CHAPTER26: Secure Hardware Extension (SHE) 1.Outline of the Secure Hardware Extension (SHE) Module	<p>Revised " Figure 1-1 Block Diagram of the SHE Module" as follows.</p> <p>(Error)</p>  <p>(Correct)</p>  <p>The diagrams illustrate the internal structure of the SHECO module. At the top is the WFLASH component, which is connected to the Control Logic block within the SHECO module. Inside the SHECO module, the AES Engine is connected to the In-/Output FIFOs, which in turn are connected to the Data Masters. The Control Logic is also connected to the In-/Output FIFOs and the Control and Status Registers. The Data Masters are connected to the Control and Status Registers. The entire module is connected to the Data Interface and the Command Interface. A legend indicates that thick double-headed arrows represent data flow, and thin double-headed arrows represent control information flow.</p>

CHAPTER40: Base Timer 4.32-bit Mode Operation	<p>Features of "For details" should be corrected as indicated by the shading below.</p> <p>(Error)</p> <p>32-bit mode settings</p> <p>First, reset the state by setting the FMD2 to FMD0 bits in the TMCR register of the even-numbered channel to "000" for reset mode. Then, in the same way as in 16-bit mode, make reload timer or PWC timer selection and operation settings. To set 32-bit operation mode at this time, write "1" to the T32 bit in the TMCR register. Keep the T32 bit of the odd-numbered channel at "0". There is no need to set reset mode. For the reload timer, set the upper 16-bit reload value of the 32 bits in the cycle setting register of the odd-numbered channel. Then, set the lower 16-bit reload value in the cycle setting register of the even-numbered channel.</p> <p>After the writing of the T32 bit, the change to 32-bit operation mode is reflected immediately, so change the settings for both channels in the count stopped state.</p> <p>To change from 32-bit mode to 16-bit mode, set the FMD2 to FMD0 bits in the TMCR register of the even-numbered channel to "000" for reset mode. This resets the states of both the even-numbered and odd-numbered channels. As a result, the settings for 16-bit mode can be made for each of the channels.</p> <p>(Correct)</p> <p>32-bit Mode Settings</p> <p>First, reset the state by setting the FMD2 to FMD0 bits in the TMCR register of the even-numbered channel to 0b000 for reset mode. Then, in the same way as in 16-bit mode, make reload timer or PWC timer selection and operation settings. To set 32-bit operation mode at this time, write "1" to the T32 bit in the TMCR register. Keep the T32 bit of the odd-numbered channel at "0". There is no need to set reset mode. For the reload timer, set the upper 16-bit reload value of the 32 bits in the cycle setting register of the odd-numbered channel. CHAPTER47: QPRC(Quadrature Position/Revolution Counter) 4.Registers 4.5.QPRC Control Register (QCR)	Features of "For details" should be corrected as indicated by the shading below. (Error) Note: –Change the swap bit (SWAP) when the position counter is disabled (PCM[1:0]= "00"). (Correct) Note: –Change the swap bit(SWAP) when the position counter is disabled(PCM[1:0]= 0b00).
CHAPTER47: QPRC(Quadrature Position/Revolution Counter) 4.Registers 4.5.QPRC Control Register (QCR)	Features of "For details" should be corrected as indicated by the shading below. (Error) When the counter clear function is enabled (QGSC="0"), the ZIN pin clears the position counter if the revolution count mode is set to RC_Mode0 (RCM[1:0]= "00"), RC_Mode1 (RCM[1:0]= "01"), or RC_Mode3 (RCM[1:0]= "11"). The CGE1 and CGE0 bits of the QCR register clear the position counter by selecting a valid edge of the ZIN pin and detecting the selected edge. When the gate function is enabled (QGSC="1"), the ZIN pin controls the count operation of the position counter. The CGE1 and CGE0 bits of the QCR register count the position counter at the valid level of the ZIN pin. (Correct) When the counter clear function is enabled(QGSC= 0), the ZIN pin clears the position counter if the revolution count mode is set to RC_Mode0(RCM[1:0]= 0b00), RC_Mode1(RCM[1:0]= 0b01), or RC_Mode3(RCM[1:0]= 0b11). The CGE1 and CGE0 bits of the QCR register clear the position counter by selecting a valid edge of the ZIN pin and detecting the selected edge. When the gate function is enabled(QGSC= 1), the ZIN pin controls the count operation of the position counter. The CGE1 and CGE0 bits of the QCR register count the position counter at the valid level of the ZIN pin.

224	CHAPTER 5:Clock System 6. Usage Precautions	<div>Added the Below:</div> <div><div>■ The selection of Domain clock</div><div>Do not use Sub clock for the domain clock.</div></div>																																																																																																																																																																																																																		

Page	Section	Change Results
233	CHAPTER 6:Low Power Consumption 3.2. Power Supply Domain	Deleted the Below: Supply of Power 3. Internal regulator supply area PD1, PD4_0, PD4_1, PD6_0, PD6_1, PD2, PD5_0, PD5_1, PD5_2, PD5_3
233	CHAPTER 6:Low Power Consumption 3.2. Power Supply Domain	Error) Startup and shutdown sequences The startup sequence is as follows. 1 Turn ON PSW of PD6_0 2 Turn ON PSW of PD2 or external power control 3 Turn ON PSW of PD4 4 Turn ON PSW of PD6_1 5 Turn ON PSW of PD5_0 6 Turn ON PSW of PD5_1 7 Turn ON PSW of PD5_2 8 Turn ON PSW of PD5_3 To shut down the power supply, turn OFF all PSWs simultaneously. To start up the power supply, turn ON all PSWs or external power simultaneously. To shut down the power supply, turn OFF all PSWs simultaneously. Correct) Startup and shutdown sequences To start up the power supply, turn ON all PSWs or external power simultaneously. To shut down the power supply, turn OFF all PSWs simultaneously.

