CHAPTER 55:APPENDIX: Major Changes

Page	Section	Change Results	
249 to 254	CHAPTER 6 Low-power Consumption 3.3. Profile Setting Items	Added the below: Table 3-4 List of RUN/PSS Profile Setting Parameters	
255 256 257 258 259 261 262 264 265 267	CHAPTER 6 Low-power Consumption 3.4.1. Profile Errors	Revised the below:	
		Error	Correct
		Profile Errors	3.4.1. Profile Errors
		The PLL0/SSCG0 Input Clock Stops when PLL0/SSCG0 Clock Oscillation Enable is Set.	3.4.1.1 The PLL0/SSCG0 Input Clock Stops when PLL0/SSCG0 Clock Oscillation Enable is Set.
		The Selected Source Clock of Clock Domain 0/MCUC Clock Domain is a Clock for which Oscillation is Disabled.	3.4.1.2 The Selected Source Clock of Clock Domain 0/MCUC Clock Domain is a Clock for which Oscillation is Disabled.
		The Source Clocks of Clock Domain 0 and Clock Domain MCUC were Set to "L" during CPU Operation.	3.4.1.3 The Source Clocks of Clock Domain 0 and Clock Domain MCUC were Set to "L" during CPU Operation.
		The PLL0/SSCG0 Setting was Changed during PLL0/SSCG0 Oscillation.	3.4.1.4 The PLL0/SSCG0 Setting was Changed during PLL0/SSCG0 Oscillation.
		CSV Operation was Enabled while Monitoring/Reference Clock Oscillation was Disabled.	3.4.1.5 CSV Operation was Enabled while Monitoring/Reference Clock Oscillation was Disabled.
		The Oscillation of the Monitoring Clock did not Stop Simultaneously when CSV Operation in Progress was Disabled.	3.4.1.6 The Oscillation of the Monitoring Clock did not Stop Simultaneously when CSV Operation in Progress was Disabled.
		The Clock Used by the Software Watchdog has Stopped.	3.4.1.7 The Clock Used by the Software Watchdog has Stopped.
		The Clock Used by the Hardware Watchdog has Stopped.	3.4.1.8 The Clock Used by the Hardware Watchdog has Stopped.
		The Regulator Mode Changed to Standby During PLL Oscillation Enable.	3.4.1.9 The Regulator Mode Changed to Standby During PLL Oscillation Enable.
		The Set Source Clock for Clock Domain 0 was Any Clock Other than the High-Speed CR Clock, with the RUN Profile at the Return Time from the PSS that Powered OFF PD2.	3.4.1.10 The Set Source Clock for Clock Domain 0 was Any Clock Other than the High-Speed CR Clock, with the RUN Profile at the Return Time from the PSS that Powered OFF PD2.
		Power Domain Restrictions (Hierarchical Relationship/Combination) were Ignored.	3.4.1.11 Power Domain Restrictions (Hierarchical Relationship/Combination) were Ignored.

CHAPTER 6
Low-power Consumption
4.3.
Transition from PSS to RUN

Revised the below:
Table 4-1 Factors in Returning from PSS (Interrupts Error)

Table 4-1 Factors in Returning from PSS (Interrupts)

Power Supply State						Interrupt Return Factor	Return Path
PD1	PD2/3	PD4_x	PD5_x	PD6_0	PD6_1		
ON	ON	ON/OFF	ON	ON	ON	Peripheral interrupt (PD1) Peripheral interrupt (PD2) Peripheral interrupt (PD5) Peripheral interrupt (PD6)	IRC
ON	ON	ON/OFF	OFF	ON	ON	Peripheral interrupt (PD1) Peripheral interrupt (PD2) Peripheral interrupt (PD6)	IRC
ON	OFF	ON/OFF	OFF	ON	ON	Peripheral interrupt (PD1) Peripheral interrupt (PD6)	Wakeup Controller
ON	OFF	ON/OFF	OFF	ON	OFF	Peripheral interrupt (PD1) Peripheral interrupt (PD6)	Wakeup Controller
ON	OFF	ON/OFF	OFF	OFF	OFF	Peripheral interrupt (PD1)	Wakeup Controller

■ Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection *1, HW-WDT *1, CSV *1

■ Peripheral interrupt (PD2): Interrupt of peripheral mounted resource, SW-WDT, etc.

■ Peripheral interrupt (PD5): Interrupt of extended peripheral, etc.

■ Peripheral interrupt (PD6): Interrupt of Sub peripheral, etc.

– *1 Where used as an interrupt when an abnormality is detected

Correct)

Table 4-1 Factors in Returning from PSS (Interrupts)

■ Default_type

Power Supply State						Interrupt Return Factor	Return Path
PD1	PD2/3	PD4_x	PD5_x	PD6_0	PD6_1		
ON	ON	ON/OFF	ON	ON	ON	Peripheral interrupt (PD1) (*1) Peripheral interrupt (PD2) (*2) Peripheral interrupt (PD5) (*3) Peripheral interrupt (PD6) (*4)	IRC
ON	ON	ON/OFF	OFF	ON	ON	Peripheral interrupt (PD1) (*1) Peripheral interrupt (PD2) (*2) Peripheral interrupt (PD6) (*4)	IRC
ON	OFF	ON/OFF	OFF	ON	ON	Peripheral interrupt (PD1) (*1) Peripheral interrupt (PD6) (*4)	Wakeup Controller
ON	OFF	ON/OFF	OFF	ON	OFF	Peripheral interrupt (PD1) (*1) Peripheral interrupt (PD6) (*4)	Wakeup Controller
ON	OFF	ON/OFF	OFF	OFF	OFF	Peripheral interrupt (PD1) (*1)	Wakeup Controller

(*1) Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection (*1-1), HW-WDT (*1-1), CSV (*1-1)

(*1-1) Where used as an interrupt when an abnormality is detected

(*2) Peripheral interrupt (PD2): Interrupt of peripheral mounted resource, SW-WDT, etc.

(*3) Peripheral interrupt (PD5): Interrupt of extended peripheral, etc.

(*4) Peripheral interrupt (PD6): Interrupt of Sub peripheral, etc.

■ LP_type

Power Supply State			Interrupt Return Factor	Return Path
PD1	PD2	PD4_x		
ON	ON	ON/OFF	Peripheral interrupt (PD1) (*1) Peripheral interrupt (PD2) (*2)	IRC
ON	OFF	ON/OFF	Peripheral interrupt (PD1) (*1)	Wakeup Controller

(*1) Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection (*1-1), HW-WDT (*1-1), CSV (*1-1)

(*1-1) Where used as an interrupt when an abnormality is detected

(*2) Peripheral interrupt (PD2): Interrupt of peripheral mounted resource, SW-WDT, etc.

Section

308

CHAPTER 6

to

Low-power

309

Consumption

5.2.5. RUN

Clock Divider

Register

(SYSC0_RU

NCKDIVR)

Revised the below:

Error)

[bit11:8] MCUCPDIV: MCU config APB clock divider setting bits

These bits set the division ratio of the PCOM clock from the HCOM clock.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved bits

[bit4:0] MCUCHDIV: MCU config AHB clock divider setting bits

These bits set the division ratio from the source clock of the clock domain MCUC.

Bits	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Correct)

■ Default_type

[bit11:8] MCUCPDIV: MCU config APB clock divider setting bits

These bits set the division ratio of the PCOM clock from the HCOM clock.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

■ LP_type

[bit11:8] Reserved: Reserved bits

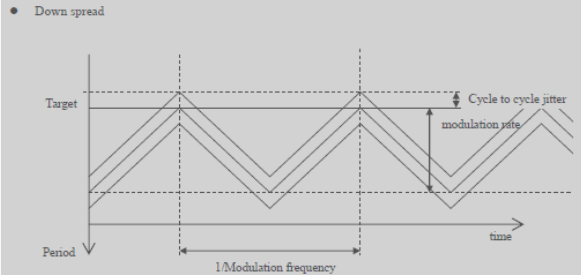

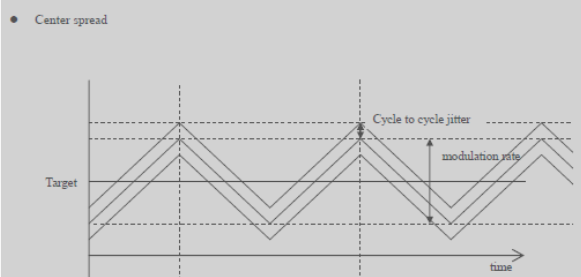

■ End_of_type_listing

[bit7:5] Reserved: Reserved bits

[bit4:0] MCUCHDIV: MCU config AHB clock divider setting bits

These bits set the division ratio from the source clock of the clock domain MCUC.

Bits	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

CHAPTER 6

Low-power Consumption

5.2.9. RUN Low-voltage Detection Setting Register (SYSC0_RU NLVDCFR)

Deleted the below:

Error)

Bit	Description
0	Reset.
1	Interrupt.

Note:

- These bits are reset by RSTX_SCUP. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

[bit5:4] Reserved: Reserved Bits

[bit3:1] LVDH2V: Extended External Low-Voltage Detection Voltage Setting Bits
These bits set the detection voltage for extended external low-voltage detection.

Bits	Description
000	(product specification)
001	(product specification)
010	(product specification)
011	(product specification)
100	(product specification)
101	(product specification)
110	(product specification)
111	(product specification)

Notes:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.
- These bits are reset by RSTX_SCUP. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

[bit0] LVDH2E: Extended External Low-Voltage Detection Operation Enable Bit
This bit sets the extended external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Notes:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.
- These bits are reset by RSTX_SCUP. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

CHAPTER 6
Low-power Consumption
5.3.3. PSS Clock Selection Register (SYSC0_PS SCKSELR)

Added the below:

Correct)

[bit2:0] CDMCUCCSL: Clock domain MCUC clock selection bits

These bits select the source clock for the clock domain MCUC.

Bits	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG PLL0 clock
110	Setting Prohibited
111	Clock fixed at "L"

336

Consumption
5.3.9. PSS
Low-voltage
Detection
Setting
Register
(SYSC0_PS
SLVDCFR)

Change Results

Revised the below:
Error)

[bit22] LVDL2S: Extended internal low-voltage detection operation selection bit
This bit selects an operation when the extended internal low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit21:19] Reserved: Reserved Bits

[bit18:17] LVDL2V: Extended internal low-voltage detection voltage setting bits
These bits set the detection voltage for extended internal low-voltage detection.

