

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

32-Bit Microcontroller TRAVEO™ T1G Family

S6J32XX Series Hardware Manual Platform Part

Document Number: 002-04854 Rev. *H

Cypress Semiconductor
An Infineon Technologies Company

This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. No computing device can be absolutely secure. Therefore, despite security measures implemented in Cypress hardware or software products, Cypress shall have no liability arising out of any security breach, such as unauthorized access to or use of a Cypress product. CYPRESS DOES NOT REPRESENT, WARRANT, OR GUARANTEE THAT CYPRESS PRODUCTS, OR SYSTEMS CREATED USING CYPRESS PRODUCTS, WILL BE FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (collectively, "Security Breach"). Cypress disclaims any liability relating to any Security Breach, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any Security Breach. In addition, the products described in these materials may contain design defects or errors known as errata which may cause the product to deviate from published specifications. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. "High-Risk Device" means any device or system whose failure could cause personal injury, death, or property damage. Examples of High-Risk Devices are weapons, nuclear installations, surgical implants, and other medical devices. "Critical Component" means any component of a High-Risk Device whose failure to perform can be reasonably expected to cause, directly or indirectly, the failure of the High-Risk Device, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any use of a Cypress product as a Critical Component in a High-Risk Device. You shall indemnify and hold Cypress, its directors, officers, employees, agents, affiliates, distributors, and assigns harmless from and against all claims, costs, damages, and expenses, arising out of any claim, including claims for product liability, personal injury or death, or property damage arising from any use of a Cypress product as a Critical Component in a High-Risk Device. Cypress products are not intended or authorized for use as a Critical Component in any High-Risk Device except to the limited extent that (i) Cypress's published data sheet for the product explicitly states Cypress has qualified the product for use in a specific High-Risk Device, or (ii) Cypress has given you advance written authorization to use the product as a Critical Component in the specific High-Risk Device and you have signed a separate indemnification agreement.

Cypress, the Cypress logo, Spansion, the Spansion logo, and combinations thereof, WICED, PSoC, CapSense, EZ-USB, F-RAM, and Traveo are trademarks or registered trademarks of Cypress in the United States and other countries. For a more complete list of Cypress trademarks, visit cypress.com. Other names and brands may be claimed as property of their respective owners.

Preface

Thank you for your continued use of Cypress semiconductor products.
Read this manual and "Data Sheet" thoroughly before using products in this family.

Purpose of this manual and intended readers

This manual explains the functions and operations of this family and describes how it is used. The manual is intended for engineers engaged in the actual development of products using this family.

** This manual explains the configuration and operation of the peripheral functions, but does not cover the specifics of each device in the family.*

Users should refer to the respective data sheets of devices for device-specific details.

Table of Contents

CHAPTER 1: Platform Overview	12
1. Overview	13
2. Product Configuration	18
3. Configuration	19
4. Abbreviations	20
5. Memory Map	23
6. I/O Map	25
7. Legend	30
8. Caution	31
CHAPTER 2: CPU	33
1. Overview	34
2. Notes	35
CHAPTER 3: Operation Mode	40
1. Overview	41
2. Configuration	42
3. Explanation of Operation	43
4. Register	44
CHAPTER 4: Reset	47
1. Overview	48
2. Configuration	49
3. Operational Description	52
4. Registers	90
CHAPTER 5: Clock System	119
1. Overview	120
2. Configuration and Block Diagram	122
3. Operations	132
4. Setting Procedure Example	143
5. Registers	147
6. Usage Precautions	181
CHAPTER 6: Low Power Consumption	182
1. Overview	183
2. Configuration	184
3. Explanation of Operation	185
4. Operation Procedure	210
5. Registers	218
6. Other	591
CHAPTER 7: Low-voltage Detection	594
1. Overview	595

2.	Configuration and Block Diagrams.....	597
3.	Explanation of Operation	599
4.	Setting Procedure Examples	601
5.	Operation Examples	603
6.	Precautions for Using This Device	606
CHAPTER 8: Clock Supervisor		608
1.	Overview	609
2.	Configuration	610
3.	Explanation of Operation	614
4.	Setting Procedure Example	616
5.	Registers.....	618
6.	Precautions for Using This Device	646
CHAPTER 9: Source Clock Timer		648
1.	Overview	649
2.	Configuration	650
3.	Explanation of Operation	652
4.	Setting Procedure Example	653
5.	Registers.....	654
6.	Precautions for Using this Device	697
CHAPTER 10: Real Time Clock.....		698
1.	Overview	699
2.	Configuration and Block Diagram	700
3.	Operation of the Real Time Clock.....	703
4.	Registers.....	709
5.	Usage Precaution	743
CHAPTER 11: CR Calibration.....		746
1.	Overview	747
2.	Configuration	748
3.	Explanation of Operation	749
4.	Registers.....	751
CHAPTER 12: Backup RAM Interface.....		758
1.	Overview	759
2.	Configuration	761
3.	Explanation of Operation	764
4.	Setting Procedure	774
5.	Registers.....	778
6.	Precautions for Using Device	808
CHAPTER 13: External Interrupt.....		810
1.	Overview	811
2.	Configuration	812
3.	Explanation of Operation	813
4.	Setting Procedure Example	815
5.	Registers.....	816
CHAPTER 14: Hardware Watchdog Timer		834
1.	Overview	835
2.	Configuration and Block Diagram	836
3.	Explanation of Operation	837
4.	Setting Procedure Example	854

5. Operation Examples	856
6. Register List	860
7. Precautions for Using This Device	885
CHAPTER 15: Software Watchdog Timer	888
1. Overview	889
2. Configuration and Block Diagram	890
3. Explanation of Operation	891
4. Setting Procedure Example	909
5. Operation Examples	910
6. Register List	913
7. Precautions for Using This Device	938
CHAPTER 16: TCRAM Interface	940
1. Overview	941
2. Configuration	942
3. Explanation of Operation	944
4. Setting Procedure Examples	949
5. Registers	953
CHAPTER 17: TCFLASH	984
1. Overview	985
2. Configuration	987
3. Explanation of Operation	993
4. Setting Procedure Examples	1006
5. Registers	1018
6. Others	1044
7. Support for Dual Port Flash Macro	1046
CHAPTER 18: WorkFLASH	1048
1. Overview	1049
2. Configuration	1050
3. Explanation of Operation	1054
4. Setting Procedure	1063
5. Registers	1070
6. Other	1103
7. Secure Hardware Extension (SHE) Support	1104
8. Dual Port FLASH Macro Support	1106
CHAPTER 19: BootROM Hardware Interface	1108
1. Overview	1109
2. Configuration	1110
3. Explanation of Operation	1111
4. Setting Procedure Example	1112
5. Registers	1113
6. Others	1126
CHAPTER 20: BootROM Software Interface	1128
1. Overview	1129
2. BootROM Markers	1130
3. BootROM Operation	1153
4. Notes	1162
CHAPTER 21: Exclusive Access Memory (EAM)	1164
1. Overview	1165

2. Configuration	1166
3. Explanation of Operation	1167
4. Operation Examples	1174
5. Memory Area	1181
CHAPTER 22: Interrupt Controller	1182
1. Overview	1183
2. Configuration	1184
3. Explanation of Operation	1185
4. Setting Procedure Examples	1198
5. Registers	1199
6. Others	1251
CHAPTER 23: Time Protection	1252
1. Overview	1253
2. Configuration	1254
3. Explanation of Operation	1255
4. Setting Procedure Examples	1257
5. Registers	1259
6. Others	1273
CHAPTER 24: Security	1274
1. Overview	1275
2. Security Scope and Access Restriction by the Security	1276
3. Using and Configuring the Security	1279
4. Registers	1292
CHAPTER 25: Memory Protection Unit for AXI of SHE	1328
1. Overview	1329
2. Configuration and Block Diagram	1330
3. Operation of the MPU AXI	1331
4. Registers	1337
5. Notes on Using MPU AXI	1356
CHAPTER 26: Secure Hardware Extension (SHE)	1358
1. Overview	1359
2. Block Diagram of the SHE Module	1360
3. Secure Hardware Extension Registers	1361
4. Operation of the Secure Hardware Extension	1422
5. Notes on Using SHE	1444
6. Enhanced Secure Hardware Extension	1450
7. References	1455
CHAPTER 27: DMA Controller	1456
1. Overview	1457
2. Configuration	1458
3. Operational Description	1460
4. Registers	1481
5. Additional Information	1512
CHAPTER 28: DMA COMPLEX SUBSYSTEM	1514
1. Overview	1515
2. Configuration and Block Diagram	1516
3. Operation of the DMA COMPLEX SUBSYSTEM	1518
4. Registers	1524

5. Overview in DMA COMPLEX SUBSYSTEM.....	1537
6. Configuration and Block Diagram in DMA COMPLEX SUBSYSTEM	1538
7. Operation of the 32-Bit Reload Timer in DMA COMPLEX SUBSYSTEM	1539
8. Registers in DMA COMPLEX SUBSYSTEM	1547
CHAPTER 29: MPU16 AHB	1556
1. Outline of the MPU16 AHB	1557
2. Configuration and Diagram	1558
3. MPU16 AHB Registers	1559
4. Operation of the MPU16 AHB	1574
CHAPTER 30: CAN FD Controller(MCAN3.0.1)	1578
1. Overview	1579
2. Configuration	1580
3. Explanation of Operations.....	1582
4. Setup Procedure Examples	1615
5. Registers.....	1638
6. Message RAM	1731
CHAPTER 31: CAN FD Controller(MCAN3.2)	1745
1. Overview	1746
2. Configuration	1747
3. Explanation of Operations.....	1750
4. Setup Procedure Examples	1781
5. Registers.....	1800
6. Message RAM	1896
CHAPTER 32: External Time Stamp Counter For CAN FD	1911
1. Overview	1912
2. Configuration	1913
3. Operations	1914
4. Example of the Operation	1919
5. Register	1920
CHAPTER 33: CAN FD Message RAM ECC Function	1927
1. Overview	1928
2. Configuration	1929
3. Interrupts.....	1931
4. Explanation of Operation	1932
5. Setup Procedure Examples	1934
6. Registers.....	1935
7. Precautions.....	1947
CHAPTER 34: CAN Prescaler.....	1949
1. Overview	1950
2. Configuration	1950
3. Explanation of Operation	1951
4. Setting Procedure	1952
5. Registers.....	1954
6. Restriction.....	1958
CHAPTER 35: Overview of Multi-function Serial Interface	1959
1. Overview of the UART (Asynchronous Serial Interface)	1960
2. Overview of the CSIO (Clock Synchronous Serial Interface)	1962
3. Overview of the LIN Interface (v2.1) (LIN Communication Control Interface (v2.1))	1963

4.	Overview of the I ² C Interface (I ² C Communication Control Interface).....	1967
5.	Block Diagram.....	1968
6.	Registers of the Multi-Function Serial Interface	1971
CHAPTER 36: UART (Asynchronous Serial Interface).....		1985
1.	Overview of the UART (Asynchronous Serial Interface)	1986
2.	Interrupts from the UART.....	1988
3.	UART Operation	1999
4.	Serial Timer Operation.....	2007
5.	Test Mode	2016
6.	Dedicated Baud Rate Generator.....	2017
7.	Block Transfer.....	2023
8.	Setup Procedure and Program Flow for Operation Mode 0 (Asynchronous Normal Mode).....	2028
9.	Setup Procedure and Program Flow for Operation Mode 1 (Asynchronous Multi-processor Mode).....	2031
10.	Registers of UART (Asynchronous Serial Interface)	2035
CHAPTER 37: CSIO (Clock Synchronous Serial Interface)		2089
1.	Overview of the CSIO (Clock Synchronous Serial Interface)	2090
2.	Interrupts of the CSIO (Clock Synchronous Serial Interface)	2091
3.	Operation of the CSIO (Clock Synchronous Serial Interface)	2104
4.	Serial Timer Operation.....	2138
5.	Operation of Serial Chip Select.....	2149
6.	Test Mode	2161
7.	Dedicated Baud Rate Generator.....	2162
8.	Block Transfer.....	2169
9.	Registers of the CSIO (Clock Synchronous Serial Interface)	2174
CHAPTER 38: I²C Interface (I²C Communication Control Interface).....		2247
1.	Overview of the I ² C Interface (I ² C Communication Control Interface).....	2248
2.	I ² C Interface Interrupts.....	2249
3.	I ² C Interface Operation	2253
4.	Serial Timer Operation.....	2305
5.	Dedicated Baud Rate Generator.....	2308
6.	Block Transfer.....	2310
7.	I ² C Communication Operation Flowchart Examples	2315
8.	I ² C Interface Registers.....	2323
CHAPTER 39: LIN Interface (V2.1) (LIN Communication Control Interface (V2.1)).....		2395
1.	LIN Interface (V2.1) (LIN Communication Control Interface (V2.1)).....	2396
2.	LIN Interface (v2.1) Interrupts	2400
3.	Serial Timer Operation.....	2427
4.	Test Mode	2432
5.	Dedicated Baud Rate Generator.....	2439
6.	Block Transfer.....	2445
7.	LIN Interface (V2.1) Operation.....	2450
8.	Setup Procedure and Program Flow for Operation Mode 3 (LIN Communication Mode)	2487
9.	Interface (V2.1) Registers	2496
CHAPTER 40: Base Timer		2583
1.	Overview of the Base Timer.....	2584
2.	Block Diagrams of the Base Timer.....	2587
3.	Operations of the Base Timer	2591

4.	32-Bit Mode Operation.....	2593
5.	Interrupts from the Base Timer	2595
6.	Start of DMA Controller (DMAC)	2596
7.	Registers of the Base Timer	2597
8.	Notes on Using the Base Timer	2602
9.	Base Timer Description by Function Mode	2604
CHAPTER 41: Base Timer I/O Selection Function.....		2683
1.	Overview	2684
2.	Configuration	2685
3.	Explanation of Operation	2686
4.	Registers.....	2690
CHAPTER 42: 32-bit Free-run Timer.....		2697
1.	Overview of the 32-Bit Free-Run Timer	2698
2.	Configuration and Block Diagram	2699
3.	Explanation of the 32-Bit Free-Run Timer Operation	2700
4.	Registers of the 32-Bit Free-Run Timer	2710
5.	Precautions for Using This Device	2731
CHAPTER 43: 32-bit Input Capture.....		2733
1.	Overview of the 32-Bit Input Capture	2734
2.	Configuration and Block Diagram	2735
3.	Explanation of 32-Bit Input Capture Operation	2736
4.	Registers of the 32-Bit Input Capture	2739
5.	Precautions for Using This Device	2751
CHAPTER 44: 32-bit Output Compare.....		2753
1.	Overview	2754
2.	Configuration	2755
3.	Explanation of Operation	2756
4.	Setting Procedure Example	2773
5.	Registers.....	2774
6.	Precautions for Using This Device	2796
CHAPTER 45: 32-bit Reload Timer		2797
1.	Overview	2798
2.	Configuration and Block Diagram	2799
3.	Operation of the 32-Bit Reload Timer	2800
4.	Registers.....	2807
CHAPTER 46: Reload Timer Simultaneous Soft Start		2815
1.	Overview	2816
2.	Configuration	2817
3.	Explanation of Operation	2818
4.	Registers.....	2819
CHAPTER 47: QPRC (Quadrature Position/Revolution Counter)		2823
1.	Overview	2824
2.	Configuration	2826
3.	Operations	2827
4.	Registers.....	2840
CHAPTER 48: External Interrupt Capture		2861
1.	Overview	2862
2.	Configuration	2863

3. Explanation of Operation	2864
4. Setting Procedure Examples	2867
5. Registers.....	2870
CHAPTER 49: CRC (Cyclic Redundancy Check).....	2877
1. Overview	2878
2. Configuration and Diagram	2879
3. Operations	2880
4. Registers.....	2887
CHAPTER 50: I/O Port	2893
1. Overview	2894
2. Configuration and Block Diagrams.....	2895
3. Setting Procedure Examples	2897
4. Register List.....	2904
5. Precautions for Using This Device	2932

8. Caution

OVERVIEW-TXXPT03P01R01L06-E1-XX

1. Overview

This section gives a brief overview of B/B platform.

B/B is the MCU platform which targets instrument cluster, graphics controller, gateway and body controller application area.

■ Computation features

Cortex-R5F single core, 16K I-Cache.

Main Flash I/F which have advanced speculative prefetching algorithm.

■ Software assist features

2 independent DMA controller instances offer parallelism and much of channels.

DMA with chain function using dedicated Reload Timer.

RMW Proxy Bridge unit minimizes register access for clearing the peripheral status bits.

WorkFlash which has EEPROM emulation.

Interrupt controller which supports up to 512 vectors by 512 IRQs.

■ Bus structure

NIC-301 offers high performance, high parallelism and high flexibility.

Dedicated low latency bus for peripheral access.

■ Safety features

Peripheral Protection Unit which controls access rights to each peripherals.

Memory protection units. (Cortex-R5F and DMAC)

High-speed and easy-to-use CRC calculation unit x 4.

Software and hardware watchdog timers

Clock supervisors which monitor clock frequencies of each clock sources.

TPU (Time Protection Unit) which verifies correct interrupt processing.

Error correction schemes in RAMs.

■ Security

Security features which protect Flash data from unauthorized reading and unauthorized debugger connections.

SHE engine (Secure boot, encryption/decryption/hash-generation accelerators, random value generator)

■ Power saving features

Rich sets of PSS (Power Saving State) modes including power gating options.

Peripheral operations are available in the PSS mode.

■ Timers

Rich set of timers. (Base Timer, Reload Timer, Freerun-Timer, Input capture, Output compare, QPRC)

■ Connectivity

CAN FD offers CAN protocol and highly flexible message buffering.

Multi-function serial I/F which has not only UART, CSIO and I2C but also LIN hardware assist feature

DDR-HSSPI to connect high-speed serial Flash memory by low pin count

■ Debug assist features

Following peripheral function can be forcedly stopped by entering debug mode.

- (1) DMA
- (2) Reload Timer in DMA Complex Subsystem
- (3) Real Time Clock
- (4) Hardware Watchdog Timer
- (5) Software Watchdog Timer
- (6) Time Protection Unit
- (7) Source Clock Timer

Dedicated Reload Times can capture DMA control signal events like DREQ.

EICU can capture pin status of peripherals.

1.1. Function Overview

This section gives a brief overview of each function in B/B.

Function	Summary
Technology	55nm with embedded flash memory
CPU	ARM Cortex™-R5F (revision r1p3) ARMv7/Thumb® instruction set Up to 240MHz operation I-Cache 16KB (configurable by option, present or not) D-Cache 16KB (configurable by option, present or not) Double precision FPU (configurable by option, precision[single/double], present or not) MPU 16 region (configurable by option, 12 or 16 region) SECCED ECC for TCM ports (for RAM) VIC port for low latency interrupt Trace by ETM-R5 with 16KB trace buffer (buffer size configurable by option)
Debug	CoreSight™ Debug Dedicated bus master port for debugger access inside internal bus matrix.
Operation modes	User mode Serial flash writer mode Parallel flash writer mode
Clock controls	Internal fast CR oscillator 4MHz Internal slow CR oscillator 100KHz Main clock by quartz or ceramic resonator Sub clock by 32kHz RTC resonator Up to 4 internal PLL Up to 4 internal SSCG
Reset	Power-on reset LVD reset Reset by external pins Software reset
Low power consumption	PSS (Power saving state) with power shutdown PSS (Power saving state) without power shutdown
MPU	16 region MPU inside CPU core (configurable by option, 12 or 16 region) 16 region MPU for each DMA controller
Peripheral Protection Unit	Protection to peripherals from unauthorized access Individual protection setting per peripheral Return bus error response for the unauthorized access
Time protection unit	Maximum up to eight identical timers which can be used for execution time protection, locking time protection, inter-arrival time protection, or deadline protection 24-bit up-counters with programmable normal and overflow mode Global linear prescaler (1 to 64) to scale down the system clock frequency to required frequency, as input to individual timer prescaler Individual timer prescaler to support four different software-programmable frequencies(F_{in} , $F_{in}/2$, $F_{in}/4$, $F_{in}/16$)

Function	Summary
Clock supervisor	Clock frequency supervision for Main clock and Sub clock, PLL0-3 clock, SSCG PLL0-3 clock Reset/NMI generation for out-of bounds clock frequencies Clock stop supervision for CR clock and slow CR clock Reset generation for clock stop detection
Watchdog timers	Two types of Watchdog Timer (Hardware Watchdog Timer, Software Watchdog Timer) Both Watchdog Timer supports: 32-bit counter Window Watchdog functionality. Runs in RUN state or PSS state. Each state has its own configuration. Reset or Non-Maskable Interrupt (NMI) generation in Watchdog error Pre-warning interrupt can be generated in Watchdog error, before a Watchdog reset or NMI is generated. Hardware Watchdog Timer supports selection of two clock sources (CRclock or slow CRclock) Software Watchdog Timer supports selection of four clock sources (Main clock, Sub clock, CR clock or slow CR clock)
Low voltage detection (LVD)	Monitor following power supply : External 5V External 3.3V External 1.2V Internal power supply Internal power supply monitoring RAM retention
Main Flash memory (TCFlash)	Up to 4MB (product specification) SECDED ECC by 8-byte via AXI Read access via TCM port Read and write access via AXI TCM buffer for effective access via TCM port The ECC movement in TCM port is based on ECC setting inside the CPU
Work Flash memory	Up to 112KB (product specification) SECDED ECC by 8-byte Dedicated command sequencer for EEPROM emulation
TCRAM	Up to 128KB with SECDED ECC (product specification) SECDED ECC
System RAM	Up to 384KB (product specification) SECDED ECC
DMA Controller	Up to 2 instances 16 channels per instance Up to 512 DMA client interfaces Block / burst transfer Fixed / dynamic / round-robin priority scheme
Interrupt Controller (IRC)	Up to 512 sources for IRQ with 32 levels of priority Up to 32 sources for NMI with 16 level priority Register interface for software interrupt
External Interrupt	Up to 32 inputs for IRQ Up to 1 input for NMI Sensitive : H level, L level, pos-edge, neg-edge, both-edge
Exclusive Access Memory	48-byte memory for creating semaphore using exclusive load / store instructions.

Function	Summary
Read-Modify-Write proxy bridge	Bus bridge which convert a write access to an atomic read-modify-write operation to set one bit inside a byte.
CRC	4 CRC calculators (CRC32, CCITT)
Reload Timer	32-bit Reload Timer
Base Timer	16-bit PWM Timer 16-bit PPG Timer 16/32-bit Reload Timer 16/32-bit PWC Timer
Freerun Timer	32-bit Freerun Timer
Input Capture	32-bit Input Capture
Output Compare	32-bit Output Compare
QPRC (Quad Precision Counter)	Quad Position & Revolution Counter 16-bit position counter
Multi-function Serial Interface	UART mode CSIO (SPI) mode LIN mode I2C mode
CAN FD	Bosch M_CAN
SHE (Secure Hardware Extension)	Provides cryptographic functions and secure key storage Provides AES-128 encryption and decryption operations Supports the generation of the cipher-based message authentication code Provides a random number generation function It has a unique read-only Identification item (UID) It has a data interface for direct access to microcontroller memory locations
Power supply	5V external power supply (For I/O, analog power supply) 3.3V external power supply (For I/O, analog power supply) 1.2V external power supply (For logic) 1.2V internal LDO (For logic in Always-ON area)

2. Product Configuration

This section gives the product configuration.

Memories

Item	Size
Main Flash	Up to 4MB with SECDED ECC via AXI(product specification)
Work Flash	Up to 112KB with SECDED ECC (product specification)
TCRAM	Up to 128KB with SECDED ECC (product specification)
System RAM	Up to 384KB with SECDED ECC (product specification)
Backup RAM	Up to 8KB + 8KB with SECDED ECC (product specification)
BootROM	Up to 16KB (product specification)

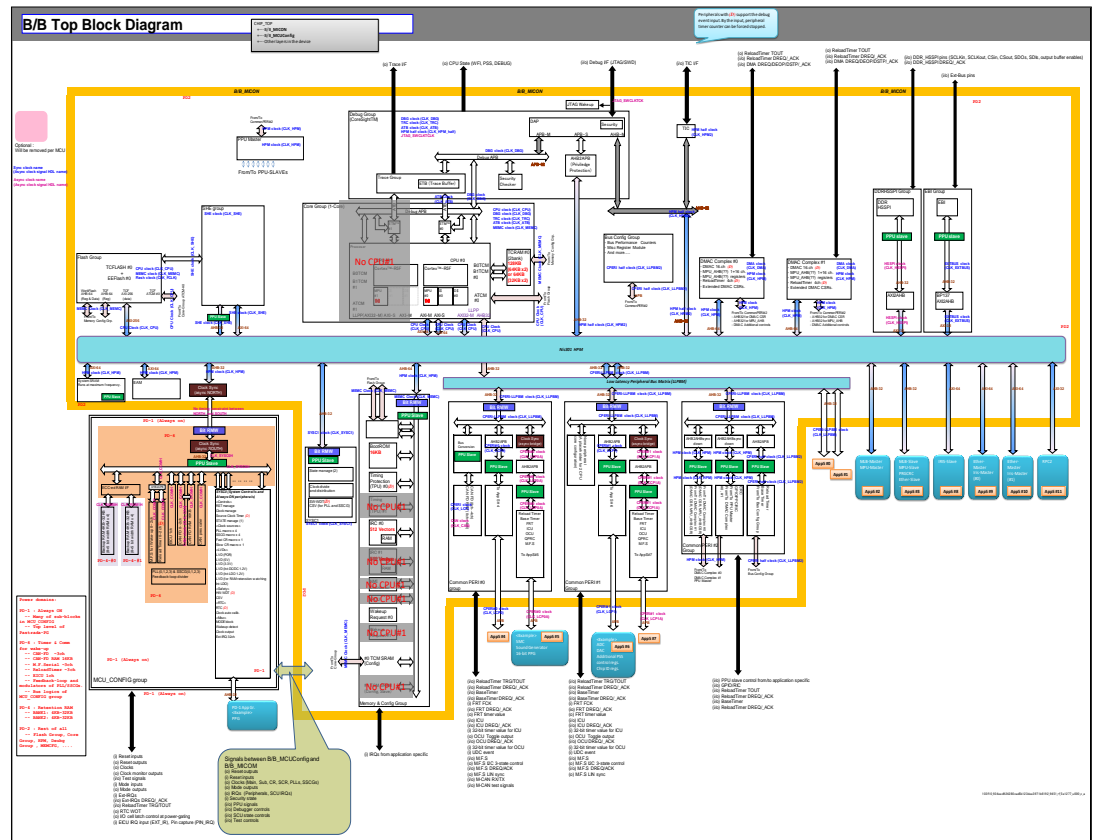

Functions

Item	Specification / Number of Channels
System clock	Up to 240MHz
CR oscillator	Yes (Fast and slow)
Sub oscillator for RTC	Yes
DMA Controller	Up to 2 instances 16 channels per instance Up to 512 DMA client interfaces
Reload Timer	Up to 48 channels + Up to 3 channels in Always-on area
Base Timer	Up to 36 channels
Freerun Timer	Up to 16 channels
Output Compare	Up to 16 instances (32 channels)
Input Capture	Up to 16 instances (32 channels)
QPRC	Up to 16 channels
CRC calculation unit	4 units
Multi-function Serial Interface	Up to 16 channels + Up to 3 channels in Always-on area
CAN-FD	Up to 5 channels + Up to 3 channels in Always-on area
External Interrupt	Up to 32 inputs for IRQ + Up to 1 input for NMI
Exclusive Access Memory (EAM)	Yes
Software Watchdog Timer	Yes
Hardware Watchdog Timer	Yes
Power-on Reset	Yes
Low Voltage Reset	Yes
Debug interface	JTAG, SWJP
GPIO	Up to 16 ports

3. Configuration

This section shows the block diagram of B/B platform.