668	CHAPTER 8:Clock Supervisor 1. Overview	<p>Error)</p> <p>Two types of clock supervisors are equipped with this device. The clock supervisor to be used by the clock to be monitored is different.</p> <p>Correct)</p> <p>This device is equipped with several instances of two different types of clock supervisors. The used type of clock supervisor depends on the clock signal which is to be monitored.</p>
668		<p>Error)</p> <p>1. Detection type of stop or frequency range abnormality of the clock.</p> <p>It monitors for stop or frequency range abnormality of the monitoring clock. Parameters for reference clock frequency, upper limit of the monitoring clock frequency and lower limit of the monitoring clock frequency are set to the monitoring clock counter and reference clock counter. Frequency range comparator can detect abnormalities from each counter output. Either reset or interrupt is generated when the comparator detect abnormalities.</p> <p>Correct)</p> <p>1. Detector for stopped clock or abnormal frequency of the monitored clock.</p> <p>This type of clock supervisor detects two possible errors in clock operation: a stopped clock or a clock operating in an abnormal frequency range. There are clock counters for both the monitored clock and the reference clock. Parameters for each counter define the frequency of the reference clock as well as the upper and lower limit for the frequency of the monitored clock. In case the dedicated frequency range comparator detects a stopped clock or a clock outside the frequency range, an abnormal state is signalled. Then, it depends on register settings and on the way, the monitored clock is used on the device, whether a reset or an interrupt is generated.</p>

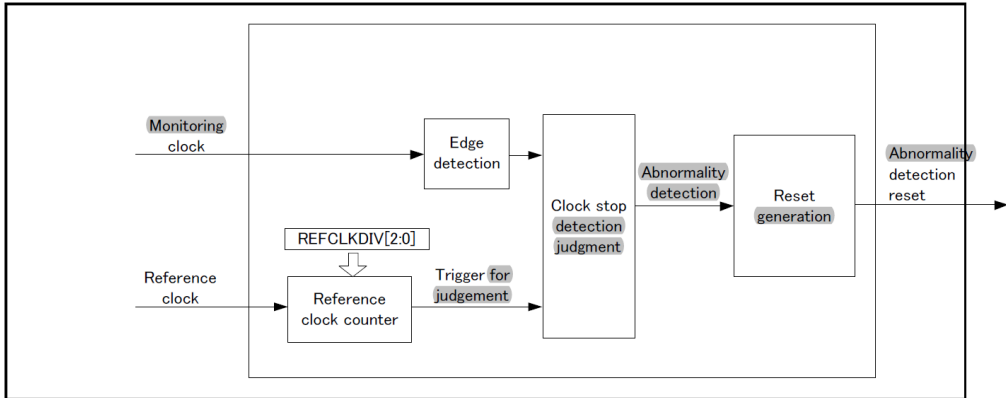

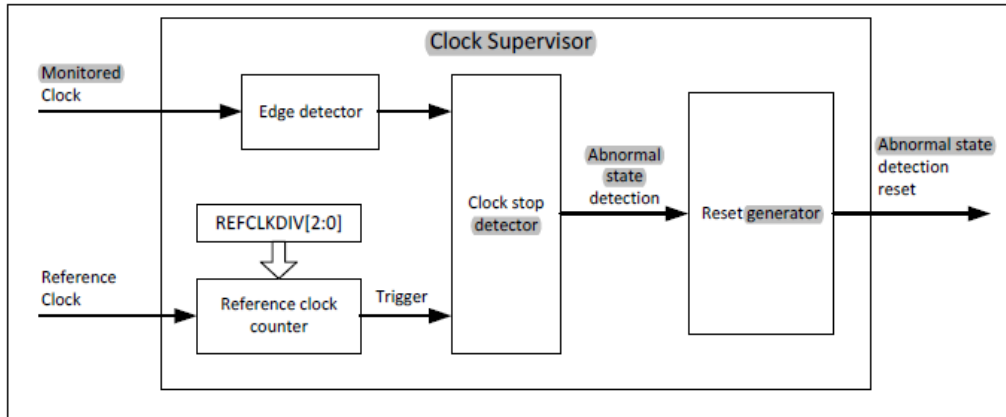

Page	Section	Change Results
668	CHAPTER 8:Clock Supervisor 1. Overview	<p>Error)</p> <p>2. Detection type of stop of the clock.</p> <p>It monitors for stop of the monitoring clock. When the rising edge of the monitoring clock is not detected, the clock supervisor detects the abnormalities of oscillator. Reset is generated when the comparator detect abnormalities.</p> <p>Correct)</p> <p>2. Detector for stopped clock only.</p> <p>This type of clock supervisor detects a stopped clock operation for the monitored clock. When the rising edge of the monitored clock does not occur, the clock supervisor signals an abnormal state. In this case, a reset is generated.</p>