Bits	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended internal low-voltage detection operation enable bit
This bit sets the extended internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

Correct)

■ Default_type

[bit22] LVDL2S: Extended internal low-voltage detection operation selection bit
This bit selects an operation when the extended internal low-voltage detection occurs. See Table 5-31 Bit explanation (1).

[bit21:19] Reserved: Reserved Bits

[bit18:17] LVDL2V: Extended internal low-voltage detection voltage setting bits
These bits set the detection voltage for extended internal low-voltage detection. See Table 5-32 Bit explanation (2).

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended internal low-voltage detection operation enable bit
This bit sets the extended internal low-voltage detection operation. See Table 5-33 Bit explanation (3).

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

■ LP_type

[bit22:16] Reserved: Reserved bits

CHAPTER 55:APPENDIX: Major Changes

Page

Section

Change Results

349

CHAPTER 6

Low-power Consumption

5.3.9. PSS

Low-voltage Detection Setting Register

(SYSC0_PS SLVDCFGR)

Deleted the below:

Error)

[bit6] LVDH2S: Extended External Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the extended external low-voltage detection occurs.

Bit

Description

0

Reset.

1

Interrupt.

Note:

These bits are reset by RSTX_SCUP. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

[bit5:4] Reserved: Reserved Bits

[bit3:1] LVDH2V: Extended External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended external low-voltage detection.

Bits

Description

000

(product specification)

001

(product specification)

010

(product specification)

011

(product specification)

100

(product specification)

101

(product specification)

110

(product specification)

111

(product specification)

Notes:

After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

These bits are reset by RSTX_SCUP. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

[bit0] LVDH2E: Extended External Low-Voltage Detection Operation Enable Bit

This bit sets the extended external low-voltage detection operation.

Bit

Description

0

Stop operation.

1

Enable operation.

Notes:

After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

These bits are reset by RSTX_SCUP. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

Change Results

Revised the below:
Error)

[bit19] SSCG3CSVE: SSCG PLL3 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit18] SSCG2CSVE: SSCG PLL2 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit17] SSCG1CSVE: SSCG PLL1 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit16] SSCG0CSVE: SSCG PLL0 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit15:12] Reserved: Reserved bits

Correct)

■ Default_type

[bit19] SSCG3CSVE: SSCG PLL3 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL3 clock supervisor. See Table 5-35 Bit explanation (1).

[bit18] SSCG2CSVE: SSCG PLL2 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL2 clock supervisor. See Table 5-35 Bit explanation (1).

[bit17] SSCG1CSVE: SSCG PLL1 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL1 clock supervisor. See Table 5-35 Bit explanation (1).

■ LP_type

[bit19:17] Reserved: Reserved bits

■ End_of_type_listing

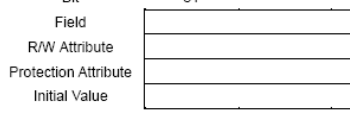

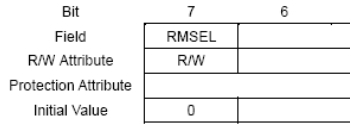

[bit16] SSCG0CSVE: SSCG PLL0 clock supervisor enable bit
This bit sets whether to enable or disable the SSCG PLL0 clock supervisor. See Table 5-35 Bit explanation (1).

[bit15:12] Reserved: Reserved bits

Consumption
5.4.9. APP
Low-voltage
Detection
Setting
Register
(SYSC0_AP
PLVDCFGR)

Change Results

Revised the below:
Error)

[bit30] LVDL1S: Internal low-voltage detection operation selection bit
This bit selects an operation for the internal low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit29:27] Reserved: Reserved bits

[bit26:25] LVDL1V: Internal low-voltage detection voltage setting bits
These bits set the detection voltage for internal low-voltage detection.

Bits	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

– After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

Correct)

[bit30] LVDL1S: Internal low-voltage detection operation selection bit
This bit selects an operation for the internal low-voltage detection. See Table 5-39 Bit explanation (1).

Note:

– In "■LP_type" product, the bits are reset only by RSTX_SCUP. Please refer to the Chapter "Reset".

■ Default_type

[bit29:27] Reserved: Reserved bits

[bit26:25] LVDL1V: Internal low-voltage detection voltage setting bits
These bits set the detection voltage for internal low-voltage detection. See Table 5-40 Bit explanation (2).

Note:

– After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

■ LP_type

[bit29:28] Reserved: Reserved Bits

[bit27:25] LVDL1V: Internal Low-Voltage Detection Voltage Setting Bits
These bits set the detection voltage for internal low-voltage detection.

Bits	Description
000	(product specification)
001	(product specification)
010	(product specification)
011	(product specification)
100	(product specification)
101	(product specification)
110	(product specification)
111	(product specification)

Notes:

– After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

– The bits are reset only by RSTX_SCUP. Please refer to the Chapter "Reset".

CHAPTER 6

Low-power Consumption

5.4.9. APP

Low-voltage Detection Setting Register (SYSC0_APPLVDCFR)

Revised the below:

Error)

[bit22] LVDL2S: Extended internal low-voltage detection operation selection bit

This bit selects an operation for the extended internal low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit21:19] Reserved: Reserved bits

[bit18:17] LVDL2V: Extended internal low-voltage detection voltage setting bits

These bits set the detection voltage for extended internal low-voltage detection.

Bits	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended internal low-voltage detection operation enable bit

This bit enables the extended internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

Correct)

■ Default_type

[bit22] LVDL2S: Extended internal low-voltage detection operation selection bit

This bit selects an operation for the extended internal low-voltage detection. See Table 5-39 Bit explanation (1).

[bit21:19] Reserved: Reserved bits

[bit18:17] LVDL2V: Extended internal low-voltage detection voltage setting bits

These bits set the detection voltage for extended internal low-voltage detection. See Table 5-40 Bit explanation (2).

Note:

After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended internal low-voltage detection operation enable bit

This bit enables the extended internal low-voltage detection operation. See Table 5-41 Bit explanation (3).

Note:

After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

Low-power
Consumption
5.5.10. STS
Clock
Supervisor
Setting
Register
(SYSC0_ST
SCSVCFGR)

Change Results

Revised the below:
Error)

[bit3] SCRCSE: Low-speed CR clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the low-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit2] FCRCSE: High-speed CR clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the high-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit1] SOCSVE: Sub clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the sub clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit0] MOCSVE: Main clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the main clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

Correct)

[bit3] SCRCSE: Low-speed CR clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the low-speed CR clock supervisor. See Table 5-54 Bit explanation (1).

[bit2] FCRCSE: High-speed CR clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the high-speed CR clock supervisor. See Table 5-54 Bit explanation (1).

[bit1] SOCSVE: Sub clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the sub clock supervisor. See Table 5-54 Bit explanation (1).

[bit0] MOCSVE: Main clock supervisor enable bit

This bit indicates the value for setting whether to enable/disable the main clock supervisor. See Table 5-54 Bit explanation (1).

Table 5-54 Bit explanation (1)

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

(SYSC0_SY

SERRIR0)

Change Results

Revised the below:

Error)

[bit19] SSCG3IF: SSCG PLL3 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL3 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit18] SSCG2IF: SSCG PLL2 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL2 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit17] SSCG1IF: SSCG PLL1 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL1 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit16] SSCG0IF: SSCG PLL0 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL0 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit15:12] Reserved: Reserved bits

Correct)

■ Default_type

[bit19] SSCG3IF: SSCG PLL3 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL3 abnormality detection error. See Table 5-56 Bit explanation (1).

[bit18] SSCG2IF: SSCG PLL2 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL2 abnormality detection error. See Table 5-56 Bit explanation (1).

[bit17] SSCG1IF: SSCG PLL1 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL1 abnormality detection error. See Table 5-56 Bit explanation (1).

■ LP_type

[bit19:17] Reserved: Reserved bits

■ End_of_type_listing

[bit16] SSCG0IF: SSCG PLL0 abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL0 abnormality detection error. See Table 5-56 Bit explanation (1).

[bit15:12] Reserved: Reserved bits

CHAPTER 6

Low-power Consumption

5.6.6.

System Error Interrupt Factor

Register 0 (SYSC0_SY SERRIR0)

Revised the below:

Error)

[bit1] SOSCIF: Sub oscillation abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for a sub oscillation abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit0] MOSCIF: Main oscillation abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for a main oscillation abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

Correct)

[bit1] SOSCIF: Sub oscillation abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for a sub oscillation abnormality detection error. See Table 5-56 Bit explanation (1).

[bit0] MOSCIF: Main oscillation abnormality detection error interrupt request bit

This bit retains the fact that an interrupt request was generated for a main oscillation abnormality detection error. See Table 5-56 Bit explanation (1).

Table 5-56 Bit explanation (1)

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

5.6.8.
System Error
Interrupt
Factor Clear
Register 0
(SYSC0_SY
SERRICLR0)

Revised the below:
Error)

[bit29] LVDH2ICLR: Extended external low-voltage detection interrupt factor clear bit
This bit clears the interrupt factor of the detection of extended external low-voltage.

LVDH2ICLR	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit28] LVDH1ICLR: External low-voltage detection interrupt factor clear bit
This bit clears the interrupt factor of the detection of external low-voltage.

LVDH1ICLR	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit27:26] Reserved: Reserved bits

[bit25] LVDL2ICLR: Extended internal low-voltage detection interrupt factor clear bit
This bit clears the interrupt factor of the detection of extended internal low-voltage.

LVDL2ICLR	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit24] LVDL1ICLR: Internal low-voltage detection interrupt factor clear bit
This bit clears the interrupt factor of the detection of internal low-voltage.

LVDL1ICLR	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit23:20] Reserved: Reserved bits

Correct)

[bit29] LVDH2ICLR: Extended external low-voltage detection interrupt factor clear bit
This bit clears the interrupt factor of the detection of extended external low-voltage. See Table 5-58 Bit
explanation (1).

