ADMA2 is selected - 0x3 (ADMA2_3): ADMA2 or ADMA3 is selected Default Value: 0

23.1.14 SDHC0_CORE_HOST_CTRL1_R (continued)

2	HIGH_SPEED_EN	High Speed Enable (SD/eMMC Mode only) Before setting this bit, the Host Driver checks the High Speed Support in the Capabilities register. Note: SDHC always outputs the sd_cmd_out and sd_dat_out lines at the rising edge of card clock irrespective of this bit. Values: - 0x1 (HIGH_SPEED): High Speed mode - 0x0 (NORMAL_SPEED): Normal Speed mode Default Value: 0
1	DAT_XFER_WIDTH	Data Transfer Width For SD/eMMC mode,this bit selects the data transfer width of the Host Controller. The Host Driver sets it to match the data width of the SD/eMMC card. Values: - 0x1 (FOUR_BIT): 4-bit mode - 0x0 (ONE_BIT): 1-bit mode Default Value: 0
0	LED_CTRL	LED Control This bit is used to caution the user not to remove the card while the SD card is being accessed. The value is reflected on the led_ctrl ouput. Values: - 0x0 (OFF): LED off - 0x1 (ON): LED on Default Value: 0

23.1.15 SDHC0_CORE_PWR_CTRL_R

Description: Power Control Register

Address: 0x44811029

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			RW
HW Access	Reserved				R			R
Name	Reserved [7:4]				SD_BUS_VOL_VDD1 [3:1]			SD_BUS_PWR_VDD1

Bits	Name	Description
3 : 1	SD_BUS_VOL_VDD1	These bits are NON-operational (they can be written and read but they have no effect). In a generic HCI host these would select the card supply voltage. But, for the applications targeted for this block it is assumed that the card supply voltage is always fixed at the board level. If for some reason there is a variable power supply then that can be managed through normal GPIO programming separately. Default Value: 0
0	SD_BUS_PWR_VDD1	SD Bus Power for VDD1 This bit enables VDD1 power of the card. This setting is available on the card_if_pwr_en output so that it can be used to control the VDD1 power supply of the card. Before setting this bit, the SD Host Driver sets the SD Bus Voltage Select bit. If the Host Controller detects a No Card state, this bit is cleared. In SD mode, if this bit is cleared, the Host Controller stops the SD Clock by clearing the SD_CLK_IN bit in the CLK_CTRL_R register. Values: - 0x0 (OFF): Power off - 0x1 (ON): Power on Default Value: 0

23.1.16 SDHC0_CORE_BGAP_CTRL_R

Description: Block Gap Control Register

Address: 0x4481102A

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW	RW	RW	RW
HW Access	Reserved				R	R	RW	R
Name	Reserved [7:4]				INT_AT_B-GAP	RD_WAIT_CTRL	CONTIN-UE_REQ	STOP_B-G_REQ

Bits	Name	Description
3	INT_AT_BGAP	Interrupt At Block Gap This bit is valid only in the 4-bit mode of an SDIO card and is used to select a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Values: - 0x0 (DISABLE): Disabled - 0x1 (ENABLE): Enabled Default Value: 0
2	RD_WAIT_CTRL	Reserved: set to 0 Default Value: 0
1	CONTINUE_REQ	Continue Request This bit is used to restart the transaction, which was stopped using the Stop At Block Gap Request. The Host Controller automatically clears this bit when the transaction restarts. If stop at block gap request is set to 1, any write to this bit is ignored. Values: - 0x0 (NO_AFFECT): No Affect - 0x1 (RESTART): Restart Default Value: 0
0	STOP_BG_REQ	Stop At Block Gap Request This bit is used to stop executing read and write transactions at the next block gap for non-DMA, SDMA, and ADMA transfers. Values: - 0x0 (XFER): Transfer - 0x1 (STOP): Stop Default Value: 0

23.1.17 SDHC0_CORE_WUP_CTRL_R

Description: Wakeup Control Register

Address: 0x4481102B

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					R	R	R
Name	Reserved [7:3]					WUP_-CARD_RE-MOVAL	WUP_-CARD_INS ERT	WUP_-CARD_INT

Bits	Name	Description
2	WUP_CARD_REMOVAL	Wakeup Event Enable on SD Card Removal This bit enables wakeup event through Card Removal assertion in the Normal Interrupt Status register. For the SDIO card, Wake Up Support (FN_WUS) in the Card Information Structure (CIS) register does not affect this bit. Values: - 0x0 (DISABLED): Disable - 0x1 (ENABLED): Enable Default Value: 0
1	WUP_CARD_INSERT	Wakeup Event Enable on SD Card Insertion This bit enables wakeup event through Card Insertion assertion in the Normal Interrupt Status register. FN_WUS (Wake Up Support) in CIS does not affect this bit. Values: - 0x0 (DISABLED): Disable - 0x1 (ENABLED): Enable Default Value: 0
0	WUP_CARD_INT	Wakeup Event Enable on SDIO Card Interrupt (through DAT[1]). This bit enables wakeup event through an SDIO Card Interrupt assertion in the Normal Interrupt Status register. This bit can be set to 1 if FN_WUS (Wake Up Support) in CIS is set to 1. Values: - 0x0 (DISABLED): Disable - 0x1 (ENABLED): Enable Default Value: 0

23.1.18 SDHC0_CORE_CLK_CTRL_R

Description: Clock Control Register

Address: 0x4481102C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW	Reserved	RW	RW	R	RW
HW Access	RW		RW	Reserved	R	R	RW	R
Name	UPPER_FREQ_SEL [7:6]		CLK_-GEN_SE-LECT	Reserved	PLL_EN-ABLE	SD_-CLK_EN	INTER-NAL_-CLK_STAB LE	INTER-NAL_-CLK_EN

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	FREQ_SEL [15:8]							

Bits	Name	Description
15 : 8	FREQ_SEL	SDCLK Frequency Select These bits are used to select the frequency of the SDCLK signal. 10-bit Divided Clock Mode: - 0x3FF - 1/2046 Divided clock - ..... - N - 1/2N Divided Clock - ..... - 0x002 - 1/4 Divided Clock - 0x001 - 1/2 Divided Clock - 0x000 - Base clock (10MHz - 255 MHz) Default Value: 0
7 : 6	UPPER_FREQ_SEL	These bits specify the upper 2 bits of 10-bit SDCLK Frequency Select control. Default Value: 0
5	CLK_GEN_SELECT	Clock Generator Select This bit is used to select the clock generator mode in SDCLK Frequency Select. Values: - 0x0 (FALSE): Divided Clock Mode - 0x1 (TRUE): Programmable Clock Mode Default Value: 0
3	PLL_ENABLE	PLL Enable This bit is used to activate the PLL (applicable when Host Version 4 Enable = 1). Values: - 0x0 (FALSE): PLL is in low power mode - 0x1 (TRUE): PLL is enabled Default Value: 0
2	SD_CLK_EN	SD/eMMC Clock Enable This bit stops the clk_card output when set to 0. The SDCLK Frequency Select bit can be changed when this bit is set to 0. Values: - 0x0 (FALSE): Disable providing clk_card - 0x1 (TRUE): Enable providing clk_card Default Value: 0

23.1.18 SDHC0_CORE_CLK_CTRL_R (continued)

1	INTERNAL_CLK_STABLE	Internal Clock Stable This bit enables the Host Driver to check the clock stability twice after the Internal Clock Enable bit is set and after the PLL Enable bit is set. This bit reflects the synchronized value of the Internal Clock Stable signal after the Internal Clock Enable bit is set to 1 and also reflects the synchronized value of the Card Clock Stable signal after the PLL Enable bit is set to 1. Values: - 0x0 (FALSE): Not Ready - 0x1 (TRUE): Ready Default Value: 0
0	INTERNAL_CLK_EN	Internal Clock Enable This bit is set to 0 when the Host Driver is not using the Host Controller or the Host Controller awaits a wakeup interrupt. The Host Controller must stop its internal clock to enter a very low power state. Certain registers are not accessible when this bit is off. So, to be safe turn it on for any register access. Values: - 0x0 (FALSE): Stop - 0x1 (TRUE): Oscillate Default Value: 0

23.1.19 SDHC0_CORE_TOUT_CTRL_R

Description: Timeout Control Register

Address: 0x4481102E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				TOUT_CNT [3:0]			

Bits	Name	Description
3 : 0	TOUT_CNT	Data Timeout Counter Value. This value determines the interval by which DAT line timeouts are detected. The Timeout clock frequency is generated by dividing the base clock TMCLK value by this value. When setting this register, prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in the Error Interrupt Status Enable register). The values for these bits are: - 0xF - Reserved - 0xE - TMCLK x 2^27 - ..... - 0x1 - TMCLK x 2^14 - 0x0 - TMCLK x 2^13 Note: During a boot operating in an eMMC mode, an application must configure the boot data timeout value (approximately 1 sec) in this bit. Default Value: 0

23.1.20 SDHC0_CORE_SW_RST_R

Description: Software Reset Register

Address: 0x4481102F

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					RW	RW	RW
Name	Reserved [7:3]					SW_RST_-DAT	SW_RST_CMD	SW_RST_ALL

Bits	Name	Description
2	SW_RST_DAT	Software Reset For DAT line This bit is used in SD/eMMC mode and it resets only a part of the data circuit and the DMA circuit is also reset. The following registers and bits are cleared by this bit: - Buffer Data Port register - Buffer is cleared and initialized. - Present state register - Buffer Read Enable - Buffer Write Enable - Read Transfer Active - Write Transfer Active - DAT Line Active - Command Inhibit (DAT) - Block Gap Control register - Continue Request - Stop At Block Gap Request - Normal Interrupt status register - Buffer Read Ready - Buffer Write Ready - DMA Interrupt - Block Gap Event - Transfer Complete Values: - 0x0 (FALSE): Work - 0x1 (TRUE): Reset Default Value: 0
1	SW_RST_CMD	Software Reset For CMD line This bit resets only a part of the command circuit to be able to issue a command. This reset is effective only for a command issuing circuit (including response error statuses related to Command Inhibit (CMD) control) and does not affect the data transfer circuit. Host Controller can continue data transfer even after this reset is executed while handling subcommand-response errors. The following registers and bits are cleared by this bit: - Present State register - Command Inhibit (CMD) bit - Normal Interrupt Status register - Command Complete bit - Error Interrupt Status - Response error statuses related to Command Inhibit (CMD) bit Values: - 0x0 (FALSE): Work - 0x1 (TRUE): Reset Default Value: 0

23.1.20 SDHC0_CORE_SW_RST_R (continued)

0	SW_RST_ALL	Software Reset For All This reset affects the entire Host Controller except for the card detection circuit. During its initialization, the Host Driver sets this bit to 1 to reset the Host Controller. All registers are reset except the capabilities register. If this bit is set to 1, the Host Driver must issue reset command and reinitialize the card. Values: - 0x0 (FALSE): Work - 0x1 (TRUE): Reset Default Value: 0

23.1.21 SDHC0_CORE_NORMAL_INT_STAT_R

Description: Normal Interrupt Status Register

Address: 0x44811030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C
HW Access	RW	RW	RW	RW	RW	RW	RW	RW
Name	CARD_RE-MOVAL	CARD_IN-SERTION	BUF_RD_R EADY	BUF_WR_R EADY	DMA_IN-TERRUPT	BGAP_EVE NT	XFER_-COMPLETE	CMD_COM-PLETE

Bits	15	14	13	12	11	10	9	8
SW Access	R	RW1C	R	Reserved				R
HW Access	RW	RW	RW	Reserved				RW
Name	ERR_IN-TERRUPT	CQE_EVEN T	FX_EVENT	Reserved [12:9]				CARD_IN-TERRUPT

Bits	Name	Description
15	ERR_INTERRUPT	Error Interrupt If any of the bits in the Error Interrupt Status register are set, then this bit is set. Values: - 0x0 (FALSE): No Error - 0x1 (TRUE): Error Default Value: 0
14	CQE_EVENT	Command Queuing Event This status is set if Command Queuing/Crypto related event has occurred in eMMC/SD mode. Read CQHCI's CQIS/CRNQIS register for more details. In UHS-II Mode, this bit is irrelevant. Values: - 0x0 (FALSE): No Event - 0x1 (TRUE): Command Queuing Event is detected Default Value: 0
13	FX_EVENT	FX Event This status is set when R[14] of response register is set to 1 and Response Type R1/R5 is set to 0 in Transfer Mode register. This interrupt is used with response check function. Values: - 0x0 (FALSE): No Event - 0x1 (TRUE): FX Event is detected Default Value: 0
8	CARD_INTERRUPT	Card Interrupt This bit reflects the synchronized value of: - DAT[1] Interrupt Input for SD Mode Values: - 0x0 (FALSE): No Card Interrupt - 0x1 (TRUE): Generate Card Interrupt Default Value: 0
7	CARD_REMOVAL	Card Removal This bit is set if the Card Inserted in the Present State register changes from 1 to 0. Values: - 0x0 (FALSE): Card state stable or Debouncing - 0x1 (TRUE): Card Removed Default Value: 0

23.1.21 SDHC0_CORE_NORMAL_INT_STAT_R (continued)

6	CARD_INSERTION	Card Insertion This bit is set if the Card Inserted in the Present State register changes from 0 to 1. Values: - 0x0 (FALSE): Card state stable or Debouncing - 0x1 (TRUE): Card Inserted Default Value: 0
5	BUF_RD_READY	Buffer Read Ready This bit is set if the Buffer Read Enable changes from 0 to 1. Values: - 0x0 (FALSE): Not ready to read buffer - 0x1 (TRUE): Ready to read buffer Default Value: 0
4	BUF_WR_READY	Buffer Write Ready This bit is set if the Buffer Write Enable changes from 0 to 1. Values: - 0x0 (FALSE): Not ready to write buffer - 0x1 (TRUE): Ready to write buffer Default Value: 0
3	DMA_INTERRUPT	DMA Interrupt This bit is set if the Host Controller detects the SDMA Buffer Boundary during transfer. In case of ADMA, by setting the Int field in the descriptor table, the Host controller generates this interrupt. This interrupt is not generated after a Transfer Complete. Values: - 0x0 (FALSE): No DMA Interrupt - 0x1 (TRUE): DMA Interrupt is generated Default Value: 0
2	BGAP_EVENT	Block Gap Event This bit is set when both read/write transaction is stopped at block gap due to a Stop at Block Gap Request. Values: - 0x0 (FALSE): No Block Gap Event - 0x1 (TRUE): Transaction stopped at block gap Default Value: 0
1	XFER_COMPLETE	Transfer Complete This bit is set when a read/write transfer and a command with status busy is completed. Values: - 0x0 (FALSE): Not complete - 0x1 (TRUE): Command execution is completed Default Value: 0
0	CMD_COMPLETE	Command Complete In an SD/eMMC Mode, this bit is set when the end bit of a response except for Auto CMD12 and Auto CMD23. This interrupt is not generated when the Response Interrupt Disable in Transfer Mode Register is set to 1. Values: - 0x0 (FALSE): No command complete - 0x1 (TRUE): Command Complete Default Value: 0

23.1.22 SDHC0_CORE_ERROR_INT_STAT_R

Description: Error Interrupt Status Register

Address: 0x44811032

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C
HW Access	RW	RW	RW	RW	RW	RW	RW	RW
Name	CUR_LMT_ERR	DATA_END_BIT_ERR	DATA_CRC_ERR	DATA_TOUT_ERR	CMD_IDX-_ERR	CM-D_END_BIT_ERR	CM-D_CRC_ERR	CM-D_TOUT_ERR

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW1C	RW1C	RW1C	RW1C	RW1C
HW Access	Reserved			RW	RW	RW	RW	RW
Name	Reserved [15:13]			BOOT_ACK_ERR	RESP_ERR	TUN-ING_ERR	AD-MA_ERR	AUTO_CM-D_ERR

Bits	Name	Description
12	BOOT_ACK_ERR	Boot Acknowledgement Error This bit is set when there is a timeout for boot acknowledgement or when detecting boot ack status having a value other than 010. This is applicable only when boot acknowledgement is expected in eMMC mode. In SD mode, this bit is irrelevant. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Error Default Value: 0
11	RESP_ERR	Response Error Host Controller Version 4.00 supports response error check function to avoid overhead of response error check by Host Driver during DMA execution. If Response Error Check Enable is set to 1 in the Transfer Mode register, Host Controller Checks R1 or R5 response. If an error is detected in a response, this bit is set to 1.This is applicable in SD/eMMC mode. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Error Default Value: 0
10	TUNING_ERR	Reserved Default Value: 0

23.1.22 SDHC0_CORE_ERROR_INT_STAT_R (continued)

9	ADMA_ERR	ADMA Error This bit is set when the Host Controller detects error during ADMA-based data transfer. The error could be due to following reasons: - Error response received from System bus (Master I/F) - ADMA3,ADMA2 Descriptors invalid - CQE Task or Transfer descriptors invalid When the error occurs, the state of the ADMA is saved in the ADMA Error Status register. In eMMC CQE mode: The Host Controller generates this Interrupt when it detects an invalid descriptor data (Valid=0) at the ST_FDS state. ADMA Error State in the ADMA Error Status indicates that an error has occurred in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Error Default Value: 0
8	AUTO_CMD_ERR	Auto CMD Error This error status is used by Auto CMD12 and Auto CMD23 in SD/eMMC mode. This bit is set when detecting that any of the bits D00 to D05 in Auto CMD Error Status register has changed from 0 to 1. D07 is effective in case of Auto CMD12. Auto CMD Error Status register is valid while this bit is set to 1 and may be cleared by clearing of this bit. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Error Default Value: 0
7	CUR_LMT_ERR	Current Limit Error By setting the SD Bus Power bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. A reading of 1 for this bit means that the Host Controller is not supplying power to the SD card due to some failure. A reading of 0 for this bit means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. DWC_mshc Host Controller does not support this function, this bit is always set to 0. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Power Fail Default Value: 0
6	DATA_END_BIT_ERR	Data End Bit Error This error occurs in SD/eMMC mode either when detecting 0 at the end bit position of read data that uses the DAT line or at the end bit position of the CRC status. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Error Default Value: 0

23.1.22 SDHC0_CORE_ERROR_INT_STAT_R (continued)

5	DATA_CRC_ERR	Data CRC Error This error occurs in SD/eMMC mode when detecting CRC error when transferring read data which uses the DAT line, when detecting the Write CRC status having a value of other than 010 or when write CRC status timeout. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Error Default Value: 0
4	DATA_TOUT_ERR	Data Timeout Error This bit is set in SD/eMMC mode when detecting one of the following timeout conditions: - Busy timeout for R1b, R5b type - Busy timeout after Write CRC status - Write CRC Status timeout - Read Data timeout Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Time out Default Value: 0
3	CMD_IDX_ERR	Command Index Error This bit is set if a Command Index error occurs in the command respons in SD/eMMC mode. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Error Default Value: 0
2	CMD_END_BIT_ERR	Command End Bit Error This bit is set when detecting that the end bit of a command response is 0 in SD/eMMC mode. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): End Bit error generated Default Value: 0
1	CMD_CRC_ERR	Command CRC Error Command CRC Error is generated in SD/eMMC mode for following two cases. - If a response is returned and the Command Timeout Error is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. - The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller aborts the command (stop driving CMD line) and set this bit to 1. The Command Timeout Error is also set to 1 to distinguish a CMD line conflict. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): CRC error generated Default Value: 0
0	CMD_TOUT_ERR	Command Timeout Error In SD/eMMC Mode,this bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict, along with Command CRC Error bit, this bit is set to 1, without waiting for 64 SD/eMMC card clock cycles. Values: - 0x0 (FALSE): No error - 0x1 (TRUE): Time out Default Value: 0

23.1.23 SDHC0_CORE_NORMAL_INT_STAT_EN_R

Description: Normal Interrupt Status Enable Register

Address: 0x44811034

Retention: Retained

Bits	7	6	5	4	3	2	1	0

0	CMD_TOUT_ERR_SIGNAL_EN	Command Timeout Error Signal Enable (SD/eMMC Mode only) Values: - 0x0 (FALSE): Masked - 0x1 (TRUE): Enabled Default Value: 0

23.1.27 SDHC0_CORE_AUTO_CMD_STAT_R

Description: Auto CMD Status Register

Address: 0x4481103C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	Reserved	R	R	R	R	R	R
HW Access	RW	Reserved	RW	RW	RW	RW	RW	RW
Name	CMD_NOT_ISSUED_AUTO_CMD12	Reserved	AUTO_CMD_RESP_ERR	AUTO_CMD_IDX_ERR	AUTO_CMD_EBIT_ERR	AUTO_CMD_CRC_ERR	AUTO_CMD_TOUT_ERR	AUTO_CMD12_NOT_EXEC

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	Name	Description
7	CMD_NOT_ISSUED_AUTO_CMD12	Command Not Issued By Auto CMD12 Error If this bit is set to 1, CMD_wo_DAT is not executed due to an Auto CMD12 Error (D04-D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. Values: - 0x1 (TRUE): Not Issued - 0x0 (FALSE): No Error Default Value: 0
5	AUTO_CMD_RESP_ERR	Auto CMD Response Error This bit is set when Response Error Check Enable in the Transfer Mode register is set to 1 and an error is detected in R1 response of either Auto CMD12 or CMD13. This status is ignored if any bit between D00 to D04 is set to 1. Values: - 0x1 (TRUE): Error - 0x0 (FALSE): No Error Default Value: 0
4	AUTO_CMD_IDX_ERR	Auto CMD Index Error This bit is set if the command index error occurs in response to a command. Values: - 0x1 (TRUE): Error - 0x0 (FALSE): No Error Default Value: 0
3	AUTO_CMD_EBIT_ERR	Auto CMD End Bit Error This bit is set when detecting that the end bit of command response is 0. Values: - 0x1 (TRUE): End Bit Error Generated - 0x0 (FALSE): No Error Default Value: 0

23.1.27 SDHC0_CORE_AUTO_CMD_STAT_R (continued)

2	AUTO_CMD_CRC_ERR	Auto CMD CRC Error This bit is set when detecting a CRC error in the command response. Values: - 0x1 (TRUE): CRC Error Generated - 0x0 (FALSE): No Error Default Value: 0
1	AUTO_CMD_TOUT_ERR	Auto CMD Timeout Error This bit is set if no response is returned with 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, error status bits (D04-D01) are meaningless. Values: - 0x1 (TRUE): Time out - 0x0 (FALSE): No Error Default Value: 0
0	AUTO_CMD12_NOT_EXEC	Auto CMD12 Not Executed If multiple memory block data transfer is not started due to a command error, this bit is not set because it is not necessary to issue an Auto CMD12. Setting this bit to 1 means that the Host Controller cannot issue Auto CMD12 to stop multiple memory block data transfer, due to some error. If this bit is set to 1, error status bits (D04-D01) is meaningless. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. Values: - 0x1 (TRUE): Not Executed - 0x0 (FALSE): Executed Default Value: 0

23.1.28 SDHC0_CORE_HOST_CTRL2_R

Description: Host Control 2 Register

Address: 0x4481103E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	RW	RW		RW	RW		
HW Access	RW	RW	RW		RW	R		
Name	SAMPLE_CLK_SEL	EXEC_TUNING	DRV_STRENGTH_SEL [5:4]		SIGNALING_EN	UHS_MODE_SEL [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	RW	RW	RW	RW	RW	RW	Reserved	RW
HW Access	R	R	R	R	R	R	Reserved	R
Name	PRESET_VAL_ENABLE	ASYNC_INT_ENABLE	ADDRESSING	HOST_VER4_ENABLE	CMD23_ENABLE	ADMA2_LEN_MODE	Reserved	UHS2_IF_ENABLE

Bits	Name	Description
15	PRESET_VAL_ENABLE	Reserved: set to 0 Default Value: 0
14	ASYNC_INT_ENABLE	Asynchronous Interrupt Enable This bit can be set if a card supports asynchronous interrupts and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Values: - 0x0 (FALSE): Disabled - 0x1 (TRUE): Enabled Default Value: 0
13	ADDRESSING	Reserved: set to 0 Default Value: 0
12	HOST_VER4_ENABLE	Host Version 4 Enable This bit selects either Version 3.00 compatible mode or Version 4 mode. Functions of following fields are modified for Host Version 4 mode: - SDMA Address: SDMA uses ADMA System Address (05Fh-058h) instead of SDMA System Address register (003h-000h) - ADMA2/ADMA3 selection: ADMA3 is selected by DMA select in Host Control 1 register - 32-bit Block Count: SDMA System Address register (003h-000h) is modified to 32-bit Block Count register Note: It is recommended not to program ADMA3 Integrated Descriptor Address registers and Command Queuing registers (if applicable) while operating in Host version less than 4 mode (Host Version 4 Enable = 0). Values: - 0x0 (FALSE): Version 3.00 compatible mode - 0x1 (TRUE): Version 4 mode Default Value: 0

23.1.28 SDHC0_CORE_HOST_CTRL2_R (continued)

11	CMD23_ENABLE	CMD23 Enable If the card supports CMD23, this bit is set to 1. This bit is used to select Auto CMD23 or Auto CMD12 for ADMA3 data transfer. Values: - 0x0 (FALSE): Auto CMD23 is disabled - 0x1 (TRUE): Auto CMD23 is enabled Default Value: 0
10	ADMA2_LEN_MODE	ADMA2 Length Mode This bit selects ADMA2 Length mode to be either 16-bit or 26-bit. Values: - 0x0 (FALSE): 16-bit Data Length Mode - 0x1 (TRUE): 26-bit Data Length Mode Default Value: 0
8	UHS2_IF_ENABLE	Reserved: set to 0 Default Value: 0
7	SAMPLE_CLK_SEL	Reserved: set to 0 Default Value: 0
6	EXEC_TUNING	Reserved: set to 0 Default Value: 0
5 : 4	DRV_STRENGTH_SEL	Driver Strength Select These bits are used to select the Host Controller output driver in 1.8V signaling UHS-I/eMMC speed modes. The value is reflected on the io_drive_strength[1:0] output. - 0x0 (TYPEB): Driver TYPEB is selected - 0x1 (TYPEA): Driver TYPEA is selected - 0x2 (TYPEC): Driver TYPEC is selected - 0x3 (TYPED): Driver TYPED is selected Default Value: 0
3	SIGNALING_EN	1.8V Signaling Enable This bit controls voltage regulator for I/O cell in SD UHS-I mode. Setting this bit from 0 to 1 starts changing the signal voltage from 3.3V to 1.8V. Host Controller clears this bit if switching to 1.8V signaling fails per protocol. The value is reflected on the io_volt_sel output which can then be used to change an external regulator to supply 1.8V instead of 3.3V on the VDDIO pin associated with the CLK/CMD/DAT signals. Note: This bit must be set for all UHS-I speed modes (SDR12/SDR25/SDR50/DDR50). Values: - 0x0 (V_3_3): 3.3V Signalling - 0x1 (V_1_8): 1.8V Signalling Default Value: 0

23.1.28 SDHC0_CORE_HOST_CTRL2_R (continued)

2 : 0	UHS_MODE_SEL	UHS Mode/eMMC Speed Mode Select These bits are used to select UHS mode in the SD mode of operation. In eMMC mode, these bits are used to select eMMC Speed mode. UHS-I Mode: - 0x0: SDR12 - 0x1: SDR25 - 0x2: SDR50 - 0x3: Reserved - 0x4: DDR50 - 0x5: Reserved - 0x6: Reserved - 0x7: Reserved eMMC Speed Mode (eMMC mode only): - 0x0: Legacy - 0x1: High Speed SDR - 0x2: Reserved - 0x3: Reserved - 0x4: High Speed DDR - 0x5: Reserved - 0x6: Reserved - 0x7: Reserved Default Value: 0

23.1.29 SDHC0_CORE_CAPABILITIES1_R

Description: Capabilities 1 Register - 0 to 31

Address: 0x44811040

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	R		R	R	R	R	R	R
HW Access	R		R	R	R	R	R	R
Name	SLOT_TYPE_R [31:30]		ASYN-C_INT_-SUPPORT	SYS_AD-DR_64_V3	SYS_AD-DR_64_V4	VOLT_18	VOLT_30	VOLT_33

Bits	Name	Description
31 : 30	SLOT_TYPE_R	Slot Type These bits indicate usage of a slot by a specific Host System. Values: - 0x0 (REMOVABLE_SLOT): Removable Card Slot - 0x1 (EMBEDDED_SLOT): Embedded Slot for one Device - 0x2 (SHARED_SLOT): Shared Bus Slot (SD mode) - 0x3 (UHS2_EMBEDDED_SLOT): UHS-II Multiple Embedded Devices Default Value: 0
29	ASYNC_INT_SUPPORT	Asynchronous Interrupt Support (SD Mode only) Values: - 0x0 (FALSE): Asynchronous Interrupt Not Supported - 0x1 (TRUE): Asynchronous Interrupt Supported Default Value: 1

23.1.29 SDHC0_CORE_CAPABILITIES1_R (continued)

28	SYS_ADDR_64_V3	64-bit System Address Support for V3 This bit sets the Host controller to support 64-bit System Addressing of V3 mode. SDMA cannot be used in 64-bit Addressing in Version 3 Mode. If this bit is set to 1, 64-bit ADMA2 with using 96-bit Descriptor can be enabled by setting Host Version 4 Enable (HOST_VER4_ENABLE = 0) and DMA select (DMA_SEL = 11b). Values: - 0x0 (FALSE): 64-bit System Address for V3 is Not Supported - 0x1 (TRUE): 64-bit System Address for V3 is Supported Default Value: 0
27	SYS_ADDR_64_V4	64-bit System Address Support for V4 This bit sets the Host Controller to support 64-bit System Addressing of V4 mode. When this bit is set to 1, full or part of 64-bit address must be used to decode the Host Controller Registers so that Host Controller Registers can be placed above system memory area. 64-bit address decode of Host Controller registers is effective regardless of setting to 64-bit Addressing in Host Control 2. If this bit is set to 1, 64-bit DMA Addressing for version 4 is enabled by setting Host Version 4 Enable (HOST_VER4_ENABLE = 1) and by setting 64-bit Addressing (ADDRESSING =1) in the Host Control 2 register. SDMA can be used and ADMA2 uses 128-bit Descriptor. Values: - 0x0 (FALSE): 64-bit System Address for V4 is Not Supported - 0x1 (TRUE): 64-bit System Address for V4 is Supported Default Value: 0
26	VOLT_18	Voltage Support 1.8V Values: - 0x0 (FALSE): 1.8V Not Supported - 0x1 (TRUE): 1.8V Supported Default Value: 1
25	VOLT_30	Voltage Support 3.0V Values: - 0x0 (FALSE): 3.0V Not Supported - 0x1 (TRUE): 3.0V Supported Default Value: 1
24	VOLT_33	Voltage Support 3.3V Values: - 0x0 (FALSE): 3.3V Not Supported - 0x1 (TRUE): 3.3V Supported Default Value: 1
23	SUS_RES_SUPPORT	Suspense/Resume Support This bit indicates whether the Host Controller supports Suspend/Resume functionality. If this bit is 0, the Host Driver does not issue either Suspend or Resume commands because the Suspend and Resume mechanism is not supported. Values: - 0x0 (FALSE): Not Supported - 0x1 (TRUE): Supported Default Value: 0

23.1.29 SDHC0_CORE_CAPABILITIES1_R (continued)

22	SDMA_SUPPORT	SDMA Support This bit indicates whether the Host Controller is capable of using SDMA to transfer data between the system memory and the Host Controller directly. Values: - 0x0 (FALSE): SDMA not Supported - 0x1 (TRUE): SDMA Supported Default Value: 1
21	HIGH_SPEED_SUPPORT	High Speed Support This bit indicates whether the Host Controller and the Host System supports High Speed mode and they can supply the SD Clock frequency from 25 MHz to 50 MHz. Values: - 0x0 (FALSE): High Speed not Supported - 0x1 (TRUE): High Speed Supported Default Value: 1
19	ADMA2_SUPPORT	ADMA2 Support This bit indicates whether the Host Controller is capable of using ADMA2. Values: - 0x0 (FALSE): ADMA2 not Supported - 0x1 (TRUE): ADMA2 Supported Default Value: 1
18	EMBEDDED_8_BIT	8-bit Support for Embedded Device This bit indicates whether the Host Controller is capable of using an 8-bit bus width mode. This bit is not effective when the Slot Type is set to 10b. Values: - 0x0 (FALSE): 8-bit Bus Width not Supported - 0x1 (TRUE): 8-bit Bus Width Supported Default Value: 1
17 : 16	MAX_BLK_LEN	Maximum Block Length This bit indicates the maximum block size that the Host driver can read and write to the buffer in the Host Controller. The buffer transfers this block size without wait cycles. The transfer block length is always 512 bytes for the SD Memory irrespective of this bit. Value is fixed to (including the default value): 0x0: when MAX_BLK_SIZE=0 indicating 512 Bytes 0x1: when MAX_BLK_SIZE=1 indicating 1024 Bytes 0x2: Reserved 0x3: Reserved Default Value: 1

23.1.29 SDHC0_CORE_CAPABILITIES1_R (continued)

15 : 8	BASE_CLK_FREQ	Base Clock Frequency for SD clock These bits indicate the base (maximum) clock frequency for the SD Clock. The definition of these bits depend on the Host Controller Version. - 6-Bit Base Clock Frequency: This mode is supported by the Host Controller version 1.00 and 2.00. The upper 2 bits are not effective and are always 0. The unit values are 1 MHz. The supported clock range is 10 MHz to 63 MHz. - 0x00 - Get information through another method - 0x01 - 1 MHz - 0x02 - 2 MHz - ..... - 0x3F - 63 MHz - 0x40-0xFF - Not Supported - 8-Bit Base Clock Frequency: This mode is supported by the Host Controller version 3.00. The unit values are 1 MHz. The supported clock range is 10 MHz to 255 MHz. - 0x00 - Get information through another method - 0x01 - 1 MHz - 0x02 - 2 MHz - ..... - 0xFF - 255 MHz If the frequency is 16.5 MHz, the larger value is set to 0001001b (17 MHz) because the Host Driver uses this value to calculate the clock divider value and it does not exceed the upper limit of the SD Clock frequency. If these bits are all 0, the Host system has to get information using a different method. Default Value: 0x64
7	TOUT_CLK_UNIT	Timeout Clock Unit This bit shows the unit of base clock frequency used to detect Data TImeout Error. Values: - 0x0 (KHZ): KHz - 0x1 (MHZ): MHz Default Value: 1
5 : 0	TOUT_CLK_FREQ	Timeout Clock Frequency This bit shows the base clock frequency used to detect Data Timeout Error. The Timeout Clock unit defines the unit of timeout clock frequency. It can be KHz or MHz. - 0x00 - Get information through another method - 0x01 - 1KHz / 1MHz - 0x02 - 2KHz / 2MHz - 0x03 - 3KHz / 3MHz - ..... - 0x3F - 63KHz / 63MHz Default Value: 1

27	ADMA3_SUPPORT	ADMA3 Support This bit indicates whether the Host Controller is capable of using ADMA3. Values: - 0x0 (FALSE): ADMA3 not Supported - 0x1 (TRUE): ADMA3 Supported Default Value: 1
23 : 16	CLK_MUL	Clock Multiplier These bits indicate the clock multiplier of the programmable clock generator. Setting these bits to 0 means that the Host Controller does not support a programmable clock generator. - 0x0: Clock Multiplier is not Supported - 0x1: Clock Multiplier M = 2 - 0x2: Clock Multiplier M = 3 - ..... - 0xFF: Clock Multiplier M = 256 Default Value: 0

23.1.30 SDHC0_CORE_CAPABILITIES2_R (continued)

15 : 14	RE_TUNING_MODES	Re-Tuning Modes (UHS-I only) These bits select the re-tuning method and limit the maximum data length. Values: - 0x0 (MODE1): Timer - 0x1 (MODE2): Timer and Re-Tuning Request (Not supported) - 0x2 (MODE3): Auto Re-Tuning (for transfer) - 0x3 (RSVD_MODE): Reserved Default Value: 0
13	USE_TUNING_SDR50	Use Tuning for SDR50 (UHS-I only) Values: - 0x0 (ZERO): SDR50 does not require tuning - 0x1 (ONE): SDR50 requires tuning Default Value: 0
11 : 8	RETUNE_CNT	Timer Count for Re-Tuning (UHS-I only) - 0x0: Re-Tuning Timer disabled - 0x1: 1 seconds - 0x2: 2 seconds - 0x3: 4 seconds - ..... - 0xB: 1024 seconds - 0xC: Reserved - 0xD: Reserved - 0xE: Reserved - 0xF: Get information from other source Default Value: 0
6	DRV_TYPED	Driver Type D Support (UHS-I only) This bit indicates support of Driver Type D for 1.8 Signaling. Values: - 0x0 (FALSE): Driver Type D is not supported - 0x1 (TRUE): Driver Type D is supported Default Value: 1
5	DRV_TYPEC	Driver Type C Support (UHS-I only) This bit indicates support of Driver Type C for 1.8 Signaling. Values: - 0x0 (FALSE): Driver Type C is not supported - 0x1 (TRUE): Driver Type C is supported Default Value: 1
4	DRV_TYPEA	Driver Type A Support (UHS-I only) This bit indicates support of Driver Type A for 1.8 Signaling. Values: - 0x0 (FALSE): Driver Type A is not supported - 0x1 (TRUE): Driver Type A is supported Default Value: 1
3	UHS2_SUPPORT	UHS-II Support (UHS-II only) This bit indicates whether Host Controller supports UHS-II. Values: - 0x0 (FALSE): UHS-II is not supported - 0x1 (TRUE): UHS-II is supported Default Value: 0
2	DDR50_SUPPORT	DDR50 Support (UHS-I only) Values: - 0x0 (FALSE): DDR50 is not supported - 0x1 (TRUE): DDR50 is supported Default Value: 1

23.1.30 SDHC0_CORE_CAPABILITIES2_R (continued)

1	SDR104_SUPPORT	SDR104 Support (UHS-I only) This bit mentions that SDR104 requires tuning. Values: - 0x0 (FALSE): SDR104 is not supported - 0x1 (TRUE): SDR104 is supported (NOT ACTUALLY SUPPORTED) Default Value: 1
0	SDR50_SUPPORT	SDR50 Support (UHS-I only) Thsi bit indicates that SDR50 is supported. The bit 13 (USE_TUNING_SDR50) indicates whether SDR50 requires tuning or not. Values: - 0x0 (FALSE): SDR50 is not supported - 0x1 (TRUE): SDR50 is supported Default Value: 1

23.1.31 SDHC0_CORE_CURR_CAPABILITIES1_R

Description: Current Capabilities Register - 0 to 31

Address: 0x44811048

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	MAX_CUR_33V [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	MAX_CUR_30V [15:8]							

Bits	23	22	21	20	19	18	17	16

Bits	Name	Description
15	FORCE_VENDOR_ERR3	This bit (FORCE_VENDOR_ERR3) of the FORCE_ERROR_INT_STAT_R register is reserved. It always returns 0. Default Value: 0
14	FORCE_VENDOR_ERR2	This bit (FORCE_VENDOR_ERR2) of the FORCE_ERROR_INT_STAT_R register is reserved. It always returns 0. Default Value: 0
13	FORCE_VENDOR_ERR1	This bit (FORCE_VENDOR_ERR1) of the FORCE_ERROR_INT_STAT_R register is reserved. It always returns 0. Default Value: 0
12	FORCE_-BOOT_ACK_ERR	Force Event for Boot Ack error Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Boot ack Error Status is set Default Value: 0
11	FORCE_RESP_ERR	Force Event for Response Error (SD Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Response Error Status is set Default Value: 0
10	FORCE_TUNING_ERR	Force Event for Tuning Error (UHS-I Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Tuning Error Status is set Default Value: 0
9	FORCE_ADMA_ERR	Force Event for ADMA Error Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): ADMA Error Status is set Default Value: 0

23.1.34 SDHC0_CORE_FORCE_ERROR_INT_STAT_R (continued)

8	FORCE_AUTO_CMD_ERR	Force Event for Auto CMD Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Auto CMD Error Status is set Default Value: 0
7	FORCE_CUR_LMT_ERR	Force Event for Current Limit Error Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Current Limit Error Status is set Default Value: 0
6	FORCE_DATA_END_BIT_ERR	Force Event for Data End Bit Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Data End Bit Error Status is set Default Value: 0
5	FORCE_DATA_CRC_ERR	Force Event for Data CRC Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Data CRC Error Status is set Default Value: 0
4	FORCE_DATA_TOUT_ERR	Force Event for Data Timeout Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Data Timeout Error Status is set Default Value: 0
3	FORCE_CMD_IDX_ERR	Force Event for Command Index Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Command Index Error Status is set Default Value: 0
2	FORCE_CMD_END_BIT_ERR	Force Event for Command End Bit Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Command End Bit Error Status is set Default Value: 0
1	FORCE_CMD_CRC_ERR	Force Event for Command CRC Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Command CRC Error Status is set Default Value: 0
0	FORCE_CMD_TOUT_ERR	Force Event for Command Timeout Error (SD/eMMC Mode only) Values: - 0x0 (FALSE): Not Affected - 0x1 (TRUE): Command Timeout Error Status is set Default Value: 0

23.1.35 SDHC0_CORE_ADMA_ERR_STAT_R

Description: ADMA Error Status Register

Address: 0x44811054

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R	R	
HW Access	Reserved					RW	RW	
Name	Reserved [7:3]					ADMA_LEN_ERR	ADMA_ERR_STATES [1:0]	

Bits	Name	Description
2	ADMA_LEN_ERR	ADMA Length Mismatch Error States This error occurs in the following instances: - While the Block Count Enable is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count and Block Length - When the total data length cannot be divided by the block length Values: - 0x0 (NO_ERR): No Error - 0x1 (ERROR): Error Default Value: 0
1 : 0	ADMA_ERR_STATES	ADMA Error States These bits indicate the state of ADMA when an error occurs during ADMA data transfer. Values: - 0x0 (ST_STOP): Stop DMA - SYS_ADR register points to a location next to the error descriptor - 0x1 (ST_FDS): Fetch Descriptor - SYS_ADR register points to the error descriptor - 0x2 (UNUSED): Never set this state - 0x3 (ST_TFR): Transfer Data - SYS_ADR register points to a location next to the error descriptor Default Value: 0

23.1.36 SDHC0_CORE_ADMA_SA_LOW_R

Description: ADMA System Address Register - Low

Address: 0x44811058

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	ADMA_SA_LOW [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	ADMA_SA_LOW [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	ADMA_SA_LOW [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	ADMA_SA_LOW [31:24]							

Bits	Name	Description
31 : 0	ADMA_SA_LOW	ADMA System Address These bits indicate the lower 32 bits of the ADMA system address. - SDMA: If Host Version 4 Enable is set to 1, this register stores the system address of the data location - ADMA2: This register stores the byte address of the executing command of the descriptor table - ADMA3: This register is set by ADMA3. ADMA2 increments the address of this register that points to the next line, every time a Descriptor line is fetched. Default Value: 0

23.1.37 SDHC0_CORE_ADMA_ID_LOW_R

Description: ADMA3 Integrated Descriptor Address Register - Low

Address: 0x44811078

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	ADMA_ID_LOW [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	ADMA_ID_LOW [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	ADMA_ID_LOW [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	ADMA_ID_LOW [31:24]							

Bits	Name	Description
31 : 0	ADMA_ID_LOW	ADMA Integrated Descriptor Address These bits indicate the lower 32-bit of the ADMA Integrated Descriptor address. The start address of Integrated Descriptor is set to these register bits. The ADMA3 fetches one Descriptor Address and increments these bits to indicate the next Descriptor address. Default Value: 0

23.1.38 SDHC0_CORE_HOST_CNTRL_VERS_R

Description: Host Controller Version

Address: 0x448110FE

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	SPEC_VERSION_NUM [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VENDOR_VERSION_NUM [15:8]							

Bits	Name	Description
15 : 8	VENDOR_VERSION_-NUM	Vendor Version Number This field is reserved for the vendor version number. Host Driver must not use this status. Default Value: 0
7 : 0	SPEC_VERSION_NUM	Specification Version Number These bits indicate the Host controller specification version. The upper and lower 4-bits indicate the version. Values 0x06-0xFF are reserved. Values: - 0x0 (VER_1_00): SD Host Controller Specification Version 1.00 - 0x1 (VER_2_00): SD Host Controller Specification Version 2.00 - 0x2 (VER_3_00): SD Host Controller Specification Version 3.00 - 0x3 (VER_4_00): SD Host Controller Specification Version 4.00 - 0x4 (VER_4_10): SD Host Controller Specification Version 4.10 - 0x5 (VER_4_20): SD Host Controller Specification Version 4.20 Default Value: 5

23.1.39 SDHC0_CORE_CQVER

Description: Command Queuing Version register

Address: 0x44811180

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	R				R			
Name	EMMC_VER_MINOR [7:4]				EMMC_VER_SUFFIX [3:0]			

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12	DCMD_EN	This bit indicates to the hardware whether the Task Descriptor in slot #31 of the TDL is a data transfer descriptor or a direct-command descriptor. CQE uses this bit when a task is issued in slot #31, to determine how to decode the Task Descriptor. Values: - 0x1 (SLOT31_DCMD_ENABLE): Task descriptor in slot #31 is a DCMD Task Descriptor - 0x0 (SLOT31_DCMD_DISABLE): Task descriptor in slot #31 is a data Transfer Task Descriptor Default Value: 0
8	TASK_DESC_SIZE	Bit Value Description This bit indicates the size of task descriptor used in host memory. This bit can only be configured when Command Queuing Enable bit is 0 (command queuing is disabled). Values: - 0x1 (TASK_DESC_128b): Task descriptor size is 128 bits - 0x0 (TASK_DESC_64b): Task descriptor size is 64 bits Default Value: 0

23.1.41 SDHC0_CORE_CQCFG (continued)

1	CR_GENERAL_EN	Crypto General Enable Enable/Disable bit for Crypto Engine. If cryptographic operations are not supported, this status bit is reserved. Values: - 0x1 (ENABLE): Enable cryptographic operations for transactions where TD.CE=1 or CRNQP.CE=1 - 0x0 (DISABLE): Disable cryptographic operations for all transactions Bit only available if DWC_MSHC_CRYPTO_SUPPORT = 1 Default Value: 0
0	CQ_EN	Enable command queuing engine (CQE). When CQE is disable, the software controls the eMMC bus using the registers between the addresses 0x000 to 0x1FF. Before the software writes to this bit, the software verifies that the eMMC host controller is in idle state and there are no ongoing commands or data transfers. When software wants to exit command queuing mode, it clears all previous tasks (if any) before setting this bit to 0. Values: - 0x1 (CQE_ENABLE): Enable command queuing - 0x0 (CQE_DISABLE): Disable command queuing Default Value: 0

23.1.42 SDHC0_CORE_CQCTL

Description: Command Queuing Control register

Address: 0x4481118C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							RW
Name	Reserved [7:1]							HALT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							RW
Name	Reserved [15:9]							CL-R_ALL_TASKS

Bits	23	22	21	20	19	18	17	16

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	CLR_ALL_TASKS	Clear all tasks This bit can only be written when the controller is halted. This bit does not clear tasks in the device. The software has to use the CMDQ_TASK_MGMT command to clear device's queue. Values: - 0x1 (CLEAR_ALL_TASKS): Clears all the tasks in the controller - 0x0 (NO_EFFECT): Programming 0 has no effect Default Value: 0
0	HALT	Halt request and resume Values: - 0x1 (HALT_CQE): Software writes 1 to this bit when it wants to acquire software control over the eMMC bus and to disable CQE from issuing command on the bus. For example, issuing a Discard Task command (CMDQ_TASK_MGMT). When the software writes 1, CQE completes the ongoing task (if any in progress). After the task is completed and the CQE is in idle state, CQE does not issue new commands and indicates to the software by setting this bit to 1. The software can poll on this bit until it is set to 1 and only then send commands on the eMMC bus. - 0x0 (RESUME_CQE): Software writes 0 to this bit to exit from the halt state and resume CQE activity. Default Value: 0

Name	Reserved [31:24]							

Bits	Name	Description
5	ICCE	Invalid Crypto Configuration Error If cryptographic operations is supported by host controller (CQCAP.CS=1) and (CQCFG.GCE=1); and encryption/decryption is enabled (TD.CE=1), this status bit is asserted (if CQISE.ICCE_STE=1) if either of the below conditions are met. - CRYPTOCFG disabled (CRYPTOCFG_i_16[TD.CCI].CFGE_i=0) OR nonexistent (TD.CCI>=CRCAP.CFGC) - Capability index in Configuration (CRYPTOCFG_i_16[TD.CCI].CAPIDX_i) is greater than maximum number of capabilities supported (CAPIDX_i > CRCAP.CC) - Data unit size in Configuration (CRYPTOCFG_i_16[TD.CCI].DUSIZE_i) is not supported by selected capability (CRYPTOCAP_x[CAPIDX_i].SDUSB) If cryptographic operations are not supported, this status bit is reserved. Values: - 0x1 (SET): ICCE interrupt is set - 0x0 (UNSET): ICCE interrupt is not set Bit only available if DWC_MSHC_CRYPTO_SUPPORT = 1 Default Value: 0

23.1.43 SDHC0_CORE_CQIS (continued)

4	GCE	General Crypto Error If cryptographic operations is supported by host controller (CQCAP.CS=1) and (CQCFG.GCE=1); and encryption/decryption is enabled (TD.CE=1), this status bit is asserted (if CQISE.GCE_STE=1) when the crypto hardware encounters any of the following error in the processing of a transaction. - Block size is not multiple of 16 bytes - Total transfer length (Block size * Block count) is not an integral multiple of DUSize - Device data block transfer starting address is not aligned to DUSize - CQE task descriptor data transfer length is not multiple of 16 bytes If cryptographic operations are not supported, this status bit is reserved. Values: - 0x1 (SET): GCE interrupt is set - 0x0 (UNSET): GCE interrupt is not set Bit only available if DWC_MSHC_CRYPTO_SUPPORT = 1 Default Value: 0
3	TCL	Task cleared interrupt This status bit is asserted (if CQISE.TCL_STE=1) when a task clear operation is completed by CQE. The completed task clear operation is either an individual task clear (by writing CQTCLR) or clearing of all tasks (by writing CQCTL). A value of 1 clears this status bit. Values: - 0x1 (SET): TCL Interrupt is set - 0x0 (NOTSET): TCL Interrupt is not set Default Value: 0
2	RED	Response error detected interrupt This status bit is asserted (if CQISE.RED_STE=1) when a response is received with an error bit set in the device status field. Configure the CQRMEM register to identify device status bit fields that may trigger an interrupt and that are masked. A value of 1 clears this status bit. Values: - 0x1 (SET): RED Interrupt is set - 0x0 (NOTSET): RED Interrupt is not set Default Value: 0
1	TCC	Task complete interrupt This status bit is asserted (if CQISE.TCC_STE=1) when at least one of the following conditions are met: - A task is completed and the INT bit is set in its Task Descriptor - Interrupt caused by Interrupt Coalescing logic due to timeout - Interrupt Coalescing logic reached the configured threshold A value of 1 clears this status bit Values: - 0x1 (SET): TCC Interrupt is set - 0x0 (NOTSET): TCC Interrupt is not set Default Value: 0

23.1.43 SDHC0_CORE_CQIS (continued)

0	HAC	Halt complete interrupt This status bit is asserted (only if CQISE.HAC_STE=1) when halt bit in the CQCTL register transitions from 0 to 1 indicating that the host controller has completed its current ongoing task and has entered halt state. A value of 1 clears this status bit. Values: - 0x1 (SET): HAC Interrupt is set - 0x0 (NOTSET): HAC Interrupt is not set Default Value: 0

23.1.44 SDHC0_CORE_CQISE

SW Access	Reserved			R	Reserved			W
HW Access	Reserved			R	Reserved			R
Name	Reserved [23:21]			INTC_STAT	Reserved [19:17]			INTC_RST

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	INTC_EN	Reserved [30:24]						

Bits	Name	Description
31	INTC_EN	Interrupt Coalescing Enable Bit Values: - 0x1 (ENABLE_INT_COALESCING): Interrupt coalescing mechanism is active. Interrupts are counted and timed, and coalesced interrupts are generated - 0x0 (DISABLE_INT_COALESCING): Interrupt coalescing mechanism is disabled (Default). Default Value: 0
20	INTC_STAT	Interrupt Coalescing Status Bit This bit indicates to the software whether any tasks (with INT=0) have completed and counted towards interrupt coalescing (that is, this is set if and only if INTC counter > 0). Values: - 0x1 (INTC_ATLEAST1_COMP): At least one INT0 task completion has been counted (INTC counter > 0) - 0x0 (INTC_NO_TASK_COMP): INT0 Task completions have not occurred since last counter reset (INTC counter == 0) Default Value: 0

23.1.46 SDHC0_CORE_CQIC (continued)

16	INTC_RST	Counter and Timer Reset When host driver writes 1, the interrupt coalescing timer and counter are reset. Values: - 0x1 (ASSERT_INTC_RESET): Interrupt coalescing timer and counter are reset - 0x0 (NO_EFFECT): No Effect Default Value: 0
15	INTC_TH_WEN	Interrupt Coalescing Counter Threshold Write Enable When software writes 1 to this bit, the value INTC_TH is updated with the contents written on the same cycle. Values: - 0x1 (WEN_SET): Sets INTC_TH_WEN - 0x0 (WEN_CLR): Clears INTC_TH_WEN Default Value: 0
12 : 8	INTC_TH	Interrupt Coalescing Counter Threshold filed Software uses this field to configure the number of task completions (only tasks with INT=0 in the Task Descriptor), which are required in order to generate an interrupt. Counter Operation: As data transfer tasks with INT=0 complete, they are counted by CQE. The counter is reset by software during the interrupt service routine. The counter stops counting when it reaches the value configured in INTC_TH, and generates interrupt. - 0x0: Interrupt coalescing feature disabled - 0x1: Interrupt coalescing interrupt generated after 1 task when INT=0 completes - 0x2: Interrupt coalescing interrupt generated after 2 tasks when INT=0 completes - ..... - 0x1f: Interrupt coalescing interrupt generated after 31 tasks when INT=0 completes To write to this field, the INTC_TH_WEN bit must be set during the same write operation. Default Value: 0
7	TOUT_VAL_WEN	When software writes 1 to this bit, the value TOUT_VAL is updated with the contents written on the same cycle. Values: - 0x1 (WEN_SET): Sets TOUT_VAL_WEN - 0x0 (WEN_CLR): clears TOUT_VAL_WEN Default Value: 0
6 : 0	TOUT_VAL	Interrupt Coalescing Timeout Value Software uses this field to configure the maximum time allowed between the completion of a task on the bus and the generation of an interrupt. Timer Operation: The timer is reset by software during the interrupt service routine. It starts running when the first data transfer task with INT=0 is completed, after the timer was reset. When the timer reaches the value configured in ICTOVAL field, it generates an interrupt and stops. The timer's unit is equal to 1024 clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field CQCAP register. - 0x0: Timer is disabled. Timeout-based interrupt is not generated - 0x1: Timeout on 01x1024 cycles of timer clock frequency - 0x2: Timeout on 02x1024 cycles of timer clock frequency - ..... - 0x7f: Timeout on 127x1024 cycles of timer clock frequency In order to write to this field, the TOUT_VAL_WEN bit must be set at the same write operation. Default Value: 0

23.1.47 SDHC0_CORE_CQTDLBA

Name	TDLBA [31:24]							

Bits	Name	Description
31 : 0	TDLBA	This register stores the LSB bits (31:0) of the byte address of the head of the Task Descriptor List in system memory. The size of the task descriptor list is 32 * (Task Descriptor size + Transfer Descriptor size) as configured by the host driver. This address is set on 1 KB boundary. The lower 10 bits of this register are set to 0 by the software and are ignored by CQE. Default Value: 0

23.1.48 SDHC0_CORE_CQTDBR

Description: Command Queuing DoorBell register

Address: 0x448111A8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	DBR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	DBR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	RW							
Name	DBR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	DBR [31:24]							

Bits	Name	Description
31 : 0	DBR	The software configures TDLBA and TDLBAU, and enable CQE in CQCFG before using this register. Writing 1 to bit n of this register triggers CQE to start processing the task encoded in slot n of the TDL. Writing 0 by the software does not have any impact on the hardware, and does not change the value of the register bit. CQE always processes tasks according to the order submitted to the list by CQTDBR write transactions. CQE processes Data Transfer tasks by reading the Task Descriptor and sending QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) commands to the device. CQE processes DCMD tasks (in slot #31, when enabled) by reading the Task Descriptor, and generating the command encoded by its index and argument. The corresponding bit is cleared to 0 by CQE in one of the following events: - A task execution is completed (with success or error). - The task is cleared using CQTCLR register. - All tasks are cleared using CQCTL register. - CQE is disabled using CQCFG register. Software may initiate multiple tasks at the same time (batch submission) by writing 1 to multiple bits of this register in the same transaction. In the case of batch submission, CQE processes the tasks in order of the task index, starting with the lowest index. If one or more tasks in the batch are marked with QBR, the ordering of execution is based on said processing order. Default Value: 0

23.1.49 SDHC0_CORE_CQTCN

Description: Command Queuing TaskClear Notification register

Address: 0x448111AC

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	DPT [31:24]							

Bits	Name	Description
31 : 0	DPT	Device-Pending Tasks Each of the 32 bits are bit mapped to the 32 tasks. - Bit-N(1): Task-N has been successfully queued into the device and is awaiting execution - Bit-N(0): Task-N is not yet queued. Bit n of this register is set if and only if QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) were sent for this specific task and if this task has not been executed. The controller sets this bit after receiving a successful response for CMD45. CQE clears this bit after the task has completed execution. Software reads this register in the task-discard procedure to determine if the task is queued in the device. Default Value: 0

23.1.52 SDHC0_CORE_CQTCLR

Description: Command Queuing DoorBell register

Address: 0x448111B8

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	TCLR [31:24]							

Bits	Name	Description
31 : 0	TCLR	Writing 1 to bit n of this register orders CQE to clear a task that the software has previously issued. This bit can only be written when CQE is in Halt state as indicated in CQCFG register Halt bit. When software writes 1 to a bit in this register, CQE updates the value to 1, and starts clearing the data structures related to the task. CQE clears the bit fields (sets a value of 0) in CQTCLR and in CQTDBR once the clear operation is complete. Software must poll on the CQTCLR until it is cleared to verify that a clear operation was done. Default Value: 0

23.1.53 SDHC0_CORE_CQSSC1

Description: CQ Send Status Configuration 1 register

Address: 0x448111C0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SQSCMD_IDLE_TMR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	SQSCMD_IDLE_TMR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				SQSCMD_BLK_CNT [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19 : 16	SQSCMD_BLK_CNT	This field indicates when SQS CMD is sent while data transfer is in progress. A value of 'n' indicates that CQE sends status command on the CMD line, during the transfer of data block BLOCK_CNTn, on the data lines, where BLOCK_CNT is the number of blocks in the current transaction. - 0x0: SEND_QUEUE_STATUS (CMD13) command is not sent during the transaction. Instead, it is sent only when the data lines are idle. - 0x1: SEND_QUEUE_STATUS command is to be sent during the last block of the transaction. - 0x2: SEND_QUEUE_STATUS command when last 2 blocks are pending. - 0x3: SEND_QUEUE_STATUS command when last 3 blocks are pending. - ..... - 0xf: SEND_QUEUE_STATUS command when last 15 blocks are pending. Should be programmed only when CQCFG.CQ_EN is '0' Default Value: 0x1

23.1.53 SDHC0_CORE_CQSSC1 (continued)

15 : 0	SQSCMD_IDLE_TMR	This field configures the polling period to be used when using periodic SEND_QUEUE_STATUS (CMD13) polling. Periodic polling is used when tasks are pending in the device, but no data transfer is in progress. When a SEND_QUEUE_STATUS response indicates that no task is ready for execution, CQE counts the configured time until it issues the next SEND_QUEUE_STATUS. Timer units are clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field CQCAP register. The minimum value is 0001h (1 clock period) and the maximum value is FFFFh (65535 clock periods). For example, a CQCAP field value of 0 indicates a 19.2 MHz clock frequency (period = 52.08 ns). If the setting in CQSSC1.CIT is 1000h, the calculated polling period is 4096*52.08 ns= 213.33 ns. Should be programmed only when CQCFG.CQ_EN is '0'. Default Value: 0x1000

23.1.54 SDHC0_CORE_CQSSC2

Name	RESP_ERR_MASK [31:24]							

Bits	Name	Description
31 : 0	RESP_ERR_MASK	The bits of this field are bit mapped to the device response. This bit is used as an interrupt mask on the device status filed that is received in R1/R1b responses. - 1: When a R1/R1b response is received, with a bit i in the device status set, a RED interrupt is generated. - 0: When a R1/R1b response is received, bit i in the device status is ignored. The reset value of this register is set to trigger an interrupt on all "Error" type bits in the device status. Note: Responses to CMD13 (SQS) encode the QSR so that they are ignored by this logic. Default Value: 0xFDF9A080

23.1.57 SDHC0_CORE_CQTERRI

Description: CQ Task Error Information register

Address: 0x448111D4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		R					
HW Access	Reserved		RW					
Name	Reserved [7:6]		RESP_ERR_CMD_INDX [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	R	Reserved		R				
HW Access	RW	Reserved		RW				
Name	RESP_ER-R_-FIELDS_VALID	Reserved [14:13]		RESP_ERR_TASKID [12:8]				

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved		R					
HW Access	Reserved		RW					
Name	Reserved [23:22]		TRANS_ERR_CMD_INDX [21:16]					

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved		R				
HW Access	RW	Reserved		RW				
Name	TRANS_ERR_-FIELDS_VALID	Reserved [30:29]		TRANS_ERR_TASKID [28:24]				

Bits	Name	Description
31	TRANS_ERR_-FIELDS_VALID	This bit is updated when an error is detected while a data transfer transaction was in progress. Values: - 0x1 (SET): data transfer related error detected. Check contents of TRANS_ERR_TASKID and TRANS_ERR_CMD_INDX fields - 0x0 (NOT_SET): Ignore contents of TRANS_ERR_TASKID and TRANS_ERR_CMD_INDX Default Value: 0
28 : 24	TRANS_ERR_TASKID	This field captures the ID of the task that was executed and whose data transfer has errors. Default Value: 0
21 : 16	TRANS_ERR_CMD_INDX	This field captures the index of the command that was executed and whose data transfer has errors. Default Value: 0

23.1.57 SDHC0_CORE_CQTERRI (continued)

15	RESP_ERR_-FIELDS_VALID	This bit is updated when an error is detected while a command transaction was in progress. Values: - 0x1 (SET): Response-related error is detected. Check contents of RESP_ERR_TASKID and RESP_ERR_CMD_INDX fields - 0x0 (NOT_SET): Ignore contents of RESP_ERR_TASKID and RESP_ERR_CMD_INDX Default Value: 0
12 : 8	RESP_ERR_TASKID	This field captures the ID of the task which was executed on the command line when the error occurred. Default Value: 0
5 : 0	RESP_ERR_CMD_INDX	This field captures the index of the command that was executed on the command line when the error occurred. Default Value: 0

23.1.58 SDHC0_CORE_CQCRI

Description: CQ Command response index

Address: 0x448111D8

Retention: Retained

SW Access	R							
HW Access	R							
Name	MSHC_VER_TYPE [31:24]							

Bits	Name	Description
31 : 0	MSHC_VER_TYPE	Current release type This field indicates the Synopsys DesignWare Cores DWC_mshc/DWC_mshc_lite current release type that is read by an application. For example, release type is "ga" is represented in ASCII as 0x6761. Lower 16 bits read from this register can be ignored by the application. An application reading this register in conjunction with the MSHC_VER_ID_R register, gathers details of the current release. Default Value: 0x67612A2A

23.1.62 SDHC0_CORE_MSHC_CTRL_R

Description: MSHC Control register

Address: 0x44811508

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved			RW	Reserved			RW
HW Access	Reserved			R	Reserved			R
Name	Reserved [7:5]			SW_CG_DIS	Reserved [3:1]			CMD_CONFLICT_CHECK

Bits	Name	Description
4	SW_CG_DIS	Internal clock gating disable control This bit must be used to disable IP's internal clock gating when required. when disabled clocks are not gated. Clocks to the core (except hclk) must be stopped when programming this bit. Values: - 0x0 (ENABLE): Internal clock gates are active and clock gating is controlled internally - 0x1 (DISABLE): Internal clock gating is disabled, clocks are not gated internally Default Value: 0
0	CMD_CONFLICT_CHECK	Command conflict check This bit enables command conflict check. Note: DWC_mshc controller monitors the CMD line whenever a command is issued and checks whether the value driven on sd_cmd_out matches the value on sd_cmd_in at next subsequent edge of cclk_tx to determine command conflict error. This bit is cleared only if the feed back delay (including IO Pad delay) is more than (t_card_clk_period - t_setup), where t_setup is the setup time of a flop in DWC_mshc. The I/O pad delay is consistent across CMD and DATA lines, and it is within the value: (2*t_card_clk_period - t_setup) Values: - 0x0 (DISABLE_CMD_CONFLICT_CHK): Disable command conflict check - 0x1 (CMD_CONFLICT_CHK_LAT1): Check for command conflict after 1 card clock cycle Default Value: 1

23.1.63 SDHC0_CORE_MBIU_CTRL_R

Description: MBIU Control register

Address: 0x44811510

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW	RW	RW	RW
HW Access	Reserved				R	R	R	R
Name	Reserved [7:4]				BURST_IN-CR16_EN	BURST_IN-CR8_EN	BURST_IN-CR4_EN	UNDE-FL_IN-CR_EN

Bits	Name	Description
3	BURST_INCR16_EN	INCR16 Burst Controls generation of INCR16 transfers on Master interface. Values: - 0x0 (FALSE): AHB INCR16 burst type is not generated on Master I/F - 0x1 (TRUE): AHB INCR16 burst type can be generated on Master I/F Default Value: 0
2	BURST_INCR8_EN	INCR8 Burst Controls generation of INCR8 transfers on Master interface. Values: - 0x0 (FALSE): AHB INCR8 burst type is not generated on Master I/F - 0x1 (TRUE): AHB INCR8 burst type can be generated on Master I/F Default Value: 0
1	BURST_INCR4_EN	INCR4 Burst Controls generation of INCR4 transfers on Master interface. Values: - 0x0 (FALSE): AHB INCR4 burst type is not generated on Master I/F - 0x1 (TRUE): AHB INCR4 burst type can be generated on Master I/F Default Value: 0
0	UNDEFL_INCR_EN	Undefined INCR Burst Controls generation of undefined length INCR transfer on Master interface. Values: - 0x0 (FALSE): Undefined INCR type burst is the least preferred burst on AHB Master I/F - 0x1 (TRUE): Undefined INCR type burst is the most preferred burst on AHB Master I/F Default Value: 1

23.1.64 SDHC0_CORE_EMMC_CTRL_R

Description: eMMC Control register

Address: 0x4481152C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW	RW	RW	RW
HW Access	Reserved				R	R	R	R
Name	Reserved [7:4]				EMMC_RST_N_OE	EMMC_RST_N	DISABLE_DATA_CRC_CHK	CARD_IS_EMMC

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					RW	RW	Reserved
HW Access	Reserved					R	R	Reserved
Name	Reserved [15:11]					CQE_PREFETCH_DISABLE	CQE_ALGO_SEL	Reserved

Bits	Name	Description
10	CQE_PREFETCH_DISABLE	Enable or Disable CQE's PREFETCH feature This field allows Software to disable CQE's data prefetch feature when set to 1. Values: - 0x0 (PREFETCH_ENABLE): CQE can Prefetch data for sucessive WRITE transfers and pipeline sucessive READ transfers - 0x1 (PREFETCH_DISABLE): Prefetch for WRITE and Pipeline for READ are disabled Default Value: 0
9	CQE_ALGO_SEL	Scheduler algorithm selected for execution This bit selects the Algorithm used for selecting one of the many ready tasks for execution. Values: - 0x0 (PRI_REORDER_PLUS_FCFS): Priority based reordering with FCFS to resolve equal priority tasks - 0x1 (FCFS_ONLY): First come First serve, in the order of DBR rings Default Value: 0
3	EMMC_RST_N_OE	Output Enable (OE) control for EMMC Device Reset signal (card_emmc_reset_n). Values: - 0x1 (ENABLE): OE for card_emmc_reset_n is 1 - 0x0 (DISABLE): OE for card_emmc_reset_n is 0 Default Value: 1
2	EMMC_RST_N	EMMC Device Reset signal control. This register field controls the card_emmc_reset_n output of SDHC Values: - 0x1 (RST_DEASSERT): Reset to eMMC device is deasserted - 0x0 (RST_ASSERT): Reset to eMMC device asserted (active low) Default Value: 1

23.1.64 SDHC0_CORE_EMMC_CTRL_R (continued)

1	DISABLE_- DATA_CRC_CHK	Disable Data CRC Check This bit controls masking of CRC16 error for Card Write in eMMC mode. This is useful in bus testing (CMD19) for an eMMC device. In bus testing, an eMMC card does not send CRC status for a block, which may generate CRC error. This CRC error can be masked using this bit during bus testing. Values: - 0x1 (DISABLE): DATA CRC check is disabled - 0x0 (ENABLE): DATA CRC check is enabled Default Value: 0
0	CARD_IS_EMMC	eMMC Card present This bit indicates the type of card connected. An application program this bit based on the card connected to SDHC. Values: - 0x1 (EMMC_CARD): Card connected to SDHC is an eMMC card - 0x0 (NON_EMMC_CARD): Card connected to SDHC is a non-eMMC card Default Value: 0

23.1.65 SDHC0_CORE_BOOT_CTRL_R

Description: eMMC Boot Control register

Address: 0x4481152E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	W	Reserved						RW
HW Access	R	Reserved						R
Name	VALI-DATE_-BOOT	Reserved [6:1]						MAN_-BOOT_EN

Bits	15	14	13	12	11	10	9	8
SW Access	RW				Reserved			RW
HW Access	R				Reserved			R
Name	BOOT_TOUT_CNT [15:12]				Reserved [11:9]			BOOT_ACK_ENABLE

Bits	Name	Description
15 : 12	BOOT_TOUT_CNT	Boot Ack Timeout Counter Value. This value determines the interval by which boot ack timeout (50 ms) is detected when boot ack is expected during boot operation. - 0xF - Reserved - 0xE - TMCLK x 2^27 - .. - ..... - 0x1 - TMCLK x 2^14 - 0x0 - TMCLK x 2^13 Default Value: 0
8	BOOT_ACK_ENABLE	Boot Acknowledge Enable When this bit set, SDHC checks for boot acknowledge start pattern of 0-1-0 during boot operation. This bit is applicable for both mandatory and alternate boot mode. Values: - 0x1 (TRUE): Boot Ack enable - 0x0 (FALSE): Boot Ack disable Default Value: 0
7	VALIDATE_BOOT	Validate Mandatory Boot Enable bit This bit is used to validate the MAN_BOOT_EN bit. Values: - 0x1 (TRUE): Validate Mandatory boot enable bit - 0x0 (FALSE): Ignore Mandatory boot Enable bit Default Value: 0
0	MAN_BOOT_EN	Mandatory Boot Enable This bit is used to initiate the mandatory boot operation. The application sets this bit along with VALIDATE_BOOT bit. Writing 0 is ignored. The SDHC clears this bit after the boot transfer is completed or terminated. Values: - 0x1 (MAN_BOOT_EN): Mandatory boot enable - 0x0 (MAN_BOOT_DIS): Mandatory boot disable Default Value: 0

23.1.66 SDHC0_CORE_GP_IN_R

Description: General Purpose Input register

Address: 0x44811530

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							GP_IN

Name	Reserved [31:24]							

Bits	Name	Description
0	GP_IN	It reflects the value of gp_in ports. NOT USED - ALWAYS READS 0 Default Value: 0

23.1.67 SDHC0_CORE_GP_OUT_R

Description: General Purpose Output register

Address: 0x44811534

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW	RW	RW	RW	RW	RW
HW Access	R		R	R	R	R	R	R
Name	CARD_CLOCK_OUT_D-LY [7:6]		IO_-VOLT_SEL_OE	CARD_IF_PWR_EN_OE	CARD_-CLOCK_OE	LED_C-TRL_OE	CARD_-MECH_WRITE_PROT_EN	CARD_DE-TECT_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [15:10]						CARD_CLOCK_IN_DLY [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 8	CARD_CLOCK_IN_DLY	Delay CARD_CLOCK input internally to optimally sample CMD/DAT; set according to interface mode: 00: SD Default Speed, SD SDR12, eMMC Legacy 01: SD SDR25, SD SDR50 10: SD High Speed, eMMC High Speed SDR 11: SD DDR50, eMMC DDR Default Value: 0
7 : 6	CARD_CLOCK_OUT_D-LY	Delay CARD_CLOCK output relative to CMD/DAT to meet output setup/hold times; set according to interface mode: 00: SD Default Speed, SD High Speed, SD SDR12, eMMC Legacy 01: SD SDR25, SD SDR50, eMMC High Speed SDR 10: RESERVED 11: SD DDR50, eMMC DDR Default Value: 0
5	IO_VOLT_SEL_OE	Active high output enable for the IO voltage selection signal (io_volt_sel) controlled through HOST_CTRL_2.SIGNALING_EN: 0: disable OE to the io_volt_sel output 1: enable OE to the io_volt_sel output Default Value: 0

23.1.67 SDHC0_CORE_GP_OUT_R (continued)

4	CARD_IF_PWR_EN_OE	Active high output enable for the card interface power enable output (card_if_pwr_en) controlled through PWR_CTRL_R.SD_BUS_PWR_VDD1: 0: disable OE to the card_if_pwr_en output 1: enable OE to the card_if_pwr_en output Default Value: 0
3	CARD_CLOCK_OE	Active high output enable for the card clock output (clk_card) which is gated by CLK_CTRL_R.SD_CLK_EN: 0: disable OE to the clk_card output 1: enable OE to the clk_card output Default Value: 0
2	LED_CTRL_OE	Active high output enable for the LED output signal (led_ctrl) controlled through HOST_CTRL1_R.LED_CTRL: 0: disable OE associated with the led_ctrl output 1: enable OE associated with the led_ctrl output Default Value: 0
1	CARD_MECH_WRITE_PROT_EN	card_mech_write_prot, despite its name, is an active low signal (per the SD Host Controller Standard spec it is officially called SDWP#). Consider that in the following: 0: Force card_mech_write_prot input to 0 internally; this forces write protection to be active 1: Allow card_mech_write_prot to work normally per the device's pin state Default Value: 0
0	CARD_DETECT_EN	0: Force card_detect_n input to 0 1: Normal card_detect_n operation allowing card detection from a device pin Default Value: 0

24 Universal Serial Bus High-Speed registers

This section discusses the USBHS registers. It lists all the registers in mapping tables, in address order.

24.1 Register details

Register name	Address	Description
USBHS_DWC_otg_intreg_GOTGCTL	0x44900000	The OTG Control and Status register controls the behavior and reflects the status of the OTG function of the controller.
USBHS_DWC_otg_intreg_GOTGINT	0x44900004	The application reads this register whenever there is an OTG interrupt and clears the bits in this register to clear the OTG interrupt.
USBHS_DWC_otg_intreg_GAHBCFG	0x44900008	This register can be used to configure the core after power-on or a change in mode. This register mainly contains AHB system-related configuration parameters. Do not change this register after the initial programming. The application must program this register before starting any transactions on either the AHB or the USB.
USBHS_DWC_otg_intreg_GUSBCFG	0x4490000C	This register can be used to configure the core after power-on or when changing to Host mode or Device mode. It contains USB and USB-PHY related configuration parameters. The application must program this register before starting any transactions on either the AHB or the USB. If you are using the HSIC interface, HSIC PHY must be in reset while programming this register. Do not make changes to this register after the initial programming.
USBHS_DWC_otg_intreg_GRSTCTL	0x44900010	The application uses this register to reset various hardware features inside the controller.

Register name	Address	Description
USBHS_DWC_otg_intreg_GINTSTS	0x44900014	This register interrupts the application for system-level events in the current mode (Device mode or Host mode). Some of the bits in this register are valid only in Host mode, while others are valid in Device mode only. This register also indicates the current mode. To clear the interrupt status bits of type R_SS_WC, the application must write 1'b1 to the bit. The FIFO status interrupts are read only; once software reads from or writes to the FIFO while servicing these interrupts, FIFO interrupt conditions are cleared automatically. The application must clear the GINTSTS register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization. Note: Read the reset value of GINTSTS.CurMod only after the following conditions: - If IDDIG_FILTER is disabled, read only after PHY clock is stable. - If IDDIG_FILTER is enabled, read only after the filter timer expires.
USBHS_DWC_otg_intreg_GINTMSK	0x44900018	This register works with the Interrupt Register (GINTSTS) to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the GINTSTS register bit corresponding to that interrupt is still set. Note: The fields of this register change depending on host or device mode.
USBHS_DWC_otg_intreg_GRXSTSR	0x4490001C	A read to the Receive Status Debug Read register returns the contents of the top of the Receive FIFO. The receive status contents must be interpreted differently in Host and Device modes. The core ignores the receive status read when the receive FIFO is empty and returns a value of 32'h0000_0000. Note: - Use of these fields vary based on whether the core is functioning as a host or a device. - Do not read this register's reset value before configuring the core because the read value is 'X' in the simulation.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_GRXSTSP	0x44900020	A read to the Receive Status Read and Pop register returns the contents of the top of the Receive FIFO and additionally pops the top data entry out of the RxFIFO. The receive status contents must be interpreted differently in Host and Device modes. The core ignores the receive status pop/read when the receive FIFO is empty and returns a value of 32'h0000_0000. The application must only pop the Receive Status FIFO when the Receive FIFO Non-Empty bit of the Core Interrupt register (GINTSTS.RxFLvl) is asserted. Note: - Use of these fields vary based on whether the core is functioning as a host or a device. - Do not read this register's reset value before configuring the core because the read value is 'X' in the simulation.
USBHS_DWC_otg_intreg_GRXFSIZ	0x44900024	The application can program the RAM size that must be allocated to the RxFIFO.
USBHS_DWC_otg_intreg_GNPTXFSIZ	0x44900028	The application can program the RAM size and the memory start address for the Non-periodic TxFIFO Note: The fields of this register change depending on host or device mode.
USBHS_DWC_otg_intreg_GNPTXSTS	0x4490002C	In Device mode, this register is valid only in Shared FIFO operation. This read-only register contains the free space information for the Non-periodic TxFIFO and the Non-periodic Transmit Request Queue.
USBHS_DWC_otg_intreg_GGPIO	0x44900038	The application can use this register for general purpose input/output ports or for debugging.
USBHS_DWC_otg_intreg_GUID	0x4490003C	This is a read/write register containing the User ID. It is implemented only if Remove Optional Features? was deselected during coreConsultant configuration (parameter OTG_RM_OPT_FEATURES = 0). The power-on value for this register is specified as the Power-on Value of User ID Register User Identification Register during coreConsultant configuration (parameter OTG_USERID). This register can be used in the following ways: - To store the version or revision of your system - To store hardware configurations that are outside the DWC_otg core - As a scratch register
USBHS_DWC_otg_intreg_GSNPSID	0x44900040	This read-only register contains the release number of the core being used.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_GHWCFG1	0x44900044	This register contains the logical endpoint direction(s) selected using coreConsultant.
USBHS_DWC_otg_intreg_GHWCFG2	0x44900048	This register contains configuration options selected using coreConsultant.
USBHS_DWC_otg_intreg_GHWCFG3	0x4490004C	This register contains configuration options selected using coreConsultant.
USBHS_DWC_otg_intreg_GHWCFG4	0x44900050	This register contains configuration options selected using coreConsultant. Note: Bit [31] is available only when Scatter/Gather DMA mode is enabled. When Scatter/Gather DMA mode is disabled, this field is reserved.
USBHS_DWC_otg_intreg_GLPMCFG	0x44900054	Register to control the LPM functionality of the controller.
USBHS_DWC_otg_intreg_GDFIFOCFG	0x4490005C	Register to configure the DFIFOs for the controller.
USBHS_DWC_otg_intreg_GINTMSK2	0x44900068	This register works with the Interrupt Register (GINTSTS2) to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the GINTSTS2 register bit corresponding to that interrupt is still set. Note: The fields of this register change depending on host or device mode.
USBHS_DWC_otg_intreg_GINTSTS2	0x4490006C	This register interrupts the application for system-level events in the current mode (Device mode or Host mode). Some of the bits in this register are valid only in Host mode, while others are valid in Device mode only. This register also indicates the current mode. To clear the interrupt status bits of type R_SS_WC, the application must write 1'b1 to the bit. The application must clear the GINTSTS2 register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization.
USBHS_DWC_otg_intreg_HPTXFSIZ	0x44900100	This register holds the size and the memory start address of the Periodic TxFIFO. Note: Read the reset value of this register only after the following conditions: - If IDDIG_FILTER is disabled, read only after PHY clock is stable. - If IDDIG_FILTER is enabled, read only after the filter timer expires.

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPTXF1	0x44900104	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.
USBHS_DWC_otg_intreg_DIEPTXF2	0x44900108	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.
USBHS_DWC_otg_intreg_DIEPTXF3	0x4490010C	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.
USBHS_DWC_otg_intreg_DIEPTXF4	0x44900110	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.
USBHS_DWC_otg_intreg_DIEPTXF5	0x44900114	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPTXF6	0x44900118	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.
USBHS_DWC_otg_intreg_DIEPTXF7	0x4490011C	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.
USBHS_DWC_otg_intreg_DIEPTXF8	0x44900120	This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.
USBHS_DWC_otg_intreg_HCFG	0x44900400	This register is used to configure the controller in Host mode.
USBHS_DWC_otg_intreg_HFIR	0x44900404	This register is used to control the interval between two consecutive SOFs.
USBHS_DWC_otg_intreg_HFNUM	0x44900408	This register indicates the current frame number. It also indicates the time remaining (in terms of the number of PHY clocks) in the current (micro)frame. Note: Read the reset value of this register only after the following conditions: - If IDDIG_FILTER is disabled, read only when the PHY clock is stable. - If IDDIG_FILTER is enabled, read only after the filter timer expires.
USBHS_DWC_otg_intreg_HPTXSTS	0x44900410	This register contains information about the Periodic Transmit Queue in the Host controller.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_HAINT	0x44900414	When a significant event occurs on a channel, the Host All Channels Interrupt register interrupts the application using the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt). This is shown in the "Interrupt Hierarchy" figure in the databook. There is one interrupt bit per channel, up to a maximum of 16 bits. Bits in this register are set and cleared when the application sets and clears bits in the corresponding Host Channel-n Interrupt register.
USBHS_DWC_otg_intreg_HAINTMSK	0x44900418	The Host All Channel Interrupt Mask register works with the Host All Channel Interrupt register to interrupt the application when an event occurs on a channel. There is one interrupt mask bit per channel, up to a maximum of 16 bits.
USBHS_DWC_otg_intreg_HFLBAddr	0x4490041C	This register is present only in case of Scatter/Gather DMA. It is implemented as flops. This register holds the starting address of the Frame list information.
USBHS_DWC_otg_intreg_HPRT	0x44900440	This register is available only in Host mode. Currently, the OTG Host supports only one port. A single register holds USB port-related information such as USB reset, enable, suspend, resume, connect status, and test mode for each port. It is shown in the "Interrupt Hierarchy" figure in the databook. The R_SS_WC bits in this register can trigger an interrupt to the application through the Host Port Interrupt bit of the Core Interrupt register (GINTSTS.PrtInt). On a Port Interrupt, the application must read this register and clear the bit that caused the interrupt. For the R_SS_WC bits, the application must write a 1 to the bit to clear the interrupt.
USBHS_DWC_otg_intreg_HCCHAR0	0x44900500	This register contains the characteristics of the Host Channel.
USBHS_DWC_otg_intreg_HCSPLT0	0x44900504	This register contains the Split characteristics of the Host Channel.
USBHS_DWC_otg_intreg_HCINT0	0x44900508	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINTMSK0	0x4490050C	This register reflects the mask for each channel status described in the previous section.
USBHS_DWC_otg_intreg_HCTSIZ0	0x44900510	This register reflects the transfer size for the Host Channel.
USBHS_DWC_otg_intreg_HCDMA0	0x44900514	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned.
USBHS_DWC_otg_intreg_HCDMAB0	0x4490051C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address.
USBHS_DWC_otg_intreg_HCCHAR1	0x44900520	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT1	0x44900524	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINT1	0x44900528	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK1	0x4490052C	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ1	0x44900530	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA1	0x44900534	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCDMAB1	0x4490053C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR2	0x44900540	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT2	0x44900544	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINT2	0x44900548	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK2	0x4490054C	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ2	0x44900550	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA2	0x44900554	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB2	0x4490055C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCCHAR3	0x44900560	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT3	0x44900564	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINT3	0x44900568	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK3	0x4490056C	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ3	0x44900570	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA3	0x44900574	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB3	0x4490057C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR4	0x44900580	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT4	0x44900584	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINT4	0x44900588	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. USBHS_DWC_otg_intreg_HCTSIZ9	0x44900630	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA9	0x44900634	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB9	0x4490063C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR10	0x44900640	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT10	0x44900644	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINT10	0x44900648	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK10	0x4490064C	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ10	0x44900650	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA10	0x44900654	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB10	0x4490065C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR11	0x44900660	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT11	0x44900664	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINT11	0x44900668	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK11	0x4490066C	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ11	0x44900670	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA11	0x44900674	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB11	0x4490067C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR12	0x44900680	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT12	0x44900684	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINT12	0x44900688	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. USBHS_DWC_otg_intreg_HCINTMSK12	0x4490068C	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ12	0x44900690	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA12	0x44900694	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB12	0x4490069C	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR13	0x449006A0	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT13	0x449006A4	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINT13	0x449006A8	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK13	0x449006AC	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ13	0x449006B0	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA13	0x449006B4	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB13	0x449006BC	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR14	0x449006C0	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT14	0x449006C4	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINT14	0x449006C8	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK14	0x449006CC	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ14	0x449006D0	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA14	0x449006D4	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB14	0x449006DC	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCCHAR15	0x449006E0	This register contains the characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCCHAR0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCSPLT15	0x449006E4	This register contains the Split characteristics of the Host Channel. See USBHS_DWC_otg_intreg_HCSPLT0 for the details of bit fields.

Register name	Address	Description
USBHS_DWC_otg_intreg_HCINT15	0x449006E8	This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers. See USBHS_DWC_otg_intreg_HCINT0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCINTMSK15	0x449006EC	This register reflects the mask for each channel status described in the previous section. See USBHS_DWC_otg_intreg_HCINTMSK0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCTSIZ15	0x449006F0	This register reflects the transfer size for the Host Channel. See USBHS_DWC_otg_intreg_HCTSIZ0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMA15	0x449006F4	This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned. See USBHS_DWC_otg_intreg_HCDMA0 for the details of bit fields.
USBHS_DWC_otg_intreg_HCDMAB15	0x449006FC	This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address. See USBHS_DWC_otg_intreg_HCDMAB0 for the details of bit fields.
USBHS_DWC_otg_intreg_DCFG	0x44900800	This register configures the core in Device mode after power-on or after certain control commands or enumeration. Do not make changes to this register after initial programming.
USBHS_DWC_otg_intreg_DCTL	0x44900804	This register is used to control the characteristics of the Device controller.
USBHS_DWC_otg_intreg_DSTS	0x44900808	This register indicates the status of the core with respect to USB-related events. It must be read on interrupts from Device All Interrupts (DAINT) register.

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPMSK	0x44900810	This register works with each of the Device IN Endpoint Interrupt (DIEPINTn) registers for all endpoints to generate an interrupt per IN endpoint. The IN endpoint interrupt for a specific status in the DIEPINTn register can be masked by writing to the corresponding bit in this register. Status bits are masked by default.
USBHS_DWC_otg_intreg_DOEPMSK	0x44900814	This register works with each of the Device OUT Endpoint Interrupt (DOEPINTn) registers for all endpoints to generate an interrupt per OUT endpoint. The OUT endpoint interrupt for a specific status in the DOEPINTn register can be masked by writing into the corresponding bit in this register. Status bits are masked by default.
USBHS_DWC_otg_intreg_DAINT	0x44900818	When a significant event occurs on an endpoint, a Device All Endpoints Interrupt register interrupts the application using the Device OUT Endpoints Interrupt bit or Device IN Endpoints Interrupt bit of the Core Interrupt register (GINTSTS.OEPInt or GINTSTS.IEPInt, respectively). This is shown in Figure 5-2. There is one interrupt bit per endpoint, up to a maximum of 16 bits for OUT endpoints and 16 bits for IN endpoints. For a bidirectional endpoint, the corresponding IN and OUT interrupt bits are used. Bits in this register are set and cleared when the application sets and clears bits in the corresponding Device Endpoint-n Interrupt register (DIEPINTn/DOEPINTn).
USBHS_DWC_otg_intreg_DAINTMSK	0x4490081C	The Device Endpoint Interrupt Mask register works with the Device Endpoint Interrupt register to interrupt the application when an event occurs on a device endpoint. However, the Device All Endpoints Interrupt (DAINT) register bit corresponding to that interrupt is still set.
USBHS_DWC_otg_intreg_DVBUSDIS	0x44900828	This register specifies the VBUS discharge time after VBUS pulsing during SRP.
USBHS_DWC_otg_intreg_DVBUSPULSE	0x4490082C	This register contains the VBUS pulsing time during SRP.
USBHS_DWC_otg_intreg_DTHRCTL	0x44900830	This register contains the Receive and Transmit Threshold characteristics of the Device controller.
USBHS_DWC_otg_intreg_DIEPEMPMSK	0x44900834	This register is valid only in Dedicated FIFO operation (OTG_EN_DED_TX_FIFO = 1). This register is used to control the IN endpoint FIFO empty interrupt generation (DIEPINTn.TxfEmp).