1362	CHAPTER 24:Security 3. Using and Configuring the Security 3.3. Security Marker Definition	<p>Error)</p> <p>The security markers are transferred after each RSTX_PD2H into the appropriate registers containing the security state of the device. This process is called "Security Fetch". There is no error signaling during that hardware mechanism, since the CPU is not involved into that mechanism (no bus transfer). No errors will succeed in loading the marker values from Flash to registers. Single bit errors get corrected and will succeed in loading the marker values from Flash to registers. Fatal errors will not succeed in loading the marker values from Flash to registers. The according security register will keep its previous initial value. To check the integrity of ECC of the above marker section, it is recommended, to read the markers by the application. The normal ECC error detection by the TCFLASH interface can be utilized for that.</p> <p>Correct)</p> <p>The security markers are transferred after each RSTX_PD2H into the appropriate registers containing the security state of the device. Value	Description							
0xFFFFFFFF	The chip erase of a secured device is enabled.							
Other	Any other value disables the chip erase in non-USERMODE.							

Page	Section	Change Results
1382	CHAPTER 24:Security 4. Registers 4.4. Chip Erase Enable Register (TCFCFG0_CEER)	<p>Added  Error)</p> <p>TCFCFG0_CEER can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error.</p> <p>Correct)</p> <p>TCFCFG0_CEER can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error.</p> <p>Refer to datasheet of product.</p> <p>If being written with "MK_CEER = Selectable", below is spec.</p> <p>The chip erase can be triggered by JTAG equipment, writing the chip erase sequence to the general purpose registers of the security checker or transferring the chip erase sequence through serial interface when using Serial Loader equipment. It erases all sectors of the WORKFLASH and TCFLASH. Sectors used for SHE are not erased.</p> <p>Notes:</p> <ul style="list-style-type: none"> - A secured device without an unlock mechanism implemented by the application and without the ability to erase the full device cannot be updated or tested anymore. Not programming the unlock marker value to CEEM should be used with absolute care! - Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the chip erase will be disabled.

HBUSREQ	HBUSREQ is asserted to "1" at transfer starts. HBUSREQ is de-asserted to "0" at transfer completion of current block. By referring to HBUSREQ, "transfer gap" can be observed. Please refer to "CHAPTER : DMA Controller" for the "transfer gap".									
Software trigger	When bit 'j' of DMAAn_RTSSSR is written, a "0"→"1"→"0" pulse will be given to TIN of ReloadTimer channel j. Using the DMAAn_RTSSSR, all of four Reload Timer can be triggered at the same time. Software trigger is always able to be used regardless DMAAn_RTTSR setting.									
1636	CHAPTER 28:DMA COMPLEX SUBSYSTEM 8.Registers in DMA COMPLEX SUBSYSTEM 8.2.Timer Control Status Register (DMAAn_RLTm _TMCSR)	<div>Error)</div> <div><div><div>– This bit is enable at</div><div>✧ from ch. 0 to ch. 3 of CPER#2</div><div>✧ from ch.0 to ch. 1 of MCU_CONFIG_GROUP.</div></div></div> <div>Correct)</div> <div><div><div>– This bit is enable at</div><div>✧ from ch. 0 to ch. 3 of CPER#2</div><div>✧ from ch.0 to ch. 1 of MCU_CONFIG_GROUP.</div></div></div>

CHAPTER 31:CAN FD Controller(MCAN3.2)

5. Registers

5.3. Data Bit Timing & Prescaler Register (MCG_CANF Dx_DBTP, CPG_CANFD x_DBTP)

Error)

[bit12:8] DTSEG1[3:0]: Data Time Segment before sample Point

DTSEG1[4:0]	Description
0x00-0x1F	Valid values are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

Correct)

[bit12:8] DTSEG1[4:0]: Data Time Segment before sample Point

DTSEG1[4:0]	Description
0x00-0x1F	Valid values are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

1903

CHAPTER 31:CAN FD Controller(MCAN3.2)

5. Registers

5.6. CC Control Register (MCG_CANF Dx_CCCR, CPG_CANFD x_CCCR)

CHAPTER 36:UART (Asynchronous Serial Interface)

10. Registers of UART (Asynchronous Serial Interface)

10.9. Transfer Byte Register (TBYTE0)

Error)

The transfer byte (TBYTE0) represents the transfer data amount when each serial chip select pin is active.

Correct)

The transfer byte (TBYTE0) represents the transfer data amount when synchronous transmission or external trigger transmission starts.