[bit28] LVDH1ICLR: External low-voltage detection interrupt factor clear bit
This bit clears the interrupt factor of the detection of external low-voltage. See Table 5-58 Bit explanation
(1).

[bit27:26] Reserved: Reserved bits

■ Default_type

[bit25] LVDL2ICLR: Extended internal low-voltage detection interrupt factor clear bit
This bit clears the interrupt factor of the detection of extended internal low-voltage. See Table 5-58 Bit
explanation (1).

CHAPTER 6

to

Low-power

435

Consumption

5.7.1.

System

Special

Setting

Register

(SYSC0_SP

ECFGR)

Revised the below:

Error)

[bit24] HOLDIO_PD2: Setting bit for power domain 2 HOLD data latch

This bit sets whether to retain I/O control in power domain 2 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

Note:

– Make the decision on the model side about whether to use this setting.

[bit23] PSSPADCTRL: PSS-time port configuring bit

This bit sets whether to perform Hi-z control of I/O at the PSS time.

Bit	Description
0	Do not perform Hi-z control.
1	Perform Hi-z control.

[bit22] IO3RSTC: I/O3V reset configuring bit

This bit sets 3V I/O reset control.

Bit	Description
0	I/O reset released
1	I/O reset enabled

[bit21] IO35RSTC: I/O5/3V reset configuring bit

This bit sets 5/3V I/O reset control.

Bit	Description
0	I/O reset released
1	I/O reset enabled

[bit20:10] Reserved bits

[bit9] EXVRSTCNT: Reset level configuring bit for external power supply control

This bit sets requested reset level to the external power supply control.

Bit	Description
0	External power supply control is reset by LVDH1
1	External power supply control is not reset by LVDH1

Note:

– This bit is reset by RSTX_POWER. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

Correct)

[bit24] HOLDIO_PD2: Setting bit for power domain 2 HOLD data latch

This bit sets whether to retain I/O control in power domain 2 when shutting off the power supply. See Table 5-60 Bit explanation (1).

Note:

– Make the decision on the model side about whether to use this setting.

[bit23] PSSPADCTRL: PSS-time port configuring bit

This bit sets whether to perform Hi-z control of I/O at the PSS time. See Table 5-61 Bit explanation (2).

[bit22] IO3RSTC: I/O3V reset configuring bit

This bit sets 3V I/O reset control. See Table 5-62 Bit explanation (3).

[bit21] IO35RSTC: I/O5/3V reset configuring bit

This bit sets 5/3V I/O reset control. See Table 5-62 Bit explanation (3).

[bit20:10] Reserved bits

[bit9] EXVRSTCNT: Reset level configuring bit for external power supply control

This bit sets requested reset level to the external power supply control.

Bit	Description
0	External power supply control is reset by LVDH1
1	External power supply control is not reset by LVDH1

Notes:

– The bits are reset only by RSTX_POWER. Please refer to the Chapter "Reset".

– Setting register of EXVRSTCNT to "0" is prohibited. ("LP_type" product)

CHAPTER 6

Low-power Consumption

5.12.3. PSS Clock Selection Register 2 (SYSC1_PS SCKSELR2)

Added the below:

Correct)

[bit3:0] CD5CSL: Clock domain 5 clock selection bits

These bits select the source clock for clock domain 5.

Bits	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

CHAPTER 6

to

Low-power

511

Consumption

5.12.12. PSS

Clock Divider

Register 5~9

(SYSC1_PS

SCKDIVR5~

9)

Revised the below:

Error)

[bit23:20] CD1B1DIV: CD1B1 clock divider setting bits

These bits set the division ratio of the CD1B1 clock from the CD1B0 clock.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD1B0DIV: CD1B0 clock divider setting bits

These bits set the division ratio of the CD1B0 clock from the CD1 clock.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD1A1DIV: CD1A1 clock divider setting bits

These bits set the division ratio of the CD1A1 clock from the CD1A0 clock.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD1A0DIV: CD1A0 clock divider setting bits

These bits set the division ratio of the CD1A0 clock from the CD1 clock.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved bits

[bit4:0] CD1DIV: CD1 clock divider setting bits

These bits set the division ratio of the CD1 clock from the source clock (clock domain 1).

Bits	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

CHAPTER 6
Low-power
Consumption
5.13.12. APP
Clock Divider
Register 5~9
(SYSC1_AP
PCKDIVR5~
9)

Revised the below:
Error)

[bit23:20] CD1B1DIV: CD1B1 clock divider setting bits

These bits indicate the set value of the division ratio of the CD1B1 clock from the CD1B0 clock to be updated.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD1B0DIV: CD1B0 clock divider setting bits

These bits indicate the set value of the division ratio of the CD1B0 clock from the CD1 clock to be updated.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD1A1DIV: CD1A1 clock divider setting bits

These bits indicate the set value of the division ratio of the CD1A1 clock from the CD1A0 clock to be updated.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD1A0DIV: CD1A0 clock divider setting bits

These bits indicate the set value of the division ratio of the CD1A0 clock from the CD1 clock to be updated.

Bits	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved bits

[bit4:0] CD1DIV: CD1 clock divider setting bits

These bits indicate the set value of the division ratio of the CD1 clock from the source clock (clock domain 1) to be updated.

Bits	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

824	CHAPTER 14 Hardware Watchdog Timer 3. Explanation of Operation	<p>Error)</p> <p>Output of the Watchdog Counter Monitor Bit for MCU Output Pin For This Product, Output of the Watchdog Counter Monitor Bit of MCU Output Pin is Supported by the Hardware Watchdog Timer.</p> <p>The Hardware watchdog timer outputs the watchdog counter monitor bit to the outside so that watchdog counter operation can be monitored from the outside. You can select any 1 bit in the watchdog counter (32 bits) by setting the OBSSEL[4:0] bits in the Hardware watchdog configuration register (HWDG_CFG).</p> <p>Correct)</p> <p>Output of the Watchdog Counter Monitor Bit for MCU Output Pin The Hardware watchdog timer outputs the watchdog counter monitor bit to the outside so that watchdog counter operation can be monitored from the outside. You can select any 1 bit in the watchdog counter (32 bits) by setting the OBSSEL[4:0] bits in the Hardware watchdog configuration register (HWDG_CFG). Support of this function is different depends on product specification.</p>
826	CHAPTER 14 Hardware Watchdog Timer 3. Explanation of Operation	<p>Error)</p> <p>Notes: – The following register setting values are determined by a marker in the flash memory (BootROM marker). – HWDT_INT – HWDT_TRG0CFG – HWDT_TRG1CFG – HWDT_RUNLLS – HWDT_RUNULS – HWDT_PSSLLS – HWDT_PSSULS – HWDT_RSTDLY – HWDT_CFG</p> <p>Correct)</p> <p>Notes: – The following register setting values are determined by a marker in the flash memory (BootROM marker). – HWDG_INT – HWDG_TRG0CFG – HWDG_TRG1CFG – HWDG_RUNLLS – HWDG_RUNULS – HWDG_PSSLLS – HWDG_PSSULS – HWDG_RSTDLY – HWDG_CFG</p>

CHAPTER 55:APPENDIX: Major Changes

Page	Section	Change Results
831	CHAPTER 14 Hardware Watchdog Timer 3. Explanation of Operation	<p>Error)</p> <p>The watchdog counter in RUN always operates. When the device state transitions from RUN to PSS, the processing transitions to the operation of the watchdog in PSS. For details, see The following figure shows the Hardware watchdog operation in PSS.</p> <p>During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Do this to clear the watchdog counter periodically.</p> <ol style="list-style-type: none"> 6. If a runaway state caused by a user program occurs and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI). 7. According to the value of the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Hardware watchdog reset delay counter register (HWDG_RSTDLY) are inserted. 8. After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3-6. <p>Correct)</p> <ol style="list-style-type: none"> 1. The watchdog counter in RUN always operates. 2. When the device state transitions from RUN to PSS, the processing transitions to the operation of the watchdog in PSS. For details, see Figure 3-5. 3. During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Do this to clear the watchdog counter periodically. 4. If a runaway state caused by a user program occurs and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI). 5. According to the value of the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Hardware watchdog reset delay counter register (HWDG_RSTDLY) are inserted. 6. After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3-6.
834	CHAPTER 14 Hardware Watchdog Timer 3. Explanation of Operation	<p>Error)</p> <p>Note:</p> <p>The notation * in The following figure shows the operation of the test function of the Hardware watchdog.</p> <p>Correct)</p> <p>Note:</p> <ul style="list-style-type: none"> - The notation * in Figure 3-6 means "RUN" or "PSS".

Value	Description							
0xFFFFFFFF	The chip erase of a secured device is enabled.							
Other	Any other value disables the chip erase in non-USERMODE.							

Page	Section	Change Results
1301	CHAPTER 24:Security 4. Registers 4.4. Chip Erase Enable Register (TCFCFG0_CEER)	<p>Added (Error)</p> <p>TCFCFG0_CEER can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error.</p> <p>Correct)</p> <p>TCFCFG0_CEER can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error.</p> <p>Refer to datasheet of product.</p> <p>If being written with "MK_CEER is Selectable", below is spec.</p> <p>The chip erase can be triggered by JTAG equipment, writing the chip erase sequence to the general purpose registers of the security checker or transferring the chip erase sequence through serial interface when using Serial Loader equipment. It erases all sectors of the WORKFLASH and TCFLASH. Sectors used for SHE are not erased.</p> <p>Notes:</p> <ul style="list-style-type: none"> - A secured device without an unlock mechanism implemented by the application and without the ability to erase the full device cannot be updated or tested anymore. Not programming the unlock marker value to CEEM should be used with absolute care. - Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the chip erase will be disabled.

CHAPTER 35:UART (Asynchronous Serial Interface)

10. Registers of UART (Asynchronous Serial Interface)

10.9. Transfer Byte Register (TBYTE0)

Error)

The transfer byte (TBYTE0) represents the transfer data amount when each serial chip select pin is active.

Correct)

The transfer byte (TBYTE0) represents the transfer data amount when synchronous transmission or external trigger transmission starts.

