LEGAL DISCLAIMER

THE INFORMATION GIVEN IN THIS APPLICATION NOTE IS GIVEN AS A HINT FOR THE IMPLEMENTATION OF THE INFINEON TECHNOLOGIES COMPONENT ONLY AND SHALL NOT BE REGARDED AS ANY DESCRIPTION OR WARRANTY OF A CERTAIN FUNCTIONALITY, CONDITION OR QUALITY OF THE INFINEON TECHNOLOGIES COMPONENT. THE RECIPIENT OF THIS APPLICATION NOTE MUST VERIFY ANY FUNCTION DESCRIBED HEREIN IN THE REAL APPLICATION. INFINEON TECHNOLOGIES HEREBY DISCLAIMS ANY AND ALL WARRANTIES AND LIABILITIES OF ANY KIND (INCLUDING WITHOUT LIMITATION WARRANTIES OF NON-INFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS OF ANY THIRD PARTY) WITH RESPECT TO ANY AND ALL INFORMATION GIVEN IN THIS APPLICATION NOTE.

Information

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
High Power Applications up to 35 dBm

1 Introduction

The BGS12PL6 general purpose RF MOS power switch is designed to cover a broad range of high power applications from 30 MHz to 4 GHz, mainly in the transmit path of WCDMA and LTE mobile phones. The symmetric design of its single pole double throw (SPDT) configuration, as shown in Figure 1 offers high design flexibility.

This single supply chip integrates on-chip CMOS logic driven by a simple, single-pin CMOS or TTL compatible control input signal. The 0.1 dB compression point exceeds the switch’s maximum input power level of 35 dBm, resulting in linear performance at all signal levels. The RF switch has a very low insertion loss of 0.33 dB in the 1 GHz, 0.42 dB in the 2 GHz and 0.6 dB in the 3 GHz range.

Unlike GaAs technology, external DC blocking capacitors at the RF ports are only required if DC voltage is applied externally.

The BGS12PL6 RF switch is manufactured in Infineon’s patented MOS technology, offering the performance of GaAs with the economy and integration of conventional CMOS including the inherent higher ESD robustness.

The device has a very small size of only 0.7 x 1.1 mm² and a maximum height of 0.4 mm.

2 BGS12PL6 Features

2.1 Main Features

- 2 high-linearity TRx paths with power handling capability of up to 35 dBm
- All ports fully symmetrical
- No external decoupling components required
- Very low insertion loss
- Very low harmonic generation
- High port-to-port-isolation
- 0.1 to 4 GHz coverage
- High ESD robustness
- On-chip control logic
- Small lead and halogen free package TSLP-6-4 (0.7 x 1.1 mm²)
- RoHS compliant package

3 Application

3.1 LTE Band Switch

The next generation smart phones are required to support up to 15 different frequency bands and even more number of band combinations. Often the number of pins on the transceiver is limited. An RF switch can be used to expand the number of reception bands. One of the possible applications of this high power SPDT is an LTE band switch which can be used after the Power Amplifier (PA) as shown in the figure below.

![Figure 3](image_url)

**Figure 3** Application LTE Switch

3.2 Antenna switch

Another application is the antenna switch for certain bands in LTE and CDMA.

![Figure 4](image_url)

**Figure 4** Antenna Switch with BGS12PL6
3.3 Application Board

Below is a picture of the evaluation board used for the measurements (Figure 5). The board is designed so that all connecting 50 Ohm lines have the same length.

In order to get accurate values for the insertion loss of the BGS12PL6 all influences and losses of the evaluation board, lines and connectors have to be eliminated. Therefore a separate de-embedding board, representing the line length is necessary (Figure 6).

The calibration of the network analyser (NWA) is done in several steps:
- Perform full calibration on all NWA ports.
- Attach empty SMA connector at port 2 and perform “open” port extension. Turn port extensions on.
- Connect the “half” de-embedding board (Figure 6 left board) between port 1 and port 2, store this as a s-parameter (s2p) file.
- Turn all port extensions off.
- Load the stored s-parameter file as de-embedding file for all used NWA ports
- Switch all port extensions on
- Check insertion loss with the de-embedding through board (Figure 6 right board)

![Figure 5](image1.jpg) **Photo of the Application Board**

![Figure 6](image2.jpg) **Photos of De-embedding Boards**

The construction of the PCB is shown in Figure 7.

![Figure 7](image3.jpg) **PCB layer information**
4 Small Signal Characteristics

The small signal characteristics are measured at 25 °C with a 4-port Network Analyzer.

4.1 Measurement Results

In the following tables and graphs the most important RF parameters of the BGS12SL6 are shown. The markers are set to the most important frequencies of the WDCDMA system.

5 Intermodulation

Another very important parameter of a RF switch is the large signal capability. One of the possible intermodulation scenarios is shown in Figure 12. The transmission (Tx) signal from the main antenna is coupled into the diversity antenna with high power. This signal (20 dBm) and a received Jammer signal (-15 dBm) are entering the switch.

![Block Diagram of Intermodulation Measurement of RF Switch](image)

Special combinations of TX and Jammer signals produce 2nd and 3rd order intermodulation products, which fall in the RX band and interfere with the wanted RX signal.

In Table 5 frequencies for 3 bands and the intermodulation specifications for an undisturbed communication are given.

</tbody>
</table>

The test setup for the IMD measurements has to provide a very high isolation between RX and TX signals. As an example the test set-up and the results for the high band are shown (Figure 13 and Figure 14).

For the RX/TX separation a professional duplexer with 80 dB isolation is used.
Figure 14 and Figure 15 show the results for Band I and Band V. For each distortion scenario there is a min. and a max. value given. This variation is caused by a phase shifter connected between the switch and the duplexer. In the test set-up the phase shifter represents a non-ideal matching of the switch to 50 Ohm.

Figure 15  IMD Results for Band V
6 Harmonic Generation

Harmonic generation is another important parameter for the characterization of a RF switch. RF switches have to deal with high RF levels up to 35 dBm. Harmonics are generated with such high RF power levels at the input of the switch. These harmonics (2\(^{nd}\) and 3\(^{rd}\)) can disturb the reception of other bands or cause distortion in other RF applications (GPS, WLAN…) within the mobile phone.

**Figure 16  Set-Up for Harmonics Measurement**

The results for the harmonic generation at 830 MHz are shown in Figure 17 (2\(^{nd}\) harmonic) and Figure 18 (3\(^{rd}\) harmonic) for all RF ports. In Figure 19 and Figure 20 the results for 1800 MHz are given.

On the x-axis the input power is plotted and on the y-axis the generated harmonics in dBm.

**Figure 17  2\(^{nd}\) Harmonic at f\(_{c}\)=830 MHz**
High Power Applications up to 35 dBm

Harmonic Generation

Figure 18  3rd Harmonic at $f_c=830$ MHz

Figure 20  3rd Harmonic at $f_c=1800$ MHz
7 Power Compression Measurements on all RF Paths

To judge the large signal capability of a switch, ‘power compression’ is a widely used measurement. The output power is measured while the input power increasing gradually. At a certain point the output power does not follow the input power and the switch compresses the RF signal. In the diagram below (Figure 21) the IL is plotted versus the injected input power. The input power can be increased up to 38 dBm and there is no compression visible on any of the RF ports.

![Figure 21 Power Compression Measurement Results at f_c=830 MHz](image)

The measurements are done on large signal measurement setup which is not calibrated for Insertion Loss with high precision. So the values here may differ with the actual IL values earlier in this report.