2154

CHAPTER 36:UART (Asynchronous Serial Interface)

FIFO Byte Register (FBYTE)	<p>Error)</p> <p>[bit15:8] FBYTE2: FIFO2 Data Count Indication byte [bit7:0] FBYTE1: FIFO1 Data Count Indication Byte</p> <ul style="list-style-type: none"> ■ Change the value after disabling the reception operation. ■ Any setting that exceeds the FIFO capacity is prohibited. <p>Correct)</p> <p>[bit15:8] FBYTE2: FIFO2 Data Count Indication byte [bit7:0] FBYTE1: FIFO1 Data Count Indication Byte</p> <p>Notes:</p> <ul style="list-style-type: none"> – Change the value of the FBYTE of the reception FIFO after disabling the reception operation. – Any setting that exceeds the FIFO capacity is prohibited. – Set the FIFO byte register (FBYTE) after setting the FIFO selection bit (FCR1:FSEL). – The FIFO selection bit (FCR1:FSEL) and the FIFO byte register (FBYTE) cannot be set at the same time. – As the FIFO data count for transmission, the transmission data count that has been written, minus 1, is displayed as the valid data count. This is because an attempt to write transmission data to the TDR register stores the data in the transmission FIFO if the TDR register contains data that has not been transmitted yet. When the data in the TDR register is transmitted, the data in the transmission FIFO that has not been transmitted is transferred to the TDR register. – The FIFO data count for reception represents the data count received by the reception FIFO but which has not yet been read. The data count does not include the data being received by the RDR register.

2390	CHAPTER 38:I2C Interface (I2C Communication Control Interface) 3 I2C Interface Operation 3.2. Slave Mode	<p>Error)</p> <p>Slave Address Match Detection</p> <p>After the (repeated) start condition is detected, the next data is received as a 7-bit address. With regard to the bits that are set to "1" in the ISMK register, the bits in the ISBA register are compared with the bits of the received address. If they match, ACK is output.</p> <p>Correct)</p> <p>Slave Address Match Detection</p> <p>The 1st receiving data after the start condition or the repeated start condition is detected contains 7-bit slave address and the bit that shows the direction of the data transmission. The ISMK register is set the value that masks the slave address of the ISBA register. The bit value "0" means "don't care", and "1" means that it needs that the bit value of address corresponds with the data of received slave address. That is, the bit whose the value is set to "0" in the ISMK register is not compared to the bit of the address.</p> <p>When SAEN is set to "1", it enables the slave address detection.</p> <p>The data as the address sent by a master is compared with some slave address bits(SA[6:0]) that mask bits(SM[6:0]) corresponded to is set to "1".</p> <p>If they match, ACK is output. If not, ACK is not output.</p> <p>Example of the address detection</p> <p>For example, a master send the slave address 0x23.</p> <p>Figure 3-39 The example of the slave address detection</p>  <p>Just SA5, SA1, SA0 are compared the data as the address sent by the master. Because SM[6], SM[4:2] are set to "0", those bits are "don't care". As a result, the Multi-function serial interface outputs the ACK response.</p>

2961	CHAPTER 47:QPRC (Quadrature Position/Revolution Counter) 4. Registers 4.5. QPRC Control Register (QCR)	Error)	When the counter clear function is enabled(QGSC= 0), the ZIN pin clears the position counter if the revolution count mode is set to RC_Mode0(RCM[1:0]= 0b00), RC_Mode1(RCM[1:0]= 0b01), or RC_Mode3(RCM[1:0]= 0b11). The CGE1 and CGE0 bits of the QCR register clear the position counter by selecting a valid edge of the ZIN pin and detecting the selected edge.
		Correct)	When the counter clear function is enabled(QGSC= 0), the ZIN pin clears the position counter if the revolution count mode is set to RC_Mode0(RCM[1:0]= 0b00), RC_Mode1(RCM[1:0]= 0b01), or RC_Mode3(RCM[1:0]= 0b11). The CGE[1] and CGE[0] bits of the QCR register clear the position counter by selecting a valid edge of the ZIN pin and detecting the selected edge.
2961	CHAPTER 47:QPRC (Quadrature Position/Revolution Counter) 4. Registers 4.5. QPRC Control Register (QCR)	Error)	When the gate function is enabled(QGSC= 1), the ZIN pin controls the count operation of the position counter. The CGE1 and CGE0 bits of the QCR register count the position counter at the valid level of the ZIN pin.
		Correct)	When the gate function is enabled(QGSC= 1), the ZIN pin controls the count operation of the position counter. The CGE[1] and CGE[0] bits of the QCR register count the position counter at the valid level of the ZIN pin.
2961	CHAPTER 47:QPRC (Quadrature Position/Revolution Counter) 4. Registers 4.5. QPRC Control Register (QCR)	Error)	These bits are used to select the count mode of the revolution counter and the reset mode of the position counter. For the effect on the position counter, see " Operation of Revolution Counter 3.2 ".
		Correct)	These bits are used to select the count mode of the revolution counter and the reset mode of the position counter. For the effect on the position counter, see " 3.2 Operation of Revolution Counter ".