Figure 3-1 Block Diagram

4. Abbreviations

This section explains abbreviations used in the document.

AHB -- Advanced High-performance Bus

AMBA™ -- Advanced Microcontroller Bus Architecture

APB -- Advanced Peripheral Bus

ATB -- AMBA Trace Bus

ATCM -- TCM-A port

AXI -- Advanced eXtensible Interface

B/B -- Base Block

BBU -- Bit Banding Unit

BDR -- Boot Description Record

B0TCM TCM-B0 -- port

B1TCM TCM-B1 -- port

CAN -- Controller Area Network

CD -- Clock Domain

CPU -- Central Processing Unit

CR -- CR Oscillator

CRC -- Cyclic Redundancy Check

CSR -- Configuration and Status Register

CSV -- Clock Supervisor

DAP -- Debug Access Port

DED -- Double Error Detection

DMA -- Direct Memory Access

DMAC -- DMA Controller

EAM -- Exclusive Access Memory

ECC -- Error Checking Code

ETM -- Embedded Trace Macro

EXT-IRC -- External Interrupt Controller

FIQ -- Fast Interrupt Request

FPU -- Floating Point Unit

FRT -- Free Running Timer

GPIO -- General Purpose Input / Output

HPM -- High Performance Matrix

HW-WDT -- Hardware Watchdog Timer

ICU -- Input Capture Unit

IRC -- Interrupt Controller

IRQ -- Interrupt Request
ISR -- Interrupt Service Routine
JTAG -- Joint Test Action Group
LLPP -- Low Latency Peripheral Port
LVD -- Low Voltage Detector
MCU -- Microcontroller Unit
MFS -- Multi-Function Serial Interface
NF -- Noise Filter
NMI -- Non-Maskable Interrupt
OSC -- Oscillator
OCU -- Output Compare Unit
PD -- Power Domain
PLL -- Phase Locked Loop
PONR -- Power-ON Reset
PPC -- Port Pin Configuration
PPU -- Peripheral Protection Unit
PSS -- Power Saving State
RAM -- Random Access Memory
RIC -- Resource Input Configuration
RLT -- Reload Timer
ROM -- Read Only Memory
RUN -- Run State
SCT -- Source Clock Timer
SDR -- Security Description Record
SEC -- Single Error Correction
SRAM -- Static RAM
SSCG -- Spread Spectrum Clock Generator
SW-WDT -- Software Watchdog Timer
SWD -- Serial Wire Debug
SYSC -- System Controller
TCFLASH -- TCM Flash Memory
TCM -- Tightly Coupled Memory
TCRAM -- TCM SRAM
TPU -- Time Protection Unit
VIC -- Vectored Interrupt Controller
WDR -- Watchdog Description Record
WDT -- Watchdog Timer
WorkFLASH -- Work Flash Memory

(product specification) *1 -- Device-specific information

***1 Notes:**

- *For details, please refer to the Datasheet or Hardware Manual of Device.*
- *Originally, device-specific information should be written in this part.*
However, in order to avoid the state which Platform Hardware Manual has different contents in each devices, the expression of "(product specification)" are used.

5. Memory Map

This section shows memory map of B/B platform.

Memory Map

	Address		size			module	
	START	END	[Mbyte]	[Kbyte]	[Kbyte]	group	part

	FFFE_F000	FFFE_FFFF			4		ERRCFG
4G	FFFF_0000	FFFF_FFFF			64		BootROM

Notes:

- Access to reserved areas is responded with bus error.
- AXI_SLAVE_CORE1~3 are reserved.
- AppS areas are used in each MCU implementations.
- Only the CPU core can access 0000_0000 ~ 01FF_FFFF. Bus masters other than the CPU core cannot access the region.
- Internal area of CR5 complex (0000_0000 ~ 01FF_FFFF) is mapped to AXI_SLAVE_CORE0. All bus masters can access to internal area of CR5 complex via AXI_SLAVE_CORE0.

Default Memory Attribute for the CPU Core

	Address range		Instruction memory type		Data memory type		Execute Never
	START	END	Instruction cache enabled	Instruction cache disabled	Data cache enabled	Data cache disabled	
1G	0000_0000	3FFF_FFFF	Normal, Cacheable, Non-shared	Normal, Cacheable, Non-shared	Normal, WBWA Cacheable, Non-shared	Normal, Non-cacheable, Shared	Instruction execution permitted
	4000_0000	5FFF_FFFF	Normal, Cacheable, Non-shared	Normal, Cacheable, Non-shared	Normal, WT Cacheable, Non-shared	Normal, Non-cacheable, Shared	Instruction execution permitted
2G	6000_0000	7FFF_FFFF	Normal, Cacheable, Non-shared	Normal, Cacheable, Non-shared	Normal, Non-Cacheable, shared	Normal, Non-cacheable, Shared	Instruction execution permitted
	8000_0000	9FFF_FFFF	-	-	Non-shared Device	Non-shared Device	Execute Never
3G	A000_0000	B2FF_FFFF	-	-	Shared Device	Shared Device	Execute Never
	B300_0000	BFFF_FFFF					
4G	C000_0000	EFFE_FFFF	-	-	Strongly Ordered	Strongly Ordered	Execute Never
	F000_0000	FFFF_FFFF	Normal Non-cacheable only if HIVECS is TRUE	Normal Non-cacheable only if HIVECS is TRUE	Strongly Ordered	Strongly Ordered	Instruction execution only permitted if HIVECS is TRUE

When MPU attribute of Cortex-R5F is configured as "Normal", store buffer inside Cortex-R5F can operate and write data can be merged. To avoid influence of this data merger, MPU attribute "Device" or "Strongly Ordered" should be used.

MPU attribute "Device" or "Strongly Ordered" must be used for areas below, to avoid this influence.

- Backup RAM area (BACKUP_RAM) [0E80_0000 ~ 0E87_FFFF]
- Peripheral area (Peri area) [B000_0000 ~ B7FF_FFFF]
- Error Config area (ERRCFG) [FFFE_E000 ~ FFFE_FFFF]
- AppS area [B800_0000 ~ BFFF_FFFF]

MPU attribute "Device" or "Strongly Ordered" is required for accesses to areas below, in particular situation.

- FLASH Memory (when writing commands)

6. I/O Map

This section shows I/O map of B/B platform.

*: Only CPU0 can access to IRC0 in this area. This area is reserved for masters other than CPU0.

Note:

- Access to reserved areas is responded with bus error.

Notes:

- For the base address, please refer to the Hardware Manual of Device.
- For the register names, please refer to the Hardware Manual of Platform.

7. Legend

This section describes the legend used throughout this manual.

7.1. Read/Write Attribute (R/W Attribute)

R/W Attribute	Description
R	Readable
R0	Read value is always 0
R1	Read value is always 1
RX	Read access returns unknown value
W	Writable
W0	Write value must be 0
W1	Write value must be 1
WX	Write invalid (write operation has no influence)
/ (slash mark)	Writable and readable (read value is equal to write value)
, (comma)	Different behavior in read and write (read value is different with write value)

Example

R/W : Readable and writable [read value is equal to write value]

R,W0 : Readable, Write value must be 0 [read value is different with write value]

Notes:

- In case factors that influences read value are following, R/W attribute is described with / (slash mark).
 - Bit set by bit set register operation
 - Bit clear by bit clear register operation

7.2. Protection Attribute

Protection Attribute	Description
RP	Readable in privilege mode
RS	Readable, with protected sequence
RPS	Readable in privilege mode, with protected sequence
WP	Writeable in privilege mode
WS	Writeable, with protected sequence
WPS	Writeable in privilege mode, with protected sequence
- (hyphen)	No protection in both read and write
/ (slash mark)	Both read and write has protection left side of slash mark shows read protection right side of slash mark shows write protection

8. Caution

8.1. How to Use Reset Factor Register

When the reset occurs, it is possible for a user to know which reset factor generated in reading a reset factor register. Then, the user can do initialization or return processing by his own program according to the factor. However, it is assumed that another reset occurs again in this program. Therefore, when the reset factor register clears a factor, pay attention to the following item.

- Clear a reset factor in the end of the reset factor processing.

Even if a different reset occurs on the way of the factor processing, the older reset factor remains just as it is inside the register.

- Clear in turn from the low reset factor of the order of priority.

Even if the different reset occurs while processing, the high reset factor of the order of priority which you should process can be left.

- Clear all reset registers by lump-sum,

It is possible to process early when clearing by the writing in of Word.

These are the reset factor registers which adopt above explanation.

```
SYSC_RSTCAUSEUR, SYSC_EXCSVRSTCAUSEUR,
SYSC_PDRSTCAUSEUR, SYSC_RSTCAUSEBT, SYSC_EXCSVRSTCAUSEBT,
SYSC_PDRSTCAUSEBT, HWDG_RSTCAUSE, SWDG_RSTCAUSE
```

8.2. Caution in Setting and clearing Bit

The AHB bus doesn't have the signal which shows being the period of RMW. Therefore, the feature that is "controlling the operation of hardware in writing 0 or 1", like interrupt request flags which were used at our F2MC/FR family, are changed into "the set bit register" "the clear bit register" in the ARM type CPU including TRAVEO™ T1G. But, there are some peripheral circuits which cannot support yet. In that case, when you access to the other bit which is contained the register that also have the above bit, please set to the value which doesn't have an influence for the bit.

[ex1] SomeRegister has "0 write clear bit" in bit 1 and you want to clear bit 2 in SomeRegister.

```
SomeRegister=(SomeRegister && 0b1111_1011) || 0b0000_0010; // no influence writing 1 to bit1
```

[ex2] SomeRegister has "0 write clear bit" in bit 1 and you want to set bit 2 in SomeRegister

```
SomeRegister=SomeRegister || 0b0000_0110; // no influence writing 1 to bit1
```

We will change the feature that is "controlling the operation of hardware in writing 0 or 1" to "the set bit register" "the clear bit register" step by step. Please use this feature from now on.

These are the reset factor registers which adopt above explanation.

RTC_WTCR, RTC_WTSR, QECR, QICRL, QICRH

And there are the registers which also have "the set bit register " "the clear bit register ".

CU_CUCR1, BURIF_EECSR, BURIF_TTCR, BURIF_TICR, FCR0, TCCS, TECCS, IR(CAN FD)

CHAPTER 2: CPU

This chapter provides an overview of the CPU and related notes.

1. Overview
2. Notes

CPU-TXXPT03P01R01L05-E1-XX

1. Overview

This section explains the features of the CPU.

Features

- The processor is a Cortex-R5™ Single Core (1 CPU) processor.
- The CPU is equipped with 16 KB of instruction cache with ECC support.
- The CPU is equipped with 16 KB of data cache with ECC support.
- The CPU is equipped with a memory protection unit (MPU) with 16 regions.
- The CPU is equipped with a double precision floating-point unit (FPU).
- TCFLASH is connected to the ATCM of the CPU.
- TCRAM is connected to the BTCM of the CPU.
- The ATCM supports 64-bit ECC.
- The BTCM supports 32-bit ECC.
- B0TCM and B1TCM are used in interleaving.
- The CPU is equipped with the 64-bit AXI Master and Slave interfaces.
- The CPU is equipped with the 32-bit AXI Master interface for the low latency peripheral port (LLPP) and with the 32-bit AHB-Lite Master interface.
- The CPU is equipped with a VIC port, which enables direct retrieval of interrupt vector addresses.
- For details, see the Cortex™-R5 Revision:r1p2 Technical Reference Manual (ARM DDI 0460D), an ARM manual. For example, there are such notes.
 - If a write to a peripheral on one interface causes a side effect on a peripheral on a different interface, there is no implicit ordering to ensure the side effect is observed by a subsequent access to the second peripheral, even if both are in Device-type memory.
 - In this situation, you must perform a read from the first peripheral to ensure that the write has completed, followed by a DMB to ensure ordering before performing the second access.
 - On the Cortex-R5 processor, a DMB alone is sufficient to force this ordering, but this is not architectural and cannot be relied on in the general case.

2. Notes

This section provides notes on the CPU.

Low Latency Peripheral Port

The low latency peripheral port is used as the port for accessing peripherals.

The Peripheral Interface Region Register, Normal AXI Peripheral Interface Region, Virtual AXI Peripheral Interface Region, AHB Peripheral Interface Region: En bit must not be changed.

WFE Instruction

The WFE instruction is not supported and must not be used.

VIC Port

Interrupts (IRQs) are processed through the VIC port.

To enable the VIC port, the System Control Register:VE, which is an internal core register, is set to 1 by the BootROM software.

If the VIC port is disabled, interrupts cannot be processed properly, so the VIC port must not be disabled.

Flag Clear

Note that the hardware operation of a write access to a register which has status flags may be later than program operations of software. The delay results from the fact that the write accesses and their signals are operated through multiple buses.

For example, when a software program intends to return from interrupt software routine (ISR) after clearing the interrupt flag, the return instruction may practically be executed before the completion of the write access as for hardware operation. That is, the CPU execution may immediately jump to the ISR again after returning from the ISR because the flag is not cleared.

To avoid such a phenomenon, the execution of Data Memory Barrier (DMB) instruction between the write access and the return instruction is recommended for the program. The return instruction is never executed before the completion of DMB execution.

It should be considered that the method takes a number of execution cycles and that it may cause some influence to application performance. For example, one time of the DMB execution is enough after a number of continuous flag clear operations.

Build Option

The build option of Cortex-R5 is shown below.

Table 2-1 Cortex-R5 Build Option

Feature	Options	Sub-options	Configuration
Number of CPUs	Single-CPU (no redundancy)	-	Single-CPU (no redundancy)
	Redundant CPU	-	
	Twin-CPU (no redundancy)	-	
	Split/Lock	Safety-mode (redundancy) Performance-mode (twin CPU)	
Instruction cache	No I-Cache	-	-
	I-Cache included	No error checking	64-bit ECC error checking
		Parity error checking	
		64-bit ECC error checking	
		4KB (4x1KB ways)	16KB(4x4KB ways)
		8KB (4x2KB ways)	
		16KB (4x4KB ways)	
		32KB (4x8KB ways)	
Data cache	No D-Cache	-	-
	D-Cache included	No error checking	32-bit ECC error checking
		Parity error checking	
		32-bit ECC error checking	
		4KB (4x1KB ways)	16KB(4x4KB ways)
		8KB (4x2KB ways)	
		16KB (4x4KB ways)	
		32KB (4x8KB ways)	
ATCM	No ATCM ports	-	-
	One ATCM port	No error checking	64-bit ECC error checking
		32-bit ECC error checking	
		64-bit ECC error checking	
		4KB, 8KB, 16KB, 32KB, 64KB, 128KB, 256KB, 512KB, 1MB, 2MB, 4MB, or 8MB	8MB

Feature	Options	Sub-options	Configuration
BTM	No BTM ports	-	-
	One BTM port (B0TCM)	No error checking	-
		32-bit ECC error checking	
		64-bit ECC error checking	
	Two BTM ports (B0TCM and B1TCM)	4KB, 8KB, 16KB, 32KB, 64KB, 128KB, 256KB, 512KB, 1MB, 2MB, 4MB, or 8MB	-
		No error checking	32-bit ECC error checking
		32-bit ECC error checking	
		64-bit ECC error checking	
		2x2KB, 2x4KB, 2x8KB, 2x16KB, 2x32KB, 2x64KB, 2x128KB, 2x256KB, 2x512KB, 2x1MB, 2x2MB, or 2x4MB	Product Specification
		Interleaved on 64-bit granularity in memory	Interleaved on 64-bit granularity in memory
		Adjacent in memory	
Instruction endianness	Little-endian	-	Little-endian
	Pin-configured	Little-endian	
		Big-endian	
Floating point (VFP)	No FPU	-	Product Specification
	FPU included	Full implementation	
		Single-precision only	
MPU	No MPU	-	16 MPU regions
	MPU included	12 MPU regions	
		16 MPU regions	
TCM bus parity	No TCM address and control bus parity	-	No TCM address and control bus parity
	TCM address and control bus parity generated	-	
AXI bus ECC/parity on AXI-master, AXI-slave (if included) and ACP (if included)	No AXI bus ECC/parity	-	No AXI bus ECC/parity
	AXI bus ECC/parity generated/ checked	-	
Bus ECC/parity on AXI peripheral port and AHB peripheral port (if included)	No peripheral port bus ECC/parity	-	No peripheral port bus ECC/parity
	Peripheral port bus ECC/parity generated/checked	-	
Breakpoints	2-8 breakpoint register pairs	-	8
Watchpoints	1-8 watchpoint registers	-	8

Feature	Options	Sub-options	Configuration
ATCM at reset	Disabled	-	Base address configured
	Enabled	Base address 0x0	
		Base address configured	
BTCM at reset	Disabled	-	Base address 0x0
	Enabled	Base address configured	
		Base address 0x0	
Peripheral ID RevAnd field	Any 4-bit value	-	0000
AXI slave interface	No AXI-slave	-	AXI-slave included
	AXI-slave included	-	
TCM Hard Error Cache	No TCM Hard Error Cache	-	TCM Hard Error Cache included
	TCM Hard Error Cache included	-	
Non-Maskable FIQ Interrupt	Disabled (FIQ can be masked by software)	-	Enabled
	Enabled	-	
Parity type	Odd parity	-	Odd parity
	Even parity	-	
AXI coherency port (ACP)	No ACP	-	No ACP
	ACP included	-	
AHB peripheral port	AXI peripheral port only	-	-
	AXI and AHB peripheral ports	AHB peripheral port region size: 4KB, 8KB, 16KB, 32KB, 64KB, 128KB, 256KB, 512KB, 1MB, 2MB, 4MB, or 8MB. 16MB, 32MB, 64MB, 128MB, 256MB, 512MB, 1GB, 2GB, 4GB	64MB
		AHB peripheral port base address: any size-aligned address	0xB400_0
AXI peripheral interface region size	4KB, 8KB, 16KB, 32KB, 64KB, 128KB, 256KB, 512KB, 1MB, 2MB, 4MB, or 8MB. 16MB, 32MB, 64MB, 128MB, 256MB, 512MB, 1GB, 2GB, 4GB	-	64MB
AXI peripheral interface base address	Any size-aligned address	-	0xB000_0
Virtual AXI peripheral interface region size	4KB, 8KB, 16KB, 32KB, 64KB, 128KB, 256KB, 512KB, 1MB, 2MB, 4MB, or 8MB. 16MB, 32MB, 64MB, 128MB, 256MB, 512MB, 1GB, 2GB, 4GB	-	-

Feature	Options	Sub-options	Configuration
Virtual AXI peripheral interface base address	Any size-aligned address	-	-

CHAPTER 3: Operation Mode

This chapter explains the operation modes.

1. Overview
2. Configuration
3. Explanation of Operation
4. Register

MODE-TXXPT03P01R01L04-E1-XX

1. Overview

This section provides an overview of the operation mode.

The mode controller determines the device operation mode. This device has the following operation modes.

User Mode

User Mode executes the user program from the Flash.

Board Mode

Board Mode has below sub-mode.

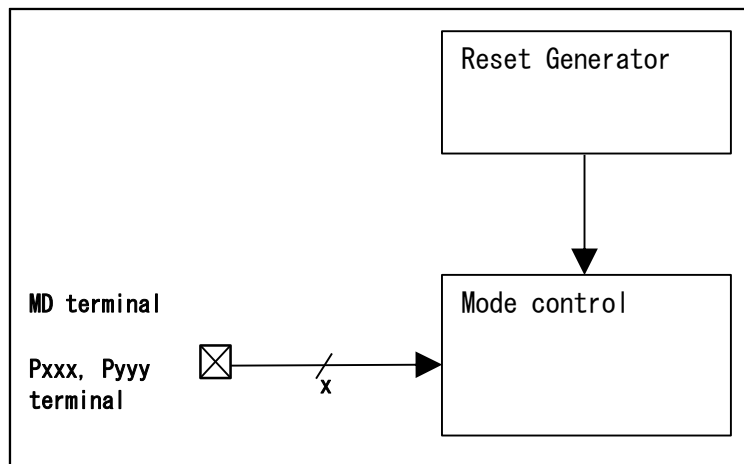

Serial Writer Mode

This mode executes program using a serial writer.

2. Configuration

The following figure is a block diagram of the Mode Controller.

Figure 2-1 Mode Controller

3. Explanation of Operation

This section explains the operation of the operation mode.

Determination of Operation Mode

Operation Mode is determined at the release of the reset. The MD pin input level has to stay unchanged at all time.

4. Register

This section lists the operation mode registers.

Table 4-1 List of Operation Mode Registers

Abbreviated Register Name	Register Name	Reference
MODEC_MODER	Mode Register	4.1

Table 4-2 shows the register address map.

Table 4-2 Operation Mode Register Map

Offset	Register Name/Initial Value
0x0000_0000	MODEC_MODER *00000000_00000000_000*0000_00000000

Notes:

- *: Initial value "0" or "1" according to the setting
- Initial value depends on the MD pin status during the start-up period.

Table 4-3 List of Register Mirror Area

Address of Register Mirror Area	Mirrored Peripheral	Mirror Area Behavior	PPU
0x0000_0900 to 0x0000_09FF 0x0000_0A00 to 0x0000_0AFF 0x0000_0B00 to 0x0000_0BFF 0x0000_0C00 to 0x0000_0CFF 0x0000_0D00 to 0x0000_0DFF 0x0000_0E00 to 0x0000_0EFF 0x0000_0F00 to 0x0000_0FFF	MODEC	Accessing this region results to the access to MODEC register area with following offset. Offset: (addr & 0000_007F)	This area is covered by PPU #55 as well as the mirrored peripheral.

4.1. Mode Register (MODEC_MODER)

Mode register (MODEC_MODER) shows states of the operation mode and the MD pin determined during the device start-up.

Bit	31	30	29	28	27	26	25	24
Field	USER MODE	Reserved						
R/W	R,WX	R0,WX						
ATTRIBUTE								
Protection	-

Attribute								
Initial Value	00000000							

* Initial value depends on the MD pin status during the start-up period.

[bit31] USERMODE: User Mode Bit

This bit indicates whether the operation mode is in Board Mode or User Mode.

Bit	Description
0	Board Mode
1	User Mode

[bit30:13] Reserved: Reserved Bits**[bit12] MD: Mode Bit**

Bit	Description
0	MD pin input value is "0"
1	MD pin input value is "1"

[bit11:0] Reserved: Reserved Bits

CHAPTER 4: Reset

This chapter explains the reset.

1. Overview
2. Configuration
3. Operational Description
4. Registers

RESET-TXXPT03P01R01L11-E1-XX

1. Overview

This product has the following reset factors. Depending on each factor, a reset is issued for initialization within the device. The reset factors are shown below.

Table 1-1 Reset Factor

Reset Category	Reset Factor
Hard reset	Power-on reset (PONR) RAM retention low-voltage detection reset (RVD) INITX (INITX) Illegal mode detection reset (IMR) Internal power supply low-voltage detection reset (LVDL1R) External power supply low-voltage detection reset (LVDH1R) Extended internal power supply low-voltage detection reset (LVDL2R) Extended external power supply low-voltage detection reset (LVDH2R) Clock stop wait timeout reset (CKTOR) RSTX pin input reset (RSTX) Hardware watchdog reset (HWDR) Software watchdog reset (SWDR) Main clock supervisor reset (CSVMOR) Sub clock supervisor reset (CSVSOR) PLL clock supervisor reset (CSVPRn) SSCG clock supervisor reset (CSVSRn) Fast CR clock supervisor reset (CSVFCRR) Slow CR clock supervisor reset (CSVSCRR) Profile error reset (PRFERR) Software trigger hard reset (SHRST) nSRST pin input reset (SRSTX)
Soft reset	Software reset (SRST)
Debugger reset	TRSTX pin input reset (TRSTX) Software debugger reset (SDBGST)
Standby transition reset	PowerDomain reset 2 (PD2R) PowerDomain reset 3 (PD3Rn) PowerDomain reset 4 (PD4Rn) PowerDomain reset 5 (PD5Rn) PowerDomain reset 6 (PD6Rn)

Notes:

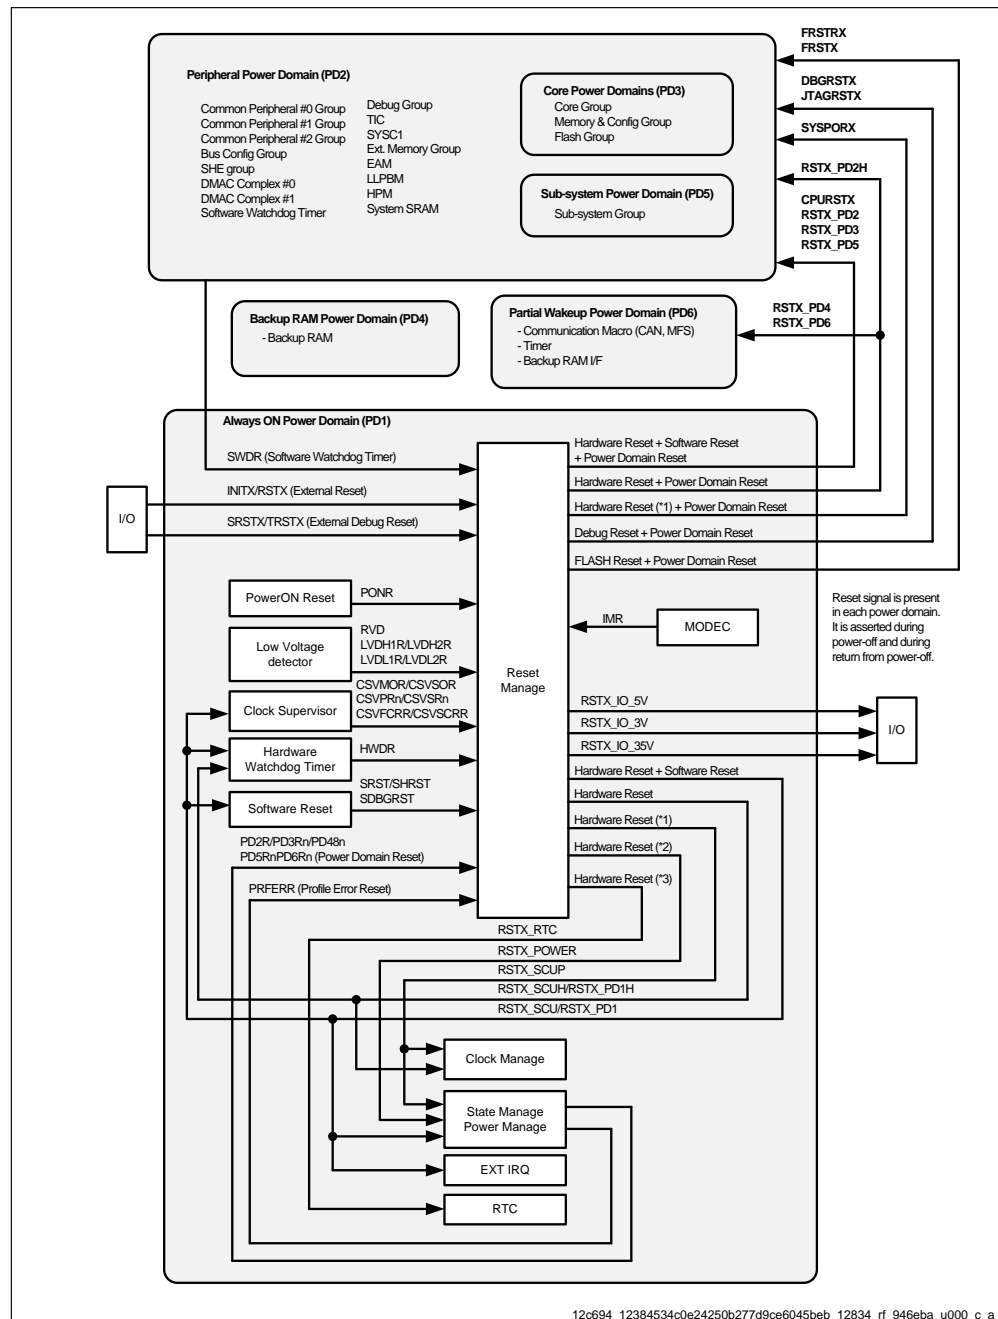

- *nSRST pin input reset cannot be used. Therefore, please ignore the description about nSRST in RESET chapter.*
- *Supported reset factors depend on product. For details, see product specification.*

2. Configuration

This section shows block diagrams of reset system.