1891

2097	CHAPTER 37:I2C Interface (I2C Communication Control Interface) 3 I2C Interface Operation 3.1 Master Mode	<p>Error)</p> <p>When DMA Mode is Enabled (SSR:DMA = 1)</p> <p>■ If the IBSR: RSA bit is "1", the interrupt flag (IBCR: INT) is set to "1" after the reserved address is received (before an acknowledgment), the SCL remains "L", and a wait is performed. After the RDR register is read, the IBCR:ACE bit and transmission data are set, and "0" is written to the interrupt flag. This sets the interrupt flag to "0", which releases the wait.</p> <p>Correct)</p> <p>When DMA Mode is Enabled (SSR:DMA = 1)</p> <p>If the IBSR:RSA bit is "1", the interrupt flag (IBCR:INT) is set to "1" after the reserved address is received (before an acknowledgment), the SCL remains "L", and a wait is performed. After the RDR register is read, the IBCR:ACE bit and transmission data are set, the writing "1" to the IBCR:INTC sets the interrupt flag to "0", which releases the wait.</p>
2131	CHAPTER 37:I2C Interface (I2C Communication Control Interface) 3 I2C Interface Operation 3.2. Slave Mode	<p>Error)</p> <p>Operation is in slave mode after the (repeated) start condition is detected and an ACK response is returned when the combination of the ISBA register and the ISMK register matches the received address.</p> <p>Notes:</p> <p>■ When EIBCR:BEC = 0 during address data transfer after the start condition has been detected or during transfer of bit2 to bit9 (acknowledgment bits), the start condition may be detected again. If so, a bus error is detected (IBCR:BER = 1) and reception is stopped, so the next data cannot be received.</p> <p>Correct)</p> <p>Operation is in slave mode after the start condition or the repeated start condition is detected and an ACK response is returned when the combination of the ISBA register and the ISMK register matches the received address.</p> <p>Notes:</p> <p>– When EIBCR:BEC=0, if 2nd start condition is detected after 1st start condition is detected (during transfer of bit2 to bit9), a bus error is detected (IBCR:BER=1) and reception is stopped.</p>

Page	Section	Change Results
2131	CHAPTER 37:I2C Interface (I2C Communication Control Interface) 3 I2C Interface Operation 3.2. Slave Mode	<p>Error)</p> <p>Slave Address Match Detection</p> <p>After the (repeated) start condition is detected, the next data is received as a 7-bit address. With regard to the bits that are set to "1" in the ISMK register, the bits in the ISBA register are compared with the bits of the received address. If they match, ACK is output.</p> <p>Correct)</p> <p>Slave Address Match Detection</p> <p>The 1st receiving data after the start condition or the repeated start condition is detected contains 7-bit slave address and the bit that shows the direction of the data transmission. The ISMK register is set the value that masks the slave address of the ISBA register. The bit value "0" means "don't care", and "1" means that it needs that the bit value of address corresponds with the data of received slave address. That is, the bit whose the value is set to "0" in the ISMK register is not compared to the bit of the address.</p> <p>When SAEN is set to "1", it enables the slave address detection.</p> <p>The data as the address sent by a master is compared with some slave address bits(SA[6:0]) that mask bits(SM[6:0]) corresponded to is set to "1".</p> <p>If they match, ACK is output. If not, ACK is not output.</p> <p>Example of the address detection</p> <p>For example, a master send the slave address 0x23.</p> <p>Figure 3-2 The example of the slave address detection</p>  <p>Just SA5, SA1, SA0 are compared the data as the address sent by the master. Because SM[6], SM[4:2] are set to "0", those bits are "don't care". As a result, the Multi-function serial interface outputs the ACK response.</p>

2863	CHAPTER 51: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI 4.2. Command Sequencer Mode	<p>Error)</p> <p>The Least Significant Bits of the System Bus Address received by the DDRHSSPI on the System Bus are used as the offset within the bank selected by the Address Extension bits.</p> <p>The concatenation of the appropriate number of bits from the Address Extension Register with the appropriate number of bits from the address bus, determine the 32-bit address of the memory to be accessed on the Serial Interface. Please refer to Table 4-5.</p> <p>Correct)</p> <p>The Least Significant Bits of the System Bus Address received by the DDRHSSPI on the System Bus are used as the offset within the bank selected by the Address Extension bits. The final 32-bit address on the SPI is generated by the following concatenation:</p> <ul style="list-style-type: none"> - Upper bits: Register bits DDRHSSPIIn_CSAEXT.AEXT[31:m] - Lower bits: Address on the System Bus[m-1:0] <p>(m = DDRHSSPIIn_CSCFG.MSEL[3:0] + 13.)</p> <p>For details, please refer to Table 4-5.</p>

CHAPTER 55: APPENDIX: Major Changes

Page	Section	Change Results
2864	CHAPTER 51: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI 4.2. Command Sequencer Mode	<p>Error)</p> <p>Last two columns in Table 4-5 indicate which bits from the DDRHSSPI_{IN}_CSAEXT.AEXT and the address bus (i.e. HADDR) are concatenated, to get the final 32-bit address of the Serial Flash Memory.</p> <p>Although, the final memory address generated in this way is a 32-bit address, it must be noted, that the software can choose the number of bytes (from this 32-bit address) to be sent to the Serial Flash Memory during the address phase of a memory read Command Sequence.</p> <p>Internal Prefetch Buffer</p> <p>In Command Sequencer Mode the DDRHSSPI internally has one Prefetch Buffer for temporary storage, of the data to be received (Prefetch Buffer).</p> <p>This Prefetch Buffer consists of 48 locations each 32-bit wide.</p> <p>Prefetch Buffer shall support 32 bits, 16 bits and 8 bits reads using the following mechanism:</p> <p>In generation of the Command Sequence the two least significant address bits shall be ignored.</p> <p>When a byte or halfword is read at a random (non-sequential) address, the Command Sequence shall be generated at the aligned word address which contains this byte or halfword. In any access scenario where the required data can be read from the top most position of the Prefetch Buffer, there will be no additional Command Sequence.</p> <p>When the Prefetch Buffer is read (as FIFO), only if the read includes the last byte within the actual Prefetch Buffer word, it will be popped. Following are typical read scenarios with explanation when the Prefetch Buffer pops:</p> <p>In order to obtain maximum throughput, 32-bit access is highly recommended.</p> <p>Correct)</p> <p>Last two columns in Table 4-5 indicate which bits from the DDRHSSPI_{IN}_CSAEXT.AEXT and the address bus (i.e. HADDR) are concatenated, to get the final 32-bit address of the Serial Flash Memory.</p> <p>The output memory address on the SPI can be 32 or 24 bits according to the Serial Flash Memory products, and this is controlled by the register settings of DDRHSSPI_{IN}_RDCSDC0-11 (for details, refer to Table 4-6).</p> <p>Internal Prefetch Buffer</p> <p>In Command Sequencer Mode the DDRHSSPI internally has one Prefetch Buffer for a temporary storage of received data.</p> <p>This Prefetch Buffer consists of 48 locations, 32-bit wide.</p> <p>Prefetch Buffer shall support 32 bits, 16 bits and 8 bits reads using the following mechanism:</p> <ul style="list-style-type: none"> – When a byte or halfword is read at a random (non-sequential) address on the System Bus, the Command Sequence is generated with the address aligned to the word boundary, which covers the required data. – In the actual Command Sequence in transmission, the two least significant address bits are fixed to "00" (i.e. these two bits from the System Bus are ignored). <p>As long as the software reads a series of continuous data from the top most position of the Prefetch Buffer, there will be no additional Command Sequence on the SPI.</p> <p>When the Prefetch Buffer is read, it internally works as a FIFO, and a word data in the next location pops out only when the current read data includes the last byte in the word line. The typical cases to pop the Prefetch Buffer are as below:</p> <p>In order to obtain the maximum throughput, word access (i.e. 32-bit access) is highly recommended.</p>

282	CHAPTER 6: Low-power Consumption 4. Operation Procedure	Changed the Blow: 4.3 Transition from PSS to RUN Table 4-1 Factors in Returning from PSS (Interrupts) Error) ■Default_type (*1) Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection (*1-1), HW-WDT (*1-1), CSV (*1-1) ■LP_type (*1) Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection (*1-1), HW-WDT (*1-1), CSV (*1-1) Correct) ■Default_type (*1) Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection (*1-1), HW-WDT (*1-1) ■LP_type (*1) Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection (*1-1), HW-WDT (*1-1)
358	CHAPTER 6: Low-power Consumption 5. Registers 5.3. PSS Profile Register Group (SYSC0)	Changed as following: 5.3.11. PSS Regulator Setting Register (SYSC0_PSSREGCFGR) [bit7] RMSEL: Regulator mode setting bit This bit set the regulator mode setting. Main mode is normal operation in regulator. Standby mode is low power operation in regulator. In `Standby mode`, current consumption in PSS mode can be reduced than Main mode by setting this bit. Notes: – Specific value of current consumption depend on each product. Please refer to Datasheet for any device-specific information.
415	CHAPTER 6: Low-power 5. Registers	Deleted the Below: 5.5.11. STS Regulator Setting Register Note: – The initial value and setting value of these bits can be set with the external pin.