3134	CHAPTER 52: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI 4.4. General Use Case Guidelines for DDRHSSPI 4.4.4. Using the DDRHSSPI in Command Sequencer Mode of Operation	<p>Added the below:</p> <p>Calibration of SDATA Sampling Points</p> <p>Before running the main process, the software shall adjust the SDATA Sampling Points by setting up registers DDRHSSPI_{IN}_SDATASAMPLEPT{LFT/CNT/RGH}0-7. To determine the best sampling points on each bit lane of SDATA[7:0], the software has to run a flow (1)~(3) as below. This flow is an example. The overview of this flow is also illustrated in Figure 4-13.</p> <p>(1) Calibration sequence</p> <p>First of all, the software needs to prepare arrays to store the result of Calibration. Each array has a size corresponding to SDATA Sampling Points (=128). It is recommended to prepare 8 arrays to store results for each bit lane of SDATA[7:0].</p> <p>The software runs the following sequence:</p> <ul style="list-style-type: none"> – a) Set DDRHSSPI_{IN}_MCTRL.DLPEN bit to "1". – The Calibration sequence goes with causing Bus Errors, and these errors have to be ignored by the system. Please make the settings on the system for it. – b) Set all {R/C/L} of SDATA Sampling Points to 0. – The target registers are for current bit lane of SDATA[7:0]. – E.g. If current bit lane is SDATA[0], write 0x00 to registers DDRHSSPI_{IN}_SDATASAMPLEPT{LFT/CNT/RGH}0. – c) Run a Memory Read access at 32-bits width. – From the second round in the loop, the software shall increment the address at least +8. – If any of SDATA Sampling Points is not in the valid bit range, the DLP checking results in error and causes a Bus Error. – d) Check the status of DDRHSSPI_{IN}_DLPSAMPLESTATUS register. – The software shall check the bit fields for current bit lane of SDATA[7:0], and store the result to the corresponding array. – e) Clear the DLPFS bit by writing "1" to DDRHSSPI_{IN}_FAULTC.DLPFC. – f) Increment all {R/C/L} of SDATA Sampling Points (+1 on each). – g) Repeat (c)~(f) until the max value of SDATA Sampling Points (128 rounds). – h) Repeat (b)~(g) until completing all bit lanes of SDATA[7:0] (8 rounds). – i) At this moment, DDRHSSPI is expected to be in the status as below: – SDATA Sampling Points are the max value. – The last Memory Read access has ended in Bus Error. – DDRHSSPI_{IN}_FAULTF.DLPFS="1" – DDRHSSPI_{IN}_RXF.DLPERR="1" – The software holds all arrays of "PASS"/"FAIL" results for each bit lane of SDATA[7:0].

Page	Section	Change Results
3134, 3135	CHAPTER 52: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI 4.4. General Use Case Guidelines for DDRHSSPI 4.4.4. Using the DDRHSSPI in Command Sequencer Mode of Operation	<p>Added the below:</p> <p>(2) Setting SDATA Sampling Points</p> <p>Set the registers DDRHSSPIn_SDATASAMPLEPTCNT0-7 to the center positions in respective "PASS" ranges. If there is no "PASS" range in the array, the DDRHSSPI hereafter cannot serve Memory Read access. Else if the "PASS" range is divided by "FAIL(s)", choose the longest "PASS" range and take the center position of it.</p> <p>DDRHSSPIn_SDATASAMPLEPTLFT0-7 shall be set to less values than DDRHSSPIn_SDATASAMPLEPTCNT0-7 (for each bit lane of SDATA[7:0]).</p> <p>DDRHSSPIn_SDATASAMPLEPTRGH0-7 shall be set to greater values than DDRHSSPIn_SDATASAMPLEPTCNT0-7 (for each bit lane of SDATA[7:0]).</p> <p>These register settings for {"LFT", "RGH"} are actually not used in the data reception, and they are just used for detecting the violation of sampling.</p> <p>The degree of 'less' and 'greater' depends on the window size of "PASS" range, and these differences are used in the re-adjustment of SDATA Sampling Points afterward.</p> <p>(3) To the main process</p> <p>The software shall clear DDRHSSPIn_MCTRL.DLPEN bit to "0", if it is not allowed to lose the Memory Read data in the main process by the occurrence of DLP error. Now the DDRHSSPI is ready for the Memory Read access in the main process. During the main process, the software is required to run a periodical adjustment of SDATA Sampling Points, and this operation is described later in this section.</p> <p>Notes:</p> <ul style="list-style-type: none"> - If the Serial Flash Memory does not support the DLP function, please change following points. - DDRHSSPIn_MCTRL.DLPEN should be "0". - DLP-related status bits are not used. - All Serial Flash Memories have to store certain data in certain addresses in advance. These data are used for pattern matching instead of DLP, and shall have bit-toggling pattern on each bit lane of SDATA[7:0] as well as DLP. Please consider the "bit pattern" and "bit alignment" according to the intended SPI protocol (Quad or Dual-Quad).