Following block diagram show connections between the control logics and Power Domains.

Figure 2-1 Reset System Block Diagram

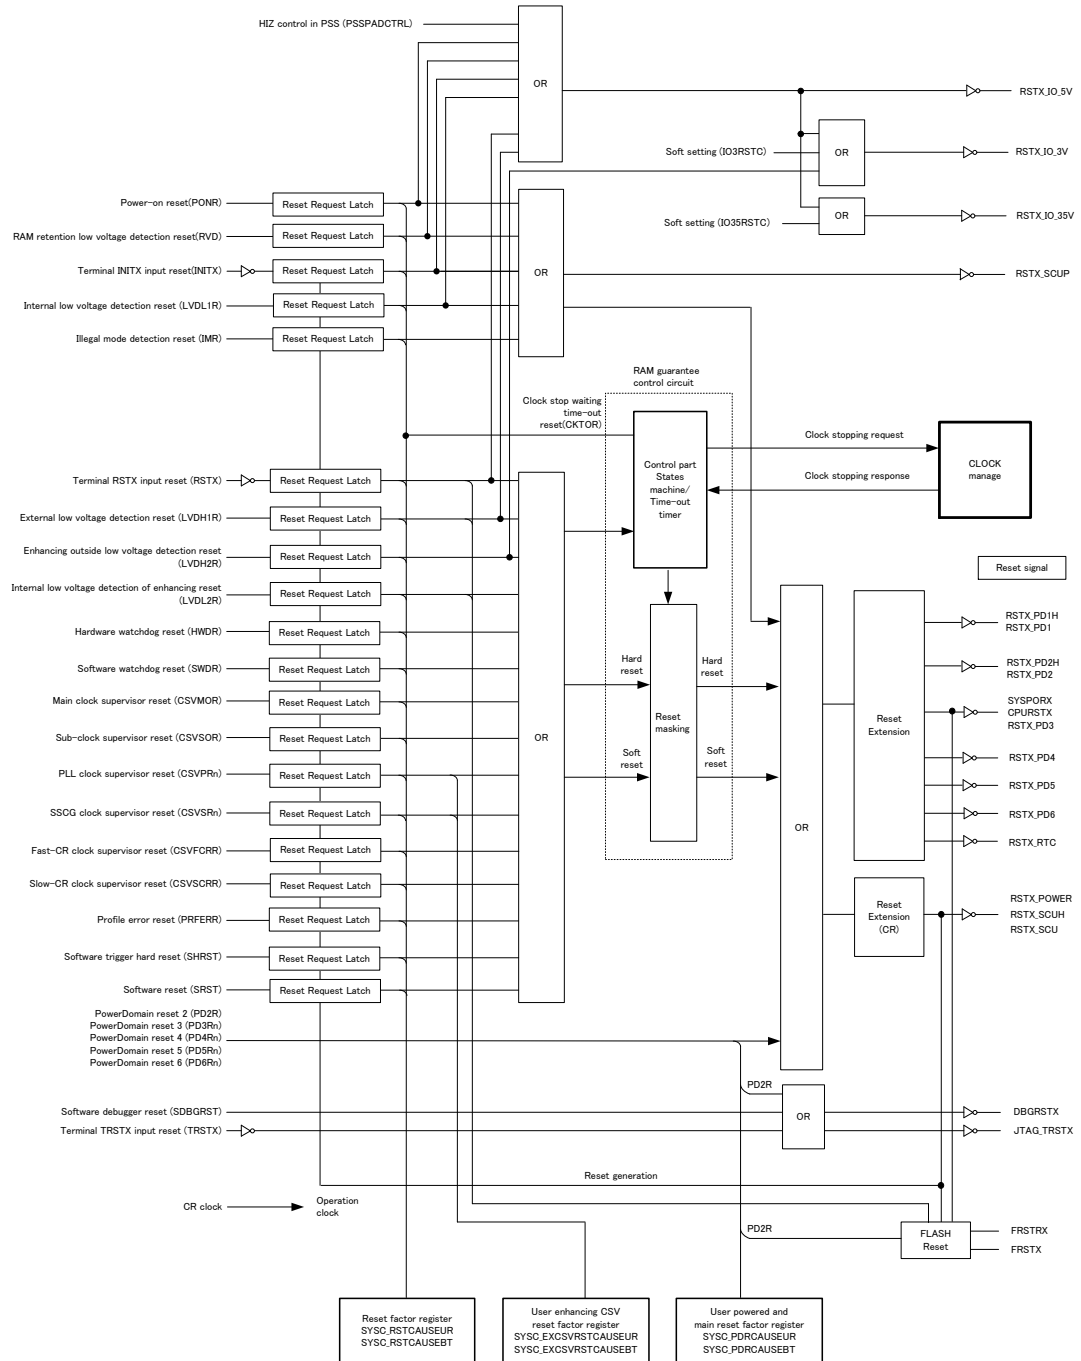

*1: It consists of PONR/INITX/RVD/LVDL1R.

*2: It consists of PONR/INITX/RVD/LVDL1R/HWDR.

*3: It consists of PONR/INITX/RVD/LVDL1R/HWDR/CSVMOR/CSVSOR/CSVSCRR

Following block diagram shows the control logic of the reset.

Figure 2-2 RST Manage Block Diagram

Notes:

- As platform, *RSTX_IO_3V* is selectable the use or the nonuse. The use or the nonuse of *RSTX_IO_3V* is device-specific for each product. Please refer to Datasheet for any device-specific information.

- *As platform, RSTX_IO_35V is selectable the use or the nonuse. The use or the nonuse of RSTX_IO_35V is device-specific for each product. Please refer to Datasheet for any device-specific information.*

3. Operational Description

This section explains operations of the reset.

3.1 Reset Factor

3.2 Internal Reset of Device

3.3 Reset Sequence

3.4 Operations after Reset Release

3.1. Reset Factor

This section explains details of each reset factors.

- 3.1.1 Power-on Reset (PONR)
- 3.1.2 RAM Retention Low-Voltage Detection Reset (RVD)
- 3.1.3 INITX (INITX)
- 3.1.4 Illegal Mode Detection Reset(IMR)
- 3.1.5 Internal Power Supply Low-Voltage Detection Reset (LVDL1R)
- 3.1.6 External Power Supply Low-Voltage Detection Reset (LVDH1R)
- 3.1.7 Extended Internal Power Supply Low-Voltage Reset (LVDL2R)
- 3.1.8 Extended External Power Supply Low-Voltage Reset (LVDH2R)
- 3.1.9 Clock Stop Wait Timeout Reset (CKTOR)
- 3.1.10 RSTX Pin Input Reset (RSTX)
- 3.1.11 Hardware Watchdog Reset (HWDR)
- 3.1.12 Software Watchdog Reset (SWDR)
- 3.1.13 Main Clock Supervisor Reset (CSVMOR)
- 3.1.14 Sub Clock Supervisor Reset (CSVSOR)
- 3.1.15 PLL Clock Supervisor Reset (CSVPRn)
- 3.1.16 SSCG Clock Supervisor Reset (CSVSRn)
- 3.1.17 Fast CR Clock Supervisor Reset (CSVFCRR)
- 3.1.18 Slow CR Clock Supervisor Reset (CSVSCRR)
- 3.1.19 Profile Error Reset (PRFERR)
- 3.1.20 Software Trigger Hard Reset (SHRST)
- 3.1.21 Software Reset (SRST)
- 3.1.22 TRSTX Pin Input Reset (TRSTX)
- 3.1.23 Software Debugger Reset (SDBGST)
- 3.1.24 PowerDomain Reset 2 (PD2R)
- 3.1.25 PowerDomain Reset 3 (PD3Rn)
- 3.1.26 PowerDomain Reset 4 (PD4Rn)
- 3.1.27 PowerDomain Reset 5 (PD5Rn)
- 3.1.28 PowerDomain Reset 6 (PD6Rn)

3.1.1. Power-on Reset

It explains power-on reset.

Table 3-1 Power-on Reset

Occurrence factor	A power-on reset occurs when the internal PONR generator detects power-on of the 5 V system.
Release factor	The internal PONR generator releases the reset after the power-on reset release time elapses.
Initialization target	All registers
Corresponding flag	bit0 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit0 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	Please refer to the "Data Sheet" for occurrence/release of Power-on Reset

Note:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.

3.1.2. RAM Retention Low-Voltage Detection Reset

It explains RAM Retention Low-voltage Detection reset.

Table 3-2 RAM Retention Low-Voltage Detection Reset

Occurrence factor	This occurs when the low-voltage detector (LVD) that is monitoring the 1.2 V power supply status enters the detection state.
Release factor	This is due to the release state of the low-voltage detector (LVD) that is monitoring the 1.2 V power supply status.
Initialization target	All registers except the following Reset factor registers
Corresponding flag	bit1 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit1 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	Please refer to the "Data Sheet" for occurrence/release of RAM retention low-voltage detection reset

Note:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.

3.1.3. INITX

It explains INITX.

Table 3-3 INITX

Occurrence factor	Or,it is issued by inputting "L" level to simultaneous assert of RSTX pin and MD pin.
Release factor	Or,it is released by inputting other than "L" level to simultaneous assert of RSTX pin and MD pin.
Initialization target	All registers except the following: Reset factor registers
Corresponding flag	bit2 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit2 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	For the noise filter removal width, see the Data Sheet.

Note:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.

3.1.4. Illegal Mode Detection Reset

It explains illegal mode detection reset.

Table 3-4 Illegal Mode Detection Reset

Occurrence factor	Illegal state is detected by comparing MD pin value and the device internal state. (MODEC_MODER.USERMODE="0" && MODEC_MODER.MD="1")
Release factor	Reset is released when the state is cleared.
Initialization target	All registers except the following: Reset factor registers
Corresponding flag	bit8 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit8 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	-

Note:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.

3.1.5. Internal Power Supply Low-Voltage Detection Reset

It explains internal power supply low-voltage detection reset.

Table 3-5 Internal Power Supply Low-Voltage Detection Reset

Occurrence factor	This occurs when the low-voltage detector (LVD) which is monitoring the 1.2 V power supply status enters the detection state.
Release factor	This is due to the release state of the low-voltage detector (LVD) which is monitoring the 1.2 V power supply status.
Initialization target	All registers except the following: – Reset factor registers
Corresponding flag	bit30 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit30 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	Please refer to the "Data Sheet" for occurrence/release of internal power supply low-voltage detection reset

Note:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.

3.1.6. External Power Supply Low-Voltage Detection Reset

It explains external power supply low-voltage detection reset.

Table 3-6 External Power Supply Low-Voltage Detection Reset

Occurrence factor	This occurs when the low-voltage detector (LVD) which is monitoring the 5.0 V power supply status enters the detection state.
Release factor	This is due to the release state of the low-voltage detector (LVD) which is monitoring the 5.0 V power supply status.
Initialization target	All registers except the following: – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit6 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit6 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	Please refer to the "Data Sheet" for occurrence/release of external power supply low-voltage detection reset

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.7. Extended Internal Power Supply Low-Voltage Reset

It explains extended internal power supply low-voltage reset.

Table 3-7 Extended Internal Power Supply Low-Voltage Reset

Occurrence factor	This occurs when the low-voltage detector (LVD) which is monitoring the 1.2 V power supply status enters the detection state.
Release factor	This is due to the release state of the low-voltage detector (LVD) which is monitoring the 1.2 V power supply status.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit31 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit31 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	Please refer to the "Data Sheet" for occurrence/release of extended internal power supply low-voltage detection reset

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.8. Extended External Power Supply Low-Voltage Reset

It explains extended external power supply low-voltage reset.

Table 3-8 Extended External Power Supply Low-Voltage Reset

Occurrence factor	This occurs when the low-voltage detector (LVD) which is monitoring the external power supply status enters the detection state.
Release factor	This is due to the release state of the low-voltage detector (LVD) which is monitoring the external power supply status.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit7 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit7 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	Please refer to the "Data Sheet" for occurrence/release of extended external power supply low-voltage detection reset

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.9. Clock Stop Wait Timeout Reset

It explains clock stop wait timeout reset.

Table 3-9 Clock Stop Wait Timeout Reset

Occurrence factor	This occurs when the clock stop wait timer expiration.
Release factor	This is automatically released after a reset is issued
Initialization target	Initialization target changes with each the reset factor.
Corresponding flag	bit3 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit3 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	Timer expiration time: $CR(4MHz) \times 1024 \text{ cycle (typ} = 256\mu s)$

Notes:

- Please refer to *Operations after Reset Release for the functions of clock stop wait timeout reset.*
- Please refer to *User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.*

3.1.10. RSTX Pin Input Reset

It explains RSTX pin input reset.

Table 3-10 RSTX Pin Input Reset

Occurrence factor	This occurs because the "L" level is input to the RSTX pin
Release factor	This is released by input of the "H" level to the RSTX pin
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit4 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit4 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)
Remarks	For the noise filter removal width, see the Data Sheet

Notes:

- Please refer to *User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.*
- *Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.*

3.1.11. Hardware Watchdog Reset

It explains hardware watchdog reset.

Table 3-11 Hardware Watchdog Reset

Occurrence factor	A reset occurs when the CPU does not input a trigger within the window defined for the hardware watchdog.
Release factor	This is automatically released after the reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> Reset factor registers Clock supervisor output enable register Debugging circuit Real Time Clock
Corresponding flag	bit11 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit11 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.12. Software Watchdog Reset

It explains software watchdog reset.

Table 3-12 Software Watchdog Reset

Occurrence factor	A reset occurs when the CPU does not input a trigger within the specified window period for the software watchdog.
Release factor	After reset is issued, it automatically releases it.
Initialization target	All registers except the following: <ul style="list-style-type: none"> Reset factor registers Clock supervisor output enable register Debugging circuit Real Time Clock
Corresponding flag	bit12 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit12 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.13. Main Clock Supervisor Reset

It explains main clock supervisor reset.

Table 3-13 Main Clock Supervisor Reset

Occurrence factor	This occurs when the CSV for monitoring the main clock detects a reset abnormality (reset occurrence condition).
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit24 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit24 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to "Chapter: Clock Supervisor" about monitoring main clock.
- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Real Time Clock listed in the above table will be initialized if the operation clock of Real Time Clock is set to main clock.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.14. Sub Clock Supervisor Reset

It explains sub clock supervisor reset.

Table 3-14 Sub Clock Supervisor Reset

Occurrence factor	This occurs when the CSV for monitoring the sub clock detects a reset abnormality (reset occurrence condition).
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit25 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit25 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to "Chapter: Clock Supervisor" about monitoring sub clock.
- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Real Time Clock listed in the above table will be initialized if the operation clock of Real Time Clock is set to sub clock.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.15. PLL Clock Supervisor Reset

It explains PLL clock supervisor reset.

Table 3-15 PLL Clock Supervisor Reset

Occurrence factor	This occurs when the CSV for monitoring the PLL clock detects a reset abnormality (reset occurrence condition).
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> Reset factor registers Clock supervisor output enable register Debugging circuit Real Time Clock
Corresponding flag	For PLL0: bit26 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit26 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT) For PLL1 to 3: bit3 to 1 of User Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEUR) bit3 to 1 of BootROM Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEBT)

Notes:

- Please refer to "Chapter: Clock Supervisor" about monitoring PLL clock.
- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag for PLL0.
- Please refer to User Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEUR) and BootROM Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEBT) for the corresponding flag for PLL1 to 3.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.16. SSCG Clock Supervisor Reset

It explains SSCG Clock Supervisor reset.

Table 3-16 SSCG Clock Supervisor Reset

Occurrence factor	This occurs when the CSV for monitoring the SSCG clock detects a reset abnormality (reset occurrence condition).
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	For SSCG0: bit27 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit27 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT) For SSCG1 to 3: bit7 to 5 of User Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEUR) bit7 to 5 of BootROM Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEBT)

Notes:

- Please refer to "Chapter: Clock Supervisor" about monitoring PLL clock.
- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag for SSCG0.
- Please refer to User Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEUR) and BootROM Extended CSV Reset Factor Register (SYSC_EXCSVRSTCAUSEBT) for the corresponding flag for SSCG1 to 3.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.17. Fast CR Clock Supervisor Reset

It explains Fast CR Clock Supervisor reset.

Table 3-17 Fast CR Clock Supervisor Reset

Occurrence factor	This occurs when the CSV for monitoring the Fast CR clock detects a reset abnormality (reset occurrence condition).
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit28 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit28 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to "Chapter: Clock Supervisor" about monitoring Fast CR clock.
- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.18. Slow CR Clock Supervisor Reset

It explains Slow CR Clock Supervisor reset.

Table 3-18 Slow CR Clock Supervisor Reset

Occurrence factor	This occurs when the CSV for monitoring the Slow CR clock detects a reset abnormality (reset occurrence condition).
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit29 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit29 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to "Chapter: Clock Supervisor" about monitoring Slow CR clock.
- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.
- Real Time Clock listed in the above table will be initialized if the operation clock of Real Time Clock is set to Slow CR clock.

3.1.19. Profile Error Reset

It explains profile error reset.

Table 3-19 Profile Error Reset

Occurrence factor	The reset occurs when an error is detected in the RUN profile in a transition from PSS to RUN
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit10 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit10 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Please refer to "Chapter: Low-power Consumption" for profile error.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.20. Software Trigger Hard Reset

It explains software trigger hard reset.

Table 3-20 Software Trigger Hard Reset

Occurrence factor	SYSC_RSTCNTR.SWHRST The reset occurs because 0xA5 is written to the control register.
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> – Reset factor registers – Clock supervisor output enable register – Debugging circuit – Real Time Clock
Corresponding flag	bit20 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit20 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.21. Software Reset

It explains software reset.

Table 3-21 Software Reset

Occurrence factor	SYSC_RSTCNTR.SWRST The reset occurs because 0x5A is written to the register.
Release factor	This is automatically released after a reset is issued.
Initialization target	All registers except the following: <ul style="list-style-type: none"> - Reset factor registers - Clock supervisor output enable register - Debugging circuit - Software watchdog setting register - Hardware watchdog setting register - System controller clock setting register - Register for the clock supervisor in the system controller - Clock system setting register - Clock supervisor setting register - Source clock timer setting register - Real Time Clock - Hardware watchdog trigger sequence monitoring logic - Software watchdog trigger sequence monitoring logic
Corresponding flag	bit16 of User Reset Factor Register (SYSC_RSTCAUSEUR) bit16 of BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

Notes:

- Please refer to User Reset Factor Register (SYSC_RSTCAUSEUR) and BootROM Reset Factor Register (SYSC_RSTCAUSEBT) for the corresponding flag.
- In case of generating the software reset, please write to SYSC_RSTCNTR after clearing the hardware watchdog counter in advance. After writing to SYSC_RSTCNTR, please do not clear the watchdog counter until the reset is released.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.22. TRSTX Pin Input Reset

It explains TRSTX Pin Input

Table 3-22 TRSTX Pin Input

Occurrence factor	This occurs because the "L" level is input to the TRSTX pin.
Release factor	This is released by input of the "H" level to the TRSTX pin.
Initialization target	Debugging circuit
Corresponding flag	None

Note:

- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.23. Software Debugger Reset

It explains software debugger reset.

Table 3-23 Software Debugger Reset

Occurrence factor	SYSC_RSTCNTR.DBGR The reset occurs because 0xDA is written to the control register.
Release factor	After reset is issued, it automatically releases it.
Initialization target	Debugging circuit
Corresponding flag	None

Note:

- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.24. PowerDomain Reset 2

It explains PowerDomain reset 2.

Table 3-24 PowerDomain Reset 2

Occurrence factor	This occurs because of a power shutdown.
Release factor	This is released by recovery from the power shutdown.
Initialization target	PowerDomain 2
Corresponding flag	bit0 of User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) bit0 of BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT)

Notes:

- Please refer to "Chapter: Low-power Consumption" for the definition of PowerDomain.
- Please refer to User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) and BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.25. PowerDomain Reset 3

It explains PowerDomain reset 3.

Table 3-25 PowerDomain Reset 3

Occurrence factor	This occurs because of a power shutdown.
Release factor	This is released by recovery from the power shutdown.
Initialization target	PowerDomain 3
Corresponding flag	bit4 of User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) bit4 of BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT)

Notes:

- Please refer to "Chapter: Low-power Consumption" for the definition of PowerDomain.
- Please refer to User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) and BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.26. PowerDomain Reset 4

It explains PowerDomain reset 4.

Table 3-26 PowerDomain Reset 4

Occurrence factor	This occurs because of a power shutdown.
Release factor	This is released by recovery from the power shutdown.
Initialization target	PowerDomain 4
Corresponding flag	bit9-8 of User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) bit9-8 of BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT)

Notes:

- Please refer to "Chapter: Low-power Consumption" for the definition of PowerDomain.
- Please refer to User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) and BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.27. PowerDomain Reset 5

It explains PowerDomain reset 5.

Table 3-27 PowerDomain Reset 5

Occurrence factor	This occurs because of a power shutdown.
Release factor	This is released by recovery from the power shutdown.
Initialization target	PowerDomain 5
Corresponding flag	bit15-12 of User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) bit15-12 of BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT)

Notes:

- Please refer to "Chapter: Low-power Consumption" for the definition of PowerDomain.
- Please refer to User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) and BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.1.28. PowerDomain Reset 6

It explains PowerDomain reset 6.

Table 3-28 PowerDomain Reset 6

Occurrence factor	This occurs because of a power shutdown.
Release factor	This is released by recovery from the power shutdown.
Initialization target	PowerDomain 6
Corresponding flag	bit17-16 of User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) bit17-16 of BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT)

Notes:

- Please refer to "Chapter: Low-power Consumption" for the definition of PowerDomain.
- Please refer to User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR) and BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT) for the corresponding flag.
- Initialization target registers are described outline only. Please refer to the register description of the appropriate chapter about the details.

3.2. Internal Reset of Device

This section explains the internal reset signals of this device.

The reset connected to this device are reset input to CPU, input to peripheral circuits and input to external 1.2V.

- CPU reset
- I/O reset
- External 1.2V power supply reset circuit

3.2.1. CPU Reset

This section explains the CPU reset. There are 4 types of CPU reset signals. The following shows the corresponding reset factor and initialize target.

Table 3-29 CPU Reset

Signal Name	Initialization Target	Reset Category	Reset Factor
SYSPORX	Core Group Debug Group	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset Extended internal power supply low-voltage detection reset INITX Illegal mode detection reset
		Standby transition reset	PowerDomain reset 2
CPURSTX	Core Group Debug Group	Hard reset	All reset factors
		Soft reset	All reset factors
		Standby transition reset	PowerDomain reset 2
DBGRSTX	Debug Group	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset Extended internal power supply low-voltage detection reset INITX Illegal mode detection reset
		Debugger reset	Software debugger reset
		Standby transition reset	PowerDomain reset 2
JTAGRSTX	Debug Group	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset Extended internal power supply low-voltage detection reset INITX Illegal mode detection reset
		Debugger reset	TRSTX pin input reset
		Standby transition reset	PowerDomain reset 2

3.2.2. I/O Reset

This section explains the I/O reset. The types of reset signals for I/O are shown below. The following table shows the corresponding reset factor and initialize target.

Table 3-30 I/O Reset

Signal Name	Initialization Target	Reset Category	Reset Factor
RSTX_IO_5V	I/O cell driven by 5V power supply	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset External power supply low-voltage detection reset RSTX pin input reset INITX I/O Hi-z control at PSS *3
RSTX_IO_3V	I/O cell driven by 3V power supply	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset External power supply low-voltage detection reset RSTX pin input reset INITX Extended external power supply low-voltage detection reset Soft setting *1 I/O Hi-z control at PSS *3
RSTX_IO_35V	I/O cell driven by 3V/5V power supply	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset External power supply low-voltage detection reset RSTX pin input reset INITX Soft setting *2 I/O Hi-z control at PSS *3

The I/O cell connected to the external pin of the device is initialized when the I/O reset is issued. During the initialization, the I/O cell is either outputting "L" or in the high impedance state. Refer to the "Pin State Table" for pin state during the initialization. The I/O cell is asynchronously initialized when a reset factor is received. It stays in this state until an internal reset is issued and the reset factor is released.

Notes:

- *1: It is controlled by IO3RSTC in system special setting register (SYSC0_SPECFGR).
RSTX_IO_3V becomes active by IO3RSTC, when IO3RSTC is initialized by hard reset or soft reset.
- *2: It is controlled by IO35RSTC in system special setting register (SYSC0_SPECFGR).
RSTX_IO_35V becomes active by IO35RSTC, when IO35RSTC is initialized by hard reset or soft reset.
- *3: It is activated by the transition to the PSS in case of PSSPADCTRL="1" in system special setting register (SYSC0_SPECFGR).

3.2.3. Reset of External Power Supply Control

This section explains the reset of the external power supply control.

Table 3-31 Reset of External Power Supply Control

Signal Name	Initialization Target	Reset Category	Reset Factor
EX12VRST	1.2V external power supply control	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset External power supply low-voltage detection reset *1 Extended internal power supply low-voltage detection reset INITX Illegal mode detection reset Hardware watchdog reset
		Standby transition reset	PowerDomain reset 2
EX5VRST	5/3.3V external power supply control	Hard reset	Power-on reset RAM retention low-voltage detection reset Internal power supply low-voltage detection reset External power supply low-voltage detection reset *1 Extended internal power supply low-voltage detection reset INITX Illegal mode detection reset Hardware watchdog reset
		Standby transition reset	PowerDomain reset 2

Note:

- *1: It is activated by EXVRSTCNT=0 in system special setting register (SYSC0_SPECFGR).

There are some cases 1.2V external power supply control to be high.