687	CHAPTER 10: Real Time Clock 2. Configuration and Block Diagram	<p>Changed the Below:</p> <p>Figure 2-3 Calibration Module Diagram</p> <p>Error)</p> <p>The diagram shows the internal components of the Calibration Module. It includes a central 'Calibration FSM' block. Inputs to the FSM include 'CLK_SRC', 'CLK_SUB', 'RTC_WTCCR:CKSEL', 'RTC_DEBUG:DBGEN', 'RTC_WTCCR:ACAL', 'RTC_WTCCR:MTRG', and 'Trigger from RTC'. The FSM is connected to several other blocks: 'RTC_CNTCAL 24-bit counter', 'Barrel shifter', 'CNTDMW 24-bit counter', 'RTC_CNTPCAL 11-bit counter', 'RTC_WTCCR:SCAL', 'RTC_WTCCR:ENUP', 'RTC_DURMW', 'RTC_WTCCR:UPCAL', 'RTC_WTCCR:WINE:CALDE', 'RTC_WTCCR:WINS:CALD', and 'RTC_WTCCR:WINS:RUNC'. The output of the barrel shifter is 'Calibrated data to Sub-second register'. The output of the barrel shifter and 'RTC_WTCCR:ENUP' is 'Update signal to Sub-second register'. The output of the barrel shifter and 'RTC_WTCCR:WINE:CALDE' is 'CALIRQ'.</p> <p>Correct)</p> <p>The diagram is identical to the one above, but it shows the correct configuration of the Calibration Module. The only difference is the label 'Correct)' instead of 'Error)'.</p>

933	CHAPTER 16: TCRAM Interface 4. Setting Procedure Examples	<p>Correct)</p> <pre> graph TD Start([Start of Test]) --> Unlock[Configuration register UNLOCK (Register UNLOCK processing of *1)] Unlock --> DirectPerm[Direct access permission (Direct reading, Enable processing of *2)] DirectPerm --> WriteParity["(0xB5000000 Parity data) writing to TRCFGn_ECCDW"] WriteParity --> ReadECCDW[TRCFGn_ECCDW reading] ReadECCDW --> DWEN1{DWEN == 1?} DWEN1 -- No --> WriteParity DWEN1 -- Yes --> WriteData[Data writing to the address corresponding] WriteData --> ECCComp{ECC domain writing completed?} ECCComp -- No --> WriteParity ECCComp -- Yes --> WriteUnlock["The value except 0b10110101 writing to DWEN, DWENUNLOCK of TRCFGn_ECCDW"] WriteUnlock --> ReadECCDW2[TRCFGn_ECCDW reading] ReadECCDW2 --> DWEN0{DWEN == 0?} DWEN0 -- No --> WriteUnlock DWEN0 -- Yes --> DirectProh[Direct access prohibition (Direct reading, Disable processing of *2)] DirectProh --> Lock[Configuration register LOCK (Register LOCK processing of *1)] Lock --> End([End of Test]) </pre> <p>The flowchart illustrates the process of writing to the ECC domain and unlocking the configuration register. It begins with 'Start of Test', followed by 'Configuration register UNLOCK (Register UNLOCK processing of *1)'. Then, 'Direct access permission (Direct reading, Enable processing of *2)' is enabled. The process involves writing '(0xB5000000 Parity data) writing to TRCFGn_ECCDW' and then reading 'TRCFGn_ECCDW reading'. A decision 'DWEN == 1?' is made; if 'No', it loops back to the writing step. If 'Yes', it proceeds to 'Data writing to the address corresponding'. Another decision 'ECC domain writing completed?' is made; if 'No', it loops back to the writing step. If 'Yes', it proceeds to 'The value except 0b10110101 writing to DWEN, DWENUNLOCK of TRCFGn_ECCDW'. This is followed by 'TRCFGn_ECCDW reading' and a decision 'DWEN == 0?'. If 'No', it loops back to the writing step. If 'Yes', it proceeds to 'Direct access prohibition (Direct reading, Disable processing of *2)', then 'Configuration register LOCK (Register LOCK processing of *1)', and finally 'End of Test'.</p> <p>Annotations in the flowchart:</p> <ul style="list-style-type: none"> A box labeled <code>{DEN,DENUNLOCK} = 0b10110101</code> points to the 'Direct reading, Enable processing' section. A bracket labeled 'Direct reading, Enable processing' spans the 'Direct access permission' and the first 'TRCFGn_ECCDW reading' step. A bracket labeled 'Direct reading, Disable processing' spans the second 'TRCFGn_ECCDW reading' and the 'Direct access prohibition' step.

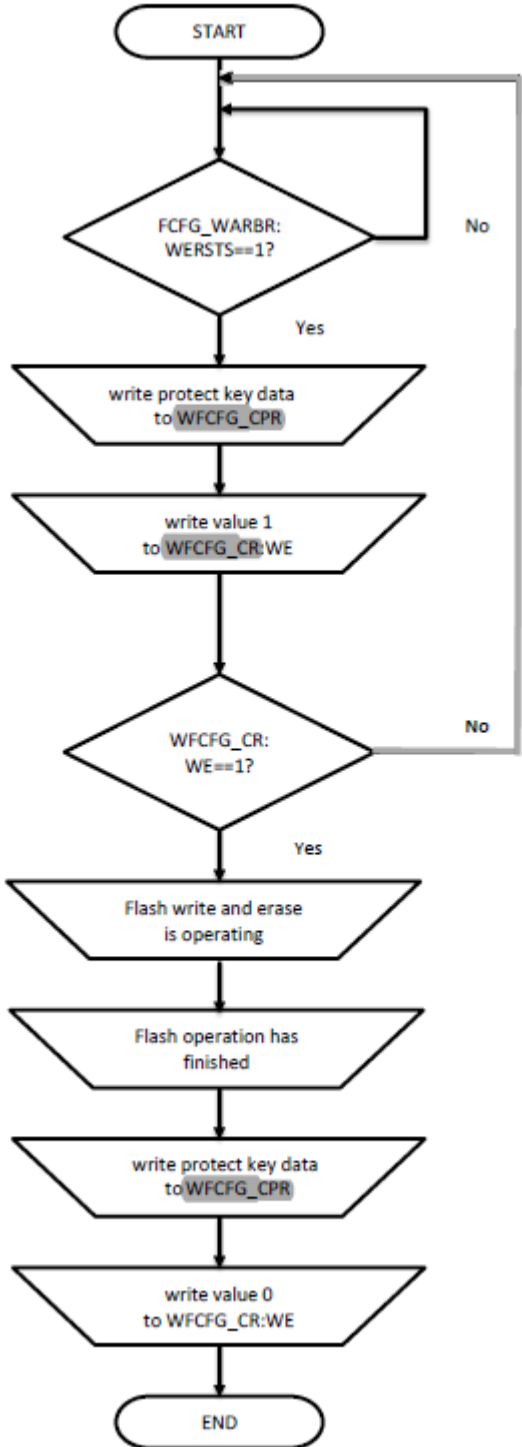

Page	Section	Change Results
1642	CHAPTER 30: CAN FD Controller(MCA N3.2) 5. Registers	<p>Add the below:</p> <p>5.3. Data Bit Timing & Prescaler Register (MCG_CANFDx_DBTP,CPG_CANFDx_DBTP)</p> <p>[bit 20:16] DBPR[4:0] Data Bit Rate Prescaler. Valid values for the Data Bit Rate Prescaler are 0 to 31. When DBTP.TDC = "1", the range is limited to 0, 1. This limitation is required by the ISO. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.</p>
1649	CHAPTER 30: CAN FD Controller(MCA N3.2) 5. Registers	<p>Add the below:</p> <p>5.6. CC Control Register (MCG_CANFDx_CCCR, CPG_CANFDx_CCCR)</p> <p>[bit6] DAR: Disable Automatic Retransmission <i>Note:</i> – When CCCR.DAR is set "1", always set "00" to first two identifier (Arbitration field) bits on transmission frame configuration.</p>
1687	CHAPTER 30: CAN FD Controller(MCA N3.2) 5. Registers	<p>Add the below:</p> <p>5.23. High Priority Message Status (MCG_CANFDx_HPMS, CPG_CANFDx_HPMS) <i>Note:</i> – If all the following conditions are fulfilled, set at least 1 to both List Size Standard (SIDFC.LSS[7:0]) and List Size Extended (XIDFC.LSE[6:0]). – To use high priority events – To use both standard and extended frame format</p>
1704	CHAPTER 30: CAN FD Controller(MCA N3.2) 5. Registers	<p>Add the below:</p> <p>5.34. Tx Buffer Configuration (MCG_CANFDx_TXBC, CPG_CANFDx_TXBC) <i>Notes:</i> – Don't use combination Tx FIFO and Dedicated Tx Buffers. In case of setting "1" to Tx FIFO/Queue Mode (TXBC.TFQM), set 0 to TXBC.NDTB[5:0]</p>

2174	CHAPTER37: I2C Interface (I2C Communication) 8. I ² C Interface Registers	Add the below: 8.2. Serial Mode Register (SMR) [bit4] WUCR: WAKE UP Control Bit Note: - The WAKE UP function is not supported.
2237	CHAPTER 38: LIN Interface (V2.1) (LIN Communication Control Interface (V2.1))	Deleted the Below: Cover of chapter The LIN communication function has the following 2 modes: Manual mode, which allows the transmission/reception of the LIN header section using interrupt functions, and the assist mode, which allows automatic transmission/reception of the LIN header.
2355	CHAPTER 38: LIN Interface (V2.1) (LIN Communication Control Interface (V2.1))	Add the below: 9.2. Serial Mode Register (SMR) [bit4] WUCR: WAKE UP Control Bit Note: - The WAKE UP function is not supported.

2885	CHAPTER 51: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI	<p>Deleted the Below:</p> <p>4.4. General Use Case Guidelines for DDRHSSPI</p> <p>4.4.5. Notice On Document Designations Cypress issues documents and data sheets with Advance Information or Preliminary designations to advise readers of product information or intended specifications throughout the product life cycle,including development, qualification, initial production, and full production. In all cases, however, readers are encouraged to verify that they have the latest information before finalizing their design. The following descriptions of Cypress data sheet designations are presented here to highlight their presence and definitions</p> <p>4.4.6. Advance Information The Advance Information designation indicates that Cypress Semiconductor Corp. is developing one or more specific products, but has not committed any design to production. Information presented in a document with this designation is likely to change, and in some cases, development on the product may discontinue. Cypress Semiconductor Corp. therefore places the following conditions upon Advance Information content: This document contains information on one or more products under development at Cypress Semiconductor Corp. The information is intended to help you evaluate this product. Do not design in this product without contacting the Cypress Semiconductor Corp. Cypress Semiconductor Corp. reserves the right to change or discontinue work on this proposed product without notice.</p>

CHAPTER
18:
WorkFLASH
5. Registers
5.12.
WorkFLASH
Sequencer
Command
Register:
WFCFG_SE
QCM

Added the shading parts as below:

Correct)

[bit3:0] OPC[3:0]: Command

Bits	Description
0000	No operation (write operation is ignored)
0001	Execute the read/reset command.
0010	Execute the sector erase command. ERS[7:0] specifies the sector erase target. If sector erase has been suspended, the sector erase resume command is executed. When the sector erase resume command is executed, ERS[7:0] is ignored.
0011	Execute the sector erase suspend-1 command. Sector erase operation is suspended immediately. If this command is used very frequently, no erase progress can happen at all. When the sector erase suspend command is executed, ERS[7:0] is ignored.
0100	Reserved. The software should not write this value.
0101	Reserved. The software should not write this value.
0110	Reserved. The software should not write this value.
0111	Reserved. The software should not write this value.
1000	Reserved. The software should not write this value.
1001	Reserved. The software should not write this value.
1010	Reserved. The software should not write this value.
1011	Execute the sector erase suspend-2 command. Sector erase operation is suspended after some erase progress. This guarantees that the erase operation will finish at the end even if this command used very frequently. When the sector erase suspend command is executed, ERS[7:0] is ignored.
1100	Reserved. The software should not write this value.
1101	Reserved. The software should not write this value.
1110	Reserved. The software should not write this value.
1111	Reserved. The software should not write this value.

