

Objective

This example demonstrates use of the PSoC Creator Bootloader and Bootloadable Components in a USB-based bootloader system. It also demonstrates a PC-based bootloader host program.

Overview

This example uses two PSoC Creator projects – bootloader and bootloadable – to demonstrate the PSoC Creator bootloader system. The bootloader project communicates with a PC host via USB HID, to program an application image. The bootloadable project is the application image that is programmed.

Requirements

Tool: PSoC Creator 4.0 or higher

Programming Language: C (GCC 4.9)

Associated Parts: All PSoC 3, PSoC 4 L-series, and PSoC 5LP parts with USB

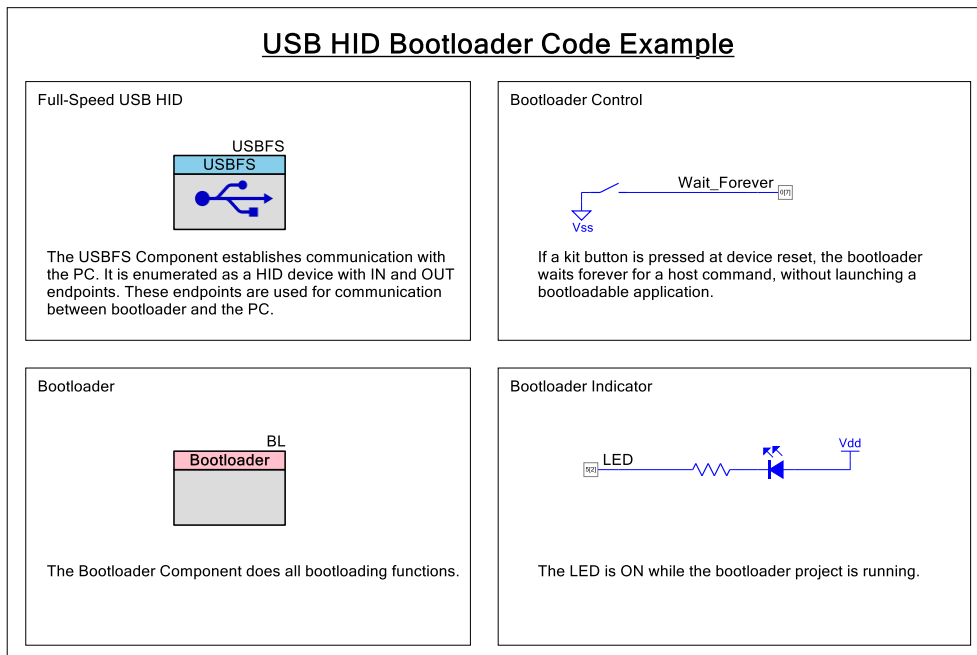

Related Hardware: [CY8CKIT-030](#), [CY8CKIT-046](#), [CY8CKIT-050](#), [CY8CKIT-059](#)

Design

USB HID Bootloader

The bootloader project design features the PSoC Creator Bootloader and USBFS Components, as [Figure 1](#) shows. The USBFS Component communicates with the PC host to get commands and a new application image. The Bootloader Component does flash programming, host command / response protocol, and launches the bootloadable application.