Table 3-32 Behavior of External Power Supply Control

Condition	Reset trigger0	Reset trigger1	Reset trigger2	1.2V external power supply control
In power on sequence, Reset trigger1 and Reset trigger2 release during Fast-CR stabilization time	1	x	x	Case0
In power on sequence, Reset trigger1, Reset trigger2 release after Fast-CR stabilization time	0	1	x	Case1
	0	0	1	Case2
	0	1	1	Case3
In PSS mode with Fast-CR oscillating, Reset trigger0, Reset trigger1, Reset trigger2 occur	1	x	x	Case0
	0	1	1	Case4
In PSS mode with Fast-CR stopping, Reset trigger0, Reset trigger1, Reset trigger2 occur	1	x	x	Case0
	0	1	x	Case5
	0	0	1	Case6

- Reset trigger0:

Power-on reset, RAM retention low-voltage detection reset, Internal power supply low-voltage detection reset,

Extended internal power supply low-voltage detection reset, INITX, Illegal mode detection reset, Hardware watchdog reset

- Reset trigger1:

External power supply low-voltage detection reset

- Reset trigger2:

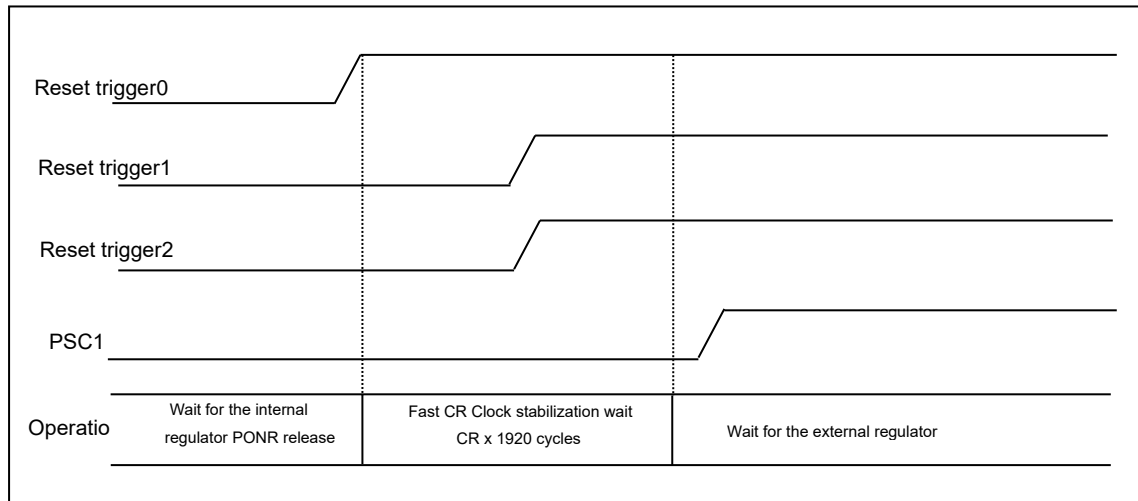

RSTX

1: reset active

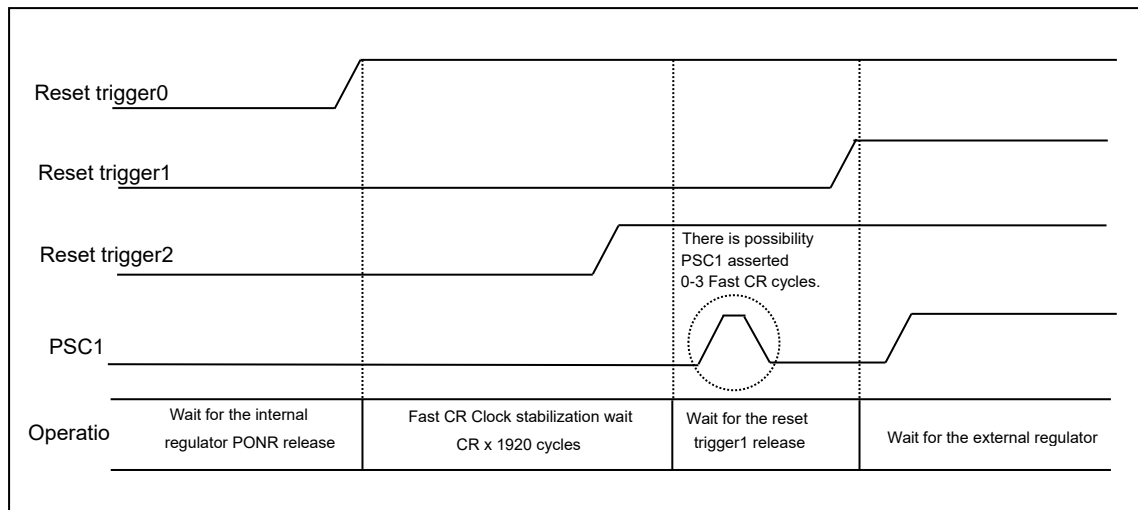

0: reset inactive

x: reset inactive or reset inactive before completion of Fast-CR stabilization wait

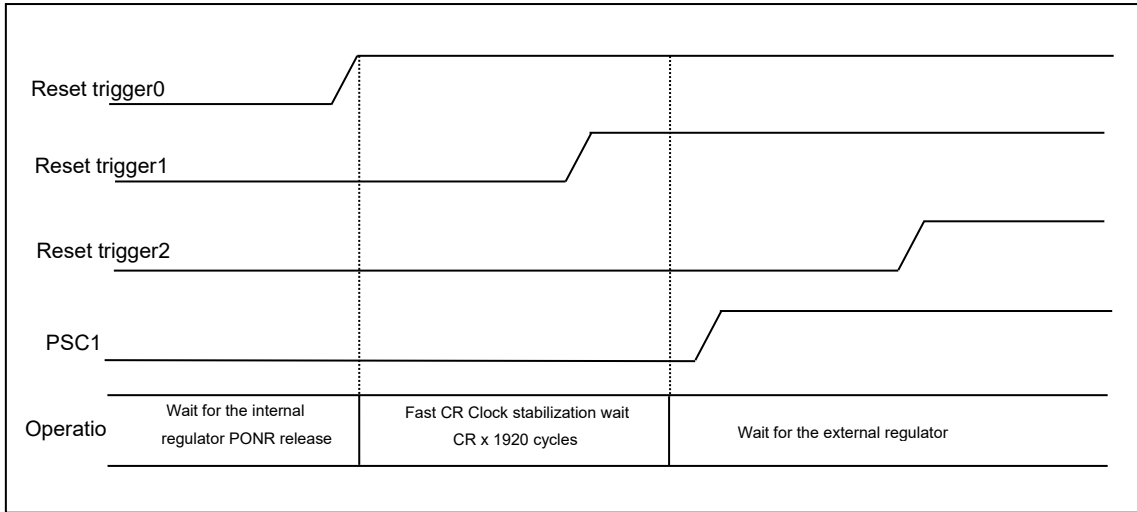

Case0) In power on sequence/PSS, Reset trigger1 and 2 release during Fast-CR stabilization time

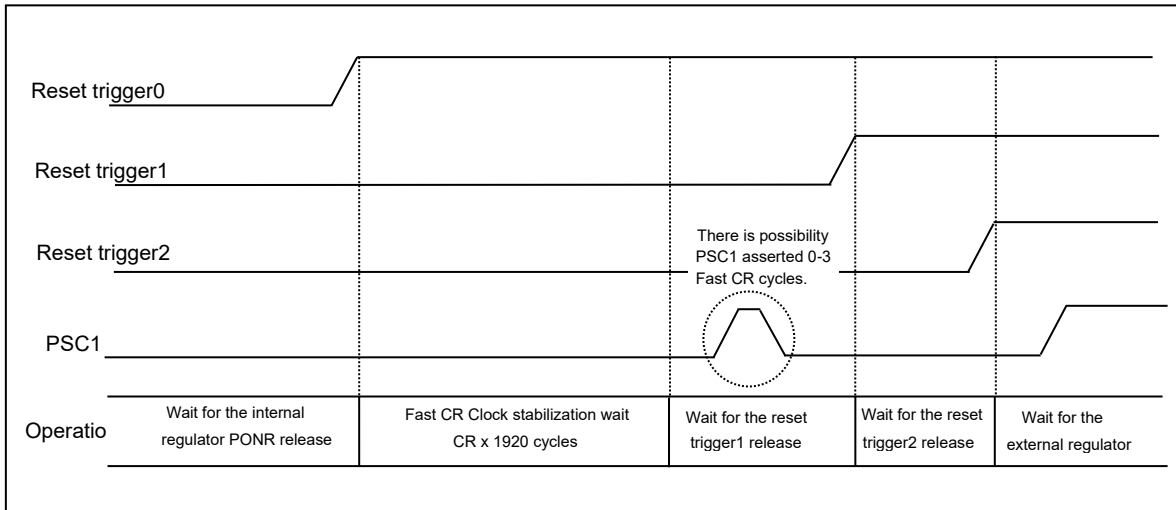

Case1) In power on sequence, Reset trigger1 release after Fast-CR stabilization time

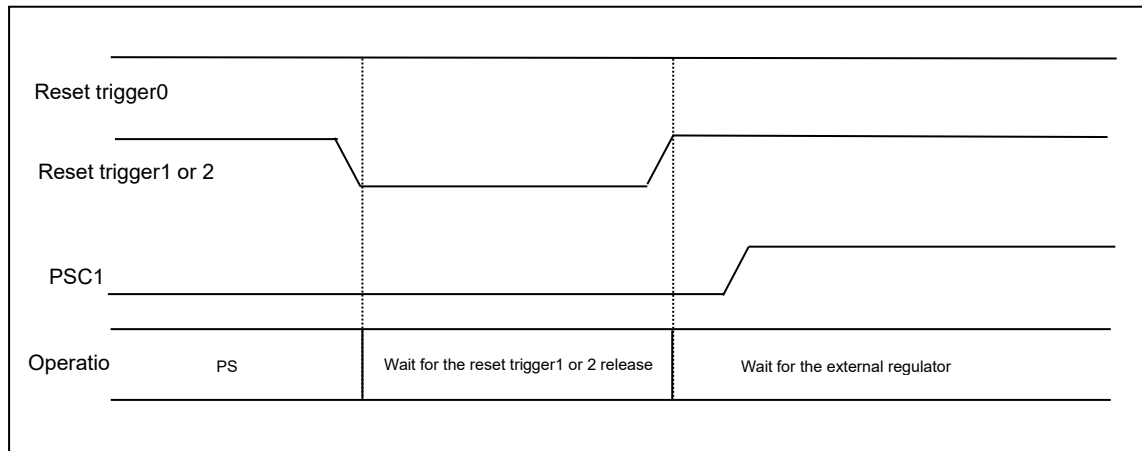

Case2) In power on sequence, Reset trigger2 release after Fast-CR stabilization time

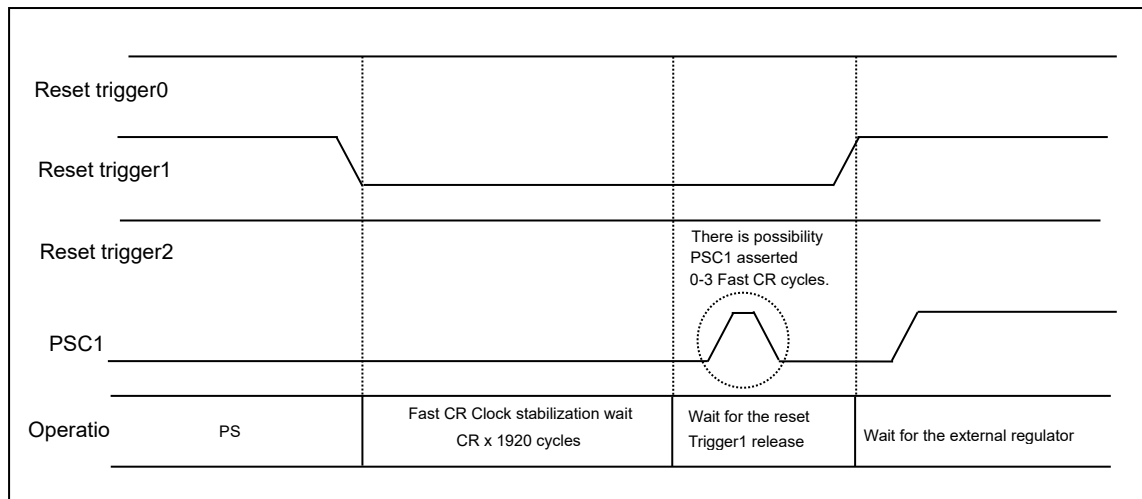

Case3) In power on sequence, Reset trigger1 and Reset trigger2 release after Fast-CR stabilization time

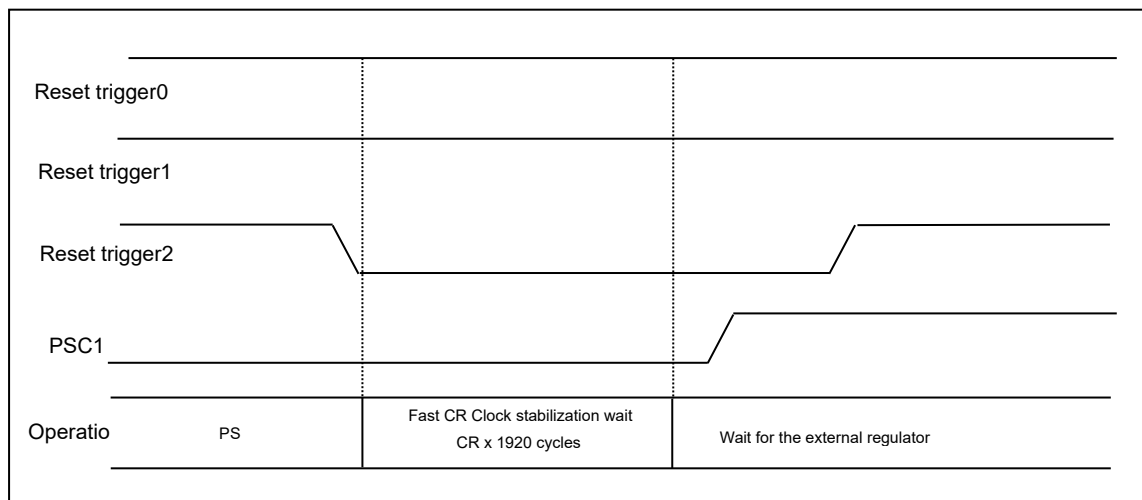

Case4) In PSS mode with Fast-CR oscillating, Reset trigger1 or Reset trigger2 occur

Case5) In PSS mode with Fast-CR stopped, Reset trigger1 occur and release after Fast-CR stabilization time

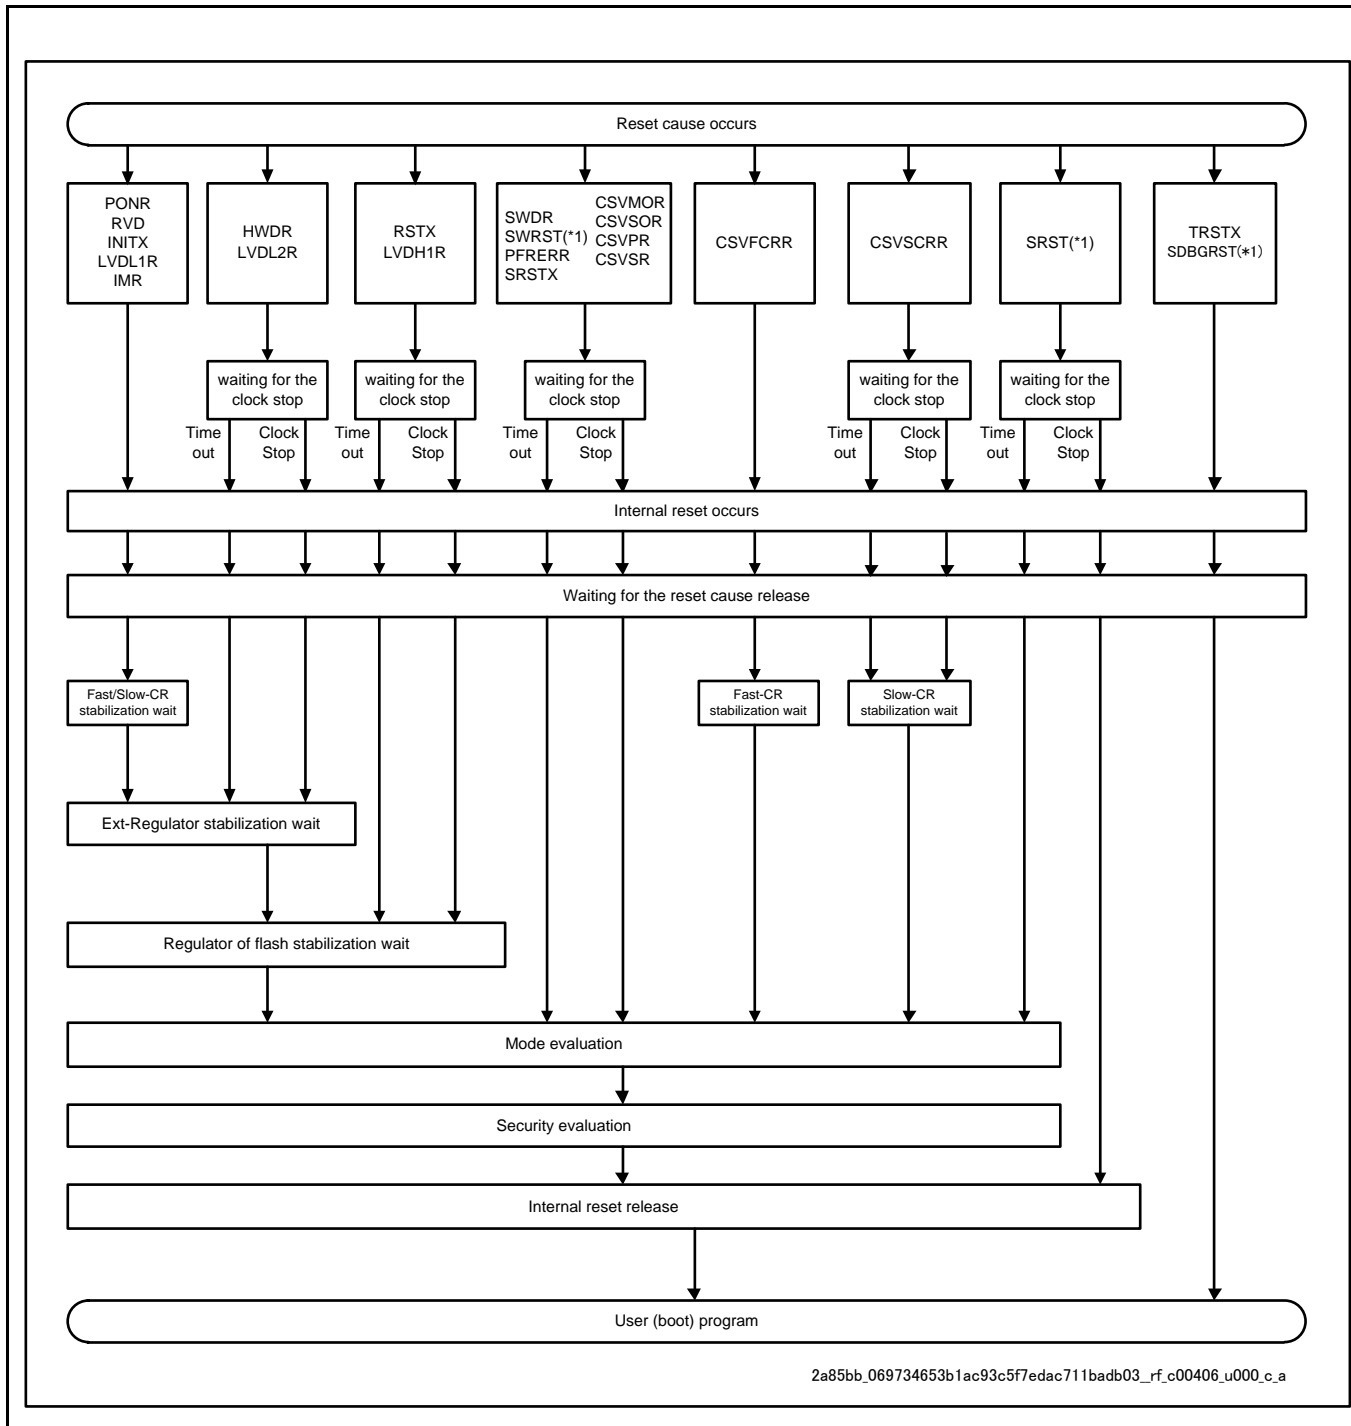

Case6) In PSS mode with Fast-CR stopped, Reset trigger2 occur and release after Fast-CR stabilization time

3.3. Reset Sequence

This section explains the reset sequence of this device. Program and hardware operation will start from initial state by releasing the reset. The sequence from reset to operation start is called reset sequence.

Figure 3-1 Reset Sequence

Note:

- *At Power Saving State (It is *1 in figure), the lying reset factor (hard software trigger reset, software reset, and software debugger reset) doesn't generate CPU.*

Reset Sequence

1. Reset cause occurred
Reset cause is captured and will be held until a reset is issued inside the device.
2. Waiting for the clock stop
Before a reset, clock source is stopped for the resets which need RAM(TCRAM, Backup RAM, System RAM) to be guaranteed. Timeover will occur if the clock does not stop in the specified time.
3. Internal reset occurs
Reset will be issued to internal when reset preparation is done.
4. Waiting for the reset factor release
Wait until the reset cause of the issued reset to be released. Necessary process will be done internally for reset release after the reset cause is released.
5. Fast/Slow-CR stabilization wait
Wait for Fast/Slow-CR clock stabilization.
6. Ext-Regulator stabilization wait
Wait for external power supply (1.2V) to stabilize.
7. Regulator of flash stabilization wait
Wait for Flash macro's power supply to stabilize.
8. Mode evaluation
Operation mode is set and announced to each hardware.
9. Security evaluation
Security is judged and announced to each hardware.
10. Internal reset release
Release of internal reset is done.
11. Reset vector fetch (Running the Boot ROM program)
CPU starts to fetch the reset vectors. CPU executes the program Boot ROM.
12. Running the User program
After Boot ROM program execution, CPU will jump to the user program. CPU starts user program operation.

3.4. Operations after Reset Release

The operation after the reset factor and reset are released is shown below.

Table 3-33 Operations after Reset Release

Reset Category	Reset Factor	Operation after Reset is Released				
		Waiting for Stabilization	Mode Evaluation	Security Evaluation	Operation Clock	RAM Guarantee
Hardware Reset	Power-on reset	Fast CR Slow CR FLASH 1.2V external power supply control Regulator	Yes	Yes	Fast CR	No
	RAM retention low-voltage detection reset Internal power supply low-voltage detection reset INITX Illegal mode detection reset	Fast CR Slow CR FLASH 1.2V external power supply control	Yes	Yes	Fast CR	No
	Fast CR clock supervisor reset	Fast CR	Yes	Yes	Fast CR	No
	Slow CR clock supervisor reset	Slow CR	Yes	Yes	Fast CR	No
	Clock stop wait timeout reset Main clock supervisor reset Sub-clock supervisor reset PLL clock supervisor reset SSCG clock supervisor reset	N/A	Yes	Yes	Fast CR	No
	Hardware watchdog reset Extended internal power supply low-voltage detection reset	FLASH 1.2V external power supply control	Yes	Yes	Fast CR	Yes*1
	RSTX pin input reset External power supply low-voltage detection reset	FLASH	Yes	Yes	Fast CR	Yes*3
	Software watchdog reset External power supply low-voltage detection reset Extended external Power supply low-voltage detection reset Profile error reset Software trigger hard reset	N/A	Yes	Yes	Fast CR	Yes*3
	nSRST pin input reset	N/A	No	No	No change	Yes*3
Software Reset	Software reset	N/A	No	No	No change	Yes*3
Debugger reset	TRSTX pin input reset Software debugger reset	N/A	No	No	No change	Yes*2

Several hard reset factors guarantee the RAM data after the reset but the others do not. The reset factors which do not guarantee the RAM data issue the reset regardless RAM access, so the RAM data are not guaranteed after the reset. The reset factors which guarantee the RAM data issue the reset after the clocks have stopped.

However, in a case that a reset factor which can guarantee the RAM data has not completed within a certain time period, another reset is issued (Clock stop wait timeout reset). In this case, the RAM data after recovery from the reset is not guaranteed.

Notes:

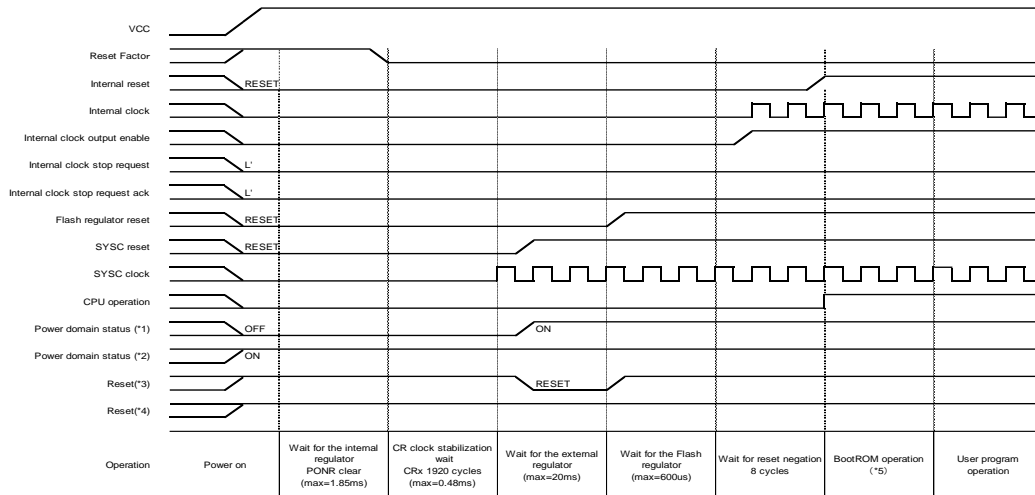

- *1: Contents of the Backup RAM are guaranteed. The other RAM contents are not guaranteed.
- *2: The reset does not impact to RAM contents. But ETB (Embedded Trace Buffer) RAM contents are not guaranteed in case of Software debugger reset.
- *3: Contents of TCRAM, System SRAM and Backup RAM are guaranteed. The other RAM contents are not guaranteed.
- nSRST pin input reset cannot be used. Therefore, please ignore the description about nSRST in RESET chapter.

Note:

- Supported reset factors depend on product. For details, see product specification.

3.4.1. Hard Reset Operation

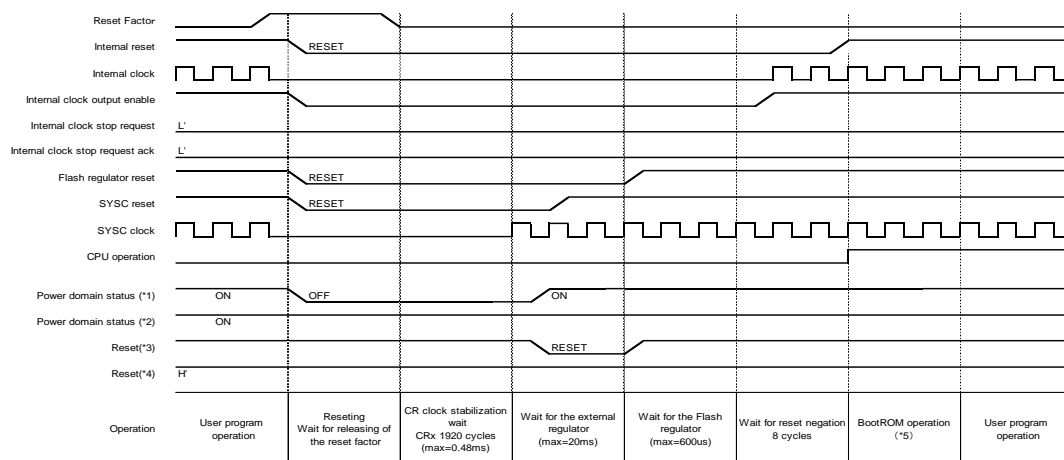

Figure 3-2 Operation at Power-on Reset

- *1: External power supply PowerDomain area status (PD2)
- *2: Internal power supply PowerDomain area status (PD4,PD6)
- *3: External power supply PowerDomain reset
- *4: Internal power supply PowerDomain reset
- *5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Notes:

- As platform, the frequency of Fast CR clock is selectable in the range between 4MHz and 8MHz. However, the actual specification for Fast CR clock is device-specific for each product. Please refer to Datasheet for any device-specific information.
- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific information.