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPCTL0	0x44900900	This register is used to control the characteristics of the IN Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DIEPINT0	0x44900908	This register indicates the status of an endpoint with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the OUT Endpoints Interrupt bit or IN Endpoints Interrupt bit of the Core Interrupt register (GINTSTS.OEPInt or GINTSTS.IEPInt, respectively) is set. Before the application can read this register, it must first read the Device All Endpoints Interrupt (DAINT) register to get the exact endpoint number for the Device Endpoint-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the DAINT and GINTSTS registers
USBHS_DWC_otg_intreg_DIEPTSIZ0	0x44900910	The application must modify this register before enabling endpoint 0. Once endpoint 0 is enabled using Endpoint Enable bit of the Device Control Endpoint 0 Control registers (DIEPCTL0.EPEna/DOEPCTL0.EPEna), the core modifies this register. The application can only read this register once the core has cleared the Endpoint Enable bit. Nonzero endpoints use the registers for endpoints 115. When Scatter/Gather DMA mode is enabled, this register must not be programmed by the application. If the application reads this register when Scatter/Gather DMA mode is enabled, the core returns all zeros.
USBHS_DWC_otg_intreg_DIEPDMA0	0x44900914	This register contains the DMA Address for the IN Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DTXFSTS0	0x44900918	This register contains information about the IN Endpoint Transmit FIFO of the Device controller.
USBHS_DWC_otg_intreg_DIEPDMAB0	0x4490091C	This register contains the DMA Buffer Address for the IN Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DIEPCTL1	0x44900920	This register is used to control the characteristics of Endpoint 1. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPINT1	0x44900928	This register contains the interrupts for the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPTSIZ1	0x44900930	This register reflects the Transfer Size of the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMA1	0x44900934	This register contains the DMA Address for the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS1	0x44900938	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMAB1	0x4490093C	This register contains the DMA Buffer Address of the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPCTL2	0x44900940	This register is used to control the characteristics of Endpoint 2. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPINT2	0x44900948	This register contains the interrupts for the IN Endpoint 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPTSIZ2	0x44900950	This register reflects the Transfer Size of the IN Endpoint 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMA2	0x44900954	This register contains the DMA Address for the IN Endpoint 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS2	0x44900958	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMAB2	0x4490095C	This register contains the DMA Buffer Address of the IN Endpoint 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPCTL3	0x44900960	This register is used to control the characteristics of Endpoint 3. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPINT3	0x44900968	This register contains the interrupts for the IN Endpoint 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPTSIZ3	0x44900970	This register reflects the Transfer Size of the IN Endpoint 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMA3	0x44900974	This register contains the DMA Address for the IN Endpoint 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS3	0x44900978	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMAB3	0x4490097C	This register contains the DMA Buffer Address of the IN Endpoint 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPCTL4	0x44900980	This register is used to control the characteristics of Endpoint 4. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPINT4	0x44900988	This register contains the interrupts for the IN Endpoint 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPTSIZ4	0x44900990	This register reflects the Transfer Size of the IN Endpoint 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMA4	0x44900994	This register contains the DMA Address for the IN Endpoint 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS4	0x44900998	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPDMAB4	0x4490099C	This register contains the DMA Buffer Address of the IN Endpoint 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPCTL5	0x449009A0	This register is used to control the characteristics of Endpoint 5. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPINT5	0x449009A8	This register contains the interrupts for the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPTSIZ5	0x449009B0	This register reflects the Transfer Size of the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMA5	0x449009B4	This register contains the DMA Address for the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS5	0x449009B8	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMAB5	0x449009BC	This register contains the DMA Buffer Address of the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPCTL6	0x449009C0	This register is used to control the characteristics of Endpoint 6. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPINT6	0x449009C8	This register contains the interrupts for the IN Endpoint 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPTSIZ6	0x449009D0	This register reflects the Transfer Size of the IN Endpoint 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPDMA6	0x449009D4	This register contains the DMA Address for the IN Endpoint 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS6	0x449009D8	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMAB6	0x449009DC	This register contains the DMA Buffer Address of the IN Endpoint 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPCTL7	0x449009E0	This register is used to control the characteristics of Endpoint 7. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPINT7	0x449009E8	This register contains the interrupts for the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPTSIZ7	0x449009F0	This register reflects the Transfer Size of the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMA7	0x449009F4	This register contains the DMA Address for the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS7	0x449009F8	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMAB7	0x449009FC	This register contains the DMA Buffer Address of the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPCTL8	0x44900A00	This register is used to control the characteristics of Endpoint 8. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPINT8	0x44900A08	This register contains the interrupts for the IN Endpoint 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_DIEPTSIZ8	0x44900A10	This register reflects the Transfer Size of the IN Endpoint 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMA8	0x44900A14	This register contains the DMA Address for the IN Endpoint 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DTXFSTS8	0x44900A18	This register reflects the status of the IN Endpoint Transmit FIFO Status Register 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DIEPDMAB8	0x44900A1C	This register contains the DMA Buffer Address of the IN Endpoint 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.
USBHS_DWC_otg_intreg_DOEPCTL0	0x44900B00	This register is used to control the characteristics of the OUT Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT0	0x44900B08	This register contains the interrupts for the OUT Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ0	0x44900B10	This register contains the Transfer Size for the OUT Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA0	0x44900B14	This register contains the DMA Address for the OUT Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB0	0x44900B1C	This register contains the DMA Buffer Address for the OUT Endpoint 0 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL1	0x44900B20	This register is used to control the characteristics of OUT Endpoint 1 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT1	0x44900B28	This register contains the interrupts for the OUT Endpoint 1 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ1	0x44900B30	This register contains the Transfer Size for the OUT Endpoint 1 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA1	0x44900B34	This register contains the DMA Address for the OUT Endpoint 1 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB1	0x44900B3C	This register contains the DMA Buffer Address for the OUT Endpoint 1 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL2	0x44900B40	This register is used to control the characteristics of OUT Endpoint 2 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT2	0x44900B48	This register contains the interrupts for the OUT Endpoint 2 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ2	0x44900B50	This register contains the Transfer Size for the OUT Endpoint 2 of the Device controller.

Register name	Address	Description
USBHS_DWC_otg_intreg_DOEPDMA2	0x44900B54	This register contains the DMA Address for the OUT Endpoint 2 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB2	0x44900B5C	This register contains the DMA Buffer Address for the OUT Endpoint 2 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL3	0x44900B60	This register is used to control the characteristics of OUT Endpoint 3 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT3	0x44900B68	This register contains the interrupts for the OUT Endpoint 3 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ3	0x44900B70	This register contains the Transfer Size for the OUT Endpoint 3 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA3	0x44900B74	This register contains the DMA Address for the OUT Endpoint 3 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB3	0x44900B7C	This register contains the DMA Buffer Address for the OUT Endpoint 3 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL4	0x44900B80	This register is used to control the characteristics of OUT Endpoint 4 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT4	0x44900B88	This register contains the interrupts for the OUT Endpoint 4 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ4	0x44900B90	This register contains the Transfer Size for the OUT Endpoint 4 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA4	0x44900B94	This register contains the DMA Address for the OUT Endpoint 4 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB4	0x44900B9C	This register contains the DMA Buffer Address for the OUT Endpoint 4 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL5	0x44900BA0	This register is used to control the characteristics of OUT Endpoint 5 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT5	0x44900BA8	This register contains the interrupts for the OUT Endpoint 5 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ5	0x44900BB0	This register contains the Transfer Size for the OUT Endpoint 5 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA5	0x44900BB4	This register contains the DMA Address for the OUT Endpoint 5 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB5	0x44900BBC	This register contains the DMA Buffer Address for the OUT Endpoint 5 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL6	0x44900BC0	This register is used to control the characteristics of OUT Endpoint 6 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT6	0x44900BC8	This register contains the interrupts for the OUT Endpoint 6 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ6	0x44900BD0	This register contains the Transfer Size for the OUT Endpoint 6 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA6	0x44900BD4	This register contains the DMA Address for the OUT Endpoint 6 of the Device controller.

Universal Serial Bus High-Speed registers

Register name	Address	Description
USBHS_DWC_otg_intreg_DOEPDMAB6	0x44900BDC	This register contains the DMA Buffer Address for the OUT Endpoint 6 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL7	0x44900BE0	This register is used to control the characteristics of OUT Endpoint 7 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT7	0x44900BE8	This register contains the interrupts for the OUT Endpoint 7 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ7	0x44900BF0	This register contains the Transfer Size for the OUT Endpoint 7 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA7	0x44900BF4	This register contains the DMA Address for the OUT Endpoint 7 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB7	0x44900BFC	This register contains the DMA Buffer Address for the OUT Endpoint 7 of the Device controller.
USBHS_DWC_otg_intreg_DOEPCTL8	0x44900C00	This register is used to control the characteristics of OUT Endpoint 8 of the Device controller.
USBHS_DWC_otg_intreg_DOEPINT8	0x44900C08	This register contains the interrupts for the OUT Endpoint 8 of the Device controller.
USBHS_DWC_otg_intreg_DOEPTSIZ8	0x44900C10	This register contains the Transfer Size for the OUT Endpoint 8 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMA8	0x44900C14	This register contains the DMA Address for the OUT Endpoint 8 of the Device controller.
USBHS_DWC_otg_intreg_DOEPDMAB8	0x44900C1C	This register contains the DMA Buffer Address for the OUT Endpoint 8 of the Device controller.
USBHS_DWC_otg_intreg_PCGCCTL	0x44900E00	This register is used to control the Power and Clock Gating characteristics of the controller.
USBHS_DWC_otg_intreg_PCGCCTL1	0x44900E04	This register is used to control the Power and Clock Gating characteristics of the controller.
USBHS_SS_SUBSYSTEM_CTL	0x44940000	Subsystem level control register
USBHS_SS_PHY_FUNC_CTL_1	0x44940004	Subsystem level- PHY functional mode control register 1
USBHS_SS_PHY_FUNC_CTL_2	0x44940008	Subsystem level- PHY functional mode control register 2
USBHS_SS_PHY_TEST_CTL	0x4494000C	Subsystem level- PHY test mode control register
USBHS_SS_CONTROLLER_DDFT_CTL	0x44940010	Subsystem level- Controller DDFT control register
USBHS_SS_INTR_SS	0x44940014	Subsystem level- Interrupt register
USBHS_SS_INTR_SS_SET	0x44940018	Subsystem level- Interrupt set register
USBHS_SS_INTR_SS_MASK	0x4494001C	Subsystem level- Interrupt mask register
USBHS_SS_INTR_SS_MASKED	0x44940020	Subsystem level- Interrupt masked register

24.1.1 USBHS_DWC_otg_intreg_GOTGCTL

Description: The OTG Control and Status register controls the behavior and reflects the status of the OTG function of the controller.

Address: 0x44900000

Retention: Not Retained

SW Access	RW	Reserved						
HW Access		Reserved						
Name	Testmod-e_cor-r_eUSB2	Reserved [30:24]						

Bits	Name	Description
31	Testmode_corr_eUSB2	UTMI IF correction for eUSB2 PHY during Test mode This bit is used to modify the behavior of UTMI 8-bit interface signals during test J and test K sequences when eUSB2 PHY is used. When this bit is set to 1'b1, the controller asserts utmi_txvalid and utmi_opmode in the same cycle during test J or test K sequence execution. Note: This bit is applicable only if eUSB2 PHY is used with 8-bit UTMI interface. Default Value: 0x0 **0x0: eUSB2_corr_disable :** The controller asserts utmi_txvalid one cycle later than utmi_opmode. **0x1: eUSB2_corr_enable :** The controller asserts utmi_txvalid and utmi_opmode in the same cycle.

24.1.1 USBHS_DWC_otg_intreg_GOTGCTL (continued)

21	CurMod	Current Mode of Operation (CurMod) Mode: Host and Device Indicates the current mode. - 1'b0: Device mode - 1'b1: Host mode Reset: - 1'b1 in Host-only mode (OTG_MODE=5 or 6) - 1'b0 in all other configurations Note: The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later. Default Value: 0x0 **0x0: DEVICEMODE :** Current mode is device mode. **0x1: HOSTMODE :** Current mode is host mode.
20	OTGVer	OTG Version (OTGVer) Indicates the OTG revision. - 1'b0: OTG Version 1.3. In this version the core supports Data line pulsing and VBus pulsing for SRP. - 1'b1: OTG Version 2.0. In this version the core supports only Data line pulsing for SRP. Default Value: 0x0 **0x0: VER13 :** Supports OTG Version 1.3 **0x1: VER20 :** Supports OTG Version 2.0
19	BSesVld	Mode: Device only B-Session Valid (BSesVld) Indicates the Device mode transceiver status. - 1'b0: B-session is not valid. - 1'b1: B-session is valid. In OTG mode, you can use this bit to determine if the device is connected or disconnected. Note: - If you do not enable OTG features (such as SRP and HNP), the read reset value will be 1.The vbus assigns the values internally for non- SRP or non-HNP configurations. - In case of OTG_MODE=0, the reset value of this bit is 1'b0. - The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_-FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later. Default Value: 0x1 **0x0: NOTVALID :** B-session is not valid. **0x1: VALID :** B-session is valid.

24.1.1 USBHS_DWC_otg_intreg_GOTGCTL (continued)

18	ASesVld	Mode: Host only A-Session Valid (ASesVld) Indicates the Host mode transceiver status. - 1'b0: A-session is not valid - 1'b1: A-session is valid Note: If you do not enabled OTG features (such as SRP and HNP), the read reset value will be 1. The vbus assigns the values internally for non-SRP or non-HNP configurations. In case of OTG_MODE=0, the reset value of this bit is 1'b0. Default Value: 0x1 **0x0: NOTVALID :** A-session is not valid. **0x1: VALID :** A-session is valid.
17	DbncTime	Mode: Host only Long/Short Debounce Time (DbncTime) Indicates the debounce time of a detected connection. - 1'b0: Long debounce time, used for physical connections (100 ms + 2.5 micro-sec) - 1'b1: Short debounce time, used for soft connections (2.5 micro-sec) Default Value: 0x0 **0x0: LONG :** Long debounce time, used for physical connections (100 ms + 2.5 micro-sec) **0x1: SHORT :** Short debounce time, used for soft connections (2.5 micro-sec)
16	ConIDSts	Mode: Host and Device Connector ID Status (ConIDSts) Indicates the connector ID status on a connect event. - 1'b0: The core is in A-Device mode. - 1'b1: The core is in B-Device mode. Note: The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_-FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later. Reset: - 1'b0: in host only mode (OTG_MODE = 5 or 6) - 1'b1: in all other configurations Default Value: 0x1 **0x0: MODEA :** The core is in A-Device mode. **0x1: MODEB :** The core is in B-Device mode.
15	DbnceFltrBypass	Mode: Host and Device Debounce Filter Bypass Bypass Debounce filters for avalid, bvalid, vbusvalid, sessend, iddig signals when enabled. - 1'b0: Disabled - 1'b1: Enabled Note: This register bit is valid only when debounce filters are present in core. Default Value: 0x0

24.1.1 USBHS_DWC_otg_intreg_GOTGCTL (continued)

		0x0: DISABLED : Debounce Filter Bypass is disabled. **0x1: ENABLED :** Debounce Filter Bypass is enabled.
7	BvalidOvVal	Mode: Device only B-Peripheral Session Valid OverrideValue (BvalidOvVal) This bit is used to set Override value for Bvalid signal when GOTGCTL.BvalidOvEn is set. - 1'b0 : Bvalid value is 1'b0 when GOTGCTL.BvalidOvEn =1 - 1'b1 : Bvalid value is 1'b1 when GOTGCTL.BvalidOvEn =1 Default Value: 0x0 **0x0: VALUE0 :** Bvalid value when GOTGCTL.BvalidOvEn =1 **0x1: VALUE1 :** Bvalid value when GOTGCTL.BvalidOvEn =1
6	BvalidOvEn	Mode: Device only B-Peripheral Session Valid Override Value (BvalidOvEn) This bit is used to enable/disable the software to override the Bvalid signal using the GOTGCTL.BvalidOvVal. - 1'b1 : Internally Bvalid received from the PHY is overridden with GOTGCTL.BvalidOvVal. - 1'b0 : Override is disabled and bvalid signal from the respective PHY selected is used internally by the force Default Value: 0x0 **0x0: DISABLED :** Override is disabled and bvalid signal from the respective PHY selected is used internally by the core **0x1: ENABLED :** Internally Bvalid received from the PHY is overridden with GOTGCTL.BvalidOvVal
5	AvalidOvVal	Mode: Host only A-Peripheral Session Valid OverrideValue (AvalidOvVal) This bit is used to set Override value for Avalid signal when GOTGCTL.AvalidOvEn is set. - 1'b0 : Avalid value is 1'b0 when GOTGCTL.AvalidOvEn =1 - 1'b1 : Avalid value is 1'b1 when GOTGCTL.AvalidOvEn =1 Default Value: 0x0 **0x0: VALUE0 :** Avalid value is 1'b0 when GOTGCTL.AvalidOvEn =1 **0x1: VALUE1 :** Avalid value is 1'b1 when GOTGCTL.AvalidOvEn =1

24.1.1 USBHS_DWC_otg_intreg_GOTGCTL (continued)

4	AvalidOvEn	Mode: Host only A-Peripheral Session Valid Override Enable (AvalidOvEn) This bit is used to enable/disable the software to override the Avalid signal using the GOTGCTL.AvalidOvVal. - 1'b1: Internally Avalid received from the PHY is overridden with GOTGCTL.AvalidOvVal. - 1'b0: Override is disabled and avalid signal from the respective PHY selected is used internally by the core Default Value: 0x0 **0x0: DISABLED :** Derive AValid from PHY **0x1: ENABLED :** Derive Avalid from GOTGCTL.AvalidOvVal
3	VbvalidOvVal	Mode: Host only VBUS Valid OverrideValue (VbvalidOvVal) This bit is used to set Override value for vbusvalid signal when GOTGCTL.VbvalidOvEn is set. - 1'b0 : vbusvalid value is 1'b0 when GOTGCTL.VbvalidOvEn =1 - 1'b1 : vbusvalid value is 1'b1 when GOTGCTL.VbvalidOvEn =1 Default Value: 0x0 **0x0: SET0 :** vbusvalid value when GOTGCTL.VbvalidOvEn = 1 **0x1: SET1 :** vbusvalid value when GOTGCTL.VbvalidOvEn is 1
2	VbvalidOvEn	Mode: Host only VBUS Valid Override Enable (VbvalidOvEn) This bit is used to enable/disable the software to override the Bvalid signal using the GOTGCTL.VbvalidOvVal. - 1'b1 : Internally Bvalid received from the PHY is overridden with GOTGCTL.VbvalidOvVal. - 1'b0 : Override is disabled and bvalid signal from the respective PHY selected is used internally by the controller. Default Value: 0x0 **0x0: DISABLED :** Override is disabled and bvalid signal from the respective PHY selected is used internally by the controller **0x1: ENABLED :** The vbus-valid signal received from the PHY is overridden with GOTGCTL.VbvalidOvVal

24.1.2 USBHS_DWC_otg_intreg_GOTGINT

Description: The application reads this register whenever there is an OTG interrupt and clears the bits in this register to clear the OTG interrupt.

Address: 0x44900004

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19	DbnceDone	Mode: Host only Debounce Done (DbnceDone) The core sets this bit when the debounce is completed after the device connect. The application can start driving USB reset after seeing this interrupt. This bit is only valid when the HNP Capable or SRP Capable bit is SET in the Core USB Configuration register (GUSBCFG.HNPCap or GUSBCFG.SRPCap, respectively). This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Debounce completed **0x0: INACTIVE :** After Connect waiting for Debounce to complete
18	ADevTOUTChg	Mode: Host and Device A-Device Timeout Change (ADevTOUTChg) The core sets this bit to indicate that the A-device has timed out while waiting for the B-device to connect.This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0

24.1.2 USBHS_DWC_otg_intreg_GOTGINT (continued)

		0x1: ACTIVE : A-Device Timeout **0x0: INACTIVE :** No A-Device Timeout
17	HstNegDet	Mode:Host and Device Host Negotiation Detected (HstNegDet) The core sets this bit when it detects a host negotiation request on the USB. This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Active HNP request detected **0x0: INACTIVE :** No Active HNP Request
9	HstNegSucStsChng	Mode: Host and Device Host Negotiation Success Status Change (HstNegSucStsChng) The core sets this bit on the success or failure of a USB host negotiation request. The application must read the Host Negotiation Success bit of the OTG Control and Status register (GOTGCTL.HstNegScs) to check for success or failure. This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Host Negotiation Status Change **0x0: INACTIVE :** No Change
8	SesReqSucStsChng	Mode: Host and Device Session Request Success Status Change (SesReqSucStsChng) The core sets this bit on the success or failure of a session request. The application must read the Session Request Success bit in the OTG Control and Status register (GOTGCTL.SesReqScs) to check for success or failure. This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Session Request Status has changed **0x0: INACTIVE :** No Change in Session Request Status
2	SesEndDet	Mode: Host and Device Session End Detected (SesEndDet) The controller sets this bit when the utmiotg_bvalid signal is deasserted. This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0

24.1.2 USBHS_DWC_otg_intreg_GOTGINT (continued)

0x1: ACTIVE :

SessionEnd utmiotg_bvalid signal is deasserted

0x0: INACTIVE :

Session is Active

24.1.3 USBHS_DWC_otg_intreg_GAHBCFG

Description: This register can be used to configure the core after power-on or a change in mode. This register mainly contains AHB system-related configuration parameters. Do not change this register after the initial programming. The application must program this register before starting any transactions on either the AHB or the USB.

Address: 0x44900008

Bits	Name	Description
24	InvDescEndianess	Mode: Host and Device Invert Descriptor Endianess (InvDescEndianess) - 1'b0: Descriptor Endianness is same as AHB Master Endianness. - 1'b1: -- If the AHB Master endianness is Big Endian, the Descriptor Endianness is Little Endian. -- If the AHB Master endianness is Little Endian, the Descriptor Endianness is Big Endian. Default Value: 0x0 **0x0: DISABLE :** Descriptor Endianness is same as AHB Master Endianness **0x1: ENABLE :** Descriptor Endianness is opposite to AHB Master Endianness

24.1.3 USBHS_DWC_otg_intreg_GAHBCFG (continued)

23	AHBSingle	Mode: Host and Device AHB Single Support (AHBSingle) This bit when programmed supports Single transfers for the remaining data in a transfer when the core is operating in DMA mode. - 1'b0: The remaining data in the transfer is sent using INCR burst size. - 1'b1: The remaining data in the transfer is sent using Single burst size. Note: If this feature is enabled, the AHB RETRY and SPLIT transfers still have INCR burst type. Enable this feature when the AHB Slave connected to the core does not support INCR burst (and when Split, and Retry transactions are not being used in the bus). Default Value: 0x0 **0x0: INCRBURST :** The remaining data in the transfer is sent using INCR burst size **0x1: SINGLEBURST :** The remaining data in the transfer is sent using Single burst size
22	NotiAllDmaWrit	Mode: Host and Device Notify All DMA Write Transactions (NotiAllDmaWrit) This bit is programmed to enable the System DMA Done functionality for all the DMA write Transactions corresponding to the Channel/Endpoint. This bit is valid only when GAHBCFG.RemMemSupp is set to 1. - GAHBCFG.NotiAllDmaWrit = 1 The core asserts int_dma_req for all the DMA write transactions on the AHB interface along with int_dma_done, chep_last_transact and chep_number signal informations. The core waits for sys_dma_done signal for all the DMA write transactions in order to complete the transfer of a particular Channel/Endpoint. - GAHBCFG.NotiAllDmaWrit = 0 The core asserts int_dma_req signal only for the last transaction of DMA write transfer corresponding to a particular Channel/Endpoint. Similarly, the core waits for sys_dma_done signal only for that transaction of DMA write to complete the transfer of a particular Channel/Endpoint. Default Value: 0x0 **0x1: ALLTRANS :** The core asserts int_dma_req for all the DMA write transactions on the AHB interface along with int_dma_done, chep_last_transact and chep_number signal informations. The core waits for sys_dma_done signal for all the DMA write transactions in order to complete the transfer of a particular Channel/Endpoint **0x0: LASTTRANS :**
21	RemMemSupp	Mode: Host and Device Remote Memory Support (RemMemSupp) This bit is programmed to enable the functionality to wait for the system DMA Done Signal for the DMA Write Transfers. - GAHBCFG.RemMemSupp=1 The int_dma_req output signal is asserted when the DMA starts write transfer to the external memory. When the core is done with the Transfers it asserts int_dma_done signal to flag the completion of DMA writes from the controller. The core then waits for sys_dma_done signal from the system to proceed further and complete the Data Transfer corresponding to a particular Channel/Endpoint. - GAHBCFG.RemMemSupp=0 The int_dma_req and int_dma_done signals are not asserted and the core proceeds with the assertion of the XferComp interrupt as soon as the DMA write transfer is done at the Core Boundary and it does not wait for the sys_dma_done signal to complete the DATA transfers. Default Value: 0x0 **0x0: DISABLED :** Remote Memory Support Feature disabled

24.1.3 USBHS_DWC_otg_intreg_GAHBCFG (continued)

		0x1: ENABLED : Remote Memory Support Feature enabled
8	PTxFEmpLvl	Mode: Host only Periodic TxFIFO Empty Level (PTxFEmpLvl) Indicates when the Periodic TxFIFO Empty Interrupt bit in the Core Interrupt register (GINTSTS.PTxFEmp) is triggered. This bit is used only in Slave mode. - 1'b0: GINTSTS.PTxFEmp interrupt indicates that the Periodic TxFIFO is half empty - 1'b1: GINTSTS.PTxFEmp interrupt indicates that the Periodic TxFIFO is completely empty Default Value: 0x0 **0x1: EMPTY :** GINTSTS.PTxFEmp interrupt indicates that the Periodic TxFIFO is completely empty. **0x0: HALFEMPTY :** GINTSTS.PTxFEmp interrupt indicates that the Periodic TxFIFO is half empty.
7	NPTxFEmpLvl	Mode: Host and device Non-Periodic TxFIFO Empty Level (NPTxFEmpLvl) This bit is used only in Slave mode. In host mode and with Shared FIFO with device mode, this bit indicates when the Non-Periodic TxFIFO Empty Interrupt bit in the Core Interrupt register (GINTSTS.NPTxFEmp) is triggered. With dedicated FIFO in device mode, this bit indicates when IN endpoint Transmit FIFO empty interrupt (DIEPINTn.TxFEmp) is triggered. Host mode and with Shared FIFO with device mode: - 1'b0: GINTSTS.NPTxFEmp interrupt indicates that the Non-Periodic TxFIFO is half empty - 1'b1: GINTSTS.NPTxFEmp interrupt indicates that the Non-Periodic TxFIFO is completely empty Dedicated FIFO in device mode: - 1'b0: DIEPINTn.TxFEmp interrupt indicates that the IN Endpoint TxFIFO is half empty - 1'b1: DIEPINTn.TxFEmp interrupt indicates that the IN Endpoint TxFIFO is completely empty Default Value: 0x0 **0x1: EMPTY :** GINTSTS.NPTxFEmp interrupt indicates that the Non-Periodic TxFIFO is completely empty or that the IN Endpoint TxFIFO is completely empty. **0x0: HALFEMPTY :** DIEPINTn.TxFEmp interrupt indicates that the Non-Periodic TxFIFO is half empty or that the IN Endpoint TxFIFO is half empty.
5	DMAEn	Mode: Host and device DMA Enable (DMAEn) This bit is always 0 when Slave-Only mode has been selected. Reset: 1'b0 Default Value: 0x0 **0x1: DMAMODE :** Core operates in a DMA mode **0x0: SLAVEMODE :** Core operates in Slave mode

24.1.3 USBHS_DWC_otg_intreg_GAHBCFG (continued)

4 : 1	HBstLen	Mode: Host and device Burst Length/Type (HBstLen) This field is used in both External and Internal DMA modes. In External DMA mode, these bits appear on dma_burst[3:0] ports, which can be used by an external wrapper to interface the External DMA Controller interface to Synopsys DW_ahb_dmac or ARM PrimeCell. External DMA Mode defines the DMA burst length in terms of 32-bit words: - 4'b0000: 1 word - 4'b0001: 4 words - 4'b0010: 8 words - 4'b0011: 16 words - 4'b0100: 32 words - 4'b0101: 64 words - 4'b0110: 128 words - 4'b0111: 256 words - Others: Reserved Internal DMA Mode AHB Master burst type: - 4'b0000 Single - 4'b0001 INCR - 4'b0011 INCR4 - 4'b0101 INCR8 - 4'b0111 INCR16 - Others: Reserved Default Value: 0x0 **0x6: WORD128 :** 128 words **0x3: WORD16ORINCR4 :** 16 words or INCR4 **0x0: WORD1ORSINGLE :** 1 word or single **0x7: WORD256ORINCR16 :** 256 words or INCR16 **0x4: WORD32 :** 32 words **0x1: WORD4ORINCR :** 4 words or INCR **0x5: WORD64ORINCR8 :** 64 words or INCR8 **0x2: WORD8 :** 8 words **0x8: WORDX :** Others reserved

24.1.3 USBHS_DWC_otg_intreg_GAHBCFG (continued)

0	GlblIntrMsk	Mode: Host and device Global Interrupt Mask (GlblIntrMsk) The application uses this bit to mask or unmask the interrupt line assertion to itself. Irrespective of this bit's setting, the interrupt status registers are updated by the controller. Default Value: 0x0 **0x0: MASK :** Mask the interrupt assertion to the application **0x1: NOMASK :** Unmask the interrupt assertion to the application.

24.1.4 USBHS_DWC_otg_intreg_GUSBCFG

Description: This register can be used to configure the core after power-on or when changing to Host mode or Device mode. It contains USB and USB-PHY related configuration parameters. The application must program this register before starting any transactions on either the AHB or the USB. If you are using the HSIC interface, HSIC PHY must be in reset while programming this register. Do not make changes to this register after the initial programming.

Address: 0x4490000C

Retention: Not Retained

Bits	Name	Description
31	CorruptTxPkt	Mode: Host and device Corrupt Tx packet (CorruptTxPkt) This bit is for debug purposes only. Never Set this bit to 1. The application should always write 1'b0 to this bit. Default Value: 0x0 **0x1: DEBUG :** Debug Mode **0x0: NODEBUG :** Normal Mode

24.1.4 USBHS_DWC_otg_intreg_GUSBCFG (continued)

30	ForceDevMode	Mode:Host and device Force Device Mode (ForceDevMode) Writing a 1 to this bit forces the controller to device mode irrespective of utmiotg_iddig input pin. - 1'b0 : Normal Mode. - 1'b1 : Force Device Mode. After setting the force bit, the application must wait at least 25 ms before the change to take effect. When the simulation is in scale down mode, waiting for 500 micro sec is sufficient. This bit is valid only when OTG_MODE = 0, 1 or 2. In all other cases, this bit reads 0. Default Value: 0x0 **0x0: DISABLED :** Normal Mode **0x1: ENABLED :** Force Device Mode
29	ForceHstMode	Mode: Host and device Force Host Mode (ForceHstMode) Writing a 1 to this bit forces the core to host mode irrespective of utmiotg_iddig input pin. - 1'b0 : Normal Mode. - 1'b1 : Force Host Mode. After setting the force bit, the application must wait at least 25 ms before the change to take effect. When the simulation is in scale down mode, waiting for 500 micro sec is sufficient. This bit is valid only when OTG_MODE = 0, 1 or 2. In all other cases, this bit reads 0. Default Value: 0x0 **0x0: DISABLED :** Normal Mode **0x1: ENABLED :** Force Host Mode
28	TxEndDelay	Mode: Device only Tx End Delay (TxEndDelay) Writing 1'b1 to this bit enables the controller to follow the TxEndDelay timings as per UTMI+ specification 1.05 section 4.1.5 for opmode signal during remote wakeup. - 1'b0 : Normal Mode. - 1'b1 : Tx End delay. Default Value: 0x0 **0x0: DISABLED :** Normal Mode **0x1: ENABLED :** Tx End delay
26	IC_USBCap	Mode: Host and Device IC_USB-Capable (IC_USBCap) The application uses this bit to control the core's IC_USB capabilities. - 1'b0: IC_USB PHY Interface is not selected. - 1'b1: IC_USB PHY Interface is selected. This bit is writable only if OTG_ENABLE_IC_USB=1 and OTG_FSPHY_INTERFACE!=0. The reset value depends on the configuration parameter OTG_SELECT_IC_USB when OTG_ENABLE_IC_USB = 1. In all other cases, this bit is set to 1'b0 and the bit is read only. Default Value: 0x0

24.1.4 USBHS_DWC_otg_intreg_GUSBCFG (continued)

		0x0: NOTSELECTED : IC_USB PHY Interface is not selected **0x1: SELECTED :** IC_USB PHY Interface is selected
22	TermSelDLPulse	Mode: Device only TermSel DLine Pulsing Selection (TermSelDLPulse) This bit selects utmi_termselect to drive data line pulse during SRP. - 1'b0: Data line pulsing using utmi_txvalid (Default). - 1'b1: Data line pulsing using utmi_termsel. Default Value: 0x0 **0x1: TERMSEL :** Data line pulsing using utmi_termsel **0x0: TXVALID :** Data line pulsing using utmi_txvalid
15	PhyLPwrClkSel	PHY Low-Power Clock Select (PhyLPwrClkSel) Mode: Host and Device Selects either 480-MHz or 48-MHz (low-power) PHY mode. In FS and LS modes, the PHY can usually operate on a 48-MHz clock to save power. - 1'b0: 480-MHz Internal PLL clock - 1'b1: 48-MHz External Clock In 480 MHz mode, the UTMI interface operates at either 60 or 30-MHz, depending upon whether 8- or 16-bit data width is selected. In 48-MHz mode, the UTMI interface operates at 48 MHz in FS mode and at either 48 or 6 MHz in LS mode (depending on the PHY vendor). This bit drives the utmi_fsls_low_power core output signal, and is valid only for UTMI+ PHYs. Default Value: 0x0 **0x1: EXTCLK :** 48-MHz External Clock **0x0: INTPLLCLK :** 480-MHz Internal PLL clock
13 : 10	USBTrdTim	Mode: Device only USB Turnaround Time (USBTrdTim) Sets the turnaround time in PHY clocks. Specifies the response time for a MAC request to the Packet FIFO Controller (PFC) to fetch data from the DFIFO (SPRAM). This must be programmed to - 4'h5 : When the MAC interface is 16-bit UTMI+ - 4'h9 : When the MAC interface is 8-bit UTMI+ Note:Programing Guide Section "Choosing the Value of GUSBCFG.USBTrdTim" consider mis-sampling into account whereas above values are without mis-sampling. During the AHB Clock Frequency selection, it is recommended to consider mis-sampling into account for USBTrdTim. Note: The previous values are calculated for the minimum AHB frequency of 30 MHz. USB turn-around time is critical for certification where long cables and 5-Hubs are used. If you need the AHB to run at less than 30 MHz, and if USB turnaround time is not critical, these bits can be programmed to a larger value. Default Value: 0x5

24.1.4 USBHS_DWC_otg_intreg_GUSBCFG (continued)

0x5: TURNTIME16BIT :

MAC interface is 16-bit UTMI+.

0x9: TURNTIME8BIT :

MAC interface is 8-bit UTMI+.

6	PHYSel	PHYSel Mode: Host and Device USB 2.0 High-Speed PHY or USB 1.1 Full-Speed Serial Transceiver Select (PHYSel) The application uses this bit to select either a high-speed UTMI+ or ULPI PHY, or a full-speed transceiver. - 1'b0: USB 2.0 high-speed UTMI+ or ULPI PHY - 1'b1: USB 1.1 full-speed serial transceiver If a USB 1.1 Full-Speed Serial Transceiver interface was not selected in, this bit is always 0, with Write Only access. If a high-speed PHY interface was not selected in, this bit is always 1, with Write Only access. If both interface types were selected (parameters have non-zero values), the application uses this bit to select which interface is active, and access is Read and Write. Default Value: 0x0 **0x1: USB11 :** USB 1.1 full-speed serial transceiver is selected **0x0: USB20 :** USB 2.0 high-speed UTMI+ or ULPI PHY is selected
5	FSIntf	Mode: Host and Device Full-Speed Serial Interface Select (FSIntf) The application uses this bit to select either a unidirectional or bidirectional USB 1.1 full-speed serial transceiver interface. - 1'b0: 6-pin unidirectional full-speed serial interface - 1'b1: 3-pin bidirectional full-speed serial interface If a USB 1.1 Full-Speed Serial Transceiver interface was not selected, this bit is always 0, with Write Only access. If a USB 1.1 FS interface was selected, Then the application can Set this bit to select between the 3- and 6-pin interfaces, and access is Read and Write. Note: For supporting the new 4-pin bi-directional interface, you need to select 6-pin unidirectional FS serial mode, and add an external control to convert it to a 4-pin interface. Default Value: 0x0 **0x1: FS3PIN :** 3-pin bidirectional full-speed serial interface **0x0: FS6PIN :** 6-pin unidirectional full-speed serial interface
4	ULPI_UTMI_Sel	Mode: Host and Device ULPI or UTMI+ Select (ULPI_UTMI_Sel) The application uses this bit to select either a UTMI+ interface or ULPI Interface. - 1'b0: UTMI+ Interface - 1'b1: ULPI Interface Default Value: 0x0 **0x1: ULPI :** ULPI Interface

24.1.4 USBHS_DWC_otg_intreg_GUSBCFG (continued)

		0x0: UTMI : UTMI+ Interface
3	PHYIf	Mode: Host and Device PHY Interface (PHYIf) The application uses this bit to configure the core to support a UTMI+ PHY with an 8- or 16-bit interface. When a ULPI PHY is chosen, this must be Set to 8-bit mode. - 1'b0: 8 bits - 1'b1: 16 bits This bit is writable only If UTMI+ and ULPI were selected. Otherwise, this bit returns the value for the power-on interface selected during configuration. Default Value: 0x0 **0x1: BITS16 :** PHY 16bit Mode **0x0: BITS8 :** PHY 8bit Mode
2 : 0	TOutCal	Mode: Host and Device HS/FS Timeout Calibration (TOutCal) The number of PHY clocks that the application programs in this field is added to the high-speed/full-speed interpacket timeout duration in the core to account for any additional delays introduced by the PHY. This can be required, because the delay introduced by the PHY in generating the linestate condition can vary from one PHY to another. The USB standard timeout value for high-speed operation is 736 to 816 (inclusive) bit times. The USB standard timeout value for full-speed operation is 16 to 18 (inclusive) bit times. The application must program this field based on the speed of enumeration. The number of bit times added per PHY clock are as follows: High-speed operation: - One 30-MHz PHY clock = 16 bit times - One 60-MHz PHY clock = 8 bit times Full-speed operation: - One 30-MHz PHY clock = 0.4 bit times - One 60-MHz PHY clock = 0.2 bit times - One 48-MHz PHY clock = 0.25 bit times Default Value: 0x0 **0x5: FIVE :** Add 5 PHY clocks **0x4: FOUR :** Add 4 PHY clocks **0x1: ONE :** Add 1 PHY clocks **0x7: SEVEN :** Add 7 PHY clocks **0x6: SIX :** Add 6 PHY clocks

24.1.4 USBHS_DWC_otg_intreg_GUSBCFG (continued)

0x3: THREE :

Add 3 PHY clocks

0x2: TWO :

Add 2 PHY clocks

0x0: ZERO :

Add 0 PHY clocks

24.1.5 USBHS_DWC_otg_intreg_GRSTCTL

Description: The application uses this register to reset various hardware features inside the controller.

Address: 0x44900010

Retention: Not Retained

0x8: TXF8 :

:DWC_DESIGN_ID==0>-Periodic TxFIFO 8 flush in device mode when in shared FIFO operation -TXFIFO 8 flush in device mode when in dedicated FIFO mode

24.1.5 USBHS_DWC_otg_intreg_GRSTCTL (continued)

		0x9: TXF9 : -Periodic TxFIFO 9 flush in device mode when in shared FIFO operation -TXFIFO 9 flush in device mode when in dedicated FIFO mode
5	TxFFlsh	Mode: Host and Device TxFIFO Flush (TxFFlsh) This bit selectively flushes a single or all transmit FIFOs, but cannot do so If the core is in the midst of a transaction. The application must write this bit only after checking that the core is neither writing to the TxFIFO nor reading from the TxFIFO. Verify using these registers: - ReadNAK Effective Interrupt ensures the core is not reading from the FIFO - WriteGRSTCTL.AHBIdle ensures the core is not writing anything to the FIFO. Flushing is normally recommended when FIFOs are reconfigured or when switching between Shared FIFO and Dedicated Transmit FIFO operation. FIFO flushing is also recommended during device endpoint disable. The application must wait until the core clears this bit before performing any operations. This bit takes eight clocks to clear, using the slower clock of phy_clk or hclk. Default Value: 0x0 **0x1: ACTIVE :** Selectively flushes a single or all transmit FIFOs **0x0: INACTIVE :** No Flush
4	RxFFlsh	Mode: Host and Device RxFIFO Flush (RxFFlsh) The application can flush the entire RxFIFO using this bit, but must first ensure that the core is not in the middle of a transaction. The application must only write to this bit after checking that the controller is neither reading from the RxFIFO nor writing to the RxFIFO. The application must wait until the bit is cleared before performing any other operations. This bit requires eight clocks (slowest of PHY or AHB clock) to clear. Default Value: 0x0 **0x1: ACTIVE :** Flushes the entire RxFIFO **0x0: INACTIVE :** Does not flush the entire RxFIFO
2	FrmCntrRst	Mode: Host only Host Frame Counter Reset (FrmCntrRst) The application writes this bit to reset the (micro)Frame number counter inside the core. When the (micro)Frame counter is reset, the subsequent SOF sent out by the core has a (micro)Frame number of 0. When application writes 1 to the bit, it might not be able to read back the value as it will get cleared by the core in a few clock cycles. Default Value: 0x0 **0x1: ACTIVE :** Host Frame Counter Reset

24.1.5 USBHS_DWC_otg_intreg_GRSTCTL (continued)

		0x0: NOTACTIVE : No reset
1	PIUFSSftRst	Mode: Host and Device PIU FS Dedicated Controller Soft Reset (PIUFSSftRst) Resets the PIU FS Dedicated Controller All module state machines in FS Dedicated Controller of PIU are reset to the IDLE state. Used to reset the FS Dedicated controller in PIU in case of any PHY Errors like Loss of activity or Babble Error resulting in the PHY remaining in RX state for more than one frame boundary. This is a self clearing bit and core clears this bit after all the necessary logic is reset in the core. Default Value: 0x0 **0x1: RESET_ACTIVE :** PIU FS Dedicated Controller Soft Reset **0x0: RESET_INACTIVE :** No Reset
0	CSftRst	Mode: Host and Device Core Soft Reset (CSftRst) Resets the hclk and phy_clock domains as follows: - Clears the interrupts and all the CSR registers except the following register bits: -- PCGCCTL.RstPdwnModule -- PCGCCTL.GateHclk -- PCGCCTL.PwrClmp -- PCGCCTL.StopPPhyLPwrClkSelclk -- GUSBCFG.ForceDevMode -- GUSBCFG.ForceHstMode -- GUSBCFG.PhyLPwrClkSel -- GUSBCFG.DDRSel -- GUSBCFG.PHYSel -- GUSBCFG.FSIntf -- GUSBCFG.ULPI_UTMI_Sel -- GUSBCFG.PHYIf -- GUSBCFG.TxEndDelay -- GUSBCFG.TermSelDLPulse -- GUSBCFG.ULPIClkSusM -- GUSBCFG.ULPIAutoRes -- GUSBCFG.ULPIFsLs -- GGPIO -- GPWRDN -- GADPCTL -- HCFG.FSLSPclkSel -- DCFG.DevSpd -- DCTL.SftDiscon - All module state machines - All module state machines (except the AHB Slave Unit) are reset to the IDLE state, and all the transmit FIFOs and the receive FIFO are flushed. - Any transactions on the AHB Master are terminated as soon as possible, after gracefully completing the last data phase of an AHB transfer. Any transactions on the USB are terminated immediately. - When Hibernation or ADP feature is enabled, the PMU module is not reset by the Core Soft Reset. The application can write to this bit any time it wants to reset the core. The application must clear this bit after checking the bit 29 of this regiser (Core Soft Reset Done). Software must also must check that bit 31 of this register is 1 (AHB Master is IDLE) before starting any operation. Typically software reset is used during software development and also when you dynamically change the PHY selection bits in the USB configuration registers listed above. When you change the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain has to be reset for proper operation. Default Value: 0x0

24.1.5 USBHS_DWC_otg_intreg_GRSTCTL (continued)

0x1: ACTIVE :

Resets hclk and phy_clock domains

0x0: NOTACTIVE :

No reset

24.1.6 USBHS_DWC_otg_intreg_GINTSTS

Description: This register interrupts the application for system-level events in the current mode (Device mode or Host mode). Some of the bits in this register are valid only in Host mode, while others are valid in Device mode only. This register also indicates the current mode. To clear the interrupt status bits of type R_SS_WC, the application must write 1'b1 to the bit. The FIFO status interrupts are read only; once software reads from or writes to the FIFO while servicing these interrupts, FIFO interrupt conditions are cleared automatically. The application must clear the GINTSTS register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization. Note: Read the reset value of GINTSTS.CurMod only after the following conditions: - If IDDIG_FILTER is disabled, read only after PHY clock is stable. - If IDDIG_FILTER is enabled, read only after the filter timer expires.

Address: 0x44900014

Bits	Name	Description
31	WkUpInt	Mode: Host and Device Resume/Remote Wakeup Detected Interrupt (WkUpInt) Wakeup Interrupt during Suspend(L2) or LPM(L1) state. - During Suspend(L2): -- Device Mode: This interrupt is asserted only when Host Initiated Resume is detected on USB. -- Host Mode: This interrupt is asserted only when Device Initiated Remote Wakeup is detected on USB. For more information, see 'Partial Power-Down and Clock Gating Programming Model' in the Programming Guide. - During LPM(L1): -- Device Mode: This interrupt is asserted for either Host Initiated Resume or Device Initiated Remote Wakeup on USB. -- Host Mode: This interrupt is asserted for either Host Initiated Resume or Device Initiated Remote Wakeup on USB. For more information, see 'LPM Entry and Exit Programming Model' in the Programming Guide. Default Value: 0x0

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

		0x1: ACTIVE : Resume or Remote Wakeup Detected Interrupt **0x0: INACTIVE :** Not active
30	SessReqInt	Mode: Host and Device Session Request/New Session Detected Interrupt (SessReqInt) In Host mode, this interrupt is asserted when a session request is detected from the device. In Host mode, this interrupt is asserted when a session request is detected from the device. In Device mode, this interrupt is asserted when the utmisrp_bvalid signal goes high. For more information on how to use this interrupt, see 'Partial Power-Down and Clock Gating Programming Model' in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** Session Request New Session Detected Interrupt **0x0: INACTIVE :** Not active
29	DisconnInt	Mode: Host only Disconnect Detected Interrupt (DisconnInt) Asserted when a device disconnect is detected. Default Value: 0x0 **0x1: ACTIVE :** Disconnect Detected Interrupt **0x0: INACTIVE :** Not active
28	ConIDStsChng	Mode: Host and Device Connector ID Status Change (ConIDStsChng) The core sets this bit when there is a change in connector ID status. Default Value: 0x0 **0x1: ACTIVE :** Connector ID Status Change **0x0: INACTIVE :** Not Active
27	LPM_Int	Mode: Host and Device LPM Transaction Received Interrupt (LPM_Int). - Device Mode: This interrupt is asserted when the device receives an LPM transaction and responds with a non-ERRORed response. - Host Mode: This interrupt is asserted when the device responds to an LPM transaction with a non-ERRORed response or when the host core has completed LPM transactions for the programmed number of times (GLPMCFG.RetryCnt). Default Value: 0x0

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

		0x1: ACTIVE : LPM Transaction Received Interrupt **0x0: INACTIVE :** Not Active
26	PTxFEmp	Mode: Host only Periodic TxFIFO Empty (PTxFEmp) This interrupt is asserted when the Periodic Transmit FIFO is either half or completely empty and there is space for at least one entry to be written in the Periodic Request Queue. The half or completely empty status is determined by the Periodic TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.PTxFEmpLvl). Default Value: 0x1 **0x1: ACTIVE :** Periodic TxFIFO Empty **0x0: INACTIVE :** Not active
25	HChInt	Mode: Host only Host Channels Interrupt (HChInt) The core sets this bit to indicate that an interrupt is pending on one of the channels of the core (in Host mode). The application must read the Host All Channels Interrupt (HAINT) register to determine the exact number of the channel on which the interrupt occurred, and Then read the corresponding Host Channel-n Interrupt (HCINTn) register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the HCINTn register to clear this bit. Default Value: 0x0 **0x1: ACTIVE :** Host Channels Interrupt **0x0: INACTIVE :** Not active
24	PrtInt	Mode: Host only Host Port Interrupt (PrtInt) The core sets this bit to indicate a change in port status of one of the controller ports in Host mode. The application must read the Host Port Control and Status (HPRT) register to determine the exact event that caused this interrupt. The application must clear the appropriate status bit in the Host Port Control and Status register to clear this bit. Default Value: 0x0 **0x1: ACTIVE :** Host Port Interrupt **0x0: INACTIVE :** Not active

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

23	ResetDet	Mode: Device only Reset detected Interrupt (ResetDet) In Device mode, this interrupt is asserted when a reset is detected on the USB in partial power-down mode when the device is in Suspend. In Host mode, this interrupt is not asserted. Default Value: 0x0 **0x1: ACTIVE :** Reset detected Interrupt **0x0: INACTIVE :** Not active
22	FetSusp	Mode: Device only Data Fetch Suspended (FetSusp) This interrupt is valid only in DMA mode. This interrupt indicates that the core has stopped fetching data. For IN endpoints due to the unavailability of TxFIFO space or Request Queue space. This interrupt is used by the application for an endpoint mismatch algorithm. For example, after detecting an endpoint mismatch, the application: - Sets a Global non-periodic IN NAK handshake - Disables IN endpoints - Flushes the FIFO - Determines the token sequence from the IN Token Sequence Learning Queue - Re-enables the endpoints - Clears the Global non-periodic IN NAK handshake If the Global non-periodic IN NAK is cleared, the core has not yet fetched data for the IN endpoint, and the IN token is received. The core generates an 'IN token received when FIFO empty' interrupt. It then sends the host a NAK response. To avoid this scenario, the application can check the GINTSTS.FetSusp interrupt, which ensures that the FIFO is full before clearing a Global NAK handshake. Alternatively, the application can mask the IN token received when FIFO empty interrupt when clearing a Global IN NAK handshake. Default Value: 0x0 **0x1: ACTIVE :** Data Fetch Suspended **0x0: INACTIVE :** Not active
21	incomplP	Incomplete Periodic Transfer (incomplP) Mode: Host only In Host mode, the core sets this interrupt bit when there are incomplete periodic transactions still pending which are scheduled for the current microframe. Incomplete Isochronous OUT Transfer (incompISOOUT) Mode: Device only The Device mode, the core sets this interrupt to indicate that there is at least one isochronous OUT endpoint on which the transfer is not completed in the current microframe. This interrupt is asserted along with the End of Periodic Frame Interrupt (EOPF) bit in this register. Default Value: 0x0 **0x1: ACTIVE :** Incomplete Periodic Transfer **0x0: INACTIVE :** Not active

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

20	incompISOIN	Mode: Device only Incomplete Isochronous IN Transfer (incompISOIN) The core sets this interrupt to indicate that there is at least one isochronous IN endpoint on which the transfer is not completed in the current microframe. This interrupt is asserted along with the End of Periodic Frame Interrupt (EOPF) bit in this register. Note: This interrupt is not asserted in Scatter/Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Incomplete Isochronous IN Transfer **0x0: INACTIVE :** Not active
19	OEPInt	Mode: Device only OUT Endpoints Interrupt (OEPInt) The controller sets this bit to indicate that an interrupt is pending on one of the OUT endpoints of the core (in Device mode). The application must read the Device All Endpoints Interrupt (DAINT) register to determine the exact number of the OUT endpoint on which the interrupt occurred, and then read the corresponding Device OUT Endpoint-n Interrupt (DOEPINTn) register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding DOEPINTn register to clear this bit. Default Value: 0x0 **0x1: ACTIVE :** OUT Endpoints Interrupt **0x0: INACTIVE :** Not active
18	IEPInt	Mode: Device only IN Endpoints Interrupt (IEPInt) The core sets this bit to indicate that an interrupt is pending on one of the IN endpoints of the core (in Device mode). The application must read the Device All Endpoints Interrupt (DAINT) register to determine the exact number of the IN endpoint on Device IN Endpoint-n Interrupt (DIEPINTn) register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding DIEPINTn register to clear this bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoints Interrupt **0x0: INACTIVE :** Not active
17	EPMis	Mode: Device only Endpoint Mismatch Interrupt (EPMis) Note: This interrupt is valid only in shared FIFO operation. Indicates that an IN token has been received for a non-periodic endpoint, but the data for another endpoint is present in the top of the Non-periodic Transmit FIFO and the IN endpoint mismatch count programmed by the application has expired. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Mismatch Interrupt

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

		0x0: INACTIVE : Not active
15	EOPF	Mode: Device only End of Periodic Frame Interrupt (EOPF) Indicates that the period specified in the Periodic Frame Interval field of the Device Configuration register (DCFG.PerFrInt) has been reached in the current microframe. In case of Non-Ignore Frame Number Scatter/Gather (Descriptor DMA) mode, the controller internally handles the following scenarios based on EOPF: Read Flush: At the EOPF, the controller checks if there are any pending packets in the FIFO corresponding to the current (micro)Frame. - If there are any pending packets, then the controller initiates read flush, due to which the read pointer is updated to the starting location of the next micro-frame packet. - If there are no pending packets corresponding to the current (micro)Frame, the controller does not take any action. Write Flush: At the EOPF, if the controller is still fetching the current micro-frame data, then the controller stops pushing data into the TXFIFO but keeps fetching the complete packet from the System Memory. After completing the scheduled packet size fetch, the controller updates the Status Quadlet Fields (Transmit Status to BUFFLUSH) and closes the Descriptor. During the descriptor close, the controller initiates write flush, due to which the write pointer is updated to the starting location of the next micro-frame packet. Because the controller stops pushing the packet to the TxFIFO after EOPF, to bring the write pointer to the starting location of the next micro-frame, write flush is done. Default Value: 0x0 **0x1: ACTIVE :** End of Periodic Frame Interrupt **0x0: INACTIVE :** Not active
14	ISOOutDrop	Mode: Device only Isochronous OUT Packet Dropped Interrupt (ISOOutDrop) The controller sets this bit when it fails to write an isochronous OUT packet into the RxFIFO because the RxFIFO does not have enough space to accommodate a maximum packet size packet for the isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** Isochronous OUT Packet Dropped Interrupt **0x0: INACTIVE :** Not active
13	EnumDone	Mode: Device only Enumeration Done (EnumDone) The core sets this bit to indicate that speed enumeration is complete. The application must read the Device Status (DSTS) register to obtain the enumerated speed. Default Value: 0x0 **0x1: ACTIVE :** Enumeration Done **0x0: INACTIVE :** Not active

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

12	USBRst	Mode: Device only USB Reset (USBRst) The controller sets this bit to indicate that a reset is detected on the USB. Default Value: 0x0 **0x1: ACTIVE :** USB Reset **0x0: INACTIVE :** Not active
11	USBSusp	Mode: Device only USB Suspend (USBSusp) The controller sets this bit to indicate that a suspend was detected on the USB. The controller enters the Suspended state when there is no activity on the linestate signal for an extended period of time. Default Value: 0x0 **0x1: ACTIVE :** USB Suspend **0x0: INACTIVE :** Not Active
10	ErlySusp	Mode: Device only Early Suspend (ErlySusp) The controller sets this bit to indicate that an Idle state has been detected on the USB for 3 ms. Default Value: 0x0 **0x1: ACTIVE :** 3ms of Idle state detected **0x0: INACTIVE :** No Idle state detected
7	GOUTNakEff	Mode: Device only Global OUT NAK Effective (GOUTNakEff) Indicates that the Set Global OUT NAK bit in the Device Control register (DCTL.SGOUTNak), Set by the application, has taken effect in the core. This bit can be cleared by writing the Clear Global OUT NAK bit in the Device Control register (DCTL.CGOUTNak). Default Value: 0x0 **0x1: ACTIVE :** Global OUT NAK Effective **0x0: INACTIVE :** Not Active

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

6	GINNakEff	Mode: Device only Global IN Non-periodic NAK Effective (GINNakEff) Indicates that the Set Global Non-periodic IN NAK bit in the Device Control register (DCTL.SGNPInNak) set by the application, has taken effect in the core. That is, the core has sampled the Global IN NAK bit Set by the application. This bit can be cleared by clearing the Clear Global Non-periodic IN NAK bit in the Device Control register (DCTL.CGNPInNak). This interrupt does not necessarily mean that a NAK handshake is sent out on the USB. The STALL bit takes precedence over the NAK bit. Default Value: 0x0 **0x1: ACTIVE :** Set Global Non-periodic IN NAK bit **0x0: INACTIVE :** Global Non-periodic IN NAK not active
5	NPTxFEmp	Mode: Host and Device Non-periodic TxFIFO Empty (NPTxFEmp) This interrupt is asserted when the Non-periodic TxFIFO is either half or completely empty, and there is space for at least one Entry to be written to the Non-periodic Transmit Request Queue. The half or completely empty status is determined by the Non-periodic TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl). In host mode, the application can use GINTSTS.NPTxFEmp with the OTG_EN_DED_TX_FIFO parameter set to either 1 or 0. In device mode, the application uses GINTSTS.NPTxFEmp when OTG_EN_DED_TX_FIFO=0. When OTG_EN_DED_TX_FIFO=1, the application uses DIEPINTn.TxFEmp. Default Value: 0x1 **0x1: ACTIVE :** Non-periodic TxFIFO is empty **0x0: INACTIVE :** Non-periodic TxFIFO is not empty
4	RxFLvl	Mode: Host and Device RxFIFO Non-Empty (RxFLvl) Indicates that there is at least one packet pending to be read from the RxFIFO. Default Value: 0x0 **0x1: ACTIVE :** Rx Fifo is not empty **0x0: INACTIVE :** Rx Fifo is empty

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

3	Sof	Mode: Host and Device Start of (micro)Frame (Sof) In Host mode, the core sets this bit to indicate that an SOF (FS), micro-SOF (HS), or Keep-Alive (LS) is transmitted on the USB. The application must write a 1 to this bit to clear the interrupt. In Device mode, the controller sets this bit to indicate that an SOF token has been received on the USB. The application can read the Device Status register to get the current (micro)Frame number. This interrupt is seen only when the core is operating at either HS or FS. This bit can be set only by the core and the application must write 1 to clear it. Note: This register may return 1'b1 if read immediately after power-on reset. If the register bit reads 1'b1 immediately after power-on reset, it does not indicate that an SOF has been sent (in case of host mode) or SOF has been received (in case of device mode). The read value of this interrupt is valid only after a valid connection between host and device is established. If the bit is set after power on reset the application can clear the bit. Default Value: 0x0 **0x1: ACTIVE :** Start of Frame **0x0: INTACTIVE :** No Start of Frame
2	OTGInt	Mode: Host and Device OTG Interrupt (OTGInt) The controller sets this bit to indicate an OTG protocol event. The application must read the OTG Interrupt Status (GOTGINT) register to determine the exact event that caused this interrupt. The application must clear the appropriate status bit in the GOTGINT register to clear this bit. Default Value: 0x0 **0x1: ACTIVE :** OTG Interrupt **0x0: INACTIVE :** No Interrupt
1	ModeMis	Mode: Host and Device Mode Mismatch Interrupt (ModeMis) The core sets this bit when the application is trying to access: - A Host mode register, when the controller is operating in Device mode - A Device mode register, when the controller is operating in Host mode The register access is completed on the AHB with an OKAY response, but is ignored by the controller internally and does not affect the operation of the controller. This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Mode Mismatch Interrupt **0x0: INACTIVE :** No Mode Mismatch Interrupt

24.1.6 USBHS_DWC_otg_intreg_GINTSTS (continued)

0	CurMod	Mode: Host and Device Current Mode of Operation (CurMod) Indicates the current mode. - 1'b0: Device mode - 1'b1: Host mode Note: The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later. Default Value: 0x0 **0x0: DEVICE :** Device mode **0x1: HOST :** Host mode

24.1.7 USBHS_DWC_otg_intreg_GINTMSK

Description: This register works with the Interrupt Register (GINTSTS) to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the GINTSTS register bit corresponding to that interrupt is still set. Note: The fields of this register change depending on host or device mode.

2	OTGIntMsk	Mode: Host and Device OTG Interrupt Mask (OTGIntMsk) Default Value: 0x0 **0x0: MASK :** OTG Interrupt Mask **0x1: NOMASK :** No OTG Interrupt Mask
1	ModeMisMsk	Mode: Host and Device Mode Mismatch Interrupt Mask (ModeMisMsk) Default Value: 0x0

24.1.7 USBHS_DWC_otg_intreg_GINTMSK (continued)

0x0: MASK :

Mode Mismatch Interrupt Mask

0x1: NOMASK :

No Mode Mismatch Interrupt Mask

24.1.8 USBHS_DWC_otg_intreg_GRXSTSR

Description: A read to the Receive Status Debug Read register returns the contents of the top of the Receive FIFO. The receive status contents must be interpreted differently in Host and Device modes. The core ignores the receive status read when the receive FIFO is empty and returns a value of 32'h0000_0000. Note: - Use of these fields vary based on whether the core is functioning as a host or a device. - Do not read this register's reset value before configuring the core because the read value is 'X' in the simulation.

Bits	Name	Description
24 : 21	FN	Mode: Device only Frame Number (FN) This is the least significant 4 bits of the (micro)Frame number in which the packet is received on the USB. This field is supported only when isochronous OUT endpoints are supported. Default Value: 0x0
20 : 17	PktSts	Packet Status (PktSts) indicates the status of the received packet. In host mode, - 4'b0010: IN data packet received - 4'b0011: IN transfer completed (triggers an interrupt) - 4'b0101: Data toggle error (triggers an interrupt) - 4'b0111: Channel halted (triggers an interrupt) - Others: Reserved Reset:4'b0 In device mode, - 4'b0001: Global OUT NAK (triggers an interrupt) - 4'b0010: OUT data packet received - 4'b0011: OUT transfer completed (triggers an interrupt) - 4'b0100: SETUP transaction completed (triggers an interrupt) - 4'b0110: SETUP data packet received - Others: Reserved Reset:4'h0 Default Value: 0x0

24.1.8 USBHS_DWC_otg_intreg_GRXSTSR (continued)

0x7: CHHALT :

Channel halted in host mode (triggers an interrupt)

0x4: DSETUPCOM :

SETUP transaction completed :DWC_DESIGN_ID==0>in device mode (triggers an interrupt)

0x6: DSETUPRX :

SETUP data packet received:DWC_DESIGN_ID==0> in device mode

0x5: DTTOG :

Data toggle error (triggers an interrupt) in host mode

0x2: INOUTDPRX :

:DWC_DESIGN_ID==0>IN data packet received in host mode and OUT data packet received :DWC_DESIGN_ID==0>in device mode

0x3: INOUTTRCOM :

IN or OUT transfer completed :DWC_DESIGN_ID==0>in both host and device mode (triggers an interrupt)

0x1: OUTNAK :

Global OUT NAK :DWC_DESIGN_ID==0>in device mode (triggers an interrupt)

16 : 15 DPID

Data PID (DPID)
In host mode, indicates the Data PID of the received packet. In device mode, indicates the Data PID of the received OUT data packet.
- 2'b00: DATA0

24.1.9 USBHS_DWC_otg_intreg_GRXSTSP

Description: A read to the Receive Status Read and Pop register returns the contents of the top of the Receive FIFO and additionally pops the top data entry out of the RxFIFO. The receive status contents must be interpreted differently in Host and Device modes. The core ignores the receive status pop/read when the receive FIFO is empty and returns a value of 32'h0000_0000. The application must only pop the Receive Status FIFO when the Receive FIFO Non-Empty bit of the Core Interrupt register (GINTSTS.RxFLvl) is asserted. Note: - Use of these fields vary based on whether the core is functioning as a host or a device. - Do not read this register's reset value before configuring the core because the read value is 'X' in the simulation.

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access								
Name	DfifoDepth [31:24]							

Bits	Name	Description
31 : 16	DfifoDepth	DFIFO Depth (DfifoDepth - EP_LOC_CNT) This value is in terms of 32-bit words. - Minimum value is 32 - Maximum value is 32,768 Note: This field is configured using the OTG_DFIFO_DEPTH parameter. For more information on EP_LOC_CNT, see the "Endpoint Information Controller (EPINFO_CTL)" section. Default Value: 0x1A4F
15	LPMMode	LPM mode specified for Mode of Operation. Default Value: 0x1 **0x0: DISABLED :** LPM disabled **0x1: ENABLED :** LPM enabled
14	BCSupport	This bit indicates the controller support for Battery Charger. - 0 - No Battery Charger Support - 1 - Battery Charger support present Default Value: 0x0

24.1.18 USBHS_DWC_otg_intreg_GHWCFG3 (continued)

		0x0: DISABLED : No Battery Charger Support **0x1: ENABLED :** Battery Charger Support present
13	HSICMode	HSIC mode specified for Mode of Operation Value Range: 0 - 1 - 1: HSIC-capable with shared UTMI PHY interface - 0: Non-HSIC-capable Default Value: 0x0 **0x0: DISABLED :** No HSIC capability **0x1: ENABLED :** HSIC-capable with shared UTMI PHY interface
12	ADPSupport	This bit indicates whether ADP logic is present within or external to the controller - 0: No ADP logic present with the controller - 1: ADP logic is present along with the controller. Default Value: 0x0 **0x0: DISABLED :** ADP logic is not present along with the controller **0x1: ENABLED :** ADP logic is present along with the controller
11	RstType	Reset Style for Clocked always Blocks in RTL (RstType) - 1'b0: Asynchronous reset is used in the controller - 1'b1: Synchronous reset is used in the controller Note: This field is configured using the OTG_SYNC_RESET_TYPE parameter. Default Value: 0x0 **0x0: ASYNCRST :** Asynchronous reset is used in the core **0x1: SYNCRST :** Synchronous reset is used in the core
10	OptFeature	Optional Features Removed (OptFeature) Indicates whether the User ID register, GPIO interface ports, and SOF toggle and counter ports were removed for gate count optimization by enabling Remove Optional Features. - 1'b0: No - 1'b1: Yes Note: This field is configured using the OTG_RM_OPT_FEATURES parameter. Default Value: 0x0 **0x0: DISABLED :** Optional features were not Removed

24.1.18 USBHS_DWC_otg_intreg_GHWCFG3 (continued)

		0x1: ENABLED : Optional Features have been Removed
9	VndctlSupt	Vendor Control Interface Support (VndctlSupt) - 1'b0: Vendor Control Interface is not available on the core. - 1'b1: Vendor Control Interface is available. Note: This field is configured using the OTG_VENDOR_CTL_INTERFACE parameter. Default Value: 0x0 **0x0: DISABLED :** Vendor Control Interface is not available. **0x1: ENABLED :** Vendor Control Interface is available.
8	I2CIntSel	I2C Selection (I2CIntSel) - 1'b0: I2C Interface is not available on the controller. - 1'b1: I2C Interface is available on the controller. Note: This field is configured using the OTG_I2C_INTERFACE parameter. Default Value: 0x0 **0x0: DISABLED :** I2C Interface is not available **0x1: ENABLED :** I2C Interface is available
7	OtgEn	OTG Function Enabled (OtgEn) The application uses this bit to indicate the OTG capabilities of the controller . - 1'b0: Not OTG capable - 1'b1: OTG Capable Note: This field is configured using the OTG_MODE parameter. Default Value: 0x1 **0x0: DISABLED :** Not OTG Capable **0x1: ENABLED :** OTG Capable
6 : 4	PktSizeWidth	Width of Packet Size Counters (PktSizeWidth) - 3'b000: 4 bits - 3'b001: 5 bits - 3'b010: 6 bits - 3'b011: 7 bits - 3'b100: 8 bits - 3'b101: 9 bits - 3'b110: 10 bits - Others: Reserved Note: This field is configured using the OTG_PACKET_COUNT_WIDTH parameter. Default Value: 0x6 **0x6: BITS10 :** Width of Packet Size Counter 10

24.1.18 USBHS_DWC_otg_intreg_GHWCFG3 (continued)

0x0: BITS4 :

Width of Packet Size Counter 4

15 : 14	PhyDataWidth	UTMI+ PHY/ULPI-to-Internal UTMI+ Wrapper Data Width (PhyDataWidth)When a ULPI PHY is used, an internal wrapper converts ULPI to UTMI+. - 2'b00: 8 bits - 2'b01: 16 bits - 2'b10: 8/16 bits, software selectable - Others: Reserved Default Value: 0x0

24.1.19 USBHS_DWC_otg_intreg_GHWCFG4 (continued)

		0x0: WIDTH1 : 8 bits **0x1: WIDTH2 :** 16 bits **0x2: WIDTH3 :** 8/16 bits, software selectable
13	EnhancedLPMSupt	Enhanced LPM Support (EnhancedLPMSupt) This bit indicates that the controller supports the following behavior: L1 Entry Behavior based on FIFO Status - TX FIFO - Accept L1 Request even if ISOC IN TX FIFO is not empty. - Reject L1 Request if Non-Periodic TX FIFO is not empty. - Ensure application can flush the TX FIFO while the Controller is in L1. - RX FIFO - Accept L1 Request even if RX FIFO (common to Periodic and Non-Periodic) is not empty. - Accept L1 Request but delay SLEEPM assertion until RX SINK Buffer is empty. Prevent L1 Entry if a Control Transfer is in progress on any Control Endpoint. Ability to Flush TxFIFO even if PHY Clock is gated. Default Value: 0x1 **0x1: ENABLED :** Enhanced LPM Support is enabled
12	ACGSupt	Active Clock Gating Support This bit indicates that the controller supports the Dynamic (Switching) Power Reduction during periods when there is no USB and AHB Traffic. - 1'b0: Active Clock Gating is not enabled. - 1'b1: Active Clock Gating Enabled. Default Value: 0x1 **0x0: DISABLED :** **0x1: ENABLED :** Active Clock Gating Support
11	ipgisocSupt	Interpacket Gap ISOC OUT Worst-case Support (ipgisocSupt) This bit indicates that the controller supports the worst-case scenario of Rx followed by Rx Inter Packet Gap (IPG) (32-bit times) as per the UTMI Specification for any token following an ISOC OUT token. Without this support, when any token follows an ISOC OUT token with the worst-case IPG, the controller will not detect the followed token. The worst-case IPG of the controller without this support depends on the AHB and PHY clock frequency.By default IPG Support is enabled. Default Value: 0x1 **0x0: DISABLED :** Interpacket Gap ISOC OUT Worst-case Support is Disabled **0x1: ENABLED :** Interpacket Gap ISOC OUT Worst-case Support is Enabled (Default)

24.1.19 USBHS_DWC_otg_intreg_GHWCFG4 (continued)

10	ServIntFlow	Service Interval Flow This bit indicates that the controller supports Service-Interval based scheduling flow for ISOC IN EPs. Default Value: 0x0 **0x0: DISABLED :** Service Interval Flow not supported **0x1: ENABLED :** Service Interval Flow supported
9	EnhancedLPMSupt1	Enhanced LPM Support1 (EnhancedLPMSupt1) - This bit indicates that the controller supports L1 entry based on FIFO status. - Accept L1 Request even if Bulk/Interrupt TxFIFO is not empty. Default Value: 0x1 **0x0: DISABLED :** Reject L1 Request even if Non-Periodic (Bulk/Interrupt) TxFIFO is not empty. **0x1: ENABLED :** Accept L1 Request even if Non-Periodic (Bulk/Interrupt) TxFIFO is not empty
7	ExtendedHibernation	Enable Hibernation - 1'b0: Extended Hibernation feature not enabled - 1'b1: Extended Hibernation feature enabled Default Value: 0x0 **0x0: DISABLED :** Extended Hibernation feature not enabled **0x1: ENABLED :** Extended Hibernation feature enabled
6	Hibernation	Enable Hibernation (Hibernation) - 1'b0: Hibernation feature not enabled - 1'b1: Hibernation feature enabled Default Value: 0x0 **0x0: DISABLED :** Hibernation feature disabled **0x1: ENABLED :** Hibernation feature enabled
5	AhbFreq	Minimum AHB Frequency Less Than 60 MHz (AhbFreq) - 1'b0: No - 1'b1: Yes Default Value: 0x1 **0x0: DISABLED :** Minimum AHB Frequency More Than 60 MHz

24.1.19 USBHS_DWC_otg_intreg_GHWCFG4 (continued)

		0x1: ENABLED : Minimum AHB Frequency Less Than 60 MHz
4	PartialPwrDn	Enable Partial Power Down (PartialPwrDn) - 1'b0: Partial Power Down Not Enabled - 1'b1: Partial Power Down Enabled Default Value: 0x0 **0x0: DISABLED :** Partial Power Down disabled **0x1: ENABLED :** Partial Power Down enabled
3 : 0	NumDevPerioEps	Number of Device Mode Periodic IN Endpoints (NumDevPerioEps) Range: 0-15 Default Value: 0x0 **0x0: Value0 :** Number of Periodic IN EPs is 0 **0x1: Value1 :** Number of Periodic IN EPs is 1 **0xa: Value10 :** Number of Periodic IN EPs is 10 **0xb: Value11 :** Number of Periodic IN EPs is 11 **0xc: Value12 :** Number of Periodic IN EPs is 12 **0xd: Value13 :** Number of Periodic IN EPs is 13 **0xe: Value14 :** Number of Periodic IN EPs is 14 **0xf: Value15 :** Number of Periodic IN EPs is 15 **0x2: Value2 :** Number of Periodic IN EPs is 2

HW Access	Reserved							
Name	Reserved [31:30]		LPM_Re-storeSlpSts	LPM_En-BESL	LPM_RetryCnt_Sts [27:25]			SndLPM

Bits	Name	Description
29	LPM_RestoreSlpSts	LPM Restore Sleep Status (LPM_RestoreSlpSts) When the application power gates the core (Partial Power Down / Hibernation) the application needs to program this bit to restore the LPM status in the core. The application needs to program this bit, during restore process, based on whether it had decided to go into Shallow Sleep (Clock Gating Only) or Deep Sleep (Power Gating) based on the BESL value received from the Host - 1'b0: The application puts the core in Shallow Sleep based on BESL value from the Host - 1'b1: The application puts the core in Deep Sleep based on BESL value from the Host Default Value: 0x0 **0x0: DISABLED :** Puts the core in Shallow Sleep mode based on the BESL value from the Host **0x1: ENABLED :** Puts the core in Deep Sleep mode based on the BESL value from the Host
28	LPM_EnBESL	LPM Enable BESL (LPM_EnBESL) This bit enables the BESL feature as defined in LPM Errata - 1'b0: The core works as per USB 2.0 Link Power Management Addendum Engineering Change Notice to the USB 2.0 specification as of July 16, 2007 - 1'b1: The core works as per the LPM Errata Default Value: 0x0

24.1.20 USBHS_DWC_otg_intreg_GLPMCFG (continued)

0x0: DISABLED :

BESL is disabled

0x1: ENABLED :

BESL is enabled as defined in LPM Errata

27 : 25 LPM_RetryCnt_Sts

LPM Retry Count Status (LPM_RetryCnt_Sts)
Host Mode: Number of LPM Host Retries still remaining to be transmitted for the current LPM sequence.
Default Value: 0x0

0x0: RETRY_REM0 :

Zero LPM retries remaining

0x1: RETRY_REM1 :

One LPM retry remaining

0x2: RETRY_REM2 :

Two LPM retries remaining

0x3: RETRY_REM3 :

Three LPM retries remaining

0x4: RETRY_REM4 :

Four LPM retries remaining

0x5: RETRY_REM5 :

Five LPM retries remaining

0x6: RETRY_REM6 :

Six LPM retries remaining

0x7: RETRY_REM7 :

Seven LPM retries remaining

24 SndLPM

Send LPM Transaction (SndLPM)
Host Mode:
When set by application software, an LPM transaction containing two tokens, EXT & LPM is sent. Cleared by the hardware once a valid response (STALL./NYET/ACK) is received from the Device or the core had finished transmitting the programmed number of LPM retries. Note that this bit should be set only when the host is connected to local port.
Default Value: 0x0

0x0: DISABLED :

In host-only mode: Received the response from the device for the LPM transaction

24.1.20 USBHS_DWC_otg_intreg_GLPMCFG (continued)

0x1: ENABLED :

In host-only mode: Sending LPM transaction containing EXT and LPM tokens

23 : 21	LPM_Retry_Cnt	LPM Retry Count (LPM_Retry_Cnt) Host Mode: Number of additional LPM retries that the HOST would perform if the Device Response was an ERROR until a valid device response is received (STALL/NYET/ACK). Device Mode: LPM Accept Control (LPM_Accept_Ctrl) LPM_Accept_Ctrl[1]: The application can use this bit to reject an LPM token (NYET) between multiple stages of a single control transfer - 1'b0: Accept(ACK) LPM token during Setup, Data and Status stage of control transfer. - 1'b1: Reject(NYET) LPM token during Setup, Data and Status stage of control transfer. LPM_Accept_Ctrl[2]: The application can use this bit to accept an LPM token even if data is present in the ISOC endpoint TxFIFO. This bit is applicable only for Dedicated TxFIFO configurations (OTG_EN_DED_TX_FIFO=1). - 1'b0: Reject (NYET) LPM token, when data is present in TxFIFO for ISOC endpoints. - 1'b1: Accept(ACK) LPM token, when data is present in TxFIFO for ISOC endpoints. LPM_Accept_Ctrl[3]: The application can use this bit to accept an LPM token even if data is present in the BULK endpoint TxFIFO. This bit is applicable only for Dedicated TxFIFO configurations (OTG_EN_DED_TX_FIFO=1). - 1'b0: Reject (NYET) LPM token, when data is present in TxFIFO for BULK endpoints. - 1'b1: Accept(ACK) LPM token, when data is present in TxFIFO for BULK endpoints. Default Value: 0x0 **0x0: RETRY0 :** Zero LPM retries **0x1: RETRY1 :** One LPM retry **0x2: RETRY2 :** Two LPM retries **0x3: RETRY3 :** Three LPM retries **0x4: RETRY4 :** Four LPM retries **0x5: RETRY5 :** Five LPM retries **0x6: RETRY6 :** Six LPM retries **0x7: RETRY7 :** Seven LPM retries

24.1.20 USBHS_DWC_otg_intreg_GLPMCFG (continued)

20 : 17	LPM_Chnl_Indx	LPM Channel Index Host Mode: The channel number on which the LPM transaction has to be applied while sending an LPM transaction to the local device. Based on the LPM channel index, the core automatically inserts the device address and end point number programmed in the corresponding channel into the LPM transaction. Device Mode: LPM Accept Control (LPM_Accept_Ctrl) LPM_Accept_Ctrl[0] (LPM_Chnl_Indx[3]): The application can use this bit to accept an LPM token even if data is present in the INTR endpoint TxFIFO. This bit is applicable only for Dedicated TX FIFO configurations (OTG_EN_DED_TX_FIFO=1). - 1'b0:Reject (NYET) LPM token, when data is present in txfifo for INTR endpoints. - 1'b1:Accept(ACK) LPM token, when data is present in txfifo for INTR endpoints. Default Value: 0x0 **0x0: CH0 :** Channel 0 **0x1: CH1 :** Channel 1 **0xa: CH10 :** Channel 10 **0xb: CH11 :** Channel 11 **0xc: CH12 :** Channel 12 **0xd: CH13 :** Channel 13 **0xe: CH14 :** Channel 14 **0xf: CH15 :** Channel15 **0x2: CH2 :** Channel 2 **0x3: CH3 :** Channel 3 **0x4: CH4 :** Channel 4

16 L1ResumeOK

Sleep State Resume OK (L1ResumeOK)
Device and Host Mode:
Indicates that the application or host can start resume from Sleep state. This bit is valid in LPM sleep (L1) state. It is set in sleep mode after a delay of 50 micro sec (TL1Residency). The bit is reset when SlpSts is 0.
- 1'b0: The application/core cannot start resume from Sleep state.
- 1'b1: The application/core can start resume from Sleep state.
Default Value: 0x0

0x0: NOTOK :

The application/core cannot start Resume from Sleep state

0x1: OK :

The application/core can start Resume from Sleep state

15 SlpSts

Port Sleep Status (SlpSts)
Device Mode: This bit is set as long as a Sleep condition is present on the USB bus.
The core enters the Sleep state when an ACK response is sent to an LPM transaction and the TL1TokenRetry timer has expired. To stop the PHY clock, the application must set the Port Clock Stop bit, which asserts the PHY Suspend input signal. The application must rely on SlpSts and not ACK in CoreL1Res to confirm transition into sleep.
The core comes out of sleep:
- When there is any activity on the USB line_state
- When the application writes to the Remote Wakeup Signaling bit in the Device Control register (DCTL.RmtWkUpSig) or when the application resets or soft-disconnects the device.
Host Mode: The host transitions to Sleep (L1) state as a side-effect of a successful LPM transaction by the core to the local port with ACK response from the device. The read value of this bit reflects the current Sleep status of the port.
The core clears this bit after:
- The core detects a remote L1 Wakeup signal;
- The application sets the Port Reset bit or the Port L1Resume bit in the HPRT register; or
- The application sets the L1Resume/ Remote Wakeup Detected Interrupt bit or Disconnect Detected Interrupt bit in the Core Interrupt register (GINTSTS.L1WkUpInt or GINTSTS.DisconnInt, respectively).
Default Value: 0x0

24.1.20 USBHS_DWC_otg_intreg_GLPMCFG (continued)

		0x1: CORE_IN_L1 : :DWC_DESIGN_ID==0>In Host mode, this bit indicates the core transitions to Sleep state as a successful LPM transaction. In Device mode, the core enters the Sleep state when an ACK response is sent to an LPM transaction **0x0: CORE_NOT_IN_L1 :** In :DWC_DESIGN_ID==0>Host or Device mode, this bit indicates core is not in L1
14 : 13	CoreL1Res	LPM Response (CoreL1Res) Device Mode: The response of the core to LPM transaction received is reflected in these two bits. Host Mode: Handshake response received from local device for LPM transaction - 11 - ACK - 10 - NYET - 01 - STALL - 00 - ERROR (No handshake response) Default Value: 0x0 **0x0: LPMRESP1 :** ERROR : No handshake response **0x1: LPMRESP2 :** STALL response **0x2: LPMRESP3 :** NYET response **0x3: LPMRESP4 :** ACK response

24.1.20 USBHS_DWC_otg_intreg_GLPMCFG (continued)

12 : 8	HIRD_Thres	BESL/HIRD Threshold (HIRD_Thres) Device Mode: Note: When a ULPI/UTMI PHY associated with the controller (Host or device) does not support the LPM sleep feature clock gating, it is recommended to keep the HIRD_Thres[12] bit in disabled state (= 1'b0). This ensures the ULPI wrapper is in enabled mode and detects any wakeup events. - EnBESL = 1'b0: The core puts the PHY into deep low power mode in L1 (by core asserting L1SuspendM) when HIRD value is greater than or equal to the value defined in this field HIRD_Thres[3:0] and HIRD_Thres[4] is set to 1b1. - EnBESL = 1'b1: The core puts the PHY into deep low power mode in L1 (by core asserting L1SuspendM) when BESL value is greater than or equal to the value defined in this field BESL_Thres[3:0] and BESL_Thres [4] is set to 1'b1. - DCTL.DeepSleepBESLReject = 1'b1: In device initiated resume, the core expects the Host to resume service to the device within the BESL value corresponding to L1 exit time specified in HIRD_Thres[3:0]. The Device sends a NYET response when the received HIRD in LPM token is greater than HIRD threshold. Host Mode: The core puts the PHY into deep low power mode in L1 (by core asserting L1SuspendM) when HIRD_Thres[4] is set to 1'b1. HIRD_Thres[3:0] specifies the time for which resume signaling is to be reflected by host (TL1HubDrvResume2) on the USB bus when it detects device initiated resume. To differentiate between Deep Sleep and Shallow Sleep, HIRD greater than or equal to HIRD threshold comparison is done. For differentiating between NYET or ACK response for LPM token HIRD greater than HIRD Threshold comparison is used. - When EnBESL = 1'b0, HIRD_Thres should not be programmed with a value greater than 4'b1100 in host mode since this will exceed maximum TL1HubDrvResume2. - When EnBESL = 1'b1, HIRD_Thres should not be programmed with a value greater than 4'b0110 in host mode since this will exceed maximum TL1HubDrvResume2. For additional details, see the "Additional Details on GLPMCFG.HIRD_Thres Register Field" section in the databook. Default Value: 0x0
7	EnblSlpM	Enable utmi_sleep_n (EnblSlpM) Mode: Host and Device For ULPI interface: The application uses this bit to control the utmi_sleep_n assertion to the PHY when in L1 state. For the host, this bit is valid only in Local Device mode. - 1'b0: utmi_sleep_n assertion from the core is not transferred to the external PHY. - 1'b1: utmi_sleep_n assertion from the core is transferred to the external PHY. Note: - When a ULPI interface is configured, enabling this bit results in a write to Bit 7 of the ULPI Function Control register. The Synopsys ULPI PHY supports writing to this bit, and in the L1 state asserts SleepM when utmi_l1_suspend_n cannot be asserted. - When a ULPI/UTMI PHY associated with the controller (Host or device) does not support the LPM sleep feature clock gating, it is recommended to keep the EnblSlpM bit in disabled state (= 1'b0). This ensures the ULPI wrapper is in enabled mode and detects any wakeup events. For all other interfaces: The application uses this bit to control utmi_sleep_n assertion to the PHY in the L1 state. For the host, this bit is valid only in Local Device mode. - 1'b0: utmi_sleep_n assertion from the core is not transferred to the external PHY. - 1'b1: utmi_sleep_n assertion from the core is transferred to the external PHY when utmi_l1_suspend_n cannot be asserted. Default Value: 0x0 **0x0: DISABLED :** utmi_sleep_n assertion from the core is not transferred to the external PHY **0x1: ENABLED :** utmi_sleep_n assertion from the core is transferred to the external PHY when utmi_l1_suspend_n cannot be asserted

24.1.20 USBHS_DWC_otg_intreg_GLPMCFG (continued)

6	bRemoteWake	RemoteWakeEnable (bRemoteWake) Mode: Host and Device Host Mode: The value of remote wake up to be sent in wIndex field of LPM transaction. Device Mode: This field is read only. It is updated with the Received LPM Token bRemoteWake bmAttribute when an ACK/NYET/STALL response is sent to an LPM transaction. Default Value: 0x0 **0x0: DISABLED :** Remote Wakeup is disabled **0x1: ENABLED :** In :DWC_DESIGN_ID==0>Host or device mode, this field takes the value of remote wake up
5 : 2	HIRD	Host-Initiated Resume Duration (HIRD) EnBESL = 1'b0 Host Initiated Resume Duration. - Host Mode: The value of HIRD to be sent in an LPM transaction. This value is also used to initiate resume for a duration TL1HubDrvResume1 for host-initiated resume. - Device Mode: This field is read only and is updated with the Received LPM Token HIRD bmAttribute when an ACK/NYET/STALL response is sent to an LPM transaction. If HIRD[3:0], - 4'b0000, THIRD(us) = 50 - 4'b0001, THIRD(us) = 125 - 4'b0010, THIRD(us) = 200 - 4'b0011, THIRD(us) = 275 - 4'b0100, THIRD(us) = 350 - 4'b0101, THIRD(us) = 425 - 4'b0110, THIRD(us) = 500 - 4'b0111, THIRD(us) = 575 - 4'b1000, THIRD(us) = 650 - 4'b1001, THIRD(us) = 725 - 4'b1010, THIRD(us) = 800 - 4'b1011, THIRD(us) = 875 - 4'b1100, THIRD(us) = 950 - 4'b1101, THIRD(us) = 1025 - 4'b1110, THIRD(us) = 1100 - 4'b1111, THIRD(us) = 1175 EnBESL = 1'b1 Best Effort Service Latency (BESL). - Host Mode: The value of BESL to be sent in an LPM transaction. This value is also used to initiate resume for a duration TL1HubDrvResume1 for host-initiated resume. - Device Mode: This field is updated with the Received LPM Token BESL bmAttribute when an ACK/NYET/STALL response is sent to an LPM transaction. If BESL[3:0], - 4'b0000, TBESL(us) = 125 - 4'b0001, TBESL(us) = 150 - 4'b0010, TBESL(us) = 200 - 4'b0011, TBESL(us) = 300 - 4'b0100, TBESL(us) = 400 - 4'b0101, TBESL(us) = 500 - 4'b0110, TBESL(us) = 1000 - 4'b0111, TBESL(us) = 2000 - 4'b1000, TBESL(us) = 3000 - 4'b1001, TBESL(us) = 4000 - 4'b1010, TBESL(us) = 5000 - 4'b1011, TBESL(us) = 6000 - 4'b1100, TBESL(us) = 7000 - 4'b1101, TBESL(us) = 8000 - 4'b1110, TBESL(us) = 9000 - 4'b1111, TBESL(us) = 10000 Default Value: 0x0

24.1.20 USBHS_DWC_otg_intreg_GLPMCFG (continued)

1	AppL1Res	Mode: Device only LPM response programmed by application (AppL1Res) Handshake response to LPM token pre-programmed by device application software. The response depends on GLPMCFG.LPMCap. If GLPMCFG.LPMCap is 1'b0, the core operates as a non-LPM-capable Device and does not respond to any LPM transactions. If GLPMCFG.LPMCap is 1'b1, the core responds as follows: - 1: ACK Even though an ACK is pre-programmed, the core responds with an ACK only on a successful LPM transaction. The LPM transaction is successful if: -- There are no PID/CRC5 errors in both the EXT token and the LPM token (else ERROR) -- A valid bLinkState = 0001B (L1) is received in the LPM transaction (else STALL) -- No data is pending in the Transmit queue (else NYET) - 0: NYET The pre-programmed software bit is overridden for response to LPM token when: -- The received bLinkState is not L1 (STALL response) -- An error is detected in either of the LPM token packets due to corruption (ERROR response). Default Value: 0x0 **0x1: ACK_RESP :** The core responds with an ACK only on a successful LPM transaction **0x0: NYET_RESP :** The core responds with a NYET when an error is detected in either of the LPM token packets due to corruption
0	LPMCap	LPM-Capable (LPMCap) The application uses this bit to control the controller LPM capabilities. If the core operates as a non-LPM-capable host, it cannot request the connected device/hub to activate LPM mode. If the core operates as a non-LPM-capable device, it cannot respond to any LPM transactions. If GLPMCFG.LPMCap is 1'b0, the software must not set any of the remaining fields in the GLPMCFG register and these fields should hold their Reset values. - 1'b0: LPM capability is not enabled. - 1'b1: LPM capability is enabled. Default Value: 0x0 **0x0: DISABLED :** LPM capability is not enabled **0x1: ENABLED :** LPM capability is enabled

24.1.21 USBHS_DWC_otg_intreg_GDFIFOCFG

Description: Register to configure the DFIFOs for the controller.