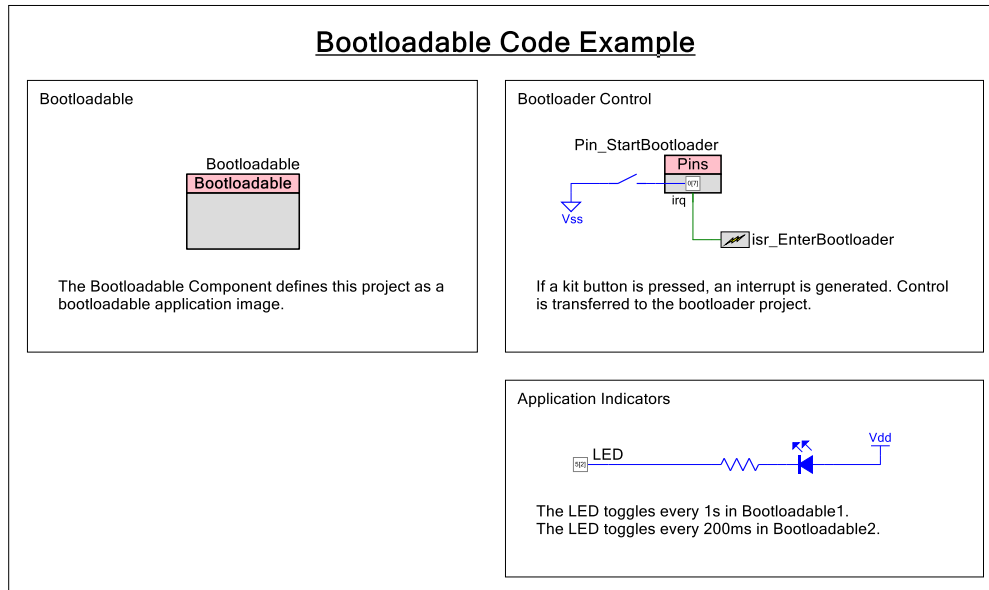

Figure 1. USB HID Bootloader Schematic (Pins and LED are Selected for CY8CKIT-046)

Bootloadable

The design of the bootloadable projects features the PSoC Creator Bootloadable Component, as [Figure 2](#) shows. Other Components implement the desired application. This code example has two bootloadable projects, which perform slightly different functions.

Figure 2. Bootloadable Schematic (Pins and LED are Selected for CY8CKIT-046)

Design Considerations

This design can be extended by changing the Bootloader Component to implement a dual-application function. Then, two bootloadable projects can be programmed into flash.

This code example is designed for the following PSoC device families and associated kits:

- The PSoC 4 L-series family and associated [CY8CKIT-046](#) kit
- The PSoC 5LP device family and associated [CY8CKIT-059](#) kit

The design is easily portable to other PSoC 3, PSoC 4 L-series, and PSoC 5LP devices and kits, typically by just changing the LED or button pin assignments.

The PSoC Creator bootloader system is designed to be used with most communication channels, and it is easy to change this example to be an I²C, UART, or SPI-based bootloader. For more information, see [AN73854](#) - PSoC(R) 3, PSoC 4, and PSoC 5LP Introduction to Bootloaders.

PSoC Creator Components

Table 1 and Table 2 list the PSoC Creator Components used in this example, as well as the hardware resources used by each Component.

Table 1. List of PSoC Creator Components for USB HID Bootloader Project

Component	Hardware Resources
BL	none
USBFS	1 USBFS
Wait_Forever	1 pin
LED	1 pin

Table 2. List of PSoC Creator Components for Bootloadable Projects

Component	Hardware Resources
Bootloadable	none
Pin_StartBootloader	1 pin
isr_EnterBootloader	1 interrupt vector
LED	1 pin