Figure 3-3 Operation at Internal Power Supply Low-voltage Detection Reset or INITX

*1: External power supply PowerDomain area status (PD2)

*2: Internal power supply PowerDomain area status (PD4,PD6)

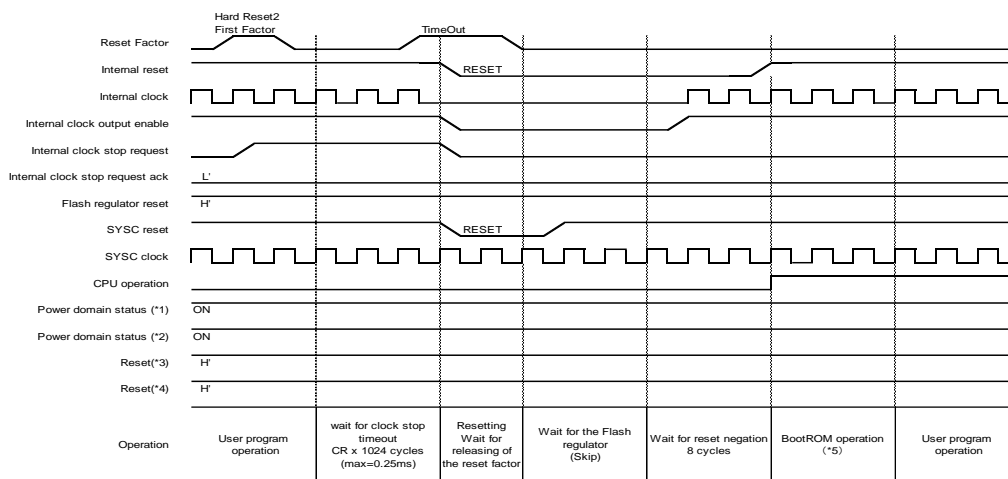

*3: External power supply PowerDomain reset

*4: Internal power supply PowerDomain reset

*5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Notes:

- As platform, the frequency of Fast CR clock is selectable in the range between 4MHz and 8MHz. However, the actual specification for Fast CR clock is device-specific for each product. Please refer to Datasheet for any device-specific information.
- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific information.

Figure 3-4 Operation at Clock Stop Wait Timeout Reset

*1: External power supply PowerDomain area status (PD2)

*2: Internal power supply PowerDomain area status (PD4,PD6)

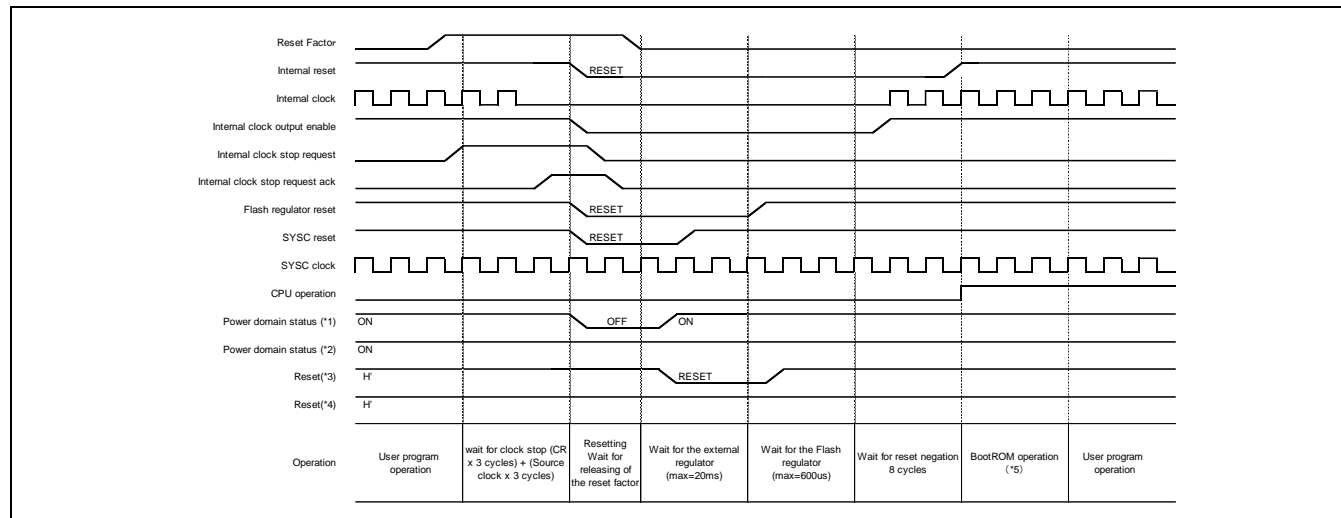

*3: External power supply PowerDomain reset

*4: Internal power supply PowerDomain reset

*5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Notes:

- As platform, the frequency of Fast CR clock is selectable in the range between 4MHz and 8MHz. However, the actual specification for Fast CR clock is device-specific for each product. Please refer to Datasheet for any device-specific information.
- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific information.

Figure 3-5 Operation at Hardware Watchdog Reset

*1: External power supply PowerDomain area status (PD2)

*2: Internal power supply PowerDomain area status (PD4,PD6)

*3: External power supply PowerDomain reset

*4: Internal power supply PowerDomain reset

*5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Note:

- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific information.

Figure 3-6 Extended Internal Power Supply Low-Voltage Reset

*1: External power supply PowerDomain area status (PD2)

*2: Internal power supply PowerDomain area status (PD4,PD6)

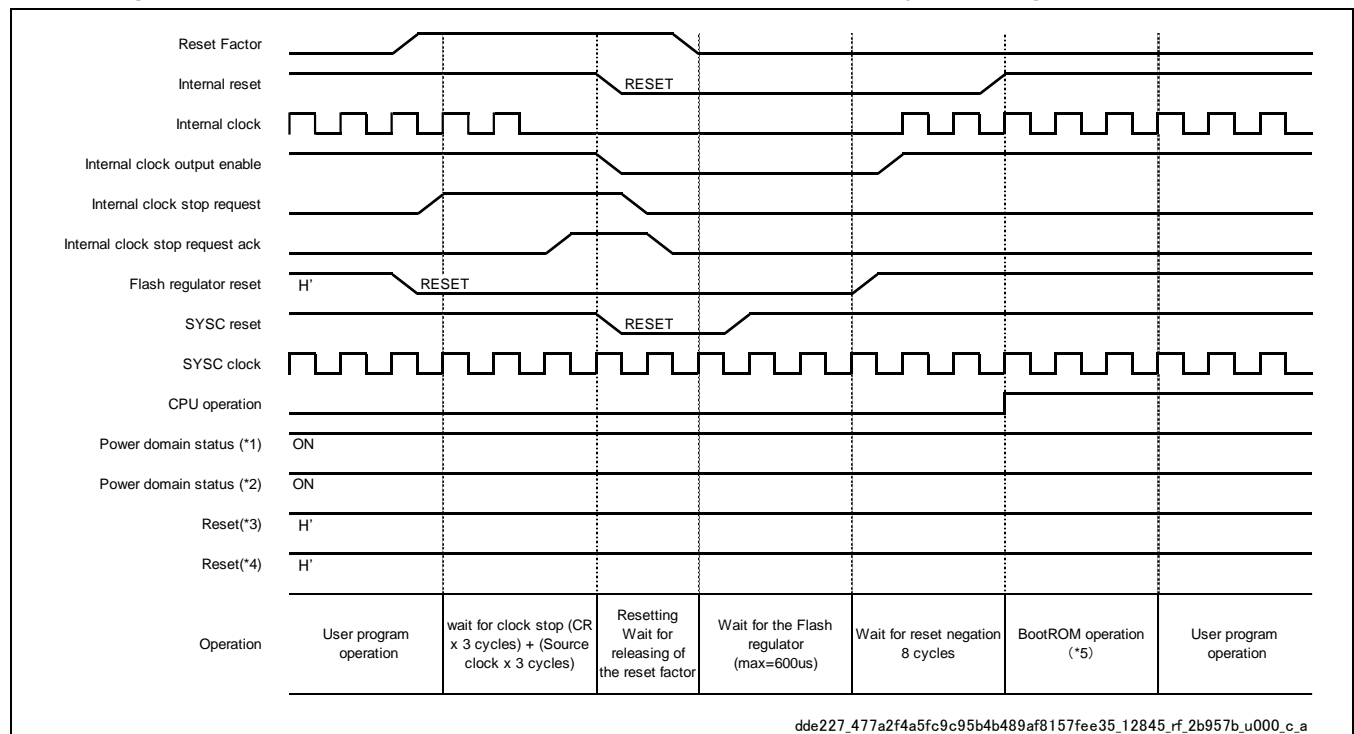

*3: External power supply PowerDomain reset

*4: Internal power supply PowerDomain reset

*5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Note:

- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific information.

Figure 3-7 Operation at RSTX Pin Input Reset or External power supply low-voltage detection reset

*1: External power supply PowerDomain area status (PD2)

*2: Internal power supply PowerDomain area status (PD4,PD6)

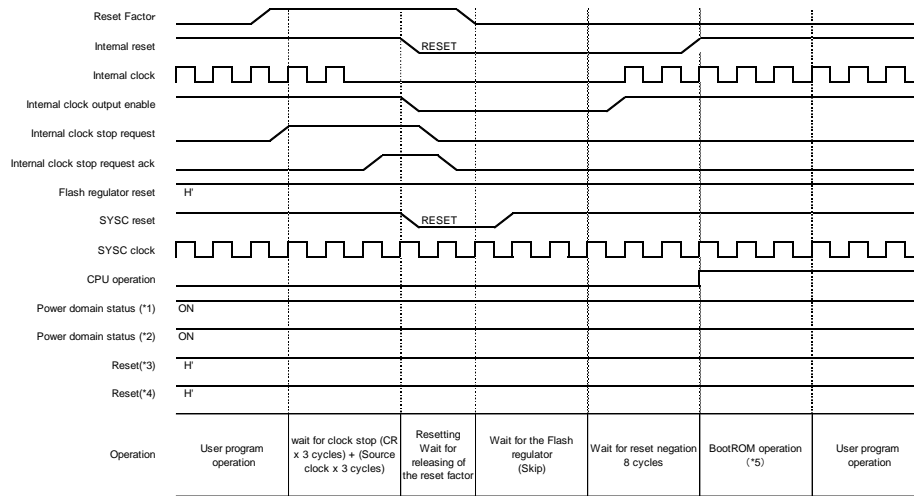

*3: External power supply PowerDomain reset

*4: Internal power supply PowerDomain reset

*5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Notes:

- The clocks in figure do not indicate actual numbers of clock cycle of the operations.
- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific inform

Figure 3-8 Operation at Other Hard Reset Factors

*1: External power supply PowerDomain area status (PD2)

*2: Internal power supply PowerDomain area status (PD4,PD6)

*3: External power supply PowerDomain reset

*4: Internal power supply PowerDomain reset

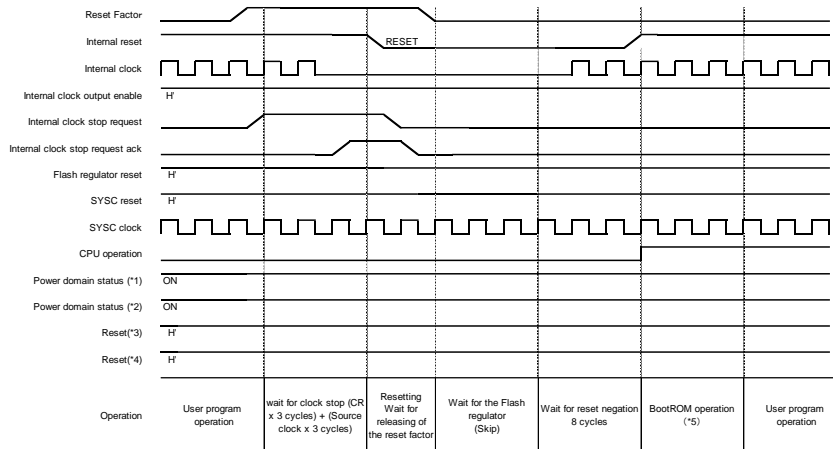

*5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Notes:

- The clocks in figure do not indicate actual numbers of clock cycle of the operations.
- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific information.

3.4.2. Soft Reset Operation

Figure 3-9 Operation at Software Reset

*1: External power supply PowerDomain area status (PD2)

*2: Internal power supply PowerDomain area status (PD4,PD6)

*3: External power supply PowerDomain reset

*4: Internal power supply PowerDomain reset

*5: Processing time: (Example) 1.31ms at SHE enable and BDR_SBMM=0

Notes:

- The clocks in figure do not indicate actual numbers of clock cycle of the operations.
- As platform, SHE is selectable the enable or the disable. However, the enable or the disable of SHE is device-specific for each product. Please refer to Datasheet for any device-specific information.

4. Registers

It explains the list of the register of reset.

Table 4-1 Reset Register List

Register Abbreviation	Register Name	Refer to:
SYSC_RSTCNTR	Reset control register	4.1
SYSC_RSTCAUSEUR	User reset factor register	4.2
SYSC_EXCSVRSTCAUSEUR	User extended CSV reset factor register	4.3
SYSC_PDRSTCAUSEUR	User PowerDomain reset factor register	4.4
SYSC_RSTCAUSEBT	BootROM reset factor register	4.5
SYSC_EXCSVRSTCAUSEBT	BootROM extended CSV reset factor register	4.6
SYSC_PDRSTCAUSEBT	BootROM PowerDomain reset factor register	4.7
SYSC_PDRSTSTATUS	PowerDomain reset status register	4.8

Table 4-2 Reset Register Memory Layout

Offset	Register Name			
	+3	+2	+1	+0
0x0000_0000	SYSC_RSTCNTR 00000000_00000000_00000000_00000000			
0x0000_0004	Reserved			
0x0000_0008	Reserved			
0x0000_000C	Reserved			
0x0000_0010	SYSC_RSTCAUSEUR 00000000_00000000_00000000_00000001			
0x0000_0014	SYSC_EXCSVRSTCAUSEUR 00000000_00000000_00000000_00000000			
0x0000_0018	SYSC_PDRSTCAUSEUR 00000000_00000000_00000000_0000000*			
0x0000_001C	Reserved			
0x0000_0020	SYSC_RSTCAUSEBT 00000000_00000000_00000000_00000001			
0x0000_0024	SYSC_EXCSVRSTCAUSEBT 00000000_00000000_00000000_00000000			
0x0000_0028	SYSC_PDRSTCAUSEBT 00000000_00000000_00000000_00000000 *			
0x0000_002C	Reserved			
0x0000_0030	Reserved			
0x0000_0034	SYSC_PDRSTSTATUS 00000000_00000000_00000000_00000000			

Notes:

- Reserved bits are always read "0"; Write "0" when writing.
- The registers are protected by protection key setting register (SYSC0_PROTKEYR). For details on the protection, see the following chapter 6: "Low-power Consumption."
- Access to reserved address results bus error response.
- *: When PD2 voltage is internal LDO, initial value is "0". When PD2 voltage is external LDO initial value is "1".

4.1. Reset Control Register (SYSC_RSTCNTR)

This register controls resets of the CPU. It generates a soft reset, software trigger hard reset, and debugging reset. Protection key code input is required for writing.

Register Structure

Bit	bit31	bit30	bit29	bit28	bit27	bit26	bit25	bit 24
Field	DBGR							
R/W attribute	R0,W							
Protection attribute	WPS							
Initial value	00000000							

Bit	bit23	bit22	bit21	bit20	bit19	bit18	bit17	bit16
Field	SWHRST							
R/W attribute	R0,W							
Protection attribute	WPS							
Initial value	00000000							

Bit	bit15	bit14	bit13	bit12	bit11	bit10	bit9	bit8
Field	Reserved							
R/W attribute	R0,W0							
Protection attribute	WPS							
Initial value	00000000							

Bit	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
Field	SWRST							
R/W attribute	R0,W							
Protection attribute	WPS							
Initial value	00000000							

Register Function

[bit31:24] DBGR: Software debugger Reset Register Bit

DBGR	Explanation
Write	The bits are used to generate the software debugger reset. Write 0xDA in this register to generate it. Refer to "Reset factor" for details of it.
Read	This register is automatically cleared after writing. The read value is always "0".

[bit23:16] SWHRST: Software Trigger hard Reset Register Bit

SWHRST	Explanation
Write	The bits are used to generate the software trigger hard reset. Write 0xA5 in this register to generate it. Refer to "Reset factor" for details of it.
Read	This register is automatically cleared after writing. The read value is always "0".

[bit15:8] Reserved**[bit7:0] SWRST: Software Reset Register Bit**

SWRST	Explanation
Write	The bits are used to generate the software reset. Write 0x5A in this register to generate it. Refer to "Reset factor" for details of it.
Read	This register is automatically cleared after writing. The read value is always "0".

Notes:

- Protection key code input is required for writing.
- It results bus error response for the violation to above restriction.

4.2. User Reset Factor Register (SYSC_RSTCAUSEUR)

This register displays the last reset factor. Clear this reset factor before the next reset. Without doing it, it will be difficult to identify the next reset factors because the register bits are overwritten by new reset factors. The register bits except RVD are initialized by the power-on reset (PONR). RVD bit is initialized by the RSTX Pin Input Reset(RSTX) or the INITX(INITX). Protection key code input is required for writing.

Register Structure

Bit	bit31	bit30	bit29	bit28	bit27	bit26	bit25	bit 24

Initial value	0	0	0	0	0	0	0	1

Register Function

[bit31] LVDL2R: Extended Internal Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the extended internal power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit30] LVDL1R: Internal Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the internal power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit29] CSVSCRR: Slow CR Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the Slow CR clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit28] CSVFCRR: Fast CR Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the Fast CR clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit27] CSVSR0: SSCG0 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG0 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit26] CSVPR0: PLL0 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the PLL0 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit25] CSVSOR: Sub Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the Sub clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit24] CSVMOR: Main Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the main clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit23:21] Reserved

[bit20] SHRST: Software Trigger hard Reset Detection Bit

This bit is used to confirm detection of the software trigger hard reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit19:17] Reserved

[bit16] SRST: Software Reset Detection Bit

This bit is used to confirm detection of the software reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit15]:13 Reserved

[bit12] SWDR: Software Watchdog Reset Detection Bit

This bit is used to confirm detection of the software watchdog reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit11] HWDR: Hardware Watchdog Reset Detection Bit

This bit is used to confirm detection of the hardware watchdog reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit10] PRFERR: Profile Error Reset Detection Bit

This bit is used to confirm detection of the profile error reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit9] SRSTX: nSRST Pin Input Reset Detection Bit

This bit is used to confirm detection of the nSRST pin input reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

Note:

- *nSRST pin input reset cannot be used. Therefore, please ignore the description about nSRST in RESET chapter.*

[bit8] IMR: Illegal Mode Detection Reset Detection Bit

This bit is used to confirm detection of the illegal mode detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit7] LVDH2R: Extended External Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the extended external power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit6] LVDH1R: External Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the external power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit5] Reserved

[bit4] RSTX: RSTX Pin Input Reset Detection Bit

This bit is used to confirm detection of the RSTX pin input reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit3] CKTOR: Clock Stop Wait Timeout Reset Detection Bit

This bit is used to confirm detection of the clock stop wait timeout reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit2] INITX: INITX Detection Bit

This bit is used to confirm detection of the INITX. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit1] RVD: RAM Retention Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the RAM retention low-voltage detection reset. Before the next reset is generated, clear this by writing "0". This bit is cleared by external reset (RSTX/INITX). When reset is generated by RVD, the PONR(bit0) detection bit is also set.

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit0] PONR: Power-on Reset Detection Bit

This bit is used to confirm detection of the power-on reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

Notes:

- Protection key code input is required for writing.

- *It results bus error response for the violation to above restriction.*
- *Initial value of the bit is undefined when the electrical characteristics specification (both DC and AC) of the power supply is not kept.*

Notes:

- *Supported reset factors depend on product. For details, see product specification.*
- *Non support reset factor can always be read zero.*

4.3. User Extended CSV Reset Factor Register (SYSC_EXCSVSTCAUSEUR)

This register displays the last reset factor. Clear this reset factor before the next reset. Without doing it, it will be difficult to identify the next reset factors because the register bits are overwritten by new reset factors. The register bits are initialized by the power-on reset (PONR). Protection key code input is required for writing.

Register Structure

Bit	bit 31							bit 8
Field	Reserved							
R/W attribute	R0, W0							
Protection attribute	WPS							
Initial value	00000000_00000000_00000000

Protection attribute	WPS								
Initial value	0	0	0	0	0	0	0	0	

Register Function

[bit31:8] Reserved

[bit7] CSVSR3: SSCG3 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG3 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit6] CSVSR2: SSCG2 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG2 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit5] CSVSR1: SSCG1 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG1 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit4] Reserved**[bit3] CSVPR3: PLL3 Clock Supervisor Reset Detection Bit**

This bit is used to confirm detection of the PLL3 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit2] CSVPR2: PLL2 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the PLL2 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit1] CSVPR1: PLL1 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the PLL1 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit0] Reserved**Notes:**

- Protection key code input is required for writing.
- It results bus error response for the violation to above restriction.

Notes:

- Supported reset factors depend on product. For details, see product specification.
- Non support reset factor can always be read zero.

4.4. User PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEUR)

This register displays the status of the reset factors by the power shutdown. Reset is issued to the shutdown area at recovery from power shutdown. The register bits are initialized by the power-on reset (PONR). Protection key code input is required for writing.

Register Structure

Bit	bit31		bit30		bit29		bit28		bit27		bit26		bit25		bit 24	
Field	Reserved															
R/W attribute	R0,W0															
Protection attribute	WPS															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note:

- *: When PD2 voltage is internal LDO, initial value is "0". When PD2 voltage is external LDO initial value is "1".

Register Function

[bit31:18] Reserved

[bit17] PD6R1: PowerDomain6_1 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 6_1. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit16] PD6R0: PowerDomain6_0 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 6_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit15] PD5R3: PowerDomain5_3 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_3. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit14] PD5R2: PowerDomain5_2 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_2. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit13] PD5R1: PowerDomain5_1 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_1. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit12] PD5R0: PowerDomain5_0 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit11:10] Reserved**[bit9] PD4R1: PowerDomain4_1 Reset Detection Bit**

This bit is used to confirm detection of the PowerDomain reset 4_1. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit8] PD4R0: PowerDomain4_0 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 4_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit7:5] Reserved

[bit4] PD3R0: PowerDomain3_0 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 3_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit3:1] Reserved

[bit0] PD2R0: PowerDomain2 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 2. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

Notes:

- Protection key code input is required for writing.
- It results bus error response for the violation to above restriction.

Notes:

- Supported reset factors depend on product. For details, see product specification.
- Non support reset factor can always be read zero.

4.5. BootROM Reset Factor Register (SYSC_RSTCAUSEBT)

This register displays the last reset factor. Clear this reset factor before the next reset. Without doing it, it will be difficult to identify the next reset factors because the register bits are overwritten by new reset factors. The register bits except RVD are initialized by the power-on reset (PONR). RVD bit is initialized by the RSTX Pin Input Reset(RSTX) or the INITX(INITX). Protection key code input is required for writing.

Register Function

[bit31] LVDL2R: Extended Internal Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the extended internal power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit30] LVDL1R: Internal Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the internal power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit29] CSVSCRR: Slow CR Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the Slow CR clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit28] CSVFCRR: Fast CR Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the Fast CR clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit27] CSVSR0: SSCG0 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG0 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit26] CSVPR0: PLL0 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the PLL0 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit25] CSVSOR: Sub Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the sub clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit24] CSVMOR: Main Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the main clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit23:21] Reserved
[bit20] SHRST: Software Trigger hard Reset Detection Bit

This bit is used to confirm detection of the software trigger hard reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit19:17] Reserved
[bit16] SRST: Software Reset Detection Bit

This bit is used to confirm detection of the software reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit15:13] Reserved
[bit12] SWDR: Software Watchdog Reset Detection Bit

This bit is used to confirm detection of the software watchdog reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit11] HWDR: Hardware Watchdog Reset Detection Bit

This bit is used to confirm detection of the Hardware watchdog reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit10] PRFERR: Profile Error Reset Detection Bit

This bit is used to confirm detection of the profile error reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit9] SRSTX: nSRST Pin Input Reset Detection Bit

This bit is used to confirm detection of the nSRST pin input reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

Note:

- *nSRST pin input reset cannot be used. Therefore, please ignore the description about nSRST in RESET chapter.*

[bit8] IMR: Illegal Mode Detection Reset Detection Bit

This bit is used to confirm detection of the illegal mode detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit7] LVDH2R: Extended External Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the extended external power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit6] LVDH1R: External Power Supply Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the external power supply low-voltage detection reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit5] Reserved

[bit4] RSTX: RSTX Pin Input Reset Detection Bit

This bit is used to confirm detection of the RSTX pin input reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit3] CKTOR: Clock Stop Wait Timeout Reset Detection Bit

This bit is used to confirm detection of the clock stop wait timeout reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit2] INITX: INITX Detection Bit

This bit is used to confirm detection of the INITX. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit1] RVD: RAM Retention Low-Voltage Detection Reset Detection Bit

This bit is used to confirm detection of the RAM retention low-voltage detection reset. Before the next reset is generated, clear this by writing "0". This bit is cleared by external reset (RSTX/INITX). When reset is generated by RVD, the PONR(bit0) detection bit is also set.

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit0] PONR: Power-on Reset Detection Bit

This bit is used to confirm detection of the power-on reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

Notes:

- Protection key code input is required for writing.
- It results bus error response for the violation to above restriction.
- Initial value of the bit is undefined when the electrical characteristics specification (both DC and AC) of the power supply is not kept.
- BootROM is used by this register. BootROM initializes this register in the startup process. Can not be read "1" set the status of each reset factor from the user program.

Notes:

- Supported reset factors depend on product. For details, see product specification.
- Non support reset factor can always be read zero.

4.6. BootROM Extended CSV Reset Factor Register (SYSC_EXCSVSTCAUSEBT)

This register displays the last reset factor. Clear this reset factor before the next reset. Without doing it, it will be difficult to identify the next reset factors because the register bits are overwritten by new reset factors. The register bits are initialized by the power-on reset (PONR). Protection key code input is required for writing.

Register Structure

Bit	bit 31							bit 8
Field	Reserved							
R/W attribute	R0, W0							
Protection attribute	WPS

Register Function

[bit31:8] Reserved

[bit7] CSVSR3: SSCG3 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG3 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit6] CSVSR2: SSCG2 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG2 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit5] CSVSR1: SSCG1 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the SSCG1 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit4] Reserved**[bit3] CSVPR3: PLL3 Clock Supervisor Reset Detection Bit**

This bit is used to confirm detection of the PLL3 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit2] CSVPR2: PLL2 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the PLL2 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit1] CSVPR1: PLL1 Clock Supervisor Reset Detection Bit

This bit is used to confirm detection of the PLL1 clock supervisor reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit0] Reserved**Notes:**

- Protection key code input is required for writing.
- It results bus error response for the violation to above restriction.
- BootROM is used by this register. BootROM initializes this register in the startup process. Can not be read "1" set the status of each reset factor from the user program.