3135, 3136	CHAPTER 52: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI 4.4. General Use Case Guidelines for DDRHSSPI 4.4.4. Using the DDRHSSPI in Command Sequencer Mode of Operation	<p>Added the below:</p> <ul style="list-style-type: none"> – <i>The software has to do pattern-matching checks with the read data, since there is no automatic checking like DLP. Please note that the read data work instead of DLP by the process of software.</i> <i>Therefore, the software shall recognize how many data to read in the DLP-like operation, and gather byte data by re-arranging bits from the read data. [e.g. Memory Read at "DDR & Dual-Quad" protocol] For the pattern matching check, it is assumed to use 8 consecutive bits on each bit lane of SDATA[7:0] as the substitute for DLP. The sum of these pattern-matching bits becomes 64 bits. In this case, the software has to read 2 words (assuming 32-bits access) to check all of these bits.</i> – <i>Although the SDATA[7:0] is sampled in parallel, the software has to check the serial bits on each bit lane of SDATA[7:0] individually. The main loop flow is basically same as the case of DLP.</i> – <i>The SPI transaction goes on regardless the sampling condition of SDATA[7:0], different from the case using DLP.</i> <p>The overview of Calibration sequence is shown in the following diagram.</p> <p>Figure 4-13 Calibration Sequence before the Main Process</p>

Page	Section	Change Results
3137	CHAPTER 52: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI 4.4. General Use Case Guidelines for DDRHSSPI 4.4.4. Using the DDRHSSPI in Command Sequencer Mode of Operation	<p>Added the below:</p> <p>c) Check the status of following registers: DDRHSSPIn_FAULTF.DLPFS bit (optional) If this bit is "0", go to (f). DDRHSSPIn_RXF.DLPERR bit (optional) If this bit is "0", go to (f). DDRHSSPIn_DLPSAMPLESTATUS register (must) For each bit lane of SDATA[7:0], the software shall check the status of sampling and update the corresponding SDATA Sampling Point. These judgments are based on the register settings of DDRHSSPIn_SDATASAMPLEPT{LFT/CNT/RGH}0-7 in the Calibration ($L < C < R$). - DLPSMPLSTx{R/C/L} = "100": --> Decrease the SDATA Sampling Point. - DLPSMPLSTx{R/C/L} = "001": --> Increase the SDATA Sampling Point. - DLPSMPLSTx{R/C/L} = "000": --> No need to change the SDATA Sampling Point. If the value of DDRHSSPIn_DLPSAMPLESTATUS register is 0x00000000, go to (f). - Otherwise: --> Outside the re-adjustable range. This situation requires a full Calibration and the system shall stop the main process for a moment. When increasing/decreasing the SDATA Sampling Points, the "CNT" shall be adjusted to the center between "LFT" and "RGH", so as to ensure the PASS range as much as possible. e.g. If DLPSMPLST0{R/C/L} = "100", the software shall decrease only the value of DDRHSSPIn_SDATASAMPLEPTRGH0 registers, then calculate the "CNT" as the average value between "LFT" and "RGH". d) If DLPFS = "1", write "1" to DDRHSSPIn_FAULTC.DLPFC to clear it. If DLPERR = "1", write "1" to DDRHSSPIn_RXC.DLPERRC to clear it. e) Repeat (b)~(d) until DDRHSSPIn_DLPSAMPLESTATUS = 0x00000000. If the period to run this operation is frequent enough against the fluctuation of SDATA timing, this loop is not always necessary. f) Clear DDRHSSPIn_MCTRL.DLPEN bit to "0", if it is not allowed to lose the Memory Read data in the main process by the occurrence of DLP error. g) Main process can access Serial Flash Memories. Notes: - If the Serial Flash Memory does not support the DLP function, the software has to check the result of Memory Read access as well as Calibration sequence (please refer to its Notes). - The system has to ensure the timing for this Re-adjustment operation. Before starting the main process, please read carefully the Notes of 3.4 SPI Data Learning Pattern.</p>

1585	CHAPTER 27:DMA Controller 4. Registers	<p>Correct)</p> <p>Added the below:</p> <p>4.8. DMA Controller Channel Configuration B Register Channel 'n' (DMAi_Bn)</p> <p>[bit15:12] SP[3:0] : Source protection</p> <p>Note:</p> <ul style="list-style-type: none"> – Configuration of SP[3] and SP[2] has no effect. <p>[bit11:8] DP[3:0] : Destination protection</p> <p>Note:</p> <ul style="list-style-type: none"> – Configuration of DP[3] has an effect. – DP[3]=0: Posted write buffer in HPM is used. Due to the posted write behavior, DMA cannot trap the error returned from the destination even if there is an error in the write access (e.g.: The destination register/memory requires Privilege level for writing, but DP[1] is "0"). – DP[3]=0: Posted write buffer in HPM is unused. DMA always traps the error when there is an error in the write access. (DMAi_Bn:EQ) – Configuration of DP[2] has no effect.

3051	CHAPTER 50: I/O Port 4. Register List	<p>Add the below:</p> <p>4.13. RIC Key Code Register (RIC_KEYCDR) [bit14:0] RADR: Port Address Bits</p> <p>Notes:</p> <ul style="list-style-type: none"> – There is no effect on the key code protection release process even if registers other than this register and the applicable key code register that is in the release processing (the register set by the RADR) are accessed while writing the key code 0b00, 0b01, 0b10, and 0b11. When key code protection is released, register of protection target can be written once. If several registers are to be written, it is necessary to release the protection for each register writing.
3052	CHAPTER 50: I/O Port 5. Precautions for Using This Device	<p>Changed the below:</p> <p>Error)</p> <p>This section describes the precautions necessary when using the I/O port. A glitch may occur for a brief nanosecond (2 or 3 nanoseconds) when a general-purpose I/O port is switched (from input to output or from output to input).</p> <p>Correct)</p> <p>Notes on switching the I/O port function are shown below. A glitch may occur for a brief second (2 or 3 ns) when a general-purpose I/O port is switched (from input to output or from output to input or from port function to resource or from resource to port function). If this glitch may cause a problem for the system, please write a value to port output data register (GPIO_PODRI) in advance at a level that will not cause a problem. When a resource input is valid and its assignment is moved to another pin, a trigger which causes resource operation may occur if the pin levels before switching and after switching are different. Therefore, please switch input pins when the resource input function is stopped.</p>
3064	CHAPTER 51: Peripheral Protection Unit 4. Registers	<p>Deleted the below:</p> <p>Register map is not required because it can be extracted from each register descriptions. For the customers, they should refer DS for the I/O map.</p>