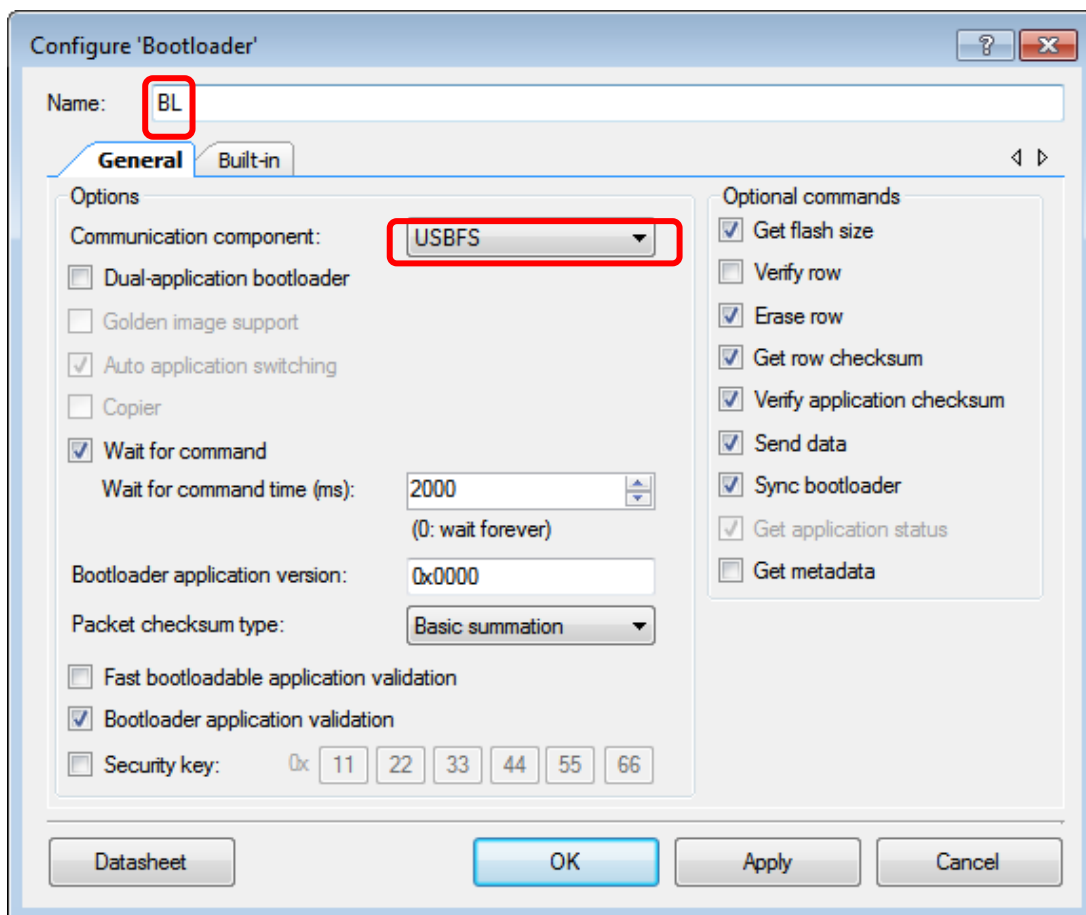

Parameter Settings

This section shows the changed configuration settings for the PSoC Creator Components in the code example projects.

Bootloader

Figure 3 shows the changed settings for the Bootloader Component. The Component Name change is optional.

Figure 3. Bootloader Component Configuration

USBFS

The USBFS Component is configured for HID bootloader by using an import file provided with PSoC Creator:

```
<PSoC Creator InstallDir> \ psoc \ content \ cycomponentlibrary \ CyComponentLibrary.cylib \
USBFS_v_x_xx \ Custom \ template \ Bootloader.root.xml
```

For details on how to import this file, see application note [AN73053](#), PSoC USB HID Bootloader.