Notes:

- Supported reset factors depend on product. For details, see product specification.
- Non support reset factor can always be read zero.

4.7. BootROM PowerDomain Reset Factor Register (SYSC_PDRSTCAUSEBT)

This register displays the status of the reset factors by the power shutdown. Reset is issued to the shutdown area at recovery from power shutdown. This register is initialized by power-on reset (PONR). Protection key code input is required for writing.

Register Structure

Bit	bit31	bit30	bit29	bit28	bit27	bit26	bit25	bit 24

[bit31:18] Reserved

[bit17] PD6R1: PowerDomain6_1 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 6_1 reset. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit16] PD6R0: PowerDomain6_0 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 6_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit15] PD5R3: PowerDomain5_3 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_3. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit14] PD5R2: PowerDomain5_2 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_2. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit13] PD5R1: PowerDomain5_1 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_1. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit12] PD5R0: PowerDomain5_0 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 5_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit11:10] Reserved

[bit9] PD4R1: PowerDomain4_1 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 4_1. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit8] PD4R0: PowerDomain4_0 Reset Detection Bit

This bit is used to confirm detection of the Q PowerDomain reset 4_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit7:5] Reserved

[bit4] PD3R0: PowerDomain3_0 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 3_0. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

[bit3:1] Reserved

[bit0] PD2R0: PowerDomain2 Reset Detection Bit

This bit is used to confirm detection of the PowerDomain reset 2. Before the next reset is generated, clear this by writing "0".

Bit	Explanation
0	The reset has not been detected.
1	The reset has been detected.

Notes:

- Protection key code input is required for writing.
- It results bus error response for the violation to above restriction.
- BootROM is used by this register. BootROM initializes this register in the startup process. Can not be read "1" set the status of each reset factor from the user program.

Notes:

- Supported reset factors depend on product. For details, see product specification.
- Non support reset factor can always be read zero.

4.8. PowerDomain Reset Status Register (SYSC_PDRSTSTATUS)

This register displays the status of the reset issuing status to the PowerDomains by the power shutdown.

Register Structure

[bit17] PD6RS1: PowerDomain6_1 Reset Status Bit

This bit displays the reset status of PowerDomain6_1.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit16] PD6RS0: PowerDomain6_0 Reset Detection Bit

This bit displays the reset status of PowerDomain6_0.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit15] PD5RS3: PowerDomain5_3 Reset Detection Bit

This bit displays the reset status of PowerDomain5_3.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit14] PD5RS2: PowerDomain5_2 Reset Detection Bit

This bit displays the reset status of PowerDomain5_2.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit13] PD5RS1: PowerDomain5_1 Reset Detection Bit

This bit displays the reset status of PowerDomain5_1.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit12] PD5RS0: PowerDomain5_0 Reset Detection Bit

This bit displays the reset status of PowerDomain5_0.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit11:10] Reserved

[bit9] PD4RS1: PowerDomain4_1 Reset Detection Bit

This bit displays the reset status of PowerDomain4_1.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit8] PD4RS0: PowerDomain4_0 Reset Detection Bit

This bit displays the reset status of PowerDomain4_0.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit7:5] Reserved**[bit4] PD3RS0: PowerDomain3_0 Reset Detection Bit**

This bit displays the reset status of PowerDomain3_0.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

[bit3:1] Reserved**[bit0] PD2RS0: PowerDomain2 Reset Detection Bit**

This bit displays the reset status of PowerDomain2.

Bit	Explanation
0	The reset is released.
1	The reset is issued.

Notes:

- Supported reset factors depend on product. For details, see product specification.
- Non support reset factor can always be read zero.

CHAPTER 5: Clock System

This chapter explains the clock system.

1. Overview
2. Configuration and Block Diagram
3. Operations
4. Setting Procedure Example
5. Registers
6. Usage Precautions

CLKSYS-TXXPT03P01R01L10-E1-XX

1. Overview

This section explains the overview of the clock system.

The clock system provides various clocks for MCU operation.

Source clocks are generated from MCU external/internal oscillation circuit. Source clocks are used to generate internal clock for MCU operation

The clock system generates the following source clocks.

- Fast-CR clock
- Slow-CR clock
- Main clock/Main clock * 1/2
- Sub clock
- PLL0 clock
- PLL1 clock
- PLL2 clock
- PLL3 clock
- SSCG PLL0 clock
- SSCG PLL1 clock
- SSCG PLL2 clock
- SSCG PLL3 clock

MCU external/internal oscillation circuit generates Fast-CR clock and Slow-CR clock, Main clock, Sub clock.

And 8 PLL circuits generate PLL clocks and SSCG PLL clocks.

Internal clocks generate from same source clock are provided to clock domain. At least clock domain has 1 internal clock.

The clock domains are the following in the clock system.

- Clock domain0
- Clock domain1
- Clock domain2
- Clock domain3
- Clock domain4
- Clock domain5
- TRC clock domain
- HSSPI clock domain
- MCUC clock domain
- CLKO clock domain

The only 1 source clock is selected for each clock domain. Each clock domain uses the selected source clock and divides to generate internal clock.

Features

The features of clock system are the following.

4 kinds of clock source (Fast-CR clock, slow-CR clock , Main clock ,Sub clock)

- All four clock sources have Source Clock Timer, which mask the clock till it is stable.

- All PLLs have stabilization counters, which masks the clock till it is stable.
- Clock gating for low power operation
- Fast-CR clock is used for complete device during initial power up, user can switch to other clocks later
- Clock Supervisor circuits are present for both external clock sources (Main osc & Sub osc) which make sure that input clocks are within configured frequency ranges
- Clock Supervisor circuits are also present for all PLLs to detect if PLL goes out of lock due to high jitter on the input clock

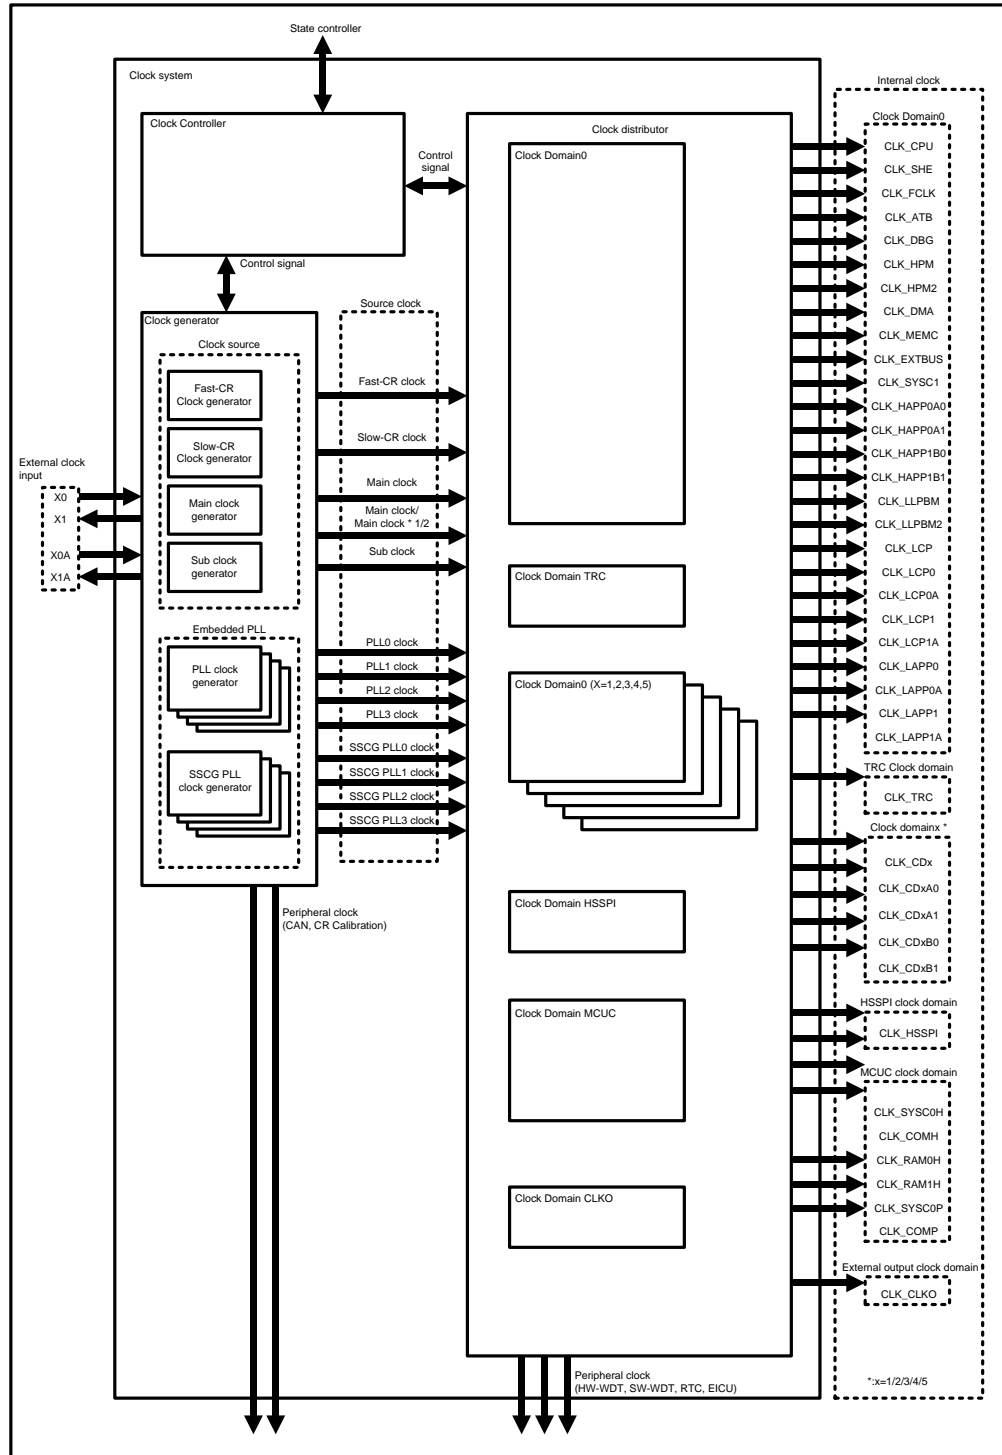

2. Configuration and Block Diagram

This section explains the block diagram of the clock system.

2.1. Clock System Configuration and Block Diagram

This section shows the block diagram of the clock system.

Figure 2-1 Clock System Block Diagram

Clock Controller

Clock controller generates control signal from configuration register value for clock system.

Clock Generator

Clock generator generates source clock from external/internal oscillation circuit.

Source Clocks

Source clocks are the following clocks.

- Fast-CR clock
- Slow-CR clock
- Main clock/Main clock * 1/2
- Sub clock
- PLLx clock (x=(product specification))
- SSCG PLLx clock (x=(product specification))

Domain Clock

Clock domain used for internal clocks which are divided into same source clock. Domain clock is selected each clock domain

Clock Distributor

Internal clocks generate from dividing into domain clock.

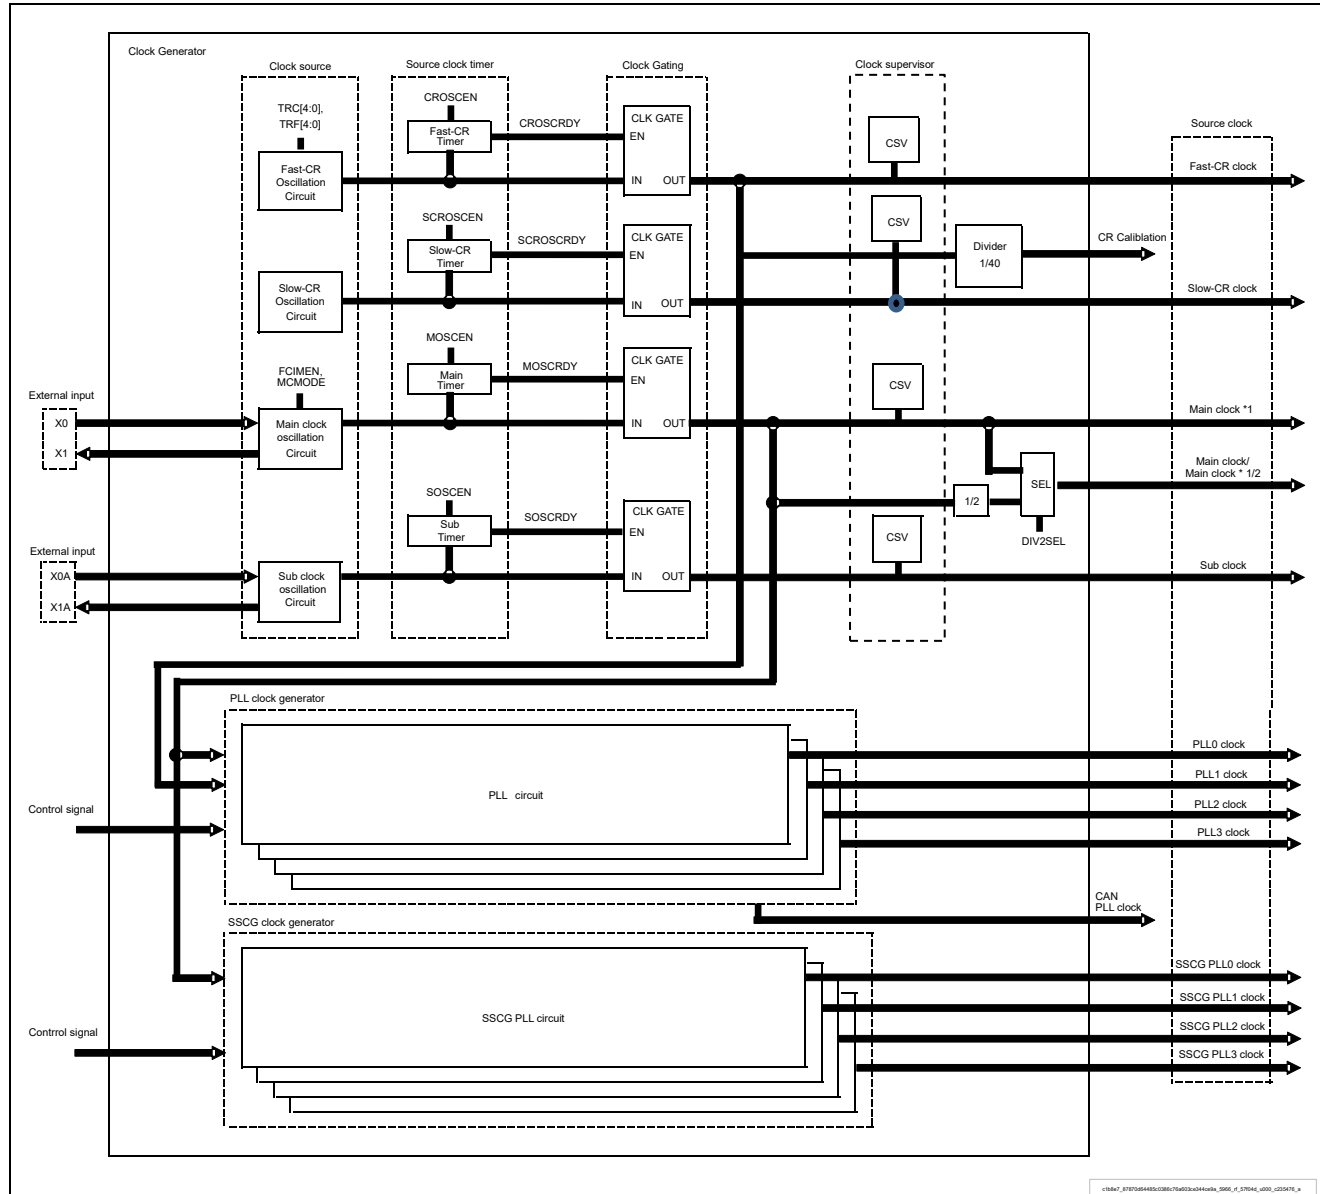

Internal Clock

Internal clocks used for each resource operation in MCU.

2.2. Clock Generator Configuration and Block Diagram

This section shows the block diagram of the clock generator.

Figure 2-2 Clock Generator Block Diagram

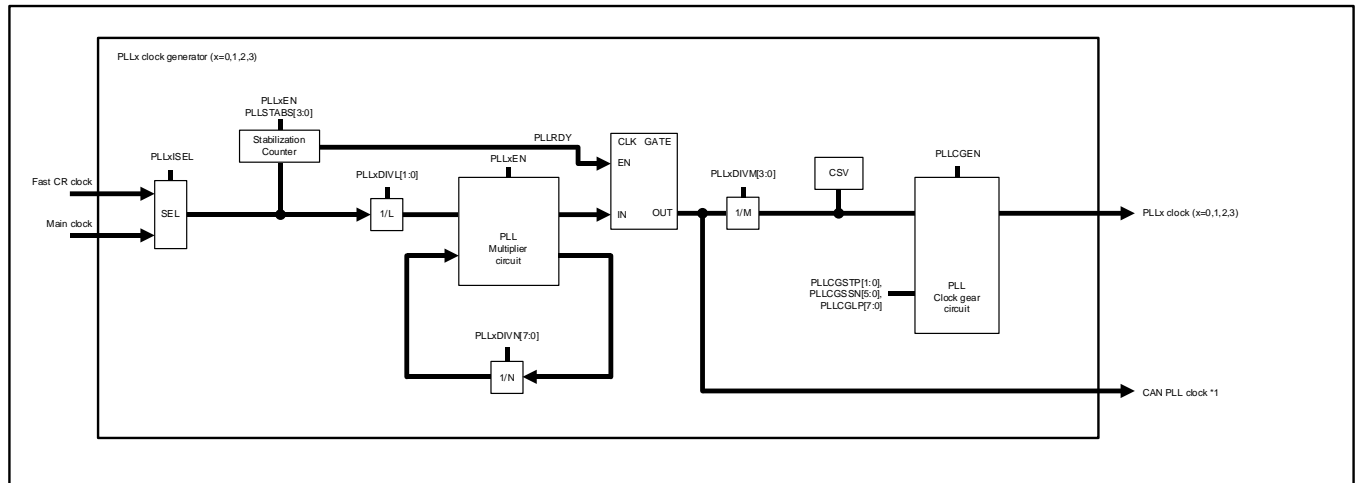

*1 : Real Time Clock and Software Watchdog use this as their Main clock source.

2.2.1. PLL Clock Generator Configuration and Block Diagram

This section shows the block diagram of the PLL clock generator.

Figure 2-3 PLLx (x=0,1,2,3) Clock Generator Block Diagram

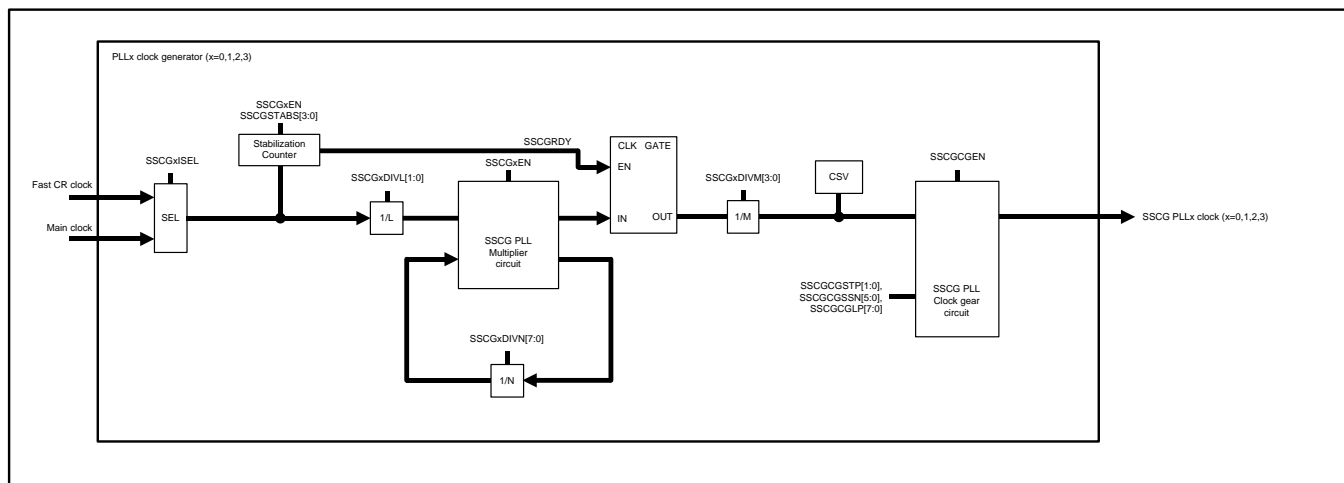

*1 : Only "(product specification)" supports the CAN PLL clock.

2.2.2. SSCG PLL Clock Generator Configuration and Block Diagram

This section shows the block diagram of the SSCG PLL clock generator.

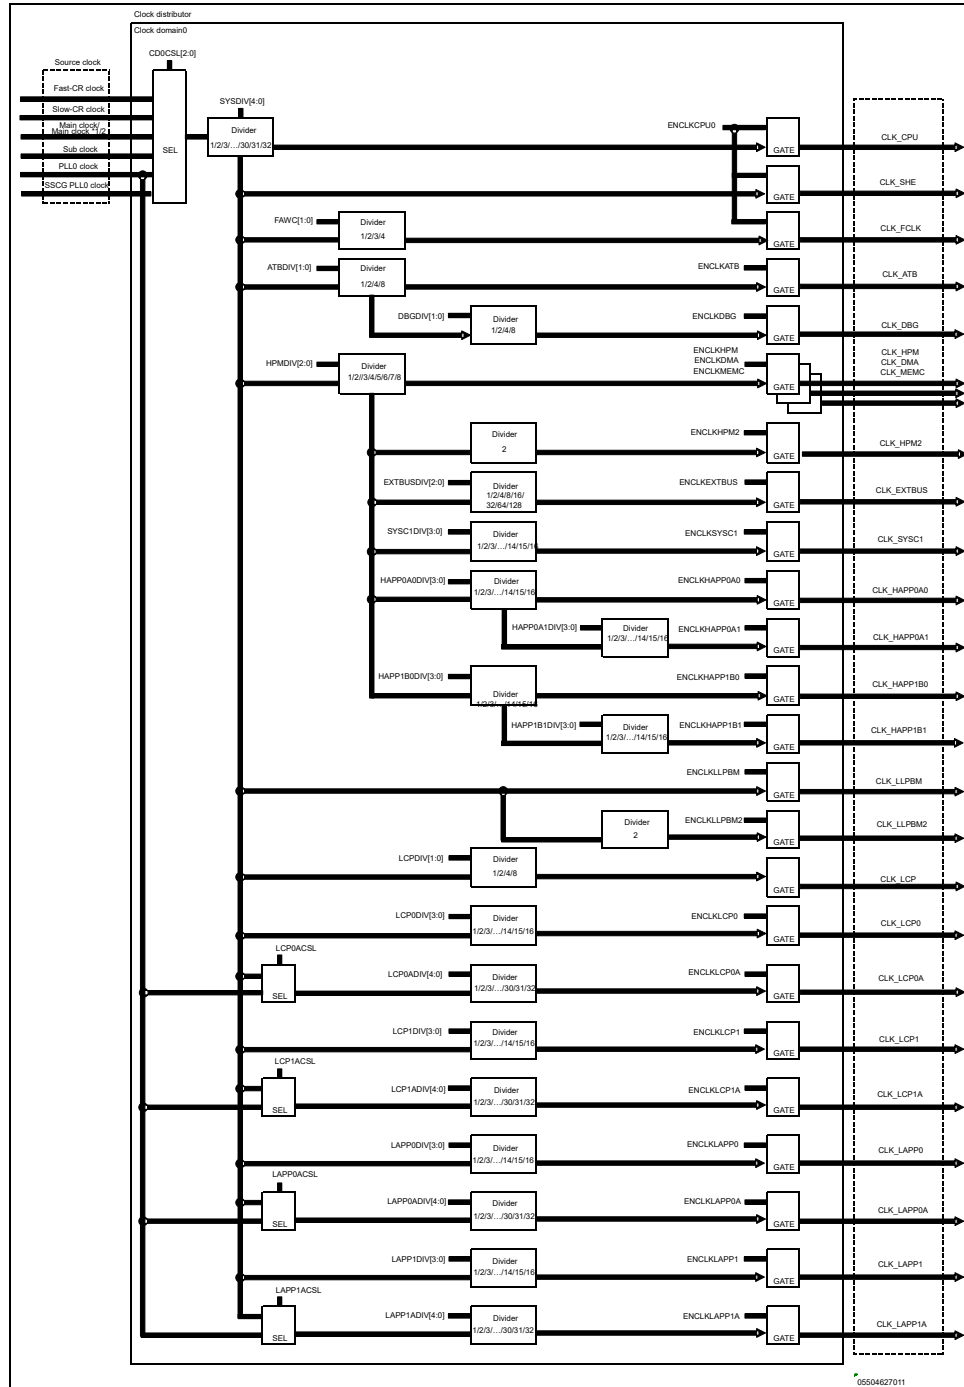

Figure 2-4 SSCG PLLx (x=0,1,2,3) Clock Generator Block Diagram

2.3. Clock Distributor Configuration and Block Diagram

This section shows the block diagram of the clock distributor.

Figure 2-5 Clock domain0 Block Diagram

Note:

- Do not use Sub clock for the domain clock.

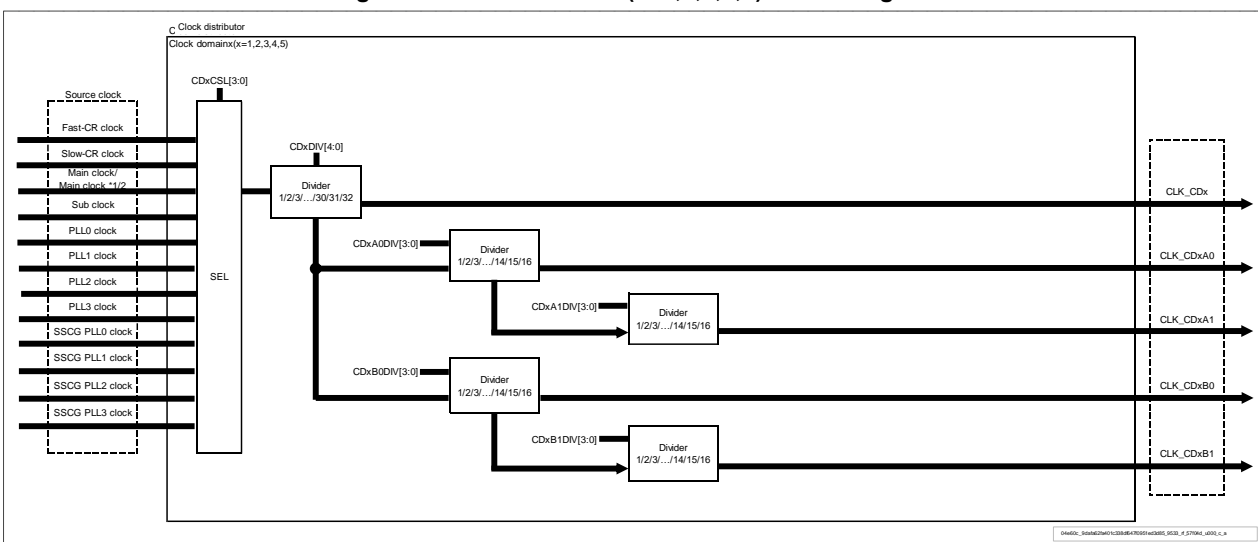

Figure 2-6 Clock Domain TRC Block Diagram

Note:

- Do not use Sub clock for the domain clock.