133	CHAPTER 5: Clock System 2.3. Clock Distributor Configuration and Block Diagram	<p>Revised the shading parts as below: Figure 2-6 Clock Domain TRC Block Diagram (Error)</p>  <p>The diagram shows a 'Clock distributor' block with a 'Clock domain TRC' input. It has a 'TRCCSL[2:0]' output connected to a 'SEL' block. The 'SEL' block has eight inputs: 'Fast-CR clock', 'Slow-CR clock', 'Main clock/Main clock *1/2', 'Sub clock', 'PLL0 clock', 'SSCG PLL0 clock', and 'PLL1 clock'. These inputs are grouped under a 'Source clock' label. The 'SEL' block has a 'TRCDIV[4:0]' output connected to a 'Divider' block. The 'Divider' block has a '1/2/3/.../30/31/32' output.</p> <p>Correct)</p>  <p>The diagram is identical to the one above, but the 'Source clock' label and the 'Fast-CR clock' through 'PLL1 clock' inputs are now enclosed in a dashed box, indicating they are the parts that were revised.</p>

2026	CHAPTER 36: UART (Asynchronous Serial Interface) 7.1. ACK Mode	Removed the shading section as below: 7.1. ACK Mode
2026	CHAPTER 36: UART (Asynchronous Serial Interface) 7.1. RW Access Mode	Revised the shading parts as below: Error) 7.2. RW Access mode Correct) 7.1. RW Access mode
2026	CHAPTER 36: UART (Asynchronous Serial Interface) 7.1. RW Access Mode	Added the shading parts as below: Correct) During application operation, if the next block transfer request occurs before the completion of the previous block transfer, this state might be reported to the system by a block transfer error. This state does not occur if you configure FBYTE=1. Completion of block transfer by DMA depends on occupation of bus transaction by application. You need to fully evaluate the application integrally, design the system, and choose the optimal number of block transfers.

2335	CHAPTER 38: I ² C Interface (I ² C Communication Control Interface) 8.2. Serial Mode Register (SMR)	Added the shading parts as below: [bit4] WUCR: WAKE UP Control Bit Note: - The WAKE UP function is not supported.
2369	CHAPTER 38: I ² C Interface (I ² C Communication Control Interface) 8.16. FIFO Byte Register (FBYTE)	Removed the shading parts as below: Table 8-4 Data Count Stored in FIFO Error) Note: - Set reception FIFO FBYTE to "2" or a larger value when block transfer. At other conditions, set "1" or a larger value for FBYTE of the reception FIFO.
2397	CHAPTER 39: LIN Interface (V2.1) (LIN Communication Control Interface (V2.1))	Removed the shading parts as below: Error) Note: - ACK Mode of Block Transfer is not supported for this device.
2397	CHAPTER 39: LIN Interface (V2.1) (LIN Communication Control Interface (V2.1))	Deleted the shading parts as below: Error) This chapter describes the LIN communication function supported by operation mode 3 of the multi-function serial interface functions. The LIN communication function has the following 2 modes: Manual mode, which allows the transmission/reception of the LIN header section using interrupt functions, and the assist mode, which allows automatic transmission/reception of the LIN header.
2416	CHAPTER 39: LIN Interface (V2.1) (LIN Communication Control Interface (V2.1)) 2.2.1. Occurrence of Reception Interrupts and Flag Set Timing in Assist Mode	Revised the shading parts as below: Error) Occurrence of Framing Error Interrupt and Flag Set Timing Correct) Occurrence of Framing Error Interrupt and Flag Set Timing

The DDRHSSPI_{IN}_CSCFG.DDRMODE bit shall be set same as DDRHSSPI_{IN}_DMFIFOCFG.DDRM bit.</p> <p>Correct)</p> <p>2.The next step is to configure the transfer protocol (i.e. whether the DDRHSSPI serial transfers use the Quad or Octal Protocol in the DDRHSSPI_{IN}_CSCFG.MBM). The DDRHSSPI_{IN}_CSCFG.DDRMODE bit shall be set same as DDRHSSPI_{IN}_DMTRP.DDRM bit.</p>
3030	CHAPTER 52: DDR High Speed SPI Controller 4. Operations of the DDRHSSPI	<p>Deleted the below:</p> <p>4.4. General Use Case Guidelines for DDRHSSPI</p> <p>4.4.5. Notice On Document Designations</p> <p>Cypress issues documents and data sheets with Advance Information or Preliminary designations to advise readers of product information or intended specifications throughout the product life cycle,including development, qualification, initial production, and full production. In all cases, however, readers are encouraged to verify that they have the latest information before finalizing their design. The following descriptions of Cypress data sheet designations are presented here to highlight their presence and definitions</p> <p>4.4.6. Advance Information</p> <p>The Advance Information designation indicates that Cypress Semiconductor Corp. is developing one or more specific products, but has not committed any design to production. Information presented in a document with this designation is likely to change, and in some cases, development on the product may discontinue. Cypress Semiconductor Corp. therefore places the following conditions upon Advance Information content:</p> <p>This document contains information on one or more products under development at Cypress Semiconductor Corp.</p> <p>The information is intended to help you evaluate this product. Do not design in this product without contacting the Cypress Semiconductor Corp.</p> <p>Cypress Semiconductor Corp. reserves the right to change or discontinue work on this proposed product without notice.</p>