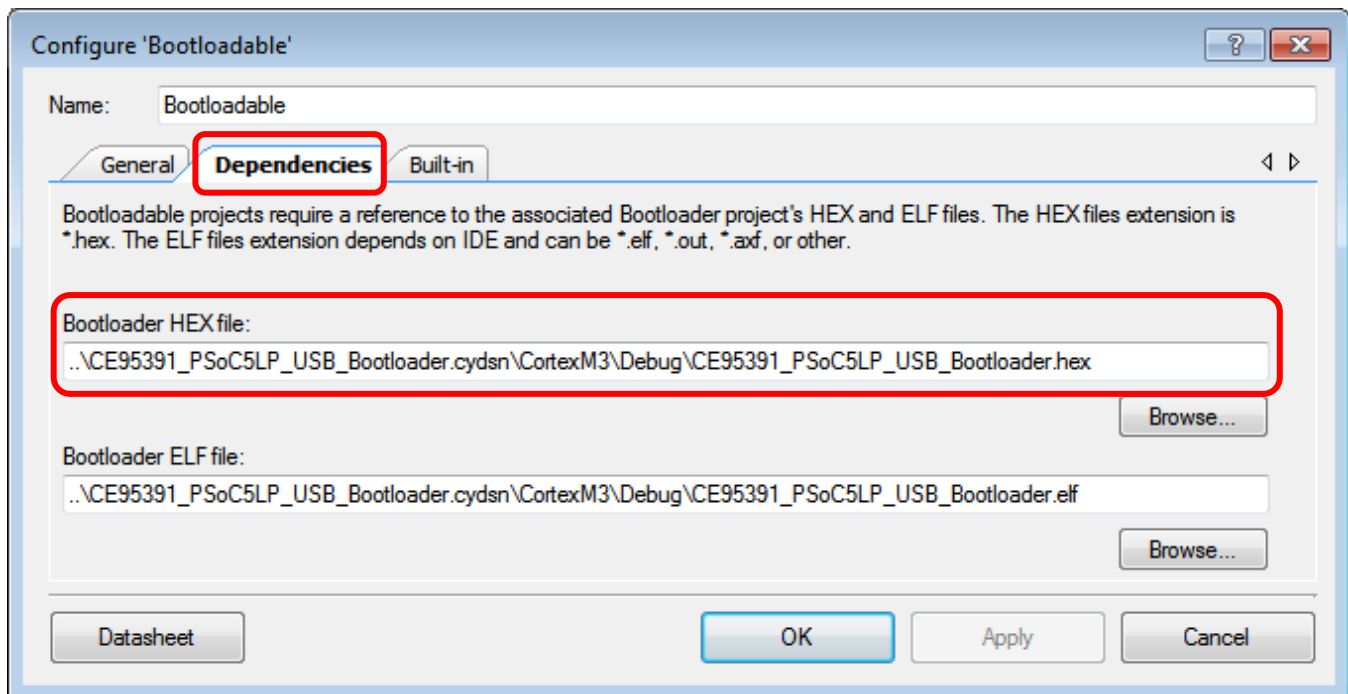

Bootloadable

A bootloadable project is always linked to the output *.hex* and *.elf* files of an associated bootloader project, as [Figure 4](#) shows. Selecting the *.hex* file automatically selects the associated *.elf* file. Before configuring a bootloadable Component, you should completely build the associated bootloader project.

For this code example, the bootloader *.hex* file is at a relative path within this PSoC Creator workspace. However, this need not be the case; bootloader and bootloadable projects can be in different workspaces.

For more information on bootloader and bootloadable files, see [AN73854](#), PSoC(R) 3, PSoC 4, and PSoC 5LP Introduction to Bootloaders.

Figure 4. Bootloadable Component Configuration

Input Pins

In all of the projects, digital input Pin Components are used to read the state of a kit button. The buttons short to ground when pressed, therefore the Pin Component must be configured for resistive pull up, as Figure 5 shows. This causes the Pin input state to be 0 when the button is pressed and 1 when it is released.