Bits	Name	Description
31 : 16	EPInfoBaseAddr	EPInfoBaseAddr This field provides the start address of the EP info controller. Default Value: 0x1A4F
15 : 0	GDFIFOCfg	GDFIFOCfg This field is for dynamic programming of the DFIFO Size. This value takes effect only when the application programs a non zero value to this register. The value programmed must conform to the guidelines described in 'FIFO RAM Allocation'. The core does not have any corrective logic if the FIFO sizes are programmed incorrectly. Default Value: 0x1A97

24.1.22 USBHS_DWC_otg_intreg_GINTMSK2

Description: This register works with the Interrupt Register (GINTSTS2) to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the GINTSTS2 register bit corresponding to that interrupt is still set. Note: The fields of this register change depending on host or device mode.

24.1.23 USBHS_DWC_otg_intreg_GINTSTS2

Description: This register interrupts the application for system-level events in the current mode (Device mode or Host mode). Some of the bits in this register are valid only in Host mode, while others are valid in Device mode only. This register also indicates the current mode. To clear the interrupt status bits of type R_SS_WC, the application must write 1'b1 to the bit. The application must clear the GINTSTS2 register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization.

Address: 0x4490006C

10 : 0	INEPnTxFStAddr	IN Endpoint FIFOn Transmit RAM Start Address (INEPnTxFStAddr) This field contains the memory start address for IN endpoint Transmit FIFOn (0< = 15). The power-on reset value of this register is specified as the Largest Rx Data FIFO Depth. The power-on reset value of this register is calculated according to the following formula: OTG_RX-_DFIFO_DEPTH + SUM of OTG_TX_DINEP_DFIFO_DEPTH_'i' (where x = 0 to n 1) If at POR the calculated value (C) exceeds 65535, then the Reset value becomes Reset Value(A) = (C 65536). Example: If start address of IN endpoint FIFO 1 is OTG_RX_DFIFO_DEPTH + OT-G_TX_DINEP_DFIFO_DEPTH_ 0 and start address of IN endpoint FIFO 2 is OTG_RX_DFI-FO_DEPTH + OTG_TX_DINEP_DFIFO_DEPTH_ 0 + OTG_TX_DINEP_DFIFO_DEPTH_ 1. - If Enable Dynamic FIFO Sizing is deselected in coreConsultant (OTG_DFIFO_DYNAMIC = 0), this field is read-only and read value is the power-on reset value. - If Enable Dynamic FIFO Sizing is selected in coreConsultant (OTG_DFIFO_DYNAMIC = 1), and you have calculated or programmed a new value for RxFIFO depth or TX FIFO depths, you can program their values according to the above formula. Programmed values must not exceed the power-on value set in coreConsultant. Default Value: 0x55F

24.1.27 USBHS_DWC_otg_intreg_DIEPTXF3

Description: This register is valid only in dedicated FIFO mode (OTG_EN_DED_TX_FIFO=1). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use GNPTXFSIZ register for programming the size and memory start address.

Address: 0x4490010C

HW Access		Reserved						
Name	ModeChTi-mEn	Reserved [30:27]				PerSchedE-na	FrListEn [25:24]	

Bits	Name	Description
31	ModeChTimEn	Mode Change Ready Timer Enable (ModeChTimEn) This bit is used to enable/disable the Host core to wait 200 PHY clock cycles at the end of Resume to change the opmode signal to the PHY to 00 after Suspend or LPM. - 1'b0 : The Host core waits for either 200 PHY clock cycles or a linestate of SE0 at the end of resume to the change the opmode from 2'b10 to 2'b00 - 1'b1 : The Host core waits only for a linstate of SE0 at the end of resume to change the opmode from 2'b10 to 2'b00. Default Value: 0x0 **0x1: DISABLED :** The Host core waits only for a linestate of SE0 at the end of resume to change the opmode from 0x2 to 0x0 **0x0: ENABLED :** The Host core waits for either 200 PHY clock cycles or a linestate of SE0 at the end of resume to change the opmode from 0x2 to 0x0

24.1.33 USBHS_DWC_otg_intreg_HCFG (continued)

26	PerSchedEna	Enable Periodic Scheduling (PerSchedEna): Applicable in host DDMA mode only. Enables periodic scheduling within the core. Initially, the bit is reset. The core will not process any periodic channels. As soon as this bit is set, the core will get ready to start scheduling periodic channels and sets HCFG.PerSchedStat. The setting of HCFG.PerSchedStat indicates the core has enabled periodic scheduling. Once HCFG.PerSchedEna is set, the application is not supposed to again reset the bit unless HCFG.PerSchedStat is set. As soon as this bit is reset, the core will get ready to stop scheduling periodic channels and resets HCFG.PerSchedStat. Default Value: 0x0 **0x0: DISABLED :** Disables periodic scheduling within the core **0x1: ENABLED :** Enables periodic scheduling within the core
25 : 24	FrListEn	Frame List Entries(FrListEn) The value in the register specifies the number of entries in the Frame list. This field is valid only in Scatter/Gather DMA mode. - 2'b00: 8 Entries - 2'b01: 16 Entries - 2'b10: 32 Entries - 2'b11: 64 Entries Default Value: 0x0 **0x1: ENTRY16 :** 16 Entries **0x2: ENTRY32 :** 32 Entries **0x3: ENTRY63 :** 64 Entries **0x0: ENTRY8 :** 8 Entries
23	DescDMA	Enable Scatter/gather DMA in Host mode (DescDMA) When the Scatter/Gather DMA option selected during configuration of the RTL, the application can set this bit during initialization to enable the Scatter/Gather DMA operation. Note: This bit must be modified only once after a reset. The following combinations are available for programming: - GAHBCFG.DMAEn=0,HCFG.DescDMA=0 => Slave mode - GAHBCFG.DMAEn=0,HCFG.DescDMA=1 => Invalid - GAHBCFG.DMAEn=1,HCFG.DescDMA=0 => Buffered DMA mode - GAHBCFG.DMAEn=1,HCFG.DescDMA=1 => Scatter/Gather DMA mode Default Value: 0x0 **0x0: DISABLED :** Scatter/Gather DMA in Host mode is disabled

24.1.33 USBHS_DWC_otg_intreg_HCFG (continued)

		0x1: ENABLED : Scatter/Gather DMA selected
16	dis_tx_ipgap_dly_check	Disable Linestate check for Token to Token/Data interpacket gap delay calculation (dis_tx_ipgap_dly_check) Applicable only in HS mode of operation. When enabled, the controller implements counter based logic to detect the end of token transmission, otherwise controller monitors the linestate for end of token transmission,to start the Token to Token and Token to Data interpacket delay counter. Default Value: 0x0 **0x0: DISABLE :** Enable Linestate check **0x1: ENABLE :** Disable Linestate check
15 : 8	ResValid	Resume Validation Period (ResValid) This field is effective only when HCFG.Ena32KHzS is set. It will control the resume period when the core resumes from suspend. The core counts for 'ResValid' number of clock cycles to detect a valid resume when this is set. Default Value: 0x2
7	Ena32KHzS	Enable 32 KHz Suspend mode (Ena32KHzS) This bit can be set only in FS PHY interface is selected. Else, this bit needs to be set to zero. When FS PHY interface is chosen and this bit is set, the core expects that the PHY clock during Suspend is switched from 48 MHz to 32 KHz. Default Value: 0x0 **0x0: DISABLED :** 32 KHz Suspend mode disabled **0x1: ENABLED :** 32 KHz Suspend mode enabled
2	FSLSSupp	FS- and LS-Only Support (FSLSSupp) The application uses this bit to control the core's enumeration speed. Using this bit, the application can make the core enumerate as a FS host, even If the connected device supports HS traffic. Do not make changes to this field after initial programming. - 1'b0: HS/FS/LS, based on the maximum speed supported by the connected device - 1'b1: FS/LS-only, even If the connected device can support HS Default Value: 0x0 **0x1: FSLS :** FS/LS-only, even if the connected device can support HS **0x0: HSFSLS :** HS/FS/LS, based on the maximum speed supported by the connected device

24.1.33 USBHS_DWC_otg_intreg_HCFG (continued)

1 : 0	FSLSPclkSel	FS/LS PHY Clock Select (FSLSPclkSel) When the core is in FS Host mode - 2'b00: PHY clock is running at 30/60 MHz - 2'b01: PHY clock is running at 48 MHz - Others: Reserved When the core is in LS Host mode - 2'b00: PHY clock is running at 30/60 MHz. When the UTMI+/ULPI PHY Low Power mode is not selected, use 30/60 MHz. - 2'b01: PHY clock is running at 48 MHz. When the UTMI+ PHY Low Power mode is selected, use 48MHz If the PHY supplies a 48 MHz clock during LS mode. - 2'b10: PHY clock is running at 6 MHz. In USB 1.1 FS mode, use 6 MHz when the UTMI+ PHY Low Power mode is selected and the PHY supplies a 6 MHz clock during LS mode. If you select a 6 MHz clock during LS mode, you must do a soft reset. - 2'b11: Reserved Notes: - When Core in FS mode, the internal and external clocks have the same frequency. - When Core in LS mode, -- If FSLSPclkSel = 2'b00: Internal and external clocks have the same frequency -- If FSLSPclkSel = 2'b10: Internal clock is the divided by eight version of external 48 MHz clock Default Value: 0x0 **0x0: CLK3060 :** PHY clock is running at 30/60 MHz **0x1: CLK48 :** PHY clock is running at 48 MHz **0x2: CLK6 :** PHY clock is running at 6 MHz

24.1.34 USBHS_DWC_otg_intreg_HFIR

Description: This register is used to control the interval between two consecutive SOFs.

Address: 0x44900404

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	HFIRRldCtrl	Reload Control (HFIRRldCtrl) This bit allows dynamic reloading of the HFIR register during run time. - 1'b0 : The HFIR cannot be reloaded dynamically - 1'b1: the HFIR can be dynamically reloaded during runtime. This bit needs to be programmed during initial configuration and its value should not be changed during runtime. Default Value: 0x0 **0x0: DISABLED :** The HFIR cannot be reloaded dynamically **0x1: ENABLED :** The HFIR can be dynamically reloaded during runtime

24.1.34 USBHS_DWC_otg_intreg_HFIR (continued)

15 : 0	FrInt	Frame Interval (FrInt) The value that the application programs to this field specifies the interval between two consecutive SOFs (FS) or micro-SOFs (HS) or Keep-Alive tokens (HS). This field contains the number of PHY clocks that constitute the required frame interval. The Default value set in this field is for FS operation when the PHY clock frequency is 60 MHz. The application can write a value to this register only after the Port Enable bit of the Host Port Control and Status register (HPRT.PrtEnaPort) has been Set. If no value is programmed, the core calculates the value based on the PHY clock specified in the FS/LS PHY Clock Select field of the Host Configuration register (HCFG.FSLSPclkSel). Do not change the value of this field after the initial configuration. - 125 s * (PHY clock frequency for HS) - 1 ms * (PHY clock frequency for FS/LS) Default Value: 0xEA60

24.1.35 USBHS_DWC_otg_intreg_HFNUM

Description: This register indicates the current frame number. It also indicates the time remaining (in terms of the number of PHY clocks) in the current (micro)frame. Note: Read the reset value of this register only after the following conditions: - If IDDIG_FILTER is disabled, read only when the PHY clock is stable. - If IDDIG_FILTER is enabled, read only after the filter timer expires.

Address: 0x44900408

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

15 : 0	PTxFSpcAvail	Periodic Transmit Data FIFO Space Available (PTxFSpcAvail) Indicates the number of free locations available to be written to in the Periodic TxFIFO. Values are in terms of 32-bit words - 16'h0 : Periodic TxFIFO is full - 16'h1 : 1 word available - 16'h2 : 2 words available - 16'hn : n words available (where 0 n 32,768) - 16'h8000 : 32,768 words - Others : Reserved Default Value: 0x400

24.1.37 USBHS_DWC_otg_intreg_HAINT

Description: When a significant event occurs on a channel, the Host All Channels Interrupt register interrupts the application using the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt). This is shown in the "Interrupt Hierarchy" figure in the databook. There is one interrupt bit per channel, up to a maximum of 16 bits. Bits in this register are set and cleared when the application sets and clears bits in the corresponding Host Channel-n Interrupt register.

Address: 0x44900414

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	HFLBAddr [31:24]							

Bits	Name	Description
31 : 0	HFLBAddr	The starting address of the Frame list. This register is used only for Isochronous and Interrupt Channels. Default Value: 0x0

24.1.40 USBHS_DWC_otg_intreg_HPRT

Description: This register is available only in Host mode. Currently, the OTG Host supports only one port. A single register holds USB port-related information such as USB reset, enable, suspend, resume, connect status, and test mode for each port. It is shown in the "Interrupt Hierarchy" figure in the databook. The R_SS_WC bits in this register can trigger an interrupt to the application through the Host Port Interrupt bit of the Core Interrupt register (GINTSTS.PrtInt). On a Port Interrupt, the application must read this register and clear the bit that caused the interrupt. For the R_SS_WC bits, the application must write a 1 to the bit to clear the interrupt.

18 : 17	PrtSpd	Port Speed (PrtSpd) Indicates the speed of the device attached to this port. - 2'b00: High speed - 2'b01: Full speed - 2'b10: Low speed - 2'b11: Reserved Default Value: 0x0 **0x1: FULLSPD :** Full speed **0x0: HIGHSPD :** High speed **0x2: LOWSPD :** Low speed

24.1.40 USBHS_DWC_otg_intreg_HPRT (continued)

0x3: RESERVEDPrtSpdHPRT :

Reserved

16 : 13	PrtTstCtl	Port Test Control (PrtTstCtl) The application writes a nonzero value to this field to put the port into a Test mode, and the corresponding pattern is signaled on the port. - 4'b0000: Test mode disabled - 4'b0001: Test_J mode - 4'b0010: Test_K mode - 4'b0011: Test_SE0_NAK mode - 4'b0100: Test_Packet mode - 4'b0101: Test_Force_Enable - Others: Reserved To move the DWC_otg controller to test mode, you must set this field. Complete the following steps to move the DWC_otg core to test mode: - 1. Power on the core. - 2. Load the DWC_otg driver. - 3. Connect an HS device and enumerate to HS mode. - 4. Access the HPRT register to send test packets. - 5. Remove the device and connect to fixture (OPT) port. The DWC_otg host core continues sending out test packets. - 6. Test the eye diagram. Default Value: 0x0 **0x0: DISABLED :** Test mode disabled **0x5: TESTFENB :** Test_force_Enable **0x1: TESTJ :** Test_J mode **0x2: TESTK :** Test_K mode **0x4: TESTPM :** Test_Packet mode **0x3: TESTSN :** Test_SE0_NAK mode
12	PrtPwr	Port Power (PrtPwr) The application uses this field to control power to this port (write 1'b1 to set to 1'b1 and write 1'b0 to set to 1'b0), and the core can clear this bit on an over current condition. - 1'b0: Power off - 1'b1: Power on Note: This bit is interface independent. The application needs to program this bit for all interfaces as described in the host programming flow in the Programming Guide. Default Value: 0x0

24.1.40 USBHS_DWC_otg_intreg_HPRT (continued)

		0x0: OFF : Power off **0x1: ON :** Power on
11 : 10	PrtLnSts	Port Line Status (PrtLnSts) Indicates the current logic level USB data lines - Bit [10]: Logic level of D+ - Bit [11]: Logic level of D- Default Value: 0x0 **0x2: MINUSD :** Logic level of D- **0x1: PLUSD :** Logic level of D+
8	PrtRst	Port Reset (PrtRst) When the application sets this bit, a reset sequence is started on this port. The application must time the reset period and clear this bit after the reset sequence is complete. - 1'b0: Port not in reset - 1'b1: Port in reset The application must leave this bit set for at least a minimum duration mentioned below to start a reset on the port. The application can leave it set for another 10 ms in addition to the required minimum duration, before clearing the bit, even though there is no maximum limit Set by the USB standard.This bit is cleared by the core even if there is no device connected to the Host. - High speed: 50 ms - Full speed/Low speed: 10 ms Default Value: 0x0 **0x0: DISABLED :** Port not in reset **0x1: ENABLED :** Port in reset

24.1.40 USBHS_DWC_otg_intreg_HPRT (continued)

7	PrtSusp	Port Suspend (PrtSusp) The application sets this bit to put this port in Suspend mode. The core only stops sending SOFs when this is Set. To stop the PHY clock, the application must Set the Port Clock Stop bit, which asserts the suspend input pin of the PHY. The read value of this bit reflects the current suspend status of the port. This bit is cleared by the core after a remote wakeup signal is detected or the application sets the Port Reset bit or Port Resume bit in this register or the Resume/Remote Wakeup Detected Interrupt bit or Disconnect Detected Interrupt bit in the Core Interrupt register (GINTSTS.WkUpInt or GINTSTS.DisconnInt, respectively).This bit is cleared by the core even if there is no device connected to the Host. - 1'b0: Port not in Suspend mode - 1'b1: Port in Suspend mode Default Value: 0x0 **0x1: ACTIVE :** Port in Suspend mode **0x0: INACTIVE :** Port not in Suspend mode
6	PrtRes	Port Resume (PrtRes) The application sets this bit to drive resume signaling on the port. The core continues to drive the resume signal until the application clears this bit. If the core detects a USB remote wakeup sequence, as indicated by the Port Resume/Remote Wakeup Detected Interrupt bit of the Core Interrupt register (GINTSTS.WkUpInt), the core starts driving resume signaling without application intervention and clears this bit when it detects a disconnect condition. The read value of this bit indicates whether the core is currently driving resume signaling. - 1'b0: No resume driven - 1'b1: Resume driven When LPM is enabled, In L1 state the behavior of this bit is as follows: The application sets this bit to drive resume signaling on the port. The core continues to drive the resume signal until a pre-determined time specified in GLPMCFG.HIRD_Thres[3:0] field. If the core detects a USB remote wakeup sequence, as indicated by the Port L1Resume/Remote L1Wakeup Detected Interrupt bit of the Core Interrupt register (GINTSTS.L1WkUpInt), the core starts driving resume signaling without application intervention and clears this bit at the end of resume.This bit can be set by both core or application and also cleared by core or application. This bit is cleared by the core even if there is no device connected to the Host. Default Value: 0x0 **0x0: NORESUME :** No resume driven **0x1: RESUME :** Resume driven

24.1.40 USBHS_DWC_otg_intreg_HPRT (continued)

5	PrtOvrCurrChng	Port Overcurrent Change (PrtOvrCurrChng) The core sets this bit when the status of the Port Overcurrent Active bit (bit 4) in this register changes.This bit can be set only by the core and the application should write 1 to clear it Default Value: 0x0 **0x1: ACTIVE :** Status of port overcurrent changed **0x0: INACTIVE :** Status of port overcurrent status is not changed
4	PrtOvrCurrAct	Port Overcurrent Active (PrtOvrCurrAct) Indicates the overcurrent condition of the port. - 1'b0: No overcurrent condition - 1'b1: Overcurrent condition Default Value: 0x0 **0x1: ACTIVE :** Overcurrent condition **0x0: INACTIVE :** No overcurrent condition
3	PrtEnChng	Port Enable/Disable Change (PrtEnChng) The core sets this bit when the status of the Port Enable bit [2] of this register changes.This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Port Enable bit 2 changed **0x0: INACTIVE :** Port Enable bit 2 has not changed
2	PrtEna	Port Enable (PrtEna) A port is enabled only by the core after a reset sequence, and is disabled by an overcurrent condition, a disconnect condition, or by the application clearing this bit. The application cannot Set this bit by a register write. It can only clear it to disable the port by writing 1. This bit does not trigger any interrupt to the application. - 1'b0: Port disabled - 1'b1: Port enabled Default Value: 0x0 **0x0: DISABLED :** Port disabled **0x1: ENABLED :** Port enabled

24.1.40 USBHS_DWC_otg_intreg_HPRT (continued)

1	PrtConnDet	Port Connect Detected (PrtConnDet) The core sets this bit when a device connection is detected to trigger an interrupt to the application using the Host Port Interrupt bit of the Core Interrupt register (GINTSTS.PrtInt).This bit can be set only by the core and the application should write 1 to clear it.The application must write a 1 to this bit to clear the interrupt. Default Value: 0x0 **0x1: ACTIVE :** Device connection detected **0x0: INACTIVE :** No device connection detected
0	PrtConnSts	Port Connect Status (PrtConnSts) - 0: No device is attached to the port. - 1: A device is attached to the port. Default Value: 0x0 **0x1: ATTACHED :** A device is attached to the port **0x0: NOTATTACHED :** No device is attached to the port

24.1.41 USBHS_DWC_otg_intreg_HCCHAR0

Description: This register contains the characteristics of the Host Channel.

Address: 0x44900500

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW	RW	RW	RW				
HW Access								
Name	ChEna	ChDis	OddFrm	DevAddr [28:24]				

Bits	Name	Description
31	ChEna	Channel Enable (ChEna) When Scatter/Gather mode is enabled - 1'b0: Indicates that the descriptor structure is not yet ready. - 1'b1: Indicates that the descriptor structure and data buffer with data is setup and this channel can access the descriptor. When Scatter/Gather mode is disabled This field is set by the application and cleared by the OTG host. - 1'b0: Channel disabled - 1'b1: Channel enabled Default Value: 0x0 **0x0: DISABLED :** If Scatter/Gather mode is enabled, indicates that the descriptor structure is not yet ready. If Scatter/Gather mode is disabled, indicates that the channel is disabled. **0x1: ENABLED :** If Scatter/Gather mode is enabled, indicates that the descriptor structure and data buffer with data is set up and this channel can access the descriptor. If Scatter/Gather mode is disabled, indicates that the channel is enabled.

24.1.41 USBHS_DWC_otg_intreg_HCCHAR0 (continued)

30	ChDis	Channel Disable (ChDis) The application sets this bit to stop transmitting/receiving data on a channel, even before the transfer for that channel is complete. The application must wait for the Channel Disabled interrupt before treating the channel as disabled. Default Value: 0x0 **0x1: ACTIVE :** Stop transmitting/receiving data on channel **0x0: INACTIVE :** Transmit/Recieve normal
29	OddFrm	Odd Frame (OddFrm) This field is set (reset) by the application to indicate that the OTG host must perform a transfer in an odd (micro)Frame. This field is applicable for only periodic (isochronous and interrupt) transactions. - 1'b0: Even (micro)Frame - 1'b1: Odd (micro)Frame Default Value: 0x0 **0x0: EFRAME :** Even Frame Transfer **0x1: OFRAME :** Odd Frame Transfer
28 : 22	DevAddr	Device Address (DevAddr) This field selects the specific device serving as the data source or sink. Default Value: 0x0
21 : 20	EC	Multi Count (MC) / Error Count (EC) When the Split Enable bit of the Host Channel-n Split Control register (HCSPLTn.SpltEna) is reset (1'b0), this field indicates to the host the number of transactions that must be executed per microframe for this periodic endpoint. For non periodic transfers, this field is used only in DMA mode, and specifies the number packets to be fetched for this channel before the internal DMA engine changes arbitration. - 2'b00: Reserved This field yields undefined results. - 2'b01: 1 transaction - 2'b10: 2 transactions to be issued for this endpoint per microframe - 2'b11: 3 transactions to be issued for this endpoint per microframe When HCSPLTn.SpltEna is Set (1'b1), this field indicates the number of immediate retries to be performed for a periodic split transactions on transaction errors. This field must be Set to at least 2'b01. Default Value: 0x0 **0x0: RESERVEDECHCCHAR0 :** Reserved. This field yields undefined result **0x1: TRANSONE :** 1 transaction

24.1.41 USBHS_DWC_otg_intreg_HCCHAR0 (continued)

		0x3: TRANSTHREE : 3 transactions to be issued for this endpoint per microframe **0x2: TRANSTWO :** 2 transactions to be issued for this endpoint per microframe
19 : 18	EPType	Endpoint Type (EPType) Indicates the transfer type selected. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CTRL :** Control **0x3: INTERR :** Interrupt **0x1: ISOC :** Isochronous
17	LSpdDev	Low-Speed Device (LSpdDev) This field is Set by the application to indicate that this channel is communicating to a low-speed device. The application must program this bit when a low speed device is connected to the host through an FS HUB. The DWC_otg Host core uses this field to drive the XCVR_SELECT signal to 2'b11 while communicating to the LS Device through the FS hub. Note: In a peer to peer setup, the DWC_otg Host core ignores this bit even if it is set by the application software. Default Value: 0x0 **0x0: DISABLED :** Not Communicating with low speed device **0x1: ENABLED :** Communicating with low speed device
15	EPDir	Endpoint Direction (EPDir) Indicates whether the transaction is IN or OUT. - 1'b0: OUT - 1'b1: IN Default Value: 0x0 **0x1: IN :** IN Direction

24.1.41 USBHS_DWC_otg_intreg_HCCHAR0 (continued)

0x0: OUT :

OUT Direction

14 : 11	EPNum	Endpoint Number (EPNum) Indicates the endpoint number on the device serving as the data source or sink. Default Value: 0x0

HW Access		Reserved						
Name	SpltEna	Reserved [30:24]						

Bits	Name	Description
31	SpltEna	Split Enable (SpltEna) The application sets this field to indicate that this channel is enabled to perform split transactions. Default Value: 0x0 **0x0: DISABLED :** Split not enabled **0x1: ENABLED :** Split enabled
16	CompSplt	Do Complete Split (CompSplt) The application sets this field to request the OTG host to perform a complete split transaction. Default Value: 0x0 **0x0: NOSPLIT :** No complete split transaction **0x1: SPLIT :** Complete Split transaction

24.1.42 USBHS_DWC_otg_intreg_HCSPLT0 (continued)

15 : 14	XactPos	Transaction Position (XactPos) This field is used to determine whether to send all, first, middle, or last payloads with each OUT transaction. - 2'b11: All. This is the entire data payload is of this transaction (which is less than or equal to 188 bytes). - 2'b10: Begin. This is the first data payload of this transaction (which is larger than 188 bytes). - 2'b00: Mid. This is the middle payload of this transaction (which is larger than 188 bytes). - 2'b01: End. This is the last payload of this transaction (which is larger than 188 bytes). Default Value: 0x0 **0x3: ALL :** All. This is the entire data payload of this transaction (which is less than or equal to 188 bytes) **0x2: BEGIN :** Begin. This is the first data payload of this transaction (which is larger than 188 bytes) **0x1: END :** End. This is the last payload of this transaction (which is larger than 188 bytes) **0x0: MIDDLE :** Mid. This is the middle payload of this transaction (which is larger than 188 bytes)
13 : 7	HubAddr	Hub Address (HubAddr) This field holds the device address of the transaction translator's hub. Default Value: 0x0
6 : 0	PrtAddr	Port Address (PrtAddr) This field is the port number of the recipient transaction translator. Default Value: 0x0

24.1.43 USBHS_DWC_otg_intreg_HCINT0

Description: This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers.

Address: 0x44900508

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
13	DESC_LST_ROLLIntr	Descriptor rollover interrupt (DESC_LST_ROLLIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core sets this bit when the corresponding channel's descriptor list rolls over. For non Scatter/Gather DMA mode, this bit is reserved. Default Value: 0x0 **0x1: ACTIVE :** Descriptor rollover interrupt **0x0: INACTIVE :** No Descriptor rollover interrupt
12	XCS_XACT_ERR	Excessive Transaction Error (XCS_XACT_ERR) This bit is valid only when Scatter/Gather DMA mode is enabled. The core sets this bit when 3 consecutive transaction errors occurred on the USB bus. XCS_XACT_ERR will not be generated for Isochronous channels. For non Scatter/Gather DMA mode, this bit is reserved. Default Value: 0x0

24.1.43 USBHS_DWC_otg_intreg_HCINT0 (continued)

		0x1: ACTIVE : Excessive Transaction Error **0x0: INACTIVE :** No Excessive Transaction Error
11	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process. BNA will not be generated for Isochronous channels. For non Scatter/Gather DMA mode, this bit is reserved. Default Value: 0x0 **0x1: ACTIVE :** BNA Interrupt **0x0: INACTIVE :** No BNA Interrupt
10	DataTglErr	Data Toggle Error (DataTglErr).This bit can be set only by the core and the application should write 1 to clear it.In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core. Default Value: 0x0 **0x1: ACTIVE :** Data Toggle Error **0x0: INACTIVE :** No Data Toggle Error
9	FrmOvrun	Frame Overrun (FrmOvrun). In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core. This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Frame Overrun **0x0: INACTIVE :** No Frame Overrun
8	BblErr	Babble Error (BblErr) In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core. This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Babble Error

24.1.43 USBHS_DWC_otg_intreg_HCINT0 (continued)

		0x0: INACTIVE : No Babble Error
7	XactErr	Transaction Error (XactErr) Indicates one of the following errors occurred on the USB. - CRC check failure - Timeout - Bit stuff error - False EOP In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core.This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Transaction Error **0x0: INACTIVE :** No Transaction Error
6	NYET	NYET Response Received Interrupt (NYET) In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core.This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** NYET Response Received Interrupt **0x0: INACTIVE :** No NYET Response Received Interrupt
5	ACK	ACK Response Received/Transmitted Interrupt (ACK) In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core.This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** ACK Response Received or Transmitted Interrup **0x0: INACTIVE :** No ACK Response Received or Transmitted Interrupt
4	NAK	NAK Response Received Interrupt (NAK) In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core.This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** NAK Response Received Interrupt **0x0: INACTIVE :** No NAK Response Received Interrupt

24.1.43 USBHS_DWC_otg_intreg_HCINT0 (continued)

3	STALL	STALL Response Received Interrupt (STALL) In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core.This bit can be set only by the core and the application should write 1 to clear it. Default Value: 0x0 **0x1: ACTIVE :** Stall Response Received Interrupt **0x0: INACTIVE :** No Stall Response Received Interrupt
2	AHBErr	AHB Error (AHBErr) This is generated only in Internal DMA mode when there is an AHB error during AHB read/write. The application can read the corresponding channel's DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB error during AHB read/write **0x0: INACTIVE :** No AHB error
1	ChHltd	Channel Halted (ChHltd) In non Scatter/Gather DMA mode, it indicates the transfer completed abnormally either because of any USB transaction error or in response to disable request by the application or because of a completed transfer. In Scatter/gather DMA mode, this indicates that transfer completed due to any of the following - EOL being set in descriptor - AHB error - Excessive transaction errors - Babble - Stall Default Value: 0x0 **0x1: ACTIVE :** Channel Halted **0x0: INACTIVE :** Channel not halted
0	XferCompl	Transfer Completed (XferCompl) Transfer completed normally without any errors.This bit can be set only by the core and the application should write 1 to clear it. - For Scatter/Gather DMA mode, it indicates that current descriptor processing got completed with IOC bit set in its descriptor. - In non Scatter/Gather DMA mode, it indicates that Transfer completed normally without any errors. Default Value: 0x0 **0x1: ACTIVE :** Transfer completed normally without any errors

24.1.43 USBHS_DWC_otg_intreg_HCINT0 (continued)

0x0: INACTIVE :

Transfer in progress or No Active Transfer

24.1.44 USBHS_DWC_otg_intreg_HCINTMSK0

13	DESC_LST_ROLLIntrMsk	Descriptor List rollover interrupt Mask register(DESC_LST_ROLLIntrMsk) This bit is valid only when Scatter/Gather DMA mode is enabled. Default Value: 0x0 **0x0: MASK :** Descriptor Rollover Interrupt Mask **0x1: NOMASK :** Descriptor Rollover Interrupt not masked
11	BNAIntrMsk	BNA (Buffer Not Available) Interrupt mask register (BNAIntrMsk) This bit is valid only when Scatter/Gather DMA mode is enabled. Default Value: 0x0 **0x0: MASK :** BNA Interrupt Masked **0x1: NOMASK :** BNA Interrupt not masked

24.1.44 USBHS_DWC_otg_intreg_HCINTMSK0 (continued)

2	AHBErrMsk	AHB Error Mask (AHBErrMsk) In scatter/gather DMA mode for host, interrupts will not be generated due to the corresponding bits set in HCINTn. Default Value: 0x0 **0x0: MASK :** AHB Error Mask **0x1: NOMASK :** No AHB Error Mask
1	ChHltdMsk	Channel Halted Mask (ChHltdMsk) Default Value: 0x0 **0x0: MASK :** Channel Halted Mask **0x1: NOMASK :** No Channel Halted Mask
0	XferComplMsk	Transfer Completed Mask (XferComplMsk) Default Value: 0x0 **0x0: MASK :** Transfer Completed Mask **0x1: NOMASK :** No Transfer Completed Mask

24.1.45 USBHS_DWC_otg_intreg_HCTSIZ0

Description: This register reflects the transfer size for the Host Channel.

Address: 0x44900510

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	XferSize [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access								
Name	XferSize [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW					RW		
HW Access								
Name	PktCnt [23:19]					XferSize [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW		RW				
HW Access								
Name	DoPng	Pid [30:29]		PktCnt [28:24]				

Bits	Name	Description
31	DoPng	Do Ping (DoPng) This bit is used only for OUT transfers. Setting this field to 1 directs the host to do PING protocol. Note: Do not set this bit for IN transfers. If this bit is set for for IN transfers it disables the channel. Default Value: 0x0 **0x0: NOPING :** No ping protocol **0x1: PING :** Ping protocol
30 : 29	Pid	PID (Pid) The application programs this field with the type of PID to use for the initial transaction. The host maintains this field for the rest of the transfer. - 2'b00: DATA0 - 2'b01: DATA2 - 2'b10: DATA1 - 2'b11: MDATA (non-control)/SETUP (control) Default Value: 0x0 **0x0: DATA0 :** DATA0

24.1.45 USBHS_DWC_otg_intreg_HCTSIZ0 (continued)

		0x2: DATA1 : DATA1 **0x1: DATA2 :** DATA2 **0x3: MDATA :** MDATA (non-control)/SETUP (control)
28 : 19	PktCnt	Non-Scatter/Gather DMA Mode: Packet Count (PktCnt) This field is programmed by the application with the expected number of packets to be transmitted (OUT) or received (IN). The host decrements this count on every successful transmission or reception of an OUT/IN packet. Once this count reaches zero, the application is interrupted to indicate normal completion. The width of this counter is specified as Width of Packet Counters during coreConsultant configuration (parameter OTG_PACKET_COUNT_WIDTH). Scatter/Gather DMA Mode: [28:19]: Reserved Default Value: 0x0

24.1.45 USBHS_DWC_otg_intreg_HCTSIZ0 (continued)

18 : 0	XferSize	Non-Scatter/Gather DMA Mode: Transfer Size (XferSize) For an OUT, this field is the number of data bytes the host sends during the transfer. For an IN, this field is the buffer size that the application has Reserved for the transfer. The application is expected to program this field as an integer multiple of the maximum packet size for IN transactions (periodic and non-periodic). The width of this counter is specified as Width of Transfer Size Counters during coreConsultant configuration (parameter OTG_TRANS_COUNT_WIDTH). Scatter/Gather DMA Mode: [18:16]: Reserved [15:8]: NTD (Number of Transfer Descriptors) (Non Isochronous) This value is in terms of number of descriptors. Maximum number of descriptor that can be present in the list is 64. The values can be from 0 to 63. - 0: 1 descriptor - 63: 64 descriptors This field indicates the total number of descriptors present in that list. The core will wrap around after servicing NTD number of descriptors for that list. (Isochronous) This field indicates the number of descriptors present in that list microframe. The possible values for FS are - 1: 2 descriptors - 3: 4 descriptors - 7: 8 descriptors - 15: 16 descriptors - 31: 32 descriptors - 63: 64 descriptors The possible values for HS are - 7: 8 descriptors - 15: 16 descriptors - 31: 32 descriptors - 63: 64 descriptors - 127: 128 descriptors - 255: 256 descriptors [7:0]: SCHED_INFO (Schedule information) Every bit in this 8 bit register indicates scheduling for that microframe. Bit 0 indicates scheduling for 1st microframe and bit 7 indicates scheduling for 8th microframe in that frame. A value of 8'b11111111 indicates that the corresponding interrupt channel is scheduled to issue a token every microframe in that frame. A value of 8'b10101010 indicates that the corresponding interrupt channel is scheduled to issue a token every alternate microframe starting with second microframe. Note that this field is applicable only for periodic (Isochronous and Interrupt) channels. Default Value: 0x0

24.1.46 USBHS_DWC_otg_intreg_HCDMA0

Description: This register is used by the OTG host in the internal DMA mode to maintain the current buffer pointer for IN/OUT transactions. The starting DMA address must be DWORD-aligned.

Address: 0x44900514

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description

24.1.46 USBHS_DWC_otg_intreg_HCDMA0 (continued)

31 : 0	DMAAddr	In Buffer DMA Mode: [31:0]: DMA Address (DMAAddr) This field holds the start address in the external memory from which the data for the endpoint must be fetched or to which it must be stored. This register is incremented on every AHB transaction. Reset: X if not programmed as the register is in SPRAM. In Scatter-Gather DMA (DescDMA) Mode for Non-Isochronous: [31:9]: DMA Address (DMAAddr) The start address must be 512-bytes aligned. This field holds the start address of the 512 bytes page. The first descriptor in the list should be located in this address. The first descriptor may be or may not be ready. The core starts processing the list from the CTD value. [8:3]: Current Transfer Desc(CTD) This value is in terms of number of descriptors. The values can be from 0 to 63. - 0 - 1 descriptor. - 63 - 64 descriptors. This field indicates the current descriptor processed in the list. This field is updated both by application and the core. For example, if the application enables the channel after programming CTD=5, then the core will start processing the sixth descriptor. The address is obtained by adding a value of (8bytes*5=) 40(decimal) to DMAAddr. Reset: 6'h0 [2:0]: Reserved In Scatter-Gather DMA (DescDMA) Mode for Isochronous: [31:N]: DMA Address (DMAAddr) The start address must be 512-bytes aligned. This field holds the address of the 2*(nTD+1) bytes of locations in which the isochronous descriptors are present where N is based on nTD as follows: - [31:N]: Base Address - [N-1:3]: Offset - [2:0]: 000 For HS ISOC, if nTD is, - 7, N=6 - 15, N=7 - 31, N=8 - 63, N=9 - 127, N=10 - 255, N=11 For FS ISOC, if nTD is, - 1, N=4 - 3, N=5 - 7, N=6 - 15, N=7 - 31, N=8 - 63, N=9 [N-1:3]: Current Transfer Desc(CTD) CTD for isochronous is based on the current frame/(micro)frame value. Need to be set to zero by application. Reset: (N+1:3)'h0 [2:0]: Reserved Default Value: 0x0

24.1.47 USBHS_DWC_otg_intreg_HCDMAB0

Description: This register is present only in case of Scatter/Gather DMA. It is implemented in RAM instead of flop-based implementation. This register holds the current buffer address.

Address: 0x4490051C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW						RW	
HW Access								
Name	ResValid [31:26]						PerSchIntvl [25:24]	

Bits	Name	Description
31 : 26	ResValid	Resume Validation Period (ResValid) This field is effective only when DCFG.Ena32KHzSusp is set. It controls the resume period when the core resumes from suspend. The core counts for ResValid number of clock cycles to detect a valid resume when this bit is set Default Value: 0x2
25 : 24	PerSchIntvl	Periodic Scheduling Interval (PerSchIntvl) PerSchIntvl must be programmed for Scatter/Gather DMA mode. This field specifies the amount of time the Internal DMA engine must allocate for fetching periodic IN endpoint data. Based on the number of periodic endpoints, this value must be specified as 25,50 or 75% of (micro)Frame. - When any periodic endpoints are active, the internal DMA engine allocates the specified amount of time in fetching periodic IN endpoint data . - When no periodic endpoints are active, Then the internal DMA engine services non-periodic endpoints, ignoring this field. - After the specified time within a (micro)Frame, the DMA switches to fetching for non-periodic endpoints. -- 2'b00: 25% of (micro)Frame. -- 2'b01: 50% of (micro)Frame. -- 2'b10: 75% of (micro)Frame. -- 2'b11: Reserved. Reset: 2'b00 Default Value: 0x0

24.1.48 USBHS_DWC_otg_intreg_DCFG (continued)

		0x0: MF25 : 25% of :DWC_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame **0x1: MF50 :** 50% of :DWC_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame **0x2: MF75 :** 75% of :DWC_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame **0x3: RESERVEDPerSchIntvlDCFG :** Reserved
23	DescDMA	Enable Scatter/gather DMA in device mode (DescDMA). When the Scatter/Gather DMA option selected during configuration of the RTL, the application can Set this bit during initialization to enable the Scatter/Gather DMA operation. Note: This bit must be modified only once after a reset. The following combinations are available for programming: - GAHBCFG.DMAEn=0,DCFG.DescDMA=0 => Slave mode - GAHBCFG.DMAEn=0,DCFG.DescDMA=1 => Invalid - GAHBCFG.DMAEn=1,DCFG.DescDMA=0 => Buffered DMA mode - GAHBCFG.DMAEn=1,DCFG.DescDMA=1 => Scatter/Gather DMA mode Default Value: 0x0 **0x0: DISABLED :** Disable Scatter/Gather DMA **0x1: ENABLED :** Enable Scatter/Gather DMA
17	ipgisocSupt	Worst-Case Inter-Packet Gap ISOC OUT Support (ipgisocSupt) This bit indicates that the controller supports the worst-case scenario of Rx followed by Rx Inter-Packet Gap (IPG) (32 bit times) as per the UTMI Specification for any token following an ISOC OUT token. Without this support, when any token follows an ISOC OUT token with the worst-case IPG, the controller will not detect the followed token. The worst-case IPG of the controller without this support depends on the AHB and PHY clock frequency. Default Value: 0x1 **0x0: DISABLED :** Worst-Case Inter-Packet Gap ISOC OUT Support is disabled **0x1: ENABLED :** Worst-Case Inter-Packet Gap ISOC OUT Support is enabled
15	ErraticIntMsk	Erratic Error Interrupt Mask Default Value: 0x0 **0x1: MASK :** Mask early suspend interrupt on erratic error

24.1.48 USBHS_DWC_otg_intreg_DCFG (continued)

		0x0: NOMASK : Early suspend interrupt is generated on erratic error
14	XCVRDLY	XCVRDLY Enables or disables delay between xcvr_sel and txvalid during device chirp Default Value: 0x0 **0x0: DISABLE :** No delay between xcvr_sel and txvalid during Device chirp **0x1: ENABLE :** Enable delay between xcvr_sel and txvalid during Device chirp
13	EnDevOutNak	Enable Device OUT NAK (EnDevOutNak) This bit enables setting NAK for Bulk OUT endpoints after the transfer is completed for Device mode Descriptor DMA - 1'b0 : The core does not set NAK after Bulk OUT transfer complete - 1'b1 : The core sets NAK after Bulk OUT transfer complete This bit is one time programmable after reset like any other DCFG register bits. Default Value: 0x0 **0x0: DISABLED :** The core does not set NAK after Bulk OUT transfer complete **0x1: ENABLED :** The core sets NAK after Bulk OUT transfer complete
12 : 11	PerFrInt	Periodic Frame Interval (PerFrInt) Indicates the time within a (micro)Frame at which the application must be notified using the End Of Periodic Frame Interrupt. This can be used to determine If all the isochronous traffic for that (micro)Frame is complete. - 2'b00: 80% of the (micro)Frame interval - 2'b01: 85% of the (micro)Frame interval - 2'b10: 90% of the (micro)Frame interval - 2'b11: 95% of the (micro)Frame interval Default Value: 0x0 **0x0: EOPF80 :** 80% of the :DWC_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame interval **0x1: EOPF85 :** 85% of the :DWC_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame interval **0x2: EOPF90 :** 90% of the :DWC_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame interval **0x3: EOPF95 :** 95% of the :DWC_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame interval

24.1.48 USBHS_DWC_otg_intreg_DCFG (continued)

10 : 4	DevAddr	Device Address (DevAddr) The application must program this field after every SetAddress control command. Default Value: 0x0
3	Ena32KHzSusp	Enable 32 KHz Suspend mode (Ena32KHzSusp) This bit can be set only if FS PHY interface is selected. Otherwise, this bit needs to be set to zero. If FS PHY interface is chosen and this bit is set, the PHY clock during Suspend must be switched from 48 MHz to 32 KHz. Default Value: 0x0 **0x0: DISABLED :** USB 1.1 Full-Speed Serial Transceiver not selected **0x1: ENABLED :** USB 1.1 Full-Speed Serial Transceiver Interface selected
2	NZStsOUTHShk	Non-Zero-Length Status OUT Handshake (NZStsOUTHShk) The application can use this field to select the handshake the core sends on receiving a nonzero-length data packet during the OUT transaction of a control transfer's Status stage. - 1'b1: Send a STALL handshake on a nonzero-length status OUT transaction and do not send the received OUT packet to the application. - 1'b0: Send the received OUT packet to the application (zerolength or nonzero-length) and send a handshake based on the NAK and STALL bits for the endpoint in the Device Endpoint Control register. Default Value: 0x0 **0x0: SENDOUT :** Send the received OUT packet to the application (zero-length or non-zero length) and send a handshake based on NAK and STALL bits for the endpoint in the Devce Endpoint Control Register **0x1: SENDSTALL :** Send a STALL handshake on a nonzero-length status OUT transaction and do not send the received OUT packet to the application
1 : 0	DevSpd	Device Speed (DevSpd) Indicates the speed at which the application requires the core to enumerate, or the maximum speed the application can support. However, the actual bus speed is determined only after the connect sequence is completed, and is based on the speed of the USB host to which the core is connected. Default Value: 0x0 **0x3: USBFS1148 :** Full speed USB 1.1 transceiver clock is 48 MHz **0x1: USBFS20 :** Full speed USB 2.0 PHY clock is 30 MHz or 60 MHz **0x0: USBHS20 :** High speed USB 2.0 PHY clock is 30 MHz or 60 MHz **0x2: USBLS116 :** Low speed USB 1.1 transceiver clock is 6 MHz

24.1.49 USBHS_DWC_otg_intreg_DCTL

Description: This register is used to control the characteristics of the Device controller.

Address: 0x44900804

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19	ServInt	Service Interval based scheduling for Isochronous IN Endpoints This field is used to enable service interval based scheduling feature for ISOC IN EPs. Note: This bit is applicable only in device mode and when Scatter/Gather DMA mode is used. This feature should not be enabled along with DCTL.IgnrFrmNum. Scatter/Gather DMA Mode (GAHBCFG.DMAEn=1,DCFG.DescDMA=1): When this bit is enabled, the frame number field in the ISOC IN descriptor structure is interpreted as the last frame of the service interval. In Scatter/Gather DMA mode, if this bit is enabled, the pending packets are flushed by the controller at the last frame of the service interval. Default Value: 0x0 **0x0: DISABLED :** The controller behavior depends on DCTL.IgnrFrmNum field. **0x1: ENABLED :** :DWC_DESIGN_ID==0>Scatter/Gather DMA Mode: The controller can transmit the packets in any frame of the service interval.

24.1.49 USBHS_DWC_otg_intreg_DCTL (continued)

18	DeepSleepBESLReject	DeepSleepBESLReject - 1: Deep Sleep BESL Reject feature is enabled - 0: Deep Sleep BESL Reject feature is disabled Core rejects LPM request with HIRD value greater than HIRD threshold programmed. NYET response is sent for LPM tokens with HIRD value greater than HIRD threshold. By default, the Deep Sleep BESL Reject feature is disabled. Default Value: 0x0 **0x0: DISABLED :** Deep Sleep BESL Reject feature is disabled **0x1: ENABLED :** Deep Sleep BESL Reject feature is enabled
17	EnContOnBNA	Enable Continue on BNA (EnContOnBNA) This bit enables the core to continue on BNA for Bulk OUT endpoints. With this feature enabled, when a Bulk OUT or INTR OUT endpoint receives a BNA interrupt the core starts processing the descriptor that caused the BNA interrupt after the endpoint re-enables the endpoint. - 1'b0: After receiving BNA interrupt,the core disables the endpoint. When the endpoint is re-enabled by the application, the core starts processing from the DOEPDMA descriptor. - 1'b1: After receiving BNA interrupt, the core disables the endpoint. When the endpoint is re-enabled by the application, the core starts processing from the descriptor that received the BNA interrupt. This bit is valid only when OTG_EN_DESC_DMA == 1'b1. It is a one-time programmable after reset bit like any other DCTL register bits. Default Value: 0x0 **0x0: DISABLED :** Core disables the endpoint after receiving BNA interrupt. When application re-enables the endpoint, core starts processing from the DOEPDMA descriptor **0x1: ENABLED :** Core disables the endpoint after receiving BNA interrupt. When application re-enables the endpoint, core starts processing from the descriptor that received the BNA interrupt.
16	NakOnBble	NAK on Babble Error (NakOnBble) Set NAK automatically on babble (NakOnBble). The core sets NAK automatically for the endpoint on which babble is received. Default Value: 0x0 **0x0: DISABLED :** Disable NAK on Babble Error **0x1: ENABLED :** NAK on Babble Error

24.1.49 USBHS_DWC_otg_intreg_DCTL (continued)

15	IgnrFrmNum	Ignore Frame Number Feature for Isochronous Endpoints (IgnrFrmNum) This field is also used to control the Periodic Transfer Interrupt (PTI) feature. Note: Do not program IgnrFrmNum bit to 1'b1 when the core is operating in threshold mode. Slave Mode (GAHBCFG.DMAEn=0): This bit is not valid in Slave mode and should not be programmed to 1. Scatter/Gather DMA Mode (GAHBCFG.DMAEn=1,DCFG.DescDMA=1): Note: When Scatter/Gather DMA mode is enabled this feature is not applicable to High Speed, High bandwidth transfers. When this bit is enabled, there must be only one packet per descriptor. - 0: The core transmits the packets only in the frame number in which they are intended to be transmitted. - 1: The core ignores the frame number, sending packets immediately as the packets are ready. In Scatter/Gather DMA mode, if this bit is enabled, the packets are not flushed when a ISOC IN token is received for an elapsed frame. Non-Scatter/Gather DMA Mode, that is, Buffer DMA Mode (GAHBCFG.DMAEn=1,DCFG.DescDMA=0): When Scatter/Gather DMA mode is disabled, this field is used by the application to enable Periodic Transfer Interrupt (PTI) Mode. The application can program Periodic Endpoint transfers for multiple (micro)Frames. - 0: Periodic Transfer Interrupt feature is disabled, application needs to program transfers for periodic endpoints every (micro)Frame - 1: Periodic Transfer Interrupt feature is enabled, application can program transfers for multiple (micro)Frames for periodic endpoints. In the PTI mode, the application will receive Transfer Complete Interrupt after transfers for multiple (micro)Frames are completed. Default Value: 0x0 **0x0: DISABLED :** :DWC_DESIGN_ID==0>Scatter/Gather DMA Mode: The core transmits the packets only in the frame number in which they are intended to be transmitted.:DWC_DESIGN_ID==0> Non-Scatter/Gather DMA Mode: Periodic Transfer Interrupt feature is disabled. **0x1: ENABLED :** :DWC_DESIGN_ID==0>Scatter/Gather DMA Mode: The core ignores the frame number, sending packets immediately as the packets are ready.:DWC_DESIGN_ID==0> Non-Scatter/Gather DMA Mode: Periodic Transfer Interrupt feature is enabled.
14 : 13	GMC	Global Multi Count (GMC) GMC must be programmed only once after initialization. Applicable only for Scatter/Gather DMA mode. This indicates the number of packets to be serviced for that end point before moving to the next end point. It is only for non-periodic endpoints. - 2'b00: Invalid. - 2'b01: 1 packet. - 2'b10: 2 packets. - 2'b11: 3 packets. The value of this field automatically changes to 2'h1 when DCFG.DescDMA is set to 1. When Scatter/Gather DMA mode is disabled, this field is reserved. and reads 2'b00. Default Value: 0x0 **0x0: NOTVALID :** Invalid **0x1: ONEPACKET :** 1 packet **0x3: THREEPACKET :** 3 packets

24.1.49 USBHS_DWC_otg_intreg_DCTL (continued)

		0x2: TWOPACKET : 2 packets
11	PWROnPrgDone	Power-On Programming Done (PWROnPrgDone) The application uses this bit to indicate that register programming is completed after a wake-up from Power Down mode. Default Value: 0x0 **0x1: DONE :** Power-On Programming Done **0x0: NOTDONE :** Power-On Programming not done
10	CGOUTNak	Clear Global OUT NAK (CGOUTNak) A write to this field clears the Global OUT NAK. Default Value: 0x0 **0x0: DISABLED :** Disable Clear Global OUT NAK **0x1: ENABLED :** Clear Global OUT NAK
9	SGOUTNak	Set Global OUT NAK (SGOUTNak) A write to this field sets the Global OUT NAK. The application uses this bit to send a NAK handshake on all OUT endpoints. The application must set the this bit only after making sure that the Global OUT NAK Effective bit in the Core Interrupt Register (GINTSTS.GOUTNakEff) is cleared. Default Value: 0x0 **0x0: DISABLED :** Disable Global OUT NAK **0x1: ENABLED :** Set Global OUT NAK
8	CGNPInNak	Clear Global Non-periodic IN NAK (CGNPInNak) A write to this field clears the Global Non-periodic IN NAK. Default Value: 0x0 **0x0: DISABLE :** Disable Global Non-periodic IN NAK **0x1: ENABLE :** Clear Global Non-periodic IN NAK

24.1.49 USBHS_DWC_otg_intreg_DCTL (continued)

7	SGNPInNak	Set Global Non-periodic IN NAK (SGNPInNak) A write to this field sets the Global Non-periodic IN NAK.The application uses this bit to send a NAK handshake on all non-periodic IN endpoints. The core can also Set this bit when a timeout condition is detected on a non-periodic endpoint in shared FIFO operation. The application must Set this bit only after making sure that the Global IN NAK Effective bit in the Core Interrupt Register (GINTSTS.GINNakEff) is cleared Default Value: 0x0 **0x0: DISABLE :** Disable Global Non-periodic IN NAK **0x1: ENABLE :** Set Global Non-periodic IN NAK
6 : 4	TstCtl	Test Control (TstCtl) - 3'b000: Test mode disabled - 3'b001: Test_J mode - 3'b010: Test_K mode - 3'b011: Test_SE0_NAK mode - 3'b100: Test_Packet mode - 3'b101: Test_Force_Enable - Others: Reserved Default Value: 0x0 **0x0: DISABLED :** Test mode disabled **0x5: TESTFE :** Test_force_Enable **0x1: TESTJ :** Test_J mode **0x2: TESTK :** Test_K mode **0x4: TESTPM :** Test_Packet mode **0x3: TESTSN :** Test_SE0_NAK mode
3	GOUTNakSts	Global OUT NAK Status (GOUTNakSts) - 1'b0: A handshake is sent based on the FIFO Status and the NAK and STALL bit settings. - 1'b1: No data is written to the RxFIFO, irrespective of space availability. Sends a NAK handshake on all packets, except on SETUP transactions. All isochronous OUT packets are dropped. Default Value: 0x0 **0x1: ACTIVE :** No data is written to the RxFIFO, irrespective of space availability. Sends a NAK handshake on all packets, except on SETUP transactions. All isochronous OUT packets are dropped.

24.1.49 USBHS_DWC_otg_intreg_DCTL (continued)

0x0: INACTIVE :

A handshake is sent based on the FIFO Status and the NAK and STALL bit settings.

2	GNPINNakSts	Global Non-periodic IN NAK Status (GNPINNakSts) - 1'b0: A handshake is sent out based on the data availability in the transmit FIFO. - 1'b1: A NAK handshake is sent out on all non-periodic IN endpoints, irrespective of the data availability in the transmit FIFO. Default Value: 0x0 **0x1: ACTIVE :** A NAK handshake is sent out on all non-periodic IN endpoints, irrespective of the data availability in the transmit FIFO. **0x0: INACTIVE :** A handshake is sent out based on the data availability in the transmit FIFO
1	SftDiscon	Soft Disconnect (SftDiscon) The application uses this bit to signal the controller to do a soft disconnect. As long as this bit is set, the host does not see that the device is connected, and the device does not receive signals on the USB. The core stays in the disconnected state until the application clears this bit. - 1'b0: Normal operation. When this bit is cleared after a soft disconnect, the core drives the phy_opmode_o signal on the UTMI+ to 2'b00, which generates a device connect event to the USB host. When the device is reconnected, the USB host restarts device enumeration. - 1'b1: The core drives the phy_opmode_o signal on the UTMI+ to 2'b01, which generates a device disconnect event to the USB host. The following is the minimum duration under various conditions for which this bit must be set for the USB host to detect a device disconnect. To accommodate clock jitter, it is recommended that the application adds some extra delay to the specified minimum duration. For high speed, if the device state is, - Suspended, the minimum duration is 1ms + 2.5us - Idle, the minimum duration is 3ms + 2.5us - Not Idle or Suspended (performing transactions), the minimum duration 125 us For full speed/low speed, if the device state is, - Suspended, the minimum duration is 1ms + 2.5us - Idle, the minimum duration is 2.5us - Not Idle or Suspended (performing transactions), the minimum duration 125 us Note: - This bit can be also used for ULPI/FS Serial interfaces. - This bit is not impacted by a soft reset. Default Value: 0x1 **0x1: DISCONNECT :** The core :DWC_DESIGN_ID!=1>drives the phy_opmode_o signal on the UTMI+ to 2'b01, which generates a device disconnect event to the USB host **0x0: NODISCONNECT :** The core :DWC_DESIGN_ID!=1>drives the phy_opmode_o signal on the UTMI+ to 2'b00, which generates a device connect event to the USB host

24.1.49 USBHS_DWC_otg_intreg_DCTL (continued)

0	RmtWkUpSig	Remote Wakeup Signaling (RmtWkUpSig) When the application sets this bit, the core initiates remote signaling to wake up the USB host. The application must Set this bit to instruct the core to exit the Suspend state. As specified in the USB 2.0 specification, the application must clear this bit 1-15 ms after setting it. If LPM is enabled and the core is in the L1 (Sleep) state, when the application sets this bit, the core initiates L1 remote signaling to wake up the USB host. The application must set this bit to instruct the core to exit the Sleep state. As specified in the LPM specification, the hardware automatically clears this bit 50 microseconds (TL1DevDrvResume) after being set by the application. The application must not set this bit when GLPMCFG bRemoteWake from the previous LPM transaction is zero. Default Value: 0x0 **0x0: DISABLEDRMWKUP :** Core does not send Remote Wakeup Signaling **0x1: ENABLERMWKUP :** Core sends Remote Wakeup Signaling

24.1.50 USBHS_DWC_otg_intreg_DSTS

Description: This register indicates the status of the core with respect to USB-related events. It must be read on interrupts from Device All Interrupts (DAINT) register.

Address: 0x44900808

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 22	DevLnSts	Device Line Status (DevLnSts) Indicates the current logic level USB data lines - DevLnSts[1]: Logic level of D+ - DevLnSts[0]: Logic level of D- Default Value: 0x0
21 : 8	SOFFN	Frame or Microframe Number of the Received SOF (SOFFN) When the core is operating at high speed, this field contains a microframe number. When the core is operating at full or low speed, this field contains a Frame number. Note: This register may return a non-zero value if read immediately after power-on reset. In case the register bit reads non-zero immediately after power-on reset, it does not indicate that SOF has been received from the host. The read value of this interrupt is valid only after a valid connection between host and device is established. Default Value: 0x0
3	ErrticErr	Erratic Error (ErrticErr) The core sets this bit to report any erratic errors (phy_rxvalid_i/phy_rxvldh_i or phy_rxactive_i is asserted for at least 2 ms, due to PHY error) seen on the UTMI+. Due to erratic errors, the core goes into Suspended state and an interrupt is generated to the application with Early Suspend bit of the Core Interrupt register (GINTSTS.ErlySusp). If the early suspend is asserted due to an erratic error, the application can only perform a soft disconnect recover. Default Value: 0x0

24.1.50 USBHS_DWC_otg_intreg_DSTS (continued)

		0x1: ACTIVE : Erratic Error **0x0: INACTIVE :** No Erratic Error
2 : 1	EnumSpd	Enumerated Speed (EnumSpd) Indicates the speed at which the controller has come up after speed detection through a connect or reset sequence. - 2'b00: High speed (PHY clock is running at 30 or 60 MHz) - 2'b01: Full speed (PHY clock is running at 30 or 60 MHz) - 2'b10: Low speed (PHY clock is running at 6 MHz) - 2'b11: Full speed (PHY clock is running at 48 MHz) Low speed is not supported for devices using a UTMI+ PHY. Default Value: 0x1 **0x1: FS3060 :** Full speed (PHY clock is running at 30 or 60 MHz) **0x3: FS48 :** Full speed (PHY clock is running at 48 MHz) **0x0: HS3060 :** High speed (PHY clock is running at 30 or 60 MHz) **0x2: LS6 :** Low speed (PHY clock is running at 6 MHz)
0	SuspSts	Suspend Status (SuspSts) In Device mode, this bit is set as long as a Suspend condition is detected on the USB. The core enters the Suspend state when there is no activity on the phy_line_state_i signal for an extended period of time. The core comes out of the suspend under the following conditions : - If there is any activity on the phy_line_state_i signal, or - If the application writes to the Remote Wakeup Signaling bit in the Device Control register (DCTL.RmtWkUpSig). When the core comes out of the suspend, this bit is set to 1'b0. Default Value: 0x0 **0x1: ACTIVE :** Suspend state **0x0: INACTIVE :** No suspend state

24.1.51 USBHS_DWC_otg_intreg_DIEPMSK

Description: This register works with each of the Device IN Endpoint Interrupt (DIEPINTn) registers for all endpoints to generate an interrupt per IN endpoint. The IN endpoint interrupt for a specific status in the DIEPINTn register can be masked by writing to the corresponding bit in this register. Status bits are masked by default.

Address: 0x44900810

6	Back2BackSETup	Back-to-Back SETUP Packets Received Mask (Back2BackSETup) Applies to control OUT endpoints only. Default Value: 0x0 **0x0: MASK :** Mask Back-to-Back SETUP Packets Received Interrupt **0x1: NOMASK :** No Back-to-Back SETUP Packets Received Interrupt Mask
5	StsPhseRcvdMsk	Status Phase Received Mask (StsPhseRcvdMsk) Applies to control OUT endpoints only. Default Value: 0x0 **0x0: MASK :** Status Phase Received Mask **0x1: NOMASK :** No Status Phase Received Mask
4	OUTTknEPdisMsk	OUT Token Received when Endpoint Disabled Mask (OUTTknEPdisMsk) Applies to control OUT endpoints only. Default Value: 0x0

24.1.52 USBHS_DWC_otg_intreg_DOEPMSK (continued)

		0x0: MASK : Mask OUT Token Received when Endpoint Disabled Interrupt **0x1: NOMASK :** No OUT Token Received when Endpoint Disabled Interrupt Mask
3	SetUPMsk	SETUP Phase Done Mask (SetUPMsk) Applies to control endpoints only. Default Value: 0x0 **0x0: MASK :** Mask SETUP Phase Done Interrupt **0x1: NOMASK :** No SETUP Phase Done Interrupt Mask
2	AHBErrMsk	AHB Error (AHBErrMsk) Default Value: 0x0 **0x0: MASK :** Mask AHB Error Interrupt **0x1: NOMASK :** No AHB Error Interrupt Mask
1	EPDisbldMsk	Endpoint Disabled Interrupt Mask (EPDisbldMsk) Default Value: 0x0 **0x0: MASK :** Mask Endpoint Disabled Interrupt **0x1: NOMASK :** No Endpoint Disabled Interrupt Mask
0	XferComplMsk	Transfer Completed Interrupt Mask (XferComplMsk) Default Value: 0x0 **0x0: MASK :** Mask Transfer Completed Interrupt **0x1: NOMASK :** No Transfer Completed Interrupt Mask

24.1.53 USBHS_DWC_otg_intreg_DAINT

Description: When a significant event occurs on an endpoint, a Device All Endpoints Interrupt register interrupts the application using the Device OUT Endpoints Interrupt bit or Device IN Endpoints Interrupt bit of the Core Interrupt register (GINTSTS.OEPInt or GINTSTS.IEPInt, respectively). This is shown in Figure 5-2. There is one interrupt bit per endpoint, up to a maximum of 16 bits for OUT endpoints and 16 bits for IN endpoints. For a bidirectional endpoint, the corresponding IN and OUT interrupt bits are used. Bits in this register are set and cleared when the application sets and clears bits in the corresponding Device Endpoint-n Interrupt register (DIEPINTn/DOEPINTn).

HW Access								
Name	RxThrLen [23:17]							RxThrEn

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved				RW	Reserved	RW	
HW Access	Reserved					Reserved		
Name	Reserved [31:28]				ArbPrkEn	Reserved	RxThrLen [25:24]	

Bits	Name	Description
27	ArbPrkEn	Arbiter Parking Enable (ArbPrkEn) This bit controls internal DMA arbiter parking for IN endpoints. If thresholding is enabled and this bit is set to one, then the arbiter parks on the IN endpoint for which there is a token received on the USB. This is done to avoid getting into underrun conditions. By default, arbiter parking is enabled. Default Value: 0x1 **0x0: DISABLED :** Disable DMA arbiter parking **0x1: ENABLED :** Enable DMA arbiter parking for IN endpoints
25 : 17	RxThrLen	Receive Threshold Length (RxThrLen) This field specifies Receive thresholding size in DWORDS. This field also specifies the amount of data received on the USB before the core can start transmitting on the AHB. The threshold length has to be at least eight DWORDS. The recommended value for ThrLen is to be the same as the programmed AHB Burst Length (GAHBCFG.HBstLen). Default Value: 0x8

24.1.57 USBHS_DWC_otg_intreg_DTHRCTL (continued)

16	RxThrEn	Receive Threshold Enable (RxThrEn) When this bit is set, the core enables thresholding in the receive direction. Note: We recommends that you do not enable RxThrEn, because it may cause issues in the Rx-FIFO especially during error conditions such as RxError and Babble. Default Value: 0x0 **0x0: DISABLED :** Disable thresholding **0x1: ENABLED :** Enable thresholding in the receive direction
12 : 11	AHBThrRatio	AHB Threshold Ratio (AHBThrRatio) These bits define the ratio between the AHB threshold and the MAC threshold for the transmit path only. The AHB threshold always remains less than or equal to the USB threshold, because this does not increase overhead. Both the AHB and the MAC threshold must be DWORD-aligned. The application needs to program TxThrLen and the AHBThrRatio to make the AHB Threshold value DWORD aligned. If the AHB threshold value is not DWORD aligned, the core might not behave correctly. When programming the TxThrLen and AHBThrRatio, the application must ensure that the minimum AHB threshold value does not go below 8 DWORDS to meet the USB turnaround time requirements. - 2'b00: AHB threshold = MAC threshold - 2'b01: AHB threshold = MAC threshold / 2 - 2'b10: AHB threshold = MAC threshold / 4 - 2'b11: AHB threshold = MAC threshold / 8 Default Value: 0x0 **0x1: THRESONE :** AHB threshold = MAC threshold /2 **0x3: THRESTHREE :** AHB threshold = MAC threshold /8 **0x2: THRESTWO :** AHB threshold = MAC threshold /4 **0x0: THRESZERO :** AHB threshold = MAC threshold
10 : 2	TxThrLen	Transmit Threshold Length (TxThrLen) This field specifies Transmit thresholding size in DWORDS. This also forms the MAC threshold and specifies the amount of data in bytes to be in the corresponding endpoint transmit FIFO, before the core can start transmit on the USB. The threshold length has to be at least eight DWORDS when the value of AHBThrRatio is 2'h00. In case the AHBThrRatio is non zero the application needs to ensure that the AHB Threshold value does not go below the recommended eight DWORD. This field controls both isochronous and non-isochronous IN endpoint thresholds. The recommended value for ThrLen is to be the same as the programmed AHB Burst Length (GAHBCFG.HBstLen). Note: - When OTG_ARCHITECTURE=0, the reset value of this register field is 0. - When OTG_ARCHITECTURE=2, the reset value of this register field is 8. Default Value: 0x8

24.1.57 USBHS_DWC_otg_intreg_DTHRCTL (continued)

1	ISOThrEn	ISO IN Endpoints Threshold Enable. (ISOThrEn) When this bit is Set, the core enables thresholding for isochronous IN endpoints. Default Value: 0x0 **0x0: DISABLED :** No thresholding **0x1: ENABLED :** Enables thresholding for isochronous IN endpoints
0	NonISOThrEn	Non-ISO IN Endpoints Threshold Enable. (NonISOThrEn) When this bit is Set, the core enables thresholding for Non Isochronous IN endpoints. Default Value: 0x0 **0x0: DISABLED :** No thresholding **0x1: ENABLED :** Enable thresholding for non-isochronous IN endpoints

24.1.58 USBHS_DWC_otg_intreg_DIEPEMPMSK

Description: This register is valid only in Dedicated FIFO operation (OTG_EN_DED_TX_FIFO = 1). This register is used to control the IN endpoint FIFO empty interrupt generation (DIEPINTn.TxfEmp).

Address: 0x44900834

SW Access	RW	RW	Reserved		W	W	RW	
HW Access			Reserved					
Name	EPEna	EPDis	Reserved [29:28]		SNAK	CNAK	TxFNum [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) When Scatter/Gather DMA mode is enabled for IN endpoints, this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. When Scatter/Gather DMA mode is disabled (such as in buffer pointer based DMA mode) this bit indicates that data is ready to be transmitted on the endpoint. The core clears this bit before setting the following interrupts on this endpoint: - Endpoint Disabled - Transfer Completed Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No action
30	EPDis	Endpoint Disable (EPDis) The application sets this bit to stop transmitting data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled Interrupt. The application must Set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0

24.1.59 USBHS_DWC_otg_intreg_DIEPCTL0 (continued)

		0x1: ACTIVE : Disabled Endpoint **0x0: INACTIVE :** No action
27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x0: NOSET :** No action **0x1: SET :** Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: CLEAR :** Clear NAK **0x0: NOCLEAR :** No action
25 : 22	TxFNum	TxFIFO Number (TxFNum) - For Shared FIFO operation, this value is always set to 0, indicating that control IN endpoint 0 data is always written in the Non-Periodic Transmit FIFO. - For Dedicated FIFO operation, this value is set to the FIFO number that is assigned to IN Endpoint. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11

21	Stall	STALL Handshake (Stall) The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Nonperiodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Default Value: 0x0 **0x1: ACTIVE :** Stall Handshake

24.1.59 USBHS_DWC_otg_intreg_DIEPCTL0 (continued)

		0x0: INACTIVE : No Stall
19 : 18	EPType	Endpoint Type (EPType) Hardcoded to 00 for control. Default Value: 0x0 **0x0: ACTIVE :** Endpoint Control 0
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status - 1'b1: The core is transmitting NAK handshakes on this endpoint. When this bit is set, either by the application or core, the core stops transmitting data, even If there is data available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** The core is transmitting NAK handshakes on this endpoint **0x0: INACTIVE :** The core is transmitting non-NAK handshakes based on the FIFO status
15	USBActEP	USB Active Endpoint (USBActEP) This bit is always SET to 1, indicating that control endpoint 0 is always active in all configurations and interfaces. Default Value: 0x1 **0x1: ACTIVE0 :** Control endpoint is always active
1 : 0	MPS	Maximum Packet Size (MPS) Applies to IN and OUT endpoints. The application must program this field with the maximum packet size for the current logical end-point. - 2'b00: 64 bytes - 2'b01: 32 bytes - 2'b10: 16 bytes - 2'b11: 8 bytes Default Value: 0x0 **0x2: BYTES16 :** 16 bytes **0x1: BYTES32 :** 32 bytes **0x0: BYTES64 :** 64 bytes

8 bytes

24.1.60 USBHS_DWC_otg_intreg_DIEPINT0

Description: This register indicates the status of an endpoint with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the OUT Endpoints Interrupt bit or IN Endpoints Interrupt bit of the Core Interrupt register (GINTSTS.OEPInt or GINTSTS.IEPInt, respectively) is set. Before the application can read this register, it must first read the Device All Endpoints Interrupt (DAINT) register to get the exact endpoint number for the Device Endpoint-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the DAINT and GINTSTS registers

Address: 0x44900908

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. : 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.60 USBHS_DWC_otg_intreg_DIEPINT0 (continued)

		0x0: INACTIVE : No interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints only. The core generates this interrupt when it detects a transmit FIFO underrun condition in threshold mode for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Fifo Underrun interrupt **0x0: INACTIVE :** No Fifo Underrun interrupt

24.1.60 USBHS_DWC_otg_intreg_DIEPINT0 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN Endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No IN Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received when TxFIFO Empty Interrupt

24.1.60 USBHS_DWC_otg_intreg_DIEPINT0 (continued)

		0x0: INACTIVE : No IN Token Received when TxFIFO Empty interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.60 USBHS_DWC_otg_intreg_DIEPINT0 (continued)

0x1: ACTIVE :

Transfer Completed Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.61 USBHS_DWC_otg_intreg_DIEPTSIZ0

Description: The application must modify this register before enabling endpoint 0. Once endpoint 0 is enabled using Endpoint Enable bit of the Device Control Endpoint 0 Control registers (DIEPCTL0.EPEna/DOEPCTL0.EPEna), the core modifies this register. The application can only read this register once the core has cleared the Endpoint Enable bit. Nonzero endpoints use the registers for endpoints 115. When Scatter/Gather DMA mode is enabled, this register must not be programmed by the application. If the application reads this register when Scatter/Gather DMA mode is enabled, the core returns all zeros.

Address: 0x44900910

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
20 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. - IN Endpoints : This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. - OUT Endpoints: This field is decremented every time a packet (maximum size or short packet) is written to the RxFIFO. Default Value: 0x0
6 : 0	XferSize	Transfer Size (XferSize) This field contains the transfer size in bytes for the current endpoint. The transfer size (XferSize) = Sum of buffer sizes across all descriptors in the list for the endpoint. In Buffer DMA, the core only interrupts the application after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. - IN Endpoints: The core decrements this field every time a packet from the external memory is written to the TxFIFO. - OUT Endpoints: The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.62 USBHS_DWC_otg_intreg_DIEPDMA0

Description: This register contains the DMA Address for the IN Endpoint 0 of the Device controller.

Address: 0x44900914

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	DMAAddr This field holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.63 USBHS_DWC_otg_intreg_DTXFSTS0

Description: This register contains information about the IN Endpoint Transmit FIFO of the Device controller.

Address: 0x44900918

Retention: Not Retained

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.65 USBHS_DWC_otg_intreg_DIEPCTL1 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.65 USBHS_DWC_otg_intreg_DIEPCTL1 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.65 USBHS_DWC_otg_intreg_DIEPCTL1 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.65 USBHS_DWC_otg_intreg_DIEPCTL1 (continued)

		0x1: ACTIVE : STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUP :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.65 USBHS_DWC_otg_intreg_DIEPCTL1 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.66 USBHS_DWC_otg_intreg_DIEPINT1

Description: This register contains the interrupts for the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900928

Retention: Not Retained

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.66 USBHS_DWC_otg_intreg_DIEPINT1 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.66 USBHS_DWC_otg_intreg_DIEPINT1 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.66 USBHS_DWC_otg_intreg_DIEPINT1 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.66 USBHS_DWC_otg_intreg_DIEPINT1 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.67 USBHS_DWC_otg_intreg_DIEPTSIZ1

Description: This register reflects the Transfer Size of the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900930

Retention: Not Retained

SW Access	Reserved	RW		RW				
HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.67 USBHS_DWC_otg_intreg_DIEPTSIZ1 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.68 USBHS_DWC_otg_intreg_DIEPDMA1

Description: This register contains the DMA Address for the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900934

Retention: Not Retained

SW Access	RW							
HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.69 USBHS_DWC_otg_intreg_DTXFSTS1

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 1 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

HW Access								
Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	TxFNum [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.71 USBHS_DWC_otg_intreg_DIEPCTL2 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.71 USBHS_DWC_otg_intreg_DIEPCTL2 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.71 USBHS_DWC_otg_intreg_DIEPCTL2 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.71 USBHS_DWC_otg_intreg_DIEPCTL2 (continued)

		0x1: ACTIVE : STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUP :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.71 USBHS_DWC_otg_intreg_DIEPCTL2 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.72 USBHS_DWC_otg_intreg_DIEPINT2

Description: This register contains the interrupts for the IN Endpoint 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900948

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.72 USBHS_DWC_otg_intreg_DIEPINT2 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.72 USBHS_DWC_otg_intreg_DIEPINT2 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.72 USBHS_DWC_otg_intreg_DIEPINT2 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.72 USBHS_DWC_otg_intreg_DIEPINT2 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.73 USBHS_DWC_otg_intreg_DIEPTSIZ2

Description: This register reflects the Transfer Size of the IN Endpoint 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900950

Retention: Not Retained

SW Access	Reserved	RW		RW				
HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.73 USBHS_DWC_otg_intreg_DIEPTSIZ2 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.74 USBHS_DWC_otg_intreg_DIEPDMA2

Description: This register contains the DMA Address for the IN Endpoint 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900954

Retention: Not Retained

HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.75 USBHS_DWC_otg_intreg_DTXFSTS2

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 2 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

HW Access								
Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	TxFNum [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.77 USBHS_DWC_otg_intreg_DIEPCTL3 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.77 USBHS_DWC_otg_intreg_DIEPCTL3 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.77 USBHS_DWC_otg_intreg_DIEPCTL3 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.77 USBHS_DWC_otg_intreg_DIEPCTL3 (continued)

		0x1: ACTIVE : STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUP :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.77 USBHS_DWC_otg_intreg_DIEPCTL3 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.78 USBHS_DWC_otg_intreg_DIEPINT3

Description: This register contains the interrupts for the IN Endpoint 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900968

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.78 USBHS_DWC_otg_intreg_DIEPINT3 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.78 USBHS_DWC_otg_intreg_DIEPINT3 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.78 USBHS_DWC_otg_intreg_DIEPINT3 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.78 USBHS_DWC_otg_intreg_DIEPINT3 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.79 USBHS_DWC_otg_intreg_DIEPTSIZ3

Description: This register reflects the Transfer Size of the IN Endpoint 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900970

Retention: Not Retained

HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.79 USBHS_DWC_otg_intreg_DIEPTSIZ3 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.80 USBHS_DWC_otg_intreg_DIEPDMA3

Description: This register contains the DMA Address for the IN Endpoint 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

SW Access	RW							
HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.81 USBHS_DWC_otg_intreg_DTXFSTS3

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 3 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900978

Retention: Not Retained

Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	TxFNum [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.83 USBHS_DWC_otg_intreg_DIEPCTL4 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.83 USBHS_DWC_otg_intreg_DIEPCTL4 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.83 USBHS_DWC_otg_intreg_DIEPCTL4 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.83 USBHS_DWC_otg_intreg_DIEPCTL4 (continued)

		0x1: ACTIVE : STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUP :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.83 USBHS_DWC_otg_intreg_DIEPCTL4 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.84 USBHS_DWC_otg_intreg_DIEPINT4

Description: This register contains the interrupts for the IN Endpoint 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900988

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.84 USBHS_DWC_otg_intreg_DIEPINT4 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.84 USBHS_DWC_otg_intreg_DIEPINT4 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.84 USBHS_DWC_otg_intreg_DIEPINT4 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.84 USBHS_DWC_otg_intreg_DIEPINT4 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.85 USBHS_DWC_otg_intreg_DIEPTSIZ4

Description: This register reflects the Transfer Size of the IN Endpoint 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900990

SW Access	Reserved	RW		RW				
HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.85 USBHS_DWC_otg_intreg_DIEPTSIZ4 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.86 USBHS_DWC_otg_intreg_DIEPDMA4

Description: This register contains the DMA Address for the IN Endpoint 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900994

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.87 USBHS_DWC_otg_intreg_DTXFSTS4

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 4 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	TxFNum [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.89 USBHS_DWC_otg_intreg_DIEPCTL5 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.89 USBHS_DWC_otg_intreg_DIEPCTL5 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.89 USBHS_DWC_otg_intreg_DIEPCTL5 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.89 USBHS_DWC_otg_intreg_DIEPCTL5 (continued)

0x1: ACTIVE :

STALL All Active Tokens

0x0: INACTIVE :

STALL All non-active tokens

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0

0x2: BULK :

Bulk

0x0: CONTROL :

Control

0x3: INTERRUP :

Interrupt

0x1: ISOCHRONOUS :

Isochronous

17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

0x1: NAK :

The core is transmitting NAK handshakes on this endpoint

0x0: NONNAK :

The core is transmitting non-NAK handshakes based on the FIFO status

24.1.89 USBHS_DWC_otg_intreg_DIEPCTL5 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.90 USBHS_DWC_otg_intreg_DIEPINT5

Description: This register contains the interrupts for the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009A8

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.90 USBHS_DWC_otg_intreg_DIEPINT5 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.90 USBHS_DWC_otg_intreg_DIEPINT5 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.90 USBHS_DWC_otg_intreg_DIEPINT5 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.90 USBHS_DWC_otg_intreg_DIEPINT5 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.91 USBHS_DWC_otg_intreg_DIEPTSIZ5

Description: This register reflects the Transfer Size of the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009B0

Retention: Not Retained

HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.91 USBHS_DWC_otg_intreg_DIEPTSIZ5 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.92 USBHS_DWC_otg_intreg_DIEPDMA5

Description: This register contains the DMA Address for the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009B4

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.93 USBHS_DWC_otg_intreg_DTXFSTS5

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 5 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	TxFNum [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.95 USBHS_DWC_otg_intreg_DIEPCTL6 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.95 USBHS_DWC_otg_intreg_DIEPCTL6 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.95 USBHS_DWC_otg_intreg_DIEPCTL6 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.95 USBHS_DWC_otg_intreg_DIEPCTL6 (continued)

		0x1: ACTIVE : STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUP :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.95 USBHS_DWC_otg_intreg_DIEPCTL6 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.96 USBHS_DWC_otg_intreg_DIEPINT6

Description: This register contains the interrupts for the IN Endpoint 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009C8

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.96 USBHS_DWC_otg_intreg_DIEPINT6 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.96 USBHS_DWC_otg_intreg_DIEPINT6 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.96 USBHS_DWC_otg_intreg_DIEPINT6 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.96 USBHS_DWC_otg_intreg_DIEPINT6 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.97 USBHS_DWC_otg_intreg_DIEPTSIZ6

Description: This register reflects the Transfer Size of the IN Endpoint 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009D0

HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.97 USBHS_DWC_otg_intreg_DIEPTSIZ6 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.98 USBHS_DWC_otg_intreg_DIEPDMA6

Description: This register contains the DMA Address for the IN Endpoint 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009D4

Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.99 USBHS_DWC_otg_intreg_DTXFSTS6

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 6 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.101 USBHS_DWC_otg_intreg_DIEPCTL7 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.101 USBHS_DWC_otg_intreg_DIEPCTL7 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.101 USBHS_DWC_otg_intreg_DIEPCTL7 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.101 USBHS_DWC_otg_intreg_DIEPCTL7 (continued)

0x1: ACTIVE :

STALL All Active Tokens

0x0: INACTIVE :

STALL All non-active tokens

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0

0x2: BULK :

Bulk

0x0: CONTROL :

Control

0x3: INTERRUP :

Interrupt

0x1: ISOCHRONOUS :

Isochronous

17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

0x1: NAK :

The core is transmitting NAK handshakes on this endpoint

0x0: NONNAK :

The core is transmitting non-NAK handshakes based on the FIFO status

24.1.101 USBHS_DWC_otg_intreg_DIEPCTL7 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.102 USBHS_DWC_otg_intreg_DIEPINT7

Description: This register contains the interrupts for the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009E8

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.102 USBHS_DWC_otg_intreg_DIEPINT7 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.102 USBHS_DWC_otg_intreg_DIEPINT7 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.102 USBHS_DWC_otg_intreg_DIEPINT7 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.102 USBHS_DWC_otg_intreg_DIEPINT7 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.103 USBHS_DWC_otg_intreg_DIEPTSIZ7

Description: This register reflects the Transfer Size of the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009F0

Retention: Not Retained

HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.103 USBHS_DWC_otg_intreg_DIEPTSIZ7 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.104 USBHS_DWC_otg_intreg_DIEPDMA7

Description: This register contains the DMA Address for the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x449009F4

Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.105 USBHS_DWC_otg_intreg_DTXFSTS7

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 7 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.107 USBHS_DWC_otg_intreg_DIEPCTL8 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	SetD1PID - Set DATA1 PID (SetD1PID) -- Applies to interrupt and bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. -- This field is applicable both for Scatter-Gather DMA mode and non Scatter-Gather DMA mode. - Set odd (micro)Frame (SetOddFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the even and odd (micro)Frame (EO_FrNum) field to odd (micro)Frame. -- This field is not applicable for Scatter-Gather DMA mode. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID **0x1: ENABLED :** Enables Set DATA1 PID
28	SetD0PID	SetD0PID - Set DATA0 PID (SetD0PID) -- Applies to interrupt/bulk IN and OUT endpoints only. -- Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. -- This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)Frame (SetEvenFr) -- Applies to isochronous IN and OUT endpoints only. -- Writing to this field sets the Even/Odd (micro)Frame (EO_FrNum) field to even (micro)Frame. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID **0x1: ENABLED :** Endpoint Data PID to DATA0)

24.1.107 USBHS_DWC_otg_intreg_DIEPCTL8 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
25 : 22	TxFNum	TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - 4'h0: Non-Periodic TxFIFO - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints. Default Value: 0x0 **0x0: TXFIFO0 :** Tx FIFO 0 **0x1: TXFIFO1 :** Tx FIFO 1 **0xa: TXFIFO10 :** Tx FIFO 10 **0xb: TXFIFO11 :** Tx FIFO 11 **0xc: TXFIFO12 :** Tx FIFO 12

24.1.107 USBHS_DWC_otg_intreg_DIEPCTL8 (continued)

		0xd: TXFIFO13 : Tx FIFO 13 **0xe: TXFIFO14 :** Tx FIFO 14 **0xf: TXFIFO15 :** Tx FIFO 15 **0x2: TXFIFO2 :** Tx FIFO 2 **0x3: TXFIFO3 :** Tx FIFO 3 **0x4: TXFIFO4 :** Tx FIFO 4 **0x5: TXFIFO5 :** Tx FIFO 5 **0x6: TXFIFO6 :** Tx FIFO 6 **0x7: TXFIFO7 :** Tx FIFO 7 **0x8: TXFIFO8 :** Tx FIFO 8 **0x9: TXFIFO9 :** Tx FIFO 9
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

24.1.107 USBHS_DWC_otg_intreg_DIEPCTL8 (continued)

0x1: ACTIVE :

STALL All Active Tokens

0x0: INACTIVE :

STALL All non-active tokens

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0

0x2: BULK :

Bulk

0x0: CONTROL :

Control

0x3: INTERRUP :

Interrupt

0x1: ISOCHRONOUS :

Isochronous

17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0

0x1: NAK :

The core is transmitting NAK handshakes on this endpoint

0x0: NONNAK :

The core is transmitting non-NAK handshakes based on the FIFO status

24.1.107 USBHS_DWC_otg_intreg_DIEPCTL8 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - 1'b0: Even (micro)frame - 1'b1: Odd (micro)frame When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Default Value: 0x0 **0x0: DATA0EVENFRM :** DATA0 or Even Frame **0x1: DATA1ODDFRM :** DATA1 or Odd Frame
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical end-point. This value is in bytes. Default Value: 0x0

24.1.108 USBHS_DWC_otg_intreg_DIEPINT8

Description: This register contains the interrupts for the IN Endpoint 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900A08

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt

24.1.108 USBHS_DWC_otg_intreg_DIEPINT8 (continued)

		0x0: INACTIVE : No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done. Default Value: 0x0 **0x1: ACTIVE :** BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	TxfifoUndrn	Fifo Underrun (TxfifoUndrn) Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** TxFIFO Underrun interrupt **0x0: INACTIVE :** No Tx FIFO Underrun interrupt

24.1.108 USBHS_DWC_otg_intreg_DIEPINT8 (continued)

7	TxFEmp	Transmit FIFO Empty (TxFEmp) This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)). Default Value: 0x1 **0x1: ACTIVE :** Transmit FIFO Empty interrupt **0x0: INACTIVE :** No Transmit FIFO Empty interrupt
6	INEPNakEff	IN Endpoint NAK Effective (INEPNakEff) Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCT-Ln.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit. Default Value: 0x0 **0x1: ACTIVE :** IN Endpoint NAK Effective interrupt **0x0: INACTIVE :** No Endpoint NAK Effective interrupt
5	INTknEPMis	IN Token Received with EP Mismatch (INTknEPMis) Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received with EP Mismatch interrupt **0x0: INACTIVE :** No IN Token Received with EP Mismatch interrupt
4	INTknTXFEmp	IN Token Received When TxFIFO is Empty (INTknTXFEmp) Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received. Default Value: 0x0 **0x1: ACTIVE :** IN Token Received Interrupt

24.1.108 USBHS_DWC_otg_intreg_DIEPINT8 (continued)

		0x0: INACTIVE : No IN Token Received interrupt
3	TimeOUT	Timeout Condition (TimeOUT) - In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Timeout interrupt **0x0: INACTIVE :** No Timeout interrupt
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt
0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0

24.1.108 USBHS_DWC_otg_intreg_DIEPINT8 (continued)

0x1: ACTIVE :

Transfer Complete Interrupt

0x0: INACTIVE :

No Transfer Complete Interrupt

24.1.109 USBHS_DWC_otg_intreg_DIEPTSIZ8

Description: This register reflects the Transfer Size of the IN Endpoint 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900A10

Retention: Not Retained

HW Access	Reserved							
Name	Reserved	MC [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetchfor an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp) Default Value: 0x0 **0x1: PACKETONE :** 1 packet **0x3: PACKETTHREE :** 3 packets **0x2: PACKETTWO :** 2 packets

24.1.109 USBHS_DWC_otg_intreg_DIEPTSIZ8 (continued)

28 : 19	PktCnt	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO. Default Value: 0x0

24.1.110 USBHS_DWC_otg_intreg_DIEPDMA8

Description: This register contains the DMA Address for the IN Endpoint 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Address: 0x44900A14

HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.111 USBHS_DWC_otg_intreg_DTXFSTS8

Description: This register reflects the status of the IN Endpoint Transmit FIFO Status Register 8 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

SW Access	RW	R	Reserved		W	W	Reserved	
HW Access			Reserved				Reserved	
Name	EPEna	EPDis	Reserved [29:28]		SNAK	CNAK	Reserved [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) - When Scatter/Gather DMA mode is enabled, for OUT endpoints this bit indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is disabled (such as for buffer-pointer based DMA mode)this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: In DMA mode, this bit must be set for the core to transfer SETUP data packets into memory and it will not be cleared on Transfer Completed interrupt of SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No action
30	EPDis	Endpoint Disable (EPDis) The application cannot disable control OUT endpoint 0. Default Value: 0x0

24.1.113 USBHS_DWC_otg_intreg_DOEPCTL0 (continued)

		0x0: INACTIVE : No Endpoint disable
27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set bit on a Transfer Completed interrupt, or after a SETUP is received on the endpoint. Default Value: 0x0 **0x0: NOSET :** No action **0x1: SET :** Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: CLEAR :** Clear NAK **0x0: NOCLEAR :** No action
21	Stall	STALL Handshake (Stall) The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit or Global OUT NAK is Set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** Stall Handshake **0x0: INACTIVE :** No Stall
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL0 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL0 :** Reserved 1
19 : 18	EPType	Endpoint Type (EPType) Hardcoded to 2'b00 for control. Default Value: 0x0

24.1.113 USBHS_DWC_otg_intreg_DOEPCTL0 (continued)

		0x0: ACTIVE : Endpoint Control 0
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit, the core stops receiving data, even If there is space in the RxFIFO to accommodate the incoming packet. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** The core is transmitting NAK handshakes on this endpoint **0x0: INACTIVE :** The core is transmitting non-NAK handshakes based on the FIFO status
15	USBActEP	USB Active Endpoint (USBActEP) This bit is always set to 1, indicating that a control endpoint 0 is always active in all configurations and interfaces. Default Value: 0x1 **0x1: ACTIVE :** USB Active Endpoint 0
1 : 0	MPS	Maximum Packet Size (MPS) The maximum packet size for control OUT endpoint 0 is the same as what is programmed in control IN Endpoint 0. - 2'b00: 64 bytes - 2'b01: 32 bytes - 2'b10: 16 bytes - 2'b11: 8 bytes Default Value: 0x0 **0x2: BYTE16 :** 16 bytes **0x1: BYTE32 :** 32 bytes **0x0: BYTE64 :** 64 bytes **0x3: BYTE8 :** 8 bytes

24.1.114 USBHS_DWC_otg_intreg_DOEPINT0

Name	Reserved [31:24]							

Bits	Name	Description
15	StupPktRcvd	Setup Packet Received Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used. - 1'b0: No Setup packet received - 1'b1: Setup packet received Reset: 1'b0 Default Value: 0x0 **0x0: NOT_RCVD :** No Setup packet received **0x1: RCVD :** Setup packet received

24.1.114 USBHS_DWC_otg_intreg_DOEPINT0 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the core to process, such as Host busy or DMA done. Default Value: 0x0

24.1.114 USBHS_DWC_otg_intreg_DOEPINT0 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write

24.1.114 USBHS_DWC_otg_intreg_DOEPINT0 (continued)

4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0 **0x1: ACTIVE :** OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.114 USBHS_DWC_otg_intreg_DOEPINT0 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled - For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. - For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. Note: In DMA mode, this bit must be set for the core to transfer SETUP data packets into memory. When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.115 USBHS_DWC_otg_intreg_DOEPTSIZ0

Description: This register contains the Transfer Size for the OUT Endpoint 0 of the Device controller.

