BGA524N6

Low Noise Amplifier for Global Navigation Satellite Systems GPS/GLONASS/Galileo/COMPASS from 1550 MHz to 1615 MHz Applications, Low Q inductor
Legal Disclaimer
The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

Information
For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

Warnings
Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.
Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

1 Introduction of Global Navigation Satellite Systems (GNSS)

The BGA524N6 is a front-end Low Noise Amplifier (LNA) for Global Navigation Satellite Systems (GNSS) application. It is based on Infineon Technologies’ B7HF Silicon-Germanium (SiGe) technology, enabling a cost-effective solution in a TSNP-6-2 leadless package with ultra low noise figure, high linearity, low current consumption and high gain, over a wide range of supply voltages from 1.5 V up to 3.3 V. All these features make BGA524N6 an excellent choice for GNSS LNA as it improves sensitivity, provide better immunity against out-of-band jammer signals, reduces filtering requirement and hence the overall cost of the GNSS receiver.

The GNSS satellites are at an orbit altitude of more than 20,000 km away from earth’s surface and transmit power in the range of +47 dBm. After taking losses (atmospheric, antenna etc.) into account, the received signal strength at the GNSS device input is very low in the range of -130 dBm. The ability of the GNSS device to receive such low signal strength and provide meaningful information to the end-user depends strongly on the noise figure of the GNSS receives chain. This ability which is called receiver sensitivity can be improved by using a low-noise amplifier with low noise figure and high gain at the input of the receiver chain. The improved sensitivity results in a shorter Time-To-First-Fix (TTFF), which is the time required for a GNSS receiver to acquire satellite signals and navigation data, and calculate a position. Noise figure of the LNA defines the overall noise figure of the GNSS receiver system. This is where BGA524N6 excels by providing noise figure as low as 0.55 dB and high gain of 19.6 dB, thereby improving the receiver sensitivity significantly.

The ever growing demand to integrate more and more functionality into one device leads to many challenges when transmitter/receiver has to work simultaneously without degrading the performance of each other. In today’s smart-phones a GNSS receiver simultaneously co-exists with transceivers in the GSM/EDGE/UMTS/LTE bands. These 3G/4G transceivers transmit high power in the range of +24 dBm which due to insufficient isolation couple to the GNSS receiver. The cellular signals can mix to produce Intermodulation products exactly in the GNSS receiver frequency band. For example, GSM 1712.7 MHz mixes with UMTS 1850 MHz to produce third-order-product exactly at GPS band. To quantify the effect, BGA524N6
shows out-of-band input IP3 at GPS band of -4 dBm, as a result of frequency mixing between GSM 1712.7 MHz and UMTS 1850 MHz with power levels of -20 dBm. Due to this high out-of-band input 3rd order intercept point (IIP3), BGA524N6 is especially suitable for the GPS function in mobile phones.

![Figure 1 BGA524N6 TSNP-6-2 leadless Package size](image)

As the industry inclines towards assembly miniaturization and also surface mount technology matures, there is a desire to have smaller and thinner components. This is especially the case with portable electronics where higher circuit density allows device design flexibility and also optimum use of the limited space available. BGA524N6 has a small package with dimensions of 0.70mm x 1.1mm x 0.375mm and it requires only one external component at its input, the inductor providing the input matching. The DC block at input is optional as it is usually provided by the pre-filter before the LNA in many GPS applications. All the device/phone manufacturers implement very good power supply filtering on their boards so that the RF bypass capacitor mentioned in this application circuit may not be needed in the end. The minimal number of external SMD components reduces the application bill of materials, assembly complexity and the PCB area thus making it an ideal solution for compact and cost-effective GNSS LNA. The output of the BGA524N6 is internally matched to 50 Ω, and a DC blocking capacitor is integrated on-chip, thus no external component is required at the output.
The device also integrates an on-chip ESD protection which can resist until 2 kV (referenced to human body model) in all pins. The integrated power on/off feature provides for low power consumption and increased stand-by time for GNSS handsets. Moreover, the low current consumption (2.5 mA) makes the device suitable for portable technology like GNSS receivers and mobiles phones.

The Internal circuit block diagram of the BGA524N6 is presented in Figure 3. Table 1 shows the pin assignment of BGA524N6. Table 2 shows the truth table to turn on/off BGA524N6 by applying different voltage to the PON pin.
2 BGA524N6 Overview

2.1 Features

- High insertion power gain: 19.6 dB
- Out-of-band input 3rd order intercept point: -4 dBm
- Input 1 dB compression point: -12 dBm
- Low noise figure: 0.55 dB
- Low current consumption: 2.5 mA
- Operating frequencies: 1550 - 1615 MHz
- Supply voltage: 1.5 V to 3.3 V
- Digital on/off switch (1 V logic high level)
- Ultra small TSNP-6-2 leadless package (footprint: 0.7 x 1.1 mm²)
- B7HF Silicon Germanium technology
- RF output internally matched to 50 Ω
- Only 1 external SMD component necessary
- 2 kV HBM ESD protection (including AI-pin)
- Pb-free (RoHS compliant) package

Figure 2 BGA524N6 in TSNP-6-2

2.2 Key Applications of BGA524N6

- Ideal for all Global Navigation Satellite Systems (GNSS) like
  - GPS (Global Positioning System) working in the L1 band at 1575.42 MHz
  - GLONASS (Russian GNSS) working in the L1 band from 1598.06 MHz to 1605.38 MHz
  - Galileo (European GNSS) working in the E2-L1-E1 band from 1559 MHz to 1592 MHz
  - COMPASS (Chinese Beidou Navigation System) working in E2 band at 1561.10 MHz and E1 band at 1589.74 MHz

2.3 Description

The BGA524N6 is a front-end low noise amplifier for Global Navigation Satellite Systems (GNSS) from 1550 MHz to 1615 MHz like GPS, GLONASS, Beidou, Galileo and others. The LNA provides 16.2 dB gain and 0.55 dB noise figure at a current consumption of 4.8 mA in the application configuration described in Chapter 3. The BGA524N6 is based upon Infineon Technologies B7HF Silicon Germanium technology. It operates from 1.5 V to 3.3 V supply voltage.

3.2 Summary BGA524N6 as 1550-1615 MHz LNA for GNSS

This application note addresses the application circuit of high gain low current GNSS LNA using low Q inductor.

The circuit requires only one 0402 LQG type inductor for the application. It has in band gain of 19.3 dB. The circuit achieves input return loss better than 11.3 dB, as well as output return loss better than 15.5 dB for the whole frequency band of GNSS. At room temperature the noise figure is 0.78 dB (SMA and PCB losses are subtracted) for the GPS frequency and 0.79 dB for GLONASS frequency band. Furthermore, the circuit is unconditionally stable till 10 GHz.

At GPS frequency, using two tones spacing of 1 MHz, the output third order intercept point IIP3 reaches 9.9 dBm. And for the GLONASS frequency band, OIP3 reaches 10 dBm. Output P1dB of the GNSS LNA is about 6.3 dBm for the GPS frequency and 5.9 dBm for GLONASS frequency band. Out of band Input IP3 is -5.4 dBm for the GPS frequency.