OPC[3:0] is reset to the initial value when the command specified by OPC[3:0] is complete.

■ Suspend 1:

If the Suspend-1 command is input on during Erase, it will immediately transition to the Suspend state (max 33 us).

If the Suspend command is input after the Resume command is input from the Suspend state, it takes max 2 ms to enter the Suspend state.

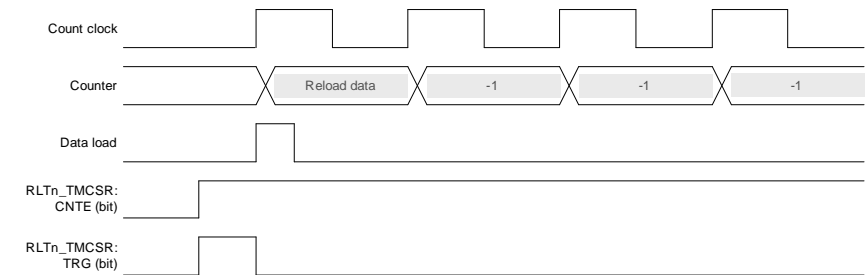

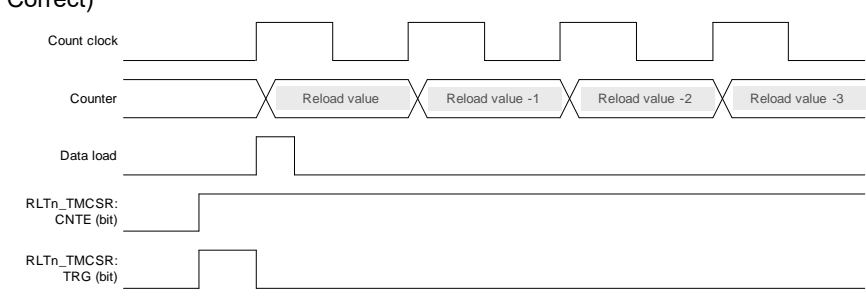

Use this command when you want to suspend Erase immediately (for emergency processing or when you cannot wait for a 2 ms Suspend transition with Suspend-2).

However, if the Suspend-1 command and the Resume command occur frequently (2 ms or less), Erase processing will not be completed.

■ Suspend-2:

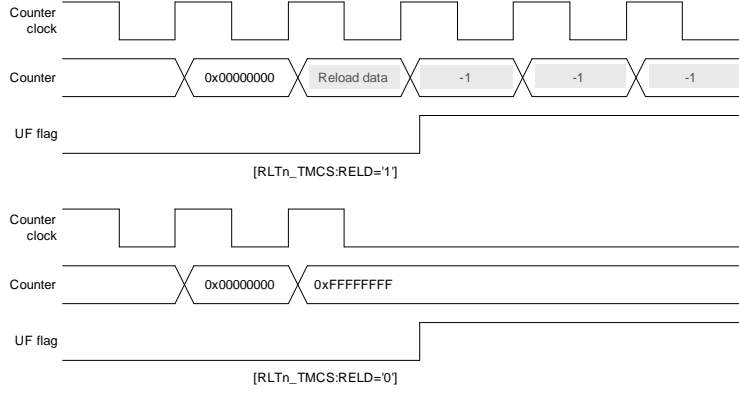

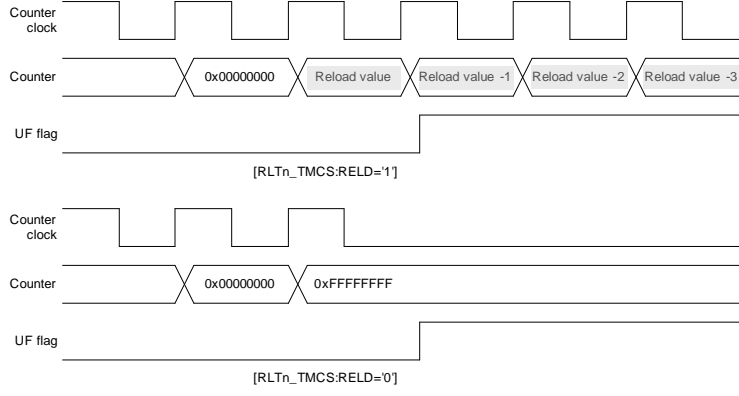

Page	Section	Change Results
		<p>If the Suspend-2 command is input during Erase, it takes max 2 ms to enter the Suspend state.</p> <p>If the Suspend command is input after the Resume command is input from the Suspend state, it immediately transitions to the Suspend state (max 5 us).</p> <p>This command is supposed to be used for normal Suspend processing.</p> <p>Even if the Suspend-2 command and the Resume command occur frequently, Erase processing of max 2 ms is executed, so Erase is finally completed.</p>

136	CHAPTER 4: Reset 4. Registers Notes:	Revised the shading parts as below: Error) Notes: – Reserved bits are always read "0"; Write "0" when writing. – Protection key code input is required to write the registers. – It results bus error response for the violation to the rules. – *: When PD2 voltage is internal LDO, initial value is "0". When PD2 voltage is external LDO initial value is "1". Correct) Notes: – Reserved bits are always read "0"; Write "0" when writing. – The registers are protected by protection key setting register (SYSC0_PROTKEYR). For details on the protection, see the following chapter 6: "Low-power Consumption." – Access to reserved address results bus error response. – *: When PD2 voltage is internal LDO, initial value is "0". When PD2 voltage is external LDO initial value is "1".

175	CHAPTER 5: Clock System 2. Configuration and Block Diagram 2.3. Clock Distributor Configuration and Block Diagram	<p>Revised the shading parts as below:</p> <p>Figure 2-7 Clock domain(x=1,2,3,4,5) Block Diagram</p> <p>Error)</p> <p>The diagram shows a clock distributor for a specific clock domain (x=1,2,3,4,5). On the left, a dashed box labeled 'Source clock' contains a list of clock sources: Fast-CR clock, Slow-CR clock, Main clock/ Main clock *1/2, Sub clock, PLL0 clock, PLL1 clock, and PLL2 clock. These sources are connected to a vertical selector block labeled 'SEL'. The 'SEL' block has a control input 'CDxCSL[3:0]' and a data output 'CDxCSL[3:0]'. The output of the 'SEL' block is connected to a 'Divider' block, which has a control input 'CDxDIV[4:0]' and a data output 'CDxA0DIV[3:0]'. The divider block also has a feedback input 'CDxA0DIV[3:0]'. The entire diagram is labeled 'Clock distributor' and 'Clock domain(x=1,2,3,4,5)'.</p> <p>Correct)</p> <p>This diagram is identical to the one labeled 'Error', showing the same clock distributor block diagram with source clocks, a selector, and a divider.</p>

Page	Section	Change Results
176	CHAPTER 5: Clock System 2. Configuration and Block Diagram 2.3. Clock Distributor Configuration and Block Diagram	<p>Revised the shading parts as below:</p> <p>Figure 2-8 Clock Domain HSSPI Block Diagram</p> <p>Error)</p> <p>The diagram shows a 'Clock distributor' block with an output 'Clock domain HSSPI'. Below it, a vertical bar labeled 'SEL' has multiple inputs. To the left of 'SEL' is a dashed box labeled 'Source clock' containing a list of clock sources: Fast-CR clock, Slow-CR clock, Main clock/ Main clock *1/2, Sub clock, PLL0 clock, PLL1 clock, PLL2 clock, PLL3 clock, SSCG PLL0 clock, and SSCG PLL1 clock. To the right of 'SEL' is a block labeled 'HSSPI DIV[4:0]' with a 'Divider' sub-block showing '1/2/3/... /30/31/32'. The output of the divider is connected to the 'Clock domain HSSPI' line. The signal path from 'SEL' to the divider is labeled 'HSSPISL[3:0]'.</p> <p>Correct)</p> <p>This diagram is identical to the 'Error)' version, showing the same components and connections: 'Clock distributor', 'Clock domain HSSPI', 'SEL' block, 'Source clock' list, and 'HSSPI DIV[4:0]' divider block.</p>

177	CHAPTER 5: Clock System 2. Configuration and Block Diagram 2.3. Clock Distributor Configuration and Block Diagram	<p>Revised the shading parts as below:</p> <p>Figure 2-10 Clock Domain CLKO Block Diagram</p> <p>Error)</p>  <p>Correct)</p>  <p>The diagram illustrates the Clock Domain CLKO Block. It features a central vertical block labeled 'SEL' with a 'CKSEL[3:0]' input at the top. To the left of 'SEL' is a 'Source clock' section containing a dashed box for 'Fast-CR clock' and a list of clock sources: 'Slow-CR clock', 'Main clock/ Main clock *1/2', 'Sub clock', 'PLL0 clock', 'PLL1 clock', 'PLL2 clock', 'PLL3 clock', 'SSCG PLL0 clock', 'SSCG PLL1 clock', and 'SSCG PLL2 clock'. To the right of 'SEL' is a 'Divider' block with inputs 'CKOUTDIV[2:0]' and '1/2/4/8/16 /32/64/128'. The output of the divider is connected to the 'Clock distributor' block, which outputs 'Clock domain CLKO'.</p>