Address: 0x44900B10

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Name	Reserved	SUPCnt [30:29]		Reserved [28:24]				

Bits	Name	Description
30 : 29	SUPCnt	SETUP Packet Count (SUPCnt) This field specifies the number of back-to-back SETUP data packets the endpoint can receive. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets Default Value: 0x0 **0x1: ONEPACKET :** 1 packet **0x3: THREEPACKET :** 3 packets **0x2: TWOPACKET :** 2 packets
19	PktCnt	Packet Count (PktCnt) This field is decremented to zero after a packet is written into the RxFIFO. Default Value: 0x0

24.1.115 USBHS_DWC_otg_intreg_DOEPTSIZ0 (continued)

6 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.116 USBHS_DWC_otg_intreg_DOEPDMA0

Description: This register contains the DMA Address for the OUT Endpoint 0 of the Device controller.

Address: 0x44900B14

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access							Reserved	
Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	Reserved [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.118 USBHS_DWC_otg_intreg_DOEPCTL1 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.118 USBHS_DWC_otg_intreg_DOEPCTL1 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL1 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL1 :** Reserved 1

24.1.118 USBHS_DWC_otg_intreg_DOEPCTL1 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.118 USBHS_DWC_otg_intreg_DOEPCTL1 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.119 USBHS_DWC_otg_intreg_DOEPINT1

Description: This register contains the interrupts for the OUT Endpoint 1 of the Device controller.

Address: 0x44900B28

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15	StupPktRcvd	Setup Packet Received Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used. - 1'b0: No Setup packet received - 1'b1: Setup packet received Reset: 1'b0 Default Value: 0x0 **0x0: NOT_RCVD :** No Setup packet received **0x1: RCVD :** Setup packet received

24.1.119 USBHS_DWC_otg_intreg_DOEPINT1 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.119 USBHS_DWC_otg_intreg_DOEPINT1 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.119 USBHS_DWC_otg_intreg_DOEPINT1 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.119 USBHS_DWC_otg_intreg_DOEPINT1 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.120 USBHS_DWC_otg_intreg_DOEPTSIZ1

Description: This register contains the Transfer Size for the OUT Endpoint 1 of the Device controller.

Address: 0x44900B30

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.123 USBHS_DWC_otg_intreg_DOEPCTL2 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.123 USBHS_DWC_otg_intreg_DOEPCTL2 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL2 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL2 :** Reserved 1

24.1.123 USBHS_DWC_otg_intreg_DOEPCTL2 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.123 USBHS_DWC_otg_intreg_DOEPCTL2 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.124 USBHS_DWC_otg_intreg_DOEPINT2

Description: This register contains the interrupts for the OUT Endpoint 2 of the Device controller.

Address: 0x44900B48

Retention: Not Retained

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15	StupPktRcvd	Setup Packet Received Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used. - 1'b0: No Setup packet received - 1'b1: Setup packet received Reset: 1'b0 Default Value: 0x0 **0x0: NOT_RCVD :** No Setup packet received **0x1: RCVD :** Setup packet received

24.1.124 USBHS_DWC_otg_intreg_DOEPINT2 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.124 USBHS_DWC_otg_intreg_DOEPINT2 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.124 USBHS_DWC_otg_intreg_DOEPINT2 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.124 USBHS_DWC_otg_intreg_DOEPINT2 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.125 USBHS_DWC_otg_intreg_DOEPTSIZ2

Description: This register contains the Transfer Size for the OUT Endpoint 2 of the Device controller.

Address: 0x44900B50

Retention: Not Retained

HW Access	Reserved							
Name	Reserved	RxDPID [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	RxDPID	RxDPID Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. - 2'b00: DATA0 - 2'b01: DATA2 - 2'b10: DATA1 - 2'b11: MDATA SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets Default Value: 0x0 **0x0: DATA0 :** DATA0 **0x2: DATA1PACKET2 :** DATA1 or 2 packets

24.1.125 USBHS_DWC_otg_intreg_DOEPTSIZ2 (continued)

		0x1: DATA2PACKET1 : DATA2 or 1 packet **0x3: MDATAPACKET3 :** MDATA or 3 packets
28 : 19	PktCnt	Packet Count (PktCnt) This field is decremented to zero after a packet is written into the RxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.126 USBHS_DWC_otg_intreg_DOEPDMA2

Description: This register contains the DMA Address for the OUT Endpoint 2 of the Device controller.

Address: 0x44900B54

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW							
HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.127 USBHS_DWC_otg_intreg_DOEPDMAB2

Description: This register contains the DMA Buffer Address for the OUT Endpoint 2 of the Device controller.

31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.128 USBHS_DWC_otg_intreg_DOEPCTL3 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.128 USBHS_DWC_otg_intreg_DOEPCTL3 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL3 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL3 :** Reserved 1

24.1.128 USBHS_DWC_otg_intreg_DOEPCTL3 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.128 USBHS_DWC_otg_intreg_DOEPCTL3 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.129 USBHS_DWC_otg_intreg_DOEPINT3

Description: This register contains the interrupts for the OUT Endpoint 3 of the Device controller.

Address: 0x44900B68

Retention: Not Retained

Bits	Name	Description
15	StupPktRcvd	Setup Packet Received Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used. - 1'b0: No Setup packet received - 1'b1: Setup packet received Reset: 1'b0 Default Value: 0x0 **0x0: NOT_RCVD :** No Setup packet received **0x1: RCVD :** Setup packet received

24.1.129 USBHS_DWC_otg_intreg_DOEPINT3 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.129 USBHS_DWC_otg_intreg_DOEPINT3 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.129 USBHS_DWC_otg_intreg_DOEPINT3 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.129 USBHS_DWC_otg_intreg_DOEPINT3 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.130 USBHS_DWC_otg_intreg_DOEPTSIZ3

Description: This register contains the Transfer Size for the OUT Endpoint 3 of the Device controller.

Address: 0x44900B70

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access	Reserved							
Name	Reserved	RxDPID [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	RxDPID	RxDPID Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. - 2'b00: DATA0 - 2'b01: DATA2 - 2'b10: DATA1 - 2'b11: MDATA SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets Default Value: 0x0 **0x0: DATA0 :** DATA0 **0x2: DATA1PACKET2 :** DATA1 or 2 packets

24.1.130 USBHS_DWC_otg_intreg_DOEPTSIZ3 (continued)

		0x1: DATA2PACKET1 : DATA2 or 1 packet **0x3: MDATAPACKET3 :** MDATA or 3 packets
28 : 19	PktCnt	Packet Count (PktCnt) This field is decremented to zero after a packet is written into the RxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.131 USBHS_DWC_otg_intreg_DOEPDMA3

Description: This register contains the DMA Address for the OUT Endpoint 3 of the Device controller.

Address: 0x44900B74

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.132 USBHS_DWC_otg_intreg_DOEPDMAB3

Description: This register contains the DMA Buffer Address for the OUT Endpoint 3 of the Device controller.

Address: 0x44900B7C

Retention: Not Retained

SW Access	RW	RW	W	W	W	W	Reserved	
HW Access							Reserved	
Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	Reserved [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.133 USBHS_DWC_otg_intreg_DOEPCTL4 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.133 USBHS_DWC_otg_intreg_DOEPCTL4 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL4 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL4 :** Reserved 1

24.1.133 USBHS_DWC_otg_intreg_DOEPCTL4 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.133 USBHS_DWC_otg_intreg_DOEPCTL4 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.134 USBHS_DWC_otg_intreg_DOEPINT4

24.1.134 USBHS_DWC_otg_intreg_DOEPINT4 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.134 USBHS_DWC_otg_intreg_DOEPINT4 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.134 USBHS_DWC_otg_intreg_DOEPINT4 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.134 USBHS_DWC_otg_intreg_DOEPINT4 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.135 USBHS_DWC_otg_intreg_DOEPTSIZ4

Description: This register contains the Transfer Size for the OUT Endpoint 4 of the Device controller.

Address: 0x44900B90

Retention: Not Retained

Bits	Name	Description
30 : 29	RxDPID	RxDPID Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. - 2'b00: DATA0 - 2'b01: DATA2 - 2'b10: DATA1 - 2'b11: MDATA SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets Default Value: 0x0 **0x0: DATA0 :** DATA0 **0x2: DATA1PACKET2 :** DATA1 or 2 packets

24.1.135 USBHS_DWC_otg_intreg_DOEPTSIZ4 (continued)

		0x1: DATA2PACKET1 : DATA2 or 1 packet **0x3: MDATAPACKET3 :** MDATA or 3 packets
28 : 19	PktCnt	Packet Count (PktCnt) This field is decremented to zero after a packet is written into the RxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.136 USBHS_DWC_otg_intreg_DOEPDMA4

Description: This register contains the DMA Address for the OUT Endpoint 4 of the Device controller.

Address: 0x44900B94

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW	RW	W	W	W	W	Reserved	
HW Access							Reserved	
Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	Reserved [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.138 USBHS_DWC_otg_intreg_DOEPCTL5 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.138 USBHS_DWC_otg_intreg_DOEPCTL5 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL5 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL5 :** Reserved 1

24.1.138 USBHS_DWC_otg_intreg_DOEPCTL5 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.138 USBHS_DWC_otg_intreg_DOEPCTL5 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.139 USBHS_DWC_otg_intreg_DOEPINT5

Description: This register contains the interrupts for the OUT Endpoint 5 of the Device controller.

Address: 0x44900BA8

Retention: Not Retained

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15	StupPktRcvd	Setup Packet Received Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used. - 1'b0: No Setup packet received - 1'b1: Setup packet received Reset: 1'b0 Default Value: 0x0 **0x0: NOT_RCVD :** No Setup packet received **0x1: RCVD :** Setup packet received

24.1.139 USBHS_DWC_otg_intreg_DOEPINT5 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.139 USBHS_DWC_otg_intreg_DOEPINT5 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.139 USBHS_DWC_otg_intreg_DOEPINT5 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.139 USBHS_DWC_otg_intreg_DOEPINT5 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.140 USBHS_DWC_otg_intreg_DOEPTSIZ5

Description: This register contains the Transfer Size for the OUT Endpoint 5 of the Device controller.

Address: 0x44900BB0

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.142 USBHS_DWC_otg_intreg_DOEPDMAB5

Description: This register contains the DMA Buffer Address for the OUT Endpoint 5 of the Device controller.

Address: 0x44900BBC

Retention: Not Retained

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.143 USBHS_DWC_otg_intreg_DOEPCTL6 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.143 USBHS_DWC_otg_intreg_DOEPCTL6 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL6 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL6 :** Reserved 1

24.1.143 USBHS_DWC_otg_intreg_DOEPCTL6 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.143 USBHS_DWC_otg_intreg_DOEPCTL6 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.144 USBHS_DWC_otg_intreg_DOEPINT6

Description: This register contains the interrupts for the OUT Endpoint 6 of the Device controller.

Address: 0x44900BC8

Retention: Not Retained

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15	StupPktRcvd	Setup Packet Received Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used. - 1'b0: No Setup packet received - 1'b1: Setup packet received Reset: 1'b0 Default Value: 0x0 **0x0: NOT_RCVD :** No Setup packet received **0x1: RCVD :** Setup packet received

24.1.144 USBHS_DWC_otg_intreg_DOEPINT6 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.144 USBHS_DWC_otg_intreg_DOEPINT6 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.144 USBHS_DWC_otg_intreg_DOEPINT6 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.144 USBHS_DWC_otg_intreg_DOEPINT6 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.145 USBHS_DWC_otg_intreg_DOEPTSIZ6

Description: This register contains the Transfer Size for the OUT Endpoint 6 of the Device controller.

Address: 0x44900BD0

Retention: Not Retained

Bits	Name	Description
30 : 29	RxDPID	RxDPID Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. - 2'b00: DATA0 - 2'b01: DATA2 - 2'b10: DATA1 - 2'b11: MDATA SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets Default Value: 0x0 **0x0: DATA0 :** DATA0 **0x2: DATA1PACKET2 :** DATA1 or 2 packets

24.1.145 USBHS_DWC_otg_intreg_DOEPTSIZ6 (continued)

		0x1: DATA2PACKET1 : DATA2 or 1 packet **0x3: MDATAPACKET3 :** MDATA or 3 packets
28 : 19	PktCnt	Packet Count (PktCnt) This field is decremented to zero after a packet is written into the RxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.146 USBHS_DWC_otg_intreg_DOEPDMA6

Description: This register contains the DMA Address for the OUT Endpoint 6 of the Device controller.

31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.148 USBHS_DWC_otg_intreg_DOEPCTL7 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.148 USBHS_DWC_otg_intreg_DOEPCTL7 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL7 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL7 :** Reserved 1

24.1.148 USBHS_DWC_otg_intreg_DOEPCTL7 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.148 USBHS_DWC_otg_intreg_DOEPCTL7 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.149 USBHS_DWC_otg_intreg_DOEPINT7

Description: This register contains the interrupts for the OUT Endpoint 7 of the Device controller.

Address: 0x44900BE8

Retention: Not Retained

Bits	Name	Description
15	StupPktRcvd	Setup Packet Received Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used. - 1'b0: No Setup packet received - 1'b1: Setup packet received Reset: 1'b0 Default Value: 0x0 **0x0: NOT_RCVD :** No Setup packet received **0x1: RCVD :** Setup packet received

24.1.149 USBHS_DWC_otg_intreg_DOEPINT7 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.149 USBHS_DWC_otg_intreg_DOEPINT7 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.149 USBHS_DWC_otg_intreg_DOEPINT7 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.149 USBHS_DWC_otg_intreg_DOEPINT7 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.150 USBHS_DWC_otg_intreg_DOEPTSIZ7

Description: This register contains the Transfer Size for the OUT Endpoint 7 of the Device controller.

Address: 0x44900BF0

Retention: Not Retained

HW Access	Reserved							
Name	Reserved	RxDPID [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	RxDPID	RxDPID Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. - 2'b00: DATA0 - 2'b01: DATA2 - 2'b10: DATA1 - 2'b11: MDATA SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets Default Value: 0x0 **0x0: DATA0 :** DATA0 **0x2: DATA1PACKET2 :** DATA1 or 2 packets

24.1.150 USBHS_DWC_otg_intreg_DOEPTSIZ7 (continued)

		0x1: DATA2PACKET1 : DATA2 or 1 packet **0x3: MDATAPACKET3 :** MDATA or 3 packets
28 : 19	PktCnt	Packet Count (PktCnt) This field is decremented to zero after a packet is written into the RxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.151 USBHS_DWC_otg_intreg_DOEPDMA7

Description: This register contains the DMA Address for the OUT Endpoint 7 of the Device controller.

Address: 0x44900BF4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW							
HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.152 USBHS_DWC_otg_intreg_DOEPDMAB7

SW Access	RW	RW	W	W	W	W	Reserved	
HW Access							Reserved	
Name	EPEna	EPDis	SetD1PID	SetD0PID	SNAK	CNAK	Reserved [25:24]	

Bits	Name	Description
31	EPEna	Endpoint Enable (EPEna) Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit will not be cleared on Transfer Completed interrupt of the SETUP packet. Default Value: 0x0 **0x1: ACTIVE :** Enable Endpoint **0x0: INACTIVE :** No Action

24.1.153 USBHS_DWC_otg_intreg_DOEPCTL8 (continued)

30	EPDis	Endpoint Disable (EPDis) Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Disable Endpoint **0x0: INACTIVE :** No Action
29	SetD1PID	Set DATA1 PID (SetD1PID) - Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Reset: 1'b0 Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA1 PID or Do not force Odd Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame
28	SetD0PID	Set DATA0 PID (SetD0PID) - Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x0: DISABLED :** Disables Set DATA0 PID or Do not force Even Frame **0x1: ENABLED :** Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd :DW-C_DESIGN_ID==1>frame:DWC_DESIGN_ID!=1>(micro)Frame

24.1.153 USBHS_DWC_otg_intreg_DOEPCTL8 (continued)

27	SNAK	Set NAK (SNAK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint. Default Value: 0x0 **0x1: ACTIVE :** Set NAK **0x0: INACTIVE :** No Set NAK
26	CNAK	Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** Clear NAK **0x0: INACTIVE :** No Clear NAK
21	Stall	STALL Handshake (Stall) Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: ACTIVE :** STALL All Active Tokens **0x0: INACTIVE :** STALL All non-active tokens
20	Snp	RESERVED Default Value: 0x0 **0x0: RESERVED0SnpDOEPCTL8 :** Reserved 0 **0x1: RESERVED1SnpDOEPCTL8 :** Reserved 1

24.1.153 USBHS_DWC_otg_intreg_DOEPCTL8 (continued)

19 : 18	EPType	Endpoint Type (EPType) This is the transfer type supported by this logical endpoint. - 2'b00: Control - 2'b01: Isochronous - 2'b10: Bulk - 2'b11: Interrupt Default Value: 0x0 **0x2: BULK :** Bulk **0x0: CONTROL :** Control **0x3: INTERRUPT :** Interrupt **0x1: ISOCHRONOUS :** Isochronous
17	NAKSts	NAK Status (NAKSts) Indicates the following: - 1'b0: The core is transmitting non-NAK handshakes based on the FIFO status. - 1'b1: The core is transmitting NAK handshakes on this endpoint. When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. Default Value: 0x0 **0x1: NAK :** The core is transmitting NAK handshakes on this endpoint **0x0: NONNAK :** The core is transmitting non-NAK handshakes based on the FIFO status

24.1.153 USBHS_DWC_otg_intreg_DOEPCTL8 (continued)

16	DPID	Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. - 1'b0: DATA0 - 1'b1: DATA1 This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Reset: 1'b0 Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. -- 1'b0: Even (micro)frame -- 1'b1: Odd (micro)frame - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. Reset: 1'b0 Default Value: 0x0 **0x1: ACTIVE :** Endpoint Data PID active **0x0: INACTIVE :** Endpoint Data PID not active
15	USBActEP	USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. Default Value: 0x0 **0x0: DISABLED :** Not Active **0x1: ENABLED :** USB Active Endpoint
10 : 0	MPS	Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes. Default Value: 0x0

24.1.154 USBHS_DWC_otg_intreg_DOEPINT8

24.1.154 USBHS_DWC_otg_intreg_DOEPINT8 (continued)

14	NYETIntrpt	NYET Interrupt (NYETIntrpt) The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint. Default Value: 0x0 **0x1: ACTIVE :** NYET Interrupt **0x0: INACTIVE :** No NYET interrupt
13	NAKIntrpt	NAK Interrupt (NAKInterrupt) The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo. Default Value: 0x0 **0x1: ACTIVE :** NAK Interrupt **0x0: INACTIVE :** No NAK interrupt
12	BbleErr	NAK Interrupt (BbleErr) The core generates this interrupt when babble is received for the endpoint. Default Value: 0x0 **0x1: ACTIVE :** BbleErr interrupt **0x0: INACTIVE :** No BbleErr interrupt
11	PktDrpSts	Packet Drop Status (PktDrpSts) This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected. Default Value: 0x0 **0x1: ACTIVE :** Packet Drop Status interrupt **0x0: INACTIVE :** No interrupt
9	BNAIntr	BNA (Buffer Not Available) Interrupt (BNAIntr) This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done Default Value: 0x0

24.1.154 USBHS_DWC_otg_intreg_DOEPINT8 (continued)

		0x1: ACTIVE : BNA interrupt **0x0: INACTIVE :** No BNA interrupt
8	OutPktErr	OUT Packet Error (OutPktErr) Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet. Default Value: 0x0 **0x1: ACTIVE :** OUT Packet Error **0x0: INACTIVE :** No OUT Packet Error
6	Back2BackSETup	Back-to-Back SETUP Packets Received (Back2BackSETup) Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, Default Value: 0x0 **0x1: ACTIVE :** Back-to-Back SETUP Packets Received **0x0: INACTIVE :** No Back-to-Back SETUP Packets Received
5	StsPhseRcvd	Status Phase Received for Control Write (StsPhseRcvd) This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase. This is applicable only in Case of Scatter Gather DMA mode. Default Value: 0x0 **0x1: ACTIVE :** Status Phase Received for Control Write **0x0: INACTIVE :** No Status Phase Received for Control Write
4	OUTTknEPdis	OUT Token Received When Endpoint Disabled (OUTTknEPdis) Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received. Default Value: 0x0

24.1.154 USBHS_DWC_otg_intreg_DOEPINT8 (continued)

		0x1: ACTIVE : OUT Token Received When Endpoint Disabled **0x0: INACTIVE :** No OUT Token Received When Endpoint Disabled
3	SetUp	SETUP Phase Done (SetUp) Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet. Default Value: 0x0 **0x1: ACTIVE :** SETUP Phase Done **0x0: INACTIVE :** No SETUP Phase Done
2	AHBErr	AHB Error (AHBErr) Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/ write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide. Default Value: 0x0 **0x1: ACTIVE :** AHB Error interrupt **0x0: INACTIVE :** No AHB Error Interrupt
1	EPDisbld	Endpoint Disabled Interrupt (EPDisbld) Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request. Default Value: 0x0 **0x1: ACTIVE :** Endpoint Disabled Interrupt **0x0: INACTIVE :** No Endpoint Disabled Interrupt

24.1.154 USBHS_DWC_otg_intreg_DOEPINT8 (continued)

0	XferCompl	Transfer Completed Interrupt (XferCompl) Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint. Default Value: 0x0 **0x1: ACTIVE :** Transfer Complete Interrupt **0x0: INACTIVE :** No Transfer Complete Interrupt

24.1.155 USBHS_DWC_otg_intreg_DOEPTSIZ8

Description: This register contains the Transfer Size for the OUT Endpoint 8 of the Device controller.

Address: 0x44900C10

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

SW Access	Reserved	R		RW				
HW Access	Reserved							
Name	Reserved	RxDPID [30:29]		PktCnt [28:24]				

Bits	Name	Description
30 : 29	RxDPID	RxDPID Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. - 2'b00: DATA0 - 2'b01: DATA2 - 2'b10: DATA1 - 2'b11: MDATA SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive. - 2'b01: 1 packet - 2'b10: 2 packets - 2'b11: 3 packets Default Value: 0x0 **0x0: DATA0 :** DATA0 **0x2: DATA1PACKET2 :** DATA1 or 2 packets

24.1.155 USBHS_DWC_otg_intreg_DOEPTSIZ8 (continued)

		0x1: DATA2PACKET1 : DATA2 or 1 packet **0x3: MDATAPACKET3 :** MDATA or 3 packets
28 : 19	PktCnt	Packet Count (PktCnt) This field is decremented to zero after a packet is written into the RxFIFO. Default Value: 0x0
18 : 0	XferSize	Transfer Size (XferSize) Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory. Default Value: 0x0

24.1.156 USBHS_DWC_otg_intreg_DOEPDMA8

Description: This register contains the DMA Address for the OUT Endpoint 8 of the Device controller.

Address: 0x44900C14

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	DMAAddr [7:0]

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	DMAAddr [31:24]							

Bits	Name	Description
31 : 0	DMAAddr	Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list. Default Value: X

24.1.157 USBHS_DWC_otg_intreg_DOEPDMAB8

Description: This register contains the DMA Buffer Address for the OUT Endpoint 8 of the Device controller.

Address: 0x44900C1C

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	L1Suspended	L1 Deep Sleep Indicates that the PHY is in deep sleep when in L1 state. Default Value: 0x0 **0x1: ACTIVE :** Deep Sleep **0x0: INACTIVE :** Non Deep Sleep
6	PhySleep	PHY In Sleep Indicates that the PHY is in Sleep State. Default Value: 0x0 **0x1: ACTIVE :** Phy in Sleep state **0x0: INACTIVE :** Phy not in Sleep state

24.1.158 USBHS_DWC_otg_intreg_PCGCCTL (continued)

5	Enbl_L1Gating	Enable Sleep Clock Gating If this bit is set, core internal clock gating is enabled sleep state if utmi_l1_suspend_n cannot be asserted by the core. The PHY clock will not be gated in sleep state if Enbl_L1Gating is not set. Default Value: 0x0 **0x0: DISABLED :** The PHY clock is not gated in Sleep state **0x1: ENABLED :** The Core internal clock gating is enabled in Sleep state
3	RstPdwnModule	Reset Power-Down Modules (RstPdwnModule) This bit is valid only in Partial Power-Down mode. - The application sets this bit when the power is turned off. - The application clears this bit after the power is turned on and the PHY clock is up. Note: The R/W of all core registers are possible only when this bit is set to 1b0. Default Value: 0x0 **0x1: OFF :** Power is turned off **0x0: ON :** Power is turned on
0	StopPclk	Stop Pclk (StopPclk) - The application sets this bit to stop the PHY clock (phy_clk) when the USB is suspended, the session is not valid, or the device is disconnected. - The application clears this bit when the USB is resumed or a new session starts. Default Value: 0x0 **0x0: DISABLED :** Disable Stop Pclk **0x1: ENABLED :** Enable Stop Pclk

24.1.159 USBHS_DWC_otg_intreg_PCGCCTL1

Description: This register is used to control the Power and Clock Gating characteristics of the controller.

Address: 0x44900E04

Retention: Not Retained

SW Access	RW							
HW Access	R							
Name	RSVD_3 [31:24]							

Bits	Name	Description
31 : 21	RSVD_3	Reserved Default Value: 0x0
20	TEST_ATERESET	USB PHY test mode ATE reset. 1'b1 : Disables PHYCLOCK0 ,FREECLK outputs. 1'b0:PHY-CLOCK0 ,FREECLK outputs are available within(maximum duration) 16.33 ns if UTMI+ interface is 8 bits else 24.66 ns Default Value: 0x0
19 : 18	TEST_ANALOGPIN_SEL	USB PHY analog test pin selection. Valid value: 2'b10,2'b11(Reserved as default to disable probing) Default Value: 0x3
17	TEST_LOOPBACK_EN	USB PHY loopback test control 1'b1: Enable.1'b0:Disable Default Value: 0x0
16	TEST_IDDQ_EN	USB PHY IDDQ test control 1'b1: Enable.1'b0:Disable Default Value: 0x0
15	TEST_SCAN_EN	USB PHY scan test (at-speed and stuck-at fault)mode. 1'b1: Enable.1'b0:Disable Default Value: 0x0
14	TEST_BURNIN	USB PHY test mode burn-in control. 1'b1: Enable(PHY performs power on reset,enters HS loop-back mode to transmit alternate 1's and 0's until disabled. 1'b0:Disable Default Value: 0x0
13 : 10	TEST_ADDR0	USB PHY test mode register address bus. Default Value: 0x0

24.1.163 USBHS_SS_PHY_TEST_CTL (continued)

9 : 2	TEST_DATAIN0	USB PHY test mode data write bus. Bits 0 to 3 are data, 4 to 7 are corresponding write enables Default Value: 0x0
1	TEST_DATAOUT_SEL0	USB PHY test mode data output selection. 1'b1: Mode-defined test register contents are output. 1'b0:Mode-defined, internally generated signals are ouptut. Default Value: 0x0
0	TEST_PULSE	USB PHY test mode non-continous clocking signal Default Value: 0x0

24.1.164 USBHS_SS_CONTROLLER_DDFT_CTL

Description: Subsystem level- Controller DDFT control register

Address: 0x44940010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW					
HW Access	R		R					
Name	DEBUG_P-CLK_PROBES_COUNT [7:6]		DEBUG_HCLK_PROBES_COUNT [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	RW		RW					
HW Access	R		R					
Name	RSVD_4 [15:14]		DEBUG_PCLK_PROBES_COUNT [13:8]					

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	RSVD_4 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	RSVD_4 [31:24]							

Bits	Name	Description
31 : 14	RSVD_4	Reserved Default Value: 0x0
13 : 6	DEBUG_P-CLK_PROBES_COUNT	USB Controller PHY clock domain internal signal probe counter value for debug[8'd0 to 8'd218] Default Value: 0x0
5 : 0	DEBUG_H-CLK_PROBES_COUNT	USB Controller AHB clock domain internal signal probe counter value for debug[6'd0 to 6'd61] Default Value: 0x0

24.1.165 USBHS_SS_INTR_SS

Description: Subsystem level- Interrupt register

Address: 0x44940014

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW1C	RW1C
HW Access	Reserved						RW1S	RW1S
Name	Reserved [7:2]						QCH_REQ_ERR	QCH_HCLK_GATED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	QCH_REQ_ERR	Subsystem and USB Controller AHB clock are gated after Q-state request is accepted either after end of transfer or forceful shutdown request from APPCPUSS Default Value: 0x0
0	QCH_HCLK_GATED	Subsystem and USB Controller AHB clock are gated after Q-state request is accepted either after end of transfer or forceful shutdown request from APPCPUSS Default Value: 0x0

24.1.166 USBHS_SS_INTR_SS_SET

Description: Subsystem level- Interrupt set register

Address: 0x44940018

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW1S	RW1S
HW Access	Reserved						A	A
Name	Reserved [7:2]						QCH_REQ_ERR	QCH_HCLK_GATED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	QCH_REQ_ERR	Write 1'b1 to set corresponding bit in interrupt register. Default Value: 0x0
0	QCH_HCLK_GATED	Write 1'b1 to set corresponding bit in interrupt register. Default Value: 0x0

24.1.167 USBHS_SS_INTR_SS_MASK

Description: Subsystem level- Interrupt mask register

Address: 0x4494001C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						QCH_REQ_ERR	QCH_HCLK_GATED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	QCH_REQ_ERR	Mask bit for corresponding bit in interrupt register. Default Value: 0x0
0	QCH_HCLK_GATED	Mask bit for corresponding bit in interrupt register. Default Value: 0x0

24.1.168 USBHS_SS_INTR_SS_MASKED

Description: Subsystem level- Interrupt masked register

Address: 0x44940020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	R
HW Access	Reserved						W	W
Name	Reserved [7:2]						QCH_REQ_ERR	QCH_HCLK_GATED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	QCH_REQ_ERR	Logical and of corresponding interrupt and mask bits. Default Value: 0x0
0	QCH_HCLK_GATED	Logical and of corresponding interrupt and mask bits.SW need to set CTL.SS_FORCED_SHUTDOWN bit one clk_pwr cycle before PERI asserts Qrequest otherwise subsystem will deny the Qrequest. This interrupt indicates Subsystem accepts Q-state request and its functional clock (mmio_clk_sys) is internally gated and is in DEEPSLEEP power mode. Its PERI/SRSS responsbility to gate clk_pwr,clk_phy_pll_ref and assert rst_pwr_act_n as required. Renabling Subsystem requires first QExit->QEntry from PERI then Subsystem programming. Default Value: 0x0

25 Ethernet registers

This section discusses the Ethernet registers. It lists all the registers in mapping tables, in address order.

25.1 Register details

Register name	Address	Description
ETH0_CTL	0x42C10000	EMAC Control Register
ETH0_STATUS	0x42C10004	EMAC Status Register
ETH0_NETWORK_CONTROL	0x42C11000	The network control register contains general MAC control functions for both receiver and transmitter.
ETH0_NETWORK_CONFIG	0x42C11004	The network configuration register contains functions for setting the mode of operation for the Gigabit Ethernet MAC.
ETH0_NETWORK_STATUS	0x42C11008	The network status register returns status information with respect to the PHY management interface.
ETH0_USER_IO_REGISTER	0x42C1100C	Not presents. Access to the register will return AHB error.
ETH0_DMA_CONFIG	0x42C11010	DMA Configuration Register
ETH0_TRANSMIT_STATUS	0x42C11014	This register, when read, provides details of the status of a transmit. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register.
ETH0_RECEIVE_Q_PTR	0x42C11018	This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the network control register. Once reception is enabled, any write to the receive buffer queue base address register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the used bits. In terms of AMBA (AXI) operation, the receive descriptors are read from memory using a single 32bit AXI access. When the datapath is configured at 64bit, the receive descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is written to using a single 64bit AXI access.

Ethernet registers

Register name	Address	Description
ETH0_TRANSMIT_Q_PTR	0x42C1101C	This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit, the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access.
ETH0_RECEIVE_STATUS	0x42C11020	This register, when read provides details of the status of a receive. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register.
ETH0_INT_STATUS	0x42C11024	If not configured for priority queueing, the GEM generates a single interrupt. This register indicates the source of this interrupt. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the ethernet_int signal will be asserted. For test purposes each bit can be set or reset by writing to the interrupt mask register. The default configuration is shown below whereby all bits are reset to zero on read. Changing the validity of the `gem_irq_read_clear define will instead require a one to be written to the appropriate bit in order to clear it. In this mode reading has no affect on the status of the bit.
ETH0_INT_ENABLE	0x42C11028	At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero.
ETH0_INT_DISABLE	0x42C1102C	Writing a 1 to the relevant bit location disables that particular interrupt. This register is write only and when read will return zero.

Ethernet registers

Register name	Address	Description
ETH0_INT_MASK	0x42C11030	The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register.
ETH0_PHY_MANAGEMENT	0x42C11034	The PHY maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit-2 is set in the network status register. It takes about 2000 pclk cycles to complete, when MDC is set for pclk divide by 32 in the network configuration register. An interrupt is generated upon completion. During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO. See Section 22.2.4.5 of the IEEE 802.3 standard. Reading during the shift operation will return the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits will be updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced. The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. For a description of MDC generation, see Network Configuration Register.
ETH0_PAUSE_TIME	0x42C11038	Received Pause Quantum Register
ETH0_TX_PAUSE_QUANTUM	0x42C1103C	Transmit Pause Quantum Register
ETH0_PBUF_TXCUTTHRU	0x42C11040	Partial store and forward is only applicable when using the DMA configured in SRAM based packet buffer mode. It is also not available when using multi buffer frames. TX Partial Store and Forward
ETH0_PBUF_RXCUTTHRU	0x42C11044	RX Partial Store and Forward
ETH0_JUMBO_MAX_LENGTH	0x42C11048	Maximum Jumbo Frame Size.
ETH0_EXTERNAL_FIFO_INTERFACE	0x42C1104C	Not presents.
ETH0_RSC_CONTROL	0x42C11058	Not presents. Access to the register will return AHB error.

Ethernet registers

Register name	Address	Description
ETH0_INT_MODERATION	0x42C1105C	Used to moderate the number of transmit and receive complete interrupts issued. With interrupt moderation enabled receive and transmit interrupts are not generated immediately a frame is transmitted or received. Instead when a receive or transmit event occurs a timer is started and the interrupt is asserted after it times out. This limits the frequency with which the CPU receives interrupts. When interrupt moderation is enabled interrupt status bit one is always used for receive and bit 7 is always used for transmit even when priority queuing is enabled. With interrupt moderation 800ns periods are counted. GEM determines what constitutes an 800ns period by looking at the tbi (bit 11), gigabit bit (10) and speed (bit 0) bits in the network configuration register and counting tx_clk cycles. Bit 0 needs to be set to 1 for 100M operation.
ETH0_SYS_WAKE_TIME	0x42C11060	Used to pause transmission after deassertion of tx_lpi_en. Each unit in this register corresponds to 64ns in gigabit mode, 320ns in 100M mode and 3200ns at 10M. After tx_lpi_en is deasserted transmission will pause for the set time.
ETH0_HASH_BOTTOM	0x42C11080	The unicast hash enable and the multicast hash enable bits in the network configuration register enable the reception of hash matched frames. Hash Register Bottom (31 to 0 bits)
ETH0_HASH_TOP	0x42C11084	Hash Register Top (63 to 32 bits)
ETH0_SPEC_ADD1_BOTTOM	0x42C11088	The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written.
ETH0_SPEC_ADD1_TOP	0x42C1108C	Specific Address Top
ETH0_SPEC_ADD2_BOTTOM	0x42C11090	The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written.
ETH0_SPEC_ADD2_TOP	0x42C11094	Specific Address Top
ETH0_SPEC_ADD3_BOTTOM	0x42C11098	The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. See ETH0_SPEC_ADD2_BOTTOM for the details of bit fields.
ETH0_SPEC_ADD3_TOP	0x42C1109C	Specific Address Top. See ETH0_SPEC_ADD2_TOP for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_SPEC_ADD4_BOTTOM	0x42C110A0	The addresses stored in the specific address registers are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. See ETH0_SPEC_ADD2_BOTTOM for the details of bit fields.
ETH0_SPEC_ADD4_TOP	0x42C110A4	Specific Address Top. See ETH0_SPEC_ADD2_TOP for the details of bit fields.
ETH0_SPEC_TYPE1	0x42C110A8	Type ID Match 1
ETH0_SPEC_TYPE2	0x42C110AC	Type ID Match 2
ETH0_SPEC_TYPE3	0x42C110B0	Type ID Match 3
ETH0_SPEC_TYPE4	0x42C110B4	Type ID Match 4
ETH0_WOL_REGISTER	0x42C110B8	Wake on LAN Register. Presents in design, but feature is not supported.
ETH0_STRETCH_RATIO	0x42C110BC	IPG stretch register
ETH0_STACKED_VLAN	0x42C110C0	Stacked VLAN Register
ETH0_TX_PFC_PAUSE	0x42C110C4	Transmit PFC Pause Register
ETH0_MASK_ADD1_BOTTOM	0x42C110C8	Specific Address Mask 1 Bottom (31 to 0 bits)
ETH0_MASK_ADD1_TOP	0x42C110CC	Specific Address Mask 1 Top (47 to 32 bits)
ETH0_DMA_ADDR_OR_MASK	0x42C110D0	Receive DMA Data Buffer Address Mask
ETH0_RX_PTP_UNICAST	0x42C110D4	PTP RX unicast IP destination address
ETH0_TX_PTP_UNICAST	0x42C110D8	PTP TX unicast IP destination address
ETH0_TSU_NSEC_CMP	0x42C110DC	TSU timer comparison value nanoseconds
ETH0_TSU_SEC_CMP	0x42C110E0	TSU timer comparison value seconds (31 to 0 bits)
ETH0_TSU_MSB_SEC_CMP	0x42C110E4	TSU timer comparison value seconds (47 to 32 bits)
ETH0_TSU_PTP_TX_MSB_SEC	0x42C110E8	PTP Event Frame Transmitted Seconds Register (47 to 32 bits)
ETH0_TSU_PTP_RX_MSB_SEC	0x42C110EC	PTP Event Frame Received Seconds Register (47 to 32 bits)
ETH0_TSU_PEER_TX_MSB_SEC	0x42C110F0	PTP Peer Event Frame Transmitted Seconds Register (47 to 32 bits)
ETH0_TSU_PEER_RX_MSB_SEC	0x42C110F4	PTP Peer Event Frame Received Seconds Register (47 to 32 bits)
ETH0_DPRAM_FILL_DBG	0x42C110F8	The fill levels for the TX & RX packet buffers can be read using this register, including the fill level for each queue in the TX direction.
ETH0_REVISION_REG	0x42C110FC	This register indicates a Cadence module identification number and module revision. The value of this register is read only as defined by `gem_revision_reg_value
ETH0_OCTETS_TXED_BOTTOM	0x42C11100	Octets Transmitted lower bits (31 to 0 bits)
ETH0_OCTETS_TXED_TOP	0x42C11104	Octets Transmitted higher bits (47 to 32 bits)
ETH0_FRAMES_TXED_OK	0x42C11108	Frames Transmitted

Ethernet registers

Register name	Address	Description
ETH0_BROADCAST_TXED	0x42C1110C	Broadcast Frames Transmitted
ETH0_MULTICAST_TXED	0x42C11110	Multicast Frames Transmitted
ETH0_PAUSE_FRAMES_TXED	0x42C11114	Pause Frames Transmitted
ETH0_FRAMES_TXED_64	0x42C11118	64 Byte Frames Transmitted
ETH0_FRAMES_TXED_65	0x42C1111C	65 to 127 Byte Frames Transmitted
ETH0_FRAMES_TXED_128	0x42C11120	128 to 255 Byte Frames Transmitted
ETH0_FRAMES_TXED_256	0x42C11124	256 to 511 Byte Frames Transmitted
ETH0_FRAMES_TXED_512	0x42C11128	512 to 1023 Byte Frames Transmitted
ETH0_FRAMES_TXED_1024	0x42C1112C	1024 to 1518 Byte Frames Transmitted
ETH0_FRAMES_TXED_1519	0x42C11130	Greater Than 1518 Byte Frames Transmitted
ETH0_TX_UNDERRUNS	0x42C11134	Transmit Under Runs
ETH0_SINGLE_COLLISIONS	0x42C11138	Single Collision Frames. Presents in design but not support.
ETH0_MULTIPLE_COLLISIONS	0x42C1113C	Multiple Collision Frames. Presents in design but not support.
ETH0_EXCESSIVE_COLLISIONS	0x42C11140	Excessive Collisions. Presents in design but not support.
ETH0_LATE_COLLISIONS	0x42C11144	Late Collisions. Presents in design but not support.
ETH0_DEFERRED_FRAMES	0x42C11148	Deferred Transmission Frames. Presents in design but not support.
ETH0_CRS_ERRORS	0x42C1114C	Carrier Sense Errors. Presents in design but not support.
ETH0_OCTETS_RXED_BOTTOM	0x42C11150	Octets Received (31 to 0 bits)
ETH0_OCTETS_RXED_TOP	0x42C11154	Octets Received (47 to 32 bits)
ETH0_FRAMES_RXED_OK	0x42C11158	Frames Received
ETH0_BROADCAST_RXED	0x42C1115C	Broadcast Frames Received
ETH0_MULTICAST_RXED	0x42C11160	Multicast Frames Received
ETH0_PAUSE_FRAMES_RXED	0x42C11164	Pause Frames Received
ETH0_FRAMES_RXED_64	0x42C11168	64 Byte Frames Received
ETH0_FRAMES_RXED_65	0x42C1116C	65 to 127 Byte Frames Received
ETH0_FRAMES_RXED_128	0x42C11170	128 to 255 Byte Frames Received
ETH0_FRAMES_RXED_256	0x42C11174	256 to 511 Byte Frames Received
ETH0_FRAMES_RXED_512	0x42C11178	512 to 1023 Byte Frames Received
ETH0_FRAMES_RXED_1024	0x42C1117C	1024 to 1518 Byte Frames Received
ETH0_FRAMES_RXED_1519	0x42C11180	1519 to maximum Byte Frames Received
ETH0_UNDERSIZE_FRAMES	0x42C11184	Undersized Frames Received
ETH0_EXCESSIVE_RX_LENGTH	0x42C11188	Oversize Frames Received
ETH0_RX_JABBERS	0x42C1118C	Jabbers Received
ETH0_FCS_ERRORS	0x42C11190	Frame Check Sequence Errors
ETH0_RX_LENGTH_ERRORS	0x42C11194	Length Field Frame Errors

Ethernet registers

Register name	Address	Description
ETH0_RX_SYMBOL_ERRORS	0x42C11198	Receive Symbol Errors
ETH0_ALIGNMENT_ERRORS	0x42C1119C	Alignment Errors
ETH0_RX_RESOURCE_ERRORS	0x42C111A0	Receive Resource Errors
ETH0_RX_OVERRUNS	0x42C111A4	Receive Overruns
ETH0_RX_IP_CK_ERRORS	0x42C111A8	IP Header Checksum Errors
ETH0_RX_TCP_CK_ERRORS	0x42C111AC	TCP Checksum Errors
ETH0_RX_UDP_CK_ERRORS	0x42C111B0	UDP Checksum Errors
ETH0_AUTO_FLUSHED_PKTS	0x42C111B4	Receive DMA Flushed Packets
ETH0_TSU_TIMER_INCR_SUB_NSEC	0x42C111BC	1588 Timer Increment Register sub nsec
ETH0_TSU_TIMER_MSB_SEC	0x42C111C0	1588 Timer Seconds Register (47 to 32 bits)
ETH0_TSU_STROBE_MSB_SEC	0x42C111C4	1588 Timer Sync Strobe Seconds Register (47 to 32 bits)
ETH0_TSU_STROBE_SEC	0x42C111C8	1588 Timer Sync Strobe Seconds Register (31 to 0 bits)
ETH0_TSU_STROBE_NSEC	0x42C111CC	1588 Timer Sync Strobe Nanoseconds Register
ETH0_TSU_TIMER_SEC	0x42C111D0	1588 Timer Seconds Register (31 to 0 bits)
ETH0_TSU_TIMER_NSEC	0x42C111D4	1588 Timer Nanoseconds Register
ETH0_TSU_TIMER_ADJUST	0x42C111D8	This register is used to adjust the value of the timer in the TSU. It allows an integral number of nanoseconds to be added or subtracted from the timer in a one-off operation. This register returns all zeroes when read.
ETH0_TSU_TIMER_INCR	0x42C111DC	1588 Timer Increment Register
ETH0_TSU_PTP_TX_SEC	0x42C111E0	PTP Event Frame Transmitted Seconds Register (31 to 0 bits)
ETH0_TSU_PTP_TX_NSEC	0x42C111E4	PTP Event Frame Transmitted Nanoseconds Register
ETH0_TSU_PTP_RX_SEC	0x42C111E8	PTP Event Frame Received Seconds Register (31 to 0 bits)
ETH0_TSU_PTP_RX_NSEC	0x42C111EC	PTP Event Frame Received Nanoseconds Register
ETH0_TSU_PEER_TX_SEC	0x42C111F0	PTP Peer Event Frame Transmitted Seconds Register (31 to 0 bits)
ETH0_TSU_PEER_TX_NSEC	0x42C111F4	PTP Peer Event Frame Transmitted Nanoseconds Register
ETH0_TSU_PEER_RX_SEC	0x42C111F8	PTP Peer Event Frame Received Seconds Register (31 to 0 bits)
ETH0_TSU_PEER_RX_NSEC	0x42C111FC	PTP Peer Event Frame Received Nanoseconds Register
ETH0_PCS_CONTROL	0x42C11200	Not presents. Access to the register returns AHB error.
ETH0_PCS_STATUS	0x42C11204	Not presents. Access to the register returns AHB error. See ETH0_PCS_CONTROL for the details of bit fields.

ETH0_SPEC_ADD5_BOTTOM	0x42C11300	Specific address registers 5 ~ 36 doesn't present. Access to the register returns AHB error.
ETH0_SPEC_ADD5_TOP	0x42C11304	Specific address registers 5 ~ 36 doesn't present. Access to the register returns AHB error. See ETH0_SPEC_ADD5_BOTTOM for the details of bit fields.
ETH0_SPEC_ADD36_BOTTOM	0x42C113F8	Not presents.
ETH0_SPEC_ADD36_TOP	0x42C113FC	Not presents. See ETH0_SPEC_ADD36_BOTTOM for the details of bit fields.
ETH0_INT_Q1_STATUS	0x42C11400	Priority queue Interrupt Status Register
ETH0_INT_Q2_STATUS	0x42C11404	Priority queue Interrupt Status Register. See ETH0_INT_Q1_STATUS for the details of bit fields.
ETH0_INT_Q3_STATUS	0x42C11408	int_q3_status to int_q15_status doesn't present. Access to the register returns AHB error.
ETH0_INT_Q15_STATUS	0x42C11438	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_TRANSMIT_Q1_PTR	0x42C11440	This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit , the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access.
ETH0_TRANSMIT_Q2_PTR	0x42C11444	This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit , the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access.
ETH0_TRANSMIT_Q3_PTR	0x42C11448	transmit_q3_ptr to transmit_q15_ptr doesn't present. Access to the register returns AHB error.

Ethernet registers

Register name	Address	Description
ETH0_TRANSMIT_Q15_PTR	0x42C11478	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_RECEIVE_Q1_PTR	0x42C11480	This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit , the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access.

Ethernet registers

Register name	Address	Description
ETH0_RECEIVE_Q2_PTR	0x42C11484	This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit , the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access. See ETH0_RECEIVE_Q1_PTR for the details of bit fields.
ETH0_RECEIVE_Q3_PTR	0x42C11488	Not presents. Start address register doesn't present for queue3 ~ queue7.
ETH0_RECEIVE_Q7_PTR	0x42C11498	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_DMA_RXBUF_SIZE_Q1	0x42C114A0	Receive Buffer queue 1 Size

ETH0_DMA_RXBUF_SIZE_Q7	0x42C114B8	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_CBS_CONTROL	0x42C114BC	The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the portTransmitRate which is dependent on the speed of operation, eg, portTranmsitRate. 1Gb/s = 32'h07735940 (125 Mbytes/s), 100Mb/sec = 32'h017D7840 (25 Mnibbles/s), 10Mb/sec = 32'h002625A0 (2.5 Mnibbles/s). If 50% of bandwidth was to be allocated to a particular queue in 1Gb/sec mode then the IdleSlope value for that queue would be calculated as 32'h07735940/2. Note that Credit-Based Shaping should be disabled prior to updating the IdleSlope values. As another example, for a 1722 audio packet with a payload of 6 samples per channel, the packet size would be 7 (preamble) + 1 (SFD) + 50 (packet header) + 6x4x2(payload) + 4 (CRC) = 110 bytes. For a rate of 8000 packets per second, the desired rate would 110 x 8000 bytes per second, so the programmed idleSlope value would be 880000 for a 1Gb/s connection, or 1760000 for a 100Mb/s or 10Mbs connection. See Figure 6.3 in the IEEE 1722 standard. In practice, the actual transmission rate will be vary slightly from that calculated. In this case, the idleSlope value should be recalibrated based on the variance between the measured and expected rate, and in this case very accurate transmission rates can be achieved.
ETH0_CBS_IDLESLOPE_Q_A	0x42C114C0	queue A is the highest priority queue. This would be queue 8 in an 8 queue configuration.
ETH0_CBS_IDLESLOPE_Q_B	0x42C114C4	queue B is the 2nd highest priority queue. This would be queue 7 in an 8 queue configuration.
ETH0_UPPER_TX_Q_BASE_ADDR	0x42C114C8	Upper 32 bits of transmit buffer descriptor queue base address.
ETH0_TX_BD_CONTROL	0x42C114CC	TX BD control register
ETH0_RX_BD_CONTROL	0x42C114D0	RX BD control register
ETH0_UPPER_RX_Q_BASE_ADDR	0x42C114D4	Upper 32 bits of receive buffer descriptor queue base address.
ETH0_HIDDEN_REG0	0x42C114E0	Hidden register
ETH0_HIDDEN_REG1	0x42C114E4	Hidden register
ETH0_HIDDEN_REG2	0x42C114E8	Hidden register
ETH0_HIDDEN_REG3	0x42C114EC	Hidden register

Ethernet registers

Register name	Address	Description
ETH0_SCREENING_TYPE_1_REGISTER_0	0x42C11500	Screening type 1 registers are used to allocate up to 16 priority queues to received frames based on certain IP or UDP fields of incoming frames. Firstly, when DS/TC match enable is set (bit 28), the DS (Differentiated Services) field of the received IPv4 header or TCfield (traffic class) of IPv6 headers are matched against bits 11 to 4. Secondly, when UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27 to 12. Both UDP and DS/TC matching can be enabled simultaneously or individually. If a match is successful, then the queue value programmed in bits 2 to 0 is allocated to the frame. The required number of Type 1 screening registers is configured in the gem defines file. Up to 16 type 1 screening registers have been allocated APB address space between 0x500 and 0x53C.
ETH0_SCREENING_TYPE_1_REGISTER_1	0x42C11504	screening type 1 register 1, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_2	0x42C11508	screening type 1 register 2, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_3	0x42C1150C	screening type 1 register 3, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_4	0x42C11510	screening type 1 register 4, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_5	0x42C11514	screening type 1 register 5, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_6	0x42C11518	screening type 1 register 6, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_7	0x42C1151C	screening type 1 register 7, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_8	0x42C11520	screening type 1 register 8, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_9	0x42C11524	screening type 1 register 9, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_10	0x42C11528	screening type 1 register 10, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_11	0x42C1152C	screening type 1 register 11, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_12	0x42C11530	screening type 1 register 12, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_13	0x42C11534	screening type 1 register 13, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_1_REGISTER_14	0x42C11538	screening type 1 register 14, same as screening_type_1_register_0

Ethernet registers

Register name	Address	Description
ETH0_SCREENING_TYPE_1_REGISTER_15	0x42C1153C	screening type 1 register 15, same as screening_type_1_register_0
ETH0_SCREENING_TYPE_2_REGISTER_0	0x42C11540	Screener Type 2 match registers operate independently of screener type 1 registers and offer additional match capabilities, extending the capabilities into vendor specific protocols.
ETH0_SCREENING_TYPE_2_REGISTER_1	0x42C11544	screening type 2 register 1, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_2	0x42C11548	screening type 2 register 2, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_3	0x42C1154C	screening type 2 register 3, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_4	0x42C11550	screening type 2 register 4, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_5	0x42C11554	screening type 2 register 5, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_6	0x42C11558	screening type 2 register 6, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_7	0x42C1155C	screening type 2 register 7, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_8	0x42C11560	screening type 2 register 8, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_9	0x42C11564	screening type 2 register 9, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_10	0x42C11568	screening type 2 register 10, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_11	0x42C1156C	screening type 2 register 11, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_12	0x42C11570	screening type 2 register 12, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_13	0x42C11574	screening type 2 register 13, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_14	0x42C11578	screening type 2 register 14, same as screening_type_2_register_0
ETH0_SCREENING_TYPE_2_REGISTER_15	0x42C1157C	screening type 2 register 15, same as screening_type_2_register_0
ETH0_TX_SCHED_CTRL	0x42C11580	This register controls the transmit scheduling algorithm the user can select for each active transmit queue. By default all queues are initialized to fixed priority, with the top indexed queue having overall priority
ETH0_BW_RATE_LIMIT_Q0TO3	0x42C11590	This register holds the DWRR weighting value or the ETS bandwidth percentage value used by the transmit scheduler for queues 0 to 3.

Ethernet registers

Register name	Address	Description
ETH0_BW_RATE_LIMIT_Q4TO7	0x42C11594	Not presents. EMAC has only 3 queues. Access to the register returns AHB error.
ETH0_BW_RATE_LIMIT_Q8TO11	0x42C11598	Not presents. EMAC has only 3 queues. Access to the register returns AHB error.
ETH0_BW_RATE_LIMIT_Q12TO15	0x42C1159C	Not presents. EMAC has only 3 queues. Access to the register returns AHB error. See ETH0_BW_RATE_LIMIT_Q8TO11 for the details of bit fields.
ETH0_TX_Q_SEG_ALLOC_Q0TO7	0x42C115A0	This register allows the user to distribute the Transmit SRAM used by the DMA across the priority queues, for queues 0 to 7. The SRAM itself is split into a number of evenly sized segments (this is defined in the verilog configuration defs file - for the configuration used to generate this register description, the total number of segments was set to '16'). Those segments can then be freely distributed across the active queues, in powers of 2. I.e. a value of 0 would mean 1 segment has been allocated to the queue. A value of 1 would mean 2 segments, a value of 2 means 4 segments and so on. The reset values of these registers are defined in the configuration defs file.
ETH0_TX_Q_SEG_ALLOC_Q8TO15	0x42C115A4	Not presents. Access to the register returns AHB error.
ETH0_RECEIVE_Q8_PTR	0x42C115C0	receive_q8_ptr to receive_q15_ptr doesn't present. Access to the register returns AHB error.
ETH0_RECEIVE_Q15_PTR	0x42C115DC	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_DMA_RXBUF_SIZE_Q8	0x42C115E0	dma_rxbuf_size_q8 to dma_rxbuf_size_q15 doesn't present. Access to the register returns AHB error.
ETH0_DMA_RXBUF_SIZE_Q15	0x42C115FC	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_INT_Q1_ENABLE	0x42C11600	At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero.
ETH0_INT_Q2_ENABLE	0x42C11604	At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero. See ETH0_INT_Q1_ENABLE for the details of bit fields.
ETH0_INT_Q3_ENABLE	0x42C11608	int_q3_enable to int_q7_enable doesn't present. Access to the register returns AHB error.
ETH0_INT_Q7_ENABLE	0x42C11618	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_INT_Q1_DISABLE	0x42C11620	Writing a 1 to the relevant bit location disables that particular interrupt. This register is write only and when read will return zero.
ETH0_INT_Q2_DISABLE	0x42C11624	Writing a 1 to the relevant bit location disables that particular interrupt. This register is write only and when read will return zero. See ETH0_INT_Q1_DISABLE for the details of bit fields.
ETH0_INT_Q3_DISABLE	0x42C11628	int_q3_disable to int_q7_disable doesn't present. Access to the register returns AHB error.
ETH0_INT_Q7_DISABLE	0x42C11638	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_INT_Q1_MASK	0x42C11640	The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register.
ETH0_INT_Q2_MASK	0x42C11644	The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register. See ETH0_INT_Q1_MASK for the details of bit fields.
ETH0_INT_Q3_MASK	0x42C11648	int_q3_mask to int_q7_mask doesn't present. Access to the register returns AHB error.
ETH0_INT_Q7_MASK	0x42C11658	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_INT_Q8_ENABLE	0x42C11660	int_q8_enable to int_q15_enable doesn't present. Access to the register returns AHB error.
ETH0_INT_Q15_ENABLE	0x42C1167C	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_INT_Q8_DISABLE	0x42C11680	int_q8_disable to int_q15_disable doesn't present. Access to the register returns AHB error.

Ethernet registers

Register name	Address	Description
ETH0_INT_Q15_DISABLE	0x42C1169C	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_INT_Q8_MASK	0x42C116A0	int_q8_mask to int_q15_mask doesn't present. Access to the register returns AHB error.
ETH0_INT_Q15_MASK	0x42C116BC	Not presents. See ETH0_EXTERNAL_FIFO_INTERFACE for the details of bit fields.
ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_0	0x42C116E0	Ethertype Register
ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_1	0x42C116E4	Ethertype Register. See ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_0 for the details of bit fields.

ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_6	0x42C116F8	Ethertype Register. See ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_0 for the details of bit fields.
ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_7	0x42C116FC	Ethertype Register. See ETH0_SCREENING_TYPE_2_ETHERTYPE_REG_0 for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_TYPE2_COMPARE_0_WORD_0	0x42C11700	"Compare A, B and C fields of the screener type 2 match register are pointers to a pool of up to 32 compare registers. If enabled the compare is true if the data at the OFFSET into the frame, ANDed with the MASK Value if the mask is enabled, is equal to the COMPARE Value. Either a 16 bit comparison or a 32 bit comparison is done. This selection is made via the associated compare word1 register bit 9. If a 16 bit comparison is selected, then a 16 bit mask is also available to the user to select which bits should be compared. If the 32 bit compare option is selected, then no mask is available. The byte at the OFFSET number of bytes from the index start is compared thru bits 7 to 0 of the configured VALUE. The byte at the OFFSET number of bytes + 1 from the index start is compared thru bits 15 to 8 of the configured VALUE and so on. The OFFSET can be configured to be from 0 to 127 bytes from either the start of the frame, the byte following the therType field (last EtherType in the header if the frame is VLAN tagged), the byte following the IP header (IPv4 or IPv6) or from the byte following the start of the TCP/UDP header. The required number of Type 2 screening registers up to a maximum of 32 is configurable in the gem defines file and have been allocated APB address space between 0x700 and 0x7fc. Note. when using RX Partial Store and Forward mode and priority queues, the frame offset must be less than the Partial Store and Forward watermark. If the offset is higher than the watermark value it's not possible to identify the priority queue before the frame is sent to the AMBA interface, and an incorrect priority queue may be used. "
ETH0_TYPE2_COMPARE_0_WORD_1	0x42C11704	"Type2 Compare Word 1"
ETH0_TYPE2_COMPARE_1_WORD_0	0x42C11708	same as type2_compare_0_word_0

ETH0_TYPE2_COMPARE_3_WORD_0	0x42C11718	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_TYPE2_COMPARE_3_WORD_1	0x42C1171C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_4_WORD_0	0x42C11720	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_4_WORD_1	0x42C11724	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_5_WORD_0	0x42C11728	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_5_WORD_1	0x42C1172C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_6_WORD_0	0x42C11730	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_6_WORD_1	0x42C11734	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_7_WORD_0	0x42C11738	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_7_WORD_1	0x42C1173C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_8_WORD_0	0x42C11740	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_8_WORD_1	0x42C11744	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_9_WORD_0	0x42C11748	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_9_WORD_1	0x42C1174C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_10_WORD_0	0x42C11750	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_10_WORD_1	0x42C11754	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_TYPE2_COMPARE_11_WORD_0	0x42C11758	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_11_WORD_1	0x42C1175C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_12_WORD_0	0x42C11760	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_12_WORD_1	0x42C11764	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_13_WORD_0	0x42C11768	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_13_WORD_1	0x42C1176C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_14_WORD_0	0x42C11770	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_14_WORD_1	0x42C11774	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_15_WORD_0	0x42C11778	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_15_WORD_1	0x42C1177C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_16_WORD_0	0x42C11780	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_16_WORD_1	0x42C11784	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_17_WORD_0	0x42C11788	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_17_WORD_1	0x42C1178C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_18_WORD_0	0x42C11790	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_TYPE2_COMPARE_18_WORD_1	0x42C11794	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_19_WORD_0	0x42C11798	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_19_WORD_1	0x42C1179C	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_20_WORD_0	0x42C117A0	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_20_WORD_1	0x42C117A4	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_21_WORD_0	0x42C117A8	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_21_WORD_1	0x42C117AC	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_22_WORD_0	0x42C117B0	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_22_WORD_1	0x42C117B4	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_23_WORD_0	0x42C117B8	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_23_WORD_1	0x42C117BC	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_24_WORD_0	0x42C117C0	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_24_WORD_1	0x42C117C4	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_25_WORD_0	0x42C117C8	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_25_WORD_1	0x42C117CC	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.

Ethernet registers

Register name	Address	Description
ETH0_TYPE2_COMPARE_26_WORD_0	0x42C117D0	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_26_WORD_1	0x42C117D4	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_27_WORD_0	0x42C117D8	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_27_WORD_1	0x42C117DC	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_28_WORD_0	0x42C117E0	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_28_WORD_1	0x42C117E4	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_29_WORD_0	0x42C117E8	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_29_WORD_1	0x42C117EC	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_30_WORD_0	0x42C117F0	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_30_WORD_1	0x42C117F4	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.
ETH0_TYPE2_COMPARE_31_WORD_0	0x42C117F8	same as type2_compare_0_word_0. See ETH0_TYPE2_COMPARE_1_WORD_0 for the details of bit fields.
ETH0_TYPE2_COMPARE_31_WORD_1	0x42C117FC	same as type2_compare_0_word_1. See ETH0_TYPE2_COMPARE_1_WORD_1 for the details of bit fields.

25.1.1 ETH0_CTL

Description: EMAC Control Register

Address: 0x42C10000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	
HW Access	Reserved					R	R	
Name	Reserved [7:3]					REFCLK_SRC_SEL	ETH_MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	REFCLK_DIV [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	EMAC enable: '0': Disabled. '1': Enabled. Default Value: 0
15 : 8	REFCLK_DIV	Specify the reference clock divider. Integer division by (1+REFCLK_DIV). Allows for integer divisions in the range [1, 256]. Default Value: 0
2	REFCLK_SRC_SEL	Select the source for reference clock. 0: Reference clock comes from ref_clk input port (HSIO). 1: Reference clock comes from an internal clock source (PLL). Default Value: 0
1 : 0	ETH_MODE	Set ethernet mode. The speed of 10M/100M/1G is selected by programming NETWORK_CONFIG after IP is enabled. The field also specifies the clock source of internal transmit clock and receive clock domain. Default Value: 0 **0x0: MII :** MII mode (10/100MHz speed is determined by NETWORK_CONFIG[0]). **0x1: GMII :** GMII mode (NETWORK_CONFIG[10] must be set to enable 1G operation).

25.1.1 ETH0_CTL (continued)

0x2: RGMII :

RGMII mode (10M/100M/1G speed is determined by NETWORK_CONFIG[10] and NETWORK_CONFIG[0]).

0x3: RMII :

RMII mode (10M/100M speed is determined by NETWORK_CONFIG[0]).

25.1.2 ETH0_STATUS

Description: EMAC Status Register

Address: 0x42C10004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							PFC_NE-GOTIATE

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	RX_PFC_PAUSED [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	RX_PFC_PAUSED	Each bit corresponds to a priority indicated within the PFC priority based pause frame. Each bit is set when a PFC priority based pause frame has been received, and the associated priority pause time quantum is non-zero. Each bit is cleared when the associated pause time identified by the received pause time quantum has elapsed. Default Value: 0
0	PFC_NEGOTIATE	Identifies that PFC priority based pause flow control has been negotiated. 0 - No PFC priority based pause frames have yet been received, flow control is being handled using classic 802.3 pause frames. 1 - At least one PFC priority based pause frames has been received. All subsequent 802.3 pause frames will be dropped. Default Value: 0

25.1.3 ETH0_NETWORK_CONTROL

Description: The network control register contains general MAC control functions for both receiver and transmitter.

Address: 0x42C11000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	W	W	RW	RW	RW	RW	RW
HW Access	R	R	R	R	R	R	R	R
Name	STATS_WRITE_EN	INC_ALL_STATS_REGS	CLEAR_ALL_STATS_REGS	MAN_PORT_EN	ENABLE_TRANSMIT	ENABLE_RECEIVE	LOOPBACK_LOCAL	LOOPBACK

Bits	15	14	13	12	11	10	9	8
SW Access	RW	R	R	W	W	W	W	RW
HW Access	R	R	R	R	R	R	R	R
Name	STORE_RX_TS	REMOVED_14	REMOVED_13	TX_PAUSE_FRAME_ZERO	TX_PAUSE_FRAME_REQ	TX_HALT_PCLK	TX_START_PCLK	BACK_PRESSURE

Bits	23	22	21	20	19	18	17	16
SW Access	R	RW	RW	RW	RW	W	W	RW
HW Access	R	R	R	R	R	R	R	R
Name	EXT_TSU_PORT_ENABLE	STORE_UDP_OFFSET	ALT_SGMII_MODE	PTP_UNICAST_ENA	TX_LPI_EN	FLUSH_RX_PKT_PCLK	TRANSMIT_PFC_PRIORITY_BASED_PAUSE_FRAME	PFC_ENABLE

Bits	31	30	29	28	27	26	25	24
SW Access	R	RW	RW	RW	RW	RW	RW	RW
HW Access	R	R	R	R	R	R	R	R
Name	EXT_RXQ_RESERVED_31	IFG_EATS_QAV_CREDIT	TWO_PT_FIVE_GIG	SEL_MII_ON_RGMII	OSS_CORRECTION_FIELD	EXT_RXQ_SEL_EN	PFC_CTRL	ONE_STEP_SYNC_MODE

Bits	Name	Description
31	EXT_RXQ_RESERVED_31	Reserved, read as 0, ignored on write. Default Value: 0
30	IFG_EATS_QAV_CREDIT	Setting this bit high modifies the CBS algorithm so the IFG/IPG associated with a transmit frame counts towards its 802.1Qav credit. Default Value: 0
29	TWO_PT_FIVE_GIG	2.5G operation selected - setting this bit high drives the SPEED_MODE[3] top level output pin high and also adjusts the link timer in the PCS auto-negotiation block to ensure it delivers 10ms for 2500BASE-X and 1.6ms in SGMII mode, and also ensures INT_MODERATION counts 800ns periods with the speeded up MAC clocks. Default Value: 0
28	SEL_MII_ON_RGMII	If the RGMII interface being used set this bit high to configure the interface for MII operation. Default Value: 0

25.1.3 ETH0_NETWORK_CONTROL (continued)

27	OSS_CORRECTION_-FIELD	1588 One Step Correction Field Update. Set this bit high to enable updating the correction field of PTP 1588 version 2 sync frames by adding current TSU timer value. Default Value: 0
26	EXT_RXQ_SEL_EN	Enable external selection of receive queue. When this bit is high the ext_match1, ext_match2, ext_match3 and ext_match4 inputs will determine which receive queue a frame is routed to. This will be the case regardless of the state of the external address match enable bit 9 of the network config register. Note that receive frames will be dropped unless they are matched by the internal frame filtering functionality. If the external address match enable bit 9 in the network config register is set frames may be matched by an external address match filter as long as one of the ext_match1, ext_match2, ext_match3 and ext_match4 inputs is asserted early enough. When set EXT_RXQ_SEL_EN takes precedence over the existing screener functionality. This bit is only relevant if priority queuing is configured. Note: ext_match1, ext_match2, ext_match_3 and ext_match4 inputs are fixed to 0 internally. Default Value: 0
25	PFC_CTRL	"Enable multiple PFC pause quantums, one per pause priority" Default Value: 0
24	ONE_STEP_SYNC_-MODE	1588 One Step Sync Mode. Write 1 to enable. Replace timestamp field in the 1588 header for TX Sync Frames with current TSU timer value. Default Value: 0
23	EXT_TSU_PORT_EN-ABLE	Write ignore, read 0 Default Value: 0
22	STORE_UDP_OFFSET	Store UDP / TCP offset to memory. Setting this bit to one will cause the upper 16-bits of the CRC of every received frame to be replaced with the offset from start of frame to the beginning of the UDP or TCP header. The lower 16-bits of the CRC are replaced with zero and reserved for future use. The offset is measured in units of 2 bytes. Set to zero for normal operation. Default Value: 0
21	ALT_SGMII_MODE	Alternative sgmii mode. If asserted with sgmii_mode in the network control register the ACK bit is driven before ability detect during transfer of status information from the PHY to the MAC. Default Value: 0
20	PTP_UNICAST_ENA	Enable detection of unicast PTP unicast frames. Default Value: 0
19	TX_LPI_EN	Enable LPI transmission when set LPI (low power idle) is immediately transmitted. LPI is transmitted even if bit 3 transmit enable is disabled. Setting this bit also sends a pause signal to the transmit datapath. Default Value: 0
18	FLUSH_RX_PKT_PCLK	Flush the next packet from the external RX DPRAM. Writing one to this bit will only have an effect if the DMA is not currently writing a packet already stored in the DPRAM to memory. Self clearing register. Default Value: 0
17	TRANSMIT_PFC_PRIOR-ITY_BASED_PAUSE_-FRAME	Write a one to transmit PFC priority based pause frame. Takes the values stored in the Transmit PFC Pause Register. Self clearing register. Default Value: 0
16	PFC_ENABLE	Enable PFC Priority Based Pause Reception capabilities. Setting this bit will enable PFC negotiation and recognition of priority based pause frames. Default Value: 0
15	STORE_RX_TS	Store receive time stamp to memory. Setting this bit to one will cause the CRC of every received frame to be replaced with the value of the nanoseconds field of the 1588 timer that was captured as the receive frame passed the message time stamp point. Set to zero for normal operation. Default Value: 0
14	REMOVED_14	Write ignore, read 0 Default Value: 0
13	REMOVED_13	Write ignore, read 0 Default Value: 0
12	TX_PAUSE_FRAME_ZE-RO	Transmit zero quantum pause frame - writing one to this bit causes a pause frame with zero quantum to be transmitted. Default Value: 0

25.1.3 ETH0_NETWORK_CONTROL (continued)

11	TX_PAUSE_-FRAME_REQ	Transmit pause frame - writing one to this bit causes a pause frame to be transmitted. Self clearing register. Default Value: 0
10	TX_HALT_PCLK	Transmit halt - writing one to this bit halts transmission as soon as any ongoing frame transmission ends. Default Value: 0
9	TX_START_PCLK	Start transmission - writing one to this bit starts transmission. Default Value: 0
8	BACK_PRESSURE	Back pressure if set in 10M or 100M half duplex mode will force collisions on all received frames. Ignored in gigabit half duplex mode. Default Value: 0
7	STATS_WRITE_EN	Write enable for statistics registers - setting this bit to one means the statistics registers can be written for functional test purposes. Default Value: 0
6	INC_ALL_STATS_REGS	Incremental statistics registers - this bit is write only. Writing a one increments all the statistics registers by one for test purposes. Self clearing register. Default Value: 0
5	CLEAR_ALL_STATS_REGS	Clear statistics registers - this bit is write only. Writing a one clears the statistics registers. Self clearing register. Default Value: 0
4	MAN_PORT_EN	Management port enable - set to one to enable the management port. When zero forces mdio to high impedance state and mdc low. Default Value: 0
3	ENABLE_TRANSMIT	Transmit enable - when set, it enables the GEM transmitter to send data. When reset transmission will stop immediately, the transmit pipeline and control registers will be cleared and the transmit queue pointer register will reset to point to the start of the transmit descriptor list. Default Value: 0
2	ENABLE_RECEIVE	Receive enable - when set, it enables the GEM to receive data. When reset frame reception will stop immediately and the receive pipeline will be cleared. The receive queue pointer register is unaffected. Default Value: 0
1	LOOPBACK_LOCAL	Not used. Default Value: 0
0	LOOPBACK	Not used. Default Value: 0

25.1.4 ETH0_NETWORK_CONFIG

Description: The network configuration register contains functions for setting the mode of operation for the Gigabit Ethernet MAC.

Address: 0x42C11004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	RW	RW	RW	RW	RW	RW	RW
HW Access	R	R	R	R	R	R	R	R
Name	UNICAST-_HASH_ENABLE	MULTI-CAST_HASH_ENABLE	NO_BROADCAST	COPY_ALL_FRAMES	JUMBO_-FRAMES	DIS-CARD_NON_VLAN_-FRAMES	FULL_DU-PLEX	SPEED

HW Access	R		R	R	R	R	R	R
Name	RECEIVE_BUFFER_OFF-SET [15:14]		PAUSE_ENABLE	RE-TRY_TEST	PCS_SE-LECT	GIGABIT_-MODE_EN-ABLE	EXTER-NAL_AD-DRESS_MATCH_EN-ABLE	RE-CEIVE_1536_BYTE_-FRAMES

Bits	23	22	21	20	19	18	17	16
SW Access	RW	RW		RW			RW	RW
HW Access	R	R		R			R	R
Name	DISABLE_-COPY_OF_PAUSE_-FRAMES	DATA_BUS_WIDTH [22:21]		MDC_CLOCK_DIVISION [20:18]			FCS_RE-MOVE	LENGTH_-FIELD_ER-ROR_FRAME_DIS-CARD

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	RW	RW	RW	RW	RW	RW
HW Access	R	R	R	R	R	R	R	R
Name	RE-SERVED_31	IG-NORE_IP-G_RX_ER	NSP_CHANGE	IP-G_STRETCH_ENABLE	SGMII_-MODE_EN-ABLE	IG-NORE_RX-_FCS	EN_HALF_-DUPLEX-_RX	RECEIVE_-CHECK-SUM_OFFLOAD_EN-ABLE

Bits	Name	Description
31	RESERVED_31	Reserved. Writeable register. Ignore on read. Default Value: 0
30	IGNORE_IPG_RX_ER	Ignore IPG rx_er. When set rx_er has no effect on the GEMs operation when rx_ctl is low. Set this when using the RGMII wrapper in half-duplex mode. Default Value: 0
29	NSP_CHANGE	Receive bad preamble. When set frames with non-standard preamble are not rejected. Default Value: 0
28	IPG_STRETCH_ENABLE	IPG stretch enable - when set the transmit IPG can be increased above 96 bit times depending on the previous frame length using the IPG stretch register. Default Value: 0

25.1.4 ETH0_NETWORK_CONFIG (continued)

27	SGMII_MODE_ENABLE	SGMII mode enable - changes behaviour of the auto-negotiation advertisement and link partner ability registers to meet the requirements of SGMII and reduces the duration of the link timer from 10 ms to 1.6 ms. Default Value: 0
26	IGNORE_RX_FCS	Ignore RX FCS - when set frames with FCS/CRC errors will not be rejected. FCS error statistics will still be collected for frames with bad FCS and FCS status will be recorded in frame's DMA descriptor. For normal operation this bit must be set to zero. Default Value: 0
25	EN_HALF_DUPLEX_RX	Enable frames to be received in half-duplex mode while transmitting. Default Value: 0
24	RECEIVE_CHECK-SUM_OFFLOAD_EN-ABLE	Receive checksum offload enable - when set, the receive checksum engine is enabled. Frames with bad IP, TCP or UDP checksums are discarded. Default Value: 0
23	DISABLE_-COPY_OF_PAUSE_-FRAMES	Disable copy of pause frames - set to one to prevent pause frames being copied to memory. When set, neither control frames with type id 8808, nor pause frames with destination address 010000c28001 are copied to memory. Note that valid pause frames received will still increment pause statistics and pause the transmission of frames as required. Default Value: 0
22 : 21	DATA_BUS_WIDTH	Data bus width - set according to AMBA (AXI/AHB) or external FIFO data bus width. Only valid bus widths may be written if the system is configured to a maximum width less than 128-bits. 00: 32 bit data bus width 01: 64 bit AMBA (AXI/AHB) data bus width 10: 128 bit AMBA (AXI/AHB) data bus width 11: 128 bit AMBA (AXI/AHB) data bus width. Note: When AXI interface for DMA access is supported, EMAC only supports 64b DMA data bus width, so must set it 1. When AHB interface for DMA access is supported, EMAC only supports 32b DMA data bus width, so must set it 0. (See TRM feature list for AXI/AHB interface) Default Value: 0x1
20 : 18	MDC_CLOCK_DIVISION	MDC clock division - set according to clk_sys speed. These three bits determine the number clk_sys will be divided by to generate MDC. For conformance with the 802.3 specification, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations). 000: divide clk_sys by 8 (clk_sys up to 20 MHz) 001: divide clk_sys by 16 (clk_sys up to 40 MHz) 010: divide clk_sys by 32 (clk_sys up to 80 MHz) 011: divide clk_sys by 48 (clk_sys up to 120MHz) 100: divide clk_sys by 64 (clk_sys up to 160 MHz) 101: divide clk_sys by 96 (clk_sys up to 240 MHz) 110: divide clk_sys by 128 (clk_sys up to 320 MHz) 111: divide clk_sys by 224 (clk_sys up to 540 MHz). Default Value: 0x3
17	FCS_REMOVE	FCS remove - setting this bit will cause received frames to be written to memory without their frame check sequence (last 4 bytes). The frame length indicated will be reduced by four bytes in this mode. Default Value: 0
16	LENGTH_FIELD_ER-ROR_FRAME_DISCARD	Length field error frame discard - setting this bit causes frames with a measured length shorter than the extracted length field (as indicated by bytes 13 and 14 in a non-VLAN tagged frame) to be discarded. This only applies to frames with a length field less than 0x0600. Default Value: 0
15 : 14	RECEIVE_BUFFER_OFF-SET	Receive buffer offset - indicates the number of bytes by which the received data is offset from the start of the receive buffer. Default Value: 0
13	PAUSE_ENABLE	Pause enable - when set, transmission will pause if a non zero 802.3 classic pause frame is received and PFC has not been negotiated. Default Value: 0

25.1.4 ETH0_NETWORK_CONFIG (continued)

12	RETRY_TEST	Retry test - must be set to zero for normal operation. If set to one the backoff between collisions will always be one slot time. Setting this bit to one helps test the too many retries condition. Also used in the pause frame tests to reduce the pause counter's decrement time from 512 bit times, to every receive clock cycle. Default Value: 0
11	PCS_SELECT	PCS select - selects between MII/GMII and TBI Default Value: 0
10	GIGABIT_MODE_ENABLE	Gigabit mode enable - setting this bit configures the GEM for 1000 Mbps operation. 0: 10/100 operation using MII interface 1: Gigabit operation using GMI interface Default Value: 0
9	EXTERNAL_ADDRESS_MATCH_ENABLE	External address match enable - when set the external address match interface can be used to copy frames to memory. Default Value: 0
8	RECEIVE_1536_BYTE_FRAMES	Receive 1536 byte frames - setting this bit means the GEM will accept frames up to 1536 bytes in length. Normally the GEM would reject any frame above 1518 bytes. Default Value: 0
7	UNICAST_HASH_ENABLE	Unicast hash enable - when set, unicast frames will be accepted when the 6 bit hash function of the destination address points to a bit that is set in the hash register. Default Value: 0
6	MULTICAST_HASH_ENABLE	Multicast hash enable - when set, multicast frames will be accepted when the 6 bit hash function of the destination address points to a bit that is set in the hash register. Default Value: 0
5	NO_BROADCAST	No broadcast - when set to logic one, frames addressed to the broadcast address of all ones will not be accepted. Default Value: 0
4	COPY_ALL_FRAMES	Copy all frames - when set to logic one, all valid frames will be accepted. Default Value: 0
3	JUMBO_FRAMES	Jumbo frames - set to one to enable jumbo frames up to 10,240 bytes to be accepted. The default length is 10,240 bytes. Default Value: 0
2	DISCARD_NON_VLAN_FRAMES	Discard non-VLAN frames - when set only VLAN tagged frames will be passed to the address matching logic. Default Value: 0
1	FULL_DUPLEX	Full duplex - if set to logic one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting. Default Value: 0
0	SPEED	Speed - set to logic one to indicate 100Mbps operation, logic zero for 10Mbps. Default Value: 0

25.1.5 ETH0_NETWORK_STATUS

Description: The network status register returns status information with respect to the PHY management interface.

Address: 0x42C11008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	R	R		R	R	R	R
HW Access	W	W	W		W	W	W	W
Name	LPI_INDICATE_PCLK	PFC_NEGOTIATE_PCLK	REMOVED_5_4 [5:4]		MAC_FULL_DUPLEX	MAN_DONE	MDIO_IN	PCS_LINK_STATE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	LPI_INDICATE_PCLK	LPI Indication - Low power idle has been detected on receive. This bit is set when LPI is detected and reset when normal idle is detected. An interrupt is generated when the state of this bit changes. Default Value: 0
6	PFC_NEGOTIATE_PCLK	Set when PFC Priority Based Pause has been negotiated. Default Value: 0
5 : 4	REMOVED_5_4	Reserved, read as 0, ignored on write. Default Value: 0
3	MAC_FULL_DUPLEX	PCS auto-negotiation duplex resolution. Set to one if the resolution function determines that both devices are capable of full duplex operation. If zero half-duplex operation is possible as long as bit 0 (PCS link state) is also one. Default Value: 0
2	MAN_DONE	The PHY management logic is idle (i.e. has completed). Default Value: 1
1	MDIO_IN	Returns status of the mdio pin. Default Value: 1
0	PCS_LINK_STATE	Returns status of PCS link state. If auto-negotiation is disabled this returns the synchronisation status. If auto-negotiation is enabled it is set in the LINK_OK state as long as a compatible duplex mode is resolved. Default Value: 0

25.1.6 ETH0_USER_IO_REGISTER

Description: Not presents. Access to the register will return AHB error.

Address: 0x42C1100C

Retention: Not Retained

SW Access	RW							
HW Access	R							
Name	RX_BUF_SIZE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved	RW	RW	RW	Reserved	RW	RW	RW
HW Access	Reserved	R	R	R	Reserved	R	R	R
Name	Reserved	DMA_ADDR_BUS_WIDTH_1	TX_BD_EXTENDED_MODE_EN	RX_BD_EXTENDED_MODE_EN	Reserved	FORCE_MAX_AMBA_BURST_TX	FORCE_MAX_AMBA_BURST_RX	FORCE_DISCARD_ON_ERR

Bits	Name	Description
30	DMA_ADDR_BUS_WIDTH_1	DMA address bus width. 0 = 32b, 1 = 64b. Note: EMAC only supports 32b DMA address bus width, so must set it 0. Default Value: 0
29	TX_BD_EXTENDED_MODE_EN	Enable TX extended BD mode. See TX BD control register definition for description of feature. Default Value: 0
28	RX_BD_EXTENDED_MODE_EN	Enable RX extended BD mode. See RX BD control register definition for description of feature. Default Value: 0
26	FORCE_MAX_AMBA_BURST_TX	Force max length bursts on TX. Force the TX DMA to always issue max length bursts on EOP(end of packet) or EOB(end of buffer) transfers as defined by bits 4:0 of this register, even when there is less that max burst data bytes to read. Residual data read is ignored. Does not apply on bursts that break 1k boundary rule. Default Value: 0

25.1.7 ETH0_DMA_CONFIG (continued)

25	FORCE_MAX_AMBA_BURST_RX	Force max length bursts on RX. Force the RX DMA to always issue max length bursts on EOP(end of packet) or EOB(end of buffer)transfers, even if there is less than max burst real packet data required to write. Any extra bytes of pad data is set to 0x00. Does not apply on bursts that break 1k boundary rule. Default Value: 0
24	FORCE_DISCARD_ON_ERR	Auto Discard RX pkts during lack of resource. When set, the GEM DMA will automatically discard receive packets from the receiver packet buffer memory when no AMBA (AXI/AHB) resource is available. When low, then received packets will remain to be stored in the SRAM based packet buffer until AMBA (AXI/AHB) buffer resource next becomes available. A write to this bit is ignored if the DMA is not configured in the packet buffer full store and forward mode. Default Value: 0
23 : 16	RX_BUF_SIZE	DMA receive buffer size in external AMBA (AXI/AHB) system memory. The value defined by these bits determines the size of buffer to use in main system memory when writing received data. The value is defined in multiples of 64 bytes. 0x01 corresponds to buffers of 64 bytes 0x02 corresponds to 128 bytes etc. For example: 0x02: 128 byte. 0x18: 1536 byte (1*max length frame/buffer) 0xA0: 10240 byte (1*10K jumbo frame/buffer) Note that this value should never be written as zero. Default Value: 0x18
13	CRC_ERROR_REPORT	When the bit is set, bit 16 of the receive buffer descriptor will represent FCS/CRC error (only if frames with FCS are copied to memory as enabled by bit 26 in the network config register). When this bit is clear, bit 16 of the receive buffer descriptor will represent the Canonical format indicator (CFI) bit as extracted from the receive frame (if the receive buffer descriptor is pointing to the last data buffer of the receive frame and the received frame was VLAN tagged). Default Value: 0
12	INFINITE_LAST_DBUF_SIZE_EN	Forces the DMA to consider the data buffer pointed to by last descriptor in the descriptor list to be of infinite size. Default Value: 0
11	TX_PBUF_TCP_EN	Transmitter IP, TCP and UDP checksum generation offload enable (not supported when in TX Partial Store and Forward mode). When set, the transmitter checksum generation engine is enabled, to calculate and substitute checksums for transmit frames. When clear, frame data is unaffected. If the GEM is not configured to use the DMA packet buffer, this bit is not implemented and will be treated as reserved, read as 0, ignored on write. Default Value: 0
10	TX_PBUF_SIZE	Transmitter packet buffer memory size select. Having this bit at zero halves the amount of memory used for the transmit packet buffer. This reduces the amount of memory used by the GEM. It is important to set this bit to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 4 Kbytes. 1: Use full configured addressable space (4 Kb) 0: Do not use top address bit (2 Kb) If the GEM is not configured to use the DMA packet buffer, this bit is not implemented and will be treated as reserved, read as 0, ignored on write. Default Value: 1
9 : 8	RX_PBUF_SIZE	Receiver packet buffer memory size select. Having these bits at less than 11 reduces the amount of memory used for the receive packet buffer. This reduces the amount of memory used by the GEM. It is important to set these bits both to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 8 Kbytes. 11: Use full configured addressable space (8 Kb) 10: Do not use top address bit (4 Kb) 01: Do not use top two address bits (2 Kb) 00: Do not use top three address bits (1 Kb) If the GEM is not configured to use the DMA packet buffer, these bits are not implemented and will be treated as reserved, read as 0, ignored on write. Default Value: 0x3

25.1.7 ETH0_DMA_CONFIG (continued)

7	ENDIAN_SWAP_PACKET	endian swap mode enable for packet data accesses. When set, selects swapped endianism for AMBA (AXI/AHB) transfers. When clear, selects little endian mode. Default Value: 0
6	ENDIAN_SWAP_MAN-AGEMENT	endian swap mode enable for management descriptor accesses. When set, selects swapped endianism for AMBA (AXI/AHB) transfers. When clear, selects little endian mode. Default Value: 0
5	HDR_DATA_SPLIT-TING_EN	Enable header data Splitting. When set, receive frames will be forwarded to main memory using a minimum of two DMA data buffers. The first X data buffers will contain the frame header, consisting of the Ethernet,VLAN,(IPv4 or IPv6),(TCP or UDP). X= (frame header size divided by RX-_BUF_SIZE as defined in bits 23:16 of this register). The last Y data buffers will contain the frame payload. Y= (frame payload size divided by RX_BUF_SIZE). Note that for non VLAN/IP/TCP/UDP frames, the header will always be 14 bytes. When this feature is disabled, the frame is forwarded to main memory in blocks of RX_BUF_SIZE. Note: This feature can only be set when AXI interface for DMA access is used. (See TRM feature list for AXI/AHB interface) Default Value: 0
4 : 0	AMBA_BURST_LENGTH	Selects the burst length to use on the AMBA (AHB/AXI) when transferring frame data. Not used for DMA management operations and only used where space and data size allow and respecting AXI/AHB burst boundary rules. One-hot priority encoding enforced automatically on register writes as follows, where x represents don't care: 1xxxx: Attempt to use bursts of up to 16. 01xxx: Attempt to use bursts of up to 8. 001xx: Attempt to use bursts of up to 4. 0001x: Always use SINGLE bursts. 00001: Always use SINGLE bursts. 00000: Attempt to use bursts of up to 256. Note: EMAC only supports burst length up to 16. Default Value: 0x04

25.1.8 ETH0_TRANSMIT_STATUS

Description: This register, when read, provides details of the status of a transmit. Once read, individual bits may be cleared by writing 1 to them. It is not possible to set a bit to 1 by writing to the register.