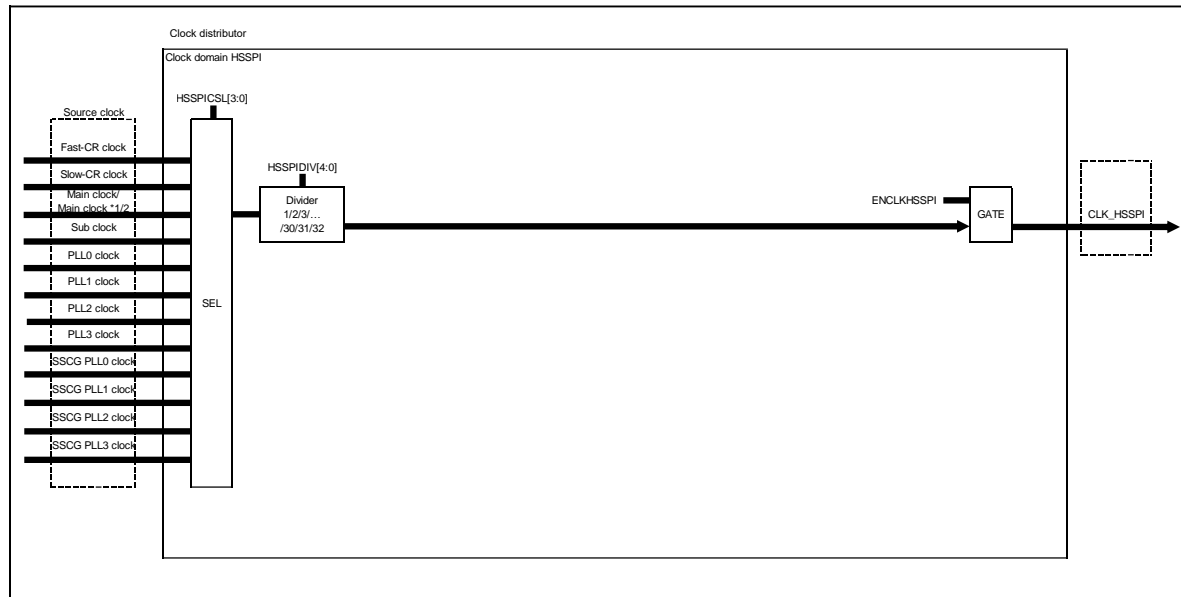

Figure 2-7 Clock domainx(x=1,2,3,4,5) Block Diagram

Note:

- Do not use Sub clock for the domain clock.

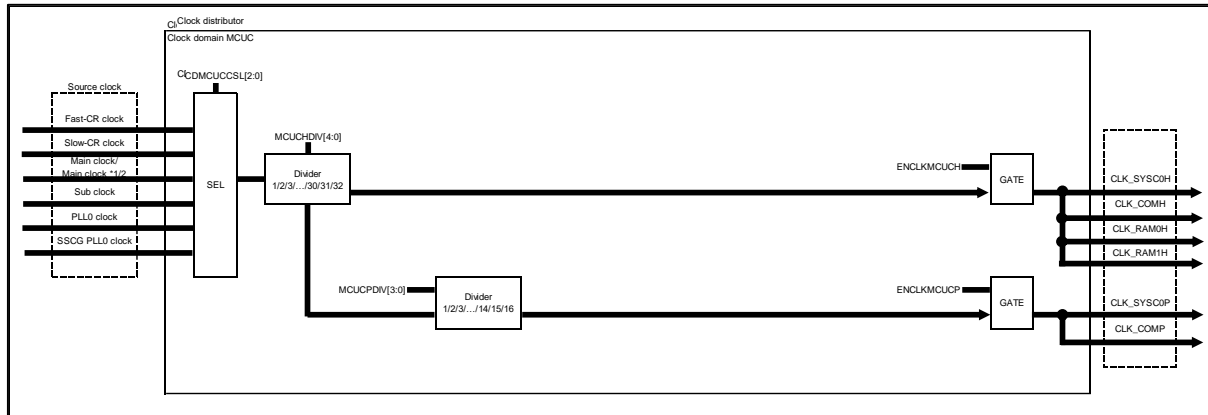

Figure 2-8 Clock Domain HSSPI Block Diagram

Note:

- Do not use Sub clock for the domain clock.

Figure 2-9 Clock Domain MCUC Block Diagram

Note:

- Do not use Sub clock for the domain clock.

Figure 2-10 Clock Domain CLKO Block Diagram

Note:

- Do not use Sub clock for the domain clock.

3. Operations

This section shows the configuration of the clock system.

3.1. Source Clock Generation

This section explains source clock generation.

Source Clock Enable/Disable

Source clocks not used in the device can be enabled and disabled in the profile with the corresponding enable bits in the profile.

The Main clock must be enabled if the PLL clock should be enabled, otherwise profile error interrupt will be asserted.

Table 3-1 Source Clock Enable/Disable

Source Clock	Initial State	RUN	PSS
Fast-CR clock	Enable	Enable	Programmable
Slow-CR clock	Enable	Enable	Programmable
Main clock/Main clock * 1/2	Enable	Programmable	Programmable
Sub clock	(product specification)	Programmable	Programmable
PLL0 clock	Disable	Programmable	Programmable
PLL1 clock	Disable	Programmable	Programmable
PLL2 clock	Disable	Programmable	Programmable
PLL3 clock	Disable	Programmable	Programmable
SSCG PLL0 clock	Disable	Programmable	Programmable
SSCG PLL1 clock	Disable	Programmable	Programmable
SSCG PLL2 clock	Disable	Programmable	Programmable
SSCG PLL3 clock	Disable	Programmable	Programmable

3.2. PLL/SSCG PLL Clock

This section explains PLL/SSCG PLL clock.

Clock system has several PLL/SSCG PLL multiplier circuits which is used to generate the PLL/SSCG PLL clock out of the Fast-CR clock / Main clock.

PLL Clock Configuration

Following steps are required to enable PLL:

1. Set the PLL stabilization time (SYSC_PLLSSCGSTCNTR.PLLSTABS)
2. Set the RUN/PSS profile register for PLLx configuration.(SYSC0_RUNPLLxCNTR/SYSC0_PSSPLLxCNTR)
3. Set the RUN/PSS profile register for PLLxEN (SYSC0_RUNCKSRER/SYSC0_PSSCKSRER)
4. Set profile Trigger Register or execute WFI instruction to update profile registers.
5. Device state control logic first enables the PLL with configured settings, waits for the PLL stabilization time and then switches the clock source domain to PLL source.

SSCG PLL Clock Configuration

Following steps are required to enable SSCG PLL:

1. Set the SSCG PLL stabilization time (SYSC_PLLSSCGSTCNTR.PLLSTABS)
2. Set the RUN/PSS profile register for SSCG PLLx configuration.(SYSC0_RUNSSCGxCNTR0 and SYSC0_RUNSSCGxCNTR1/SYSC0_PSSSSCGxCNTR0 and SYSC0_PSSSSCGxCNTR1)
3. Set the RUN/PSS profile register for SSCG PLLxEN (SYSC0_RUNCKSRER/SYSC0_PSSCKSRER)
4. Set profile Trigger Register or execute WFI instruction to update profile registers.
5. Device state control logic first enables the PLL with configured settings, waits for the SSCG PLL stabilization time and then switches the clock source domain to SSCG PLL source.

Configuration of PLL/SSCG PLL Clock Stabilization Time

For details refer to '5.1.4 PLL/SSCG stabilization time control register(SYSC_PLLSSCGSTCNTR)'.

Multiplying Configuration of PLL Clock

Table 3-2 Example of PLL Clock Configuration

Input Clock	Input Clock Divider Configuration	PLLIn	PLL Multiplier Configuration	PLLout	Output Divider Configuration	PLL Clock
4MHz	1	4MHz	120	480MHz	2	240MHz
8MHz	2	4MHz	120	480MHz	2	240MHz
8MHz	1	8MHz	60	480MHz	2	240MHz
16MHz	4	4MHz	120	480MHz	2	240MHz
16MHz	2	8MHz	60	480MHz	2	240MHz
16MHz	1	16MHz	30	480MHz	2	240MHz
20MHz	4	5MHz	96	480MHz	2	240MHz
20MHz	2	10MHz	48	480MHz	2	240MHz
20MHz	1	20MHz	24	480MHz	2	240MHz

Note:

- Make the input clock frequency division setting so that the PLL input clock (PLLIn) is at 3.6 MHz to 32 MHz. Make the multiplication setting so that the PLL output clock (PLLout) is at 400 MHz to (product specification) MHz.

Multiplying Configuration of SSCG PLL Clock

Table 3-3 Example of SSCG PLL Clock Configuration

Input Clock	Input Clock Divider Configuration	SSCG PLLIn	SSCG PLL Multiplier Configuration	SSCG PLLout	Output Divider Configuration	SSCG PLL Clock
4MHz	1	4MHz	120	480MHz	2	240MHz
8MHz	2	4MHz	120	480MHz	2	240MHz
8MHz	1	8MHz	60	480MHz	2	240MHz
16MHz	4	4MHz	120	480MHz	2	240MHz
16MHz	2	8MHz	60	480MHz	2	240MHz
16MHz	1	16MHz	30	480MHz	2	240MHz
20MHz	4	5MHz	96	480MHz	2	240MHz
20MHz	2	10MHz	48	480MHz	2	240MHz
20MHz	1	20MHz	24	480MHz	2	240MHz

Note:

- Make the input clock frequency division setting so that the SSCG PLL input clock (SSCG PLLIn) is at 3.6 MHz to 32 MHz. Make the multiplication setting so that the SSCG PLL output clock (SSCG PLLout) is at 400 MHz to (product specification) MHz.

3.3. Clock Distributor

This section explains clock distributor.

Clock distributor has source clock selector and clock divider for each clock domain.

Source Clock Selector Configuration

After each hard reset, Fast-CR clock is selected in all clock domain.

Source clock can be selected for each clock domain by RUN/PSS profile registers.

Table 3-4 Source Clock Selector Configuration

Clock Domain	Domain Clock	Resources	Initial State	RUN/PSS
CD0	CD0_CLK	CPU, TCFWASH/WFLASH, ATB, DBG, TRC, High Performance Matrix, MCU Config Group1, Memory & Config Group, Common Peripheral Group, Application Specific Group, Ext Bus Group	Fast-CR clock	Programmable
CD1	CD1_CLK	(product specification)	Fast-CR clock	Programmable
CD2	CD2_CLK	(product specification)	Fast-CR clock	Programmable
CD3	CD3_CLK	(product specification)	Fast-CR clock	Programmable
CD4	CD4_CLK	(product specification)	Fast-CR clock	Programmable
CD5	CD5_CLK	(product specification)	Fast-CR clock	Programmable
CD_TRC	TRC_CLK	Debug Group	Fast-CR clock	Programmable
CD_HSSPI	HSSPI_CLK	DDRHSSPI Group	Fast-CR clock	Programmable
CD_MCUC	MCUC_CLK	MCU Config Group0	Fast-CR clock	Programmable
CD_CLKO	CLKO_CLK	Clock output function	Fast-CR clock	Programmable

Clock Divider Configuration

There are 1-4 divider circuits on each clock path.

Divided clock of source clock is distributed as internal operating clock.

Table 3-5 Clock Divider Configuration and Maximum Frequency

Clock Domain	Internal Clock	Resources	Parent Clock	Initial State	RUN/PSS	Maximum Frequency
CD0	CLK_CPU	CPU	Source clock selected by CD0CSL[2:0]	1	Programmable	240MHz
	CLK_SHE	SHE	CLK_CPU	1	No div of CLK_CPU	Same as CLK_CPU
	CLK_FCLK	TCFLASH WFLASH	CLK_CPU	4	Programmable	100MHz
	CLK_ATB	ATB	CLK_CPU	1	Programmable	120MHz
	CLK_DBG	DBG	CLK_ATB	1	Programmable	120MHz
	CLK_HPM	High Performance Matrix, Common Peripheral2	CLK_CPU	1	Programmable	240MHZ
	CLK_HPM2		CLK_HPM	2	2	120MHz
	CLK_DMA	DMA	CLK_HPM	1	Programmable	240MHz
	CLK_MEMC	Memory & Config Group	CLK_HPM	1	Programmable	240MHz
	CLK_EXTBUS	Ext Bus Group	CLK_HPM	1	Programmable	120MHz
	CLK_SYSC1	MCU config Group1	CLK_HPM	1	Programmable	120MHz
	CLK_HAPP0A0	Application Specific0 (HPM)	CLK_HPM	1	Programmable	120MHz
	CLK_HAPP0A1		CLK_HAPP0A0	1	Programmable	60MHz
	CLK_HAPP0B0	Application Specific1 (HPM)	CLK_HPM	1	Programmable	120MHz
	CLK_HAPP0B1		CLK_HAPP0B0	1	Programmable	60MHz
	CLK_LLBPBM	Common Peripheral (LLPBM)	CLK_CPU	1	Programmable	240MHz
	CLK_LLBPBM2	Common Peripheral0/1/2	CLK_LLBPBM2	2	2	120MHz
	CLK_LCP	Common Peripheral0/1	CLK_CPU	1	Programmable	120MHz
	CLK_LCP0	Common Peripheral0	CLK_CPU	1	Programmable	120MHz
	CLK_LCP0A		Source clock selected by LCP0ACSEL	1	Programmable	120MHz
	CLK_LCP1	Common Peripheral1	CLK_CPU	1	Programmable	120MHz
	CLK_LCP1A		Source clock selected by LCP1ACSEL	1	Programmable	120MHz

Clock Domain	Internal Clock	Resources	Parent Clock	Initial State	RUN/PSS	Maximum Frequency
	CLK_LAPP0	Application Specific0	CLK_CPU	1	Programmable	120MHz
	CLK_LAPP0A	(LLPPBM)	Source clock selected by LAPP0ACSEL	1	Programmable	120MHz
	CLK_LAPP1	Application Specific1	CLK_CPU	1	Programmable	120MHz
	CLK_LAPP1A	(LLPPBM)	Source clock selected by LAPP1ACSEL	1	Programmable	120MHz
CDx (x=1/2/3/4/5)	CLK_CDx	(product specification)	Source clock selected by CDxCSL	1	Programmable	240MHz
	CLK_CDxA0		CLK_CDx	1	Programmable	120MHz
	CLK_CDxA1		CLK_CDxA0	1	Programmable	60MHz
	CLK_CDB0		CLK_CDx	1	Programmable	120MHz
	CLK_CDB1		CLK_CDB0	1	Programmable	60MHz
CD_TRC	CLK_TRC	Debug Group	Source clock selected by TRCCSL	1	Programmable	120MHz
CD_HSSPI	CLK_HSSPI	HSSPI	Source clock selected by HSSPICSL	1	Programmable	200MHz
CD_MCUC	CLK_SYSC0H	MCU Config Group (AHB)	Source clock selected by CDMCUCCSL	1	Programmable	120MHz
	CLK_COMH	Communication Peripheral (AHB)	Source clock selected by CDMCUCCSL	1	Programmable	120MHz
	CLK_RAM0H	Back-up RAM0	Source clock selected by CDMCUCCSL	1	Programmable	120MHz
	CLK_RAM1H	Back-up RAM1	Source clock selected by CDMCUCCSL	1	Programmable	120MHz
	CLK_SYSC0P	MCU Config Group0 (APB)	CLK_SYSC0H	1	Programmable	60MHz
	CLK_COMP	Communication Peripheral (APB)	CLK_SYSC0H	1	Programmable	60MHz
CD_CLKO	CLK_CLKO	Clock output function	Source clock selected by CKSEL	1	Programmable	240MHz

Note:

- Make the frequency division setting so that no clocks are supplied that exceed the maximum operating frequency of any internal operating clock.

3.4. Clock Gear

This section explains clock gear.

- Due to drastic frequency difference, switching from/to the main clock to/from PLL/SSCG clock causes huge fluctuation of power supply current. By utilizing the clock gear circuit equipped in the clock switch section, you can gradually shift the operating frequency from/to high-frequency to/from low-frequency, reducing sudden surge of power supply current.

Clock Gear Control

Gear clock is output from clock gear circuit. The frequency of gear clock is gradually changed by the step-by-step outputting of the input clock.

Gear clock is controlled the following configuration.

- Start step configuration
 - Setting to select the range ("START STEP" to STEP 63) during Gear operation that defined by Start Step configuration (xxxCGSSN).
 - It is selectable from STEP 0 to 63.
 - At Gear Up, the Gear operation starts from the selected STEP 'n' and stops at STEP 63. (Refer to Step Width Configuration for the increment width of 'n' after 1 step operation.)
 - At Gear Down, the Gear operation starts from STEP 63 and stops at STEP 'n' the selected. (Refer to Step Width Configuration for the decrement width of 'n' after 1 step operation.)
- Step loop configuration
 - STEP:
 - Loop that is repeated a defined number of times when the Loop configuration(xxxCGLP).
 - It is configurable from 1 to 256 loops.
 - 1 step is xxxCGLP <loop> = xxxCGLP x 64 <cycle>.
 - LOOP:
 - The minimum operation unit that configures gear operation.
 - 1 Loop fixed at 64 <cycle>.
- Step width configuration
 - The width defined by Step Width configuration (xxxCGSTP) which "n" of STEP "n" is increment / decrement (when Gear Up / Gear Down) after 1 STEP execution.
 - Step width can be set to 1 to 4.
 - At Gear Up, the width to increment 'n' after 1 step of STEP 'n'. (In the case of Width = 2, STEP 0, STEP 2, STEP 4 ...).
 - At Gear Down, the width to decrement 'n' after 1 step of STEP 'n'. (In the case of Width 4, STEP 63, STEP 59, STEP 55 ...)

Note::

STEP 0 to 63: Clock output patterns of Gear operation.

As the number of step increases, the clock output increases.

STEP 0 : 1 clock/loop

STEP 1 : 2 clock/loop

:

:

:

STEP 63 : 64 clock/loop (Clock output for all cycles in loop)

Refer to Figure 3-1 for details pattern.

The length of STEP 0 to 63 (the number of Loop repetitions) is determined by the setting of STEP ($xxxCGLP \times 64 <cycle>$).

Figure 3-1 Gear Clock Output

Figure.3-2(Gear Up) and Figure.3-3(Gear Down) show the relationship between the register configuration and the Clock Gear STEP.

Figure 3-2 Clock Gear STEP by register configuration (Gear Up)**Figure 3-3 Clock Gear STEP by register configuration (Gear Down)**

3.4.1. Gear Up Procedure

This section explains gear up procedure.

1. After completion of oscillation stabilization standby timer, the initial step clock, selected to clock gear start step, is output.
2. When GEAR_START is set to "1", and its rising is detected, GEAR_STATUS shifts from "00" → "01". (gear-up start.)
3. Following the clock gear step selection and repeat time selection, gear-up is initiated. Give smaller steps and more repetition time for smoother change.
4. When clock reaches the maximum step, GEAR_STATUS shifts from "01" to "10". (Gear-up completed, gear stopped)
5. After stopping of the gear, GEAR_START is cleared to "0" by hardware.

Note:

- Poll the clock gear status flag during clock gear UP/DOWN operation and wait for the clock Lower/Upper stop status.

3.4.2. Gear Down Procedure

This section explains gear down procedure.

1. When GEAR_START is set to "1", and its rising is detected, GEAR_STATUS shifts from "10" → "11". (gear-down start.)
2. Following the clock gear step selection and repeat time selection, gear-down is initiated. Give smaller steps and more repetition time for smoother change.
3. When clock reaches the minimum step, GEAR_STATUS shifts from "11" to "00". (Gear-down completed, gear stopped)
4. After stopping of the gear, GEAR_START is cleared to "0" by hardware.

Note:

- Poll the clock gear status flag during clock gear UP/DOWN operation and wait for the clock Lower/Upper stop status.

3.5. Clock Stabilization Time

This section explains clock stabilization time.

Source clock needs to wait for stabilization when source clock is not ready. Source clock does not provide for other resources during waiting clock stabilization time. After clock stabilization time, source clock can be used for each clock domain.

For more details refer to 'chapter:source clock timer'.

3.6. Interrupt

This section explains interrupt factor of clock system.

Interrupt Factor

The clock system has the following interrupt factor.

- Clock supervisor interrupt
For more details refer to 'chapter:clock supervisor'.
- Profile Error interrupt
For more details refer to 'chapter: Low-Power Consumption'.

4. Setting Procedure Example

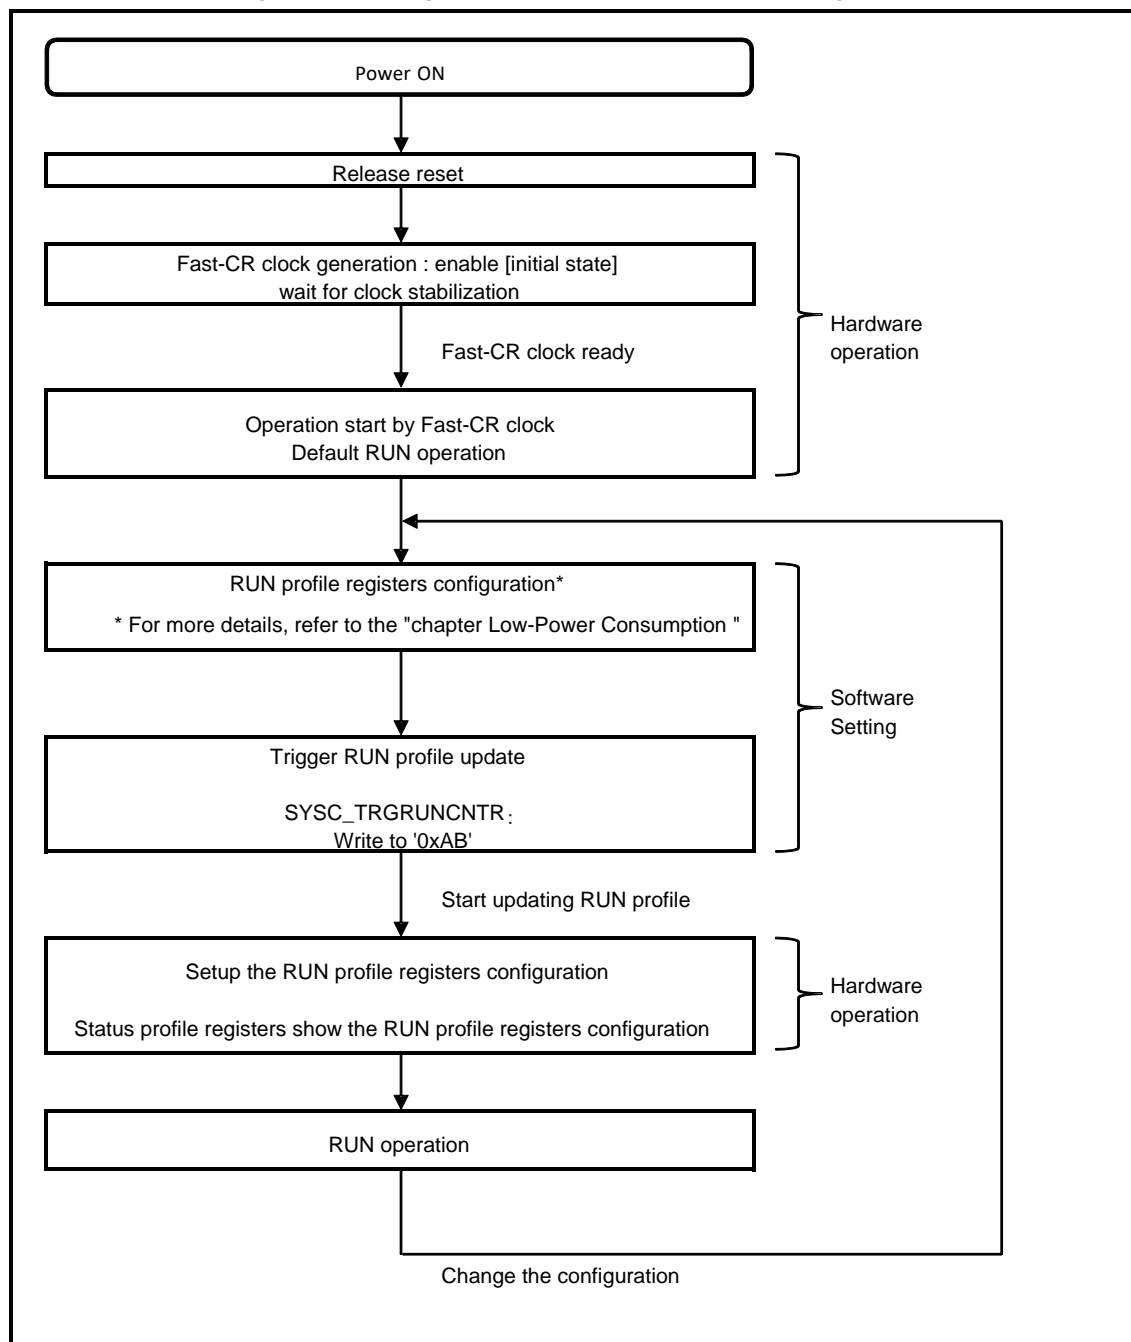

This section explains a setting procedure example of the clock system.

4.1. RUN Configuration

This section explains RUN configuration of clock system.