CHAPTER 55:APPENDIX: Major Changes

Page	Section	Change Results						
1010	CHAPTER 17:TCFLASH 5. Registers	<p>Revised the shading parts as below:</p> <p>Table 5-3 Register Map</p> <p>Error)</p> <table border="1"> <tr> <td>0x060 to 0x064</td><td>TCFCFG0_FUIDR0 to 1 XXXXXXXX_XXXXXXXX_XXXXXXXX_XXXX XXXX</td><td>TCFLASH unique ID ROM register</td></tr> </table> <p>Correct)</p> <table border="1"> <tr> <td>0x060 to 0x064</td><td></td><td>Reserved area</td></tr> </table>	0x060 to 0x064	TCFCFG0_FUIDR0 to 1 XXXXXXXX_XXXXXXXX_XXXXXXXX_XXXX XXXX	TCFLASH unique ID ROM register	0x060 to 0x064		Reserved area
0x060 to 0x064	TCFCFG0_FUIDR0 to 1 XXXXXXXX_XXXXXXXX_XXXXXXXX_XXXX XXXX	TCFLASH unique ID ROM register						
0x060 to 0x064		Reserved area						
1015	CHAPTER 17:TCFLASH 5. Registers 5.2. TCFLASH Configuration Register : TCFCFG_FC FGR (TCFLASH Configuration Register)	<p>Added the shading parts as below:</p> <p>Correct)</p> <p>Note:</p> <p>- Avoid TCFlash access via AXI bus while changing Flash wait configuration (FAWC[1:0]) 0 -> X (X=1,2,3).</p>						
1020	CHAPTER 17:TCFLASH 5. Registers 5.6. TCFLASH Interrupt Control Register: TCFCFGn_FI CTRL (TCFLASH Interrupt Control Register)	<p>Added the shading parts as below:</p> <p>[bit 9] HANGIC: Hang Interrupt Clear</p> <p>Correct)</p> <p>Note:</p> <p>- Do not use this function.</p>						

Page	Section	Change Results																
1022	CHAPTER 17:TCFLASH 5. Registers 5.7. TCFLASH Status Register: TCFCFGn_FSTAT	Added the shading parts as below: Correct) Note: – Do not use this function. Use polling instead of interrupt. Use HANG(bit-1) bit.																
1028	CHAPTER 17:TCFLASH 5. Registers	Removed the shading section as below: 5.10. TCFLASH Unique ID ROM Register: TCFCFG0_FUIDR0 to 1																
1036	CHAPTER 17: TCFLASH 5. Registers 5.15. TCFLASH TCM Buffer Register: TCFCFGn_TCMBUF0 to 15 (TCFLASH Buffer0 to 15)	Revised the shading parts as below: Error) <table><tr><th>TCFLASH Memory Size</th><th>Initial Value of BUFADDH[23:4] and BUFADDL[3:0]</th></tr><tr><td>1MB</td><td>0x900000</td></tr><tr><td>2MB</td><td>0x800000</td></tr><tr><td>4MB</td><td>0x800000</td></tr></table> Correct) <table><tr><th>TCFLASH Memory Size</th><th>Initial Value of BUFADDH[23:4] and BUFADDL[3:0]</th></tr><tr><td>1MB</td><td>0x900000</td></tr><tr><td>2MB</td><td>0x900000</td></tr><tr><td>4MB</td><td>0x900000</td></tr></table>	TCFLASH Memory Size	Initial Value of BUFADDH[23:4] and BUFADDL[3:0]	1MB	0x900000	2MB	0x800000	4MB	0x800000	TCFLASH Memory Size	Initial Value of BUFADDH[23:4] and BUFADDL[3:0]	1MB	0x900000	2MB	0x900000	4MB	0x900000
TCFLASH Memory Size	Initial Value of BUFADDH[23:4] and BUFADDL[3:0]																	
1MB	0x900000																	
2MB	0x800000																	
4MB	0x800000																	
TCFLASH Memory Size	Initial Value of BUFADDH[23:4] and BUFADDL[3:0]																	
1MB	0x900000																	
2MB	0x900000																	
4MB	0x900000																	
1037	CHAPTER 17: TCFLASH 6. Others	Revised the shading parts as below: Reset During Execution of Program or Erase Operation Error) In these cases, retry the suspended program or erase operation after reset completes. Correct) In these cases, following steps should be done. 1. erase the sector. 2. re-program the sector.																

Page	Section	Change Results
		<p>Revised the shading parts as below:</p> <p>When 1-bit ECC error is detected</p> <p>Error) But, TCFlash can't be written, so the interrupt occurred.</p> <p>Correct) But, TCFlash can't be written, so it results to the data abort.</p>

Page	Section	Change Results						
1037, 1038	CHAPTER 17:TCFLASH 6. Others	<p>Added the shading parts as below:</p> <p>Note:</p> <p><i>TCFLASH Status Register Bits</i></p> <p><i>Since some status information of flash memory is common to Code side (TCFLASH) and Work side (WorkFLASH) in Dual Port FLASH macro,</i></p> <p><i>TCFLASH status register bits listed below are affected by WorkFLASH operation in addition to TCFLASH operation:</i></p> <ul style="list-style-type: none"> - TCFCFG_FSTAT.ESPS - TCFCFG_FSTAT.ERSEC - TCFCFG_FSTAT.RDY - TCFCFG_FSTAT.HANG - TCFCFG_FSTAT.RDYINT - TCFCFG_FSTAT.HANGINT <p><i>Use these bits only when program/erase is performed in TCFLASH.</i></p>						
1046	CHAPTER 18: WorkFLASH 3. Explanation of Operation 3.2. Write and Erase	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>Overwriting of the same data bit is prohibited. (Even overwriting of 1 -> 0, 0 -> 0, or 1 -> 1 is also prohibited.) The Flash security function does not allow writing and erasing of protected sectors. For details, see the security specifications.</p> <p>Correct)</p> <p>Overwriting of the same data bit is prohibited. (Even overwriting of 1 -> 0, 0 -> 0, or 1 -> 1 is also prohibited.)</p> <p>After erase operation completed, all the values of the flash memory cells in the target sectors are "1".</p> <p>The Flash security function does not allow writing and erasing of protected sectors. For details, see the security specifications.</p>						
1055	CHAPTER 18:WorkFLA SH 3.7. Bus Error Response	<p>Revised the shading parts as below:</p> <p>Error)</p> <table border="1"> <tr> <td>- Writing to the mirror area 4 (however, if the reserved area is written, RESA flag is set instead of this bit).</td> <td>9</td> <td>NWTM</td> </tr> </table> <p>Correct)</p> <table border="1"> <tr> <td>- Writing to the mirror area 4 (Refer next table for detail condition when NWTM flag is set.)</td> <td>9</td> <td>NWTM</td> </tr> </table>	- Writing to the mirror area 4 (however, if the reserved area is written, RESA flag is set instead of this bit).	9	NWTM	- Writing to the mirror area 4 (Refer next table for detail condition when NWTM flag is set.)	9	NWTM
- Writing to the mirror area 4 (however, if the reserved area is written, RESA flag is set instead of this bit).	9	NWTM						
- Writing to the mirror area 4 (Refer next table for detail condition when NWTM flag is set.)	9	NWTM						

CHAPTER 55:APPENDIX: Major Changes

Page	Section	Change Results		
		Revised the shading parts as below:		
		Error)		
		- Accessing the reserved area of WorkFLASH (the reserved area in Flash and registers)	5	RESA
		Correct)		
		- Accessing the reserved area of WorkFLASH (Reserved area in Flash and registers, refer next table for detail condition when RESA flag is set in access to WorkFLASH memory map)	5	RESA

Page	Section	Change Results												
		<p>Revised the shading parts as below:</p> <p>Error)</p> <table border="1"> <tr> <td>- Selecting a write protected or a reserved sector in the Sector Erase Number (ERS) bit field of the WFCFG_SEQCM register (even if no operation is started at the same time).</td><td>4</td><td>RWE</td></tr> <tr> <td>- The sector protection function specifies the protected sectors.</td><td></td><td></td></tr> </table> <p>Correct)</p> <table border="1"> <tr> <td>- Selecting a write protected sector or sector whose number is exceeding number of implemented sectors in the Sector Erase Number (ERS) bit field of the WFCFG_SEQCM register (even if no operation is started at the same time).</td><td>4</td><td>RWE</td></tr> <tr> <td>- The sector protection function specifies the protected sectors.</td><td></td><td></td></tr> </table>	- Selecting a write protected or a reserved sector in the Sector Erase Number (ERS) bit field of the WFCFG_SEQCM register (even if no operation is started at the same time).	4	RWE	- The sector protection function specifies the protected sectors.			- Selecting a write protected sector or sector whose number is exceeding number of implemented sectors in the Sector Erase Number (ERS) bit field of the WFCFG_SEQCM register (even if no operation is started at the same time).	4	RWE	- The sector protection function specifies the protected sectors.		
- Selecting a write protected or a reserved sector in the Sector Erase Number (ERS) bit field of the WFCFG_SEQCM register (even if no operation is started at the same time).	4	RWE												
- The sector protection function specifies the protected sectors.														
- Selecting a write protected sector or sector whose number is exceeding number of implemented sectors in the Sector Erase Number (ERS) bit field of the WFCFG_SEQCM register (even if no operation is started at the same time).	4	RWE												
- The sector protection function specifies the protected sectors.														