Address: 0x42C11014

Retention: Not Retained

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	RESP_NOT_OK123	bresp/hresp not OK - set when BRESP (AXI write response) or HRESP (AHB read/write response) is detected as not OK on AXI/AHB interface for DMA access. Cleared by writing a one to this bit. Default Value: 0
7	LATE_COLLISION_OC-CURRED	Late collision occurred - only set if the condition occurs in gigabit mode, as retry is not attempted. Cleared by writing a one to this bit. Default Value: 0
6	TRANS-MIT_UNDER_RUN123	Transmit under run - this bit is set if the transmitter was forced to terminate a frame that it had already began transmitting due to further data being unavailable. This bit is set if a transmitter status write back has not completed when another status write back is attempted. When using the DMA interface configured for packet buffer mode, this bit will never be set. Cleared by writing a 1. Default Value: 0
5	TRANSMIT_COM-PLETE123	Transmit complete - set when a frame has been transmitted. Cleared by writing a one to this bit. Default Value: 0

25.1.8 ETH0_TRANSMIT_STATUS (continued)

4	AMBA_ERROR123	Transmit frame corruption due to AMBA (AXI/AHB) errors. Set if an error occurs whilst midway through reading transmit frame from external memory including HRESP (read/write response on AHB interface for DMA access), RRESP or BRESP (read/write response on AXI interface for DMA access) errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and tx_er asserted). Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size. Cleared by writing a one to this bit. Default Value: 0
3	TRANSMIT_GO	Transmit go - if high transmit is active. When using the exposed FIFO interface, this bit represents bit 3 of the network control register. When using the DMA interface this bit represents the tx_go variable as specified in the transmit buffer description. Default Value: 0
2	RETRY_LIMIT_EXCEEDED	Retry limit exceeded - cleared by writing a one to this bit. Default Value: 0
1	COLLISION_OCCURRED	Collision occurred - set by the assertion of collision. Cleared by writing a one to this bit. When operating in 10/100 mode, this status indicates either a collision or a late collision. In gigabit mode, this status is not set for a late collision. Default Value: 0
0	USED_BIT_READ	Used bit read - set when a transmit buffer descriptor is read with its used bit set. Cleared by writing a one to this bit. Default Value: 0

25.1.9 ETH0_RECEIVE_Q_PTR

Description: This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the network control register. Once reception is enabled, any write to the receive buffer queue base address register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the used bits. In terms of AMBA (AXI) operation, the receive descriptors are read from memory using a single 32bit AXI access. When the datapath is configured at 64bit, the receive descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is written to using a single 64bit AXI access.

Address: 0x42C11018

Bits	Name	Description
31 : 2	DMA_RX_Q_PTR	Receive buffer queue base address - written with the address of the start of the receive queue. Default Value: 0x00000000
0	DMA_RX_DIS_Q	Disable queue if set to 1. This can be used to reduce the number of active queues and should only be changed while receive is not enabled. Default Value: 0

25.1.10 ETH0_TRANSMIT_Q_PTR

Description: This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit, the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access.

Name	Reserved [31:24]							

Bits	Name	Description
3	RESP_NOT_OK1234	bresp/hresp not OK - set when BRESP (AXI write response) or HRESP (AHB read/write response) is detected as not OK on AXI/AHB interface for DMA access. Cleared by writing a one to this bit. Default Value: 0
2	RECEIVE_OVERRUN123	Receive overrun - this bit is set if either the gem_dma RX FIFO or external RX FIFO were unable to store the receive frame due to a FIFO overflow, or if the receive status, reported by the gem_rx module to the gem_dma was not taken at end of frame. This bit is also set in DMA packet buffer mode if the packet buffer overflows. For DMA operation the buffer will be recovered if an overrun occurs. This bit is cleared by writing a one to it. Default Value: 0
1	FRAME_RECEIVED	Frame received - one or more frames have been received and placed in memory. Cleared by writing a one to this bit. Default Value: 0
0	BUFFER_NOT_AVAIL-ABLE	Buffer not available - an attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA will reread the pointer each time an end of frame is received until a valid pointer is found. This bit is set following each descriptor read attempt that fails, even if consecutive pointers are unsuccessful and software has in the mean time cleared the status flag. Cleared by writing a one to this bit. Default Value: 0

25.1.12 ETH0_INT_STATUS

Description: If not configured for priority queueing, the GEM generates a single interrupt. This register indicates the source of this interrupt. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the ethernet_int signal will be asserted. For test purposes each bit can be set or reset by writing to the interrupt mask register. The default configuration is shown below whereby all bits are reset to zero on read. Changing the validity of the `gem_irq_read_clear define will instead require a one to be written to the appropriate bit in order to clear it. In this mode reading has no affect on the status of the bit.

Bits	Name	Description
29	TSU_TIMER_COMPARISON_INTERRUPT	TSU timer comparison interrupt. Indicates when TSU timer count value is equal to programmed value. Default Value: 0

25.1.12 ETH0_INT_STATUS (continued)

28	REMOVED_28	Write ignore, read 0 Default Value: 0
27	RECEIVE_LPI_INDICATION_STATUS_BIT_CHANGE	Receive LPI indication status bit change Default Value: 0
26	TSU_SECONDS_REGISTER_INCREMENT	TSU seconds register increment indicates the register has incremented. Cleared on read. Default Value: 0
25	PTP_PDELAY_RESP_FRAME_TRANSMITTED	PTP pdelay_resp frame transmitted indicates a PTP pdelay_resp frame has been transmitted. Cleared on read. Default Value: 0
24	PTP_PDELAY_REQ_FRAME_TRANSMITTED	PTP pdelay_req frame transmitted indicates a PTP pdelay_req frame has been transmitted. Cleared on read. Default Value: 0
23	PTP_PDELAY_RESP_FRAME_RECEIVED	PTP pdelay_resp frame received indicates a PTP pdelay_resp frame has been received. Cleared on read. Default Value: 0
22	PTP_PDELAY_REQ_FRAME_RECEIVED	PTP pdelay_req frame received indicates a PTP pdelay_req frame has been received. Cleared on read. Default Value: 0
21	PTP_SYNC_FRAME_TRANSMITTED	PTP sync frame transmitted indicates a PTP sync frame has been transmitted. Cleared on read. Default Value: 0
20	PTP_DELAY_REQ_FRAME_TRANSMITTED	PTP delay_req frame transmitted indicates a PTP delay_req frame has been transmitted. Cleared on read. Default Value: 0
19	PTP_SYNC_FRAME_RECEIVED	PTP sync frame received indicates a PTP sync frame has been received. Cleared on read. Default Value: 0
18	PTP_DELAY_REQ_FRAME_RECEIVED	PTP delay_req frame received indicates a PTP delay_req frame has been received. Cleared on read. Default Value: 0
17	REMOVED_17	Write ignore, read 0 Default Value: 0
16	REMOVED_16	Write ignore, read 0 Default Value: 0
15	REMOVED_15	Write ignore, read 0 Default Value: 0
14	PAUSE_FRAME_TRANSMITTED	Pause frame transmitted - indicates a pause frame has been successfully transmitted after being initiated from the network control register. Cleared on read. Default Value: 0
13	PAUSE_TIME_ELAPSED	Pause Time elapsed. set when either the pause time register at address 0x38 decrements to zero, or when a valid pause frame is received with a zero pause quantum field. Cleared on read. Default Value: 0
12	PAUSE_FRAME_WITH_NON_ZERO_PAUSE_QUANTUM_RECEIVED	Pause frame with non-zero pause quantum received - indicates a valid pause has been received that has a non-zero pause quantum field. Cleared on read. Default Value: 0
11	RESP_NOT_OK	bresp/hresp not OK - set when BRESP (AXI write response) or HRESP (AHB read/write response) is detected as not OK on AXI/AHB interface for DMA access. Cleared on read. Default Value: 0
10	RECEIVE_OVERRUN	Receive overrun - set when the receive overrun status bit gets set. Cleared on read. Default Value: 0
9	REMOVED_9	Write ignore, read 0 Default Value: 0
7	TRANSMIT_COMPLETE	Transmit complete - set when a frame has been transmitted. Cleared on read. Default Value: 0

25.1.12 ETH0_INT_STATUS (continued)

6	AMBA_ERROR	Transmit frame corruption due to AMBA (AXI/AHB) error. Set if an error occurs whilst midway through reading transmit frame from external system memory, including HRESP (AHB), RRESP or BRESP(AXI) errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and tx_er asserted). Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size. Cleared on a read. Default Value: 0
5	RETRY_LIMIT_EXCEEDED_OR_LATE_COLLISION	Retry limit exceeded or late collision - transmit error. Late collision will only cause this status bit to be set in gigabit mode (as a retry is not attempted). Cleared on read. Default Value: 0
4	TRANSMIT_UNDER_RUN	Transmit under run - this interrupt is set if the transmitter was forced to terminate a frame that it has already began transmitting due to further data being unavailable. If an under run occurs, the transmitter will force bad crc and tx_er high. This interrupt is set if a transmitter status write back has not completed when another status write back is attempted. When using the DMA interface configured for internal FIFO mode, this interrupt is also set when the transmit DMA has written the SOP data into the FIFO and either the AHB bus was not granted in time for further data, or because an AHB/AXI error response was returned by the connected slave, or because a used bit was read. When using the DMA interface configured for packet buffer mode, this bit will never be set. Cleared on read. Default Value: 0
3	TX_USED_BIT_READ	TX used bit read - set when a transmit buffer descriptor is read with its used bit set. Cleared on read. Default Value: 0
2	RX_USED_BIT_READ	RX used bit read - set when a receive buffer descriptor is read with its used bit set. Cleared on read. Default Value: 0
1	RECEIVE_COMPLETE	Receive complete - a frame has been stored in memory. Cleared on read. Default Value: 0
0	MANAGEMENT_FRAME_SENT	Management frame sent - the PHY maintenance register has completed its operation. Cleared on read. Default Value: 0

25.1.13 ETH0_INT_ENABLE

Description: At reset all interrupts are disabled. Writing a one to the relevant bit location enables the required interrupt. This register is write only and when read will return zero.

Address: 0x42C11028

Retention: Not Retained

25.1.15 ETH0_INT_MASK

Description: The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register.

Bits	Name	Description

25.1.15 ETH0_INT_MASK (continued)

29	TSU_TIMER_COMPARISON_MASK	Enable TSU timer comparison interrupt mask. Default Value: 1
28	UNUSED_28	unused Default Value: 1
27	RX_LPI_INDICATION_MASK	A read of this register returns the value of the RX LPI indication mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written Default Value: 1
26	TSU_SECONDS_REGISTER_INCREMENT_MASK	A read of this register returns the value of the TSU seconds register increment mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
25	PTP_PDELAY_RESP_FRAME_TRANSMITTED_MASK	A read of this register returns the value of the PTP pdelay_resp frame transmitted mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
24	PTP_PDELAY_REQ_FRAME_TRANSMITTED_MASK	A read of this register returns the value of the PTP pdelay_req frame transmitted mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
23	PTP_PDELAY_RESP_FRAME_RECEIVED_MASK	A read of this register returns the value of the PTP pdelay_resp frame received mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
22	PTP_PDELAY_REQ_FRAME_RECEIVED_MASK	A read of this register returns the value of the PTP pdelay_req frame received mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
21	PTP_SYNC_FRAME_TRANSMITTED_MASK	A read of this register returns the value of the PTP sync frame transmitted mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
20	PTP_DELAY_REQ_FRAME_TRANSMITTED_MASK	A read of this register returns the value of the PTP delay_req frame transmitted mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
19	PTP_SYNC_FRAME_RECEIVED_MASK	A read of this register returns the value of the PTP sync frame received mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1

25.1.15 ETH0_INT_MASK (continued)

18	PTP_DELAY_REQ_-FRAME_RE-CEIVED_MASK	A read of this register returns the value of the PTP delay_req frame received mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
17	UNUSED_17	Not used Default Value: 1
16	UNUSED_16	Not used Default Value: 1
15	UNUSED_15	Not used Default Value: 1
14	PAUSE_FRAME_TRANS-MITTED_INTER-RUPT_MASK	pause frame transmitted interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
13	PAUSE_TIME_ZERO_IN-TERRUPT_MASK	pause time zero interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
12	PAUSE_-FRAME_WITH_NON_ZE-RO_PAUSE_QUANTUM_I NTERRUPT_MASK	pause frame with non-zero pause quantum interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
11	RESP_NOT_OK_INTER-RUPT_MASK	bresp not OK interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
10	RECEIVE_OVERRUN_IN-TERRUPT_MASK	receive overrun interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
9	UNUSED_9	Not used Default Value: 1
8	UNUSED_8	Not used Default Value: 1
7	TRANSMIT_COM-PLETE_INTER-RUPT_MASK	transmit complete interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
6	AMBA_ERROR_INTER-RUPT_MASK	transmit frame corruption due to AMBA (AXI/AHB) error interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1

25.1.15 ETH0_INT_MASK (continued)

5	RETRY_LIMIT_EXCEEDED_OR_LATE_COLLISION_MASK	A read of this register returns the value of the retry limit exceeded or late collision (gigabit mode only) interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
4	TRANSMIT_BUFFER_UNDER_RUN_INTERRUPT_MASK	transmit buffer under run interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
3	TRANSMIT_USED_BIT_READ_INTERRUPT_MASK	transmit used bit read interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
2	RECEIVE_USED_BIT_READ_INTERRUPT_MASK	receive used bit read interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
1	RECEIVE_COMPLETE_INTERRUPT_MASK	receive complete interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1
0	MANAGEMENT_DONE_INTERRUPT_MASK	management done interrupt mask. 0: Interrupt is enabled. 1: Interrupt is disabled. A write to this register directly affects the state of the corresponding bit in the interrupt status register, causing an interrupt to be generated if a 1 is written. Default Value: 1

25.1.16 ETH0_PHY_MANAGEMENT

Description: The PHY maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit-2 is set in the network status register. It takes about 2000 pclk cycles to complete, when MDC is set for pclk divide by 32 in the network configuration register. An interrupt is generated upon completion. During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO. See Section 22.2.4.5 of the IEEE 802.3 standard. Reading during the shift operation will return the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits will be updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced. The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. For a description of MDC generation, see Network Configuration Register.

Address: 0x42C11034

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Name	REMOVED_31_0 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	REMOVED_31_0 [31:24]							

Bits	Name	Description
31 : 0	REMOVED_31_0	Write ignore, read 0 Default Value: 0x0

25.1.24 ETH0_INT_MODERATION

Description: Used to moderate the number of transmit and receive complete interrupts issued. With interrupt moderation enabled receive and transmit interrupts are not generated immediately a frame is transmitted or received. Instead when a receive or transmit event occurs a timer is started and the interrupt is asserted after it times out. This limits the frequency with which the CPU receives interrupts. When interrupt moderation is enabled interrupt status bit one is always used for receive and bit 7 is always used for transmit even when priority queuing is enabled. With interrupt moderation 800ns periods are counted. GEM determines what constitutes an 800ns period by looking at the tbi (bit 11), gigabit bit (10) and speed (bit 0) bits in the network configuration register and counting tx_clk cycles. Bit 0 needs to be set to 1 for 100M operation.

Address: 0x42C1105C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	RX_INT_MODERATION [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	TX_INT_MODERATION [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	TX_INT_MODERATION	Count of 800ns periods before bit 7 is set in the interrupt status register after a frame is transmitted. A non-zero value indicates transmit interrupt moderation will be performed. Default Value: 0x00
7 : 0	RX_INT_MODERATION	Count of 800ns periods before bit 1 is set in the interrupt status register after a frame is received. A non-zero value indicates receive interrupt moderation will be performed. Default Value: 0x00

25.1.25 ETH0_SYS_WAKE_TIME

Description: Used to pause transmission after deassertion of tx_lpi_en. Each unit in this register corresponds to 64ns in gigabit mode, 320ns in 100M mode and 3200ns at 10M. After tx_lpi_en is deasserted transmission will pause for the set time.

Address: 0x42C11060

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SYS_WAKE_TIME [7:0]

HW Access	Reserved				R	R	R	R
Name	Reserved [23:20]				WOL_MASK_3	WOL_MASK_2	WOL_MASK_1	WOL_MASK_0

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19	WOL_MASK_3	Wake on LAN multicast hash event enable. Default Value: 0
18	WOL_MASK_2	Wake on LAN specific address register 1 event enable. Default Value: 0
17	WOL_MASK_1	Wake on LAN ARP request event enable. Default Value: 0
16	WOL_MASK_0	Wake on LAN magic packet event enable. Default Value: 0
15 : 0	ADDR	Wake on LAN ARP request IP address. Written to define the least significant 16 bits of the target IP address that is matched to generate a Wake on LAN event. A value of zero will not generate an event, even if this is matched by the received frame. Default Value: 0x0000

25.1.37 ETH0_STRETCH_RATIO

Description: IPG stretch register

Address: 0x42C110BC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	IPG_STRETCH [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	IPG_STRETCH [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	IPG_STRETCH	IPG Stretch. Bits 7:0 are multiplied with the previously transmitted frame length (including preamble) bits 15:8 +1 divide the frame length. If the resulting number is greater than 96 and bit 28 is set in the network configuration register then the resulting number is used for the transmit inter-packet-gap. 1 is added to bits 15:8 to prevent a divide by zero. Default Value: 0x0000

25.1.38 ETH0_STACKED_VLAN

Description: Stacked VLAN Register

Address: 0x42C110C0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	MATCH [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	MATCH [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLE_PROCESSING	Reserved [30:24]						

Bits	Name	Description
31	ENABLE_PROCESSING	Enable stacked VLAN processing mode Default Value: 0
15 : 0	MATCH	User defined VLAN_TYPE field. When Stacked VLAN is enabled, the first VLAN tag in a received frame will only be accepted if the VLAN type field is equal to this user defined VLAN_TYPE OR equal to the standard VLAN type (0x8100). Note that the second VLAN tag of a Stacked VLAN packet will only be matched correctly if its VLAN_TYPE field equals 0x8100. Default Value: 0x0000

25.1.39 ETH0_TX_PFC_PAUSE

Description: Transmit PFC Pause Register

Address: 0x42C110C4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VECTOR_ENABLE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	VECTOR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 8	VECTOR	Priority Vector Pause Size. If bit 17 of the network control register is written with a one then for each entry equal to zero in the Transmit PFC Pause Register[15:8], the PFC pause frame's pause quantum field associated with that entry will be taken from the transmit pause quantum register. For each entry equal to one in the Transmit PFC Pause Register [15:8], the pause quantum associated with that entry will be zero. Default Value: 0x00
7 : 0	VECTOR_ENABLE	Priority Vector Enable. If bit 17 of the network control register is written with a one then the priority enable vector of the PFC priority based pause frame will be set equal to the value stored in this register [7:0]. Default Value: 0x00

25.1.40 ETH0_MASK_ADD1_BOTTOM

Description: Specific Address Mask 1 Bottom (31 to 0 bits)

Address: 0x42C110C8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDRESS_MASK_BOTTOM [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDRESS_MASK_BOTTOM [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	ADDRESS_MASK_BOTTOM [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDRESS_MASK_BOTTOM [31:24]							

Bits	Name	Description
31 : 0	ADDRESS_MASK_BOTTOM	Specific Address Mask. Setting a bit to one masks the corresponding bit in the specific address 1 register (31 to 0 bits) Default Value: 0x00000000

25.1.41 ETH0_MASK_ADD1_TOP

Description: Specific Address Mask 1 Top (47 to 32 bits)

Address: 0x42C110CC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDRESS_MASK_TOP [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDRESS_MASK_TOP [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	ADDRESS_MASK_TOP	Specific Address Mask. Setting a bit to one masks the corresponding bit in the specific address 1 register (47 to 32 bits). Default Value: 0x0000

25.1.42 ETH0_DMA_ADDR_OR_MASK

Description: Receive DMA Data Buffer Address Mask

Address: 0x42C110D0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				MASK_ENABLE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW				Reserved			
HW Access	R				Reserved			
Name	MASK_VALUE_DA [31:28]				Reserved [27:24]			

Bits	Name	Description
31 : 28	MASK_VALUE_DA	Data Buffer Address Mask Value. Values used to force bits 31:28 of the receive data buffer AHB address to a particular value when the associated enable bits stored in this register [3:0] are set. Any changes to this register will be ignored while the DMA is currently processing a receive packet. It will only affect the next full packet to be written to external system memory. Default Value: 0x0
3 : 0	MASK_ENABLE	Data Buffer Address Mask Enable. These bits are associated directly with bits[31:28].When bit 0 is set, the AXI/AHB address bit 28 used for accessing the receive data buffers will be forced to the value stored in bit 28 of this register. When bit 1 is set, the AXI/AHB address bit 29 used for accessing the receive data buffers will be forced to the value stored in bit 29 of this register. When bit 2 is set, the AXI/AHB address bit 30 used for accessing the receive data buffers will be forced to the value stored in bit 30 of this register. When bit 3 is set, the AXI/AHB address bit 31 used for accessing the receive data buffers will be forced to the value stored in bit 31 of this register. When these bits are clear, the associated value stored in bits 31:28 have no effect on the AXI/AHB address used for receive data buffer accesses. Any changes to this register will be ignored while the DMA is currently processing a receive packet. It will only affect the next full packet to be written to external memory. Default Value: 0x0

25.1.43 ETH0_RX_PTP_UNICAST

Description: PTP RX unicast IP destination address

Address: 0x42C110D4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDRESS_UNICAST [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDRESS_UNICAST [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	ADDRESS_UNICAST [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDRESS_UNICAST [31:24]							

Bits	Name	Description
31 : 0	ADDRESS_UNICAST	Unicast IP destination address. Used for detection of PTP frames on receive path. Default Value: 0x00000000

25.1.44 ETH0_TX_PTP_UNICAST

Description: PTP TX unicast IP destination address

Address: 0x42C110D8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDRESS_UNICAST [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	ADDRESS_UNICAST [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDRESS_UNICAST [31:24]							

Bits	Name	Description
31 : 0	ADDRESS_UNICAST	Unicast IP destination address. Used for detection of PTP frames on transmit path. Default Value: 0x00000000

25.1.45 ETH0_TSU_NSEC_CMP

Description: TSU timer comparison value nanoseconds

Address: 0x42C110DC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	COMPARISON_NSEC [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	COMPARISON_NSEC [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved		RW					
HW Access	Reserved		R					
Name	Reserved [23:22]		COMPARISON_NSEC [21:16]					

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
21 : 0	COMPARISON_NSEC	TSU timer comparison value (ns). Value is compared to the bits[45:24] of the TSU timer count value (upper 22 bits of nanosecond value). Default Value: 0x000000

25.1.46 ETH0_TSU_SEC_CMP

Description: TSU timer comparison value seconds (31 to 0 bits)

Address: 0x42C110E0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	COMPARISON_SEC [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	COMPARISON_SEC [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW

Name	COMPARISON_SEC [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	COMPARISON_SEC [31:24]							

Bits	Name	Description
31 : 0	COMPARISON_SEC	TSU timer comparison value (s). Value is compared to seconds value bits [31:0] of the TSU timer count value. Default Value: 0x00000000

25.1.47 ETH0_TSU_MSB_SEC_CMP

Description: TSU timer comparison value seconds (47 to 32 bits)

Address: 0x42C110E4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	COMPARISON_MSB_SEC [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	COMPARISON_MSB_SEC [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	COMPARISON_MS-B_SEC	TSU timer comparison value (s). Value is compared to the top 16 bits (most significant 16-bits {47:32] of seconds value) of the TSU timer count value. Default Value: 0x0000

25.1.48 ETH0_TSU_PTP_TX_MSB_SEC

Description: PTP Event Frame Transmitted Seconds Register (47 to 32 bits)

Address: 0x42C110E8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	TIMER_SECONDS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	TIMER_SECONDS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	TIMER_SECONDS	PTP Event Frame TX Seconds. The register is updated with the value that the 1588 timer seconds register held when the SFD of a PTP transmit primary event crosses the MII interface. The actual update occurs when the GEM recognizes the frame as a PTP sync or delay_req frame. An interrupt is issued when the register is updated. Default Value: 0x0000

25.1.49 ETH0_TSU_PTP_RX_MSB_SEC

Description: PTP Event Frame Received Seconds Register (47 to 32 bits)

Address: 0x42C110EC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	TIMER_SECONDS [7:0]							

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	TIMER_SECONDS	PTP Peer Event Frame RX Seconds. The register is updated with the value that the 1588 timer seconds register held when the SFD of a PTP receive peer event crosses the MII interface. The actual update occurs when the GEM recognizes the frame as a PTP pdelay_req or pdelay_resp frame. An interrupt is issued when the register is updated. Default Value: 0x0000

25.1.52 ETH0_DPRAM_FILL_DBG

Description: The fill levels for the TX & RX packet buffers can be read using this register, including the fill level for each queue in the TX direction.

Address: 0x42C110F8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				Reserved			RW
HW Access	R				Reserved			R
Name	DMA_TX_Q_FILL_LEVEL_SELECT [7:4]				Reserved [3:1]			DMA_TX-_RX_-FILL_LEVEL_SELECT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	DMA_TX_RX_FILL_LEVEL [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	DMA_TX_RX_FILL_LEVEL [31:24]							

Bits	Name	Description
31 : 16	DMA_TX_RX_FILL_LEV-EL	Fill Level - TX or RX packet buffer fill level, selected by the DMA_TX_Q_FILL_LEVEL_SELECT and DMA_TX_RX_FILL_LEVEL_SELECT bit fields. Read this register to determine the fill level. Default Value: 0x0000
7 : 4	DMA_TX_Q_-FILL_LEVEL_SELECT	TX queue fill level select - select what TX queue to report fill levels for. Default Value: 0x0
0	DMA_TX_RX_-FILL_LEVEL_SELECT	TX/RX Fill Level select - report the fill level for the TX or RX packet buffer. Default Value: 0

25.1.53 ETH0_REVISION_REG

Description: This register indicates a Cadence module identification number and module revision. The value of this register is read only as defined by `gem_revision_reg_value

Address: 0x42C110FC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	MODULE_REVISION [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	MODULE_REVISION [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	MODULE_IDENTIFICATION_NUMBER [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R				R			
HW Access	W				W			
Name	FIX_NUMBER [31:28]				MODULE_IDENTIFICATION_NUMBER [27:24]			

Bits	Name	Description
31 : 28	FIX_NUMBER	Fix number - incremented for fix releases. Default Value: 0x0
27 : 16	MODULE_IDENTIFICA-TION_NUMBER	Module identification number - for the GEM, this value is fixed. Default Value: 0x007
15 : 0	MODULE_REVISION	Module revision - fixed value specific to the revision of the design which is incremented for each non-fix release of the IP. Default Value: 0x0109

25.1.54 ETH0_OCTETS_TXED_BOTTOM

Description: Octets Transmitted lower bits (31 to 0 bits)

Address: 0x42C11100

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_BOTTOM [7:0]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17 : 0	COUNT15	Multiple collision frames - an 18 bit register counting the number of frames experiencing between two and fifteen collisions prior to being successfully transmitted, i.e. no under run and not too many retries. Default Value: 0x00000

25.1.70 ETH0_EXCESSIVE_COLLISIONS

Description: Excessive Collisions. Presents in design but not support.

Address: 0x42C11140

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT16 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT16 [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT16	Excessive collisions - a 10 bit register counting the number of frames that failed to be transmitted because they experienced 16 collisions. Default Value: 0x000

25.1.71 ETH0_LATE_COLLISIONS

Description: Late Collisions. Presents in design but not support.

Address: 0x42C11144

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT17 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT17 [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT17	Late collisions - a 10 bit register counting the number of late collision occurring after the slot time (512 bits) has expired. In 10/100 mode, late collisions are counted twice i.e. both as a collision and a late collision. In gigabit mode, a late collision causes the transmission to be aborted, thus the single and multi collision registers are not updated. Default Value: 0x000

25.1.72 ETH0_DEFERRED_FRAMES

Description: Deferred Transmission Frames. Presents in design but not support.

Address: 0x42C11148

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT18 [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	COUNT18 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [23:18]						COUNT18 [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17 : 0	COUNT18	Deferred transmission frames - an 18 bit register counting the number of frames experiencing deferral due to carrier sense being active on their first attempt at transmission. Frames involved in any collision are not counted nor are frames that experienced a transmit under run. Default Value: 0x00000

25.1.73 ETH0_CRS_ERRORS

Description: Carrier Sense Errors. Presents in design but not support.

Address: 0x42C1114C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT19 [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT19 [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT19	Carrier sense errors - a 10 bit register counting the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no under run). Only incremented in half duplex mode. The only effect of a carrier sense error is to increment this register. The behaviour of the other statistics registers is unaffected by the detection of a carrier sense error. Default Value: 0x000

25.1.74 ETH0_OCTETS_RXED_BOTTOM

Description: Octets Received (31 to 0 bits)

Address: 0x42C11150

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W

Name	COUNT_1519 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RC							
HW Access	W							
Name	COUNT_1519 [31:24]							

Bits	Name	Description
31 : 0	COUNT_1519	1519 to maximum byte frames received without error. A 32 bit register counting the number of 1519 byte or above frames successfully received without error. Maximum frame size is determined by the network configuration register bit 8 (1536 maximum frame size) or bit 3 (jumbo frame size). Excludes pause frames, and is only incremented if the frame is successfully filtered. Default Value: 0x00000000

25.1.87 ETH0_UNDERSIZE_FRAMES

Description: Undersized Frames Received

Address: 0x42C11184

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_UNDERSIZE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_UNDERSIZE [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_UNDERSIZE	Undersize frames received - a 10 bit register counting the number of frames received less than 64 bytes in length (10/100 mode or gigabit mode, full duplex) that do not have either a CRC error or an alignment error. In gigabit mode, half duplex, this register counts either frames not conforming to the minimum slot time of 512 bytes or frames not conforming to the minimum frame size once bursting is active. Default Value: 0x000

25.1.88 ETH0_EXCESSIVE_RX_LENGTH

Description: Oversize Frames Received

Address: 0x42C11188

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_OVERSIZE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_OVERSIZE [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_OVERSIZE	Oversize frames received - a 10 bit register counting the number of frames received exceeding 1518 bytes (1536 bytes if bit 8 is set in network configuration register, 10,240 bytes if bit 3 is set in the network configuration register) in length but do not have either a CRC error, an alignment error nor a receive symbol error. Default Value: 0x000

25.1.89 ETH0_RX_JABBERS

Description: Jabbers Received

Address: 0x42C1118C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_JABBERS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_JABBERS [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_JABBERS	Jabbers received - a 10 bit register counting the number of frames received exceeding 1518 bytes (1536 if bit 8 set in network configuration register, 10,240 bytes if bit 3 is set in the network configuration register) in length and have either a CRC error, an alignment error or a receive symbol error. Default Value: 0x000

25.1.90 ETH0_FCS_ERRORS

Description: Frame Check Sequence Errors

Address: 0x42C11190

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_FCS_ERR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_FCS_ERR [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_FCS_ERR	Frame check sequence errors - a 10 bit register counting frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 set in network configuration register, 10,240 bytes if bit 3 is set in the network configuration register). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes. This register is incremented for a frame with bad FCS, regardless of whether it is copied to memory due to ignore FCS mode being enabled in bit 26 of the network configuration register. Default Value: 0x000

25.1.91 ETH0_RX_LENGTH_ERRORS

Description: Length Field Frame Errors

Address: 0x42C11194

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_LENGTH_ERR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_LENGTH_ERR [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_LENGTH_ERR	Length field frame errors - this 10-bit register counts the number of frames received that have a measured length shorter than that extracted from the length field (bytes 13 and 14). This condition is only counted if the value of the length field is less than 0x0600, the frame is not of excessive length and checking is enabled through bit 16 of the network configuration register. Default Value: 0x000

25.1.92 ETH0_RX_SYMBOL_ERRORS

Description: Receive Symbol Errors

Address: 0x42C11198

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_SYMBOL_ERR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_SYMBOL_ERR [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_SYMBOL_ERR	Receive symbol errors - a 10-bit register counting the number of frames that had rx_er asserted during reception. For 10/100 mode symbol errors are counted regardless of frame length checks. For gigabit mode the frame must satisfy slot time requirements in order to count a symbol error. Additionally, in gigabit half duplex mode, carrier extension errors are also recorded. Receive symbol errors will also be counted as an FCS or alignment error if the frame is between 64 and 1518 bytes (1536 bytes if bit 8 is set in the network configuration register, 10240 bytes if bit 3 is set in the network configuration register). If the frame is larger it will be recorded as a jabber error. Default Value: 0x000

25.1.93 ETH0_ALIGNMENT_ERRORS

Description: Alignment Errors

Address: 0x42C1119C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_ALIGNMENT_ERROR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_ALIGN-MENT_ERROR [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_ALIGN-MENT_ERROR	Alignment errors - a 10 bit register counting frames that are not an integral number of bytes long and have bad CRC when their length is truncated to an integral number of bytes and are between 64 and 1518 bytes in length (1536 if bit 8 set in network configuration register, 10,240 bytes if bit 3 is set in the network configuration register). This register is also incremented if a symbol error is detected and the frame is of valid length and does not have an integral number of bytes. Default Value: 0x000

25.1.94 ETH0_RX_RESOURCE_ERRORS

Description: Receive Resource Errors

Address: 0x42C111A0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_RESOURCE_ERR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RC							
HW Access	W							
Name	COUNT_RESOURCE_ERR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [23:18]						COUNT_RESOURCE_ERR [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17 : 0	COUNT_RESOURCE_ERR	Receive resource errors - an 18 bit register counting the number of frames that were successfully received by the MAC (correct address matched frame and adequate slot time) but could not be copied to memory because no receive buffer was available. This occurs when the GEM reads a buffer descriptor with its ownership (or used) bit set. Default Value: 0x00000

25.1.95 ETH0_RX_OVERRUNS

Description: Receive Overruns

Address: 0x42C111A4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_OVERRUN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RC	
HW Access	Reserved						W	
Name	Reserved [15:10]						COUNT_OVERRUN [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	COUNT_OVERRUN	Receive overruns - a 10 bit register counting the number of frames that are address recognized but were not copied to memory due to a receive overrun. Default Value: 0x000

25.1.96 ETH0_RX_IP_CK_ERRORS

Description: IP Header Checksum Errors

Address: 0x42C111A8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	W							
Name	COUNT_IPCK_ERR [7:0]

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	COUNT_FLUSHED	Flushed RX packets counter. A 16 bit register counting the number of frames that have been flushed from the receive SRAM based packet buffer due to one of the following reasons .1. When partial store and forward mode is enabled or bit 24 of the DMA configuration register is enabled, a packet is received while there is no AMBA (AXI/AHB) resource. 2. When partial store and forward mode is enabled and an AMBA (AXI/AHB) error is encountered while writing the packet data to external memory. When bit 18 of the network control register(software action to flush a packet from the head of the PBUF queue) is pulsed and the GEM DMA is not currently busy. Default Value: 0x0000

25.1.100 ETH0_TSU_TIMER_INCR_SUB_NSEC

Description: 1588 Timer Increment Register sub nsec

Address: 0x42C111BC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SUB_NS_INCR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	SUB_NS_INCR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	SUB_NS_INCR_LSB [31:24]							

Bits	Name	Description
31 : 24	SUB_NS_INCR_LSB	These are the least significant bits [7:0] of the sub-ns value by which the 1588 timer will be incremented each clock cycle. Default Value: 0x00
15 : 0	SUB_NS_INCR	These are the most significant bits [23:8] of the sub-ns value by which the 1588 timer will be incremented each clock cycle. 24 bits of sub nanosecond precision gives resolution of approximately 5.86E-17 seconds (16 bits gives 15.2 femtoseconds). Default Value: 0x0000

25.1.101 ETH0_TSU_TIMER_MSB_SEC

Description: 1588 Timer Seconds Register (47 to 32 bits)

Address: 0x42C111C0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	TIMER_MSB_SEC [7:0]							

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	TIMER_MSB_SEC	TSU timer value (s). Most significant 16 bits of seconds timer count. The register is writeable. The 48-bit counter increments by one when the 1588 nanoseconds counter counts to one second. It may also be incremented or decremented when the timer adjust register is written (if decremented from zero the 48-bit combined count would roll back to 0xFFFFFFFFFFFF). Note: The value of this register is used only when the lower 32 bit register is written to. This is to ensure a single update of the 48 bit seconds value Default Value: 0x0000

25.1.102 ETH0_TSU_STROBE_MSB_SEC

Description: 1588 Timer Sync Strobe Seconds Register (47 to 32 bits)

Address: 0x42C111C4

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	RW							
Name	TIMER_SEC [31:24]							

Bits	Name	Description
31 : 0	TIMER_SEC	1588 Timer Seconds Register. TSU timer value (s). Least significant 32 bits of seconds timer count. This register is writeable. The 48-bit counter increments by one when the 1588 nanoseconds counter counts to one second. It may also be incremented or decremented when the timer adjust register is written (if decremented from zero the 48-bit combined count would roll back to 0xFFFFFFFFFFFF). Default Value: 0x00000000

25.1.106 ETH0_TSU_TIMER_NSEC

Description: 1588 Timer Nanoseconds Register

Address: 0x42C111D4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	TIMER_NSEC [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	TIMER_NSEC [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved		RW					
HW Access	Reserved		RW					
Name	Reserved [31:30]		TIMER_NSEC [29:24]					

Bits	Name	Description
29 : 0	TIMER_NSEC	Timer count in nanoseconds. This register is writeable. It can also be adjusted by writes to the 1588 timer adjust register. It increments by the value of the 1588 timer increment register each clock cycle (if this register is close to zero and a write to the timer adjust register causes a decrement the seconds register will be decremented if necessary and the nanoseconds register will roll back to 9999999xx(decimal)). Default Value: 0x00000000

25.1.107 ETH0_TSU_TIMER_ADJUST

Description: This register is used to adjust the value of the timer in the TSU. It allows an integral number of nanoseconds to be added or subtracted from the timer in a one-off operation. This register returns all zeroes when read.

Address: 0x42C111D8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

SW Access	W	Reserved	W					
HW Access	R	Reserved	R					
Name	ADD_SUB-TRACT	Reserved	INCREMENT_VALUE [29:24]					

Bits	Name	Description
31	ADD_SUBTRACT	Write as one to subtract from the 1588 timer. Write as zero to add to it. Default Value: 0
29 : 0	INCREMENT_VALUE	Timer increment value. The number of nanoseconds to increment or decrement the 1588 timer nanoseconds register. If necessary the 1588 seconds register will be incremented or decremented. Default Value: 0x0000

25.1.108 ETH0_TSU_TIMER_INCR

Description: 1588 Timer Increment Register

Address: 0x42C111DC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	NS_INCREMENT [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	ALT_NS_INCR [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	NUM_INCS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	NUM_INCS	Number of incs before alt inc. The number of increments after which the alternative increment is used. Default Value: 0x00
15 : 8	ALT_NS_INCR	Alternative nanoseconds count. Alternative count of nanoseconds by which the 1588 timer nanoseconds register will be incremented each clock cycle. Default Value: 0x00
7 : 0	NS_INCREMENT	A count of nanoseconds by which the 1588 timer nanoseconds register will be incremented each clock cycle. These are the most significant 8 bits of the 32 bit timer_increment counter. The TSU_TIMER_INCR_SUB_NSEC register holds the least significant 24 bits of the increment. Default Value: 0x00

25.1.109 ETH0_TSU_PTP_TX_SEC

Description: PTP Event Frame Transmitted Seconds Register (31 to 0 bits)

Address: 0x42C111E0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	COUNT_LPI	Count of RX LPI transitions. A count of the number of times there is a transition from receiving normal idle to receiving low power idle. Cleared on read. Default Value: 0x0000

25.1.122 ETH0_RX_LPI_TIME

Description: Received LPI time

Address: 0x42C11274

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	R							
Name	LPI_TIME [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RC							
HW Access	R							
Name	LPI_TIME [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RC							
HW Access	R							
Name	LPI_TIME [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 0	LPI_TIME	Time in LPI. This register increments once every 16 clk_sys cycles when the LPI indication bit 20 is set in the receive configuration register. Cleared on read. Default Value: 0x000000

25.1.123 ETH0_TX_LPI

Description: Transmit LPI transitions

Address: 0x42C11278

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RC							
HW Access	R							
Name	COUNT_LPI [7:0]							

Bits	15	14	13	12	11	10	9	8

25.1.139 ETH0_TRANSMIT_Q1_PTR

Description: This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The transmit buffer queue base address register must be initialized before transmit is started through bit 9 of the network control register. Once transmission has started, any write to the transmit buffer queue base address register is illegal and therefore ignored. Note that due to clock boundary synchronization, it takes a maximum of four pclk cycles from the writing of the transmit start bit before the transmitter is active. Writing to the transmit buffer queue base address register during this time may produce unpredictable results. Reading this register returns the location of the descriptor currently being accessed. Because the DMA can store data for multiple frames at once, this may not necessarily be pointing to the current frame being transmitted. In terms of AMBA AXI operation, the transmit descriptors are written to memory using a single 32bit AHB access. When the datapath is configured as 64bit , the transmit descriptors should be aligned at 64-bit boundaries and each pair of 32-bit descriptors is read from memory using a single AXI access.

25.1.147 ETH0_CBS_CONTROL

Description: The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent. This must not exceed the portTransmitRate which is dependent on the speed of operation, eg, portTranmsitRate. 1Gb/s = 32'h07735940 (125 Mbytes/s), 100Mb/sec = 32'h017D7840 (25 Mnibbles/s), 10Mb/sec = 32'h002625A0 (2.5 Mnibbles/s). If 50% of bandwidth was to be allocated to a particular queue in 1Gb/sec mode then the IdleSlope value for that queue would be calculated as 32'h07735940/2. Note that Credit-Based Shaping should be disabled prior to updating the IdleSlope values. As another example, for a 1722 audio packet with a payload of 6 samples per channel, the packet size would be 7 (preamble) + 1 (SFD) + 50 (packet header) + 6x4x2(payload) + 4 (CRC) = 110 bytes. For a rate of 8000 packets per second, the desired rate would 110 x 8000 bytes per second, so the programmed idleSlope value would be 880000 for a 1Gb/s connection, or 1760000 for a 100Mb/s or 10Mbs connection. See Figure 6.3 in the IEEE 1722 standard. In practice, the actual transmission rate will be vary slightly from that calculated. In this case, the idleSlope value should be recalibrated based on the variance between the measured and expected rate, and in this case very accurate transmission rates can be achieved.

Name	Reserved [31:24]							

Bits	Name	Description
3 : 0	HIDDEN3_FIELD	Writing is prohibited. Default Value: 0x00000007

25.1.158 ETH0_SCREENING_TYPE_1_REGISTER_0

Description: Screening type 1 registers are used to allocate up to 16 priority queues to received frames based on certain IP or UDP fields of incoming frames. Firstly, when DS/TC match enable is set (bit 28), the DS (Differentiated Services) field of the received IPv4 header or TCfield (traffic class) of IPv6 headers are matched against bits 11 to 4. Secondly, when UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27 to 12. Both UDP and DS/TC matching can be enabled simultaneously or individually. If a match is successful, then the queue value programmed in bits 2 to 0 is allocated to the frame. The required number of Type 1 screening registers is configured in the gem defines file. Up to 16 type 1 screening registers have been allocated APB address space between 0x500 and 0x53C.

25.1.194 ETH0_TX_Q_SEG_ALLOC_Q0TO7

Description: This register allows the user to distribute the Transmit SRAM used by the DMA across the priority queues, for queues 0 to 7. The SRAM itself is split into a number of evenly sized segments (this is defined in the verilog configuration defs file - for the configuration used to generate this register description, the total number of segments was set to '16'). Those segments can then be freely distributed across the active queues, in powers of 2. I.e. a value of 0 would mean 1 segment has been allocated to the queue. A value of 1 would mean 2 segments, a value of 2 means 4 segments and so on. The reset values of these registers are defined in the configuration defs file.

Address: 0x42C115A0

Retention: Not Retained

25.1.202 ETH0_INT_Q1_MASK

Description: The interrupt mask register is a read only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the interrupt enable register or set individually by writing to the interrupt disable register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the interrupt mask register. For test purposes there is a write-only function to this register that allows the bits in the interrupt status register to be set or cleared, regardless of the state of the mask register.

25.1.208 ETH0_TYPE2_COMPARE_0_WORD_0

Description: "Compare A, B and C fields of the screener type 2 match register are pointers to a pool of up to 32 compare registers. If enabled the compare is true if the data at the OFFSET into the frame, ANDed with the MASK Value if the mask is enabled, is equal to the COMPARE Value. Either a 16 bit comparison or a 32 bit comparison is done. This selection is made via the associated compare word1 register bit 9. If a 16 bit comparison is selected, then a 16 bit mask is also available to the user to select which bits should be compared. If the 32 bit compare option is selected, then no mask is available. The byte at the OFFSET number of bytes from the index start is compared thru bits 7 to 0 of the configured VALUE. The byte at the OFFSET number of bytes + 1 from the index start is compared thru bits 15 to 8 of the configured VALUE and so on. The OFFSET can be configured to be from 0 to 127 bytes from either the start of the frame, the byte following the therType field (last EtherType in the header if the frame is VLAN tagged), the byte following the IP header (IPv4 or IPv6) or from the byte following the start of the TCP/UDP header. The required number of Type 2 screening registers up to a maximum of 32 is configurable in the gem defines file and have been allocated APB address space between 0x700 and 0x7fc. Note. when using RX Partial Store and Forward mode and priority queues, the frame offset must be less than the Partial Store and Forward watermark. If the offset is higher than the watermark value it's not possible to identify the priority queue before the frame is sent to the AMBA interface, and an incorrect priority queue may be used. "

HW Access	R							
Name	RESERVED_31_10 [31:24]							

Bits	Name	Description
31 : 10	RESERVED_31_10	"Reserved, read as 0, ignored on write." Default Value: 0x000000
9	DISABLE_MASK	"This bit is used to control whether the compare register word_0 contains a 4-byte compare value, or a 2-byte compare value with a 2-byte mask value. 1 - 4-byte compare value 0 - 2-byte compare, 2-byte mask " Default Value: 0
8 : 7	COMPARE_OFFSET	"Compare byte offset. 00 : Offset from beginning of the frame. 01 : Offset from byte after Ether Type. 10 : Offset from byte following end of IP header. 11 : Offset from byte following end of TCP/UDP header" If bit 9 of the associated compare_word1 register is set, then the byte stored in bits [23:16] is compared against the byte in the received frame from the selected offset+2 and the byte stored in bits [31:24] is compared against the byte in the received frame from the selected offset+3. If bit 9 of the associated compare_word1 register is clear, then the byte stored in bits [23:16] is compared against the byte in the received frame from the selected offset+0 and the byte stored in bits [31:24] is compared against the byte in the received frame from the selected offset+1. Default Value: 0x0
6 : 0	OFFSET_VALUE	"Offset value in bytes" Default Value: 0x00

26 Controller Area Network Flexible Data- Rate (CAN-FD) registers

This section discusses the CAN-FD registers. It lists all the registers in mapping tables, in address order.

26.1 Register details

Register name	Address	Description
CANFD0_CH0_CREL	0x42840000	Core Release Register
CANFD0_CH0_ENDN	0x42840004	Endian Register
CANFD0_CH0_DBTP	0x4284000C	Data Bit Timing & Prescaler Register
CANFD0_CH0_TEST	0x42840010	Test Register
CANFD0_CH0_RWD	0x42840014	RAM Watchdog
CANFD0_CH0_CCCR	0x42840018	CC Control Register
CANFD0_CH0_NBTP	0x4284001C	Nominal Bit Timing & Prescaler Register
CANFD0_CH0_TSCC	0x42840020	Timestamp Counter Configuration
CANFD0_CH0_TSCV	0x42840024	Timestamp Counter Value
CANFD0_CH0_TOCC	0x42840028	Timeout Counter Configuration
CANFD0_CH0_TOCV	0x4284002C	Timeout Counter Value
CANFD0_CH0_ECR	0x42840040	Error Counter Register
CANFD0_CH0_PSR	0x42840044	Protocol Status Register
CANFD0_CH0_TDCR	0x42840048	Transmitter Delay Compensation Register
CANFD0_CH0_IR	0x42840050	Interrupt Register
CANFD0_CH0_IE	0x42840054	Interrupt Enable
CANFD0_CH0_ILS	0x42840058	Interrupt Line Select
CANFD0_CH0_ILE	0x4284005C	Interrupt Line Enable
CANFD0_CH0_GFC	0x42840080	Global Filter Configuration
CANFD0_CH0_SIDFC	0x42840084	Standard ID Filter Configuration
CANFD0_CH0_XIDFC	0x42840088	Extended ID Filter Configuration
CANFD0_CH0_XIDAM	0x42840090	Extended ID AND Mask
CANFD0_CH0_HPMS	0x42840094	High Priority Message Status
CANFD0_CH0_NDAT1	0x42840098	New Data 1
CANFD0_CH0_NDAT2	0x4284009C	New Data 2
CANFD0_CH0_RXF0C	0x428400A0	Rx FIFO 0 Configuration
CANFD0_CH0_RXF0S	0x428400A4	Rx FIFO 0 Status
CANFD0_CH0_RXF0A	0x428400A8	Rx FIFO 0 Acknowledge
CANFD0_CH0_RXBC	0x428400AC	Rx Buffer Configuration
CANFD0_CH0_RXF1C	0x428400B0	Rx FIFO 1 Configuration
CANFD0_CH0_RXF1S	0x428400B4	Rx FIFO 1 Status
CANFD0_CH0_RXF1A	0x428400B8	Rx FIFO 1 Acknowledge
CANFD0_CH0_RXESC	0x428400BC	Rx Buffer / FIFO Element Size Configuration

Controller Area Network Flexible Data- Rate (CAN-FD) registers

Register name	Address	Description
CANFD0_CH0_TXBC	0x428400C0	Tx Buffer Configuration
CANFD0_CH0_TXFQS	0x428400C4	Tx FIFO/Queue Status
CANFD0_CH0_TXESC	0x428400C8	Tx Buffer Element Size Configuration
CANFD0_CH0_TXBRP	0x428400CC	Tx Buffer Request Pending
CANFD0_CH0_TXBAR	0x428400D0	Tx Buffer Add Request
CANFD0_CH0_TXBCR	0x428400D4	Tx Buffer Cancellation Request
CANFD0_CH0_TXBTO	0x428400D8	Tx Buffer Transmission Occurred
CANFD0_CH0_TXBCF	0x428400DC	Tx Buffer Cancellation Finished
CANFD0_CH0_TXBTIE	0x428400E0	Tx Buffer Transmission Interrupt Enable
CANFD0_CH0_TXBCIE	0x428400E4	Tx Buffer Cancellation Finished Interrupt Enable
CANFD0_CH0_TXEFC	0x428400F0	Tx Event FIFO Configuration
CANFD0_CH0_TXEFS	0x428400F4	Tx Event FIFO Status
CANFD0_CH0_TXEFA	0x428400F8	Tx Event FIFO Acknowledge
CANFD0_CH0_TTTMC	0x42840100	TT Trigger Memory Configuration
CANFD0_CH0_TTRMC	0x42840104	TT Reference Message Configuration
CANFD0_CH0_TTOCF	0x42840108	TT Operation Configuration
CANFD0_CH0_TTMLM	0x4284010C	TT Matrix Limits
CANFD0_CH0_TURCF	0x42840110	TUR Configuration
CANFD0_CH0_TTOCN	0x42840114	TT Operation Control
CANFD0_CH0_TTGTP	0x42840118	TT Global Time Preset
CANFD0_CH0_TTTMK	0x4284011C	TT Time Mark
CANFD0_CH0_TTIR	0x42840120	TT Interrupt Register
CANFD0_CH0_TTIE	0x42840124	TT Interrupt Enable
CANFD0_CH0_TTILS	0x42840128	TT Interrupt Line Select
CANFD0_CH0_TTOST	0x4284012C	TT Operation Status
CANFD0_CH0_TURNA	0x42840130	TUR Numerator Actual
CANFD0_CH0_TTLGT	0x42840134	TT Local & Global Time
CANFD0_CH0_TTCTC	0x42840138	TT Cycle Time & Count
CANFD0_CH0_TTCPT	0x4284013C	TT Capture Time
CANFD0_CH0_TTCSM	0x42840140	TT Cycle Sync Mark
CANFD0_CH0_RXFTOP_CTL	0x42840180	Receive FIFO Top control
CANFD0_CH0_RXFTOP0_STAT	0x428401A0	Receive FIFO 0 Top Status
CANFD0_CH0_RXFTOP0_DATA	0x428401A8	Receive FIFO 0 Top Data
CANFD0_CH0_RXFTOP1_STAT	0x428401B0	Receive FIFO 1 Top Status
CANFD0_CH0_RXFTOP1_DATA	0x428401B8	Receive FIFO 1 Top Data
CANFD0_CH1_CREL	0x42840200	Core Release Register. See CANFD0_CH0_CREL for the details of bit fields.
CANFD0_CH1_ENDN	0x42840204	Endian Register. See CANFD0_CH0_ENDN for the details of bit fields.

Controller Area Network Flexible Data- Rate (CAN-FD) registers

Register name	Address	Description
CANFD0_CH1_DBTP	0x4284020C	Data Bit Timing & Prescaler Register. See CANFD0_CH0_DBTP for the details of bit fields.
CANFD0_CH1_TEST	0x42840210	Test Register. See CANFD0_CH0_TEST for the details of bit fields.
CANFD0_CH1_RWD	0x42840214	RAM Watchdog. See CANFD0_CH0_RWD for the details of bit fields.
CANFD0_CH1_CCCR	0x42840218	CC Control Register. See CANFD0_CH0_CCCR for the details of bit fields.
CANFD0_CH1_NBTP	0x4284021C	Nominal Bit Timing & Prescaler Register. See CANFD0_CH0_NBTP for the details of bit fields.
CANFD0_CH1_TSCC	0x42840220	Timestamp Counter Configuration. See CANFD0_CH0_TSCC for the details of bit fields.
CANFD0_CH1_TSCV	0x42840224	Timestamp Counter Value. See CANFD0_CH0_TSCV for the details of bit fields.
CANFD0_CH1_TOCC	0x42840228	Timeout Counter Configuration. See CANFD0_CH0_TOCC for the details of bit fields.
CANFD0_CH1_TOCV	0x4284022C	Timeout Counter Value. See CANFD0_CH0_TOCV for the details of bit fields.
CANFD0_CH1_ECR	0x42840240	Error Counter Register. See CANFD0_CH0_ECR for the details of bit fields.
CANFD0_CH1_PSR	0x42840244	Protocol Status Register. See CANFD0_CH0_PSR for the details of bit fields.
CANFD0_CH1_TDCR	0x42840248	Transmitter Delay Compensation Register. See CANFD0_CH0_TDCR for the details of bit fields.
CANFD0_CH1_IR	0x42840250	Interrupt Register. See CANFD0_CH0_IR for the details of bit fields.
CANFD0_CH1_IE	0x42840254	Interrupt Enable. See CANFD0_CH0_IE for the details of bit fields.
CANFD0_CH1_ILS	0x42840258	Interrupt Line Select. See CANFD0_CH0_ILS for the details of bit fields.
CANFD0_CH1_ILE	0x4284025C	Interrupt Line Enable. See CANFD0_CH0_ILE for the details of bit fields.
CANFD0_CH1_GFC	0x42840280	Global Filter Configuration. See CANFD0_CH0_GFC for the details of bit fields.
CANFD0_CH1_SIDFC	0x42840284	Standard ID Filter Configuration. See CANFD0_CH0_SIDFC for the details of bit fields.
CANFD0_CH1_XIDFC	0x42840288	Extended ID Filter Configuration. See CANFD0_CH0_XIDFC for the details of bit fields.
CANFD0_CH1_XIDAM	0x42840290	Extended ID AND Mask. See CANFD0_CH0_XIDAM for the details of bit fields.
CANFD0_CH1_HPMS	0x42840294	High Priority Message Status. See CANFD0_CH0_HPMS for the details of bit fields.

Controller Area Network Flexible Data- Rate (CAN-FD) registers

Register name	Address	Description
CANFD0_CH1_NDAT1	0x42840298	New Data 1. See CANFD0_CH0_NDAT1 for the details of bit fields.
CANFD0_CH1_NDAT2	0x4284029C	New Data 2. See CANFD0_CH0_NDAT2 for the details of bit fields.
CANFD0_CH1_RXF0C	0x428402A0	Rx FIFO 0 Configuration. See CANFD0_CH0_RXF0C for the details of bit fields.
CANFD0_CH1_RXF0S	0x428402A4	Rx FIFO 0 Status. See CANFD0_CH0_RXF0S for the details of bit fields.
CANFD0_CH1_RXF0A	0x428402A8	Rx FIFO 0 Acknowledge. See CANFD0_CH0_RXF0A for the details of bit fields.
CANFD0_CH1_RXBC	0x428402AC	Rx Buffer Configuration. See CANFD0_CH0_RXBC for the details of bit fields.
CANFD0_CH1_RXF1C	0x428402B0	Rx FIFO 1 Configuration. See CANFD0_CH0_RXF1C for the details of bit fields.
CANFD0_CH1_RXF1S	0x428402B4	Rx FIFO 1 Status. See CANFD0_CH0_RXF1S for the details of bit fields.
CANFD0_CH1_RXF1A	0x428402B8	Rx FIFO 1 Acknowledge. See CANFD0_CH0_RXF1A for the details of bit fields.
CANFD0_CH1_RXESC	0x428402BC	Rx Buffer / FIFO Element Size Configuration. See CANFD0_CH0_RXESC for the details of bit fields.
CANFD0_CH1_TXBC	0x428402C0	Tx Buffer Configuration. See CANFD0_CH0_TXBC for the details of bit fields.
CANFD0_CH1_TXFQS	0x428402C4	Tx FIFO/Queue Status. See CANFD0_CH0_TXFQS for the details of bit fields.
CANFD0_CH1_TXESC	0x428402C8	Tx Buffer Element Size Configuration. See CANFD0_CH0_TXESC for the details of bit fields.
CANFD0_CH1_TXBRP	0x428402CC	Tx Buffer Request Pending. See CANFD0_CH0_TXBRP for the details of bit fields.
CANFD0_CH1_TXBAR	0x428402D0	Tx Buffer Add Request. See CANFD0_CH0_TXBAR for the details of bit fields.
CANFD0_CH1_TXBCR	0x428402D4	Tx Buffer Cancellation Request. See CANFD0_CH0_TXBCR for the details of bit fields.
CANFD0_CH1_TXBTO	0x428402D8	Tx Buffer Transmission Occurred. See CANFD0_CH0_TXBTO for the details of bit fields.
CANFD0_CH1_TXBCF	0x428402DC	Tx Buffer Cancellation Finished. See CANFD0_CH0_TXBCF for the details of bit fields.
CANFD0_CH1_TXBTIE	0x428402E0	Tx Buffer Transmission Interrupt Enable. See CANFD0_CH0_TXBTIE for the details of bit fields.
CANFD0_CH1_TXBCIE	0x428402E4	Tx Buffer Cancellation Finished Interrupt Enable. See CANFD0_CH0_TXBCIE for the details of bit fields.
CANFD0_CH1_TXEFC	0x428402F0	Tx Event FIFO Configuration. See CANFD0_CH0_TXEFC for the details of bit fields.

Controller Area Network Flexible Data- Rate (CAN-FD) registers

Register name	Address	Description
CANFD0_CH1_TXEFS	0x428402F4	Tx Event FIFO Status. See CANFD0_CH0_TXEFS for the details of bit fields.
CANFD0_CH1_TXEFA	0x428402F8	Tx Event FIFO Acknowledge. See CANFD0_CH0_TXEFA for the details of bit fields.
CANFD0_CH1_TTTMC	0x42840300	TT Trigger Memory Configuration. See CANFD0_CH0_TTTMC for the details of bit fields.
CANFD0_CH1_TTRMC	0x42840304	TT Reference Message Configuration. See CANFD0_CH0_TTRMC for the details of bit fields.
CANFD0_CH1_TTOCF	0x42840308	TT Operation Configuration. See CANFD0_CH0_TTOCF for the details of bit fields.
CANFD0_CH1_TTMLM	0x4284030C	TT Matrix Limits. See CANFD0_CH0_TTMLM for the details of bit fields.
CANFD0_CH1_TURCF	0x42840310	TUR Configuration. See CANFD0_CH0_TURCF for the details of bit fields.
CANFD0_CH1_TTOCN	0x42840314	TT Operation Control. See CANFD0_CH0_TTOCN for the details of bit fields.
CANFD0_CH1_TTGTP	0x42840318	TT Global Time Preset. See CANFD0_CH0_TTGTP for the details of bit fields.
CANFD0_CH1_TTTMK	0x4284031C	TT Time Mark. See CANFD0_CH0_TTTMK for the details of bit fields.
CANFD0_CH1_TTIR	0x42840320	TT Interrupt Register. See CANFD0_CH0_TTIR for the details of bit fields.
CANFD0_CH1_TTIE	0x42840324	TT Interrupt Enable. See CANFD0_CH0_TTIE for the details of bit fields.
CANFD0_CH1_TTILS	0x42840328	TT Interrupt Line Select. See CANFD0_CH0_TTILS for the details of bit fields.
CANFD0_CH1_TTOST	0x4284032C	TT Operation Status. See CANFD0_CH0_TTOST for the details of bit fields.
CANFD0_CH1_TURNA	0x42840330	TUR Numerator Actual. See CANFD0_CH0_TURNA for the details of bit fields.
CANFD0_CH1_TTLGT	0x42840334	TT Local & Global Time. See CANFD0_CH0_TTLGT for the details of bit fields.
CANFD0_CH1_TTCTC	0x42840338	TT Cycle Time & Count. See CANFD0_CH0_TTCTC for the details of bit fields.
CANFD0_CH1_TTCPT	0x4284033C	TT Capture Time. See CANFD0_CH0_TTCPT for the details of bit fields.
CANFD0_CH1_TTCSM	0x42840340	TT Cycle Sync Mark. See CANFD0_CH0_TTCSM for the details of bit fields.
CANFD0_CH1_RXFTOP_CTL	0x42840380	Receive FIFO Top control. See CANFD0_CH0_RXFTOP_CTL for the details of bit fields.
CANFD0_CH1_RXFTOP0_STAT	0x428403A0	Receive FIFO 0 Top Status. See CANFD0_CH0_RXFTOP0_STAT for the details of bit fields.

Controller Area Network Flexible Data- Rate (CAN-FD) registers

Register name	Address	Description
CANFD0_CH1_RXFTOP0_DATA	0x428403A8	Receive FIFO 0 Top Data. See CANFD0_CH0_RXFTOP0_DATA for the details of bit fields.
CANFD0_CH1_RXFTOP1_STAT	0x428403B0	Receive FIFO 1 Top Status. See CANFD0_CH0_RXFTOP1_STAT for the details of bit fields.
CANFD0_CH1_RXFTOP1_DATA	0x428403B8	Receive FIFO 1 Top Data. See CANFD0_CH0_RXFTOP1_DATA for the details of bit fields.
CANFD0_CTL	0x42841000	Global CAN control register
CANFD0_STATUS	0x42841004	Global CAN status register
CANFD0_INTR0_CAUSE	0x42841010	Consolidated interrupt0 cause register
CANFD0_INTR1_CAUSE	0x42841014	Consolidated interrupt1 cause register
CANFD0_TS_CTL	0x42841020	Time Stamp control register
CANFD0_TS_CNT	0x42841024	Time Stamp counter value

26.1.1 CANFD0_CH0_CREL

Description: Core Release Register

Address: 0x42840000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	DAY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	MON [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R				R			
HW Access	R				R			
Name	SUBSTEP [23:20]				YEAR [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	R				R			
HW Access	R				R			
Name	REL [31:28]				STEP [27:24]			

Bits	Name	Description
31 : 28	REL	Core Release One digit, BCD-coded. Default Value: 0x3
27 : 24	STEP	Step of Core Release One digit, BCD-coded. Default Value: 0x2
23 : 20	SUBSTEP	Sub-step of Core Release One digit, BCD-coded. Default Value: 0x3
19 : 16	YEAR	Time Stamp Year One digit, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis. Default Value: 0x8
15 : 8	MON	Time Stamp Month Two digits, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis. Default Value: 0x06
7 : 0	DAY	Time Stamp Day Two digits, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis. Default Value: 0x09

26.1.2 CANFD0_CH0_ENDN

Description: Endian Register

Address: 0x42840004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	ETV [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	ETV [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	ETV [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	ETV [31:24]							

Bits	Name	Description
31 : 0	ETV	Endianness Test Value The endianness test value is 0x87654321. Default Value: 0x87654321

26.1.3 CANFD0_CH0_DBTP

Description: Data Bit Timing & Prescaler Register

Address: 0x4284000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	DTSEG2 [7:4]				DSJW [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [15:13]			DTSEG1 [12:8]				

Bits	23	22	21	20	19	18	17	16
SW Access	RW	Reserved		RW				
HW Access	R	Reserved		R				
Name	TDC	Reserved [22:21]		DBRP [20:16]				

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23	TDC	Transmitter Delay Compensation 0= Transmitter Delay Compensation disabled 1= Transmitter Delay Compensation enabled Default Value: 0
20 : 16	DBRP	Data Bit Rate Prescaler 0x00-0x1F The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. Default Value: 0
12 : 8	DTSEG1	Data time segment before sample point 0x00-0x1F Valid values are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the programmed value is used. Default Value: 0xA
7 : 4	DTSEG2	Data time segment after sample point 0x0-0xF Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used. Default Value: 3
3 : 0	DSJW	Data (Re)Synchronization Jump Width 0x0-0xF Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. Default Value: 3

26.1.4 CANFD0_CH0_TEST

Description: Test Register

Address: 0x42840010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	RW		RW	RW	RW	RW	RW
HW Access	R	R		R	R	R	R	R
Name	RX	TX [6:5]		LBCK	CAT	CAM	TAT	TAM

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	RX	Receive Pin Monitors the actual value of pin m_ttcan_rx 0= The CAN bus is dominant (m_ttcan_rx = '0') 1= The CAN bus is recessive (m_ttcan_rx = '1') Default Value: Undefined
6 : 5	TX	Control of Transmit Pin 00 Reset value, m_ttcan_tx controlled by the CAN Core, updated at the end of the CAN bit time 01 Sample Point can be monitored at pin m_ttcan_tx 10 Dominant ('0') level at pin m_ttcan_tx 11 Recessive ('1') at pin m_ttcan_tx Default Value: 0
4	LBCK	Loop Back Mode 0= Reset value, Loop Back Mode is disabled 1= Loop Back Mode is enabled (see Section 3.1.9, Test Modes) Default Value: 0
3	CAT	ASC is not supported by M_TTCAN Check ASC Transmit Control Monitors level at output pin m_ttcan_asct. 0= Output pin m_ttcan_asct = '0' Default Value: 0
2	CAM	ASC is not supported by M_TTCAN Check ASC Multiplexer Control Monitors level at output pin m_ttcan_ascm. 0= Output pin m_ttcan_ascm = '0' 1= Output pin m_ttcan_ascm = '1' Default Value: 0

26.1.4 CANFD0_CH0_TEST (continued)

1	TAT	ASC is not supported by M_TTCAN Test ASC Transmit Control Controls output pin m_ttcan_asct in test mode, ORed with the signal from the FSE 0= Level at pin m_ttcan_asct controlled by FSE 1= Level at pin m_ttcan_asct = '1' Default Value: 0
0	TAM	ASC is not supported by M_TTCAN Test ASC Multiplexer Control Controls output pin m_ttcan_ascm in test mode, ORed with the signal from the FSE 0= Level at pin m_ttcan_ascm controlled by FSE 1= Level at pin m_ttcan_ascm = '1' Default Value: 0

26.1.5 CANFD0_CH0_RWD

Description: RAM Watchdog

Address: 0x42840014

Retention: Retained

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15	NISO	Non ISO Operation If this bit is set, the M_TTCAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0. 0= CAN FD frame format according to ISO 11898-1:2015 1= CAN FD frame format according to Bosch CAN FD Specification V1.0 addressing the non-ISO CAN FD Default Value: 0
14	TXP	Transmit Pause If this bit is set, the M_TTCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see Section 3.5). 0= Transmit pause disabled 1= Transmit pause enabled Default Value: 0
13	EFBI	Edge Filtering during Bus Integration 0= Edge filtering disabled 1= Two consecutive dominant tq required to detect an edge for hard synchronization Default Value: 0
12	PXHD	Protocol Exception Handling Disable 0= Protocol exception handling enabled 1= Protocol exception handling disabled Default Value: 0
9	BRSE	Bit Rate Switch Enable 0= Bit rate switching for transmissions disabled 1= Bit rate switching for transmissions enabled Default Value: 0

26.1.6 CANFD0_CH0_CCCR (continued)

8	FDOE	FD Operation Enable 0= FD operation disabled 1= FD operation enabled Default Value: 0
7	TEST	Test Mode Enable 0= Normal operation, register TEST holds reset values 1= Test Mode, write access to register TEST enabled Default Value: 0
6	DAR	Disable Automatic Retransmission 0= Automatic retransmission of messages not transmitted successfully enabled 1= Automatic retransmission disabled Default Value: 0
5	MON_	Bus Monitoring Mode Bit MON can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. 0= Bus Monitoring Mode is disabled 1= Bus Monitoring Mode is enabled Default Value: 0
4	CSR	Clock Stop Request, not supported by M_TTCAN use CTL.STOP_REQ at the group level instead. 0= No clock stop is requested 1= Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle. Default Value: 0
3	CSA	Clock Stop Acknowledge 0= No clock stop acknowledged 1= M_TTCAN may be set in power down by stopping m_ttcan_hclk and m_ttcan_cclk Default Value: 0
2	ASM	Restricted Operation Mode Bit ASM can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. For a description of the Restricted Operation Mode see Section 3.1.5. 0= Normal CAN operation 1= Restricted Operation Mode active Default Value: 0
1	CCE	Configuration Change Enable 0= The CPU has no write access to the protected configuration registers 1= The CPU has write access to the protected configuration registers (while CCCR.INIT = '1') Default Value: 0
0	INIT	Initialization 0= Normal Operation 1= Initialization is started Default Value: 1

26.1.7 CANFD0_CH0_NBTP

Description: Nominal Bit Timing & Prescaler Register

Address: 0x4284001C

HW Access	R							R
Name	NSJW [31:25]							NBRP

Bits	Name	Description
31 : 25	NSJW	Nominal (Re)Synchronization Jump Width 0x00-0x7F Valid values are 0 to 127. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. Default Value: 3
24 : 16	NBRP	Nominal Bit Rate Prescaler 0x000-0x1FFThe value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 511. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. Default Value: 0
15 : 8	NTSEG1	Nominal Time segment before sample point 0x01-0xFF Valid values are 1 to 255. The actual interpretation by the hardware of this value is such that one more than the programmed value is used. Default Value: 0xA
6 : 0	NTSEG2	Nominal Time segment after sample point 0x01-0x7F Valid values are 1 to 127. The actual interpretation by the hardware of this value is such that one more than the programmed value is used. Default Value: 3

26.1.8 CANFD0_CH0_TSCC

Description: Timestamp Counter Configuration

Address: 0x42840020

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	TSC	Timestamp Counter, not used for M_TTCAN The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When TSCC.TSS = '01', the Timestamp Counter is incremented in multiples of CAN bit times [1...16] depending on the configuration of TSCC.TCP. A wrap around sets interrupt flag IR.TSW. Write access resets the counter to zero. When TSCC.TSS = '10', TSC reflects the external Timestamp Counter value. A write access has no impact. Default Value: 0

26.1.10 CANFD0_CH0_TOCC

Description: Timeout Counter Configuration

Address: 0x42840028

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW		RW

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	TOP [31:24]							

Bits	Name	Description
31 : 16	TOP	Timeout Period Start value of the Timeout Counter (down-counter). Configures the Timeout Period. Default Value: 0xFFFF
2 : 1	TOS	Timeout Select When operating in Continuous mode, a write to TOCV presets the counter to the value configured by TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by TOCC.TOP. Down-counting is started when the first FIFO element is stored. 00= Continuous operation 01= Timeout controlled by Tx Event FIFO 10= Timeout controlled by Rx FIFO 0 11= Timeout controlled by Rx FIFO 1 Default Value: 0
0	ETOC	Enable Timeout Counter 0= Timeout Counter disabled 1= Timeout Counter enabled Default Value: 0

26.1.11 CANFD0_CH0_TOCV

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	CEL	CAN Error Logging The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO. Default Value: 0
15	RP	Receive Error Passive 0= The Receive Error Counter is below the error passive level of 128 1= The Receive Error Counter has reached the error passive level of 128 Default Value: 0
14 : 8	REC	Receive Error Counter Actual state of the Receive Error Counter, values between 0 and 127 Default Value: 0
7 : 0	TEC	Transmit Error Counter Actual state of the Transmit Error Counter, values between 0 and 255 Default Value: 0

26.1.13 CANFD0_CH0_PSR

Description: Protocol Status Register

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
22 : 16	TDCV	Transmitter Delay Compensation Value 0x00-0x7F Position of the secondary sample point, defined by the sum of the measured delay from m_can_tx to m_can_rx and TDCR.TDCO. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point. Valid values are 0 to 127 mtq. Default Value: 0
14	PXE	Protocol Exception Event , Reset on Read 0= No protocol exception event occurred since last read access 1= Protocol exception event occurred Default Value: 0
13	RFDF	Received a CAN FD Message , Reset on Read This bit is set independent of acceptance filtering. 0= Since this bit was reset by the CPU, no CAN FD message has been received 1= Message in CAN FD format with FDF flag set has been received Default Value: 0
12	RBRS	BRS flag of last received CAN FD Message , Reset on Read This bit is set together with RFDF, independent of acceptance filtering. 0= Last received CAN FD message did not have its BRS flag set 1= Last received CAN FD message had its BRS flag set Default Value: 0

26.1.13 CANFD0_CH0_PSR (continued)

11	RESI	ESI flag of last received CAN FD Message , Reset on Read This bit is set together with RFDF, independent of acceptance filtering. 0= Last received CAN FD message did not have its ESI flag set 1= Last received CAN FD message had its ESI flag set Default Value: 0
10 : 8	DLEC	Data Phase Last Error Code , Set on Read Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error. Default Value: 7
7	BO	Bus_Off Status 0= The M_CAN is not Bus_Off 1= The M_CAN is in Bus_Off state Default Value: 0
6	EW	Warning Status 0= Both error counters are below the Error_Warning limit of 96 1= At least one of error counter has reached the Error_Warning limit of 96 Default Value: 0
5	EP	Error Passive 0= The M_CAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1= The M_CAN is in the Error_Passive state Default Value: 0
4 : 3	ACT	Activity Monitors the module's CAN communication state. 00= Synchronizing - node is synchronizing on CAN communication 01= Idle - node is neither receiver nor transmitter 10= Receiver - node is operating as receiver 11= Transmitter - node is operating as transmitter Default Value: 0
2 : 0	LEC	Last Error Code, Set on Read0 The LEC indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error. 0= No Error: No error occurred since LEC has been reset by successful reception or transmission. 1= Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 2= Form Error: A fixed format part of a received frame has the wrong format. 3= AckError: The message transmitted by the M_TTCAN was not acknowledged by another node. 4= Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant. 5= Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value 0'), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 6= CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data. 7= NoChange: Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows the value '7', no CAN bus event was detected since the last CPU read access to the Protocol Status Register. Default Value: 7

26.1.14 CANFD0_CH0_TDCR

Description: Transmitter Delay Compensation Register

HW Access	Reserved		RW	RW	RW	RW	RW	RW
Name	Reserved [31:30]		ARA	PED	PEA	WDI	BO_	EW_

Bits	Name	Description
29	ARA	Access to Reserved Address 0= No access to reserved address occurred 1= Access to reserved address occurred Default Value: 0
28	PED	Protocol Error in Data Phase (Data Bit Time is used) 0= No protocol error in data phase 1= Protocol error in data phase detected (PSR.DLEC != 0,7) Default Value: 0
27	PEA	Protocol Error in Arbitration Phase (Nominal Bit Time is used) 0= No protocol error in arbitration phase 1= Protocol error in arbitration phase detected (PSR.LEC != 0,7) Default Value: 0
26	WDI	Watchdog Interrupt 0= No Message RAM Watchdog event occurred 1= Message RAM Watchdog event due to missing READY Default Value: 0
25	BO_	Bus_Off Status 0= Bus_Off status unchanged 1= Bus_Off status changed Default Value: 0
24	EW_	Warning Status 0= Error_Warning status unchanged 1= Error_Warning status changed Default Value: 0

26.1.15 CANFD0_CH0_IR (continued)

23	EP_	Error Passive 0= Error_Passive status unchanged 1= Error_Passive status changed Default Value: 0
22	ELO	Error Logging Overflow 0= CAN Error Logging Counter did not overflow 1= Overflow of CAN Error Logging Counter occurred Default Value: 0
21	BEU	Bit Error Uncorrected Message RAM bit error detected, uncorrected. The flag is set in the folloiwng cases. - M_TTCAN detects uncorrectable ECC error from Message RAM when ECC is enabled and ECC error injection is disabled. - M_TTCAN reads from an out of range Message RAM address. Message RAM bit error sets CCCR.INIT to '1'. This is done to avoid transmission of corrupted data. 0= No bit error detected when reading from Message RAM 1= Bit error detected, uncorrected Default Value: 0
20	BEC	Bit Error Corrected This bit always reads as 0. Default Value: 0
19	DRX	Message stored to Dedicated Rx Buffer The flag is set whenever a received message has been stored into a dedicated Rx Buffer. 0= No Rx Buffer updated 1= At least one received message stored into a Rx Buffer Default Value: 0
18	TOO	Timeout Occurred 0= No timeout 1= Timeout reached Default Value: 0
17	MRAF	Message RAM Access Failure The flag is set, when the Rx Handler - has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. - was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the M_TTCAN is switched into Restricted Operation Mode (see Section 3.1.5). To leave Restricted Operation Mode, the Host CPU has to reset CCCR.ASM. 0= No Message RAM access failure occurred 1= Message RAM access failure occurred Default Value: 0
16	TSW	Timestamp Wraparound 0= No timestamp counter wrap-around 1= Timestamp counter wrapped around Default Value: 0
15	TEFL_	Tx Event FIFO Element Lost 0= No Tx Event FIFO element lost 1= Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero Default Value: 0
14	TEFF	Tx Event FIFO Full 0= Tx Event FIFO not full 1= Tx Event FIFO full Default Value: 0

26.1.15 CANFD0_CH0_IR (continued)

13	TEFW	Tx Event FIFO Watermark Reached 0= Tx Event FIFO fill level below watermark 1= Tx Event FIFO fill level reached watermark Default Value: 0
12	TEFN	Tx Event FIFO New Entry 0= Tx Event FIFO unchanged 1= Tx Handler wrote Tx Event FIFO element Default Value: 0
11	TFE	Tx FIFO Empty 0= Tx FIFO non-empty 1= Tx FIFO empty Default Value: 0
10	TCF	Transmission Cancellation Finished 0= No transmission cancellation finished 1= Transmission cancellation finished Default Value: 0
9	TC	Transmission Completed 0= No transmission completed 1= Transmission completed Default Value: 0
8	HPM	High Priority Message 0= No high priority message received 1= High priority message received Default Value: 0
7	RF1L_	Rx FIFO 1 Message Lost 0= No Rx FIFO 1 message lost 1= Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero Default Value: 0
6	RF1F	Rx FIFO 1 Full 0= Rx FIFO 1 not full 1= Rx FIFO 1 full Default Value: 0
5	RF1W	Rx FIFO 1 Watermark Reached 0= Rx FIFO 1 fill level below watermark 1= Rx FIFO 1 fill level reached watermark Default Value: 0
4	RF1N	Rx FIFO 1 New Message 0= No new message written to Rx FIFO 1 1= New message written to Rx FIFO 1 Default Value: 0
3	RF0L_	Rx FIFO 0 Message Lost 0= No Rx FIFO 0 message lost 1= Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero Default Value: 0
2	RF0F	Rx FIFO 0 Full 0= Rx FIFO 0 not full 1= Rx FIFO 0 full Default Value: 0
1	RF0W	Rx FIFO 0 Watermark Reached 0= Rx FIFO 0 fill level below watermark 1= Rx FIFO 0 fill level reached watermark Default Value: 0
0	RF0N	Rx FIFO 0 New Message 0= No new message written to Rx FIFO 0 1= New message written to Rx FIFO 0 Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	RW							
Name	TRP [31:24]							

Bits	Name	Description
31 : 0	TRP	Transmission Request Pending Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register TX-BAR. The bits are reset after a requested transmission has completed or has been cancelled via register TXBCR. TXBRP bits are set only for those Tx Buffers configured via TXBC. After a TXBRP bit has been set, a Tx scan (see Section 3.5, Tx Handling) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID). A cancellation request resets the corresponding transmission request pending bit of register TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset. After a cancellation has been requested, a finished cancellation is signaled via TXBCF after successful transmission together with the corresponding TXBTO bit when the transmission has not yet been started at the point of cancellation when the transmission has been aborted due to lost arbitration when an error occurred during frame transmission In DAR mode all transmissions are automatically cancelled if they are not successful. The corresponding TXBCF bit is set for all unsuccessful transmissions. 0= No transmission request pending 1= Transmission request pending Default Value: 0

Bits	Name	Description
15	LCKC	TT Operation Control Register Locked Set by a write access to register TTOCN. Reset when the updated configuration has been synchronized into the CAN clock domain. 0= Write access to TTOCN enabled 1= Write access to TTOCN locked Default Value: 0
13	ESCN	External Synchronization Control If enabled the M_TTCAN synchronizes its cycle time phase to an external event signaled by a rising edge at pin m_ttcan_evt (see Section 4.11). 0= External synchronization disabled 1= External synchronization enabled Default Value: 0
12	NIG	Next is Gap This bit can only be set when the M_TTCAN is the actual Time Master and when it is configured for external event-synchronized time-triggered operation (TTOCF.GEN = '1') 0= No action, reset by reception of any reference message 1= Transmit next reference message with Next_is_Gap = '1' Default Value: 0
11	TMG	Time Mark Gap 0= Reset by each reference message 1= Next reference message started when Register Time Mark interrupt TTIR.RTMI is activated Default Value: 0

26.1.52 CANFD0_CH0_TTOCN (continued)

10	FGP	Finish Gap Set by the CPU, reset by each reference message 0= No reference message requested 1= Application requested start of reference message Default Value: 0
9	GCS	Gap Control Select 0= Gap control independent from m_ttcan_evt 1= Gap control by input pin m_ttcan_evt Default Value: 0
8	TTIE	Trigger Time Mark Interrupt Pulse Enable External time mark events are configured by trigger memory element TMEX (see Section 2.4.7). A trigger time mark interrupt pulse is generated when the trigger memory element becomes active, and the M_TTCAN is in synchronization state In_Schedule or In_Gap. 0= Trigger Time Mark Interrupt output m_ttcan_tmp disabled 1= Trigger Time Mark Interrupt output m_ttcan_tmp enabled Default Value: 0
7 : 6	TMC	Register Time Mark Compare 00= No Register Time Mark Interrupt generated 01= Register Time Mark Interrupt if Time Mark = cycle time 10= Register Time Mark Interrupt if Time Mark = local time 11= Register Time Mark Interrupt if Time Mark = global time Default Value: 0
5	RTIE	Register Time Mark Interrupt Pulse Enable Register time mark interrupts are configured by register TTTMK. A register time mark interrupt pulse with the length of one NTU is generated when the time referenced by TTOCN.TMC (cycle, local, or global) equals TTTMK.TM, independent of the synchronization state. 0= Register Time Mark Interrupt output m_ttcan_rtp disabled 1= Register Time Mark Interrupt output m_ttcan_rtp enabled Default Value: 0
4 : 3	SWS	Stop Watch Source 00= Stop Watch disabled 01= Actual value of cycle time is copied to TTCPT.SWV 10= Actual value of local time is copied to TTCPT.SWV 11= Actual value of global time is copied to TTCPT.SWV Default Value: 0
2	SWP	Stop Watch Polarity 0= Rising edge trigger 1= Falling edge trigger Default Value: 0
1	ECS	External Clock Synchronization Writing a '1' to ECS sets TTOST.WECS if the node is the actual Time Master. ECS is reset after one Host clock period. The external clock synchronization takes effect at the start of the next basic cycle. Default Value: 0
0	SGT	Set Global time Writing a '1' to SGT sets TTOST.WGDT if the node is the actual Time Master. SGT is reset after one Host clock period. The global time preset takes effect when the node transmits the next reference message with the Master_Ref_Mark modified by the preset value written to TTGTP. Default Value: 0

SW Access	R	R	Reserved					
HW Access	RW	RW	Reserved					
Name	GFI	WGTD	Reserved [21:16]					

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	R	R	R	R		
HW Access	RW	RW	RW	RW	RW	RW		
Name	SPL	WECS	AWE	WFE	GSI	TMP [26:24]		

Bits	Name	Description
31	SPL	Schedule Phase Lock The bit is valid only when external synchronization is enabled (TTOCN.ESCN = '1'). In this case it signals that the difference between cycle time configured by TTGTP.CTP and the cycle time at the rising edge at pin m_ttcan_evt is less or equal 9 NTU (see Section 4.11). 0= Phase outside range 1= Phase inside range Default Value: 0
30	WECS	Wait for External Clock Synchronization 0= No external clock synchronization pending 1= Node waits for external clock synchronization to take effect. The bit is reset at the start of the next basic cycle. Default Value: 0
29	AWE	Application Watchdog Event The application watchdog is served by reading TTOST. When the watchdog is not served in time, bit AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitor-ing Mode. 0= Application Watchdog served in time 1= Failed to serve Application Watchdog in time Default Value: 0
28	WFE	Wait for Event 0= No Gap announced, reset by a reference message with Next_is_Gap = '0' 1= Reference message with Next_is_Gap = '1' received Default Value: 0

26.1.58 CANFD0_CH0_TTOST (continued)

27	GSI	Gap Started Indicator 0= No Gap in schedule, reset by each reference message and for all time slaves 1= Gap time after Basic Cycle has started Default Value: 0
26 : 24	TMP	Time Master Priority 0x0-7 Priority of actual Time Master Default Value: 0
23	GFI	Gap Finished Indicator Set when the CPU writes TTOCN.FGP, or by a time mark interrupt if TMG = '1', or via input pin m_ttcan_evt if TTOCN.GCS = '1'. Not set by Ref_Trigger_Gap or when Gap is finished by another node sending a reference message. 0= Reset at the end of each reference message 1= Gap finished by M_TTCAN Default Value: 0
22	WGTD	Wait for Global Time Discontinuity 0= No global time preset pending 1= Node waits for the global time preset to take effect. The bit is reset when the node has transmitted a reference message with Disc_Bit = '1' or after it received a reference message. Default Value: 0
15 : 8	RTO	Reference Trigger Offset The Reference Trigger Offset value is a signed integer with a range from -127 (0x81) to 127 (0x7F). There is no notification when the lower limit of -127 is reached. In case the M_TTCAN becomes Time Master (MS[1:0] = '11'), the reset of RTO is delayed due to synchronization between Host and CAN clock domain. For time slaves the value configured by TTOCF.IRTO is read. 0x00-FF Actual Reference Trigger offset value Default Value: 0
7	QCS	Quality of Clock Speed Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to '1'. 0= Local clock speed not synchronized to Time Master clock speed 1= Synchronization Deviation <= SDL Default Value: 1
6	QGTP	Quality of Global Time Phase Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to '0'. 0= Global time not valid 1= Global time in phase with Time Master Default Value: 0
5 : 4	SYS	Synchronization State 00= Out of Synchronization 01= Synchronizing to TTCAN communication 10= Schedule suspended by Gap (In_Gap) 11= Synchronized to schedule (In_Schedule) Default Value: 0
3 : 2	MS	Master State 00= Master_Off, no master properties relevant 01= Operating as Time Slave 10= Operating as Backup Time Master 11= Operating as current Time Master Default Value: 0
1 : 0	EL	Error Level 00= Severity 0 - No Error 01= Severity 1 - Warning 10= Severity 2 - Error 11= Severity 3 - Severe Error Default Value: 0

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
15 : 0	VALUE	The counter value of the Time Stamp Counter. When enabled this counter will count Time Stamp clock ticks from the pre-scaler. When written this counter and the pre-scaler will reset to 0 (write data is ignored). Default Value: 0

27 Graphics Subsystem (GFXSS) registers

This section discusses the GFXSS registers. It lists all the registers in mapping tables, in address order.