Figure 5. Digital Input Pin Configuration for Resistive Pull Up

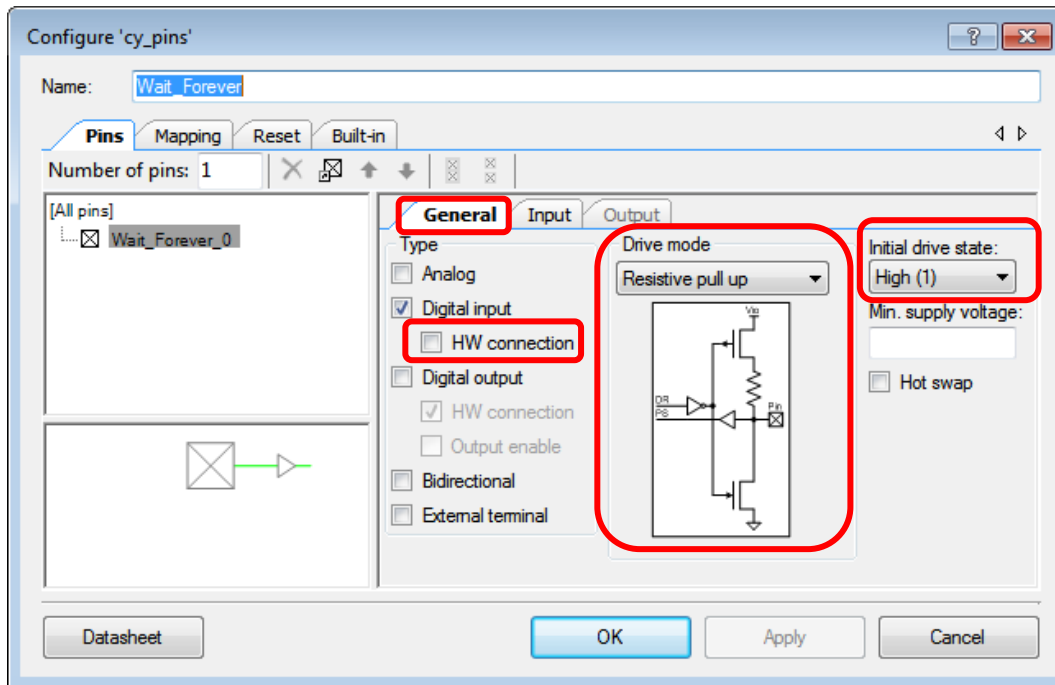

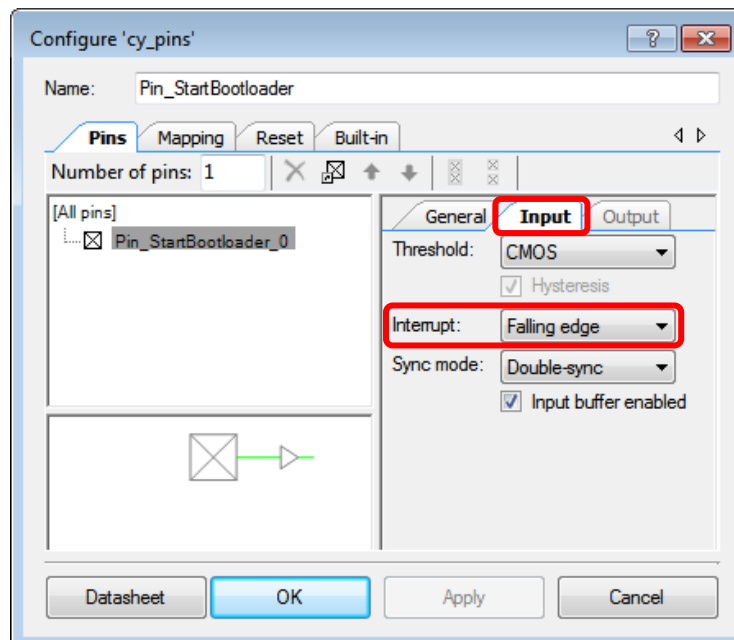

Figure 6 shows the configuration for the input Pin Component to generate an interrupt.

Figure 6. Digital Input Pin Configuration for Interrupt

Design-Wide

The design-wide clocks are configured for USB, as [Figure 7](#) shows for the PSoC 4 L-series, and [Figure 8](#) shows for PSoC 3 and PSoC 5LP.