Page	Section	Change Results
1099	CHAPTER 18:WorkFLASH SH 6. Other	<p>Deleted the following parts as below:</p> <p>Correct)</p> <p>Handling the Values Read from Reserved Bits</p> <p>"0" is read from the reserved bits in the registers in WorkFLASH. From the viewpoint of ensuring compatibility with future products and software, make sure that in programming, no significance is attached to any value that is read from a reserved bit.</p> <p>Added the following parts as below:</p> <p>Correct)</p> <p>WorkFLASH Status Register Bits</p> <p>Since some status information of flash memory is common to Code side (TCFLASH) and Work side (WorkFLASH) in Dual Port FLASH macro,</p> <p>WorkFLASH status register bits listed below are affected by TCFLASH operation in addition to WorkFLASH operation:</p> <p>- WFCFG_SR.ESPS</p> <p>Use this bit only when program/erase is performed in WorkFLASH.</p>
1169	CHAPTER 21: Exclusive Access Memory (EAM) 3. Explanation of Operation	<p>Changed the shading parts as below:</p> <p>Error)</p> <p>The letter "x" in LDRx, STRx, LDREXx, STREXx, and so on in the commands described below represents the size of the command: "D" = Doubleword, "W" = Word, "H" = Halfword, and "B" = Byte. (There is not suffix of "x" in the Word case.)</p> <p>Correct)</p> <p>The letter "x" in LDRx, STRx, LDREXx, STREXx, and so on in the commands described below represents the size of the command: "D" = Doubleword, "" = Word, "H" = Halfword, and "B" = Byte. (There is not suffix of "x" in the Word case.)</p>

Page	Section	Change Results																																																															
1280	CHAPTER 24:Security 2. Security Scope and Access Restriction by the Security 2.2. Access Restriction by the Security	<div>Revised the shading parts as below:</div> <div>Access Restriction in Non-USERMODE</div> <div>Error)</div> <table><thead><tr><th>Operation</th><th>Non-USERMODE Security=Disabled</th><th>Non-USERMODE Security=Flash Protection</th><th>Non-USERMODE Security=Device Protection</th></tr></thead><tbody><tr><td>TCFlash Macro Erase</td><td>Enabled</td><td>Restricted *1</td><td rowspan="7">Restricted *2</td></tr><tr><td>TCFlash Sector Erase</td><td>Enabled</td><td>Disabled</td></tr><tr><td>WorkFlash Sector Erase</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Programming</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Reading</td><td>Enabled</td><td>Disabled</td></tr><tr><td>Use of Serial Programmer</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Use of Parallel Programmer</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Debugger connection</td><td>Enabled</td><td>Enabled *3</td></tr></tbody></table> <div>*1: It has to follow the steps shown in Erase Order Restriction in Non-USERMODE to Devices with Flash Protection or Device Protection.</div> <div>*2: Only a certain sequence of erase operations (full-chip erase) can be triggered by the writer equipment (Serial or JTAG).</div> <div>*3: Access to Flash is restricted (only full-chip erase is possible)</div> <div>Correct)</div> <table><thead><tr><th>Operation</th><th>Non-USERMODE Security=Disabled</th><th>Non-USERMODE Security=Flash Protection Chip Erase Enabled = Enabled</th><th>Non-USERMODE Security=Flash Protection Chip Erase Enabled = Disabled</th><th>Non-USERMODE Security=Device Protection Chip Erase Enabled = Enabled</th><th>Non-USERMODE Security=Device Protection Chip Erase Enabled = Disabled</th></tr></thead><tbody><tr><td>TCFlash Macro Erase</td><td>Enabled</td><td>Restricted *1</td><td rowspan="7">Disabled</td><td rowspan="7">Restricted *2</td><td rowspan="7">Disabled</td></tr><tr><td>TCFlash Sector Erase</td><td>Enabled</td><td>Disabled</td></tr><tr><td>WorkFlash Sector Erase</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Programming</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Reading</td><td>Enabled</td><td>Disabled</td></tr><tr><td>Use of Serial Programmer</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Use of Parallel Programmer</td><td>Enabled</td><td>Restricted *1</td></tr><tr><td>Debugger connection</td><td>Enabled</td><td>Enabled *3</td><td>Enabled*4</td></tr></tbody></table> <div>*1: It has to follow the steps shown in Erase Order Restriction in Non-USERMODE to Devices with Flash Protection or Device Protection.</div> <div>*2: Only a certain sequence of erase operations (full-chip erase) can be triggered by the writer equipment (Serial or JTAG).</div> <div>*3: Access to Flash is restricted (only full-chip erase is possible).</div> <div>*4: Access to Flash is restricted (Nothing can be done to Flash).</div>	Operation	Non-USERMODE Security=Disabled	Non-USERMODE Security=Flash Protection	Non-USERMODE Security=Device Protection	TCFlash Macro Erase	Enabled	Restricted *1	Restricted *2	TCFlash Sector Erase	Enabled	Disabled	WorkFlash Sector Erase	Enabled	Restricted *1	Programming	Enabled	Restricted *1	Reading	Enabled	Disabled	Use of Serial Programmer	Enabled	Restricted *1	Use of Parallel Programmer	Enabled	Restricted *1	Debugger connection	Enabled	Enabled *3	Operation	Non-USERMODE Security=Disabled	Non-USERMODE Security=Flash Protection Chip Erase Enabled = Enabled	Non-USERMODE Security=Flash Protection Chip Erase Enabled = Disabled	Non-USERMODE Security=Device Protection Chip Erase Enabled = Enabled	Non-USERMODE Security=Device Protection Chip Erase Enabled = Disabled	TCFlash Macro Erase	Enabled	Restricted *1	Disabled	Restricted *2	Disabled	TCFlash Sector Erase	Enabled	Disabled	WorkFlash Sector Erase	Enabled	Restricted *1	Programming	Enabled	Restricted *1	Reading	Enabled	Disabled	Use of Serial Programmer	Enabled	Restricted *1	Use of Parallel Programmer	Enabled	Restricted *1	Debugger connection	Enabled	Enabled *3	Enabled*4

Page	Section	Change Results
1861	CHAPTER 35: UART (Asynchronous Serial Interface) 7.1. RW Access Mode	Revised the shading parts as below: Error) 7.2. RW Access mode Correct) 7.1. RW Access mode
1861	CHAPTER 35: UART (Asynchronous Serial Interface) 7.1. RW Access Mode	Added the shading parts as below: Correct) During application operation, if the next block transfer request occurs before the completion of the previous block transfer, this state might be reported to the system by a block transfer error. This state does not occur if you configure FBYTE=1. Completion of block transfer by DMA depends on occupation of bus transaction by application. You need to fully evaluate the application integrally, design the system, and choose the optimal number of block transfers.

CHAPTER 55:APPENDIX: Major Changes

Page	Section	Change Results
282	CHAPTER 6: Low-power Consumption 4.3. Transition from PSS to RUN	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>5. CPUs wait for Flash macro to stabilize from DeepStandby release. Stabilize wait time will occur for regulator if mode change occurs.</p> <p>Correct)</p> <p>5. The CPU waits for the Flash macro to stabilize from DeepStandby release. Stabilize wait time will occur for the regulator if mode change occurs.</p>
282	CHAPTER 6: Low-power Consumption 4.3. Transition from PSS to RUN	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>6. There is a transition to RUN, and the CPUs start program operations.</p> <p>Correct)</p> <p>6. There is a transition to RUN, and the CPU starts program operations.</p>
282	CHAPTER 6: Low-power Consumption 4.3. Transition from PSS to RUN	<p>Revised the shading parts as below:</p> <p>Notes:</p> <p>Error)</p> <p>– If the power domain 6 is turned OFF in PSS mode, it is prohibited that PLL/SSCG oscillation allowed. After the power domain 6 is turn ON in RUN mode, it please allowed PLL/SSCG oscillation in RUN profile updating.</p> <p>Correct)</p> <p>– If the power domain 6 is turned OFF in PSS mode, it is prohibited that PLL/SSCG oscillation enabled. After the power domain 6 is turn ON in RUN mode, it is allowed PLL/SSCG oscillation in RUN profile updating.</p>
561	CHAPTER 6: Low-power Consumption 6.1. Restrictions on Transitioning to the PSS	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>When transitioning to the PSS, create a 1:1:1:1 relationship among the CPU clock, the Memory Configuration clock, the SCU clock, and the MCUC clock. The loss of this relationship among these clocks may cause abnormal operation.</p> <p>Correct)</p> <p>When transitioning to the PSS, create a 1:1:1:1 relationship among the CPU clock (CLK_CPU), the Memory Configuration clock (CLK_MEMC), the SCU clock (Fast CR clock), and the MCUC clock (CLK_SYSC0H) in PSS profile. The loss of this relationship among these clocks may cause abnormal operation.</p>

Page	Section	Change Results
1604	CHAPTER 30: CAN FD Controller(M CAN3.2) 3.5: Tx Handling 3.5.2. Dedicated Tx Buffers	<p>Added the shading parts as below:</p> <p>Correct)</p> <p>Dedicated Tx Buffers are intended for message transmission under complete control of the CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first. These Tx buffers shall be requested in ascending order with the lowest buffer number first. Alternatively all Tx buffers configured with the same Message ID can be requested simultaneously by a single write access to TXBAR.</p>
1605	CHAPTER 30: CAN FD Controller(M CAN3.2) 3.5: Tx Handling 3.5.4. Tx Queue	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>Tx Queue operation is configured by programming the Tx FIFO/Queue Mode bit TXBC.TFQM to "1". Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.</p> <p>Correct)</p> <p>Tx Queue operation is configured by programming the Tx FIFO/Queue Mode bit TXBC.TFQM to "1". Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). If multiple Tx Queue buffers are configured with the same Message ID, the transmission order depends on the numbers of the buffers where the messages were stored for transmission. As these buffer numbers depend on the then current states of the PUT index, a prediction of the transmission order is not possible.</p>
1605	CHAPTER 30: CAN FD Controller(M CAN3.2) 3.5: Tx Handling 3.5.4. Tx Queue	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>Adding Messages and Requesting Transmissions</p> <p>New messages have to be written to the Tx Buffer referenced by the Tx FIFO/Queue Put Index TXFQS.TFQPI[4:0]. An Add Request cyclically increments the Put Index to the next free Tx Buffer.</p> <p>Correct)</p> <p>Adding Messages and Requesting Transmissions</p> <p>New messages have to be written to the Tx Buffer referenced by the Tx FIFO/Queue Put Index TXFQS.TFQPI[4:0]. The Put Index always points to that free buffer of the Tx Queue with the lowest buffer number.</p>

CHAPTER 55:APPENDIX: Major Changes

Page	Section	Change Results
1791	CHAPTER 33: CAN Prescaler 5. Registers 5.1. CAN Prescaler Control Register (CANP_CTR)	<p>Added the shading parts as below:</p> <p>Correct)</p> <p>■ Default_type:</p> <p>– Note that the PLL clock is derived after the PLL(product specification)DIVM divider. Choose the CANP division accordingly and update it in case PLL(product specification)DIVM changes.</p>