27.1 Register details

Register name	Address	Description
GFXSS_GPU_MXGPU_CTL	0x44800000	IP control.
GFXSS_GPU_MXGPU_STATUS	0x4480000C	IP status.
GFXSS_GPU_MXGPU_INTR	0x44800010	Interrupt status bits.
GFXSS_GPU_MXGPU_INTR_SET	0x44800014	Interrupt set bits.
GFXSS_GPU_MXGPU_INTR_MASK	0x44800018	Interrupt mask bits.
GFXSS_GPU_MXGPU_INTR_MASKED	0x4480001C	Interrupt masked bits.
GFXSS_GPU_GCNANO_AQHICLOCKCONTROL	0x44800800	Clock Control Register.
GFXSS_GPU_GCNANO_AQHIIDLE	0x44800804	Idle Status Register.
GFXSS_GPU_GCNANO_AQAXICONFIG	0x44800808	AXI Configuration Register.
GFXSS_GPU_GCNANO_AQAXISTATUS	0x4480080C	AXI Status Register. READ ONLY. Back-to-back read is forbidden to this register and can cause system hang. Please insert delay (nop operation) between two consecutive reads while accessing this register outside of VSI drivers.
GFXSS_GPU_GCNANO_AQINTRACKNOWLEDGE	0x44800810	Interrupt Acknowledge Register. Each bit represents a corresponding event being triggered. Reading from this register clears the outstanding interrupt. READ ONLY. When the access comes from a debugger (HMASTER[0] == 1), the clear by read function is disabled. Back-to-back read is forbidden to this register and can cause system hang. Please insert delay (nop operation) between two consecutive reads while accessing this register outside of VSI drivers.
GFXSS_GPU_GCNANO_AQINTRENBL	0x44800814	Interrupt Enable Register. Each bit enables a corresponding event.
GFXSS_GPU_GCNANO_GCCHIPREV	0x44800824	Chip Revsion Register. Shows the revision for the chip in BCD. This register has no set reset value. It varies with the implementation. READ ONLY.
GFXSS_GPU_GCNANO_GCCHIPDATE	0x44800828	Chip Date Register. Shows the release date for the IP in YYYYMMDD (year/month/day) format. This register has no set reset value. It varies with the implementation. READ ONLY.
GFXSS_GPU_GCNANO_GCREGHICHIPPATCHREV	0x44800898	Chip Patch Revision Register. Patch revision level for the chip. It varies per release. READ ONLY
GFXSS_GPU_GCNANO_GCPRODUCTID	0x448008A8	Product Identification Register. Shows Product ID. READ ONLY.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_GPU_GCNANO_GCMODULEPOWERCONTROLS	0x44800900	Module Power Control Register. Control register for module level power controls.
GFXSS_GPU_GCNANO_GCMODULEPOWERMODULECONTROL	0x44800904	Module Power Module Control Register. Module level control register.
GFXSS_GPU_GCNANO_GCMODULEPOWERMODULESTATUS	0x44800908	Module Power Module Status Register. Module level control status.
GFXSS_GPU_GCNANO_AQMEMORYDEBUG	0x44800C14	Memory Debug Register.
GFXSS_GPU_GCNANO_AQREGISTERTIMINGCONTROL	0x44800C2C	Timing Control Register.
GFXSS_GPU_GCNANO_GCREGFETCHADDRESS	0x44800D00	Fetch Command Buffer Base Address Register. Address of the command buffer. The address must be 64-byte aligned.
GFXSS_GPU_GCNANO_GCREGFETCHCONTROL	0x44800D04	Fetch Control Register. Writing a non-zero value to this register starts the fetch engine. The FE will start fetching 64-bit commands and data starting at the address specified by the gcregFetchAddress register. Make sure this count is large enough to fetch the END command, otherwise the FE will wait until more data is coming.
GFXSS_GPU_GCNANO_GCREGCURRENTFETCHADDRESS	0x44800D08	Current Fetch Command Address Register. Debugging register that defines the current address the FE is fetching data from. READ ONLY.
GFXSS_DC_MXDC_CTL	0x44801000	IP control.
GFXSS_DC_MXDC_CLK_CTL	0x44801004	Clock control.
GFXSS_DC_MXDC_IO_CTL	0x44801008	IO enable control.
GFXSS_DC_MXDC_STATUS	0x4480100C	IP status.
GFXSS_DC_MXDC_INTR	0x44801010	Interrupt status.
GFXSS_DC_MXDC_INTR_SET	0x44801014	Interrupt set bits.
GFXSS_DC_MXDC_INTR_MASK	0x44801018	Interrupt mask bits.
GFXSS_DC_MXDC_INTR_MASKED	0x4480101C	Interrupt masked bits.
GFXSS_DC_MXDC_ADDR0_INT	0x44801020	Address 0 for interrupt generation.
GFXSS_DC_MXDC_ADDR1_INT	0x44801024	Address 1 for interrupt generation.
GFXSS_DC_MXDC_ADDR2_INT	0x44801028	Address 2 for interrupt generation.
GFXSS_DC_MXDC_ADDR3_INT	0x4480102C	Address 3 for interrupt generation.
GFXSS_DC_MXDC_RLAD_CTL	0x44801040	Control options for the RLAD decoder.
GFXSS_DC_MXDC_RLAD_IMG	0x44801044	Properties of the uncompressed image.
GFXSS_DC_MXDC_RLAD_ENC	0x44801048	Configuration of the encoder that compressed the image.
GFXSS_DC_MXDC_RLAD_BUF0	0x4480104C	Properties of the compressed image data buffer.
GFXSS_DC_MXDC_RLAD_BUF1	0x44801050	Properties of the compressed image data buffer.
GFXSS_DC_MXDC_RLAD_STATUS	0x44801054	RLAD decoder status.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_DC_MXDC_IPIDENTIFIER	0x44801070	GFXSS IP and desig release identification (with DC, GPU and MIPIDSI).
GFXSS_DC_DCNANO_GCREGDCCHIPREV	0x44801800	Chip Revision Register. Shows the revision for the chip in BCD. This register has no set reset value. It varies with the implementation. READ ONLY.
GFXSS_DC_DCNANO_GCREGDCCHIPDATE	0x44801804	Chip Date Register. Shows the release date for the IP in YYYYMMDD (year, month. day) format. This register has no set reset value. It varies with the implementation. READ ONLY.
GFXSS_DC_DCNANO_GCREGDCCHIPPATCHREV	0x44801808	Patch Revision Register. Patch revision level for the chip. READ ONLY.
GFXSS_DC_DCNANO_GCREGDCPRODUCTID	0x4480180C	Product Identification Register. READ ONLY.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERCONFIG	0x44801824	Frame Buffer Configuration Register. Frame Buffer and Timing control. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERADDRESS	0x44801828	Frame Buffer Base Address Register. Starting address of the frame buffer. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERSTRIDE	0x4480182C	Frame Buffer Stride Register. Stride of the frame buffer in bytes. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDCTILEINCFG	0x44801834	Tile Input Configuration Register. Tile input configuration. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDCTILEUVFRAMEBUFFERADR	0x44801838	Frame Buffer Tiled UV Base Address Register. UV frame buffer address when tile input. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDCTILEUVFRAMEBUFFERSTR	0x4480183C	Frame Buffer Tiled UV Stride Register. UV frame buffer stride when tile input NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERBACKGROUND	0x44801858	Framebuffer background color. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERCOLORKEY	0x4480185C	Framebuffer Color Key Start Address Register. Start of color key range of framebuffer. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERCOLORKEYHIGH	0x44801860	Framebuffer Color Key End Address Register. End of color key range of framebuffer. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERCLEARVALUE	0x44801864	Framebuffer Clear Value Register. Clear value used when dcregFrameBufferConfig.Clear is enabled, format is A8R8G8B8. NOTE.. This register is double buffered.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_DC_DCNANO_GCREGVIDEOTL	0x44801868	Top left coordinate of panel pixel where the video should start. Be aware there is no panning inside the video. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGFRAMEBUFFERSIZE	0x4480186C	video size information. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGVIDEOGLOBALALPHA	0x44801870	Global alpha for the video. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGBLENDSTACKORDER	0x44801874	Set the video, overlay0, overlay1 order for blend. The 1st is the lowest layer, the 2nd is the middle layer, the 3rd is the highest layer. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGVIDEOALPHABLENDCONFIG	0x44801878	Alpha Blending Configuration Register. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYCONFIG	0x4480187C	Overlay Configuration Register. Overlay control. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYADDRESS	0x44801880	Starting address of the overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYSTRIDE	0x44801884	Stride of the overlay in bytes. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDCOVERLAYTILEINCFG	0x44801888	Tile Input Configuration Register. Tile input configuration. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDCTILEUVOVERLAYADR	0x4480188C	Starting address of the overlay UV. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDCTILEUVOVERLAYSTR	0x44801890	Stride of the overlay UV in bytes. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYTL	0x44801894	Top left coordinate of panel pixel where the overlay should start. Be aware there is no panning inside the overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYSIZE	0x44801898	overlay size information. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYCOLORKEY	0x4480189C	Overlay Color Key Start Address Register. Start of color key range for overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYCOLORKEYHIGH	0x448018A0	Overlay Color Key End Address Register. End of color key range for overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYALPHABLENDCONFIG	0x448018A4	Alpha Blending Configuration Register. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYGLOBALALPHA	0x448018A8	Overlay global alpha value. NOTE.. This register is double buffered.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_DC_DCNANO_GCREGOVERLAYCLEARVALUE	0x448018AC	Overlay Clear Value Register. Clear value used when dcregOverlayConfig.Clear is enabled, Format is A8R8G8B8. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYCONFIG1	0x448018B0	Overlay Configuration Register. Overlay control. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYADDRESS1	0x448018B4	Starting address of the overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYSTRIDE1	0x448018B8	Stride of the overlay in bytes. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYTL1	0x448018BC	Top left coordinate of panel pixel where the overlay should start. Be aware there is no panning inside the overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYSIZE1	0x448018C0	overlay1 size information. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYCOLORKEY1	0x448018C4	Overlay Color Key Start Address Register. Start of color key range for overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYCOLORKEYHIGH1	0x448018C8	Overlay Color Key End Address Register. End of color key range for overlay. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYALPHABLENDCONFIG1	0x448018CC	Alpha Blending Configuration Register. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYGLOBALALPHA1	0x448018D0	Overlay global alpha value. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGOVERLAYGLOBALALPHA1	0x448018D4	Overlay Clear Value Register. Clear value used when dcregOverlayConfig.Clear is enabled, Format is A8R8G8B8. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDISPLAYDITHERTABLELOW	0x448018E0	Dither Threshold Table Register.
GFXSS_DC_DCNANO_GCREGDISPLAYDITHERTABLEHIGH	0x448018E4	Dither Threshold Table Register.
GFXSS_DC_DCNANO_GCREGPANELCONFIG	0x448018E8	Panel Configuration Register.
GFXSS_DC_DCNANO_GCREGPANELCONTROL	0x448018EC	Panel control Register.
GFXSS_DC_DCNANO_GCREGPANELFUNCTION	0x448018F0	Panel function Register. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGPANELWORKING	0x448018F4	Register to trigger Display Controller.
GFXSS_DC_DCNANO_GCREGPANELSTATE	0x448018F8	Register representing the Display Controller status. READ ONLY.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_DC_DCNANO_GCREGHDISPLAY	0x44801900	Horizontal Display Total and Visible Pixel Count Register. Horizontal Total and Display End counters. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGHSYNC	0x44801904	Horizontal Sync Counter Register. Horizontal Sync counters. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGVDISPLAY	0x44801910	Vertical Total and Visible Pixel Count Register. Vertical Total and Display End counters. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGVSYNC	0x44801914	Vertical Sync Counter Register. Vertical Sync counters. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDISPLAYCURRENTLOCATION	0x44801918	Display Current Location Register. Current x,y location of display controller. READ ONLY.
GFXSS_DC_DCNANO_GCREGGAMMAINDEX	0x4480191C	Gamma Index Register. Index into gamma table. See gcregGammaData for more information.
GFXSS_DC_DCNANO_GCREGGAMMADATA	0x44801920	Gamma Data Register. Translation values for the gamma table. When this register gets written, the data gets stored in the gamma table at the index specified by the gcregGammaIndex register. After the register is written, the index gets incremented.
GFXSS_DC_DCNANO_GCREGCURSORCONFIG	0x44801924	Cursor Configuration Register. Configuration register for the cursor. Double-buffered values in this register cannot be read while a flip is in progress. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGCURSORADDRESS	0x44801928	Cursor Base Address Register. Address of the cursor shape. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGCURSORLOCATION	0x4480192C	Cursor Location Register. Location of the cursor on the owning display. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGCURSORBACKGROUND	0x44801930	Cursor Background Color Register. The background color for Masked cursors. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGCURSORFOREGROUND	0x44801934	Cursor Foreground Color Register. The foreground color for Masked cursors. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDISPLAYINTR	0x44801938	Display Interrupt Register. This is the interrupt register for the Display. This register will automatically clear after a read. The interrupt bit is set when the current frame buffer is used up. The interrupt signal will be pulled up only when the interrupt enable bit in register gcregDisplayIntrEnable is enabled. READ ONLY. When the access comes from a debugger (HMASTER[0] == 1), the clear by read function is disabled.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_DC_DCNANO_GCREGDISPLAYINTRENABLE	0x4480193C	Display Interrupt Enable Register. The interrupt enable register for display_0 (and display_1 if present). NOTE.. Interrupt enable for register gcregDisplayIntr. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDBICONFIG	0x44801940	DBI Configuration Register. Configuration register for DBI output.
GFXSS_DC_DCNANO_GCREGDBIIFRESET	0x44801944	DBI Reset Register. Reset DBI interface to idle state. WRITE ONLY.
GFXSS_DC_DCNANO_GCREGDBIWRCHAR1	0x44801948	DBI Write AC Characteristics 1 Register. DBI write AC characteristics definition register 1
GFXSS_DC_DCNANO_GCREGDBIWRCHAR2	0x4480194C	DBI Write AC Characteristics 2 Register. DBI write AC characteristics definition register 2
GFXSS_DC_DCNANO_GCREGDBICMD	0x44801950	DBI Command Control Register. DBI Command in/out port. Writes to this register will send command/data to the DBI port. WRITE ONLY.
GFXSS_DC_DCNANO_GCREGDPICONFIG	0x44801954	DPI Configuration Register. The configuration register for DPI output. NOTE.. This register is double buffered.
GFXSS_DC_DCNANO_GCREGDBITYPECCFG	0x44801958	DBI Type C Timing Control Register. DBI Type C write timing definition.
GFXSS_DC_DCNANO_GCREGDCSTATUS	0x4480195C	Display Controller Status Register. READ ONLY.
GFXSS_DC_DCNANO_GCREGSRCCONFIGENDIAN	0x44801960	Endian control.
GFXSS_DC_DCNANO_GCREGSOFTRESET	0x44801964	Soft reset. WRITE ONLY.
GFXSS_DC_DCNANO_GCREGDCCONTROL	0x44801968	Control register.
GFXSS_DC_DCNANO_GCREGREGISTERTIMINGCONTROL	0x4480196C	Timing control register.
GFXSS_DC_DCNANO_GCREGDEBUGCOUNTERSELECT	0x44801970	Debug Counter Select Register.
GFXSS_DC_DCNANO_GCREGDEBUGCOUNTERVALUE	0x44801974	Debug Counter Value Register. Debug Counter Value as specified in gcregDebugCounterSelect. READ ONLY
GFXSS_DC_DCNANO_GCREGLAYERCLOCKGATE	0x448019A0	Layer clock gater Register. disable video/overlay0/overlay1 clock gater
GFXSS_DC_DCNANO_GCREGDEBUGTOTVIDEOREQ	0x448019A4	debug registers.. count video current frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTVIDEOREQ	0x448019A8	debug registers.. count video last frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTVIDEORRB	0x448019AC	debug registers.. count video current frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTVIDEORRB	0x448019B0	debug registers.. count video last frame number of returned burst. READ ONLY

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_DC_DCNANO_GCREGDEBUGTOTOVERLAY0REQ	0x448019B4	debug registers.. count overlay0 current frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTOVERLAY0REQ	0x448019B8	debug registers.. count overlay0 last frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTOVERLAY0RRB	0x448019BC	debug registers.. count overlay0 current frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTOVERLAY0RRB	0x448019C0	debug registers.. count overlay0 last frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTOVERLAY1REQ	0x448019C4	debug registers.. count overlay1 current frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTOVERLAY1REQ	0x448019C8	debug registers.. count overlay1 last frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTOVERLAY1RRB	0x448019CC	debug registers.. count overlay1 current frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTOVERLAY1RRB	0x448019D0	debug registers.. count overlay1 last frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTCURSORREQ	0x448019D4	debug registers.. count cursor current frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTCURSORREQ	0x448019D8	debug registers.. count cursor last frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTCURSORRRB	0x448019DC	debug registers.. count cursor current frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTCURSORRRB	0x448019E0	debug registers.. count cursor last frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTDCREQ	0x448019E4	debug registers.. count DC current frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTDCREQ	0x448019E8	debug registers.. count DC last frame number of requested burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGTOTDCRRB	0x448019EC	debug registers.. count DC current frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGLSTDCRRB	0x448019F0	debug registers.. count DC last frame number of returned burst. READ ONLY
GFXSS_DC_DCNANO_GCREGDEBUGFRAMEANDMISFLAG	0x448019F4	debug registers. READ ONLY
GFXSS_MIPIDSI_MXMIPIDSI_CTL	0x44802000	IP control.
GFXSS_MIPIDSI_MXMIPIDSI_CLK_CTL	0x44802004	Clock control.
GFXSS_MIPIDSI_MXMIPIDSI_INTR	0x44802010	Interrupt status bits.
GFXSS_MIPIDSI_MXMIPIDSI_INTR_SET	0x44802014	Interrupt set bits.
GFXSS_MIPIDSI_MXMIPIDSI_INTR_MASK	0x44802018	Interrupt mask bits.
GFXSS_MIPIDSI_MXMIPIDSI_INTR_MASKED	0x4480201C	Interrupt masked bits.
GFXSS_MIPIDSI_MXMIPIDSI_DPI_CMD	0x44802020	DPI command control.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_MIPIDSI_MXMIPIDSI_DBI_CMD	0x44802024	DBI command control.
GFXSS_MIPIDSI_MXMIPIDSI_PHY_FREQ_RANGE	0x44802030	PHY frequency range selection.
GFXSS_MIPIDSI_MXMIPIDSI_BIST	0x44802034	BIST control.
GFXSS_MIPIDSI_MXMIPIDSI_IO_CONTINUITY_TEST	0x44802038	IO continuity test control.
GFXSS_MIPIDSI_MXMIPIDSI_PLL_TEST_CONFIG1	0x4480203C	PLL-SoC interface configuration for Test.
GFXSS_MIPIDSI_MXMIPIDSI_PLL_TEST_CONFIG2	0x44802040	PLL-SoC interface configuration for Test.
GFXSS_MIPIDSI_MXMIPIDSI_PLL_TEST_OBS1	0x44802044	PLL Test Observation bits.
GFXSS_MIPIDSI_MXMIPIDSI_PLL_TEST_OBS2	0x44802048	PLL Test Observation bits.
GFXSS_MIPIDSI_MXMIPIDSI_LP_INTERNAL_LOOPBACK_TEST	0x4480204C	Low Power internal Loopback Test
GFXSS_MIPIDSI_DWCMIPIDSI_VERSION	0x44803000	Contains the version of the DSI host controller.
GFXSS_MIPIDSI_DWCMIPIDSI_PWR_UP	0x44803004	Controls the power up of the controller.
GFXSS_MIPIDSI_DWCMIPIDSI_CLKMGR_CFG	0x44803008	Configures the factor for internal dividers to divide lanebyteclk for timeout purposes.
GFXSS_MIPIDSI_DWCMIPIDSI_DPI_VCID	0x4480300C	Configures the Virtual Channel ID for DPI traffic.
GFXSS_MIPIDSI_DWCMIPIDSI_DPI_COLOR_CODING	0x44803010	Configures DPI color coding.
GFXSS_MIPIDSI_DWCMIPIDSI_DPI_CFG_POL	0x44803014	Configures the polarity of DPI signals.
GFXSS_MIPIDSI_DWCMIPIDSI_DPI_LP_CMD_TIM	0x44803018	Configures the timing for low-power commands sent while in video mode.
GFXSS_MIPIDSI_DWCMIPIDSI_DBI_VCID	0x4480301C	Configures Virtual Channel ID for DBI traffic.
GFXSS_MIPIDSI_DWCMIPIDSI_DBI_CFG	0x44803020	Configures the bit width of pixels for DBI.
GFXSS_MIPIDSI_DWCMIPIDSI_DBI_PARTITIONING_EN	0x44803024	Configures whether DWC_mipi_dsi_host is to partition DBI traffic automatically.
GFXSS_MIPIDSI_DWCMIPIDSI_DBI_CMDSIZE	0x44803028	Configures the command size and the size for automatic partitioning of DBI packets.
GFXSS_MIPIDSI_DWCMIPIDSI_PCKHDL_CFG	0x4480302C	Configures how EoTp, BTA, CRC and ECC are to be used, to meet peripherals characteristics
GFXSS_MIPIDSI_DWCMIPIDSI_GEN_VCID	0x44803030	Configures the Virtual Channel ID of READ responses to store and return to Generic interface.
GFXSS_MIPIDSI_DWCMIPIDSI_MODE_CFG	0x44803034	Configures the mode of operation between Video or Command Mode. (Commands can still be sent while in video mode.)

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_MIPIDSI_DWCMIPIDSI_VID_MODE_CFG	0x44803038	Configures several aspects of Video mode operation, the transmission mode, switching to low-power in the middle of a frame, enabling acknowledge and whether to send commands in low-power.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_PKT_SIZE	0x4480303C	Configures the video packet size.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_NUM_CHUNKS	0x44803040	Configures the number of chunks to use. The data in each chunk has the size provided by VID_PKT_SIZE.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_NULL_SIZE	0x44803044	Configures the size of null packets.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_HSA_TIME	0x44803048	Configures the video HSA time.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_HBP_TIME	0x4480304C	Configures the video HBP time.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_HLINE_TIME	0x44803050	Configures the overall time for each video line.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VSA_LINES	0x44803054	Configures the VSA period.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VBP_LINES	0x44803058	Configures the VBP period.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VFP_LINES	0x4480305C	Configures the VFP period.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VACTIVE_LINES	0x44803060	Configures the vertical resolution of video.
GFXSS_MIPIDSI_DWCMIPIDSI_CMD_MODE_CFG	0x44803068	Configures several aspect of command mode operation, tearing effect, acknowledge for each packet and the speed mode to transmit each Data Type related to commands.
GFXSS_MIPIDSI_DWCMIPIDSI_GEN_HDR	0x4480306C	Sets the header for new packets sent using the Generic interface.
GFXSS_MIPIDSI_DWCMIPIDSI_GEN_PLD_DATA	0x44803070	Sets the payload for packets sent using the Generic interface and, when read returns the contents of READ responses from the peripheral.
GFXSS_MIPIDSI_DWCMIPIDSI_CMD_PKT_STATUS	0x44803074	Contains information about the status of FIFOs related to DBI and Generic interface.
GFXSS_MIPIDSI_DWCMIPIDSI_TO_CNT_CFG	0x44803078	Configures counters that trigger timeout errors. These are used to warn the system of a failure, through an interrupt, and restart the controller in case of unexpected situations that cause deadlock conditions.
GFXSS_MIPIDSI_DWCMIPIDSI_HS_RD_TO_CNT	0x4480307C	Configures the Peripheral Response timeout after high-speed Read operations.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_MIPIDSI_DWCMIPIDSI_LP_RD_TO_CNT	0x44803080	Configures the Peripheral Response timeout after low-power Read operations.
GFXSS_MIPIDSI_DWCMIPIDSI_HS_WR_TO_CNT	0x44803084	Configures the Peripheral Response timeout after high-speed Write operations.
GFXSS_MIPIDSI_DWCMIPIDSI_LP_WR_TO_CNT	0x44803088	Configures the Peripheral Response timeout after low-power Write operations.
GFXSS_MIPIDSI_DWCMIPIDSI_BTA_TO_CNT	0x4480308C	Configures the Peripheral Response timeout after Bus Turnaround completion.
GFXSS_MIPIDSI_DWCMIPIDSI_SDF_3D	0x44803090	Stores 3D control information for VSS packets in video mode.
GFXSS_MIPIDSI_DWCMIPIDSI_LPCLK_CTRL	0x44803094	Configures the possibility for using non continuous clock in the clock lane.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_TMR_LPCLK_CFG	0x44803098	Sets the time that DWC_mipi_dsi_host assumes in calculations for the clock lane to switch between high-speed and low-power.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_TMR_CFG	0x4480309C	Sets the time that DWC_mipi_dsi_host assumes in calculations for the data lanes to switch between high-speed and low-power.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_RSTZ	0x448030A0	Controls resets and the PLL of the D-PHY.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_IF_CFG	0x448030A4	Configures the number of active lanes and the minimum time to remain in stop state.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_ULPS_CTRL	0x448030A8	Configures entering and leaving ULPS in the D-PHY.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_TX_TRIGGERS	0x448030AC	Configures the pins that activate triggers in the D-PHY.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_STATUS	0x448030B0	Contains information about the status of the D-PHY.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_TST_CTRL0	0x448030B4	Controls clock and clear pins of the D-PHY vendor specific interface.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_TST_CTRL1	0x448030B8	Controls data and enable pins of the D-PHY vendor specific interface.
GFXSS_MIPIDSI_DWCMIPIDSI_INT_ST0	0x448030BC	Contains the status of interrupt sources from acknowledge reports and the D-PHY.
GFXSS_MIPIDSI_DWCMIPIDSI_INT_ST1	0x448030C0	Contains the status of interrupt sources related to timeouts, ECC, CRC, packet size, EoTp, Generic and DBI interfaces.
GFXSS_MIPIDSI_DWCMIPIDSI_INT_MSK0	0x448030C4	Configures masks for the sources of interrupts that affect the INT_ST0 register. Write 1 to un-mask each error report.
GFXSS_MIPIDSI_DWCMIPIDSI_INT_MSK1	0x448030C8	Configures masks for the sources of interrupts that affect the INT_ST1 register.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_CAL	0x448030CC	Controls the skew calibration of D-PHY.

Graphics Subsystem (GFXSS) registers

Register name	Address	Description
GFXSS_MIPIDSI_DWCMIPIDSI_INT_FORCE0	0x448030D8	Forces interrupt that affect the INT_ST0 register.
GFXSS_MIPIDSI_DWCMIPIDSI_INT_FORCE1	0x448030DC	Forces interrupts that affect the INT_ST1 register.
GFXSS_MIPIDSI_DWCMIPIDSI_DSC_PARAMETER	0x448030F0	Configures Display Stream Compression.
GFXSS_MIPIDSI_DWCMIPIDSI_PHY_TMR_RD_CFG	0x448030F4	Configures times related to PHY to perform some operations in lane byte clock cycles.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_SHADOW_CTRL	0x44803100	Controls dpi shadow feature
GFXSS_MIPIDSI_DWCMIPIDSI_DPI_VCID_ACT	0x4480310C	Holds the value that controller is using for DPI_VCID.
GFXSS_MIPIDSI_DWCMIPIDSI_DPI_COLOR_CODING_ACT	0x44803110	Holds the value that controller is using for DPI_COLOR_CODING.
GFXSS_MIPIDSI_DWCMIPIDSI_DPI_LP_CMD_TIM_ACT	0x44803118	Holds the value that controller is using for DPI_LP_CMD_TIM.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_MODE_CFG_ACT	0x44803138	Holds the value that controller is using for VID_MODE_CFG.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_PKT_SIZE_ACT	0x4480313C	Holds the value that controller is using for VID_PKT_SIZE.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_NUM_CHUNKS_ACT	0x44803140	This register holds the value that controller is using for VID_NUM_CHUNKS.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_NULL_SIZE_ACT	0x44803144	Holds the value that controller is using for VID_NULL_SIZE.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_HSA_TIME_ACT	0x44803148	Holds the value that controller is using for VID_HSA_TIME.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_HBP_TIME_ACT	0x4480314C	Holds the value that controller is using for VID_HBP_TIME.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_HLINE_TIME_ACT	0x44803150	Holds the value that controller is using for VID_HLINE_TIME.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VSA_LINES_ACT	0x44803154	Holds the value that controller is using for VID_VSA_LINES.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VBP_LINES_ACT	0x44803158	Holds the value that controller is using for VID_VBP_LINES.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VFP_LINES_ACT	0x4480315C	Holds the value that controller is using for VID_VFP_LINES.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_VACTIVE_LINES_ACT	0x44803160	Holds the value that controller is using for VID_VACTIVE_LINES.
GFXSS_MIPIDSI_DWCMIPIDSI_VID_PKT_STATUS	0x44803168	Contains information about the status of FIFOs related to DPI and eDPI interfaces.
GFXSS_MIPIDSI_DWCMIPIDSI_SDF_3D_ACT	0x44803190	Holds the value that controller is using for SDF_3D.

27.1.1 GFXSS_GPU_MXGPU_CTL

Description: IP control.

Address: 0x44800000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	IP enable bit. When disabled (value 0), the functional state of the GCNano core is reset and its clock input gated. Access to MMIO of the core results in an AHB error response. Note, that the effect of this bit is delayed (see STATUS.CORE_RST). The core must be idle (no outstanding or pending AXI transactions) before clearing this bit. Default Value: 0

27.1.2 GFXSS_GPU_MXGPU_STATUS

Description: IP status.

Address: 0x4480000C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							CORE_RST

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CORE_RST	Reset state of the GCNano core (1 = in reset). This state is delayed to GFXSS_GPU reset. After reset de-activation it has to be checked for value 0 before the core can be used. After activation it has to be checked for value 1 before turning off the external clk_hf source. Default Value: 1

27.1.3 GFXSS_GPU_MXGPU_INTR

Description: Interrupt status bits.

Address: 0x44800010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1C
HW Access	Reserved							RW1SC
Name	Reserved [7:1]							CORE

Bits	15	14	13	12	11	10	9	8

SW Access	R			RW				
HW Access	W			R				
Name	AQHICLOCKCONTROL_RESERVED_5 [31:29]			AQHICLOCKCONTROL_RESERVED_4 [28:24]				

Bits	Name	Description
31 : 29	AQHICLOCKCON-TROL_RESERVED_5	Reserved Default Value: 0x0
28 : 20	AQHICLOCKCON-TROL_RESERVED_4	Reserved Default Value: 0x000
19	AQHICLOCKCON-TROL_ISOLATE_GPU	Reserved Default Value: 0x0
18	AQHICLOCKCON-TROL_IDLE_VG	VG pipe is idle: 0=Busy: 1=Idle or not present Default Value: 0x1
17	AQHICLOCKCON-TROL_IDLE2_D	2D pipe is idle or not present: 0=Busy: 1=Idle or not present Default Value: 0x1

27.1.7 GFXSS_GPU_GCNANO_AQHICLOCKCONTROL (continued)

16	AQHICLOCKCON-TROL_IDLE3_D	3D pipe is idle or not present: 0=Busy: 1=Idle or not present Default Value: 0x1
15	AQHICLOCKCON-TROL_RESERVED_3	Reserved Default Value: 0x0
14	AQHICLOCKCON-TROL_RESERVED_2	Reserved Default Value: 0x0
13	AQHICLOCKCONTROL_-DISABLE_RAM_POW-ER_OPTIMIZATION	Reserved Default Value: 0x0
12	AQHICLOCKCONTROL_-SOFT_RESET	Soft resets the IP. Write 1 to reset, defaults to 0 after reset. Default Value: 0x0
11	AQHICLOCKCONTROL_-DISABLE_DEBUG_REG-ISTERS	0=Enable debug registers 1=Disable debug registers Default Value: 0x1
10	AQHICLOCKCONTROL_-DISABLE_RAM_CLOCK_-GATING	RAM clock gating: 0=automatic turn off RAM clock when RAM not accessed; 1=ram clock always on Default Value: 0x0
9	AQHICLOCKCON-TROL_FSCALE_CMD_-LOAD	Core clock frequency scale value enable. When writing a 1 to this bit, it updates the frequency scale factor with the value FSCALE_VAL[6:0]. The bit must be set back to 0 after that. If this bit is set and FSCALE_VAL=0 (an invalid combination), the HREADYOUT output signal will get stuck to 0. Default Value: 0x0
8 : 2	AQHICLOCKCON-TROL_FSCALE_VAL	Core clock frequency scale value. Default Value: 0x40
1	AQHICLOCKCONTROL_-CLK2D_DIS	Disable 2D/VG clock when set to 1. CLK2D_DIS should be controlled by software. The AXI interface clock is the only block not stalled at that point. 0: VG clock on 1:VG clock off Default Value: 0x0
0	AQHICLOCKCON-TROL_RESERVED_1	Reserved Default Value: 0x0

27.1.8 GFXSS_GPU_GCNANO_AQHIIDLE

Description: Idle Status Register.

Address: 0x44800804

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R	R	R	R	R	R	R	R
HW Access	W	W	W	W	W	W	W	W
Name	AQHI-IDLE_IDLE_TX	AQHI-IDLE_IDLE_RA	AQHI-IDLE_IDLE_SE	AQHI-IDLE_IDLE_PA	AQHI-IDLE_IDLE_SH	AQHI-IDLE_IDLE_PE	AQHI-IDLE_IDLE_DE	AQHI-IDLE_IDLE_FE

Bits	Name	Description
31 : 10	AQAXISTATUS_RE-SERVED	Reserved Default Value: 0x000000
9	AQAXISTATUS_DE-T_RD_ERR	1=A read error is detected. Default Value: 0x0
8	AQAXISTATUS_DE-T_WR_ERR	1=A write error is detected. Default Value: 0x0
7 : 4	AQAXISTATUS_RD_ER-R_ID	The ID which caused illegal read access error. Default Value: 0x0
3 : 0	AQAXISTATUS_WR_ER-R_ID	The ID which caused illegal write access error. Default Value: 0x0

27.1.11 GFXSS_GPU_GCNANO_AQINTRACKNOWLEDGE

Description: Interrupt Acknowledge Register. Each bit represents a corresponding event being triggered. Reading from this register clears the outstanding interrupt. READ ONLY. When the access comes from a debugger (HMASTER[0] == 1), the clear by read function is disabled. Back-to-back read is forbidden to this register and can cause system hang. Please insert delay (nop operation) between two consecutive reads while accessing this register outside of VSI drivers.

Address: 0x44800810

Retention: Not Retained

Name	GCCHIPDATE_DATE [31:24]							

Bits	Name	Description
31 : 0	GCCHIPDATE_DATE	Date. This value will vary each release and can be ignored during test. Default Value: Undefined

27.1.15 GFXSS_GPU_GCNANO_GCREGHICHIPPATCHREV

Description: Chip Patch Revision Register. Patch revision level for the chip. It varies per release. READ ONLY

Address: 0x44800898

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	GCREGHICHIPPATCHREV_PATCH_REV [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	GCREGHICHIPPATCHREV_RESERVED [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	GCREGHICHIPPATCHREV_RESERVED [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCREGHICHIPPATCHREV_RESERVED [31:24]							

Bits	Name	Description
31 : 8	GCREGHICHIP-PATCHREV_RESERVED	Reserved Default Value: 0x000000
7 : 0	GCREGHICHIP-PATCHREV_-PATCH_REV	Patch Revision. This value will vary each release and can be ignored during test. Default Value: Undefined

27.1.16 GFXSS_GPU_GCNANO_GCPRODUCTID

Description: Product Identification Register. Shows Product ID. READ ONLY.

Address: 0x448008A8

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	W				W			
Name	GCPRODUCTID_NUM [7:4]				GCPRODUCTID_GRADE_LEVEL [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	GCPRODUCTID_NUM [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	GCPRODUCTID_NUM [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R				R			
HW Access	W				W			
Name	GCPRODUCTID_RESERVED [31:28]				GCPRODUCTID_TYPE [27:24]			

Bits	Name	Description
31 : 28	GCPRODUCTID_RESERVED	Reserved Default Value: 0x0
27 : 24	GCPRODUCTID_TYPE	Product Type is 3: VG (Vector Graphics). Default Value: 0x3
23 : 4	GCPRODUCTID_NUM	Product number is 265. Default Value: 0x00265
3 : 0	GCPRODUCTID_GRADE_LEVEL	0:None-no extra letter on the product name for this core; 1:Nano; 5:NanoUltra. Default Value: 0x5

27.1.17 GFXSS_GPU_GCNANO_GCMODULEPOWERCONTROLS

Description: Module Power Control Register. Control register for module level power controls.

Address: 0x44800900

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				R	RW	RW	RW
HW Access	R				W	R	R	R
Name	GCMODULEPOWERCONTROLS_TURN_ON_COUNTER [7:4]				GCMODULEPOWERCONTROLS_RESERVED_1	GCMODULEPOWERCONTROLS_DISABLE_STARVE_MODULE_CLOCK_GATING	GCMODULEPOWERCONTROLS_DISABLE_STALL_MODULE_CLOCK_GATING	GCMODULEPOWERCONTROLS_ENABLE_MODULE_CLOCK_GATING

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	GCMODULEPOWERCONTROLS_RESERVED_2 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	GCMODULEPOWERCONTROLS_TURN_OFF_COUNTER [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	GCMODULEPOWERCONTROLS_TURN_OFF_COUNTER [31:24]							

Bits	Name	Description
31 : 16	GCMODULEPOWERCONTROLS_TURN_OFF_COUNTER	Counter value for clock gating the module if the module is idle for this amount of clock cycles. Default Value: 0x0014
15 : 8	GCMODULEPOWERCONTROLS_RESERVED_2	Reserved Default Value: 0x00
7 : 4	GCMODULEPOWERCONTROLS_TURN_ON_COUNTER	Number of clock cycles to wait after turning on the clock: 0-15 cycles Default Value: 0x2
3	GCMODULEPOWERCONTROLS_RESERVED_1	Reserved Default Value: 0x0
2	GCMODULEPOWERCONTROLS_DISABLE_STARVE_MODULE_CLOCK_GATING	Disables module level clock gating for starve/idle condition:0=module clock can be turned off for starve/idle condition 1=module clock can not be turned off for starve/idle condition Default Value: 0x0

27.1.17 GFXSS_GPU_GCNANO_GCMODULEPOWERCONTROLS (continued)

1	GCMODULEPOWER-CONTROLS_DIS-ABLE_STALL_MODULE_CLOCK_GATING	Disables module level clock gating for stall condition: 0=module clock can be turned off for stall condition 1=module clock can not be turned off for stall condition Default Value: 0x0
0	GCMODULEPOWER-CONTROLS_ENABLE_-MODULE_CLOCK_GATING	0=module clock always on 1=If the corresponding bit in GCMODULEPOWERMODULECONTROL is configured as 0, the clock will be turned off when the module is not working. Default Value: 0x0

27.1.18 GFXSS_GPU_GCNANO_GCMODULEPOWERMODULECONTROL

Description: Module Power Module Control Register. Module level control register.

Address: 0x44800904

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW					RW	RW	RW
HW Access	R					R	R	R
Name	GCMODULEPOWERMODULECONTROL_RESERVED_2 [7:3]					GCMODULEPOWERMODULECONTROL_DISABLE_MODULE_CLOCK_GATING_PE	GCMODULEPOWERMODULECONTROL_RESERVED_1	GCMODULEPOWERMODULECONTROL_DISABLE_MODULE_CLOCK_GATING_FE

Bits	15	14	13	12	11	10	9	8
SW Access	R			R	RW	RW	RW	RW
HW Access	W			W	R	R	R	R
Name	GCMODULEPOWERMODULECONTROL_RESERVED_4 [15:13]			GCMODULEPOWERMODULECONTROL_DISABLE_MODULE_CLOCK_GATING_FLEXA	GCMODULEPOWERMODULECONTROL_DISABLE_MODULE_CLOCK_GATING_TS	GCMODULEPOWERMODULECONTROL_RESERVED_3	GCMODULEPOWERMODULECONTROL_DISABLE_MODULE_CLOCK_GATING_IM	GCMODULEPOWERMODULECONTROL_DISABLE_MODULE_CLOCK_GATING_VG

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	GCMODULEPOWERMODULECONTROL_RESERVED_4 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCMODULEPOWERMODULECONTROL_RESERVED_4 [31:24]							

Bits	Name	Description
31 : 13	GCMODULEPOWERMODULECONTROL_RESERVED_4	Reserved Default Value: 0x00000
12	GCMODULEPOWERMODULECONTROL_DISABLE_MODULE_CLOCK_GATING_FLEXA	Reserved Default Value: 0x0

27.1.18 GFXSS_GPU_GCNANO_GCMODULEPOWERMODULECONTROL (continued)

11	GCMODULEPOWER-MODULECONTROL_DIS-ABLE_MODULE_CLOCK _GATING_TS	Disables module level clock gating for TS(Tessellation Engine): 0=the module clock can be turned off when the module not working 1=the module clock always on Default Value: 0x0
10	GCMODULEPOWER-MODULECONTROL_RE-SERVED_3	Reserved Default Value: 0x0
9	GCMODULEPOWER-MODULECONTROL_DIS-ABLE_MODULE_CLOCK _GATING_IM	Disables module level clock gating for IM(Image Engine): 0=the module clock can be turned off when the module not working 1=the module clock always on Default Value: 0x0
8	GCMODULEPOWER-MODULECONTROL_DIS-ABLE_MODULE_CLOCK _GATING_VG	Disables module level clock gating for VG(Vector Graphics Engine): 0=the module clock can be turned off when the module not working 1=the module clock always on Default Value: 0x0
7 : 3	GCMODULEPOWER-MODULECONTROL_RE-SERVED_2	Reserved Default Value: 0x00
2	GCMODULEPOWER-MODULECONTROL_DIS-ABLE_MODULE_CLOCK _GATING_PE	Disables module level clock gating for PE(Pixel Engine) : 0=the module clock can be turned off when the module not working 1=the module clock always on Default Value: 0x0
1	GCMODULEPOWER-MODULECONTROL_RE-SERVED_1	Reserved Default Value: 0x0
0	GCMODULEPOWER-MODULECONTROL_DIS-ABLE_MODULE_CLOCK _GATING_FE	Disables module level clock gating for FE(Fetch Engine): 0=the module clock can be turned off when the module not working 1=the module clock always on Default Value: 0x0

27.1.19 GFXSS_GPU_GCNANO_GCMODULEPOWERMODULESTATUS

Description: Module Power Module Status Register. Module level control status.

Address: 0x44800908

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R					R	R	R
HW Access	W					W	W	W
Name	GCMODULEPOWERMODULESTATUS_RESERVED_2 [7:3]					GCMODULEPOWERMODULESTATUS_MODULE_CLOCK_GATED_PE	GCMODULEPOWERMODULESTATUS_RESERVED_1	GCMODULEPOWERMODULESTATUS_MODULE_CLOCK_GATED_FE

Bits	15	14	13	12	11	10	9	8
SW Access	R			R	R	Reserved	R	R
HW Access	W			W	W	Reserved	W	W

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCMODULEPOWERMODULESTATUS_RESERVED_3 [31:24]							

Bits	Name	Description
31 : 13	GCMODULEPOWERMODULESTATUS_RESERVED_3	Reserved Default Value: 0x00000
12	GCMODULEPOWERMODULESTATUS_MODULE_CLOCK_GATED_FLEXA	Reserved Default Value: 0x0
11	GCMODULEPOWERMODULESTATUS_MODULE_CLOCK_GATED_TS	Module level clock gating is ON for TS: 0=TS module clock is turned on. 1=TS module clock is turned off. Default Value: 0x0
9	GCMODULEPOWERMODULESTATUS_MODULE_CLOCK_GATED_IM	Module level clock gating is ON for IM: 0=IM module clock is turned on. 1=IM module clock is turned off. Default Value: 0x0

27.1.19 GFXSS_GPU_GCNANO_GCMODULEPOWERMODULESTATUS (continued)

8	GCMODULEPOWER-MODULESTATUS_MOD-ULE_CLOCK_GATED_VG	Module level clock gating is ON for VG: 0=VG module clock is turned on. 1=VG module clock is turned off. Default Value: 0x0
7 : 3	GCMODULEPOWER-MODULESTATUS_RE-SERVED_2	Reserved Default Value: 0x00
2	GCMODULEPOWER-MODULESTATUS_MOD-ULE_CLOCK_GATED_PE	Module level clock gating is ON for PE: 0=PE module clock is turned on. 1=PE module clock is turned off. Default Value: 0x0
1	GCMODULEPOWER-MODULESTATUS_RE-SERVED_1	Reserved Default Value: 0x0
0	GCMODULEPOWER-MODULESTATUS_MOD-ULE_CLOCK_GATED_FE	Module level clock gating is ON for FE: 0=FE module clock is turned on. 1=FE module clock is turned off. Default Value: 0x0

27.1.20 GFXSS_GPU_GCNANO_AQMEMORYDEBUG

Description: Memory Debug Register.

Address: 0x44800C14

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	AQMEMORYDEBUG_MAX_OUTSTANDING_READS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	AQMEMORYDEBUG_RESERVED_1 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW					R		RW
HW Access	R					W		R
Name	AQMEMORYDEBUG_RESERVED_4 [23:19]					AQMEMORYDEBUG_RESERVED_3 [18:17]		AQMEMORYDEBUG_RESERVED_2

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	AQMEMORYDEBUG_RESERVED_5 [31:24]							

Bits	Name	Description
31 : 24	AQMEMORYDEBUG_RESERVED_5	Reserved Default Value: 0x00
23 : 19	AQMEMORYDEBUG_RESERVED_4	Reserved Default Value: 0x00
18 : 17	AQMEMORYDEBUG_RESERVED_3	Reserved Default Value: 0x0
16	AQMEMORYDEBUG_RESERVED_2	Reserved Default Value: 0x0
15 : 8	AQMEMORYDEBUG_RESERVED_1	Reserved Default Value: 0x00
7 : 0	AQMEMORYDEBUG_MAX_OUTSTANDING_READS	Limits the total number of outstanding read requests. Default Value: 0x00

27.1.21 GFXSS_GPU_GCNANO_AQREGISTERTIMINGCONTROL

Description: Timing Control Register.

Address: 0x44800C2C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	AQREGISTERTIMINGCONTROL_FOR_RF1P [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	AQREGISTERTIMINGCONTROL_RESERVED [23:21]			AQREGISTERTIMINGCONTROL_POWER_DOWN	AQREGISTERTIMINGCONTROL_FAST_WTC [19:18]		AQREGISTERTIMINGCONTROL_FAST_RTC [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	AQREGISTERTIMINGCONTROL_RESERVED [31:24]							

Bits	Name	Description
31 : 21	AQREGISTERTIMINGCONTROL_RESERVED	Reserved Default Value: 0x000
20	AQREGISTERTIMINGCONTROL_POWER_DOWN	Reserved Default Value: 0x0
19 : 18	AQREGISTERTIMINGCONTROL_FAST_WTC	Reserved Default Value: 0x0
17 : 16	AQREGISTERTIMINGCONTROL_FAST_RTC	Reserved Default Value: 0x3
15 : 8	AQREGISTERTIMINGCONTROL_FOR_RF2P	Reserved Default Value: 0x00
7 : 0	AQREGISTERTIMINGCONTROL_FOR_RF1P	Reserved Default Value: 0x00

27.1.22 GFXSS_GPU_GCNANO_GCREGFETCHADDRESS

Description: Fetch Command Buffer Base Address Register. Address of the command buffer. The address must be 64-byte aligned.

Address: 0x44800D00

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW						RW	
HW Access	R						R	
Name	GCREGFETCHADDRESS_ADDRESS [7:2]						GCREGFETCHAD-DRESS_TYPE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	GCREGFETCHADDRESS_ADDRESS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	GCREGFETCHADDRESS_ADDRESS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	GCREGFETCHADDRESS_ADDRESS [31:24]							

Bits	Name	Description
31 : 2	GCREGFETCHAD-DRESS_ADDRESS	fetch address Default Value: 0x00000000
1 : 0	GCREGFETCHAD-DRESS_TYPE	Type of address. Local is reserved for now. Default Value: 0x0 **0x0: SYSTEM :** (none) **0x2: VIRTUAL :** (none) **0x1: LOCAL :** (none)

27.1.23 GFXSS_GPU_GCNANO_GCREGFETCHCONTROL

Description: Fetch Control Register. Writing a non-zero value to this register starts the fetch engine. The FE will start fetching 64-bit commands and data starting at the address specified by the gcregFetchAddress register. Make sure this count is large enough to fetch the END command, otherwise the FE will wait until more data is coming.

Address: 0x44800D04

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	GCREGFETCHCONTROL_COUNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	GCREGFETCHCONTROL_COUNT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R			RW				
HW Access	W			R				
Name	GCREGFETCHCONTROL_RESERVED [23:21]			GCREGFETCHCONTROL_COUNT [20:16]				

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCREGFETCHCONTROL_RESERVED [31:24]							

Bits	Name	Description
31 : 21	GCREGFETCHCON-TROL_RESERVED	Reserved Default Value: 0x000
20 : 0	GCREGFETCHCON-TROL_COUNT	Number of 64-bit words to fetch. 21 bits is enough for 16 MB. Default Value: 0x000000

27.1.24 GFXSS_GPU_GCNANO_GCREGCURRENTFETCHADDRESS

Description: Current Fetch Command Address Register. Debugging register that defines the current address the FE is fetching data from. READ ONLY.

Address: 0x44800D08

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	GCREGCURRENTFETCHADDRESS_ADDRESS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R

HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	IP enable bit. When disabled (value 0), the functional state of the DCNano core is reset and its clock input gated. Access to MMIO of the core results in an AHB error response. Note, that the effect of this bit is delayed (see STATUS.CORE_RST). The core must be idle (no outstanding or pending AXI transactions) before clearing this bit. Default Value: 0

27.1.26 GFXSS_DC_MXDC_CLK_CTL

Description: Clock control.

Address: 0x44801004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		Reserved					RW
HW Access	R		Reserved					R
Name	CLK_DIV [7:6]		Reserved [5:1]					CLK_CORE

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	CLK_DIV [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	CLK_DIV [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	CLK_DIV [31:24]							

Bits	Name	Description
31 : 6	CLK_DIV	Setup of the fractional divider to generate clk_hf_div. In DPI mode the output is the pixel clock. In DBI Type C mode it's two times the serial clock. Format of programmed value is unsigned fix-point 10.16. It must not be set to a value smaller than 2.0 (= 0x020000). It can be set to 0, which results in no clock being generated. Change only while CTL.ENABLED is off. Default Value: 0x80000
0	CLK_CORE	Setup for DC core and AXI clock. Must only be set to 0 if clk_hf is not faster than 200 MHz. Change only while CTL.ENABLED is off. Default Value: 1 **0x0: HF_DIV1 :** Core clock is clk_hf. **0x1: HF_DIV2 :** Core clock is clk_hf divided by 2.

27.1.27 GFXSS_DC_MXDC_IO_CTL

Description: IO enable control.

Address: 0x44801008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						SPI_S-DOEN	SPI_EN-ABLED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							DPI_EN-ABLED

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [23:17]							DBI_EN-ABLED

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	DBI_ENABLED	Enable control for IO cells in DBI Type A/B mode (1 = enabled). CTL.ENABLED must also be 1. Default Value: 1
8	DPI_ENABLED	Enable control for IO cells in DPI mode (1 = enabled). CTL.ENABLED must also be 1. Default Value: 1
1	SPI_SDOEN	Controls if the enable for spi_dout is separately controlled by the DCNano core with dbiTypecS-doEn signal (0 = yes, 1 = no). Field has no effect if SPI_ENABLED is 0. Default Value: 1
0	SPI_ENABLED	Enable control for IO cells in DBI Type C mode (1 = enabled). CTL.ENABLED must also be 1. Default Value: 1

27.1.28 GFXSS_DC_MXDC_STATUS

Description: IP status.

Address: 0x4480100C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							CORE_RST

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CORE_RST	Reset state of the DCNano core (1 = in reset). This state is delayed to GFXSS_DC reset. After reset de-activation it has to be checked for value 0 before the core can be used. After activation it has to be checked for value 1 before turning off the external clk_hf source. Default Value: 1

27.1.29 GFXSS_DC_MXDC_INTR

Description: Interrupt status.

Address: 0x44801010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1C
HW Access	Reserved							RW1SC
Name	Reserved [7:1]							CORE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				RW1C	RW1C	RW1C	RW1C
HW Access	Reserved				RW1SC	RW1SC	RW1SC	RW1SC
Name	Reserved [15:12]				ADDR3	ADDR2	ADDR1	ADDR0

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW1C
HW Access	Reserved							RW1SC
Name	Reserved [23:17]							RLAD_ER-ROR

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	RLAD_ERROR	The RLAD decoder has entered fail state (see RLAD_STATUS register). Writing a '1' to this field will reset the bit. Default Value: 0
11	ADDR3	Read access to INT_ADDR3 completed. Writing a '1' to this field will reset the bit. Default Value: 0
10	ADDR2	Read access to INT_ADDR2 completed. Writing a '1' to this field will reset the bit. Default Value: 0
9	ADDR1	Read access to INT_ADDR1 completed. Writing a '1' to this field will reset the bit. Default Value: 0
8	ADDR0	Read access to INT_ADDR0 completed. Writing a '1' to this field will reset the bit. Default Value: 0
0	CORE	DCNano core has signalled an interrupt. Writing a '1' to this field will reset the bit. Interrupt status inside the core is not affected by this. Default Value: 0

27.1.30 GFXSS_DC_MXDC_INTR_SET

Description: Interrupt set bits.

Address: 0x44801014

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [7:1]							CORE_SET

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				RW1S	RW1S	RW1S	RW1S
HW Access	Reserved				A	A	A	A
Name	Reserved [15:12]				ADDR3_SET	ADDR2_SET	ADDR1_SET	ADDR0_SET

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [23:17]							RLAD_ERROR_SET

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	RLAD_ERROR_SET	Write this field with '1' to set corresponding INTR field (a write of '0' has no effect). Default Value: 0
11	ADDR3_SET	Write this field with '1' to set corresponding INTR field (a write of '0' has no effect). Default Value: 0
10	ADDR2_SET	Write this field with '1' to set corresponding INTR field (a write of '0' has no effect). Default Value: 0
9	ADDR1_SET	Write this field with '1' to set corresponding INTR field (a write of '0' has no effect). Default Value: 0
8	ADDR0_SET	Write this field with '1' to set corresponding INTR field (a write of '0' has no effect). Default Value: 0
0	CORE_SET	Write this field with '1' to set corresponding INTR field (a write of '0' has no effect). Default Value: 0

27.1.31 GFXSS_DC_MXDC_INTR_MASK

Description: Interrupt mask bits.

Address: 0x44801018

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							CORE_MASK

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				RW	RW	RW	RW
HW Access	Reserved				R	R	R	R
Name	Reserved [15:12]				ADDR3_MASK	ADDR2_MASK	ADDR1_MASK	ADDR0_MASK

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [23:17]							RLAD_ERROR_MASK

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	RLAD_ERROR_MASK	Mask for corresponding field in INTR register. Default Value: 0
11	ADDR3_MASK	Mask for corresponding field in INTR register. Default Value: 0
10	ADDR2_MASK	Mask for corresponding field in INTR register. Default Value: 0
9	ADDR1_MASK	Mask for corresponding field in INTR register. Default Value: 0
8	ADDR0_MASK	Mask for corresponding field in INTR register. Default Value: 0
0	CORE_MASK	Mask for corresponding field in INTR register. Default Value: 0

27.1.32 GFXSS_DC_MXDC_INTR_MASKED

Description: Interrupt masked bits.

Address: 0x4480101C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							CORE_MASKED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				R	R	R	R
HW Access	Reserved				W	W	W	W
Name	Reserved [15:12]				ADDR3_MASKED	ADDR2_MASKED	ADDR1_MASKED	ADDR0_MASKED

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [23:17]							RLAD_ERROR_MASKED

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	RLAD_ERROR_MASKED	Logical AND of corresponding INTR and INTR_MASK fields. Default Value: 0
11	ADDR3_MASKED	Logical AND of corresponding INTR and INTR_MASK fields. Default Value: 0
10	ADDR2_MASKED	Logical AND of corresponding INTR and INTR_MASK fields. Default Value: 0
9	ADDR1_MASKED	Logical AND of corresponding INTR and INTR_MASK fields. Default Value: 0
8	ADDR0_MASKED	Logical AND of corresponding INTR and INTR_MASK fields. Default Value: 0
0	CORE_MASKED	Logical AND of corresponding INTR and INTR_MASK fields. Default Value: 0

27.1.33 GFXSS_DC_MXDC_ADDR0_INT

Description: Address 0 for interrupt generation.

Address: 0x44801020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDR0_INT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDR0_INT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	ADDR0_INT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDR0_INT [31:24]							

Bits	Name	Description
31 : 0	ADDR0_INT	A completed read access to this memory address will set INTR.ADDR0. The shadow values of all address fields are copied into the active configuration when a display frame has completed and GCREGPANELCONTROL_VALID was set before in DCNANO. Default Value: 0

27.1.34 GFXSS_DC_MXDC_ADDR1_INT

Description: Address 1 for interrupt generation.

Address: 0x44801024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDR1_INT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDR1_INT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	ADDR1_INT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDR1_INT [31:24]							

Bits	Name	Description
31 : 0	ADDR1_INT	A completed read access to this memory address will set INTR.ADDR1. Default Value: 0

27.1.35 GFXSS_DC_MXDC_ADDR2_INT

Description: Address 2 for interrupt generation.

Address: 0x44801028

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDR2_INT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDR2_INT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	ADDR2_INT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDR2_INT [31:24]							

Bits	Name	Description
31 : 0	ADDR2_INT	A completed read access to this memory address will set INTR.ADDR2. Default Value: 0

27.1.36 GFXSS_DC_MXDC_ADDR3_INT

Description: Address 3 for interrupt generation.

Address: 0x4480102C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	ADDR3_INT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	ADDR3_INT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	ADDR3_INT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	ADDR3_INT [31:24]							

Bits	Name	Description
31 : 0	ADDR3_INT	A completed read access to this memory address will set INTR.ADDR3. Default Value: 0

27.1.37 GFXSS_DC_MXDC_RLAD_CTL

Description: Control options for the RLAD decoder.

Address: 0x44801040

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							RLAD_ENABLE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [15:10]						RLAD_LAYER [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 8	RLAD_LAYER	ID of the display layer to decode (0 = reserved, 1 = video, 2 = overlay 0, 3 = overlay 1). Default Value: 0
0	RLAD_ENABLE	When set to 0, the RLAD decoder is disabled. It's clock tree is gated and the functional logic reset. All RLAD configuration fields, including this enable field, are shadowed. The shadow values are copied into the active configuration when a display frame has completed and GCREGPANELCONTROL_VALID was set before in DCNANO. Once the load of shadows has been initiated by setting the VALID flag, the RLAD configuration fields must not be changed again before the frame complete interrupt. Beside inconsistent setup for a display frame, this can lead to data corruption of the active configuration. Default Value: 0

27.1.38 GFXSS_DC_MXDC_RLAD_IMG

Description: Properties of the uncompressed image.

Address: 0x44801044

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	RLAD_WIDTH [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW		Reserved		RW			
HW Access	R		Reserved		R			
Name	RLAD_HEIGHT [15:14]		Reserved [13:12]		RLAD_WIDTH [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	RLAD_HEIGHT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW				Reserved		RW	
HW Access	R				Reserved		R	
Name	RLAD_FORMAT [31:28]				Reserved [27:26]		RLAD_HEIGHT [25:24]	

Bits	Name	Description
31 : 28	RLAD_FORMAT	Color format of the uncompressed image. The RLAD block converts the configured format after decompression to ARGB8888, which is the format the DC layer has to be configured for (in linear order and with component swizzle ARGB). Alpha value is set to 255 for RGB and GRAY formats. Default Value: 4 **0x1: ARGB4444 :** **0x2: ARGB1555 :** **0x3: RGB565 :** **0x4: ARGB8888 :** **0x5: RGB888 :** **0x6: RGB666 :** **0x7: RGB444 :** **0x8: GRAY8 :** **0x9: GRAY6 :**

27.1.38 GFXSS_DC_MXDC_RLAD_IMG (continued)

0xa: GRAY4 :

25 : 14	RLAD_HEIGHT	Height of the image in number of lines minus one. The DC layer must be setup for the same height. Default Value: 0
11 : 0	RLAD_WIDTH	Width of the image in number of pixels minus one. The DC layer must be setup for the same width. Default Value: 0

27.1.39 GFXSS_DC_MXDC_RLAD_ENC

Description: Configuration of the encoder that compressed the image.

Address: 0x44801048

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	
HW Access	Reserved						R	
Name	Reserved [7:2]						RLAD_MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW				RW			
HW Access	R				R			
Name	RLAD_BITS_G [23:20]				RLAD_BITS_R [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	RW				RW			
HW Access	R				R			
Name	RLAD_BITS_A [31:28]				RLAD_BITS_B [27:24]			

Bits	Name	Description
31 : 28	RLAD_BITS_A	Max number of alpha channel bits (used for RLAD modes only). Default Value: 8
27 : 24	RLAD_BITS_B	Max number of blue channel bits (used for RLAD modes only). Default Value: 8
23 : 20	RLAD_BITS_G	Max number of green channel bits (used for RLAD modes only). Default Value: 8
19 : 16	RLAD_BITS_R	Max number of red channel bits (used for RLAD modes only). Default Value: 8
1 : 0	RLAD_MODE	Encoding mode. Default Value: 0 **0x0: RLAD :** Run-Length Adaptive Dithering (lossy). **0x1: RLAD_UNIFORM :** RLAD with uniform package size (less efficient, but can force a consistent read bandwidth if needed). **0x2: RLA :** Run-Length Adaptive (lossless).

27.1.39 GFXSS_DC_MXDC_RLAD_ENC (continued)

0x3: RL :

Standard Run-Length (lossless).

27.1.40 GFXSS_DC_MXDC_RLAD_BUF0

Description: Properties of the compressed image data buffer.

Address: 0x4480104C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	RLAD_ADDRESS	Reserved [6:0]						

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	RLAD_ADDRESS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	RLAD_ADDRESS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	RLAD_ADDRESS [31:24]							

Bits	Name	Description
31 : 7	RLAD_ADDRESS	Base address of the encoded image buffer in multiple of 128 bytes. The DC layer must be configured to the same base address and with the smallest possible stride value (aligned to 128 bytes). Default Value: 0

27.1.41 GFXSS_DC_MXDC_RLAD_BUF1

Description: Properties of the compressed image data buffer.

Address: 0x44801050

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	RLAD_SIZE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	RLAD_SIZE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	RLAD_SIZE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved			RW				
HW Access	Reserved			R				
Name	Reserved [31:29]			RLAD_SIZE [28:24]				

Bits	Name	Description
28 : 0	RLAD_SIZE	Size of the the encoded image in number of 32-bit words minus one. The buffer must be readable to the subsequent 128 bytes boundary. Default Value: 0

27.1.42 GFXSS_DC_MXDC_RLAD_STATUS

Description: RLAD decoder status.

Address: 0x44801054

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R		
HW Access	Reserved					W		
Name	Reserved [7:3]					RLAD_FAILED [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2 : 0	RLAD_FAILED	The fail state is activated in case an error condition has been detected. This will also trigger the RLAD_ERROR interrupt. In that state the RLAD decoding process is stopped and the DC will only read null data. No more read accesses to the memory buffer are generated. The fail state is quit by disabling the DC via CTL.ENABLED. Default Value: 0 **0x0: OFF :** No fail state (= normal operation). **0x1: AXI_ERROR :** An AXI error response was received when reading compressed image data. **0x2: BUF_TOO_SMALL :** The RLAD_SIZE setting is inconsistent with the compressed image data (image decompression not complete when end of buffer was reached). **0x3: BUF_TOO_LARGE :** The RLAD_SIZE setting is inconsistent with the compressed image data (image decompression completed before end of buffer was reached).

27.1.42 GFXSS_DC_MXDC_RLAD_STATUS (continued)

0x4: DC_INVALID_SIZE :

The DC was reading the first pixel of a frame when it was not expected. This means an inconsistent setup of RLAD and DC configuration.

0x5: DC_INVALID_FORMAT :

The DC was reading data with an unexpected burst length. This means an invalid buffer format was configured.

27.1.43 GFXSS_DC_MXDC_IPIDENTIFIER

Description: GFXSS IP and desig release identification (with DC, GPU and MIPIDSI).

Address: 0x44801070

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		R		Reserved			R
HW Access	Reserved		W		Reserved			W
Name	Reserved [7:6]		IPNAME [5:4]		Reserved [3:1]			IPPLAT-FORM

Bits	15	14	13	12	11	10	9	8
SW Access	R				R			
HW Access	W				W			
Name	IPVERMINOR [15:12]				IPVERMAJOR [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R				Reserved		R	
HW Access	W				Reserved		W	
Name	IPRELEASE [23:20]				Reserved [19:18]		IPMATURITY [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved			R	R			
HW Access	Reserved			W	W			
Name	Reserved [31:29]			IPIMPLE-MENTA-TION	IPRELEASE [27:24]			

Bits	Name	Description
28	IPIMPLEMENTATION	Implementation type. Default Value: Undefined **0x0: RTL :** Logic design for FPGA and ASIC synthesis.
27 : 20	IPRELEASE	Release ID. This is independently set for each implementation type. The value starts with 0 and is increased for every new release of a an IP project, which is defined by IPName, IPVERMAJOR and IPVERMINOR. Default Value: Undefined
17 : 16	IPMATURITY	IP Maturity Status with Chip Integration Cycle targets (CIC). This is independently set for each implementation type. Default Value: Undefined **0x0: NONE :** Undefined. **0x1: CPR :** Implementation incomplete (for CIC Physical Readiness Review).

27.1.43 GFXSS_DC_MXDC_IPIDENTIFIER (continued)

		0x2: CMR : Implementation complete (for CIC Mock Review). **0x3: CFR :** Verification complete (for CIC Final Handoff Review).
15 : 12	IPVERMINOR	Minor IP Version Number. Default Value: Undefined
11 : 8	IPVERMAJOR	Major IP Version Number. Default Value: Undefined
5 : 4	IPNAME	Name of IP family. Default Value: Undefined **0x0: GFXSS :** Graphics Subsystem with Display Controller for Low Power applications.
0	IPPLATFORM	Name of SOC Platform. Default Value: Undefined **0x0: MXS22_S22 :** MXS22 Base Variant.

27.1.44 GFXSS_DC_DCNANO_GCREGDCCHIPREV

Description: Chip Revision Register. Shows the revision for the chip in BCD. This register has no set reset value. It varies with the implementation. READ ONLY.

Address: 0x44801800

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPREV_REV [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPREV_REV [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPREV_REV [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPREV_REV [31:24]							

Bits	Name	Description
31 : 0	GCREGDC-CHIPREV_REV	Revision. The reset value for this field is subject to change and may be ignored during test. Default Value: Undefined

27.1.45 GFXSS_DC_DCNANO_GCREGDCCHIPDATE

Description: Chip Date Register. Shows the release date for the IP in YYYYMMDD (year, month. day) format. This register has no set reset value. It varies with the implementation. READ ONLY.

Address: 0x44801804

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPDATE_DATE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPDATE_DATE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPDATE_DATE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPDATE_DATE [31:24]							

Bits	Name	Description
31 : 0	GCREGDCCHIPDATE_-DATE	Date. The reset value for this field changes per release and may be ignored during test. You can read the accurate value from the RTL file because the actual value may be later than the document release time. Default Value: Undefined

27.1.46 GFXSS_DC_DCNANO_GCREGDCCHIPPATCHREV

Description: Patch Revision Register. Patch revision level for the chip. READ ONLY.

Address: 0x44801808

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPPATCHREV_PATCH_REV [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPPATCHREV_PATCH_REV [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPPATCHREV_PATCH_REV [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCREGDCCHIPPATCHREV_PATCH_REV [31:24]							

Bits	Name	Description
31 : 0	GCREGDCCHIP-PATCHREV_-PATCH_REV	Patch revision. The reset value for this field changes per release and may be ignored during test. You can read the accurate value from the RTL file because the actual value may be later than the document release time. Default Value: Undefined

27.1.47 GFXSS_DC_DCNANO_GCREGDCPRODUCTID

Description: Product Identification Register. READ ONLY.

Address: 0x4480180C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	GCREGDCPRODUCTID_PRODUCT_ID [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	GCREGDCPRODUCTID_PRODUCT_ID [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	GCREGDCPRODUCTID_PRODUCT_ID [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	GCREGDCPRODUCTID_PRODUCT_ID [31:24]							

Bits	Name	Description
31 : 0	GCREGDCPRODUC-TID_PRODUCT_ID	Product ID. Bits 3:0 contain Product GRADE_LEVEL. 1 indicates level is Nano. Bits 23:4 contain Product NUM, product number. None for DCNano; 8000 for DC8000 Series. Bits 27:24 contain Product TYPE. 2 indicates Display Controller. Default Value: 0x02080001

27.1.48 GFXSS_DC_DCNANO_GCREGFRAMEBUFFERCONFIG

Description: Frame Buffer Configuration Register. Frame Buffer and Timing control. NOTE.. This register is double buffered.

Address: 0x44801824

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW	Reserved	RW	RW

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	GCREGPANELCONTROL_BACK_PRESSURE_DISABLE	Interface of DPI Default Value: 0x0 **0x0: NO :** (none) **0x1: YES :** (none)
0	GCREGPANELCONTROL_VALID	The valid field defines whether we can copy a new set of registers at the next VBLANK or not. This ensures a frame will always start with a valid working set if this register is programmed last, which reduces the need for SW to wait for the start of a VBLANK signal in order to ensure all states are loaded before the next VBLANK. Default Value: 0x0 **0x0: PENDING :** (none)

27.1.89 GFXSS_DC_DCNANO_GCREGPANELCONTROL (continued)

0x1: WORKING :

(none)

27.1.90 GFXSS_DC_DCNANO_GCREGPANELFUNCTION

Description: Panel function Register. NOTE.. This register is double buffered.

Address: 0x448018F0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW	RW	RW
HW Access	Reserved					R	R	R
Name	Reserved [7:3]					GCREG-PANEL-FUNCTION_DITHER	GCREG-PANEL-FUNCTION_GAMMA	GCREG-PANEL-FUNCTION_OUTPUT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2	GCREGPANELFUNC-TION_DITHER	Enabling dithering allows R8G8B8 modes to show better on panels with less bits-per-pixel. NOTE: This field is double buffered. Default Value: 0x0 **0x0: DISABLED :** (none) **0x1: ENABLED :** (none)
1	GCREGPANELFUNC-TION_GAMMA	When Gamma is enabled, the R, G, and B channels will be routed through the Gamma LUT to perform gamma correction. NOTE: This field is double buffered. Default Value: 0x0 **0x0: DISABLED :** (none) **0x1: ENABLED :** (none)

27.1.90 GFXSS_DC_DCNANO_GCREGPANELFUNCTION (continued)

0	GCREGPANELFUNC-TION_OUTPUT	When Output is enabled, pixels will be displayed. When Output is disabled, all pixels will be black. This allows a panel to have correct timing but without any pixels. NOTE: This field is double buffered. Default Value: 0x0 **0x0: DISABLED :** (none) **0x1: ENABLED :** (none)

27.1.91 GFXSS_DC_DCNANO_GCREGPANELWORKING

Description: Register to trigger Display Controller.

Address: 0x448018F4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							W
HW Access	Reserved							R
Name	Reserved [7:1]							GCREG-PANEL-WORKING_WORKING

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved

HW Access	R							
Name	GCREGCURSORFOREGROUND_RED [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 16	GCREGCURSORFORE-GROUND_RED	Red value. NOTE: This field is double buffered. Default Value: 0x00
15 : 8	GCREGCURSORFORE-GROUND_GREEN	Green value. NOTE: This field is double buffered. Default Value: 0x00
7 : 0	GCREGCURSORFORE-GROUND_BLUE	Blue value. NOTE: This field is double buffered. Default Value: 0x00

27.1.105 GFXSS_DC_DCNANO_GCREGDISPLAYINTR

Description: Display Interrupt Register. This is the interrupt register for the Display. This register will automatically clear after a read. The interrupt bit is set when the current frame buffer is used up. The interrupt signal will be pulled up only when the interrupt enable bit in register gcregDisplayIntrEnable is enabled. READ ONLY. When the access comes from a debugger (HMASTER[0] == 1), the clear by read function is disabled.

Address: 0x44801938

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	W		Reserved					
HW Access	R		Reserved					
Name	GCREGDBICMD_DBI_COMMANDFLAG [31:30]		Reserved [29:24]					

Bits	Name	Description

31 : 30	GCREGDBICMD_DBI_COMMANDFLAG	DBI command flag.
		Default Value: 0x0
		0x0: ADDRESS :
		//DBI_COMMAND_WORD will contain an address.
		0x1: WRITE_MEM_START :
		//Starts a write. Contents of DBI_COMMAND_WORD are ignored.
		0x2: PARAMETER_OR_DATA :
		//DBI_COMMAND_WORD will contain a parameter or data.

15 : 0	GCREGDBICMD_DBI_COMMAND_WORD	The type of data contained in this word is specified using DBI_COMMANDFLAG[bits 31:30]. For Type C Options 1 and 2: DBI_COMMAND_WORD[8] is used to indicate the polarity of D/CX. DBI_COMMAND_WORD[8] = 0 indicates DBI_COMMAND_WORD[7:0] is COMMAND WORD. DBI_COMMAND_WORD[8] = 1 indicates DBI_COMMAND_WORD[7:0] is DATA WORD. Default Value: 0x0000

27.1.112 GFXSS_DC_DCNANO_GCREGDPICONFIG

Description: DPI Configuration Register. The configuration register for DPI output. NOTE.. This register is double buffered.

Address: 0x44801954

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					RW		
HW Access	Reserved					R

HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
2 : 0	GCREGDPICONFIG_DPI_DATA_FORMAT	DPI interface data format. Refer to DPI specification section for Interface Color Coding' for detail. NOTE: This field is double buffered. Default Value: 0x5 **0x0: D16CFG1 :** (none) **0x1: D16CFG2 :** (none) **0x2: D16CFG3 :** (none) **0x3: D18CFG1 :** (none) **0x4: D18CFG2 :** (none)

27.1.112 GFXSS_DC_DCNANO_GCREGDPICONFIG (continued)

0x5: D24 :

(none)

27.1.113 GFXSS_DC_DCNANO_GCREGDBITYPECCFG

Description: DBI Type C Timing Control Register. DBI Type C write timing definition.

Address: 0x44801958

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	GCREGDBITYPECCFG_SCL_TWRL [7:4]				GCREGDBITYPECCFG_TAS [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	RW				RW			
HW Access	R				R			
Name	GCREGDBITYPECCFG_SCL_TWRH [15:12]				GCREGDBITYPECCFG_SCL_TWRL [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [23:20]				GCREGDBITYPECCFG_SCL_TWRH [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
19 : 12	GCREGDBITYPECCF-G_SCL_TWRH	Divide counter for Twrh (SCL H duration (write)). Specifies how many sdaClk cycles in Twrh phase. SCL Twrh means number of DBI_AC_TIME_UNIT of sdaClk for scl staying high. This field need to be at least 1. Default Value: 0x00
11 : 4	GCREGDBITYPECCF-G_SCL_TWRL	Divide counter for Twrl (SCL L duration (write)). Specifies how many sdaClk cycles in Twrl phase. SCL Twrl means number of DBI_AC_TIME_UNIT of sdaClk for scl staying low This field needs to be at least 1. Default Value: 0x00
3 : 0	GCREGDBITYPECCFG_-TAS	Divide counter for Tas (address setup time). Specifies how many sdaClk cycles in Tas phase. DCX Tas means number of DBI_AC_TIME_UNIT of sdaClk to be ahead of scl. Only works for DBI TYPE C Option3. Option1/2 will ignore this setting. This field needs to be at least 1. Default Value: 0x0

27.1.114 GFXSS_DC_DCNANO_GCREGDCSTATUS

Description: Display Controller Status Register. READ ONLY.

Address: 0x4480195C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	CLK_CFG	Setup for DPHY configuration clock. Typical value is DIV2. Must only be set to DIV1 if the system clock is not faster than 52 MHz and has a duty cycle of 50%. Change only while IP is disabled. Default Value: 1 **0x0: SYS_DIV1 :** System clock. **0x1: SYS_DIV2 :** System clock divided by 2. Enforces correct duty cycle for the configuration clock.

27.1.145 GFXSS_MIPIDSI_MXMIPIDSI_INTR

Description: Interrupt status bits.

Address: 0x44802010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1C
HW Access	Reserved							RW1SC
Name	Reserved [7:1]							CORE

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW1C
HW Access	Reserved							RW1SC
Name	Reserved [15:9]							DBI_TE

Bits	23	22	21	20	19	18	17	16

HW Access	Reserved							RW1SC
Name	Reserved [23:17]							DPI_HALT

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	DPI_HALT	Command transmission error occurred in DPI mode. A command initiated by the generic slave interface was too large for transmission during the blanking period of the video timing. Writing a '1' to this field resets the bit. Default Value: 0
8	DBI_TE	Tearing Effect was signalled by a display in DBI mode. Writing a '1' to this field resets the bit. Default Value: 0
0	CORE	The DSI Host Controller core has signalled an interrupt. Writing a '1' to this field resets the bit. Interrupt status inside the core is not affected by this. Default Value: 0

27.1.146 GFXSS_MIPIDSI_MXMIPIDSI_INTR_SET

Description: Interrupt set bits.

Address: 0x44802014

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							A
Name	Reserved [7:1]							CORE_SET

HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8	DPI_COLORMODE	Turns on/off the color reduction mode of a MIPI-DSI display in DPI mode. The bit is sampled with the next vertical synchronization pulse, so the video timing of the Display Controller must be active for at least one more frame. Polarity depends on the Host Controller configuration. Default Value: 0
0	DPI_SHUTDOWN	Turns on/off the shutdown mode of a MIPI-DSI display in DPI mode. The bit is sampled with the next vertical synchronization pulse, so the video timing of the Display Controller must be active for at least one more frame. Polarity depends on the Host Controller configuration. Default Value: 0

27.1.150 GFXSS_MIPIDSI_MXMIPIDSI_DBI_CMD

Description: DBI command control.

Address: 0x44802024

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	DBI_RESET	Turns on/off the reset signal for a MIPI-DSI display in DBI mode (low active). The value must only be changed while no DBI command transmission is on-going. Default Value: 1

27.1.151 GFXSS_MIPIDSI_MXMIPIDSI_PHY_FREQ_RANGE

Description: PHY frequency range selection.

Address: 0x44802030

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	CFG_CLK_FREQ_RANGE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved	RW						
HW Access	Reserved	R						
Name	Reserved	HS_FREQ_RANGE [14:8]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
14 : 8	HS_FREQ_RANGE	High-speed Frequency Range Selection. This signal should be set with the D-PHY in power-down and must not change during operation. This signal can be overridden through D-PHY test control registers. Default Value: 0
7 : 0	CFG_CLK_FRE-Q_RANGE	System clock frequency configuration preset. Should be set according to the following equation: cfgclkfreqrange[7:0] = round[(Fcfg_clk(MHz)-17)*4]. Default Value: 0x4C

27.1.152 GFXSS_MIPIDSI_MXMIPIDSI_BIST

Description: BIST control.

Address: 0x44802034

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved					R	R	RW
HW Access	Reserved					W	W	R

Name	WAKEUP-PLL	TEST_STOP_CLK_EN	SHADOW_-CLEAR	PLL_SHAD-OW_CON-TROL	FORCE_LOCK	UP-DATEPLL	CLKSEL [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23	WAKEUPPLL	Wakeuppll signal should be set to 1'b1 during entire operation except when used as part of a relock procedure. This signal has override capability over the PLL boot FSM and allows to trigger a new relock sequence in the system. It is set to 1'b1 during normal operation and pulsed low during at least 1uS during relock sequence (to trigger a new PLL relock). Default Value: 1
22	TEST_STOP_CLK_EN	Stop clock signal for scan dump support. Default Value: 0
21	SHADOW_CLEAR	Set to '1' to clear shadow registers. Default Value: 1
20	PLL_SHADOW_CON-TROL	Selection of PLL configuration mechanism. PLL can be configured through D-PHY or through SoC control and shadow control registers: 0: SoC control and shadow registers 1: D-PHY test control register Default Value: 1
19	FORCE_LOCK	Force lock bit: 0 - according to lock detector-default 1 - lock indication forced Default Value: 0

27.1.155 GFXSS_MIPIDSI_MXMIPIDSI_PLL_TEST_CONFIG2 (continued)

18	UPDATEPLL	Control for PLL operation frequency updated. When exercised, PLL SoC control signals are latched to PLL shadow_registers to set PLL operating frequency. Default Value: 0
17 : 16	CLKSEL	Control of PLL clock output selection. 00 - Clocks stopped 01 - Clock generation 10 - Buffered clkext 11 - Forbidden Default Value: 1
15 : 6	PLL_M	Control of the Feedback Multiplication Ratio M This signal can be overridden through D-PHY test control registers. Default Value: 0
5 : 2	PLL_N	Control of the Input Frequency Division Ratio N This signal can be overridden through D-PHY test control registers. Default Value: 0
1	LOCK_PLL	Lock State Signaling. 0: PLL is not locked 1: PLL is locked Default Value: 0
0	GP_CLK_EN	Enable signal for clkout_gp clock Default Value: 0

27.1.156 GFXSS_MIPIDSI_MXMIPIDSI_PLL_TEST_OBS1

Description: PLL Test Observation bits.

Address: 0x44802044

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R		R					
HW Access	W		W

SW Access	R				R		R	
HW Access	W				W		W	
Name	CPBIAS_CNTRL_OBS [23:20]				GMP_CNTRL_OBS [19:18]		INT_CNTRL_OBS [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved					R		
HW Access	Reserved					W		
Name	Reserved [31:27]					CPBIAS_CNTRL_OBS [26:24]		

Bits	Name	Description
26 : 20	CPBIAS_CNTRL_OBS	Used for SOC observability of the cpbias_cntrl_obs that is controlling the PLL. Default Value: 0
19 : 18	GMP_CNTRL_OBS	Used for SOC observability of the gmp_cntrl_obs that is controlling the PLL. Default Value: 0
17 : 12	INT_CNTRL_OBS	Used for SOC observability of the int_cntrl_obs that is controlling the PLL. Default Value: 0
11 : 6	PROP_CNTRL_OBS	Used for SOC observability of the prop_cntrl_obs that is controlling the PLL. Default Value: 0
5 : 0	VCO_CNTRL_OBS	Output of multiplexer controlled by pll_shadow_control signal. This output signal represents the control signal provided by PHY test control registers or SoC control depending on pll_shadow_control selection. Used for SOC observability of the vco_cntrl_obs that is controlling the PLL Default Value: 0

27.1.157 GFXSS_MIPIDSI_MXMIPIDSI_PLL_TEST_OBS2

Description: PLL Test Observation bits.

Address: 0x44802048

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	W				W			
Name	PLL_M_OBS [7:4]				PLL_N_OBS [3:0]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
12 : 9	RXTRIGGERESC	Received low power internal loopback data on rxtriggeresc. The TX data can be sent by writing to PHY_TX_TRIGGERS register (one hot encoded) Default Value: 0
8 : 1	RXDATAESC	Received low power internal loopback data on rxdataesc. The SW can configure the Generic interface to send short packet with payload size of 2 bytes and the first byte sent would appear on this field, if received successfully. Default Value: 0
0	RXDATAESC_VALID	Indicate that rxdatasec field is valid. SW can poll this bit before reading the rxdatasec field Default Value: 0

27.1.159 GFXSS_MIPIDSI_DWCMIPIDSI_VERSION

Description: Contains the version of the DSI host controller.

Address: 0x44803000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W

Name	CLKMGR_CFG_RESERVED_31_16 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	CLKMGR_CFG_RESERVED_31_16 [31:24]							

Bits	Name	Description
31 : 16	CLKMGR_CFG_RESERVED_31_16	Reserved and read as zero. Default Value: 0x0
15 : 8	CLKMGR_CFG_TO_CLK_DIVISION	This field indicates the division factor for the Time Out clock used as the timing unit in the configuration of high-speed to low-power and low-power to high-speed transition error. Default Value: 0x0
7 : 0	CLKMGR_CFG_TX_ESC_CLK_DIVISION	This field indicates the division factor for the TX Escape clock source (lanebyteclk). The values 0 and 1 stop the TX_ESC clock generation. Default Value: 0x0

27.1.162 GFXSS_MIPIDSI_DWCMIPIDSI_DPI_VCID

Description: Configures the Virtual Channel ID for DPI traffic.

Address: 0x4480300C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R						RW	
HW Access	R						R	
Name	DPI_VCID_RESERVED_31_2 [7:2]						DPI_VCID_DPI_VCID [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	DPI_VCID_RESERVED_31_2 [15:8]

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	DBI_PARTITIONING_EN_RESERVED_31_1 [31:24]							

Bits	Name	Description
31 : 1	DBI_PARTITION-ING_EN_RE-SERVED_31_1	Reserved and read as zero. Default Value: 0x0
0	DBI_PARTITION-ING_EN_PARTITION-ING_EN	When set to 1, this bit enables the use of write_memory_continue input commands (system needs to ensure correct partitioning of Long Write commands). When not set, partitioning is automatically performed in the DWC_mipi_dsi_host. Default Value: 0x0

27.1.169 GFXSS_MIPIDSI_DWCMIPIDSI_DBI_CMDSIZE

Description: Configures the command size and the size for automatic partitioning of DBI packets.

Address: 0x44803028

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	DBI_CMDSIZE_WR_CMD_SIZE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW

Name	DBI_CMDSIZE_WR_CMD_SIZE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	DBI_CMDSIZE_ALLOWED_CMD_SIZE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	DBI_CMDSIZE_ALLOWED_CMD_SIZE [31:24]							

Bits	Name	Description
31 : 16	DBI_CMDSIZE_ALLOWED_CMD_SIZE	This field configures the maximum allowed size for a DCS write memory command. This field is used to partition a write memory command into one write_memory_start and a variable number of write_memory_continue commands. It is only used if the partitioning_en bit of the DBI_CFG register is disabled. The size of the DSI packet payload is the actual payload size minus 1, because the DCS command is in the DSI packet payload. Default Value: 0x0
15 : 0	DBI_CMDSIZE_WR_CMD_SIZE	This field configures the size of the DCS write memory commands. The size of DSI packet payload is the actual payload size minus 1, because the DCS command is in the DSI packet payload. Default Value: 0x0

27.1.170 GFXSS_MIPIDSI_DWCMIPIDSI_PCKHDL_CFG

Description: Configures how EoTp, BTA, CRC and ECC are to be used, to meet peripherals characteristics

Address: 0x4480302C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

HW Access	R							
Name	PCKHDL_CFG_RESERVED_31_6 [31:24]							

Bits	Name	Description
31 : 6	PCKHDL_CFG_RESERVED_31_6	Reserved and read as zero. Default Value: 0x0
5	PCKHDL_CFG_EOTP_TX_LP_EN	When set to 1, this bit enables the EoTp transmission in low-power. Default Value: 0x0
4	PCKHDL_CFG_CRC_RX_EN	When set to 1, this bit enables the CRC reception and error reporting. Default Value: 0x0
3	PCKHDL_CFG_ECC_RX_EN	When set to 1, this bit enables the ECC reception, error correction, and reporting. Default Value: 0x0
2	PCKHDL_CFG_BTA_EN	When set to 1, this bit enables the Bus Turn-Around (BTA) request. Default Value: 0x0
1	PCKHDL_CFG_EOTP_RX_EN	When set to 1, this bit enables the EoTp reception. Default Value: 0x0
0	PCKHDL_CFG_EOTP_TX_EN	When set to 1, this bit enables the EoTp transmission in high-speed. Default Value: 0x0

27.1.171 GFXSS_MIPIDSI_DWCMIPIDSI_GEN_VCID

Description: Configures the Virtual Channel ID of READ responses to store and return to Generic interface.

Address: 0x44803030

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R						RW

Bits	Name	Description
31 : 25	VID_MODE_CFG_RE-SERVED_31_25	Reserved and read as zero. Default Value: 0x0
24	VID_MODE_CFG_VP-G_ORIENTATION	This field indicates the color bar orientation as follows: Default Value: 0x0 **0x0: VPGORENT0 :** (none) **0x1: VPGORENT1 :** (none)
23 : 21	VID_MODE_CFG_RE-SERVED_23_21	Reserved and read as zero. Default Value: 0x0

27.1.173 GFXSS_MIPIDSI_DWCMIPIDSI_VID_MODE_CFG (continued)

20	VID_MODE_CFG_VPG_-MODE	This field is to select the pattern: Default Value: 0x0 **0x1: BERPATTERN :** (none) **0x0: COLORBAR :** (none)
19 : 17	VID_MODE_CFG_RE-SERVED_19_17	Reserved and read as zero. Default Value: 0x0
16	VID_MODE_CFG_VP-G_EN	When set to 1, this bit enables the video mode pattern generator. Default Value: 0x0
15	VID_MODE_CFG_LP_C-MD_EN	When set to 1, this bit enables the command transmission only in low-power mode. Default Value: 0x0
14	VID_MODE_CFG_-FRAME_BTA_ACK_EN	When set to 1, this bit enables the request for an acknowledge response at the end of a frame. Default Value: 0x0
13	VID_MODE_CFG_LP_HF-P_EN	When set to 1, this bit enables the return to low-power inside the HFP period when timing allows. Default Value: 0x0
12	VID_MODE_CF-G_LP_HBP_EN	When set to 1, this bit enables the return to low-power inside the HBP period when timing allows. Default Value: 0x0
11	VID_MODE_CF-G_LP_VACT_EN	When set to 1, this bit enables the return to low-power inside the VACT period when timing allows. Default Value: 0x0
10	VID_MODE_CFG_LP_VF-P_EN	When set to 1, this bit enables the return to low-power inside the VFP period when timing allows. Default Value: 0x0
9	VID_MODE_CFG_LP_VB-P_EN	When set to 1, this bit enables the return to low-power inside the VBP period when timing allows. Default Value: 0x0
8	VID_MODE_CF-G_LP_VSA_EN	When set to 1, this bit enables the return to low-power inside the VSA period when timing allows. Default Value: 0x0
7 : 2	VID_MODE_CFG_RE-SERVED_7_2	Reserved and read as zero. Default Value: 0x0
1 : 0	VID_MODE_CFG_VID_-MODE_TYPE	This field indicates the video mode transmission type as follows: Default Value: 0x0 **0x0: VIDMODE0 :** (none) **0x1: VIDMODE1 :** (none) **0x2: VIDMODE2 :** (none) **0x3: VIDMODE3 :** (none)

27.1.174 GFXSS_MIPIDSI_DWCMIPIDSI_VID_PKT_SIZE

Description: Configures the video packet size.