994	CHAPTER 17: TCFLASH 3. Explanation of Operation 3.2. Programming and Erasing	<p>Added the shading parts as below:</p> <p>Correct)</p> <p>■After erase operation completed, all the values of the flash memory cells in the target sectors are "1".</p>
1055	CHAPTER 18: WorkFLASH 3. Explanation of Operation 3.2. Write and Erase	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>Overwriting of the same data bit is prohibited. (Even overwriting of 1 -> 0, 0 -> 0, or 1 -> 1 is also prohibited.) The Flash security function does not allow writing and erasing of protected sectors. For details, see the security specifications.</p> <p>Correct)</p> <p>Overwriting of the same data bit is prohibited. (Even overwriting of 1 -> 0, 0 -> 0, or 1 -> 1 is also prohibited.)</p> <p>After erase operation completed, all the values of the flash memory cells in the target sectors are "1".</p> <p>The Flash security function does not allow writing and erasing of protected sectors. For details, see the security specifications.</p>
1605	CHAPTER 30: CAN FD Controller(MCAN 3.2) 3.5: Tx Handling 3.5.2. Dedicated Tx Buffers	<p>Added the shading parts as below:</p> <p>Correct)</p> <p>Dedicated Tx Buffers are intended for message transmission under complete control of the CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first. These Tx buffers shall be requested in ascending order with lowest buffer number first. Alternatively all Tx buffers configured with the same Message ID can be requested simultaneously by a single write access to TXBAR.</p>

Page	Section	Change Results
1606	CHAPTER 30: CAN FD Controller(MCAN 3.2) 3.5: Tx Handling 3.5.4. Tx Queue	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>Tx Queue operation is configured by programming the Tx FIFO/Queue Mode bit TXBC.TFQM to "1". Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.</p> <p>Correct)</p> <p>Tx Queue operation is configured by programming the Tx FIFO/Queue Mode bit TXBC.TFQM to "1". Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). If multiple Tx Queue buffers are configured with the same Message ID, the transmission order depends on numbers of the buffers where the messages were stored for transmission. As these buffer numbers depend on the then current states of the PUT index, a prediction of the transmission order is not possible.</p>
1606	CHAPTER 30: CAN FD Controller(MCAN 3.2) 3.5: Tx Handling 3.5.4. Tx Queue	<p>Revised the shading parts as below:</p> <p>Error)</p> <p>Adding Messages and Requesting Transmissions</p> <p>New messages have to be written to the Tx Buffer referenced by the Tx FIFO/Queue Put Index TXFQS.TFQPI[4:0]. An Add Request cyclically increments the Put Index to the next free Tx Buffer.</p> <p>Correct)</p> <p>Adding Messages and Requesting Transmissions</p> <p>New messages have to be written to the Tx Buffer referenced by the Tx FIFO/Queue Put Index TXFQS.TFQPI[4:0]. The PUT Index always points to that free buffer of the Tx Queue with the lowest buffer number.</p>
2041	CHAPTER 36: UART (Asynchronous Serial Interface) 10.Registers of UART (Asynchronous Serial Interface) 10.2. Serial Mode Register (SMR)	<p>Added the shading parts as below:</p> <p>Correct)</p> <p>[bit4] WUCR: WAKE UP Control Bit</p> <p>WUCR is not supported</p> <p>This bit selects a pin used for external interrupts.</p>

Page	Section	Change Results
2179	CHAPTER 37: CSIO (Clock Synchronous Serial Interface) 9. Registers of the CSIO (Clock Synchronous Serial Interface) 9.2. Serial Mode Register (SMR)	Added the shading parts as below: Correct) [bit4] WUCR: WAKE UP Control Bit WUCR is not supported This bit selects a pin used for external interrupts.
2332	CHAPTER 38: I2C Interface (I2C Communication Control Interface) 8. I2C Interface Registers 8.2. Serial Mode Register (SMR)	Added the shading parts as below: Correct) [bit4] WUCR: WAKE UP Control Bit WUCR is not supported This bit selects a pin used for external interrupts.
2503	CHAPTER 39: LIN Interface (V2.1) (LIN Communication Control Interface (V2.1)) 9. Interface (V2.2) Registers 9.2. Serial Mode Register (SMR)	Added the shading parts as below: Correct) [bit4] WUCR: WAKE UP Control Bit WUCR is not supported This bit selects a pin used for external interrupts.