Figure 7. PSoC 4 L-series USB Clock Configuration

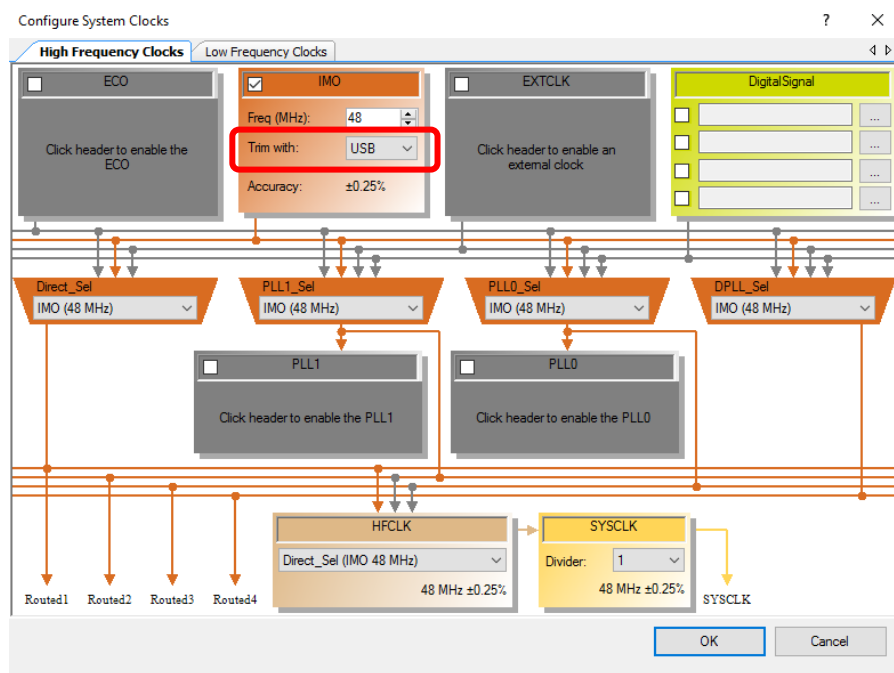

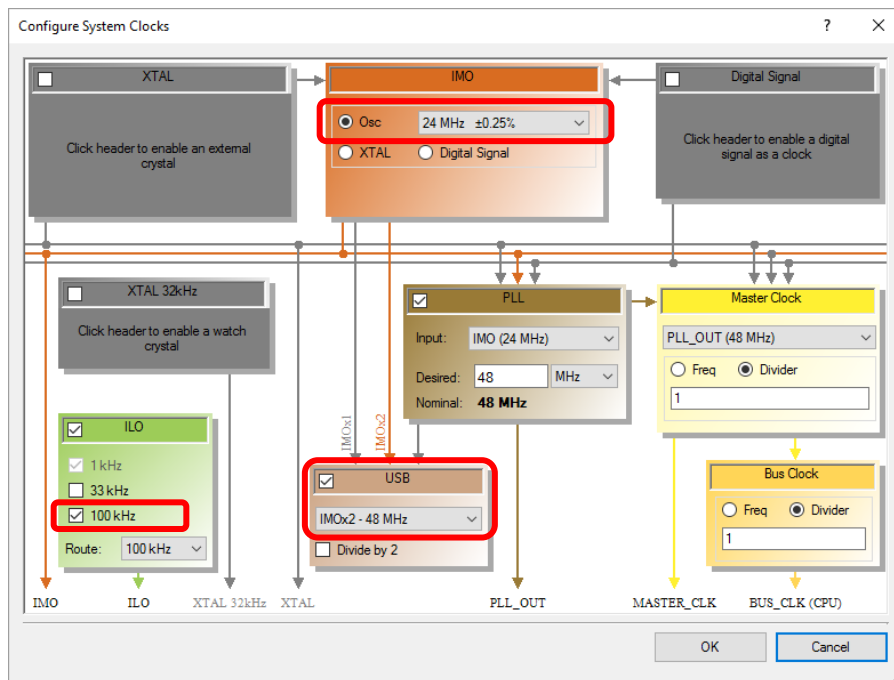

Figure 8. PSoC 3 and PSoC 5LP USB Clock Configuration

Operation

1. Connect a USB cable between the host PC and the kit *programming USB connector*. Note that some kits plug directly into the USB port.
2. Program the USB HID Bootloader project into the kit. Confirm that the kit LED is on constantly, indicating that the bootloader is running.
3. Unplug the USB cable, and plug it into the kit *general usage USB connector*. If the kit is plugged into a USB port, remove it. The kit should be able to be powered from the USB connection.
4. Run the PSoC Creator Bootloader Host program (menu item **Tools > Bootloader Host...**).
5. Select a Bootloadable1 project *.cyacd* file and program it using the bootloader. Confirm that the LED blinks at a 1-second rate, indicating that the bootloadable is running.
6. Press the kit button to switch from bootloadable to bootloader. Confirm that the LED stays on (the bootloader is running).
7. Select a bootloadable2 project *.cyacd* file and program it using the bootloader. Confirm that the LED now blinks at a 200-ms rate, indicating that the other bootloadable is running.
8. Press the kit button to switch from bootloadable to bootloader. Confirm that the LED stays on (the bootloader is running).

The remaining steps are optional:

9. Start programming a bootloadable project *.cyacd* file, as in steps 5 and 7, but during programming disconnect the USB cable.
10. Repeat step 5 or 7 and confirm the successful completion of bootloading.