Address: 0x4480303C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VID_PKT_SIZE_VID_PKT_SIZE [7:0]

SW Access	R							
HW Access	R							
Name	VID_PKT_SIZE_RESERVED_31_14 [31:24]							

Bits	Name	Description
31 : 14	VID_PKT_SIZE_RESERVED_31_14	Reserved and read as zero. Default Value: 0x0
13 : 0	VID_PKT_SIZE_VID_PKT_SIZE	This field configures the number of pixels in a single video packet. - For 18-bit not loosely packed data types, this number must be a multiple of 4. - For YCbCr data types, it must be a multiple of 2, as described in the DSI specification. - For DSC24, this field configures the number of Bytes. Note that when using slices (i.e chunks) the minimum size packet size must be 3. Default Value: 0x0

27.1.175 GFXSS_MIPIDSI_DWCMIPIDSI_VID_NUM_CHUNKS

Description: Configures the number of chunks to use. The data in each chunk has the size provided by VID_PKT_SIZE.

Address: 0x44803040

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	VID_NUM_CHUNKS_VID_NUM_CHUNKS [7:0]

Name	VID_NUM_CHUNKS_RESERVED_31_13 [31:24]							

Bits	Name	Description
31 : 13	VID_NUM_CHUNKS_RESERVED_31_13	Reserved and read as zero. Default Value: 0x0
12 : 0	VID_NUM_CHUNKS_VID_NUM_CHUNKS	This register configures the number of chunks to be transmitted during a Line period (a chunk is pair made of a video packet and a null packet). If set to 0 or 1, video line is still transmitted in a single packet. If set to 1 that packet is part of a chunk, meaning that a null packet follows it (if vid_null_size>0). Otherwise, multiple chunks are used to transmit each video line. Default Value: 0x0

27.1.176 GFXSS_MIPIDSI_DWCMIPIDSI_VID_NULL_SIZE

Description: Configures the size of null packets.

Address: 0x44803044

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	Name	Description
31 : 25	CMD_MODE_CFG_RESERVED_31_25	Reserved and read as zero. Default Value: 0x0
24	CMD_MODE_CFG_MAX_RD_PKT_SIZE	This bit configures the maximum read packet size command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)

27.1.184 GFXSS_MIPIDSI_DWCMIPIDSI_CMD_MODE_CFG (continued)

23 : 20	CMD_MODE_CFG_RESERVED_23_20	Reserved and read as zero. Default Value: 0x0
19	CMD_MODE_CFG_DCS_LW_TX	This bit configures the DCS long write packet command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
18	CMD_MODE_CFG_DCS_SR_0P_TX	This bit configures the DCS short read packet with zero parameter command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
17	CMD_MODE_CFG_DCS_SW_1P_TX	This bit configures the DCS short write packet with one parameter command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
16	CMD_MODE_CFG_DCS_SW_0P_TX	This bit configures the DCS short write packet with zero parameter command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
15	CMD_MODE_CFG_RESERVED_15	Reserved and read as zero. Default Value: 0x0
14	CMD_MODE_CFG_GEN_LW_TX	This bit configures the Generic long write packet command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)

27.1.184 GFXSS_MIPIDSI_DWCMIPIDSI_CMD_MODE_CFG (continued)

13	CMD_MODE_CFG_-GEN_SR_2P_TX	This bit configures the Generic short read packet with two parameters command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
12	CMD_MODE_CFG_-GEN_SR_1P_TX	This bit configures the Generic short read packet with one parameter command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
11	CMD_MODE_CFG_-GEN_SR_0P_TX	This bit configures the Generic short read packet with zero parameter command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
10	CMD_MODE_CFG_-GEN_SW_2P_TX	This bit configures the Generic short write packet with two parameters command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
9	CMD_MODE_CFG_-GEN_SW_1P_TX	This bit configures the Generic short write packet with one parameter command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)

27.1.184 GFXSS_MIPIDSI_DWCMIPIDSI_CMD_MODE_CFG (continued)

8	CMD_MODE_CFG_-GEN_SW_0P_TX	This bit configures the Generic short write packet with zero parameter command transmission type: Default Value: 0x0 **0x0: HIGHSPEED :** (none) **0x1: LOWPOWER :** (none)
7 : 2	CMD_MODE_CFG_RE-SERVED_7_2	Reserved and read as zero. Default Value: 0x0
1	CMD_MODE_CF-G_ACK_RQST_EN	When set to 1, this bit enables the acknowledge request after each packet transmission. Default Value: 0x0
0	CMD_MODE_CF-G_TEAR_FX_EN	When set to 1, this bit enables the tearing effect acknowledge request. Default Value: 0x0

27.1.185 GFXSS_MIPIDSI_DWCMIPIDSI_GEN_HDR

Description: Sets the header for new packets sent using the Generic interface.

Address: 0x4480306C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW

Bits	Name	Description
31 : 28	CMD_PKT_STATUS_RESERVED_31_28	Reserved and read as zero. Default Value: 0x0
27	CMD_PKT_STATUS_DBI_BUFF_PLD_FULL	This bit indicates the full status of the DBI payload internal buffer. Default Value: 0x0
26	CMD_PKT_STATUS_DBI_BUFF_PLD_EMPTY	This bit indicates the empty status of the DBI payload internal buffer. Default Value: 0x1
25	CMD_PKT_STATUS_DBI_BUFF_CMD_FULL	This bit indicates the full status of the DBI command internal buffer. Default Value: 0x0
24	CMD_PKT_STATUS_DBI_BUFF_CMD_EMPTY	This bit indicates the empty status of the DBI command internal buffer. Default Value: 0x1

27.1.187 GFXSS_MIPIDSI_DWCMIPIDSI_CMD_PKT_STATUS (continued)

23 : 20	CMD_PKT_STATUS_RESERVED_23_20	Reserved and read as zero. Default Value: 0x0
19	CMD_PKT_STATUS_GEN_BUFF_PLD_FULL	This bit indicates the full status of the generic payload internal buffer. Default Value: 0x0
18	CMD_PKT_STATUS_GEN_BUFF_PLD_EMPTY	This bit indicates the empty status of the generic payload internal buffer. Default Value: 0x1
17	CMD_PKT_STATUS_GEN_BUFF_CMD_FULL	This bit indicates the full status of the generic command internal buffer. Default Value: 0x0
16	CMD_PKT_STATUS_GEN_BUFF_CMD_EMPTY	This bit indicates the empty status of the generic command internal buffer. Default Value: 0x1
15	CMD_PKT_STATUS_RESERVED_15	Reserved and read as zero. Default Value: 0x0
14	CMD_PKT_STATUS_DBI_RD_CMD_BUSY	This bit is set when a read command is issued and cleared when the entire response is stored in the FIFO for DBI interface. Default Value: 0x0
13	CMD_PKT_STATUS_DBI_PLD_R_FULL	This bit indicates the full status of the DBI read payload FIFO. Default Value: 0x0
12	CMD_PKT_STATUS_DBI_PLD_R_EMPTY	This bit indicates the empty status of the DBI read payload Default Value: 0x1
11	CMD_PKT_STATUS_DBI_PLD_W_FULL	This bit indicates the full status of the DBI write payload FIFO. Default Value: 0x0
10	CMD_PKT_STATUS_DBI_PLD_W_EMPTY	This bit indicates the empty status of the DBI write payload FIFO. Default Value: 0x1
9	CMD_PKT_STATUS_DBI_CMD_FULL	This bit indicates the full status of the DBI command FIFO. Default Value: 0x0
8	CMD_PKT_STATUS_DBI_CMD_EMPY	This bit indicates the empty status of the DBI command FIFO. Default Value: 0x1
7	CMD_PKT_STATUS_RESERVED_7	Reserved and read as zero. Default Value: 0x0
6	CMD_PKT_STATUS_GEN_RD_CMD_BUSY	This bit is set when a read command is issued and cleared when the entire response is stored in the FIFO for GENERIC interface. Default Value: 0x0
5	CMD_PKT_STATUS_GEN_PLD_R_FULL	This bit indicates the full status of the generic read payload FIFO. Default Value: 0x0
4	CMD_PKT_STATUS_GEN_PLD_R_EMPTY	This bit indicates the empty status of the generic read payload FIFO. Default Value: 0x1
3	CMD_PKT_STATUS_GEN_PLD_W_FULL	This bit indicates the full status of the generic write payload FIFO. Default Value: 0x0
2	CMD_PKT_STATUS_GEN_PLD_W_EMPTY	This bit indicates the empty status of the generic write payload FIFO. Default Value: 0x1
1	CMD_PKT_STATUS_GEN_CMD_FULL	This bit indicates the full status of the generic command FIFO. Default Value: 0x0
0	CMD_PKT_STATUS_GEN_CMD_EMPTY	This bit indicates the empty status of the generic command FIFO. Default Value: 0x1

27.1.188 GFXSS_MIPIDSI_DWCMIPIDSI_TO_CNT_CFG

Description: Configures counters that trigger timeout errors. These are used to warn the system of a failure, through an interrupt, and restart the controller in case of unexpected situations that cause deadlock conditions.

Address: 0x44803078

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	TO_CNT_CFG_LPRX_TO_CNT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW

HW Access	R							
Name	TO_CNT_CFG_HSTX_TO_CNT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	TO_CNT_CFG_HSTX_TO_CNT [31:24]							

Bits	Name	Description
31 : 16	TO_CNT_CFG_HSTX-_TO_CNT	This field configures the timeout counter that triggers a high-speed transmission timeout contention detection (measured in TO_CLK_DIVISION cycles). If using non-burst mode and there is not sufficient time to switch from high-speed to low-power and back in the period which is from one line data finishing to the next line sync start, the DSI link returns low-power state once per frame, then you should configure the TO_CLK_DIVISION and hstx_to_cnt to satisfy the following formula: hstx_to_cnt * lanebyteclkperiod * TO_CLK_DIVISION >= the time of one FRAME data transmission * (1 + 10%) In burst mode, RGB pixel packets are time-compressed, leaving more time during a scan line. So if in burst mode and there is sufficient time to switch from high-speed to low-power and back in the period of time from one line data finishing to the next line sync start, the DSI link can return low-power mode and back in this time interval to save power. If you choose so, you should configure the TO_CLK_DIVISION and hstx_to_cnt to satisfy the following formula: hstx_to_cnt * lanebyteclkperiod * TO_CLK_DIVISION >= the time of one LINE data transmission * (1 + 10%) Default Value: 0x0
15 : 0	TO_CNT_CFG_LPRX-_TO_CNT	This field configures the timeout counter that triggers a low-power reception timeout contention detection (measured in TO_CLK_DIVISION cycles). Default Value: 0x0

27.1.189 GFXSS_MIPIDSI_DWCMIPIDSI_HS_RD_TO_CNT

Description: Configures the Peripheral Response timeout after high-speed Read operations.

Address: 0x4480307C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW

Name	PHY_RSTZ_RESERVED_31_4 [31:24]							

Bits	Name	Description
31 : 4	PHY_RSTZ_RESERVED_31_4	Reserved and read as zero. Default Value: 0x0
3	PHY_RSTZ_PHY_FORCEPLL	When the D-PHY is in ULPS, this bit enables the D-PHY PLL. Default Value: 0x0
2	PHY_RSTZ_PHY_ENABLECLK	When set to 1, this bit enables the D-PHY Clock Lane Module. Default Value: 0x0
1	PHY_RSTZ_PHY_RSTZ	When set to 0, this bit places the digital section of the D-PHY in the reset state. Default Value: 0x0
0	PHY_RSTZ_PHY_SHUTDOWNZ	When set to 0, this bit places the complete D-PHY macro in power-down state. Default Value: 0x0

27.1.199 GFXSS_MIPIDSI_DWCMIPIDSI_PHY_IF_CFG

Description: Configures the number of active lanes and the minimum time to remain in stop state.

Address: 0x448030A4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R						RW	
HW Access	R						R

SW Access	R							
HW Access	R							
Name	INT_ST0_RESERVED_31_21 [31:24]							

Bits	Name	Description
31 : 21	INT_ST0_RESERVED_31_21	Reserved and read as zero. Default Value: 0x0
20	INT_ST0_DPHY_ERRORS_4	This bit indicates LP1 contention error ErrContentionLP1 from Lane 0. Default Value: 0x0
19	INT_ST0_DPHY_ERRORS_3	This bit indicates LP0 contention error ErrContentionLP0 from Lane 0. Default Value: 0x0
18	INT_ST0_DPHY_ERRORS_2	This bit indicates control error ErrControl from Lane 0. Default Value: 0x0
17	INT_ST0_DPHY_ERRORS_1	This bit indicates ErrSyncEsc low-power data transmission synchronization error from Lane 0. Default Value: 0x0
16	INT_ST0_DPHY_ERRORS_0	This bit indicates ErrEsc escape entry error from Lane 0. Default Value: 0x0
15	INT_ST0_ACK_WITH_ERR_15	This bit retrieves the DSI protocol violation from the Acknowledge error report. Default Value: 0x0

27.1.205 GFXSS_MIPIDSI_DWCMIPIDSI_INT_ST0 (continued)

14	INT_ST0_ACK_WITH_ERR_14	This bit retrieves the reserved (specific to device) from the Acknowledge error report. Default Value: 0x0
13	INT_ST0_ACK_WITH_ERR_13	This bit retrieves the invalid transmission length from the Acknowledge error report. Default Value: 0x0
12	INT_ST0_ACK_WITH_ERR_12	This bit retrieves the DSI VC ID Invalid from the Acknowledge error report. Default Value: 0x0
11	INT_ST0_ACK_WITH_ERR_11	This bit retrieves the not recognized DSI data type from the Acknowledge error report. Default Value: 0x0
10	INT_ST0_ACK_WITH_ERR_10	This bit retrieves the checksum error (long packet only) from the Acknowledge error report. Default Value: 0x0
9	INT_ST0_ACK_WITH_ERR_9	This bit retrieves the ECC error, multi-bit (detected, not corrected) from the Acknowledge error report. Default Value: 0x0
8	INT_ST0_ACK_WITH_ERR_8	This bit retrieves the ECC error, single-bit (detected and corrected) from the Acknowledge error report. Default Value: 0x0
7	INT_ST0_ACK_WITH_ERR_7	This bit retrieves the Contention Detected error from the Acknownledge error report. Default Value: 0x0
6	INT_ST0_ACK_WITH_ERR_6	This bit retrieves the False Control error from the Acknowledge error report. Default Value: 0x0
5	INT_ST0_ACK_WITH_ERR_5	This bit retrieves the Peripheral Timeout error from the Acknowledge error report. Default Value: 0x0
4	INT_ST0_ACK_WITH_ERR_4	This bit retrieves the low-power Transmit Sync error from the Acknowledge error report. Default Value: 0x0
3	INT_ST0_ACK_WITH_ERR_3	This bit retrieves the Escape Mode Entry Command error from the Acknowledge error report. Default Value: 0x0
2	INT_ST0_ACK_WITH_ERR_2	This bit retrieves the EoT Sync error from the Acknowledge error report. Default Value: 0x0
1	INT_ST0_ACK_WITH_ERR_1	This bit retrieves the SoT Sync error from the Acknowledge error report. Default Value: 0x0
0	INT_ST0_ACK_WITH_ERR_0	This bit retrieves the SoT error from the Acknowledge error report. Default Value: 0x0

27.1.206 GFXSS_MIPIDSI_DWCMIPIDSI_INT_ST1

Description: Contains the status of interrupt sources related to timeouts, ECC, CRC, packet size, EoTp, Generic and DBI interfaces.

Address: 0x448030C0

Retention: Not Retained

Name	INT_ST1_RESERVED_31_21 [23:21]			INT_ST1_RESERVED_20	INT_ST1_DPI_BUFF_PLD_UNDER	INT_ST1_RESERVED_18	INT_ST1_DBI_ILEGAL_COMM_ERR	INT_ST1_DBI_PLD_RECV_ERR

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	INT_ST1_RESERVED_31_21 [31:24]							

Bits	Name	Description
31 : 21	INT_ST1_RESERVED_31_21	Reserved and read as zero. Default Value: 0x0
20	INT_ST1_RESERVED_20	Reserved and read as zero Default Value: 0x0
19	INT_ST1_DPI_BUFF_PLD_UNDER	This bit indicates that an underflow has occurred when reading payload to build DSI packet for video mode Default Value: 0x0
18	INT_ST1_RESERVED_18	Reserved and read as zero Default Value: 0x0
17	INT_ST1_DBI_ILEGAL_COMM_ERR	This bit indicates that an attempt to write an illegal command on the DBI interface is made and the controller is blocked by transmission. Default Value: 0x0
16	INT_ST1_DBI_PLD_RECV_ERR	This bit indicates that during a DBI read back packet, the payload FIFO becomes full and the received data is corrupted. Default Value: 0x0

27.1.206 GFXSS_MIPIDSI_DWCMIPIDSI_INT_ST1 (continued)

15	INT_ST1_DBI_PLD_RD_ERR	This bit indicates that during a DCS read data, the payload FIFO goes empty and the data sent to the interface is corrupted. Default Value: 0x0
14	INT_ST1_DBI_PLD_WR_ERR	This bit indicates that the system tried to write the payload data through the DBI interface and the FIFO is full. Therefore, the command is not written. Default Value: 0x0
13	INT_ST1_DBI_CMD_WR_ERR	This bit indicates that the system tried to write a command through the DBI but the command FIFO is full. Therefore, the command is not written. Default Value: 0x0
12	INT_ST1_GEN_PLD_RECEV_ERR	This bit indicates that during a generic interface packet read back, the payload FIFO becomes full and the received data is corrupted. Default Value: 0x0
11	INT_ST1_GEN_PLD_RD_ERR	This bit indicates that during a DCS read data, the payload FIFO becomes empty and the data sent to the interface is corrupted. Default Value: 0x0
10	INT_ST1_GEN_PLD_SEND_ERR	This bit indicates that during a Generic interface packet build, the payload FIFO becomes empty and corrupt data is sent. Default Value: 0x0
9	INT_ST1_GEN_PLD_WR_ERR	This bit indicates that the system tried to write a payload data through the Generic interface and the FIFO is full. Therefore, the payload is not written. Default Value: 0x0
8	INT_ST1_GEN_CMD_WR_ERR	This bit indicates that the system tried to write a command through the Generic interface and the FIFO is full. Therefore, the command is not written. Default Value: 0x0
7	INT_ST1_DPI_PLD_WR_ERR	This bit indicates that during a DPI pixel line storage, the payload FIFO becomes full and the data stored is corrupted. Default Value: 0x0
6	INT_ST1_EOPT_ERR	This bit indicates that the EoTp packet has not been received at the end of the incoming peripheral transmission. Default Value: 0x0
5	INT_ST1_PKT_SIZE_ERR	This bit indicates that the packet size error has been detected during the packet reception. Default Value: 0x0
4	INT_ST1_CRC_ERR	This bit indicates that the CRC error has been detected in the received packet payload. Default Value: 0x0
3	INT_ST1_ECC_MULTPL_ERR	This bit indicates that the ECC multiple error has been detected in a received packet. Default Value: 0x0
2	INT_ST1_ECC_SINGLE_ERR	This bit indicates that the ECC single error has been detected and corrected in a received packet. Default Value: 0x0
1	INT_ST1_TO_LP_RX	This bit indicates that the low-power reception timeout counter reached the end and contention has been detected. Default Value: 0x0
0	INT_ST1_TO_HS_TX	This bit indicates that the high-speed transmission timeout counter reached the end and contention has been detected. Default Value: 0x0

27.1.207 GFXSS_MIPIDSI_DWCMIPIDSI_INT_MSK0

Description: Configures masks for the sources of interrupts that affect the INT_ST0 register. Write 1 to un-mask each error report.

Address: 0x448030C4

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	PHY_TMR_RD_CFG_RESERVED_31_15 [31:24]							

Bits	Name	Description
31 : 15	PHY_TMR_RD_CFG_RESERVED_31_15	Reserved and read as zero. Default Value: 0x0
14 : 0	PHY_TMR_RD_CFG_MAX_RD_TIME	This field configures the maximum time required to perform a read command in lane byte clock cycles. This register can only be modified when no read command is in progress. Default Value: 0x0

27.1.214 GFXSS_MIPIDSI_DWCMIPIDSI_VID_SHADOW_CTRL

Description: Controls dpi shadow feature

Address: 0x44803100

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							RW
HW Access	R							R
Name	VID_SHADOW_CTRL_RESERVED_7_1 [7:1]							VID_SHADOW_CTRL_VID_SHADOW_EN

Bits	15	14	13	12	11	10	9	8
SW Access	R							RW
HW Access	R							R
Name	VID_SHADOW_CTRL_RESERVED_15_9 [15:9]							VID_SHADOW_CTRL_VID_SHADOW_REQ

Bits	23	22	21	20	19	18	17	16
SW Access	R							RW
HW Access	R							R
Name	VID_SHADOW_CTRL_RESERVED_31_17 [23:17]							VID_SHADOW_CTRL_VID_SHADOW_PIN_REQ

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VID_SHADOW_CTRL_RESERVED_31_17 [31:24]							

Bits	Name	Description
31 : 17	VID_SHADOW_CTRL_RESERVED_31_17	Reserved and read as zero. Default Value: 0x0
16	VID_SHADOW_CTRL_VID_SHADOW_PIN_REQ	When set to 1, the video request is done by external pin. In this mode vid_shadow_req is ignored. Default Value: 0x0
15 : 9	VID_SHADOW_CTRL_RESERVED_15_9	Reserved and read as zero. Default Value: 0x0
8	VID_SHADOW_CTRL_VID_SHADOW_REQ	When set to 1, this bit request that the dpi registers from regbank are copied to the auxiliary registers. When the request is completed this bit is auto clear. Default Value: 0x0
7 : 1	VID_SHADOW_CTRL_RESERVED_7_1	Reserved and read as zero. Default Value: 0x0

27.1.214 GFXSS_MIPIDSI_DWCMIPIDSI_VID_SHADOW_CTRL (continued)

0	VID_SHADOW_CTRL_VID_SHADOW_EN	When set to 1, DPI receives the active configuration from the auxiliary registers. When the feature is set at the same time than vid_shadow_req the auxiliary registers are automatically updated. Default Value: 0x0

27.1.215 GFXSS_MIPIDSI_DWCMIPIDSI_DPI_VCID_ACT

Description: Holds the value that controller is using for DPI_VCID.

Address: 0x4480310C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R						R

Name	VID_HSA_TIME_ACT_RESERVED_31_12 [31:24]							

Bits	Name	Description
31 : 12	VID_HSA_- TIME_ACT_RE- SERVED_31_12	Reserved and read as zero. Default Value: 0x0
11 : 0	VID_HSA_- TIME_ACT_VID_HSA_- TIME	This field specifies the Horizontal Synchronism Active period in lane byte clock cycles. Default Value: 0x0

27.1.223 GFXSS_MIPIDSI_DWCMIPIDSI_VID_HBP_TIME_ACT

Description: Holds the value that controller is using for VID_HBP_TIME.

Address: 0x4480314C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	VID_HBP_TIME_ACT_VID_HBP_TIME [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R				R			
HW Access	R				W			
Name	VID_HBP_TIME_ACT_RESERVED_31_12 [15:12]				VID_HBP_TIME_ACT_VID_HBP_TIME [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VID_HBP_TIME_ACT_RESERVED_31_12 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VID_HBP_TIME_ACT_RESERVED_31_12 [31:24]							

Bits	Name	Description
31 : 12	VID_HBP_- TIME_ACT_RE- SERVED_31_12	Reserved and read as zero. Default Value: 0x0
11 : 0	VID_HBP_- TIME_ACT_VID_HBP_- TIME	This field specifies the Horizontal Back Porch period in lane byte clock cycles. Default Value: 0x0

27.1.224 GFXSS_MIPIDSI_DWCMIPIDSI_VID_HLINE_TIME_ACT

Description: Holds the value that controller is using for VID_HLINE_TIME.

Address: 0x44803150

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	VID_HLINE_TIME_ACT_VID_HLINE_TIME [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R	R						
HW Access	R	W						
Name	VID_H-LINE_-TIME_ACT_RE-SERVED_31_15	VID_HLINE_TIME_ACT_VID_HLINE_TIME [14:8]						

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VID_HLINE_TIME_ACT_RESERVED_31_15 [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VID_HLINE_TIME_ACT_RESERVED_31_15 [31:24]							

Bits	Name	Description
31 : 15	VID_HLINE_-TIME_ACT_RE-SERVED_31_15	Reserved and read as zero. Default Value: 0x0
14 : 0	VID_HLINE_-TIME_ACT_VID_HLINE_-TIME	This field specifies the size of the total line time (HSA+HBP+HACT+HFP) counted in lane byte clock cycles. Default Value: 0x0

27.1.225 GFXSS_MIPIDSI_DWCMIPIDSI_VID_VSA_LINES_ACT

Description: Holds the value that controller is using for VID_VSA_LINES.

Address: 0x44803154

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	VID_VSA_LINES_ACT_VSA_LINES [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R						R	
HW Access	R						W	
Name	VID_VSA_LINES_ACT_RESERVED_31_10 [15:10]						VID_VSA_LINES_ACT_VSA_LINES [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R

Name	VID_PKT_STATUS_RESERVED_23	VID_PKT_STATUS_RESERVED_22	VID_PKT_STATUS_RESERVED_21	VID_PKT_STATUS_RESERVED_20	VID_PKT_STATUS_RESERVED_19_18 [19:18]		VID_PKT_STATUS_DPI_BUFF_PLD_FULL	VID_PKT_STATUS_DPI_BUFF_PLD_EMPTY

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VID_PKT_STATUS_RESERVED_31_24 [31:24]							

Bits	Name	Description
31 : 24	VID_PKT_STATUS_RESERVED_31_24	Reserved and read as zero. Default Value: 0x0
23	VID_PKT_STATUS_RESERVED_23	Reserved and read as zero Default Value: 0x0
22	VID_PKT_STATUS_RESERVED_22	Reserved and read as zero Default Value: 0x0
21	VID_PKT_STATUS_RESERVED_21	Reserved and read as zero Default Value: 0x0
20	VID_PKT_STATUS_RESERVED_20	Reserved and read as zero Default Value: 0x0
19 : 18	VID_PKT_STATUS_RESERVED_19_18	Reserved and read as zero. Default Value: 0x0
17	VID_PKT_STATUS_DPI_BUFF_PLD_FULL	This bit indicates the full status of the payload internal buffer for video Mode. This bit is set to 0 for command Mode. Default Value: 0x0

27.1.229 GFXSS_MIPIDSI_DWCMIPIDSI_VID_PKT_STATUS (continued)

16	VID_PKT_STATUS_DPI_BUFF_PLD_EMPTY	This bit indicates the empty status of the payload internal buffer for video Mode. This bit is set to 0 for command Mode. Default Value: 0x1
15 : 8	VID_PKT_STATUS_RESERVED_15_8	Reserved and read as zero. Default Value: 0x0
7	VID_PKT_STATUS_RESERVED_7	Reserved and read as zero Default Value: 0x0
6	VID_PKT_STATUS_RESERVED_6	Reserved and read as zero Default Value: 0x0
5	VID_PKT_STATUS_RESERVED_5	Reserved and read as zero Default Value: 0x0
4	VID_PKT_STATUS_RESERVED_4	Reserved and read as zero Default Value: 0x0
3	VID_PKT_STATUS_DPI_PLD_W_FULL	This bit indicates the full status of write payload FIFO for video Mode. This bit is set to 0 for command Mode. Default Value: 0x0
2	VID_PKT_STATUS_DPI_PLD_W_EMPTY	This bit indicates the empty status of write payload FIFO for video Mode. This bit is set to 0 for command Mode. Default Value: 0x1
1	VID_PKT_STATUS_DPI_CMD_W_FULL	This bit indicates the full status of write command FIFO for video Mode. This bit is set to 0 for command Mode. Default Value: 0x0
0	VID_PKT_STATUS_DPI_CMD_W_EMPTY	This bit indicates the empty status of write command FIFO for video Mode. This bit is set to 0 for command Mode. Default Value: 0x1

27.1.230 GFXSS_MIPIDSI_DWCMIPIDSI_SDF_3D_ACT

Description: Holds the value that controller is using for SDF_3D.

Address: 0x44803190

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R		R	R	R		R	
HW Access	R		W	W	W		W	
Name	SDF_3D_ACT_RESERVED_15_6 [7:6]		SDF_3D_ACT_RIGHT_FIRST	SDF_3D_ACT_SECOND_VSYNC	SDF_3D_ACT_FORMAT_3D [3:2]		SDF_3D_ACT_MODE_3D [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	SDF_3D_ACT_RESERVED_15_6 [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							R
HW Access	R							W
Name	SDF_3D_ACT_RESERVED_31_17 [23:17]							SDF_3D_ACT_SEND_3D_CFG

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	SDF_3D_ACT_RESERVED_31_17 [31:24]							

Bits	Name	Description
31 : 17	SDF_3D_ACT_RESERVED_31_17	Reserved and read as zero. Default Value: 0x0
16	SDF_3D_ACT_SEND_3D_CFG	When set, causes the next VSS packet to include 3D control payload in every VSS packet. Default Value: 0x0
15 : 6	SDF_3D_ACT_RESERVED_15_6	Reserved and read as zero. Default Value: 0x0
5	SDF_3D_ACT_RIGHT_FIRST	This bit specifies the left/right order: Default Value: 0x0 **0x0: LEFTFIRST :** (none) **0x1: RIGHTFIRST :** (none)

27.1.230 GFXSS_MIPIDSI_DWCMIPIDSI_SDF_3D_ACT (continued)

4	SDF_3D_ACT_SECOND_VSYNC	This field specifies whether there is a second VSYNC pulse between Left and Right Images, when 3D Image Format is Frame-based: Default Value: 0x0 **0x0: NOSYNCPULSE :** (none) **0x1: SYNCPULSE :** (none)
3 : 2	SDF_3D_ACT_FORMAT_3D	This field specifies 3D Image Format: Default Value: 0x0 **0x1: FRAME :** (none) **0x0: LINE :** (none) **0x2: PIXEL :** (none) **0x3: RESERVED :** (none)
1 : 0	SDF_3D_ACT_MODE_3D	This field specifies 3D Mode On/Off and Display Orientation: Default Value: 0x0 **0x0: MODE0 :** (none) **0x1: MODE1 :** (none) **0x2: MODE2 :** (none) **0x3: MODE3 :** (none)

28 Autonomous Analog registers

This section discusses the Autonomous Analog registers. It lists all the registers in mapping tables, in address order.

28.1 Register details

Register name	Address	Description
CTBL0_STA_CFG	0x42E00400	Configuration (only accessible if ACTRLR.STATUS.MODE=0)
CTBL0_STA_COMP_STAT	0x42E00404	Comparator status
CTBL0_DYN0_OA_MUX_CFG	0x42E00600	Opamp Mux Configuration
CTBL0_DYN1_OA_MUX_CFG	0x42E00610	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL0_DYN2_OA_MUX_CFG	0x42E00620	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL0_DYN3_OA_MUX_CFG	0x42E00630	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL0_DYN4_OA_MUX_CFG	0x42E00640	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL0_DYN5_OA_MUX_CFG	0x42E00650	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL0_DYN6_OA_MUX_CFG	0x42E00660	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL0_DYN7_OA_MUX_CFG	0x42E00670	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL0_TRIM_OA0_OFFSET_TRIM	0x42E00F00	Opamp0 trim control
CTBL0_TRIM_OA0_SLOPE_OFFSET_TRIM	0x42E00F04	Opamp0 trim control
CTBL0_TRIM_OA0_COMP_TRIM	0x42E00F08	Opamp0 trim control
CTBL0_TRIM_OA1_OFFSET_TRIM	0x42E00F0C	Opamp1 trim control
CTBL0_TRIM_OA1_SLOPE_OFFSET_TRIM	0x42E00F10	Opamp1 trim control
CTBL0_TRIM_OA1_COMP_TRIM	0x42E00F14	Opamp1 trim control
CTBL0_TRIM_RMP_TRIM	0x42E00F18	Risk Mitigation bits

Autonomous Analog registers

Register name	Address	Description
CTBL1_STA_CFG	0x42E10400	Configuration (only accessible if ACTRLR.STATUS.MODE=0). See CTBL0_STA_CFG for the details of bit fields.
CTBL1_STA_COMP_STAT	0x42E10404	Comparator status. See CTBL0_STA_COMP_STAT for the details of bit fields.
CTBL1_DYN0_OA_MUX_CFG	0x42E10600	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_DYN1_OA_MUX_CFG	0x42E10610	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_DYN2_OA_MUX_CFG	0x42E10620	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_DYN3_OA_MUX_CFG	0x42E10630	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_DYN4_OA_MUX_CFG	0x42E10640	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_DYN5_OA_MUX_CFG	0x42E10650	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_DYN6_OA_MUX_CFG	0x42E10660	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_DYN7_OA_MUX_CFG	0x42E10670	Opamp Mux Configuration. See CTBL0_DYN0_OA_MUX_CFG for the details of bit fields.
CTBL1_TRIM_OA0_OFFSET_TRIM	0x42E10F00	Opamp0 trim control. See CTBL0_TRIM_OA0_OFFSET_TRIM for the details of bit fields.
CTBL1_TRIM_OA0_SLOPE_OFFSET_TRIM	0x42E10F04	Opamp0 trim control. See CTBL0_TRIM_OA0_SLOPE_OFFSET_TRIM for the details of bit fields.
CTBL1_TRIM_OA0_COMP_TRIM	0x42E10F08	Opamp0 trim control. See CTBL0_TRIM_OA0_COMP_TRIM for the details of bit fields.
CTBL1_TRIM_OA1_OFFSET_TRIM	0x42E10F0C	Opamp1 trim control. See CTBL0_TRIM_OA1_OFFSET_TRIM for the details of bit fields.
CTBL1_TRIM_OA1_SLOPE_OFFSET_TRIM	0x42E10F10	Opamp1 trim control. See CTBL0_TRIM_OA1_SLOPE_OFFSET_TRIM for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
CTBL1_TRIM_OA1_COMP_TRIM	0x42E10F14	Opamp1 trim control. See CTBL0_TRIM_OA1_COMP_TRIM for the details of bit fields.
CTBL1_TRIM_RMP_TRIM	0x42E10F18	Risk Mitigation bits. See CTBL0_TRIM_RMP_TRIM for the details of bit fields.
PTC_STA_CFG	0x42E40400	PTC Configuration Register (only accessible if ACTRLR.STATUS.MODE=0)
PTC_STA_COMP_STAT	0x42E40404	PTC Status Register
PTC_STA_PP_CFG0	0x42E40408	Post Process Configuration register (only accessible if ACTRLR.STATUS.MODE=0)
PTC_STA_PP_CFG1	0x42E4040C	Post Process Configuration register (only accessible if ACTRLR.STATUS.MODE=0). See PTC_STA_PP_CFG0 for the details of bit fields.
PTC_DYN0_MUX_CFG	0x42E40600	PTC Mux Configuration
PTC_DYN1_MUX_CFG	0x42E40610	PTC Mux Configuration. See PTC_DYN0_MUX_CFG for the details of bit fields.
PTC_DYN2_MUX_CFG	0x42E40620	PTC Mux Configuration. See PTC_DYN0_MUX_CFG for the details of bit fields.
PTC_DYN3_MUX_CFG	0x42E40630	PTC Mux Configuration. See PTC_DYN0_MUX_CFG for the details of bit fields.
PTC_DYN4_MUX_CFG	0x42E40640	PTC Mux Configuration. See PTC_DYN0_MUX_CFG for the details of bit fields.
PTC_DYN5_MUX_CFG	0x42E40650	PTC Mux Configuration. See PTC_DYN0_MUX_CFG for the details of bit fields.
PTC_DYN6_MUX_CFG	0x42E40660	PTC Mux Configuration. See PTC_DYN0_MUX_CFG for the details of bit fields.
PTC_DYN7_MUX_CFG	0x42E40670	PTC Mux Configuration. See PTC_DYN0_MUX_CFG for the details of bit fields.
PTC_PP0_CFG	0x42E40700	Post Processing configuration
PTC_PP0_FRAME	0x42E40704	Post Processing frame
PTC_PP0_THRESHOLD	0x42E40708	Post Processing threshold
PTC_PP0_WINDOW	0x42E4070C	Post Processing window
PTC_PP1_CFG	0x42E40710	Post Processing configuration. See PTC_PP0_CFG for the details of bit fields.
PTC_PP1_FRAME	0x42E40714	Post Processing frame. See PTC_PP0_FRAME for the details of bit fields.
PTC_PP1_THRESHOLD	0x42E40718	Post Processing threshold. See PTC_PP0_THRESHOLD for the details of bit fields.
PTC_PP1_WINDOW	0x42E4071C	Post Processing window. See PTC_PP0_WINDOW for the details of bit fields.
PTC_TRIM_CMP0_OFFSET_TRIM	0x42E40F00	Comparator 0 offset trim register
PTC_TRIM_CMP1_OFFSET_TRIM	0x42E40F04	Comparator 1 offset trim register

Autonomous Analog registers

Register name	Address	Description
DAC0_SRAM0	0x42E60000	SRAM Waveform Table (only accessible if ACTRLR.STATUS.MODE=0). This is the starting address of a register bank containing 512 registers (DAC0_SRAM0 to DAC0_SRAM511).
DAC0_STA_CTRL	0x42E60800	DAC control register (only accessible if ACTRLR.STATUS.MODE=0)
DAC0_STA_SAMPLE_TIME	0x42E60804	Sample control register (only accessible if ACTRLR.STATUS.MODE=0)
DAC0_STA_STEP_VAL0	0x42E60808	step val register (only accessible if ACTRLR.STATUS.MODE=0)
DAC0_STA_STEP_VAL1	0x42E6080C	step val register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_STEP_VAL0 for the details of bit fields.
DAC0_STA_STEP_VAL2	0x42E60810	step val register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_STEP_VAL0 for the details of bit fields.
DAC0_STA_DEGLITCH_TIME	0x42E60818	deglitch time register (only accessible if ACTRLR.STATUS.MODE=0)
DAC0_STA_CHAN_CFG0	0x42E60820	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0)
DAC0_STA_CHAN_CFG1	0x42E60824	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG2	0x42E60828	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG3	0x42E6082C	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG4	0x42E60830	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG5	0x42E60834	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG6	0x42E60838	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG7	0x42E6083C	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG8	0x42E60840	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
DAC0_STA_CHAN_CFG9	0x42E60844	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG10	0x42E60848	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG11	0x42E6084C	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG12	0x42E60850	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG13	0x42E60854	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_CHAN_CFG14	0x42E60858	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC0_STA_FW_DAC_VAL	0x42E60860	Firmare Channel DAC Value (only accessible if ACTRLR.STATUS.MODE=0)
DAC0_STA_FW_DAC_VAL_NXT	0x42E60864	Firmware Channel DAC Value Next
DAC0_STA_CHAN_STATUS_CFG0	0x42E60870	Channel status configuration register
DAC0_STA_CHAN_STATUS_CFG1	0x42E60874	Channel status configuration register. See DAC0_STA_CHAN_STATUS_CFG0 for the details of bit fields.
DAC0_STA_CHAN_STATUS_CFG2	0x42E60878	Channel status configuration register. See DAC0_STA_CHAN_STATUS_CFG0 for the details of bit fields.
DAC0_STA_RANGE_STATUS	0x42E60880	Range status register
DAC0_TRIM_REFBUF_OFFSET_TRIM	0x42E60F00	Reference buffer trim control
DAC0_TRIM_REFBUF_SLOPE_OFFSET_TRIM	0x42E60F04	Reference buffer trim control
DAC0_TRIM_REFBUF_COMP_TRIM	0x42E60F08	Reference buffer trim control
DAC0_TRIM_OUTBUF_OFFSET_TRIM0	0x42E60F0C	Output buffer trim control
DAC0_TRIM_OUTBUF_OFFSET_TRIM1	0x42E60F10	Output buffer trim control. See DAC0_TRIM_OUTBUF_OFFSET_TRIM0 for the details of bit fields.
DAC0_TRIM_OUTBUF_SLOPE_OFFSET_TRIM0	0x42E60F14	Output buffer trim control
DAC0_TRIM_OUTBUF_SLOPE_OFFSET_TRIM1	0x42E60F18	Output buffer trim control. See DAC0_TRIM_OUTBUF_SLOPE_OFFSET_TRIM0 for the details of bit fields.
DAC0_TRIM_OUTBUF_COMP_TRIM0	0x42E60F1C	Output buffer trim control

Autonomous Analog registers

Register name	Address	Description
DAC0_TRIM_OUTBUF_COMP_TRIM1	0x42E60F20	Output buffer trim control. See DAC0_TRIM_OUTBUF_COMP_TRIM0 for the details of bit fields.
DAC0_TRIM_RMP_TRIM	0x42E60F24	Risk Mitigation bits
DAC1_SRAM0	0x42E70000	SRAM Waveform Table (only accessible if ACTRLR.STATUS.MODE=0). This is the starting address of a register bank containing 512 registers (DAC1_SRAM0 to DAC1_SRAM511). See DAC0_SRAM0 for the details of bit fields.
DAC1_STA_CTRL	0x42E70800	DAC control register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CTRL for the details of bit fields.
DAC1_STA_SAMPLE_TIME	0x42E70804	Sample control register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_SAMPLE_TIME for the details of bit fields.
DAC1_STA_STEP_VAL0	0x42E70808	step val register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_STEP_VAL0 for the details of bit fields.
DAC1_STA_STEP_VAL1	0x42E7080C	step val register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_STEP_VAL0 for the details of bit fields.
DAC1_STA_STEP_VAL2	0x42E70810	step val register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_STEP_VAL0 for the details of bit fields.
DAC1_STA_DEGLITCH_TIME	0x42E70818	deglitch time register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_DEGLITCH_TIME for the details of bit fields.
DAC1_STA_CHAN_CFG0	0x42E70820	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG1	0x42E70824	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG2	0x42E70828	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG3	0x42E7082C	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG4	0x42E70830	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
DAC1_STA_CHAN_CFG5	0x42E70834	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG6	0x42E70838	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG7	0x42E7083C	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG8	0x42E70840	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG9	0x42E70844	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG10	0x42E70848	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG11	0x42E7084C	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG12	0x42E70850	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG13	0x42E70854	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_CHAN_CFG14	0x42E70858	Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_CHAN_CFG0 for the details of bit fields.
DAC1_STA_FW_DAC_VAL	0x42E70860	Firmare Channel DAC Value (only accessible if ACTRLR.STATUS.MODE=0). See DAC0_STA_FW_DAC_VAL for the details of bit fields.
DAC1_STA_FW_DAC_VAL_NXT	0x42E70864	Firmware Channel DAC Value Next. See DAC0_STA_FW_DAC_VAL_NXT for the details of bit fields.
DAC1_STA_CHAN_STATUS_CFG0	0x42E70870	Channel status configuration register. See DAC0_STA_CHAN_STATUS_CFG0 for the details of bit fields.
DAC1_STA_CHAN_STATUS_CFG1	0x42E70874	Channel status configuration register. See DAC0_STA_CHAN_STATUS_CFG0 for the details of bit fields.
DAC1_STA_CHAN_STATUS_CFG2	0x42E70878	Channel status configuration register. See DAC0_STA_CHAN_STATUS_CFG0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
DAC1_STA_RANGE_STATUS	0x42E70880	Range status register. See DAC0_STA_RANGE_STATUS for the details of bit fields.
DAC1_TRIM_REFBUF_OFFSET_TRIM	0x42E70F00	Reference buffer trim control. See DAC0_TRIM_REFBUF_OFFSET_TRIM for the details of bit fields.
DAC1_TRIM_REFBUF_SLOPE_OFFSET_TRIM	0x42E70F04	Reference buffer trim control. See DAC0_TRIM_REFBUF_SLOPE_OFFSET_TRIM for the details of bit fields.
DAC1_TRIM_REFBUF_COMP_TRIM	0x42E70F08	Reference buffer trim control. See DAC0_TRIM_REFBUF_COMP_TRIM for the details of bit fields.
DAC1_TRIM_OUTBUF_OFFSET_TRIM0	0x42E70F0C	Output buffer trim control. See DAC0_TRIM_OUTBUF_OFFSET_TRIM0 for the details of bit fields.
DAC1_TRIM_OUTBUF_OFFSET_TRIM1	0x42E70F10	Output buffer trim control. See DAC0_TRIM_OUTBUF_OFFSET_TRIM0 for the details of bit fields.
DAC1_TRIM_OUTBUF_SLOPE_OFFSET_TRIM0	0x42E70F14	Output buffer trim control. See DAC0_TRIM_OUTBUF_SLOPE_OFFSET_TRIM0 for the details of bit fields.
DAC1_TRIM_OUTBUF_SLOPE_OFFSET_TRIM1	0x42E70F18	Output buffer trim control. See DAC0_TRIM_OUTBUF_SLOPE_OFFSET_TRIM0 for the details of bit fields.
DAC1_TRIM_OUTBUF_COMP_TRIM0	0x42E70F1C	Output buffer trim control. See DAC0_TRIM_OUTBUF_COMP_TRIM0 for the details of bit fields.
DAC1_TRIM_OUTBUF_COMP_TRIM1	0x42E70F20	Output buffer trim control. See DAC0_TRIM_OUTBUF_COMP_TRIM0 for the details of bit fields.
DAC1_TRIM_RMP_TRIM	0x42E70F24	Risk Mitigation bits. See DAC0_TRIM_RMP_TRIM for the details of bit fields.
SAR_SEQ_HS_DATA0	0x42E80100	SAR Sequencer High Speed Data (only accessible if ACTRLR.STATUS.MODE=0). This is the starting address of a register bank containing 32 registers (SAR_SEQ_HS_DATA0 to SAR_SEQ_HS_DATA31).
SAR_SEQ_LP_DATA0	0x42E80180	SAR Sequencer Low Power Data (only accessible if ACTRLR.STATUS.MODE=0). This is the starting address of a register bank containing 32 registers (SAR_SEQ_LP_DATA0 to SAR_SEQ_LP_DATA31).
SAR_STA_CTRL	0x42E80400	SAR Control register (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_FIR_CFG0	0x42E80408	FIR Configuration register (only accessible if ACTRLR.STATUS.MODE=0)

Autonomous Analog registers

Register name	Address	Description
SAR_STA_FIR_CFG1	0x42E8040C	FIR Configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_FIR_CFG0 for the details of bit fields.
SAR_STA_TR_SAMPLE_TIME	0x42E80418	SAR Trigger Sample Time (Risk Mitigation Only)
SAR_STA_SAMPLE_TIME0	0x42E80420	Sample control register (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_SAMPLE_TIME1	0x42E80424	Sample control register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_SAMPLE_TIME0 for the details of bit fields.
SAR_STA_SAMPLE_TIME2	0x42E80428	Sample control register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_SAMPLE_TIME0 for the details of bit fields.
SAR_STA_SAMPLE_TIME3	0x42E8042C	Sample control register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_SAMPLE_TIME0 for the details of bit fields.
SAR_STA_GPIO_CHAN_CFG0	0x42E80430	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_GPIO_CHAN_CFG1	0x42E80434	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_GPIO_CHAN_CFG0 for the details of bit fields.
SAR_STA_GPIO_CHAN_CFG2	0x42E80438	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_GPIO_CHAN_CFG0 for the details of bit fields.
SAR_STA_GPIO_CHAN_CFG3	0x42E8043C	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_GPIO_CHAN_CFG0 for the details of bit fields.
SAR_STA_GPIO_CHAN_CFG4	0x42E80440	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_GPIO_CHAN_CFG0 for the details of bit fields.
SAR_STA_GPIO_CHAN_CFG5	0x42E80444	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_GPIO_CHAN_CFG0 for the details of bit fields.
SAR_STA_GPIO_CHAN_CFG6	0x42E80448	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_GPIO_CHAN_CFG0 for the details of bit fields.
SAR_STA_GPIO_CHAN_CFG7	0x42E8044C	High Speed GPIO Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_GPIO_CHAN_CFG0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
SAR_STA_MUX_CHAN_CFG0	0x42E80450	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_MUX_CHAN_CFG1	0x42E80454	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG2	0x42E80458	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG3	0x42E8045C	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG4	0x42E80460	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG5	0x42E80464	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG6	0x42E80468	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG7	0x42E8046C	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
SAR_STA_MUX_CHAN_CFG8	0x42E80470	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG9	0x42E80474	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG10	0x42E80478	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG11	0x42E8047C	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG12	0x42E80480	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG13	0x42E80484	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_MUX_CHAN_CFG14	0x42E80488	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
SAR_STA_MUX_CHAN_CFG15	0x42E8048C	High Speed / Low Power Muxed Channel configuration register (Channel 0 routing is used for default routing (i.e. when the SAR gets enabled) (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_MUX_CHAN_CFG0 for the details of bit fields.
SAR_STA_STATUS_CFG0	0x42E80490	Global range detect mode register (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_STATUS_CFG1	0x42E80494	Global range detect mode register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_CFG0 for the details of bit fields.
SAR_STA_STATUS_CFG2	0x42E80498	Global range detect mode register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_CFG0 for the details of bit fields.
SAR_STA_STATUS_CFG3	0x42E8049C	Global range detect mode register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_CFG0 for the details of bit fields.
SAR_STA_STATUS_RANGE_LOW0	0x42E804A0	Global range detect low value register (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_STATUS_RANGE_LOW1	0x42E804A4	Global range detect low value register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_RANGE_LOW0 for the details of bit fields.
SAR_STA_STATUS_RANGE_LOW2	0x42E804A8	Global range detect low value register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_RANGE_LOW0 for the details of bit fields.
SAR_STA_STATUS_RANGE_LOW3	0x42E804AC	Global range detect low value register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_RANGE_LOW0 for the details of bit fields.
SAR_STA_STATUS_RANGE_HIGH0	0x42E804B0	Global range detect high value register (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_STATUS_RANGE_HIGH1	0x42E804B4	Global range detect high value register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_RANGE_HIGH0 for the details of bit fields.
SAR_STA_STATUS_RANGE_HIGH2	0x42E804B8	Global range detect high value register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_RANGE_HIGH0 for the details of bit fields.
SAR_STA_STATUS_RANGE_HIGH3	0x42E804BC	Global range detect high value register (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_STATUS_RANGE_HIGH0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
SAR_STA_GPIO_CHAN_RESULT0	0x42E804C0	High Speed GPIO Channel result register
SAR_STA_GPIO_CHAN_RESULT1	0x42E804C4	High Speed GPIO Channel result register. See SAR_STA_GPIO_CHAN_RESULT0 for the details of bit fields.
SAR_STA_GPIO_CHAN_RESULT2	0x42E804C8	High Speed GPIO Channel result register. See SAR_STA_GPIO_CHAN_RESULT0 for the details of bit fields.
SAR_STA_GPIO_CHAN_RESULT3	0x42E804CC	High Speed GPIO Channel result register. See SAR_STA_GPIO_CHAN_RESULT0 for the details of bit fields.
SAR_STA_GPIO_CHAN_RESULT4	0x42E804D0	High Speed GPIO Channel result register. See SAR_STA_GPIO_CHAN_RESULT0 for the details of bit fields.
SAR_STA_GPIO_CHAN_RESULT5	0x42E804D4	High Speed GPIO Channel result register. See SAR_STA_GPIO_CHAN_RESULT0 for the details of bit fields.
SAR_STA_GPIO_CHAN_RESULT6	0x42E804D8	High Speed GPIO Channel result register. See SAR_STA_GPIO_CHAN_RESULT0 for the details of bit fields.
SAR_STA_GPIO_CHAN_RESULT7	0x42E804DC	High Speed GPIO Channel result register. See SAR_STA_GPIO_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT0	0x42E804E0	High Speed / Low Power Muxed Channel result register
SAR_STA_MUX_CHAN_RESULT1	0x42E804E4	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT2	0x42E804E8	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT3	0x42E804EC	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT4	0x42E804F0	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT5	0x42E804F4	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT6	0x42E804F8	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
SAR_STA_MUX_CHAN_RESULT7	0x42E804FC	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT8	0x42E80500	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT9	0x42E80504	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT10	0x42E80508	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT11	0x42E8050C	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT12	0x42E80510	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT13	0x42E80514	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT14	0x42E80518	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_MUX_CHAN_RESULT15	0x42E8051C	High Speed / Low Power Muxed Channel result register. See SAR_STA_MUX_CHAN_RESULT0 for the details of bit fields.
SAR_STA_FIR_RESULT0	0x42E80520	FIR result register
SAR_STA_FIR_RESULT1	0x42E80524	FIR result register. See SAR_STA_FIR_RESULT0 for the details of bit fields.
SAR_STA_CHAN_RESULT_MASK	0x42E80530	Channel result mask (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_FIR_RESULT_MASK	0x42E80534	FIR result mask (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_CHAN_RESULT_UPDATED	0x42E80538	Channel result register status
SAR_STA_FIR_RESULT_UPDATED	0x42E8053C	FIR result register status
SAR_STA_STATUS	0x42E80540	SAR status register
SAR_STA_RANGE_STATUS	0x42E80544	Range status register
SAR_STA_CHAN_COEFF0	0x42E80550	Channel correction coefficients (only accessible if ACTRLR.STATUS.MODE=0)
SAR_STA_CHAN_COEFF1	0x42E80554	Channel correction coefficients (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_CHAN_COEFF0 for the details of bit fields.

Autonomous Analog registers

Register name	Address	Description
SAR_STA_CHAN_COEFF2	0x42E80558	Channel correction coefficients (only accessible if ACTRLR.STATUS.MODE=0). See SAR_STA_CHAN_COEFF0 for the details of bit fields.

Name	OA1_TOPO [23:20]				OA1_PWR_MODE [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	RW				RW	RW	RW	
HW Access	R				R	R	R	
Name	C1_FB [31:28]				OA1_C-C_ENABLE	RES1_SWAP	OA1_COMP_OUT [25:24]	

Bits	Name	Description
31 : 28	C1_FB	Feed back Cap value (see C0_FB) Default Value: 0
27	OA1_CC_ENABLE	Opamp1 miller compensation capacitor enable Default Value: 0 **0x0: DISABLE :** Opamp1 contains no miller compensation capactior. **0x1: ENABLE :** The compensation capacitor value is determined by CTBL_TRIM_STRUCT.OA1_COM-P_TRIM.OA1_COMP_TRIM
26	RES1_SWAP	Swap Top and Bottom resistor value (see RES0_SWAP) Default Value: 0
25 : 24	OA1_COMP_OUT	Opamp1 comparator edge detect output (for interrupt and trigger generation) Default Value: 0 **0x0: DISABLE :** Disabled, no interrupts will be detected

28.1.1 CTBL0_STA_CFG (continued)

		0x1: RISING : Rising edge **0x2: FALLING :** Falling edge **0x3: BOTH :** Both rising and falling edges
23 : 20	OA1_TOPO	OA1 Opamp Configuration: see description of OA0_CFG Default Value: 0
19 : 16	OA1_PWR_MODE	Opamp1 power level: see description of OA0_PWR_MODE Default Value: 0
15 : 12	C0_FB	Feed back Cap value select This field is only used if OA0_TOPO is set to 1, 2, or 4 and the Opamp Gain (set by the AC) is set to a non-unity value. The feedback capacitor is used to compensate the resistive feedback network. Values range from 0pF to 10.5pF in 0.7pF increments. 0000: 0pF 0001: 0.7pF 0010: 1.4pF 0011: 2.1pF 0100: 2.8pF 0101: 3.5pF 0110: 4.2pF 0111: 4.9pF 1000: 5.6pF 1001: 6.3pF 1010: 7.0pF 1011: 7.7pF 1100: 8.4pF 1101: 9.1pF 1110: 9.8pF 1111: 10.5pF Default Value: 0
11	OA0_CC_ENABLE	Opamp0 miller compensation capacitor enable Default Value: 0 **0x0: DISABLE :** Opamp0 contains no miller compensation capactior. **0x1: ENABLE :** The compensation capacitor value is determined by CTBL_TRIM_STRUCT.OA0_COMP_TRIM.OA0_COMP_TRIM
10	RES0_SWAP	RESERVED: Do not change from default Swap Top and Bottom resistor value Default Value: 0
9 : 8	OA0_COMP_OUT	6= Buffer Default Value: 0 **0x0: DISABLE :** Disabled, no interrupts will be detected

28.1.1 CTBL0_STA_CFG (continued)

		0x1: RISING : Rising edge **0x2: FALLING :** Falling edge **0x3: BOTH :** Both rising and falling edges
7 : 4	OA0_TOPO	OA0 Opamp Configuration 0= Comparator 1= PGA 2= TIA 3= Open Loop Opamp (must enable OA_TO_PIN in dynamic configuration) 4= Differential Amplifier (requires the same config for both OAs) 5= Hysteretic Comparator 6= Buffer 7-15=RESERVED Default Value: 0
3 : 0	OA0_PWR_MODE	Opamp0 power level Default Value: 0 **0x0: OFF :** Off **0x1: ULTRA_LOW :** If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=0: opamp quiscent current of 15uA, input common mode of 0.2V to VDDA-1V, gain bandwidth of 30kHz. If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=1: opamp quiscent current of 15uA, input common mode of 0.2V to VDDA-1V, gain bandwidth of 100kHz, 10uA output drive capability. **0x2: ULTRA_LOW_RAIL :** If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=0: opamp quiscent current of 35uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 30kHz. If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=1: opamp quiscent current of 35uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 100kHz, 10uA output drive capability. **0x3: LOW :** Do Not Use **0x4: LOW_RAIL :** If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=0: opamp quiscent current of 150uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 350kHz. If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=1: opamp quiscent current of 150uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 1.2MHz, 100uA output drive capability. **0x5: MEDIUM :** Do Not Use

28.1.1 CTBL0_STA_CFG (continued)

0x6: MEDIUM_RAIL :

If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=0: opamp quiscent current of 200uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 700kHz.
If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=1: opamp quiscent current of 200uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 2.4MHz, 1mA output drive capability.

0x7: HIGH :

Do Not Use

0x8: HIGH_RAIL :

If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=0: opamp quiscent current of 600uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 1.75MHz.
If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=1: opamp quiscent current of 600uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 6MHz,1mA output drive capability.

0x9: ULTRA_HIGH :

Do Not Use

0xa: ULTRA_HIGH_RAIL :

If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=0: opamp quiscent current of 800uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 2.8MHz.
If CTBL_DYN_CFG_STRUCT.OA_MUX_CFG.OA_TO_PIN=1: opamp quiscent current of 800uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth of 7.5MHz, 10mA output drive capability.

3 : 2	MODE	Post Processor Counter Mode Default Value: 0
		0x0: DIRECT :
		Direct mode: in this mode, the counter is configured to count the number of INPUT_TYPES. The condition is evaluated (based on the THRESHOLD register) every rising edge of the post precessor clock. If the condition is met, the counter is reset.
		0x1: FRAME :
		Frame mode: in this mode, the counter is configured to count the number of INPUT_TYPES that occur during a given frame. The frame rate is determined by FRAME.PERIOD. At the end of the frame, the condition is evaluated (based on the THRESHOLD register) and the counter is reset to begin the next frame.
		0x2: WINDOW :
		Window mode: in this mode, the counter is configured to count the number of INPUT_TYPES that occur inside a given window. The window size is set by WINDOW.SIZE. After filling the window, the condition is evaluted (based on the THRESHOLD register) every rising edge of the post processor clock. The counter is not reset in this mode.
		0x3: RESERVED :

6	DISABLED_MODE	Select the output value when the output is disabled 0: Tri-state CTDAC output when disabled 1: output Vssa or Vref when disabled (see BOT_SEL description) Default Value: 0

28.1.22 DAC0_STA_CTRL (continued)

5	BOT_SEL	Bottom connection select to R2R network. 0: Connect to VSSA: DAC enabled: when DM_OUT=OUT_EN, the DAC range is [0, 4095] * Vref / 4096, when DM_OUT=OUT_REF, the DAC outputs VSSA. DAC disabled and DISABLED_MODE=1, the DAC outputs VSSA. 1: Connect to VREF: DAC enabled: when DM_OUT=OUT_EN, the DAC range is [1, 4096] * Vref / 4096, when DM_OUT=OUT_REF, the DAC outputs VREF. DAC disabled and DISABLED_MODE=1, the DAC outputs VREF. Default Value: 0
4	DEGLITCH_EN	Deglitch enable This field is used to prevent glitches after the DAC output changes by opening the output switch for (open time set by DEGLITCH_TIME). If TOPO is set to 0-2, CHO switch is opened during deglitch time, if TOPO is set to 3,4, COS switch is opened during deglitch time. Default Value: 0 **0x0: DISABLED :** **0x1: ENABLED :**
3	VREF_SEL	DAC reference select Default Value: 0 **0x0: VREF_MUX_OUT :** DAC reference is driven by the reference mux (see REF_MUX_SEL). This selection requires that REFBUF_PWR_MODE be set to a value other than OFF. **0x1: VDDA :** DAC reference is driven directly from VDDA. Since this path does not use the DAC reference buffer, REFBUF_PWR_MODE should be set to OFF.
2 : 0	TOPO	DAC Topology Default Value: 0 **0x0: DIRECT :** DAC drives output directly **0x1: DIRECT_WITH_TRACK_CAP :** DAC drives output directly with Track Cap on output **0x2: DIRECT_WITH_TRACK_HOLD_CAP :** DAC drives output directly with Track and Hold Cap on output **0x3: BUFFERED_INTERNAL :** DAC output is buffered (internal connections only) **0x4: BUFFERED_EXTERNAL :** DAC output is buffered for internal or external connections **0x5: RESERVED_0 :** **0x6: RESERVED_1 :**

Bits	Name	Description
7 : 0	DEGLITCH_TIME	Geglitch Time selection for DAC value updates This field is only used if CTRL.DEGLITCH_EN=1. The deglitch time is measured in terms of CLK_HF (nominally 80MHz) cycles (if ACTRLR.STATUS.MODE=HS) or CLK_LPOSC (nominally 4.096MHz) cycles (if ACTRLR.STATUS.MODE=LP). Deglitch time = GEGLITCH_TIME+1, range 1..256 Default Value: 1

28.1.26 DAC0_STA_CHAN_CFG0

Description: Channel configuration register (only accessible if ACTRLR.STATUS.MODE=0)

Address: 0x42E60820

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	START_ADDR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW				Reserved	RW		
HW Access	R				Reserved	R		
Name	END_ADDR [15:12]				Reserved	START_ADDR [10:8]		

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved	RW						
HW Access	Reserved	R						
Name	Reserved	END_ADDR [22:16]						

Bits	31	30	29	28	27	26	25	24
SW Access	RW		RW		RW	RW		
HW Access	R		R		R	R		
Name	STATUS_SEL [31:30]		STEP_VAL_SEL [29:28]		SAM-PLE_AND_HOLD_EN	MODE [26:24]		

Bits	Name	Description
31 : 30	STATUS_SEL	Status selections. Default Value: 0 **0x0: DISABLED :** **0x1: STATUS_0 :** **0x2: STATUS_1 :** **0x3: STATUS_2 :**
29 : 28	STEP_VAL_SEL	DAC Step Value Selection Default Value: 0 **0x0: DISABLED :** STEP_VAL is 1. **0x1: STEP_0 :** STEP_VAL is set by STEP_VAL0.VAL.

28.1.26 DAC0_STA_CHAN_CFG0 (continued)

		0x2: STEP_1 : STEP_VAL is set by STEP_VAL1.VAL. **0x3: STEP_2 :** STEP_VAL is set by STEP_VAL2.VAL.
27	SAMPLE_AND_HOLD_EN	DAC Sample and Hold Enable SAMPLE_AND_HOLD_EN can only be selected if CTRL.TOPO=BUFFERED_INTERNAL or BUFFERED_EXTERNAL. The DAC is updated every positive edge of the DAC clock with the following sequence: 1. The DAC is configured for SAMPLE: DAC array is enabled and outputs the updated value (based on MODE) onto a capacitor for SAMPLE_TIME duration. 2. The DAC is configured for HOLD: DAC array is disabled and last output value is held on capacitor until next positive edge of the DAC clock (HOLD duration is DAC clock period - SAMPLE_TIME) *NOTE: For MODE=ADDRESS or DATA, the AC must wait for (ACT=WAIT_FOR) the DAC strobe (COND=DAC_STROBE) before re-triggering the DAC_INC/DAC_DEC fields. Default Value: 0
26 : 24	MODE	DAC operating mode Default Value: 0 **0x0: LUT_OS_ONE_QUAD :** DAC configured for One Shot One Quadrant LUT mode. LUT address increments every positive edge of the DAC clock until END_ADDR is reached or exceeded. Update Step size set by STEP_VAL_SEL. The One Shot is completed by the END_ADDR is reached. The DAC outputs an EPOCH trigger after reaching (or exceeding) the END_ADDR and outputing the corresponding value. **0x1: LUT_OS_TWO_QUAD :** DAC configured for One Shot Two Quadrant LUT mode. LUT address increments every positive edge of the DAC clock until END_ADDR is reached*, then the LUT address decrements back to the START_ADDR. DAC outputs an EPOCH trigger after returning to (or exceeding) the START_ADDR and outputing the START_ADDR value. *NOTE: If the END_ADDR is not reached but instead exceeded (can occur for STEP_VAL_SEL=1,2) then the LUT address is decremented from END_ADDR by the exceeded amount). After outputing the END ADDR in one direction, While wrapping around in reverse direction STEP_VAL is decremented from that last address value. (i.e. we output the last value only once and while going back in opposite direction, we ouput the address which is last address minus the step_val).

28.1.26 DAC0_STA_CHAN_CFG0 (continued)

0x2: LUT_OS_FOUR_QUAD :

DAC configured for One Shot Four Quadrant LUT mode.
LUT address is updated every positive edge of the DAC clock according to the following algorithm:
1. LUT address increments until END_ADDR is reached*.
2. LUT address decrements until START_ADDR is reached*.
3. Invert polarity and repeat 1 and 2.
DAC outputs an EPOCH trigger after returning to (or exceeding) the START_ADDR with an Inverted polarity and outputting the corresponding value.
(This mode assumes that the DAC waveform table (stored in SRAM) constitutes 1/4 of the desired generated waveform)
*NOTE: If the START/END_ADDR is not reached but instead exceeded (can occur for STEP_VAL_SEL=1,2) then the LUT address is adjusted (i.e. decremented from END_ADDR or incremented from the STAR_ADDR by the amount exceeded).
After outputing the START/END ADDR in one direction, While wrapping around in opposite direction STEP_VAL is incremented/decremented from that last address value. (i.e. we output the last value only once and while going back in opposite direction, we ouput the address which is last address plus/minus the step_val).

0x3: LUT_CONT_ONE_QUAD :

DAC configured for Continuous One Quadrant LUT mode.
LUT address increments every positive edge of the DAC clock until END_ADDR is reached*. The address then wraps back to the START_ADDR and repeats indefinitiely. Update Step size set by STEP_VAL_SEL.
The DAC outputs an EPOCH trigger after reaching (or exceeding) the END_ADDR and outputing the corresponding value.
*NOTE: If the END_ADDR is not reached but instead exceeded (can occur for STEP_VAL_-SEL=1,2) then the LUT address wraps back to the STAR_ADDR and is further incremented by the amount exceeded).

0x4: LUT_CONT_TWO_QUAD :

DAC configured for Continuous Two Quadrant LUT mode.
LUT address increments every positive edge of the DAC clock until END_ADDR is reached*, then the LUT address decrements back to the START_ADDR and repeats indefinitely.
DAC outputs an EPOCH trigger after returning to the START_ADDR and outputing the START_ADDR value.
*NOTE: If the START/END_ADDR is not reached but instead exceeded (can occur for STEP_VAL_SEL=1,2) then the LUT address is adjusted (i.e. decremented from END_ADDR or incremented from the STAR_ADDR by the amount exceeded).
After outputing the START/END ADDR in one direction, While wrapping around in opposite direction STEP_VAL is incremented/decremented from that last address value. (i.e. we output the last value only once and while going back in opposite direction, we ouput the address which is last address plus/minus the step_val).

28.1.26 DAC0_STA_CHAN_CFG0 (continued)

0x5: LUT_CONT_FOUR_QUAD :

DAC configured for Continuous Four Quadrant LUT mode.
LUT address is updated every positive edge of the DAC clock according to the following algorithm:
1. LUT address increments until END_ADDR is reached*.
2. LUT address decrements until START_ADDR is reached*.
3. Invert polarity and repeat 1 and 2 and repeat indefinitely.
DAC outputs an EPOCH trigger after returning to (or exceeding) the START_ADDR with an Inverted polarity and outputting the corresponding value.
(This mode assumes that the DAC waveform table (stored in SRAM) constitutes 1/4 of the desired generated waveform)
*NOTE: If the START/END_ADDR is not reached but instead exceeded (can occur for STEP_VAL_SEL=1,2) then the LUT address is adjusted (i.e. decremented from END_ADDR or incremented from the STAR_ADDR by the amount exceeded).
After outputing the START/END ADDR in one direction, While wrapping around in opposite direction STEP_VAL is incremented/decremented from that last address value. (i.e. we output the last value only once and while going back in opposite direction, we ouput the address which is last address plus/minus the step_val).

0x6: ADDR :

DAC configured for ADDRESS mode
Address is updated every positive edge of the DAC_INC or DAC_DEC from AC (unless SAMPLE_AND_HOLD_EN is set). Step size set by STEP_SIZE_EN and STEP_VAL.

If on the START_ADDR and DAC_DEC is triggered, the ADDR wraps forward to the END_ADDR.
If on the END_ADDR and DAC_INC is triggered, the address wraps back to the START_ADDR.
In this mode, the DAC does not output an EPOCH trigger.

0x7: DATA :

DAC configured for DATA mode
DAC outputs the data stored at the start address. The DAC output value is incremented or decremented based on AC.DAC_INC and AC.DAC_DEC The data is updated every positive edge of the DAC_INC or DAC_DEC (unless SAMPLE_AND_HOLD_EN is set). The increment/decrement amount is set by STEP_VAL_SEL.
In this mode, the DAC does not output an EPOCH trigger.
The DAC value is clamped if requested to go under the minimum code (0x000 for unsigned or 0x800 for signed) or above the maximum code (0xFFF for unsigned or 0x7FF for signed).

22 : 12	END_ADDR	End of Waveform Address pointer The end address must be greater than or equal to the start address (START_ADDR) END_ADDR is word(16bits) aligned and value ranges from 0-511 Default Value: 0
10 : 0	START_ADDR	Start of Waveform Address pointer When triggered (AC_DAC_TR), the DAC outputs the value at START_ADDR START_ADDR is word(16bits) aligned and value ranges from 0-511 Default Value: 0

SW Access	RW		RW		RW	RW		
HW Access	R		R		R	R		
Name	NEXT_ACTION [31:30]		CALIBRATE [29:28]		AVG_EN	AVG_CNT [26:24]		

Bits	Name	Description
31 : 30	NEXT_ACTION	Next Addr Field Default Value: Undefined **0x0: STOP :** assert SAR_DONE and SAR_EOS condition and go to idle. This action is used to indicate the end of a scan. **0x1: GO_TO_ENTRY_ADDR :** assert SAR_EOS condition and jump to Entry Addr. This action is used for continuous operation. In continuous operation, disabling the SAR (AC.SAR_EN=0) is the only mechanism available to cease SAR operation (without disabling the entire AC). **0x2: GO_TO_NEXT :** Go to next addr. This action is used to continue to a next state in a given scan. **0x3: RESERVED :**
29 : 28	CALIBRATE	Real Time Calibration Request. This signals the ADC to initiate a real-time calibration process during an ADC scan. Default Value: Undefined

28.1.38 SAR_SEQ_HS_DATA0 (continued)

		0x0: DISABLED : Calibration Disabled **0x1: OFFSET_AND_LINEARITY :** Calibrate both Offset and Linearity **0x2: OFFSET :** Callibrate Offset only **0x3: LINEARITY :** Callibrate Linearity only
27	AVG_EN	Average Enable This field is ignored if SAR_STA_CFG.CTRL.AVG_MODE=DISABLED. This field applies to all enabled channels (HS_GPIO_CHAN_EN and HS_MUX_CHAN_EN_SEL). 0 = averaging disabled 1 = averaging enabled If SAR_STA_CFG.CTRL.AVG_MODE=ACCUNDUMP, the enabled channels will be sampled, converted, and accumulated back to back (amount set by AVG_CNT). After AVG_CNT times, the accumulated results for each enabled channels are optionally shifted (set by SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.AVG_SHIFT and SAR_STA_CFG.CTRL.SHIFT_MODE). If SAR_STA_CFG.CTRL.AVG_MODE=INTERLEAVED, the enabled channels will be sampled, converted, and accumulated once per scan (amount set by AVG_CNT). After AVG_CNT scans, the accumulated results for each enabled channels are optionally shifted (set by SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.AVG_SHIFT and SAR_STA_CFG.CTRL.SHIFT_MODE). Requirements for using interleaved averaging: 1. The Entry Address state must have AVG_EN set. 2. The same value for AVG_CNT must be used across all states with AVG_EN set. 3. The AC cannot trigger the ADC with different multiple Entry Addresses (scans). 4. The SAR generates a SAR_DONE status at the end of every scan (unless confgured for continuous operation at which point only a SAR_EOS is generated), regardless of the value of AVG_CNT. If all channels in the scan are averaged, the AC can poll the SAR_RESULT or any of the SAR_(FIR)_FIFO_DONE triggers to determine when the averaged results are available. If only a subset of channels are averaged in a scan, it is up to the AC to count the number of scans to determine when the averaged results are available. Default Value: Undefined
26 : 24	AVG_CNT	Averaging Count for channels that have averaging enabled (AVG_EN). A channel will be sampled and accumulated (1<<(AVG_CNT+1)) = [2..256] times. If SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.AVG_SHIFT for an enabled channel is set, the accumulated samples are right shifted based on the value of SAR_STA_CFG.CTRL.SHIFT_MODE: SAR_STA_CFG.CTRL.SHIFT_MODE=TWELVE: After the last accumulation, the result is shifted back to 12 bits SAR_STA_CFG.CTRL.SHIFT_MODE=SIXTEEN: After the last accumulation, if avg_cnt >=32 the result will be shifted back to 16-bits, if avg_cnt < 32, no shift will be done as the result already is guaranteed to fit in 16 bits. Default Value: Undefined

28.1.38 SAR_SEQ_HS_DATA0 (continued)

23	TR_SAMPLE_TIME_EN	Trigger Sample Time Enable. This field must always remain 0. For risk mitigation purposes only: this bit only applies to the first SAR table entry pointed to by the Autonomous Controller on a trigger if additional sample time is required. When this bit is set, the sample time on this first triggered table entry is SAR_STA_CFG.TR_SAMPLE_-TIME.HS_SAMPLE_TIME. This only applies to when the table entry is first triggered. In continuous mode, when this table entry is executed again, the SAMPLE_TIME_EN/ SAMPLE_TIME_SEL will be used. Default Value: Undefined
22	SAMPLE_TIME_EN	Sample Time Enable. If this bit is set, then the start of conversion for this SAR table entry will be delayed by the sample time pointed to in SAMPLE_TIME_SEL Default Value: Undefined
21 : 20	SAMPLE_TIME_SEL	Sample Time Select. Choose from 1 of 4 available Sample Times in SAR_STA_CFG.SAMPLE_-TIME registers Default Value: Undefined
19 : 16	MUX1_CHAN_SEL	MUX1 Channel Sel (See MUX0_CHAN_SEL) (This field is not used if HS_MUX_CHAN_EN_SEL = DISABLED or MUX0_SINGLE_ENDED or MUX0_PSEUDO_DIFF) Default Value: Undefined

Bits	31	30	29	28	27	26	25	24
SW Access	RW		RW		RW	RW		
HW Access	R		R		R	R		
Name	NEXT_ACTION [31:30]		CALIBRATE [29:28]		AVG_EN	AVG_CNT [26:24]		

Bits	Name	Description
31 : 30	NEXT_ACTION	Next Addr Field Default Value: Undefined **0x0: STOP :** assert SAR_DONE and SAR_EOS condition and go to idle. This action is used to indicate the end of a scan. **0x1: GO_TO_ENTRY_ADDR :** assert SAR_EOS condition and jump to Entry Addr. This action is used for continuous operation. In continuous operation, disabling the SAR (AC.SAR_EN=0) is the only mechanism available to cease SAR operation (without disabling the entire AC). **0x2: GO_TO_NEXT :** Go to next addr. This action is used to continue to a next state in a given scan. **0x3: RESERVED :**
29 : 28	CALIBRATE	Real Time Calibration Request. This signals the ADC to initiate a real-time calibration process during an ADC scan. Default Value: Undefined

28.1.39 SAR_SEQ_LP_DATA0 (continued)

		0x0: DISABLED : Calibration Disabled **0x1: OFFSET_AND_LINEARITY :** Calibrate both Offset and Linearity **0x2: OFFSET :** Callibrate Offset only **0x3: LINEARITY :** Callibrate Linearity only
27	AVG_EN	Average Enable This field is ignored if SAR_STA_CFG.CTRL.AVG_MODE=DISABLED. This field applies to all enabled channels (HS_GPIO_CHAN_EN and HS_MUX_CHAN_EN_SEL). 0 = averaging disabled 1 = averaging enabled If SAR_STA_CFG.CTRL.AVG_MODE=ACCUNDUMP, the enabled channels will be sampled, converted, and accumulated back to back (amount set by AVG_CNT). After AVG_CNT times, the accumulated results for each enabled channels are optionally shifted (set by SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.AVG_SHIFT and SAR_STA_CFG.CTRL.SHIFT_MODE). If SAR_STA_CFG.CTRL.AVG_MODE=INTERLEAVED, the enabled channels will be sampled, converted, and accumulated once per scan (amount set by AVG_CNT). After AVG_CNT scans, the accumulated results for each enabled channels are optionally shifted (set by SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.AVG_SHIFT and SAR_STA_CFG.CTRL.SHIFT_MODE). Requirements for using interleaved averaging: 1. The Entry Address state must have AVG_EN set. 2. The same value for AVG_CNT must be used across all states with AVG_EN set. 3. The AC cannot trigger the ADC with different multiple Entry Addresses (scans). 4. The SAR generates a SAR_DONE status at the end of every scan (unless confgured for continuous operation at which point only a SAR_EOS is generated), regardless of the value of AVG_CNT. If all channels in the scan are averaged, the AC can poll the SAR_RESULT or any of the SAR_(FIR)_FIFO_DONE triggers to determine when the averaged results are available. If only a subset of channels are averaged in a scan, it is up to the AC to count the number of scans to determine when the averaged results are available. Default Value: Undefined
26 : 24	AVG_CNT	Averaging Count for channels that have averaging enabled (AVG_EN). A channel will be sampled and accumulated (1<<(AVG_CNT+1)) = [2..256] times. If SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.AVG_SHIFT for an enabled channel is set, the accumulated samples are right shifted based on the value of SAR_STA_CFG.CTRL.SHIFT_MODE: SAR_STA_CFG.CTRL.SHIFT_MODE=TWELVE: After the last accumulation, the result is shifted back to 12 bits SAR_STA_CFG.CTRL.SHIFT_MODE=SIXTEEN: After the last accumulation, if avg_cnt >=32 the result will be shifted back to 16-bits, if avg_cnt < 32, no shift will be done as the result already is guaranteed to fit in 16 bits. Default Value: Undefined

28.1.39 SAR_SEQ_LP_DATA0 (continued)

23	TR_SAMPLE_TIME_EN	Trigger Sample Time Enable. This field must always remain 0. For risk mitigation purposes only: this bit only applies to the first SAR table entry pointed to by the Autonomous Controller on a trigger if additional sample time is required. When this bit is set, the sample time on this first triggered table entry is SAR_STA_CFG.TR_SAMPLE_-TIME.LP_SAMPLE_TIME. This only applies to when the table entry is first triggered. In continuous mode, when this table entry is executed again, the SAMPLE_TIME_EN/ SAMPLE_TIME_SEL will be used. Default Value: Undefined
22	SAMPLE_TIME_EN	Sample Time Enable. If this bit is set, then the start of conversion for this SAR table entry will be delayed by the sample time pointed to in SAMPLE_TIME_SEL Default Value: Undefined
21 : 20	SAMPLE_TIME_SEL	Sample Time Select. Choose from 1 of 4 available Sample Times for the static config Default Value: Undefined
19 : 16	RESERVED_2	Default Value: Undefined
15 : 12	CHAN_SEL	LP Channel Select Default Value: Undefined **0x0: MUX_CHANNEL_0 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG0 **0x1: MUX_CHANNEL_1 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG1 **0x2: MUX_CHANNEL_2 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG2 **0x3: MUX_CHANNEL_3 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG3 **0x4: MUX_CHANNEL_4 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG4 **0x5: MUX_CHANNEL_5 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG5 **0x6: MUX_CHANNEL_6 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG6 **0x7: MUX_CHANNEL_7 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG7 **0x8: MUX_CHANNEL_8 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG8 **0x9: MUX_CHANNEL_9 :** mux configured by settings in SAR_STA_CFG.MUX_CHAN_CFG9

SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
23 : 22	LP_SAR_PWR_MODE	Request to disable Channel Buffer after sampling is done and SAR Macro after conversion is done. (Valid only in LP mode). Default Value: 0 **0x0: DISABLED :** Buffer and Core are not disabled **0x1: BUFFER_AND_CORE :** Disable both Buffer and Core **0x2: BUFFER :** Disable Buffer only **0x3: CORE :** Disable Core only
21	SHIFT_MODE	If GPIO(MUX)_CHAN_CFG.AVG_SHIFT is enabled for a given channel, shift the result to support 12 or 16-bit resolutions. This field does not impact FIR outputs. Default Value: 0

28.1.40 SAR_STA_CTRL (continued)

0x0: TWELVE :

TWELVE: After the last accumulation, the result is shifted back to 12 bits

0x1: SIXTEEN :

SIXTEEN: After the last accumulation, if SEQ_HS(LP)_DATA.AVG_CNT >=32 the result will be shifted back to 16-bits, if SEQ_HS(LP)_DATA.AVG_CNT < 32, no shift will be done as the result already is guaranteed to fit in 16 bits.

20	CHAN_ID_EN	Channel Number Identifier Enable Default Value: 0

0x0: DISABLED :

Data stored in FIFO (selected by GPIO_CHAN_CFG.FIFO_SEL or MUX_CHAN_CFG.FIFO_-SEL) does not include Channel Number Identifier. FIFO data is SAR result sign extended to 32-bits.

0x1: ENABLED :

Data stored in FIFO (selected by GPIO_CHAN_CFG.FIFO_SEL ot MUX_CHAN_CFG.FIFO_-SEL) does include Channel Number Identifier. MSB of FIFO data ([31:24]) is defined as follows:
[27:24]: GPIO Channel Number (Valid numbers are 0-7)
[31:28]: Mux Channel Number (Valid numbers are 0-15)
SAR result sign extended to 24-bits.
NOTE: FIR data that is written to a FIFO does not have an associated channel ID as the data can be up to 32-bits. FIR data should always be written to dedicated FIFOs.

19 : 18	STARTUP_CAL_EN	Startup calibration request This field is used to request a calibration process whenever the SAR is powered up (i.e. when AC.SAR.EN toggles from 0 to 1). Default Value: 0

0x0: DISABLED :

Startup calibration Disabled

0x1: OFFSET_AND_LINEARITY :

calibrate both Offset and Linearity

0x2: OFFSET :

callibrate Offset only

0x3: LINEARITY :

callibrate Linearity only

17 : 16	AVG_MODE	Averaging mode applied to all channels in a scan where averaging is enabled Default Value: 0

0x0: DISABLED :

Disabled

28.1.40 SAR_STA_CTRL (continued)

0x1: ACCUNDUMP :

Accumulate and Dump (1st order accumulate and dump filter): enabled channels for a given SEQ_HS(LP)_DATA state with AVG_EN set will be accumulated back to back and optionally shifted (if GPIO(MUX)_CHAN_CFG.SHIFT_EN is set). The number of accumulations is set by SEQ_HS(LP)_DATA.AVG_CNT.

0x2: RESERVED_0 :

0x3: RESERVED_1 :

15 : 12	BUF1_PWR_MODE	Output buffer power level: see description of BUF0_PWR_MODE Default Value: 0
11 : 8	BUF0_PWR_MODE	Buffer zero power level Default Value: 0

0x0: OFF :

Off

0x1: ULTRA_LOW :

Buffer quiscent current of 15uA, input common mode of 0.2V to VDDA-1V, gain bandwidth 30kHz

0x2: ULTRA_LOW_RAIL :

Buffer quiscent current of 35uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth 30kHz

0x3: LOW :

Do Not Use

0x4: LOW_RAIL :

Buffer quiscent current of 150uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth 350kHz

0x5: MEDIUM :

Do Not Use

0x6: MEDIUM_RAIL :

Buffer quiscent current of 200uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth 700kHz

0x7: HIGH :

Do Not Use

0x8: HIGH_RAIL :

Buffer quiscent current of 600uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth 1.75MHz

28.1.40 SAR_STA_CTRL (continued)

		0x9: ULTRA_HIGH : Do Not Use **0xa: ULTRA_HIGH_RAIL :** Buffer quiscent current of 800uA, input common mode of 0.2V to VDDA-0.2V, gain bandwidth 2.8MHz **0xb: RESERVED_0 :** **0xc: RESERVED_1 :** **0xd: RESERVED_2 :** **0xe: RESERVED_3 :** **0xf: RESERVED_4 :**
7	LP_DIFFERENTIAL_EN	Low Power Differential Enable This field is only used for LP mode and is applied to all Mux Channels. Default Value: 1 **0x0: DISABLED :** Single ended operation (MUX_CHAN_CFG[X].NEG_PIN_SEL and MUX-_CHAN_CFG[X].NEG_COEFF_SEL are ignored) **0x1: ENABLED :** Differential operation MUX_CHAN_CFG[X].NEG_PIN_SEL and MUX-_CHAN_CFG[X].NEG_COEFF_SEL are used.
6 : 4	LP_VREF_SEL	See HS_VREF_SEL Default Value: 0
2 : 0	HS_VREF_SEL	ADC Core VREF selection Default Value: 0 **0x0: VDDA :** VREF set to VDDA. The internal reference buffer is off, and an external capacitor is not used. **0x1: VREF_EXT :** VREF set to external reference (provided through GPIO). The internal reference buffer is off, and an external capacitor is optional. **0x2: VBGR :** VREF set to internal bandgap reference. The internal reference buffer is on, and an external capacitor is mandatory for HS mode and optional for LP mode. **0x3: VDDA_BY_2 :** VREF set to internal VDDA divider (VDDA/2). The internal reference buffer is on, and an external capacitor is not mandatory for HS mode and optional for LP mode.

28.1.40 SAR_STA_CTRL (continued)

0x4: PRB_VREF0 :

VREF set to internal PRB Reference 0. The internal reference buffer is on, and an external capacitor is mandatory for both HS and LP modes.

0x5: PRB_VREF1 :

VREF set to internal PRB Reference 0. The internal reference buffer is on, and an external capacitor is mandatory for both HS and LP modes.

HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	Reserved						
HW Access	W	Reserved						
Name	BUSY	Reserved [30:24]						

Bits	Name	Description
31	BUSY	If high then the SAR is busy with a conversion. This bit is always high when CONTINUOUS (i.e. the last state of a scan has SEQ_HS(LP)_DATA.NEXT_ACTION=GO_TO_ENTRY_ADDR). Except for CONINUOUS mode, firmware should wait for this bit to be low before powering down the SAR (AC.SAR_EN=0). Default Value: 0

28.1.57 SAR_STA_RANGE_STATUS

Description: Range status register

Address: 0x42E80544

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C							
HW Access	RW1S							
Name	GPIO_CHAN_RANGE_STATUS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						RW1C

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	GAIN [31:24]							

Bits	Name	Description
31 : 16	GAIN	Gain Correction Coefficient (Default value is gain of 1). This field is intended to correct sources of gain error in the SAR channel (from the GPIO to the SAR ADC input). It is expected that both the channel offset correction coefficient and SAR ADC offset have already been calibrated (i.e. HS(LP)_CAL_MEM values are valid). Multiplies the 12-bit SAR conversion by X.XXXXXXXXXXXXXXX Range is: 1/2^15=(0.000030517578125) to 2-(1/2^15)=(1.999969482421875) Default Value: 0x8000
11 : 0	OFFSET	Channel Offset Correction Coefficient (Default value is offset of 0). This field is intended to correct sources of offset error in the SAR channel (from the GPIO to the SAR ADC input). It is expected that the SAR ADC offset has already been calibrated (i.e. HS(LP)_CAL_MEM values are valid). Signed offset values range from -2048 (0x800) to +2047 (0x7FF) is added to 12-bit SAR conversion. Default Value: 0

28.1.59 SAR_FIR00_COEF

Bits	31	30	29	28	27	26	25	24
SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	- 0: LPPASS IP disabled - 1: LPPASS IP enabled This field functions as the Global Enable for the LPPASS IP. This field must be set to gain read/write access to any other register in the LPPASS memory map. During initial IP release from reset (i.e. during POR), the LPPASS IP (along with its switched internal power domain) is disabled. After setting this bit, the LPPASS internal switched domain is powered up. The user must then wait for PWR_STATUS.SW_OK to assert. At this point, the user has read/write access to all LPPASS memory map registers. Clearing this field (i.e. disabling the LPPASS) can lead to status only clearing, or status and configuration clearing (see CFG.DISABLE_MODE). Default Value: 0

28.1.79 ACTRLR_CMD_RUN

Description: run command register

Address: 0x42ED0004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							RW1C
Name	Reserved [7:1]							RUN

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	RUN	Autonomous Controller Run Command Firmware should only write to this field when STATUS=STOPPED or PAUSED. When firmware sets this field, the Autonomous Controller starts running at the State pointed to by CMD_STATE. Hardware clears this field when the Autonomous Controller acknowledges the run command. If this field is set while STATUS=RUNNING, the Autonomous Controller will not respond to the command (beyond clearing the field). This register is reset whenever the following occurs: 1. The Autonomous Controller is disabled (clearing CTRL.ENABLED) 2. The LPPASS is configured for HS mode (STATUS.MODE=0) and the chip leaves an Active Mode. Default Value: 0

28.1.80 ACTRLR_CMD_STATE

Description: state override register

Address: 0x42ED0008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW					
HW Access	Reserved		RW					
Name	Reserved [7:6]		STATE [5:0]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5 : 0	STATE	Autonomous Controller Command State This field indicates where which AC State (0-63) the AC will execute instructions from when it receives a RUN or SINGLE_STEP command. Hardware updates this field whenever the AC transitions from RUNNING to STOPPED or PAUSED. When STOPPED or PAUSED, firmware can overrwrite this field to force the AC to execute from a specific STATE when triggered by a subsequent RUN or SINGLE_STEP command. This field must never be written to if STATUS=RUNNING. This register is reset whenever the following occurs: 1. The Autonomous Controller is disabled (clearing CTRL.ENABLED) 2. The LPPASS is configured for HS mode (STATUS.MODE=0) and the chip leaves an Active Mode. Default Value: 0

28.1.81 ACTRLR_FW_TR0

Description: firmware trigger

Address: 0x42ED0010

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							RW1C
Name	Reserved [7:1]							FW_TR

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	FW_TR	Firmware Trigger This field is used as a firmware trigger for the Autonomous Controller. The Autonomous Controller can be programmed to respond to the firmware trigger by programming a state with a condtion (COND) TR_LPPASS_IN*. Additionally, writing to this field will force the Autonomus Controller to wake from sleep. Hardware clears this bit when the Autonomous Controller acknowledges the trigger. This register is reset whenever the following occurs: 1. The Autonomous Controller is disabled (clearing CTRL.ENABLED) 2. The LPPASS is configured for HS mode (STATUS.MODE=0) and the chip leaves an Active Mode. Default Value: 0

28.1.82 ACTRLR_STATUS

Description: status register

Address: 0x42ED0020

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		R					
HW Access	Reserved		W					
Name	Reserved [7:6]		CUR_STATE [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved					R	R	
HW Access	Reserved					W	W

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
10	MODE	This field indicates the mode of the Autonomous Controller. The Autonmous Controller always resets to HS mode. This field is reset whenever the following occurs: 1. The Autonomous Controller is disabled (clearing CTRL.ENABLED) 2. The LPPASS is configured for HS mode (STATUS.MODE=0) and the chip leaves an Active Mode. Default Value: 0 **0x0: HS :** Autonomous Controller is in High Speed (HS) mode In this mode, the LPPASS IP is functional only in chip Active modes. The LPPASS IP is clocked from a peripheral source derived from clk_hf. **0x1: LP :** Autonomous Controller is Low Power (LP) mode In this mode, the LPPASS IP is functional in both chip Active and Deepsleep modes. The LP-PASS IP is clocked from the internal LPOSC.
9 : 8	STATUS	Autonomous Controller status Default Value: 0 **0x0: STOPPED :** Autonomous Controller is stopped

28.1.82 ACTRLR_STATUS (continued)

		0x1: RUNNING : Autonomous Controller is running **0x2: PAUSED :** Autonomous Controller is paused **0x3: RESERVED :**
5 : 0	CUR_STATE	This register indicates the current state of the Autonomous Controller (valid values are 0-63). Default Value: 0

28.1.83 ACTRLR_CFG

Description: config register (only accessible if CTRL.EN=0)

Address: 0x42ED0024

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved				RW			
HW Access	Reserved				R			
Name	Reserved [7:4]				DOUT_EN [3:0]

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
17	DISABLE_MODE	Autonomous Controller Disable Mode -0 : Keep the LPPASS switched digital supply powered when the AC is disabled (i.e. CTRL.EN-ABLED=0). - 1: Power Down the LPPASS digital supply when AC is disabled. This has the following conse-quences to the LPPASS: 1. Digital leakage is reduced (i.e. all logic on the LPPASS switched supply is powered off). 2. All LPPASS configuration is lost (all registers are reset and SRAMs lose data). Default Value: 0
16	SLEEP_MODE	Autonomous Controller Sleep Mode -0 : Keep the LPPASS switched digital supply powered when the AC is sleeping (i.e. AC state programmed to action (ACT)=WAIT_FOR, and condition (COND)=wakeup source). - 1: Power Down the LPPASS digital supply when AC is asleep (i.e. AC ACT=WAIT_FOR, AC_COND= wakeup source). This has the following consequences to the LPPASS: 1. Digital leakage is reduced (i.e. all logic on the LPPASS switched supply is powered off). 2. CTBLs, SAR FIRs, and the DACs loose all configuration (i.e. they must be re-programmed to be functional again). 3. The wakeup time is increased by 3us (to account for the switched power domain coming up). Default Value: 0
3 : 0	DOUT_EN	DOUT output enable. Bits in this field must be set prior to writing to TIMER_TABLE_STRUCT.TT_CF0_DOUT. -0 : DOUT[X] output disabled - 1: DOUT[X] output enabled Default Value: 0

28.1.84 ACTRLR_DEBUG_PAUSE

Description: pause debug register

Address: 0x42ED0030

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							RW1C

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	PAUSE	Pause Command Setting this field requests the Autonomous Controller (AC) to pause. This field is used for debug purposes only. The AC waits for the present state to complete before pausing. If the present state cannot complete (i.e. the ACT and COND are programmed improperly), the AC will not pause. This command must not be used when executing an AC sleep state (ACT=WAIT_FOR and COND=WAKE_*). When the AC is paused, all AC registerd conditions are cleared. Hardware clears this bit when the Autonomous Controller is paused. This command is ignored if STATUS.STATUS is PAUSED or STOP. Default Value: 0

28.1.85 ACTRLR_DEBUG_SINGLE_STEP

Description: single step debug register

Address: 0x42ED0034

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW1S
HW Access	Reserved							RW1C

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	SINGLE_STEP	Single Step Command Setting this field requests the Autonomous Controller (AC) to execute the next AC state (pointed to by CMD_STATE.STATE) and pause after completing that state. This field is used for debug purposes only. If the state (pointed to by CMD_STATE.STATE) cannot complete (i.e. the ACT and COND are programmed improperly), the AC will not pause at the end of the single step command. This command must not be used when executing an AC sleep state (ACT=WAIT_FOR and COND=*_WAKE). When the AC is paused, all AC registerd conditions are cleared. Hardware clears this bit when the Autonomous Controller pauses after executing the single step command. This command is ignored if STATUS.STATUS is RUNNING. Default Value: 0

28.1.86 ACTRLR_PWR_STATUS

Description: power status register

Address: 0x42ED0038

Retention: Retained

Bits	7	6	5	4	3	2	1	0

9	PRB_UNLOCK	PRB Unlock 0: Lock: PRB fields: VREF1(0)_VAL, VREF1(0)_FW_MODE do NOT get updated 1: Unlock: PRB fields: VREF1(0)_VAL, VREF1(0)_FW_MODE do get updated Default Value: 0
8	MODE_UNLOCK	Mode Unlock 0: Lock: MODE does NOT get updated 1: Unlock: MODE does get updated Default Value: 0
4	MODE	LPPASS Operating Mode 0: High Speed (HS) Operation - The PASS is clocked from CLK_HF directly (nominally 80MHz) and is only functional in chip Active mode (i.e. the IP is reset in chip Deepsleep and Hibernate) 1: Low Power (LP) Operation - The PASS is clocked from CLK_LPOSC (4MHz) and is functional in chip Active and Deepsleep mode (i.e. the IP is only reset in Hibernate) Default Value: 0
3 : 0	DOUT	LPPASS data out generation (the corresponding bit in CFG.DOUT_EN must be set when using this field) The data out bus is driven directly to the GPIO HSIO interface. The HSIO interface must be programmed properly for the DOUT bus to be observed on the GPIO pins. Default Value: 0

28.1.89 ACTRLR_TTCFG0_TT_CFG1

Description: AC Table Configuration 1

Address: 0x42ED0804

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW					
HW Access	R		R					
Name	RESERVED_0 [7:6]		BR_ADDR [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	RW		RW					
HW Access	R		R					
Name	RESERVED_1 [15:14]		COND [13:8]					

Bits	23	22	21	20	19	18	17	16
SW Access	RW				RW	RW		
HW Access	R				R	R		
Name	CNT [23:20]				INTR_SET	ACTION [18:16]		

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	CNT [31:24]							

Bits	Name	Description
31 : 20	CNT	This field is used to set the timer/counter values for either interval and loop counts. The actual count is CNT+1. Therefore, the range is 1 to 4096. The value of 1 is degenerate. This field is only valid if the action (ACT) is set to WAIT_FOR, or BRANCH_IF_* and the condition (COND) is set to CNT_DONE. If ACT is set to WAIT_FOR, the counter is first loaded with CNT+1 and is subsequently decremented every clock cycle (clock set by MODE). On terminal count, the CNT_DONE trigger is asserted. If ACT is set to BRANCH_IF_*, the counter is first checked if it is busy (count value is nonzero). If busy, the counter is decremented. If not busy, the counter is loaded with CNT+1. On terminal count, the CNT_DONE trigger is asserted. Default Value: Undefined
19	INTR_SET	AC Interrupt Set This field is used for setting the Autonomous Controller Interrupt and/or trigger. When set in a particular state, the AC generates a single cycle pulse to the interrupt logic. The AC interrupt or AC trigger must be unmasked for this field to generate an interrupt/trigger. If ACTION=WAIT_FOR, the signle cycle pulse is generated after the COND occurs, otherwise the single cycle pulse is sent immediately upon entering the state where the field is set. Default Value: Undefined
18 : 16	ACTION	Autonomous Controller Action Default Value: Undefined **0x0: STOP :** Stop the autonomous controller

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x1: NEXT :

Proceed to the next state

0x2: WAIT_FOR :

Wait for the associated COND to occur before moving to the next state
If COND=FALSE, stay in the present state indefinitely. If COND=TRUE, move to the next state.

0x3: BRANCH_IF_TRUE :

Check if COND has occurred, If it has, take the indicated branch (BR ADDR), if not, proceed to the next state.
If COND=FALSE, proceed to the next state. If COND=TRUE, take the indicated branch (BR_ADDR).

0x4: BRANCH_IF_FALSE :

Check if COND has occurred, If it has proceed to the next state, if not, take the indicated branch (BR ADDR)
If COND=FALSE, take the indicated branch (BR_ADDR). If COND=TRUE, proceed to the next state.

0x5: BRANCH_IF_TRUE_CLR :

Check if COND has occurred, If it has, take the indicated branch (BR ADDR), if not, proceed to the next state.
If COND=FALSE, proceed to the next state. If COND=TRUE, take the indicated branch (BR_ADDR).
If the indicated branch is taken, all loop counters are cleared (reset). If the AC_CONDITION is set to CNT_DONE, then the loop counters are not cleared (reset).

0x6: BRANCH_IF_FALSE_CLR :

Check if COND has occurred, If it has proceed to the next state, if not, take the indicated branch (BR ADDR)
If COND=FALSE, take the indicated branch (BR_ADDR). If COND=TRUE, proceed to the next state.
If the indicated branch is taken, all loop counters are cleared (reset). If the AC CONDITION is set to CNT_DONE, then the loop counters are not cleared (reset).

0x7: RESERVED0 :

15 : 14	RESERVED_1	Default Value: Undefined
13 : 8	COND	Autonomous Controller Condition Default Value: Undefined

0x0: False :

Hardcoded FALSE value

0x1: True :

Hardcoded TRUE value

0x2: BLOCK_READY :

Enabled block(s) are ready for use.

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x3: CNT_DONE :

if the ACTION is WAIT_FOR - this is an interval timer.
If the ACTION is BRANCH IF - this is a loop counter.

0x4: SAR_DONE :

SAR Sequencer Done
This status is sticky. It is set by the SAR when finishing a state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to STOP. This field should NOT be used if the SAR is configured for CONTINUOUS operation (i.e. SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_DONE.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_DONEs).
This status does NOT indicate that the SAR data has been written to the FIFO (indicated by SAR_FIFO_DONE).

0x5: SAR_EOS :

SAR Sequencer EOS
This status is sticky. It is set by the SAR when finishing the state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS or STOP. The status is cleared by the AC when executing an AC state with the COND programmed to SAR_EOS. No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_EOSs).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_EOS.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_EOSs).

0x6: SAR_RANGE0 :

SAR Range 0 detection
This status is sticky. It is set by the SAR if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_0).

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_RANGE0.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_RANGE0s).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x7: SAR_RANGE1 :

SAR Range 1 detection
This status is sticky. It is set by the SAR if the RANGE0 condition is met for a given channel with range 1 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_1).

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_RANGE1.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_RANGE0s).

0x8: SAR_RANGE2 :

SAR Range 2 detection
This status is sticky. It is set by the SAR if the RANGE2 condition is met for a given channel with range 0 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_2).

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_RANGE2.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_RANGE2s).

0x9: SAR_RANGE3 :

SAR Range 3 detection
This status is sticky. It is set by the SAR if the RANGE0 condition is met for a given channel with range 3 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_3).

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_RANGE3.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_RANGE3s).

0xa: SAR_BUSY :

SAR BUSY detection
This status is set whenever the SAR is running a scan. This status is transparent from the SAR sequencer (i.e. the status is not sticky).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0xb: SAR_FIR0_DONE :

SAR FIR0 Done detection
This status is sticky. It is set by the SAR FIR0 block whenever FIR0 produces a valid output. The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_RANGE3.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
The status is cleared by the AC when executing an AC state with the COND programmed to SAR_FIR0_DONE. No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_FIR0_DONEs). This status does NOT indicate that the FIR0 data has been written to the FIFO (indicated by SAR_FIR0_FIFO_DONE).

0xc: SAR_FIR1_DONE :

SAR FIR1 Done detection
This status is sticky. It is set by the SAR FIR1 block whenever FIR0 produces a valid output. The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_RANGE3.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
The status is cleared by the AC when executing an AC state with the COND programmed to SAR_FIR1_DONE. No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_FIR1_DONEs). This status does NOT indicate that the FIR1 data has been written to the FIFO (indicated by SAR_FIR1_FIFO_DONE).

0xd: SAR_FIFO_DONE :

SAR FIFO Done
This status is sticky. This status is SAR_DONE ANDED with FIFO writing complete. This field should NOT be used if the SAR is configured for CONTINUOUS operation (i.e. SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS) since SAR_DONE is never asserted. In that case, the user should use the appropriate FIFO_LEVEL triggers.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_FIFO_DONE.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_FIFO_DONEs).
This status does NOT indicate that the SAR data has been written to the FIFO (indicated by SAR_FIFO_DONE).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0xe: SAR_FIR0_FIFO_DONE :

SAR FIR0 FIFO Done detection
This status is sticky. It is set by the SAR FIR0 block whenever FIR0 data has been written into the FIFO. When using this bit, it is expected that FIR0 writes to the FIFO only once in a given SAR scan.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_FIR0_FIFO_DONE.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_FIR0_FIFO_DONEs).

0xf: SAR_FIR1_FIFO_DONE :

SAR FIR1 FIFO Done detection
This status is sticky. It is set by the SAR FIR1 block whenever FIR1 data has been written into the FIFO. When using this bit, it is expected that FIR1 writes to the FIFO only once in a given SAR scan.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_FIR1_FIFO_DONE.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.SAR_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple SAR_FIR1_FIFO_DONEs).

0x10: PTC_STROBE0 :

PTC Post Processor 0 Strobe
This status is set whenever the PTC Post Processor 0 has valid data. This status is transparent from the PTC post processor (i.e. the status is not sticky).
The AC needs to poll this status (i.e. ACTION is WAIT_FOR and COND is PTC_STROBE0) prior to checking PTC_RANGE0.

0x11: PTC_STROBE1 :

PTC Post Processor 1 Strobe
This status is set whenever the PTC Post Processor 1 has valid data. This status is transparent from the PTC post processor (i.e. the status is not sticky).
The AC needs to poll this status (i.e. ACTION is WAIT_FOR and COND is PTC_STROBE1) prior to checking PTC_RANGE1.

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x12: PTC_CMP0 :

PTC COMP0 output
This status is sticky. It is set by the PTC Comparator 0 if the condition is met (i.e. PTC_STA_CFG.CFG.COMP0_OUT field).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to PTC_CMP0.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling PTC comparator 1 (by clearing TT_CFG3.PTC_CMP0_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple PTC_CMP0s).

0x13: PTC_CMP1 :

PTC COMP1 output
This status is sticky. It is set by the PTC Comparator 1 if the condition is met (i.e. PTC_STA_CFG.CFG.COMP1_OUT field).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to PTC_CMP1.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling PTC comparator 1 (by clearing TT_CFG3.PTC_CMP1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple PTC_CMP1s).

0x14: PTC_RANGE0 :

PTC Post Processor 0 Range output
This status is sticky. It is set by the PTC Post Processor if the RANGE0 condition is met (i.e. PTC_PP_STRUCT0.*).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_FIR1_FIFO_DONE.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling both PTC comparators (by clearing TT_CFG3.PTC_CMP0_EN AND TT_CFG3_PTC_COMP1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple PTC_RANGE0s).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x15: PTC_RANGE1 :

PTC Post Processor 1 Range output
This status is sticky. It is set by the PTC Post Processor if the RANGE1 condition is met (i.e. PTC_PP_STRUCT1.*).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to SAR_FIR1_FIFO_DONE.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling both PTC comparators (by clearing TT_CFG3.PTC_CMP0_EN AND TT_CFG3_PTC_COMP1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple PTC_RANGE1s).

0x16: CTBL0_CMP0 :

CTBL0 COMP0 output
This status is sticky. It is set by the CTBL0 Opamp0 Comparator if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP0_OUT field).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to CTBL0_CMP0.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling CTBL0 opamp0 (by clearing TT_CFG2.CTBL0_OA0_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple CTBL0_CMP0s).

0x17: CTBL0_CMP1 :

CTBL0 COMP1 output
This status is sticky. It is set by the CTBL0 Opamp1 Comparator if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP1_OUT field).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to CTBL0_CMP1.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling CTBL0 opamp1 (by clearing TT_CFG2.CTBL0_OA1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple CTBL0_CMP1s).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x18: CTBL1_CMP0 :

CTBL1 COMP0 output
This status is sticky. It is set by the CTBL1 Opamp0 Comparator if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP0_OUT field).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to CTBL1_CMP0.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling CTBL1 opamp0 (by clearing TT_CFG2.CTBL0_OA0_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple CTBL1_CMP0s).

0x19: CTBL1_CMP1 :

CTBL1 COMP1 output
This status is sticky. It is set by the CTBL1 Opamp1 Comparator if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP1_OUT field).
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to CTBL1_CMP1.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling CTBL1 opamp1 (by clearing TT_CFG2.CTBL0_OA1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple CTBL1_CMP1s).

0x1a: RESERVED0 :

0x1b: RESERVED1 :

0x1c: RESERVED2 :

0x1d: RESERVED3 :

0x1e: RESERVED4 :

0x1f: RESERVED5 :

0x20: CHIP_ACTIVE_MODE :

Chip Active Mode Status
This status is set whenever the system is operating in Active Mode (this includes all Low Power active modes)

0x21: CHIP_DEEPSLEEP_MODE :

Chip Deepsleep Mode Status
This status is set whenever the system is operating in Deepsleep Mode (this includes all RAM power modes in Deepsleep)

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x22: TR_LPPASS_IN0 :

External trigger 0 (or the FW trigger 0)
This status is sticky. It is set by the either the external hardware trigger 0 or FW trigger 0 asserting.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to TR_LPPASS_IN0.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple TR_LPPASS_IN0s).

0x23: TR_LPPASS_IN1 :

External trigger 0 (or the FW trigger 1)
This status is sticky. It is set by the either the external hardware trigger 0 or FW trigger 1 asserting.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to TR_LPPASS_IN1.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple TR_LPPASS_IN1s).

0x24: TR_LPPASS_IN2 :

External trigger 0 (or the FW trigger 2)
This status is sticky. It is set by the either the external hardware trigger 0 or FW trigger 2 asserting.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to TR_LPPASS_IN2.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple TR_LPPASS_IN2s).

0x25: TR_LPPASS_IN3 :

External trigger 0 (or the FW trigger 3)
This status is sticky. It is set by the either the external hardware trigger 0 or FW trigger 3 asserting.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to TR_LPPASS_IN3.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple TR_LPPASS_IN3s).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x26: TR_LPPASS_IN_WAKE :

External Trigger Wakeup Source
When using this condition, the action (ACT) must be set to WAIT_FOR.
This condition is used to put the AC to sleep. The AC will wake from sleep when any external trigger [0-3] is asserted.
When the AC is sleeping, all registered AC conditions are cleared.

0x27: TIMER_DONE_WAKE :

Timer Wakeup Source
When using this condition, the action (ACT) must be set to WAIT_FOR. The Wakeup Timer must also be configured (INFRA.TIMER registers).
This condition is used to put the AC to sleep. The AC will wake from sleep when the Wakeup Timer reaches terminal count (TC).
When the AC is sleeping, all registered AC conditions are cleared.

0x28: CTBL0_CMP0_WAKE :

CTBL0 comparator 0 wakeup
When using this condition, the action (ACT) must be set to WAIT_FOR. The comparator wakeup condition is configured per CTBL0_STA_CFG_Regs.CFG.OA0_COMP_OUT. The CTBL0 comparator 0 be enabled during sleep (TT_CFG2.CTBL0_OA0_EN=1).
This condition is used to put the AC to sleep. The AC will wake from sleep when CTBL0 Comparator 0 meets the configured wakeup condition.
When the AC is sleeping, all registered AC conditions are cleared.

0x29: CTBL0_CMP1_WAKE :

CTBL0 comparator 1 wakeup
When using this condition, the action (ACT) must be set to WAIT_FOR. The comparator wakeup condition is configured per CTBL0_STA_CFG_Regs.CFG.OA0_COMP_OUT. The CTBL0 comparator 1 be enabled during sleep (TT_CFG2.CTBL0_OA1_EN=1).
This condition is used to put the AC to sleep. The AC will wake from sleep when CTBL0 Comparator 1 meets the configured wakeup condition.
When the AC is sleeping, all registered AC conditions are cleared.

0x2a: CTBL1_CMP0_WAKE :

CTBL1 comparator 0 wakeup
When using this condition, the action (ACT) must be set to WAIT_FOR. The comparator wakeup condition is configured per CTBL1_STA_CFG_Regs.CFG.OA0_COMP_OUT. The CTBL1 comparator 0 be enabled during sleep (TT_CFG2.CTBL1_OA0_EN=1).
This condition is used to put the AC to sleep. The AC will wake from sleep due when CTBL1 Comparator 0 meets the configured wkaeup condition.
When the AC is sleeping, all registered AC conditions are cleared.

0x2b: CTBL1_CMP1_WAKE :

CTBL1 comparator 1 wakeup
When using this condition, the action (ACT) must be set to WAIT_FOR. The comparator wakeup condition is configured per CTBL1_STA_CFG_Regs.CFG.OA0_COMP_OUT. The CTBL1 comparator 1 be enabled during sleep (TT_CFG2.CTBL1_OA1_EN=1).
This condition is used to put the AC to sleep. The AC will wake from sleep when CTBL1 Comparator 1 meets the configured wakeup condition.
When the AC is sleeping, all registered AC conditions are cleared.

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x2c: PTC_CMP0_WAKE :

PTC comparator 0 wakeup
When using this condition, the action (ACT) must be set to WAIT_FOR. The comparator wakeup condition is configured per PTC_STA_CFG_Regs.CFG.COMP0_OUT. The PTC comparator 0 be enabled during sleep (TT_CFG3.PTC_CMP0_EN=1).
This condition is used to put the AC to sleep. The AC will wake from sleep when PTC Comparator 0 meets the configured wakeup condition.
When the AC is sleeping, all registered AC conditions are cleared.

0x2d: PTC_CMP1_WAKE :

PTC comparator 1 wakeup
When using this condition, the action (ACT) must be set to WAIT_FOR. The comparator wakeup condition is configured per PTC_STA_CFG_Regs.CFG.COMP1_OUT. The PTC comparator 0 be enabled during sleep (TT_CFG3.PTC_CMP1_EN=1).
This condition is used to put the AC to sleep. The AC will wake from sleep when PTC Comparator 1 meets the configured wakeup condition.
When the AC is sleeping, all registered AC conditions are cleared.

0x2e: FIFO_LEVEL0 :

FIFO Level 0 trigger
This status is set whenever FIFO0 level condition has been met (FIFO_LEVEL0.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

0x2f: FIFO_LEVEL1 :

FIFO Level 1 trigger
This status requires that FIFO_STA_CFG_Regs.CFG.SEL=1,2,3.
This status is set whenever FIFO1 level condition has been met (FIFO_LEVEL1.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

0x30: FIFO_LEVEL2 :

FIFO Level 2 trigger
This status requires that FIFO_STA_CFG_Regs.CFG.SEL=2,3.
This status is set whenever FIFO2 level condition has been met (FIFO_LEVEL2.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

0x31: FIFO_LEVEL3 :

FIFO Level 3 trigger
This status requires that FIFO_STA_CFG_Regs.CFG.SEL=2,3.
This status is set whenever FIFO3 level condition has been met (FIFO_LEVEL3.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

0x32: FIFO_LEVEL4 :

FIFO Level 4 trigger
This status requires that FIFO_STA_CFG_Regs.CFG.SEL=3.
This status is set whenever FIFO4 level condition has been met (FIFO_LEVEL4.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

0x33: FIFO_LEVEL5 :

FIFO Level 5 trigger
This status requires that FIFO_STA_CFG_Regs.CFG.SEL=3.
This status is set whenever FIFO5 level condition has been met (FIFO_LEVEL5.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x34: FIFO_LEVEL6 :

FIFO Level 6 trigger
This status requires that FIFO_STA_CFG_Regs.CFG.SEL=3.
This status is set whenever FIFO6 level condition has been met (FIFO_LEVEL6.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

0x35: FIFO_LEVEL7 :

FIFO Level 7 trigger
This status requires that FIFO_STA_CFG_Regs.CFG.SEL=3.
This status is set whenever FIFO7 level condition has been met (FIFO_LEVEL7.LEVEL). This status is transparent from the FIFO (i.e. the status is not sticky).

0x36: DAC0_RANGE0 :

DAC0 Range 0 detection
This status is sticky. It is set by the DAC0 if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_0). This status is not used when DAC0 is configured for FW mode.

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC0_RANGE0.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the DAC0 (by clearing TT_CFG3.DAC0_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC0_RANGE0s).

0x37: DAC0_RANGE1 :

DAC0 Range 1 detection
This status is sticky. It is set by the DAC0 if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_1). This status is not used when DAC0 is configured for FW mode.

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC0_RANGE1.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the DAC0 (by clearing TT_CFG3.DAC0_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC0_RANGE1s).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x38: DAC0_RANGE2 :

DAC0 Range 2 detection
This status is sticky. It is set by the DAC0 if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_2). This status is not used when DAC0 is configured for FW mode.

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC0_RANGE2.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the DAC0 (by clearing TT_CFG3.DAC0_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC0_RANGE2s).

0x39: DAC0_EPOCH :

DAC0 End of Waveform event
This status is sticky. It is set by the DAC when finishing a waveform. This condition is only used if the DAC channel (pointed to by the AC when triggered) is configured for LUT mode.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC0_EPOCH.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.DAC0_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC0_EPOCHs).

0x3a: DAC0_STROBE :

DAC0 Strobe
This status is set whenever the DAC output has been updated. This status is typically used by the AC to poll when the DAC has responded to the DAC_INC/DAC_DEC fields.This status is transparent from the DAC (i.e. the status is not sticky).
The AC needs to poll this status (i.e. ACTION is WAIT_FOR and COND is DAC0_STROBE) prior to checking DAC_RANGE0-2 or setting DAC_INC/DAC_DEC fields.

0x3b: DAC1_RANGE0 :

DAC1 Range 0 detection
This status is sticky. It is set by the DAC1 if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_0).

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC1_RANGE0.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the DAC1 (by clearing TT_CFG3.DAC1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC1_RANGE0s).

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

0x3c: DAC1_RANGE1 :

DAC1 Range 1 detection
This status is sticky. It is set by the DAC0 if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_1).

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC1_RANGE1.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the DAC1 (by clearing TT_CFG3.DAC1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC1_RANGE1s).

0x3d: DAC1_RANGE2 :

DAC1 Range 2 detection
This status is sticky. It is set by the DAC1 if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_2).

The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC1_RANGE2.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the DAC1 (by clearing TT_CFG3.DAC1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC1_RANGE2s).

0x3e: DAC1_EPOCH :

DAC1 End of Waveform event
This status is sticky. It is set by the DAC when finishing a waveform. This condition is only used if the DAC channel (pointed to by the AC when triggered) is configured for LUT mode.
The status is cleared by the AC when any of the following occur:
1. Executing an AC state where ACT is set to WAIT_FOR or BRANCH_IF_* and COND is set to DAC1_EPOCH.
2. Executing an AC state where ACT is set to WAIT_FOR and COND is set to any of the *_WAKE.
3. Pausing the AC (using the DEBUG_PAUSE or DEBUG_SINGLE_STEP commands)
4. Disabling the AC (through CTRL.ENABLED)
5. Disabling the SAR (by clearing TT_CFG3.DAC1_EN)
No overflow indication is provided for this bit. Therefore, it is up to the user to program the AC such that this status is read prior to an overflow (multiple DAC1_EPOCHs).

0x3f: DAC1_STROBE :

DAC1 Strobe
This status is set whenever the DAC output has been updated. This status is typically used by the AC to poll when the DAC has responded to the DAC_INC/DAC_DEC fields.This status is transparent from the DAC (i.e. the status is not sticky).
The AC needs to poll this status (i.e. ACTION is WAIT_FOR and COND is DAC1_STROBE) prior to checking DAC1_RANGE0-2 or setting DAC_INC/DAC_DEC fields.

7 : 6	RESERVED_0	Default Value: Undefined

28.1.89 ACTRLR_TTCFG0_TT_CFG1 (continued)

5 : 0	BR_ADDR	absolute address of the branch if taken (0-63 possible). This field in only used if the AC action (ACT) is set to BRANCH_IF_* and the condtion (COND) is met. Default Value: Undefined

28.1.91 ACTRLR_TTCFG0_TT_CFG3 (continued)

15	DAC0_EN	DAC0 enable This field is only used by the Autonomous Controller if DAC0_UNLOCK is set. Otherwise, the field is ignored. Default Value: Undefined **0x0: DISABLED :** Disabled DAC0 is powered down, DAC0 logic is reset, DAC0 clocks are gated, and all DAC0 AC conditions are cleared. DAC0 configuration and waveform tables are retained. **0x1: ENABLED :** Enabled DAC0 is powered and all logic is enabled and clocked.
14	DAC0_DEC	DAC0 Decrement When entering a state where this field is set, the AC generates a single cycle pulse (decrement) to the DAC0 logic. DAC_INC and DAC_DEC CANNOT be simultaneously set in a given state (doing so will cause DAC_DEC to be ignored by the DAC0 logic). This field is only used by the DAC0 logic if the DAC0_CHANNEL field is set to 0-14 (Hardware channels) and DAC0.DAC_STA_CFG.CHAN_CFG.MODE = ADDR or DATA. If DAC0.DAC_STA_CFG.CHAN_CFG.MODE=ADDR, the DAC0 logic decrements the DAC address (Amount set by DAC0.DAC_STA_CFG.CHAN_CFG.STEP_SIZE_EN and STEP_SIZE_SEL) If DAC0.DAC_STA_CFG.CHAN_CFG.MODE=DATA, the DAC0 logic decrements the DAC Value (Amount set by CHAN_CFG.STEP_SIZE_EN and STEP_SIZE_SEL) Default Value: Undefined
13	DAC0_INC	DAC0 Increment When entering a state where this field is set, the AC generates a single cycle pulse (increment) to the DAC0 logic. DAC_INC and DAC_DEC CANNOT be simultaneously set in a given state (doing so will cause DAC_DEC to be ignored by the DAC0 logic). This field is only used by the DAC0 logic if the DAC0_CHANNEL field is set to 0-14 (Hardware channels) and DAC0.DAC_STA_CFG.CHAN_CFG.MODE = ADDR or DATA. If DAC0.DAC_STA_CFG.CHAN_CFG.MODE=ADDR, the DAC0 logic increments the DAC address (Amount set by DAC0.DAC_STA_CFG.CHAN_CFG.STEP_SIZE_EN and STEP_SIZE_SEL) If DAC0.DAC_STA_CFG.CHAN_CFG.MODE=DATA, the DAC0 logic increments the DAC Value (Amount set by CHAN_CFG.STEP_SIZE_EN and STEP_SIZE_SEL) Default Value: Undefined
12	DAC0_TR	DAC0 Trigger This field initiates DAC operation per the DAC0_CHANNEL selection. When entering a state where this field is set, the AC generates a single cycle pulse (trigger) to the DAC0 logic. This field is ignored unless: the DAC has been enabled in a prior state (DAC0_EN=1) and is ready (i.e. the AC has waited for BLOCK_READY in the same state where DAC0 was enabled). The DAC does NOT need to be disabled when switching channels. Default Value: Undefined
11 : 8	DAC0_CHANNEL	DAC0 Channel select This field is pointer to the active DAC channel. Valid values are 0-15. This field is ignored unless the following conditions are guaranteed: 1. The DAC is triggered (DAC0_TR=1). 2. The DAC has been enabled in a prior state (DAC0_EN=1) and is ready (i.e. the AC has waited for BLOCK_READY in the same state where DAC0 was enabled). Default Value: Undefined **0x0: CHANNEL_0 :** Channel 0 Hardware Channel 0: configured per DAC0.DAC_STA_CFG.CHAN_CFG0 Writes to FW_DAC_VAL and FW_DAC_VAL_NXT are ignored.

0xe: CHANNEL_14 :

Channel 14
Hardware Channel 14: configured per DAC0.DAC_STA_CFG.CHAN_CFG14
Writes to FW_DAC_VAL and FW_DAC_VAL_NXT are ignored.

0xf: FW_CHANNEL :

FW Channel
When selected, the DAC is configured for Firmware mode.
If ACTRLR.STATUS.MODE=0, firmware can write to FW_DAC_VAL and FW_DAC_VAL_NXT.
If ACTRLR.STATUS.MODE=1, firmware can only write to FW_DAC_VAL_NXT.
Autonomus Controller DAC conditions, DAC0_INC, DAC0_DEC are not used in this mode.

7	SAR_EN	SAR enable This field is only used by the Autonomous Controller if SAR_UNLOCK is set. Otherwise, the field is ignored. Default Value: Undefined **0x0: DISABLED :** Disabled SAR is powered down, SAR logic (and FIRs) are reset, SAR/FIR clocks are gated, and all SAR AC conditions are cleared. SAR configuration and sequencer tables are retained. FIFO status and content is not cleared (i.e. the FIFO contents can still be read if the SAR is disabled). **0x1: ENABLED :** Enabled SAR is powered and all SAR (FIR) logic is enabled and clocked.
6	SAR_TR	SAR Trigger (initiate SAR operation at sequencer address pointed to by SAR_ENTRY_ADDR) When entering a state where this field is set, the AC generates a single cycle pulse (trigger) to the SAR sequencer. This trigger is ignored by the SAR sequencer unless ALL of the following conditions are guaranteed: 1. The SAR has been enabled in a prior state (SAR_EN=1) and is ready (i.e. the AC has waited for BLOCK_READY in the same state where the SAR was enabled). 2. The SAR is idle (SAR.SAR_STA_CFG.STATUS.BUSY=0). Default Value: Undefined
5	RESERVED_2	Default Value: Undefined

28.1.91 ACTRLR_TTCFG0_TT_CFG3 (continued)

4 : 0	SAR_ENTRY_ADDR	SAR Timer Table Entry State This field is a pointer to the entry address of the SAR sequencer state table. If ACTRLR.STATUS.MODE=0, this field points to the High Speed state table (SEQ.HS.DATA) If ACTRLR.STATUS.MODE=1, this field points to the Low Power state table (SEQ.LP.DATA) Valid values are 0-31. This field is ignored unless the following conditions are guaranteed: 1. The SAR is triggered (SAR_TR=1). 2. The SAR has been enabled in a prior state (SAR_EN=1) and is ready (i.e. the AC has waited for BLOCK_READY in the same state where the SAR was enabled). 3. The SAR is idle (SAR.SAR_STA_CFG.STATUS.BUSY=0). This field is pointer to the entry address of the SAR sequencer state table. If ACTRLR.STATUS.MODE=0, this field points to the High Speed state table (SEQ.HS.DATA) If ACTRLR.STATUS.MODE=1, this field points to the Low Power state table (SEQ.LP.DATA) Default Value: Undefined

28.1.92 ACTRLR_TTCFG0_TT_CFG4

8	SAR_READY	SAR ready Default Value: 0

28.1.96 INFRA_PRIO_CFG0 (continued)

5 : 0	COUNT_VAL	Actual count value is COUNT_VAL+1. This field determines the time delay between the Autonomous Controller (AC) setting the particular block enable bit and the corresponding assertion of the ready status bit. The delay time is based on a 4MHz clock (the corresponding delay time is 250ns*COUNT_VAL+1 (Delay time ranges from 250ns to 16us)). If delay times greater than 16us are required, then multiple PRIO_CFG states must be programmed to generate a cascade of delays (4 PRIO_CFG state*16us=64us maximum possible delay). Default Value: 0

SW Access	RW	Reserved						
HW Access	R	Reserved						
Name	ENABLED	Reserved [30:24]						

Bits	Name	Description
31	ENABLED	0=disabled, 1=enabled This timer (downcounter) is used by the Autonomous Controller (AC) as a wakeup source (Autonomous Controller Action (ACT) = WAIT_FOR and Condition (COND) = TIMER_-DONE_WAKE). Even if CTRL.ENABLED is set, the Timer is held in Reset until the Autonomous Controller is running (ACTRLR.STATUS.STATUS= RUNNING). The Timer automatically resets whenenever the Autonomous Controller transitions between HS and LP modes, is paused, or disabled. The timer will generate a wakeup signal to the AC whenever it reaches Terminal Count (0). Default Value: 0

28.1.112 INFRA_TIMER_CFG

SW Access	R	R				R	R	R
HW Access	W	W				W	W	W
Name	AC_INT	RESERVED [30:27]				SAR_-FIR1_RE-SULT_INT	SAR_-FIR0_RE-SULT_INT	SAR_RANGE3_INT

Bits	Name	Description
31	AC_INT	Autonomus Controller Interrupt Pending This interrupt is set by the Autonomus Controller whenever executing a state with ACTRLR.TIM-ER_TABLE_STRUCT.TT_CFG1.INTR_SET=1. Default Value: 0
30 : 27	RESERVED	Default Value: 0
26	SAR_FIR1_RESULT_INT	FIR1 Result Interrupt Pending This interrupt is set by SAR FIR1 whenever it generates a new result. The corresponding bit in SAR_STA_CFG.FIR_RESULT_MASK must be set in order for the FIR to generate the interrupt source. Default Value: 0
25	SAR_FIR0_RESULT_INT	FIR0 Result Interrupt Pending This interrupt is set by SAR FIR0 whenever it generates a new result. The corresponding bit in SAR_STA_CFG.FIR_RESULT_MASK must be set in order for the FIR to generate the interrupt source. Default Value: 0

28.1.114 LPPASS_MMIO_INTR_CAUSE (continued)

24	SAR_RANGE3_INT	SAR Range 3 detection Interrupt Pending This interrupt is set by the SAR if the RANGE3 condition is met for a given channel with range 3 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_-STRUCT_3). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Default Value: 0
23	SAR_RANGE2_INT	SAR Range 2 detection Interrupt Pending This interrupt is set by the SAR if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_-STRUCT_2). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Default Value: 0
22	SAR_RANGE1_INT	SAR Range 1 detection Interrupt Pending This interrupt is set by the SAR if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_-STRUCT_1). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Default Value: 0
21	SAR_RANGE0_INT	SAR Range 0 detection Interrupt Pending This interrupt is set by the SAR if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_-STRUCT_0). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Default Value: 0
20	SAR_RESULT_INT	SAR Result Interrupt Pending This interrupt is set by the SAR when a channel writes data into its associated result register. Firmware must read SAR_STA_CFG.CHAN_RESULT_UPDATED to determine which channel generated the interrupt. The corresponding bit in SAR_STA_CFG.CHAN_RESULT_MASK must be set in order for the SAR to generate the interrupt source. Default Value: 0
19	SAR_EOS_INT	SAR Sequencer EOS Interrupt Pending This interrupt is set by the SAR when finishing the state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS or STOP. This interrupt does NOT indicate that the SAR data has been written to the FIFO (the FIFO level interrupts should be used instead). Default Value: 0
18	SAR_DONE_INT	SAR Sequencer Done Interrupt Pending This interrupt is set by the SAR when finishing a state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to STOP. The interrupt is not generated if the SAR is configured for CONTINUOUS operation (i.e. SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS). This interrupt does NOT indicate that the SAR data has been written to the FIFO (the FIFO level interrupts should be used instead). Default Value: 0
17	DAC1_EMPTY_INT	DAC1 Empty Interrupt Pending It is set by DAC1 when it empties the contents of its FW_DAC_VAL register. This interrupt is only generated if DAC1 is configured for FW operation (ACTRLR.TIMER_TABLE_-STRUCT.TT_CFG3.DAC1_CHANNEL=FW_CHANNEL. Default Value: 0
16	DAC1_EPOCH_INT	DAC1 End of Waveform Interrupt Pending It is set by DAC1 when finishing a waveform. This condition is only used if the DAC0 channel (pointed to by the AC when triggered) is configured for LUT mode. Default Value: 0
15	DAC1_RANGE2_INT	DAC1 Range 2 Interrupt Pending It is set by the DAC1 if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_2). The interrupt is disabled when DAC1 is configured for FW mode. Default Value: 0

28.1.114 LPPASS_MMIO_INTR_CAUSE (continued)

14	DAC1_RANGE1_INT	DAC1 Range 1 Interrupt Pending It is set by the DAC1 if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_1). The interrupt is disabled when DAC1 is configured for FW mode. Default Value: 0
13	DAC1_RANGE0_INT	DAC1 Range 0 Interrupt Pending It is set by the DAC1 if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_0). The interrupt is disabled when DAC1 is configured for FW mode. Default Value: 0
12	DAC0_EMPTY_INT	DAC0 Empty Interrupt Pending It is set by DAC0 when it empties the contents of its FW_DAC_VAL register. This interrupt is only generated if DAC0 is configured for FW operation (ACTRLR.TIMER_TABLE_-STRUCT.TT_CFG3.DAC0_CHANNEL=FW_CHANNEL. Default Value: 0
11	DAC0_EPOCH_INT	DAC0 End of Waveform Interrupt Pending It is set by DAC0 when finishing a waveform. This condition is only used if the DAC0 channel (pointed to by the AC when triggered) is configured for LUT mode. Default Value: 0
10	DAC0_RANGE2_INT	DAC0 Range 2 Interrupt Pending It is set by the DAC0 if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_2). The interrupt is disabled when DAC0 is configured for FW mode. Default Value: 0
9	DAC0_RANGE1_INT	DAC0 Range 1 Interrupt Pending It is set by the DAC0 if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_1). The interrupt is disabled when DAC0 is configured for FW mode. Default Value: 0
8	DAC0_RANGE0_INT	DAC0 Range 0 Interrupt Pending It is set by the DAC0 if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_0). The interrupt is disabled when DAC0 is configured for FW mode. Default Value: 0
7	PTC_RANGE1_INT	PTC Post Processor 1 Range Interrupt Pending It is set by the PTC Post Processor if the RANGE0 condition is met (i.e. PTC_PP_STRUCT1.*). Default Value: 0
6	PTC_RANGE0_INT	PTC Post Processor 0 Range Interrupt Pending It is set by the PTC Post Processor if the RANGE0 condition is met (i.e. PTC_PP_STRUCT0.*). Default Value: 0
5	PTC_COMP1_INT	PTC Comparator 1 Interrupt Pending It is set by the PTC Comparator 1 if the condition is met (i.e. PTC_STA_CFG.CFG.COMP1_OUT field). Default Value: 0
4	PTC_COMP0_INT	PTC Comparator 0 Interrupt Pending It is set by the PTC Comparator 0 if the condition is met (i.e. PTC_STA_CFG.CFG.COMP0_OUT field). Default Value: 0
3	CTBL1_COMP1_INT	CTBL1 Comparator 1 Interrupt Pending It is set by the CTBL1 Opamp1 Comparator if the condition is met (i.e. CT-BL_STA_CFG.CFG.COMP1_OUT field). Default Value: 0
2	CTBL1_COMP0_INT	CTBL1 Comparator 0 Interrupt Pending It is set by the CTBL1 Opamp0 Comparator if the condition is met (i.e. CT-BL_STA_CFG.CFG.COMP0_OUT field). Default Value: 0

28.1.114 LPPASS_MMIO_INTR_CAUSE (continued)

1	CTBL0_COMP1_INT	CTBL0 Comparator 1 Interrupt Pending It is set by the CTBL0 Opamp1 Comparator if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP1_OUT field). Default Value: 0
0	CTBL0_COMP0_INT	CTBL0 Comparator 0 Interrupt Pending It is set by the CTBL0 Opamp0 Comparator if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP0_OUT field). Default Value: 0

Bits	Name	Description
31	RESERVED_3	Default Value: 0
30	FIFO_LEVEL7_INT	FIFO Level 7 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 7 meets the FIFO_STA_CFG.LEVEL7.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
29	FIFO_LEVEL6_INT	FIFO Level 6 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 6 meets the FIFO_STA_CFG.LEVEL6.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0

28.1.115 LPPASS_MMIO_FIFO_INTR_CAUSE (continued)

28	FIFO_LEVEL5_INT	FIFO Level 5 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 5 meets the FIFO_STA_CFG.LEVEL5.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
27	FIFO_LEVEL4_INT	FIFO Level 4 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 4 meets the FIFO_STA_CFG.LEVEL4.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
26	FIFO_LEVEL3_INT	FIFO Level 3 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 3 meets the FIFO_STA_CFG.LEVEL3.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0
25	FIFO_LEVEL2_INT	FIFO Level 2 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 2 meets the FIFO_STA_CFG.LEVEL2.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0
24 : 21	RESERVED_2	Default Value: 0
20	FIFO_LEVEL1_INT	FIFO Level 1 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 1 meets the FIFO_STA_CFG.LEVEL1.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=1,2, or 3) Default Value: 0
19 : 18	RESERVED_1	Default Value: 0
17	FIFO_LEVEL0_INT	FIFO Level 0 Interrupt Pending This level sensitive interrupt is set by the FIFO whenever FIFO 0 meets the FIFO_STA_CFG.LEVEL0.LEVEL condition. Default Value: 0
16	RESERVED_0	Default Value: 0
15	FIFO_UNDERFLOW7_INT	FIFO Underflow 7 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 7 underflows (i.e. a read from FIFO 7 fails because FIFO 7 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
14	FIFO_UNDERFLOW6_INT	FIFO Underflow 6 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 6 underflows (i.e. a read from FIFO 6 fails because FIFO 6 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
13	FIFO_UNDERFLOW5_INT	FIFO Underflow 5 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 5 underflows (i.e. a read from FIFO 5 fails because FIFO 5 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0

28.1.115 LPPASS_MMIO_FIFO_INTR_CAUSE (continued)

12	FIFO_UNDER-FLOW4_INT	FIFO Underflow 4 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 4 underflows (i.e. a read from FIFO 4 fails because FIFO 4 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
11	FIFO_UNDER-FLOW3_INT	FIFO Overflow 3 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 3 underflows (i.e. a read from FIFO 3 fails because FIFO 3 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0
10	FIFO_UNDER-FLOW2_INT	FIFO Overflow 2 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 2 underflows (i.e. a read from FIFO 2 fails because FIFO 2 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0
9	FIFO_UNDER-FLOW1_INT	FIFO Overflow 1 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 1 underflows (i.e. a read from FIFO 1 fails because FIFO 1 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=1,2, or 3) Default Value: 0
8	FIFO_UNDER-FLOW0_INT	FIFO Underflow 0 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 0 underflows (i.e. a read from FIFO 0 fails because FIFO 0 is empty. Default Value: 0
7	FIFO_OVERFLOW7_INT	FIFO Overflow 7 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 7 overflows (i.e. a write to FIFO 7 fails because FIFO 7 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
6	FIFO_OVERFLOW6_INT	FIFO Overflow 6 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 6 overflows (i.e. a write to FIFO 6 fails because FIFO 6 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
5	FIFO_OVERFLOW5_INT	FIFO Overflow 5 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 5 overflows (i.e. a write to FIFO 5 fails because FIFO 5 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
4	FIFO_OVERFLOW4_INT	FIFO Overflow 4 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 4 overflows (i.e. a write to FIFO 4 fails because FIFO 4 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
3	FIFO_OVERFLOW3_INT	FIFO Overflow 3 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 3 overflows (i.e. a write to FIFO 3 fails because FIFO 3 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0

28.1.115 LPPASS_MMIO_FIFO_INTR_CAUSE (continued)

2	FIFO_OVERFLOW2_INT	FIFO Overflow 2 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 2 overflows (i.e. a write to FIFO 2 fails because FIFO 2 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0
1	FIFO_OVERFLOW1_INT	FIFO Overflow 1 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 1 overflows (i.e. a write to FIFO 1 fails because FIFO 1 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=1,2, or 3) Default Value: 0
0	FIFO_OVERFLOW0_INT	FIFO Overflow 0 Interrupt Pending This interrupt is set by the FIFO whenever FIFO 0 overflows (i.e. a write to FIFO 0 fails because FIFO 0 is full). Default Value: 0

Name	AC	FIFO_LEV-EL7	FIFO_LEV-EL6	FIFO_LEV-EL5	FIFO_LEV-EL4	FIFO_LEV-EL3	FIFO_LEV-EL2	SAR_RANGE3

Bits	Name	Description
31	AC	Autonomus Controller Trigger This trigger is set by the Autonomus Controller whenever executing a state with ACTRLR.TIM-ER_TABLE_STRUCT.TT_CFG1.INTR_SET=1. Default Value: 0
30	FIFO_LEVEL7	FIFO Level 7 Trigger This level sensitive trigger is set by the FIFO whenever FIFO 7 meets the FIFO_STA_CFG.LEV-EL7.LEVEL condition. This trigger is only generated if the FIFO is configured for multiple FIFOs (i.e. FI-FO_STA_CFG.CFG.SEL=3) Default Value: 0
29	FIFO_LEVEL6	FIFO Level 6 Trigger This level sensitive trigger is set by the FIFO whenever FIFO 6 meets the FIFO_STA_CFG.LEV-EL6.LEVEL condition. This trigger is only generated if the FIFO is configured for multiple FIFOs (i.e. FI-FO_STA_CFG.CFG.SEL=3) Default Value: 0
28	FIFO_LEVEL5	FIFO Level 5 Trigger This level sensitive trigger is set by the FIFO whenever FIFO 5 meets the FIFO_STA_CFG.LEV-EL5.LEVEL condition. This trigger is only generated if the FIFO is configured for multiple FIFOs (i.e. FI-FO_STA_CFG.CFG.SEL=3) Default Value: 0

28.1.116 LPPASS_MMIO_TR_OUT0 (continued)

27	FIFO_LEVEL4	FIFO Level 4 Trigger This level sensitive trigger is set by the FIFO whenever FIFO 4 meets the FIFO_STA_CFG.LEVEL4.LEVEL condition. This trigger is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Default Value: 0
26	FIFO_LEVEL3	FIFO Level 3 Trigger This level sensitive trigger is set by the FIFO whenever FIFO 3 meets the FIFO_STA_CFG.LEVEL3.LEVEL condition. This trigger is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0
25	FIFO_LEVEL2	FIFO Level 2 Trigger This level sensitive trigger is set by the FIFO whenever FIFO 2 meets the FIFO_STA_CFG.LEVEL2.LEVEL condition. This trigger is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Default Value: 0
24	SAR_RANGE3	SAR Range 3 Trigger This trigger is set by the SAR if the RANGE3 condition is met for a given channel with range 3 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_3). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the trigger. Default Value: 0
23	SAR_RANGE2	SAR Range 2 Trigger This trigger is set by the SAR if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_2). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the trigger. Default Value: 0
22	SAR_RANGE1	SAR Range 1 Trigger This trigger is set by the SAR if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_1). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the trigger. Default Value: 0
21	SAR_RANGE0	SAR Range 0 Trigger This trigger is set by the SAR if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_0). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the trigger. Default Value: 0
20	FIFO_LEVEL1	FIFO Level 1 Trigger This level sensitive trigger is generated by the FIFO whenever FIFO 1 meets the FIFO_STA_CFG.LEVEL1.LEVEL condition. This trigger is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=1,2, or 3) Default Value: 0
19	SAR_EOS	SAR Sequencer EOS Trigger This itrigger is set by the SAR when finishing the state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS or STOP. This trigger does NOT indicate that the SAR data has been written to the FIFO (the FIFO level triggers should be used instead). Default Value: 0

28.1.116 LPPASS_MMIO_TR_OUT0 (continued)

18	SAR_DONE	SAR Sequencer Done Trigger This trigger is set by the SAR when finishing a state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to STOP. The interrupt is not generated if the SAR is configured for CONTINUOUS operation (i.e. SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS). This trigger does NOT indicate that the SAR data has been written to the FIFO (the FIFO level triggers should be used instead). Default Value: 0
17	FIFO_LEVEL0	FIFO Level 0 Trigger This is a level sensitive trigger that is generated by the FIFO whenever FIFO 0 meets the FIFO_STA_CFG.LEVEL0.LEVEL condition. Default Value: 0
16	DAC1_EPOCH	DAC1 End of Waveform Trigger It is generated by DAC1 when finishing a waveform. This condition is only used if the DAC1 channel (pointed to by the AC when triggered) is configured for LUT mode. Default Value: 0
15	DAC1_RANGE2	DAC1 Range 2 Trigger It is generated by the DAC1 if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_2). The interrupt is disabled when DAC1 is configured for FW mode. Default Value: 0
14	DAC1_RANGE1	DAC1 Range 1 Trigger It is generated by the DAC1 if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_1). The interrupt is disabled when DAC1 is configured for FW mode. Default Value: 0
13	DAC1_RANGE0	DAC1 Range 0 Trigger It is generated by the DAC1 if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_0). The interrupt is disabled when DAC1 is configured for FW mode. Default Value: 0
12	RESERVED_4	Default Value: 0
11	DAC0_EPOCH	DAC0 End of Waveform Trigger It is generated by DAC0 when finishing a waveform. This condition is only used if the DAC0 channel (pointed to by the AC when triggered) is configured for LUT mode. Default Value: 0
10	DAC0_RANGE2	DAC0 Range 2 Trigger It is generated by the DAC0 if the RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_2). The interrupt is disabled when DAC0 is configured for FW mode. Default Value: 0
9	DAC0_RANGE1	DAC0 Range 1 Trigger It is generated by the DAC0 if the RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_1). The interrupt is disabled when DAC0 is configured for FW mode. Default Value: 0
8	DAC0_RANGE0	DAC0 Range 0 Trigger It is generated by the DAC0 if the RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_SEL=STATUS_0). The interrupt is disabled when DAC0 is configured for FW mode. Default Value: 0
7	PTC_RANGE1	PTC Post Processor 1 Range Trigger It is generated by the PTC Post Processor if the RANGE0 condition is met (i.e. PTC_PP_STRUCT1.*). Default Value: 0

28.1.116 LPPASS_MMIO_TR_OUT0 (continued)

6	PTC_RANGE0	PTC Post Processor 0 Range Trigger It is generated by the PTC Post Processor if the RANGE0 condition is met (i.e. PTC_PP_-STRUCT0.*). Default Value: 0
5	PTC_COMP1	PTC Comparator 1 Interrupt Pending It is set by the PTC Comparator 1 if the condition is met (i.e. PTC_STA_CFG.CFG.COMP1_OUT field). Default Value: 0
4	PTC_COMP0	PTC Comparator 0 Trigger It is set by the PTC Comparator 0 if the condition is met (i.e. PTC_STA_CFG.CFG.COMP0_OUT field). Default Value: 0
3	CTBL1_COMP1	CTBL1 Comparator 1 Trigger It is generated by the CTBL1 Opamp1 Comparator if the condition is met (i.e. CT-BL_STA_CFG.CFG.COMP1_OUT field). Default Value: 0
2	CTBL1_COMP0	CTBL1 Comparator 0 Trigger It is generated by the CTBL1 Opamp0 Comparator if the condition is met (i.e. CT-BL_STA_CFG.CFG.COMP0_OUT field). Default Value: 0
1	CTBL0_COMP1	CTBL0 Comparator 1 Trigger It is generated by the CTBL0 Opamp1 Comparator if the condition is met (i.e. CT-BL_STA_CFG.CFG.COMP1_OUT field). Default Value: 0
0	CTBL0_COMP0	CTBL0 Comparator 0 Trigger It is generated by the CTBL0 Opamp0 Comparator if the condition is met (i.e. CT-BL_STA_CFG.CFG.COMP0_OUT field). Default Value: 0

Name	AC	RESERVED [30:27]				SAR_-FIR1_RE-SULT	SAR_-FIR0_RE-SULT	SAR_RANGE3

Bits	Name	Description
31	AC	Autonomus Controller Interrupt Request AC Interrupt: hardware sets this interrupt when the Autonomus Controller executes a state with ACTRLR.TIMER_TABLE_STRUCT.TT_CFG1.INTR_SET=1. Default Value: 0
30 : 27	RESERVED	Default Value: 0
26	SAR_FIR1_RESULT	FIR1 Result Interrupt Request SAR FIR1 Result Interrupt: hardware sets this interrupt when SAR FIR1 generates a new result. The corresponding bit in SAR_STA_CFG.FIR_RESULT_MASK must be set in order for the FIR to generate the interrupt source. Write a '1' to clear bit. Default Value: 0
25	SAR_FIR0_RESULT	FIR0 Result Interrupt Request SAR FIR0 Result Interrupt: hardware sets this interrupt when SAR FIR0 generates a new result. The corresponding bit in SAR_STA_CFG.FIR_RESULT_MASK must be set in order for the FIR to generate the interrupt source. Write a '1' to clear bit. Default Value: 0

28.1.117 LPPASS_MMIO_INTR (continued)

24	SAR_RANGE3	SAR Range 3 detection Interrupt Request SAR Range 3 Interrupt: hardware sets this interrupt when the SAR RANGE3 condition is met for a given channel with range 3 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_3). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Write a '1' to clear bit. Default Value: 0
23	SAR_RANGE2	SAR Range2 detection Interrupt Request SAR Range 2 Interrupt: hardware sets this interrupt when the SAR RANGE2 condition is met for a given channel with range 2 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_2). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Write a '1' to clear bit. Default Value: 0
22	SAR_RANGE1	SAR Range 1 detection Interrupt Request SAR Range 1 Interrupt: hardware sets this interrupt when the SAR RANGE1 condition is met for a given channel with range 1 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_1). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Write a '1' to clear bit. Default Value: 0
21	SAR_RANGE0	SAR Range 0 detection Interrupt Request SAR Range 0 Interrupt: hardware sets this interrupt when the SAR RANGE0 condition is met for a given channel with range 0 status enabled (i.e. SAR_STA_CFG.GPIO(MUX)_CHAN_CFG.STATUS_SEL=STATUS_STRUCT_0). Firmware must read SAR_STA_CFG.RANGE_STATUS to determine which channel generated the interrupt. Write a '1' to clear bit. Default Value: 0
20	SAR_RESULT	SAR Result Interrupt Request SAR Result Interrupt: hardware sets this interrupt when the SAR channel writes data into its associated result register. Firmware must read SAR_STA_CFG.CHAN_RESULT_UPDATED to determine which channel generated the interrupt. The corresponding bit in SAR_STA_CFG.CHAN_RESULT_MASK must be set in order for the SAR to generate the interrupt source. Write a '1' to clear bit. Default Value: 0
19	SAR_EOS	SAR Sequencer EOS Interrupt Request SAR Sequencer EOS Interrupt: hardware sets this interrupt when the SAR finishes the state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS or STOP. This interrupt does NOT indicate that the SAR data has been written to the FIFO (the FIFO level interrupts should be used instead). Write a '1' to clear bit. Default Value: 0
18	SAR_DONE	SAR Sequencer Done Interrupt Request SAR Done Interrupt: hardware sets this interrupt when the SAR finishes a state in the SAR sequencer table (HS or LP) where SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to STOP. The interrupt is not generated if the SAR is configured for CONTINUOUS operation (i.e. SAR.SEQ_HS(LP)_DATA.NEXT_STATE is set to GO_TO_ENTRY_ADDRESS). This interrupt does NOT indicate that the SAR data has been written to the FIFO (the FIFO level interrupts should be used instead). Write a '1' to clear bit. Default Value: 0

28.1.117 LPPASS_MMIO_INTR (continued)

17	DAC1_EMPTY	DAC1 Empty Interrupt Request DAC1 Empty Interrupt: hardware sets this interrupt when DAC1 empties the contents of its FW_-DAC_VAL register. This interrupt is only generated if DAC1 is configured for FW operation (AC-TRLR.TIMER_TABLE_STRUCT.TT_CFG3.DAC1_CHANNEL=FW_CHANNEL. Write a '1' to clear bit. Default Value: 0
16	DAC1_EPOCH	DAC1 End of Waveform Interrupt Request DAC1 EPOCH Interrupt: hardware sets this interrupt when DAC1 finishes a waveform. This condition is only used if the DAC1 channel (pointed to by the AC when triggered) is configured for LUT mode. Write a '1' to clear bit. Default Value: 0
15	DAC1_RANGE2	DAC1 Range 2 Interrupt Request DAC1 RANGE2 Interrupt: hardware sets this interrupt if the DAC1 RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_-SEL=STATUS_2). The interrupt is disabled when DAC1 is configured for FW mode. Write with '1' to clear bit. Default Value: 0
14	DAC1_RANGE1	DAC1 Range 1 Interrupt Request DAC1 RANGE1 Interrupt: hardware sets this interrupt if the DAC0 RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_-SEL=STATUS_1). The interrupt is disabled when DAC1 is configured for FW mode. Write with '1' to clear bit. Default Value: 0
13	DAC1_RANGE0	DAC1 Range 0 Interrupt Request DAC1 RANGE0 Interrupt: hardware sets this interrupt if the DAC1 RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC1_STA_CFG.CHAN_CFG.STATUS_-SEL=STATUS_0). The interrupt is disabled when DAC1 is configured for FW mode. Write with '1' to clear bit. Default Value: 0
12	DAC0_EMPTY	DAC0 Empty Interrupt Request DAC0 Empty Interrupt: hardware sets this interrupt when DAC0 empties the contents of its FW_-DAC_VAL register. This interrupt is only generated if DAC0 is configured for FW operation (AC-TRLR.TIMER_TABLE_STRUCT.TT_CFG3.DAC0_CHANNEL=FW_CHANNEL. Write a '1' to clear bit. Default Value: 0
11	DAC0_EPOCH	DAC0 End of Waveform Interrupt Request DAC0 EPOCH Interrupt: hardware sets this interrupt when DAC0 finishes a waveform. This condition is only used if the DAC0 channel (pointed to by the AC when triggered) is configured for LUT mode. Write a '1' to clear bit. Default Value: 0
10	DAC0_RANGE2	DAC0 Range 2 Interrupt Request DAC0 RANGE2 Interrupt: hardware sets this interrupt if the DAC0 RANGE2 condition is met for a given channel with range 2 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_-SEL=STATUS_2). The interrupt is disabled when DAC0 is configured for FW mode. Write with '1' to clear bit. Default Value: 0
9	DAC0_RANGE1	DAC0 Range 1 Interrupt Request DAC0 RANGE1 Interrupt: hardware sets this interrupt if the DAC0 RANGE1 condition is met for a given channel with range 1 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_-SEL=STATUS_1). The interrupt is disabled when DAC0 is configured for FW mode. Write with '1' to clear bit. Default Value: 0
8	DAC0_RANGE0	DAC0 Range 0 Interrupt Request DAC0 RANGE0 Interrupt: hardware sets this interrupt if the DAC0 RANGE0 condition is met for a given channel with range 0 status enabled (i.e. DAC0_STA_CFG.CHAN_CFG.STATUS_-SEL=STATUS_0). The interrupt is disabled when DAC0 is configured for FW mode. Write with '1' to clear bit. Default Value: 0

28.1.117 LPPASS_MMIO_INTR (continued)

7	PTC_RANGE1	PTC Post Processor 1 Range Interrupt Request PTC RANGE1 Interrupt: hardware sets this interrupt if the PTC Post Processor RANGE1 condition is met (i.e. PTC_PP_STRUCT1.*). Write with '1' to clear bit. Default Value: 0
6	PTC_RANGE0	PTC Post Processor 0 Range Interrupt Request PTC RANGE0 Interrupt: hardware sets this interrupt if the PTC Post Processor RANGE0 condition is met (i.e. PTC_PP_STRUCT0.*). Write with '1' to clear bit. Default Value: 0
5	PTC_COMP1	PTC Comparator 1 Interrupt Request PTC COMP1 Interrupt: hardware sets this interrupt if the condition is met (i.e. PTC_STA_CFG.CFG.COMP1_OUT field). Write with '1' to clear bit. Default Value: 0
4	PTC_COMP0	PTC Comparator 0 Interrupt Request PTC COMP0 Interrupt: hardware sets this interrupt if the condition is met (i.e. PTC_STA_CFG.CFG.COMP0_OUT field). Write with '1' to clear bit. Default Value: 0
3	CTBL1_COMP1	CTBL1 Comparator 1 Interrupt Request CTBL1 COMP1 Interrupt: hardware sets this interrupt if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP1_OUT field). Write with '1' to clear bit. Default Value: 0
2	CTBL1_COMP0	CTBL1 Comparator 0 Interrupt Request CTBL1 COMP0 Interrupt: hardware sets this interrupt if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP0_OUT field). Write with '1' to clear bit. Default Value: 0
1	CTBL0_COMP1	CTBL0 Comparator 1 Interrupt Request CTBL0 COMP1 Interrupt: hardware sets this interrupt if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP1_OUT field). Write with '1' to clear bit. Default Value: 0
0	CTBL0_COMP0	CTBL0 Comparator 0 Interrupt Request CTBL0 COMP0 Interrupt: hardware sets this interrupt if the condition is met (i.e. CTBL_STA_CFG.CFG.COMP0_OUT field). Write with '1' to clear bit. Default Value: 0

Bits	Name	Description
31	RESERVED_3	Default Value: 0
30	FIFO_LEVEL7	FIFO Level 7 Interrupt Request FIFO Level 7 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 7 meets the FIFO_STA_CFG.LEVEL7.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL7.LEVEL condition. Default Value: 0
29	FIFO_LEVEL6	FIFO Level 6 Interrupt Request FIFO Level 6 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 6 meets the FIFO_STA_CFG.LEVEL6.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL6.LEVEL condition. Default Value: 0

28.1.121 LPPASS_MMIO_FIFO_INTR (continued)

28	FIFO_LEVEL5	FIFO Level 5 Interrupt Request FIFO Level 5 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 5 meets the FIFO_STA_CFG.LEVEL5.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL5.LEVEL condition. Default Value: 0
27	FIFO_LEVEL4	FIFO Level 4 Interrupt Request FIFO Level 4 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 4 meets the FIFO_STA_CFG.LEVEL4.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL4.LEVEL condition. Default Value: 0
26	FIFO_LEVEL3	FIFO Level 3 Interrupt Request FIFO Level 3 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 3 meets the FIFO_STA_CFG.LEVEL3.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL3.LEVEL condition. Default Value: 0
25	FIFO_LEVEL2	FIFO Level 2 Interrupt Request FIFO Level 2 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 2 meets the FIFO_STA_CFG.LEVEL2.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL2.LEVEL condition. Default Value: 0
24 : 21	RESERVED_2	Default Value: 0
20	FIFO_LEVEL1	FIFO Level 1 Interrupt Request FIFO Level 1 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 1 meets the FIFO_STA_CFG.LEVEL1.LEVEL condition. This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=1,2, or 3) This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL1.LEVEL condition. Default Value: 0
19 : 18	RESERVED_1	Default Value: 0
17	FIFO_LEVEL0	FIFO Level 0 Interrupt Request FIFO Level 0 Interrupt: hardware sets this level sensitive interrupt whenever FIFO 0 meets the FIFO_STA_CFG.LEVEL0.LEVEL condition. This interrupt is only cleared when the contents of FIFO drop below the FIFO_STA_CFG.LEVEL0.LEVEL condition. Default Value: 0
16	RESERVED_0	Default Value: 0
15	FIFO_UNDERFLOW7	FIFO Overflow 7 Interrupt Request FIFO Overflow 7 Interrupt: hardware sets this interrupt whenever FIFO 7 underflows (i.e. a read from FIFO 7 fails because FIFO 7 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0

28.1.121 LPPASS_MMIO_FIFO_INTR (continued)

14	FIFO_UNDERFLOW6	FIFO Overflow 6 Interrupt Request FIFO Overflow 6 Interrupt: hardware sets this interrupt whenever FIFO 6 underflows (i.e. a read from FIFO 6 fails because FIFO 6 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0
13	FIFO_UNDERFLOW5	FIFO Overflow 5 Interrupt Request FIFO Overflow 5 Interrupt: hardware sets this interrupt whenever FIFO 5 underflows (i.e. a read from FIFO 5 fails because FIFO 5 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0
12	FIFO_UNDERFLOW4	FIFO Overflow 4 Interrupt Request FIFO Overflow 4 Interrupt: hardware sets this interrupt whenever FIFO 4 underflows (i.e. a read from FIFO 4 fails because FIFO 4 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0
11	FIFO_UNDERFLOW3	FIFO Overflow 3 Interrupt Request FIFO Overflow 3 Interrupt: hardware sets this interrupt whenever FIFO 3 underflows (i.e. a read from FIFO 3 fails because FIFO 3 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Write a '1' to clear bit. Default Value: 0
10	FIFO_UNDERFLOW2	FIFO Overflow 2 Interrupt Request FIFO Overflow 2 Interrupt: hardware sets this interrupt whenever FIFO 2 underflows (i.e. a read from FIFO 2 fails because FIFO 2 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Write a '1' to clear bit. Default Value: 0
9	FIFO_UNDERFLOW1	FIFO Overflow 1 Interrupt Request FIFO Underflow 1 Interrupt: hardware sets this interrupt whenever FIFO 1 underflows (i.e. a read from FIFO 1 fails because FIFO 1 is empty). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=1,2, or 3) Write a '1' to clear bit. Default Value: 0
8	FIFO_UNDERFLOW0	FIFO Underflow 0 Interrupt Request FIFO Underflow 0 Interrupt: hardware sets this interrupt whenever FIFO 0 underflows (i.e. a read from FIFO 0 fails because FIFO 0 is empty. Write a '1' to clear bit. Default Value: 0
7	FIFO_OVERFLOW7	FIFO Overflow 7 Interrupt Request FIFO Overflow 7 Interrupt: hardware sets this interrupt whenever FIFO 7 overflows (i.e. a write to FIFO 7 fails because FIFO 7 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0
6	FIFO_OVERFLOW6	FIFO Overflow 6 Interrupt Request FIFO Overflow 6 Interrupt: hardware sets this interrupt whenever FIFO 6 overflows (i.e. a write to FIFO 6 fails because FIFO 6 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0

28.1.121 LPPASS_MMIO_FIFO_INTR (continued)

5	FIFO_OVERFLOW5	FIFO Overflow 5 Interrupt Request FIFO Overflow 5 Interrupt: hardware sets this interrupt whenever FIFO 5 overflows (i.e. a write to FIFO 5 fails because FIFO 5 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0
4	FIFO_OVERFLOW4	FIFO Overflow 4 Interrupt Request FIFO Overflow 4 Interrupt: hardware sets this interrupt whenever FIFO 4 overflows (i.e. a write to FIFO 4 fails because FIFO 4 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=3) Write a '1' to clear bit. Default Value: 0
3	FIFO_OVERFLOW3	FIFO Overflow 3 Interrupt Request FIFO Overflow 3 Interrupt: hardware sets this interrupt whenever FIFO 3 overflows (i.e. a write to FIFO 3 fails because FIFO 3 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Write a '1' to clear bit. Default Value: 0
2	FIFO_OVERFLOW2	FIFO Overflow 2 Interrupt Request FIFO Overflow 2 Interrupt: hardware sets this interrupt whenever FIFO 2 overflows (i.e. a write to FIFO 2 fails because FIFO 2 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=2, or 3) Write a '1' to clear bit. Default Value: 0
1	FIFO_OVERFLOW1	FIFO Overflow 1 Interrupt Request FIFO Overflow 1 Interrupt: hardware sets this interrupt whenever FIFO 1 overflows (i.e. a write to FIFO 1 fails because FIFO 1 is full). This interrupt is only generated if the FIFO is configured for multiple FIFOs (i.e. FIFO_STA_CFG.CFG.SEL=1,2, or 3) Write a '1' to clear bit. Default Value: 0
0	FIFO_OVERFLOW0	FIFO Overflow 0 Interrupt Request FIFO Overflow 0 Interrupt: hardware sets this interrupt whenever FIFO 0 overflows (i.e. a write to FIFO 0 fails because FIFO 0 is full). Write a '1' to clear bit. Default Value: 0

10	FIFO_UNDER-FLOW2_MASK	Mask for corresponding field in INTR register. Default Value: 0
9	FIFO_UNDER-FLOW1_MASK	Mask for corresponding field in INTR register. Default Value: 0
8	FIFO_UNDER-FLOW0_MASK	Mask for corresponding field in INTR register. Default Value: 0
7	FIFO_OVER-FLOW7_MASK	Mask for corresponding field in INTR register. Default Value: 0
6	FIFO_OVER-FLOW6_MASK	Mask for corresponding field in INTR register. Default Value: 0
5	FIFO_OVER-FLOW5_MASK	Mask for corresponding field in INTR register. Default Value: 0
4	FIFO_OVER-FLOW4_MASK	Mask for corresponding field in INTR register. Default Value: 0
3	FIFO_OVER-FLOW3_MASK	Mask for corresponding field in INTR register. Default Value: 0
2	FIFO_OVER-FLOW2_MASK	Mask for corresponding field in INTR register. Default Value: 0
1	FIFO_OVER-FLOW1_MASK	Mask for corresponding field in INTR register. Default Value: 0
0	FIFO_OVER-FLOW0_MASK	Mask for corresponding field in INTR register. Default Value: 0

28.1.124 LPPASS_MMIO_FIFO_INTR_MASKED

Description: FIFO Interrupt masked request register

Address: 0x42EF0078

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1 : 0	SEL	FIFO Configuration Selection 0: FIFO configured for one 512 Entry FIFO (FIFO 0) 1: FIFO configured for two 256 Entry FIFOs: (FIFO 0-1) 2: FIFO configured for four 128 Entry FIFOs: (FIFO 0-3) 3: FIFO configured for eight 64 Entry FIFOs: (FIFO 0-7) Default Value: 0

28.1.126 LPPASS_MMIO_STA_MODE

Description: FIFO mode register.

Address: 0x42EF0404

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [7:1]							RD_LOCK-OUT_EN

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	RD_LOCKOUT_EN	FIFO Read Lockout enable. This bit must be set before the chip mode transitions from active to deepsleep. This bit must be cleared before the system reads the FIFO. After changing the state of this bit, FW must poll MODE_STATUS.READ_LOCKOUT to determine when Lockout change takes effect. 0: Read Lockout disabled, FIFO contents can be read. 1: Read Lockout enabled, FIFO contents cannot be read. Default Value: 0

28.1.127 LPPASS_MMIO_STA_MODE_STATUS

Description: FIFO mode status register.

Address: 0x42EF0408

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [7:1]							RD_LOCK-OUT

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
0	RD_LOCKOUT	FIFO Read Lockout status. 0: FIFO is not in Read Lockout mode. The system can read the contents of the FIFO. 1: FIFO is in Read Lockout mode. The chip can enter deepsleep mode. Default Value: 0

28.1.128 LPPASS_MMIO_STA_LEVEL0

Description: FIFO level register.

Address: 0x42EF0410

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	LEVEL [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							RW
HW Access	Reserved							R
Name	Reserved [15:9]							LEVEL

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
8 : 0	LEVEL	FIFO level set. A trigger (and optional interrupt) event occurs when USED.USED = LEVEL+1. Default Value: 0

28.1.129 LPPASS_MMIO_STA_RD_DATA0

Description: FIFO 32-bit read data register

Address: 0x42EF0430

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	RESULT [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	W							
Name	RESULT [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	RESULT [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	W							
Name	RESULT [31:24]							

Bits	Name	Description
31 : 0	RESULT	SAR 32-bit result. Default Value: Undefined

28.1.130 LPPASS_MMIO_STA_USED0

Description: FIFO used register

Address: 0x42EF0450

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	USED [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved						R	
HW Access	Reserved						W	
Name	Reserved [15:10]						USED [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
9 : 0	USED	Number of used/occupied entries in the FIFO. Default Value: 0

28.1.131 LPPASS_MMIO_STA_STATUS0

Description: FIFO status register

Address: 0x42EF0470

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	RD_PTR [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [15:9]							RD_PTR

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	W							
Name	WR_PTR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							R
HW Access	Reserved							W
Name	Reserved [31:25]							WR_PTR

Bits	Name	Description
24 : 16	WR_PTR	FIFO write pointer: FIFO location at which a new data is written by the hardware. Note: This functionality is intended for debugging purposes. Default Value: 0
8 : 0	RD_PTR	FIFO read pointer: FIFO location from which a data is read. Note: This functionality is intended for debugging purposes. Default Value: 0

29 Low-power Comparator (LPCOMP) registers

This section discusses the LPCOMP registers. It lists all the registers in mapping tables, in address order.

29.1 Register details

Register name	Address	Description
LPCOMP_CONFIG	0x42880000	LPCOMP Configuration Register
LPCOMP_STATUS	0x42880004	LPCOMP Status Register
LPCOMP_INTR	0x42880010	LPCOMP Interrupt request register
LPCOMP_INTR_SET	0x42880014	LPCOMP Interrupt set register
LPCOMP_INTR_MASK	0x42880018	LPCOMP Interrupt request mask
LPCOMP_INTR_MASKED	0x4288001C	LPCOMP Interrupt request masked
LPCOMP_CMP0_CTRL	0x42880040	Comparator 0 control Register
LPCOMP_CMP0_SW	0x42880050	Comparator 0 switch control
LPCOMP_CMP0_SW_CLEAR	0x42880054	Comparator 0 switch control clear
LPCOMP_CMP1_CTRL	0x42880080	Comparator 1 control Register
LPCOMP_CMP1_SW	0x42880090	Comparator 1 switch control
LPCOMP_CMP1_SW_CLEAR	0x42880094	Comparator 1 switch control clear
LPCOMP_CMP0_OFFSET_TRIM	0x42880098	Comparator 0 offset trim register
LPCOMP_CMP1_OFFSET_TRIM	0x4288009C	Comparator 1 offset trim register

29.1.1 LPCOMP_CONFIG

Description: LPCOMP Configuration Register

Address: 0x42880000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	Reserved					
HW Access	R	R	Reserved					
Name	ENABLED	LPREF_EN	Reserved [29:24]					

Bits	Name	Description
31	ENABLED	- 0: LPCOMP disabled (puts analog in power down, opens all switches, all clocks turned off) - 1: LPCOMP enabled Default Value: 0
30	LPREF_EN	Enable the local reference generator circuit to generate the local Vref and Ibias. Ibias current is an alternative to the reference current IREF generated by SRSS. This bit must be set for System Deep Sleep and System Hibernate operation. Default Value: 0

29.1.2 LPCOMP_STATUS

Description: LPCOMP Status Register

Address: 0x42880004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [7:1]							OUT0

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							R
HW Access	Reserved							RW
Name	Reserved [23:17]							OUT1

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
16	OUT1	Current output value of the comparator 1. Default Value: 0
0	OUT0	Current output value of the comparator 0. Default Value: 0

29.1.3 LPCOMP_INTR

Description: LPCOMP Interrupt request register

Address: 0x42880010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW1C	RW1C
HW Access	Reserved						A	A
Name	Reserved [7:2]						COMP1	COMP0

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	COMP1	Comparator 1 Interrupt: hardware sets this interrupt when comparator 1 triggers. Write with '1' to clear bit. Default Value: 0
0	COMP0	Comparator 0 Interrupt: hardware sets this interrupt when comparator 0 triggers. Write with '1' to clear bit. Default Value: 0

29.1.4 LPCOMP_INTR_SET

Description: LPCOMP Interrupt set register

Address: 0x42880014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW1S	RW1S
HW Access	Reserved						A	A
Name	Reserved [7:2]						COMP1	COMP0

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	COMP1	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0
0	COMP0	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0

29.1.5 LPCOMP_INTR_MASK

Description: LPCOMP Interrupt request mask

Address: 0x42880018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						RW	RW
HW Access	Reserved						R	R
Name	Reserved [7:2]						COMP1_MASK	COMP0_MASK

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	COMP1_MASK	Mask bit for corresponding bit in interrupt request register. Default Value: 0
0	COMP0_MASK	Mask bit for corresponding bit in interrupt request register. Default Value: 0

29.1.6 LPCOMP_INTR_MASKED

Description: LPCOMP Interrupt request masked

Address: 0x4288001C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved						R	R
HW Access	Reserved						W	W
Name	Reserved [7:2]						COMP1_MASKED	COMP0_MASKED

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
1	COMP1_MASKED	Logical and of corresponding request and mask bits. Default Value: 0
0	COMP0_MASKED	Logical and of corresponding request and mask bits. Default Value: 0

29.1.7 LPCOMP_CMP0_CTRL

Description: Comparator 0 control Register

Address: 0x42880040

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW	Reserved			RW	
HW Access	R		R	Reserved			R	
Name	INTTYPE0 [7:6]		HYST0	Reserved [4:2]			MODE0 [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				RW	RW	Reserved	
HW Access	Reserved				R	R	Reserved	
Name	Reserved [15:12]				DSI_LEV-EL0	DSI_BY-PASS0	Reserved [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
11	DSI_LEVEL0	Synchronous comparator output (trigger): 0=pulse 1=level Default Value: 0
10	DSI_BYPASS0	Asynchronous: bypass comparator output synchronization: 0=synchronize to system clock clk_sys (level or pulse) 1=bypass (output async) Note that in System Deep Sleep mode, this bit needs to be set to observe the output on the dedicated pin. Default Value: 0
7 : 6	INTTYPE0	Sets which edge will trigger an IRQ Default Value: 0 **0x0: DISABLE :** Disabled, no interrupts will be detected **0x1: RISING :** Rising edge **0x2: FALLING :** Falling edge

29.1.7 LPCOMP_CMP0_CTRL (continued)

		0x3: BOTH : Both rising and falling edges
5	HYST0	Add hysteresis to the comparator. See the device datasheet for the value of comparator hysterisis voltage. 0= Disable Hysteresis 1= Enable Hysteresis Default Value: 0
1 : 0	MODE0	Power mode of the comparator. See the device datasheet for the current consumption and response time of each mode Default Value: 0 **0x0: OFF :** Off **0x1: ULP :** Ultra low power operating mode. This mode must be used for System Deep Sleep and System Hibernate operation. In this mode, local Ibias is used. **0x2: LP :** Low Power operating mode. In this mode, IREF from SRSS is used. **0x3: NORMAL :** Normal power, full speed operating mode. In this mode, IREF from SRSS is used.

29.1.8 LPCOMP_CMP0_SW

Description: Comparator 0 switch control

Address: 0x42880050

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1S	RW1S	RW1S	RW1S	Reserved	RW1S	RW1S	RW1S
HW Access	RW1C	RW1C	RW1C	RW1C	Reserved	RW1C	RW1C	RW1C
Name	CMP0_VN0	CMP0_BN0	CMP0_AN0	CMP0_IN0	Reserved	CMP0_BP0	CMP0_AP0	CMP0_IP0

4	CMP0_IN0	see corresponding bit in CMP0_SW Default Value: 0
2	CMP0_BP0	see corresponding bit in CMP0_SW Default Value: 0
1	CMP0_AP0	see corresponding bit in CMP0_SW Default Value: 0
0	CMP0_IP0	see corresponding bit in CMP0_SW Default Value: 0

29.1.10 LPCOMP_CMP1_CTRL

Description: Comparator 1 control Register

Address: 0x42880080

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW	Reserved			RW	
HW Access	R		R	Reserved			R	
Name	INTTYPE1 [7:6]		HYST1	Reserved [4:2]			MODE1 [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved				RW	RW	Reserved	
HW Access	Reserved				R	R	Reserved	
Name	Reserved [15:12]				DSI_LEV-EL1	DSI_BY-PASS1	Reserved [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
11	DSI_LEVEL1	Synchronous comparator output (trigger): 0=pulse 1=level Default Value: 0
10	DSI_BYPASS1	Asynchronous: bypass comparator output synchronization: 0=synchronize to system clock clk_sys (level or pulse) 1=bypass (output async) Note that in System Deep Sleep mode, this bit needs to be set to observe the output on the dedicated pin. Default Value: 0
7 : 6	INTTYPE1	Sets which edge will trigger an IRQ Default Value: 0 **0x0: DISABLE :** Disabled, no interrupts will be detected **0x1: RISING :** Rising edge **0x2: FALLING :** Falling edge

29.1.10 LPCOMP_CMP1_CTRL (continued)

		0x3: BOTH : Both rising and falling edges
5	HYST1	Add hysteresis to the comparator. See the device datasheet for the value of comparator hysterisis voltage. 0= Disable Hysteresis 1= Enable Hysteresis Default Value: 0
1 : 0	MODE1	Power mode of the comparator. See the device datasheet for the current consumption and response time of each mode Default Value: 0 **0x0: OFF :** Off **0x1: ULP :** Ultra low power operating mode. This mode must be used for System Deep Sleep and System Hibernate operation. In this mode, local Ibias is used. **0x2: LP :** Low Power operating mode. In this mode, IREF from SRSS is used. **0x3: NORMAL :** Normal power, full speed operating mode. In this mode, IREF from SRSS is used.

29.1.11 LPCOMP_CMP1_SW

Description: Comparator 1 switch control

Address: 0x42880090

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1S	RW1S	RW1S	RW1S	Reserved	RW1S	RW1S	RW1S
HW Access	RW1C	RW1C	RW1C	RW1C	Reserved	RW1C	RW1C	RW1C
Name	CMP1_VN1	CMP1_BN1	CMP1_AN1	CMP1_IN1	Reserved	CMP1_BP1	CMP1_AP1	CMP1_IP1

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	CMP1_VN1	Comparator 0 inverting terminal switch to local Vref (LPREF_EN must be set) Default Value: 0
6	CMP1_BN1	Reserved Default Value: 0
5	CMP1_AN1	Reserved Default Value: 0
4	CMP1_IN1	Comparator 0 inverting terminal isolation switch to GPIO. See the device datasheet for the location of this GPIO. Default Value: 0
2	CMP1_BP1	Reserved Default Value: 0
1	CMP1_AP1	Reserved Default Value: 0
0	CMP1_IP1	Comparator 0 non-inverting terminal isolation switch to GPIO. See the device datasheet for the location of this GPIO. Default Value: 0

29.1.12 LPCOMP_CMP1_SW_CLEAR

Description: Comparator 1 switch control clear

Address: 0x42880094

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C	RW1C	RW1C	RW1C	Reserved	RW1C	RW1C	RW1C
HW Access	A	A	A	A	Reserved	A	A	A
Name	CMP1_VN1	CMP1_BN1	CMP1_AN1	CMP1_IN1	Reserved	CMP1_BP1	CMP1_AP1	CMP1_IP1

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
7	CMP1_VN1	see corresponding bit in CMP1_SW Default Value: 0
6	CMP1_BN1	see corresponding bit in CMP1_SW Default Value: 0
5	CMP1_AN1	see corresponding bit in CMP1_SW Default Value: 0
4	CMP1_IN1	see corresponding bit in CMP1_SW Default Value: 0
2	CMP1_BP1	see corresponding bit in CMP1_SW Default Value: 0
1	CMP1_AP1	see corresponding bit in CMP1_SW Default Value: 0
0	CMP1_IP1	see corresponding bit in CMP1_SW Default Value: 0

29.1.13 LPCOMP_CMP0_OFFSET_TRIM

Description: Comparator 0 offset trim register

Address: 0x42880098

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW	RW	RW			
HW Access	Reserved		R	R	R			
Name	Reserved [7:6]		CMP0_EN	CMP0_POLARITY	CMP0_MAGNITUDE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5	CMP0_EN	enables CMP0 offset trim 0 = disabled 1 = enabled Default Value: 0
4	CMP0_POLARITY	polarity of CMP0 offset trim. 0 = negative 1 = positive Default Value: 0
3 : 0	CMP0_MAGNITUDE	magnitude of CMP0 offset trim. 1mV offset shift per bit. Default Value: 0

29.1.14 LPCOMP_CMP1_OFFSET_TRIM

Description: Comparator 1 offset trim register

Address: 0x4288009C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	Reserved		RW	RW	RW			
HW Access	Reserved		R	R	R			
Name	Reserved [7:6]		CMP1_EN	CMP1_POLARITY	CMP1_MAGNITUDE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	Reserved							
HW Access	Reserved							
Name	Reserved [31:24]							

Bits	Name	Description
5	CMP1_EN	enables CMP1 offset trim 0 = disabled 1 = enabled Default Value: 0
4	CMP1_POLARITY	polarity of CMP1 offset trim. 0 = negative 1 = positive Default Value: 0
3 : 0	CMP1_MAGNITUDE	magnitude of CMP1 offset trim. 1mV offset shift per bit. Default Value: 0

IMPORTANT NOTICE

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics ("Beschaffenheitsgarantie").

With respect to any examples, hints or any typical values stated herein and/or any information regarding the application of the product, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.

In addition, any information given in this document is subject to customer's compliance with its obligations stated in this document and any applicable legal requirements, norms and standards concerning customer's products and any use of the product of Infineon Technologies in customer's applications.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

WARNINGS

Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.

Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.