Setting Procedure Example for RUN Configuration

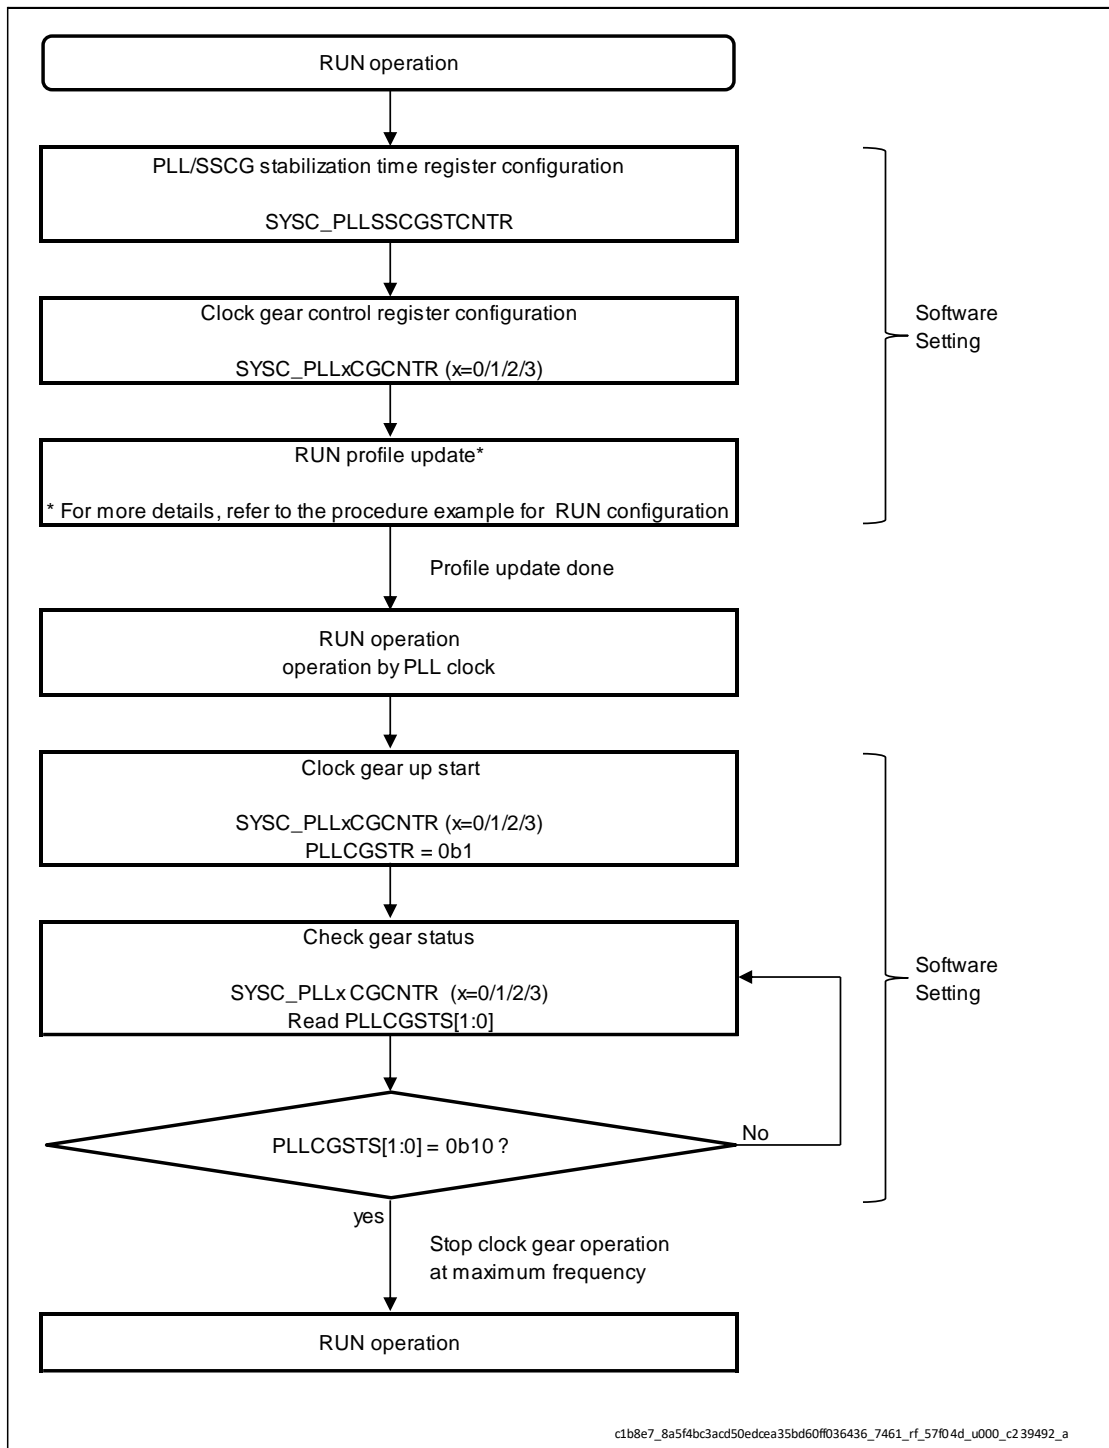

Figure 4-1 Setting Procedure Example for RUN Configuration

Note:

- To use the main clock and the PLL/SSCG PLL clock, the clock supervisor must also be set. For details, see the following chapter: "CLOCK SUPERVISOR."

Figure 4-2 Setting Procedure Example for Using PLL Clock

Note:

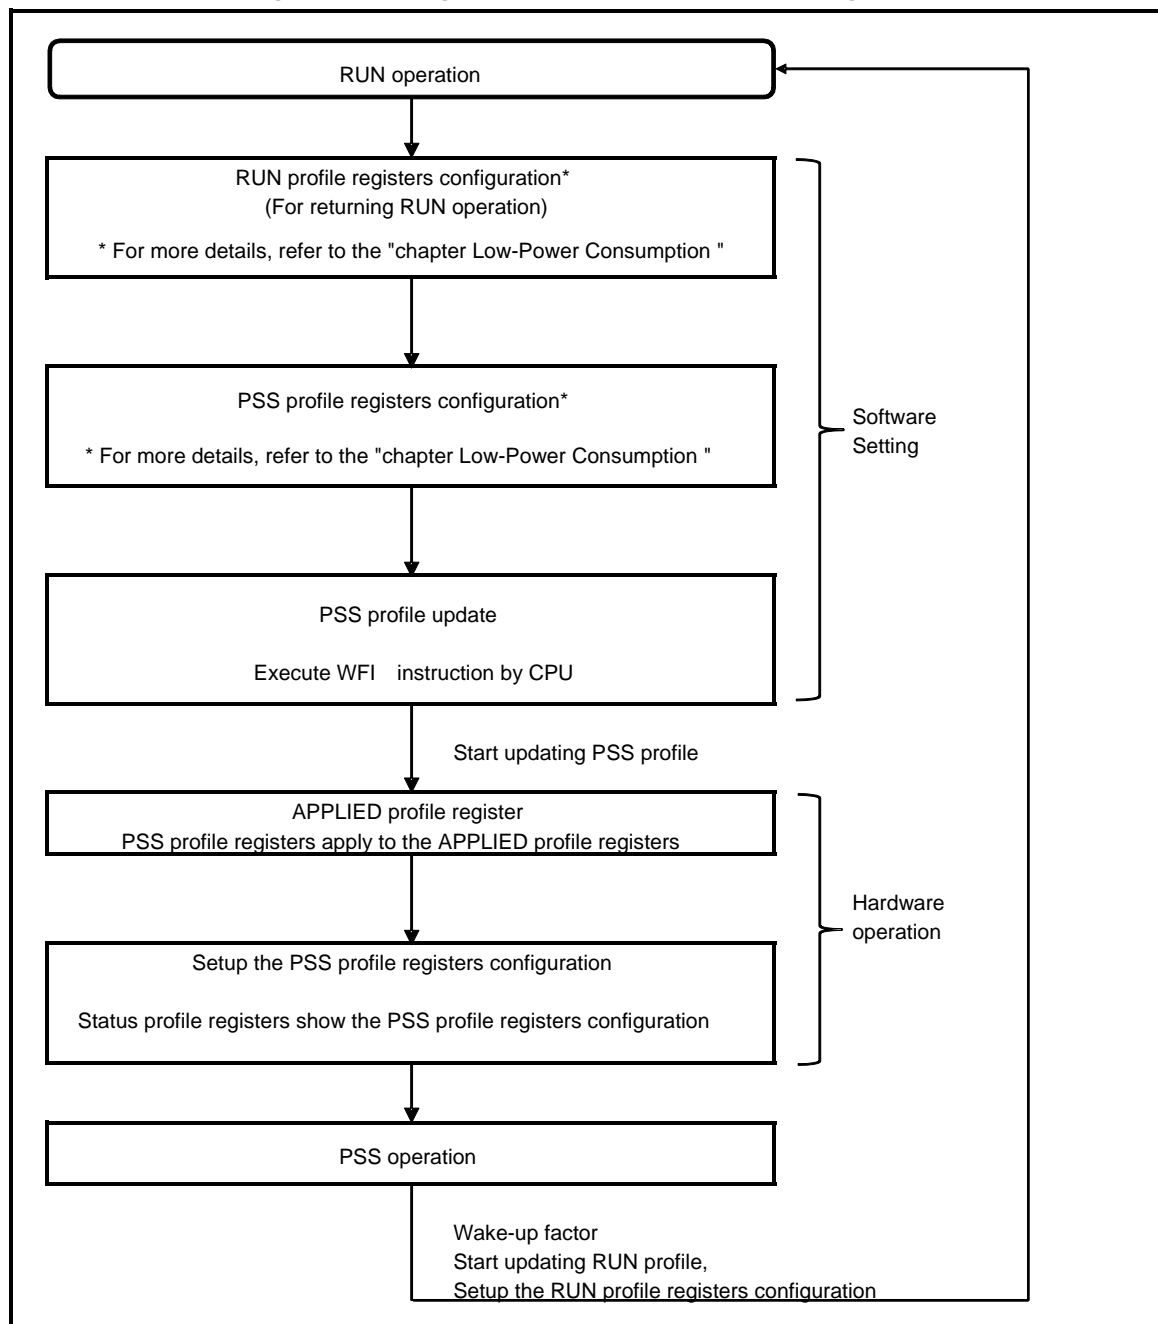

- To use the pll clock or sscg pll clock, clock gear must be used. Make sure to set the start gear step does not exceed the maximum frequency of every internal clock in the clock domain.

4.2. PSS Configuration

This section explains PSS configuration of clock system.

Setting Procedure Example for PSS Configuration

Figure 4-3 Setting Procedure Example for PSS Configuration

Note:

- To use the main clock and the (product specification) clock, the clock supervisor must also be set. For details, see the following chapter: "CLOCK SUPERVISOR."

5. Registers

This section explains the registers of clock system.

There are 6 register groups in clock system.

- RUN profile registers
- PSS profile registers
- APPLIED profile registers
- Status profile registers
- Common Configuration registers
- Clock Output function register

For more details about Run profile registers and PSS profile registers, APPLIED profile registers, Status profile registers refer to the "chapter: Low-Power Consumption".

Registers of Clock System (Common Configuration Registers)

Table 5-1 Registers of Clock System (Common Configuration Registers)

Abbreviated expressions	Register name	Reference
SYSC_CRCNTR	CR clock control register	5.1.1
SYSC_MOSCCNTR	Main oscillator control register	5.1.2
SYSC_SOSCCNTR	Sub oscillator control register	5.1.3
SYSC_PLLSSCGSTCNTR	PLL/SSCG stabilization time control register	5.1.4
SYSC_PLL0CGCNTR	PLL0 clock gear control register	5.1.5
SYSC_PLL1CGCNTR	PLL1 clock gear control register	5.1.6
SYSC_PLL2CGCNTR	PLL2 clock gear control register	5.1.7
SYSC_PLL3CGCNTR	PLL3 clock gear control register	5.1.8
SYSC_SSCG0CGCNTR	SSCG PLL0 clock gear control register	5.1.9
SYSC_SSCG1CGCNTR	SSCG PLL1 clock gear control register	5.1.10
SYSC_SSCG2CGCNTR	SSCG PLL2 clock gear control register	5.1.11
SYSC_SSCG3CGCNTR	SSCG PLL3 clock gear control register	5.1.12

Registers of Clock System (Clock Output Function Register)

Notes:

- *: product specification
- The registers are protected by protection key setting register (SYSC0_PROTKEYR). For details on the protection, see the following chapter: "Low-power Consumption."
- Access to reserved address results bus error response.

5.1. Common Configuration Registers

5.1.1. CR Clock Control Register(SYSC_CRCNTR)

CR clock control register(SYSC_CRCNTR) controls CR clock.

bit	bit 31	bit 16
Field	Reserved	
Data Attribute	R0,WX	
Prot_Attr	WPS	
Initial Value	00000000 00000000	

bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved			TRC[4:0]				
Data Attribute	R0,WX			R/W				
Prot_Attr	WPS

Data Attribute	R0,WX			R/W				
Prot_Attr	WPS							
Initial Value	000			(product specification)				

[bit31:16] Reserved

[bit12:8] TRC[4:0] : Coarse Trimming Bit

These bits are used to trim CR clock frequency

For more details on trim value refer to "chapter:CR calibration".

[bit4:0] TRF[4:0] : Fine Trimming Bit

These bits are used to trim CR clock frequency

For more details on trim value refer to "chapter:CR calibration".

5.1.2. Main Oscillator Control Register(SYSC_MOSCCNTR)

Main oscillator control register(SYSC_MOSCCNTR) is used to control main clock.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	MCMODE	Reserved			MCGAIN[1:0]		Reserved	Reserved

Field	Reserved							FCIMEN
Data Attribute	R0,WX							R0,W0
Prot_Attr	WPS							
Initial Value	00000000							0

[bit31] MCMODE : Main Clock Amplifier Oscillation Mode Bit

This bit is used to set Main clock amplifier oscillation mode.

Bit	Description
0	Main clock amplifier oscillation mode
1	Main clock amplifier oscillation stop mode

Note:

The initial value (value "0") of this bit specifies High drive mode.

To reduce noise, set the mode to low drive mode (value "1") after transition to the user program.

[bit30:28] Reserved

[bit27:26] MCGAIN[1:0] : Main Clock GAIN Bit

The setting of these bits can control gain characteristic of I/O cell.

When Main clock goes through I/O cell, its amplitude is decayed with respect to the gain characteristic.

bit	Description
00	4(3.6)MHz
01	8MHz
10	16MHz
11	25MHz

Note:

These frequency values are just reference value.

Set optimum value according to oscillator matching evaluation.

Generally, MCMODE should be "1" (Stop mode) to optimize by MCGAIN setting.

[bit25:24] Reserved
[bit8] DIV2SEL : Select Bit

This bit is used to divide main clock into two.

bit	Description
0	Main clock
1	Main clock divided by two

[bit7:1] Reserved
[bit0] FCIMEN : Fast Main Clock Input Enable Control Bit

Always set to 0.

5.1.3. Sub Oscillator Control Register(SYSC_SOSCCNTR)

Sub oscillator control register(SYSC_SOSCCNTR) is used to control sub clock.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	Reserved							Reserved
Data	R0,WX							R/W0

Data	R0,WX	R/W
Attribute		
Prot_Attr	WPS	
Initial Value	0000000	0

bit	bit 15	bit 0
Field	Reserved	
Data Attribute	R0,WX	
Prot_Attr	WPS	
Initial Value	00000000 00000000	

[bit31:17] Reserved

[bit16] SUBPORT

This bit is used to set Port function for sub clock input

bit	Description
0	Sub clock input disable (port)
1	Sub clock input enable

[bit15:0] Reserved

5.1.4. PLL/SSCG Stabilization Time Control Register (SYSC_PLLSSCGSTCNTR)

PLL/SSCG stabilization time control register(SYSC_PLLSSCGSTCNTR) is used to control clock stabilization time.

bit	bit 31										bit 8									
Field	Reserved																			
Data Attribute	R0,WX																			
Prot_Attr	WPS																			
Initial Value	00000000 00000000 00000000																			

bit	bit 7			bit 6		bit 5		bit 4		bit 3			bit 2		bit 1		bit 0	
Field	SSCGSTABS[3:0]								PLLSTABS[3:0]									
Data Attribute	R1,WX		R/W						R1,WX		R/W							
Prot_Attr	WPS																	
Initial Value	1111								1111									

[bit31:8] Reserved

[bit7:4] SSCGSTABS[3:0] :

These bits select the stabilization time for SSCG PLL0/1/2/3 clock.

bit7:4	Description
1000	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ⁹ [cycle]
1001	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁰ [cycle]
1010	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹¹ [cycle]
1011	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹² [cycle]
1100	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹³ [cycle]
1101	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁴ [cycle]
1110	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁵ [cycle]
1111	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁶ [cycle]

Reading SSCGSTABS[3] bit always returns '1'

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit3:0] PLLSTABS[3:0] :

These bits select the stabilization time for PLL0/1/2/3 clock.

bit3:0	Description
1000	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ⁹ [cycle]
1001	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁰ [cycle]
1010	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹¹ [cycle]
1011	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹² [cycle]
1100	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹³ [cycle]
1101	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁴ [cycle]
1110	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁵ [cycle]
1111	Stabilization time : (clock period of selected clock from Main clock or Fast CR clock) [s] * 2 ¹⁶ [cycle]

Reading PLLSTABS[3] bit always returns '1'

Notes:

- *These bits have to be set before PLL clock enable setting.*
- *Changing these bits are prohibited after PLL clock enable setting.*

5.1.5. PLL0 Clock Gear Control Register (SYSC_PLL0CGCNTR)

PLL0 clock gear control register(SYSC_PLL0CGCNTR) controls PLL0 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX	
Prot_Attr	WPS	
Initial Value	00000000	

bit	bit 23	bit 16
Field	PLLCGLP[7:0]	
Data Attribute	R/W	
Prot_Attr	WPS	
Initial Value	(product specification)	

bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	PLLCGSTP[1:0]		PLLCGSSN[5:0]					
Data Attribute	R/W		R/W					
Prot_Attr	WPS							
Initial Value	(product specification)		(product specification)					

bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	PLLCGSTS[1:0]		Reserved				PLLCG STR	PLLCG EN
Data Attribute	R,WX		R0,WX				R,W	R/W
Prot_Attr	WPS							
Initial Value	00		0000				0	(product specification)

[bit31:24] Reserved

[bit23:16] PLLCGLP[7:0] : PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before PLL clock enable setting.

- Changing these bits are prohibited after PLL clock enable setting.

[bit15:14] PLLCGSTP[1:0] : PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit13:8] PLLCGSSN[5:0] : PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit7:6] PLLCGSTS[1:0] : PLL Clock Gear Status Bit

These bits show the PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the PLL clock stop or PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved

[bit1] PLLCGSTR : PLL Clock Gear Start Bit

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- This bit is cleared after completion of clock gear operation.

[bit0] PLLCGEN : PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	PLL clock gear disable
1	PLL clock gear enable

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

5.1.6. PLL1 Clock Gear Control Register (SYSC_PLL1CGCNTR)

PLL1 clock gear control register(SYSC_PLL1CGCNTR) controls PLL1 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX	
Prot_Attr	WPS	
Initial Value	00000000	

bit	bit 23	bit 16
Field	PLLCGLP[7:0]	
Data Attribute	R/W	
Prot_Attr	WPS	
Initial Value	(product specification)

[bit31:24] Reserved

[bit23:16] PLLCGLP[7:0] : PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit15:14] PLLCGSTP[1:0] : PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit13:8] PLLCGSSN[5:0] : PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit7:6] PLLCGSTS[1:0] : PLL Clock Gear Status Bit

These bits show the PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the PLL clock stop or PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved

[bit1] PLLCGSTR : PLL Clock Gear Start Bit

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- *This bit is cleared after completion of clock gear operation.*

[bit0] PLLCGEN : PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	PLL clock gear disable
1	PLL clock gear enable

Notes:

- *These bits have to be set before PLL clock enable setting.*
- *Changing these bits are prohibited after PLL clock enable setting.*

5.1.7. PLL2 Clock Gear Control Register (SYSC_PLL2CGCNTR)

PLL2 clock gear control register(SYSC_PLL2CGCNTR) controls PLL2 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX

Initial Value	00		0000				0	(product specification)

[bit31:24] Reserved

[bit23:16] PLLCGLP[7:0] : PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit15:14] PLLCGSTP[1:0] : PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit13:8] PLLCGSSN[5:0] : PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit7:6] PLLCGSTS[1:0] : PLL Clock Gear Status Bit

These bits show the PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the PLL clock stop or PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved**[bit1] PLLCGSTR : PLL Clock Gear Start Bit**

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- *This bit is cleared after completion of clock gear operation.*

[bit0] PLLCGEN : PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	PLL clock gear disable
1	PLL clock gear enable

Notes:

- *These bits have to be set before PLL clock enable setting.*
- *Changing these bits are prohibited after PLL clock enable setting.*

5.1.8. PLL3 Clock Gear Control Register (SYSC_PLL3CGCNTR)

PLL3 clock gear control register(SYSC_PLL3CGCNTR) controls PLL3 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX	
Prot_Attr	WPS	
Initial Value	00000000

Initial Value	00		0000				0	(product specification)

[bit31:24] Reserved

[bit23:16] PLLCGLP[7:0] : PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit15:14] PLLCGSTP[1:0] : PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit13:8] PLLCGSSN[5:0] : PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before PLL clock enable setting.
- Changing these bits are prohibited after PLL clock enable setting.

[bit7:6] PLLCGSTS[1:0] : PLL Clock Gear Status Bit

These bits show the PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the PLL clock stop or PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved
[bit1] PLLCGSTR : PLL Clock Gear Start Bit

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- *This bit is cleared after completion of clock gear operation.*

[bit0] PLLCGEN : PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	PLL clock gear disable
1	PLL clock gear enable

Notes:

- *These bits have to be set before PLL clock enable setting.*
- *Changing these bits are prohibited after PLL clock enable setting.*

5.1.9. SSCG PLL0 Clock Gear Control Register (SYSC_SSCG0CGCNTR)

SSCG PLL0 clock gear control register(SYSC_SSCG0CGCNTR) controls SSCG PLL0 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX	
Prot_Attr	WPS	
Initial Value	00000000	

bit	bit 23	bit 16
Field	SSCGCGLP[7:0]	
Data Attribute	R/W	
Prot_Attr	WPS

Initial Value	00		0000				0	(product specification)

[bit31:24] Reserved

[bit23:16] SSCGCGLP[7:0] : SSCG PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before SSCG PLL clock enable setting.

- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit15:14] SSCGCGSTP[1:0] : SSCG PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit13:8] SSCGCGSSN[5:0] : SSCG PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit7:6] SSCGCGSTS[1:0] : SSCG PLL Clock Gear Status Bit

These bits show the SSCG PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the SSCG PLL clock stop or SSCG PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved
[bit1] SSCGCGSTR : SSCG PLL Clock Gear Start Bit

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- *This bit is cleared after completion of clock gear operation.*

[bit0] SSCGCGEN : SSCG PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	SSCG PLL clock gear disable
1	SSCG PLL clock gear enable

Notes:

- *These bits have to be set before SSCG PLL clock enable setting.*
- *Changing these bits are prohibited after SSCG PLL clock enable setting.*

5.1.10. SSCG PLL1 Clock Gear Control Register (SYSC_SSCG1CGCNTR)

SSCG PLL1 clock gear control register(SYSC_SSCG1CGCNTR) controls SSCG PLL1 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX

[bit31:24] Reserved

[bit23:16] SSCGCGLP[7:0] : SSCG PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before SSCG PLL clock enable setting.

- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit15:14] SSCGCGSTP[1:0] : SSCG PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit13:8] SSCGCGSSN[5:0] : SSCG PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit7:6] SSCGCGSTS[1:0] : SSCG PLL Clock Gear Status Bit

These bits show the SSCG PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the SSCG PLL clock stop or SSCG PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved
[bit1] SSCGCGSTR : SSCG PLL Clock Gear Start Bit

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- *This bit is cleared after completion of clock gear operation.*

[bit0] SSCGCGEN : SSCG PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	SSCG PLL clock gear disable
1	SSCG PLL clock gear enable

Notes:

- *These bits have to be set before SSCG PLL clock enable setting.*
- *Changing these bits are prohibited after SSCG PLL clock enable setting.*

5.1.11. SSCG PLL2 Clock Gear Control Register (SYSC_SSCG2CGCNTR)

SSCG PLL2 clock gear control register(SYSC_SSCG2CGCNTR) controls SSCG PLL2 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX

[bit31:24] Reserved

[bit23:16] SSCGCGLP[7:0] : SSCG PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before SSCG PLL clock enable setting.

- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit15:14] SSCGCGSTP[1:0] : SSCG PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit13:8] SSCGCGSSN[5:0] : SSCG PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit7:6] SSCGCGSTS[1:0] : SSCG PLL Clock Gear Status Bit

These bits show the SSCG PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the SSCG PLL clock stop or SSCG PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved
[bit1] SSCGCGSTR : SSCG PLL Clock Gear Start Bit

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- *This bit is cleared after completion of clock gear operation.*

[bit0] SSCGCGEN : SSCG PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	SSCG PLL clock gear disable
1	SSCG PLL clock gear enable

Notes:

- *These bits have to be set before SSCG PLL clock enable setting.*
- *Changing these bits are prohibited after SSCG PLL clock enable setting.*

5.1.12. SSCG PLL3 Clock Gear Control Register (SYSC_SSCG3CGCNTR)

SSCG PLL3 clock gear control register(SYSC_SSCG3CGCNTR) controls SSCG PLL3 clock gear.

bit	bit 31	bit 24
Field	Reserved	
Data Attribute	R0,WX

[bit31:24] Reserved

[bit23:16] SSCGCGLP[7:0] : SSCG PLL Clock Gear Loop Configuration Bit

These bits select the number of loop per step.

bit23:16	Description
00000000	1 loop
00000001	2 loops
00000010	3 loops
...	
11111101	254 loops
11111110	255 loops
11111111	256 loops

Notes:

- These bits have to be set before SSCG PLL clock enable setting.

- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit15:14] SSCGCGSTP[1:0] : SSCG PLL Clock Gear Step Configuration Bit

These bits select the number of step width at gear up/down operation.

bit15:14	Description
00	1 step
01	2 steps
10	3 steps
11	4 steps

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit13:8] SSCGCGSSN[5:0] : SSCG PLL Clock Gear Start Step Configuration Bit

These bits set the start step.

bit13:8	Description
000000	0
000001	1
000010	2
...	
111101	61
111110	62
111111	63

Notes:

- These bits have to be set before SSCG PLL clock enable setting.
- Changing these bits are prohibited after SSCG PLL clock enable setting.

[bit7:6] SSCGCGSTS[1:0] : SSCG PLL Clock Gear Status Bit

These bits show the SSCG PLL clock gear status.

Bit7:6	Description
00	Clock gear operation reaches minimum frequency
01	Gear up operation
10	Clock gear operation reaches maximum frequency
11	Gear down operation

Notes:

- In the SSCG PLL clock stop or SSCG PLL clock stabilization wait, return a "00" status.
- if clock gear not used, the status is "X" (undefined).

[bit5:2] Reserved
[bit1] SSCGCGSTR : SSCG PLL Clock Gear Start Bit

This bit is used to start clock gear operation.

bit	Description
0	No operation
1	Start clock gear operation

Note:

- *This bit is cleared after completion of clock gear operation.*

[bit0] SSCGCGEN : SSCG PLL Clock Gear Enable Bit

This bit controls enable/disable clock gear operation.

bit	Description
0	SSCG PLL clock gear disable
1	SSCG PLL clock gear enable

Notes:

- *These bits have to be set before SSCG PLL clock enable setting.*
- *Changing these bits are prohibited after SSCG PLL clock enable setting.*

5.2. Clock Output Function Register

Clock Output Function register is used to control clock output function.

5.2.1. Clock Output Function Control Register (SYSC_CKOTCNTR)

Clock output function control register(SYSC_CKOTCNTR) is used to control clock output function.

Initial Value	0000				0000			

[bit31:25] Reserved

[bit24] ENCLKO :

This bit controls enable/disable clock output function

bit	Description
0	Clock output function disable
1	Clock output function enable

[bit23:11] Reserved

[bit10:8] CKOUTDIV[2:0] : Clock Division Bits

These bits configure the clock output divider.

bit10:8	Description
000	Output clock is not divided
001	Output clock is divide by 2
010	Output clock is divide by 4
011	Output clock is divide by 8
100	Output clock is divide by 16
101	Output clock is divide by 32
110	Output clock is divide by 64
111	Output clock is divide by 128

[bit7:4] Reserved**[bit3:0] CKSEL[3:0] : Clock Select Bits**

These bits select the source clock for clock output function.

bit3:0	Description
0000	Fast-CR clock is selected
0001	Slow-CR clock is selected
0010	Main clock is selected
0011	Sub clock is selected
0100	PLL0 clock is selected
0101	PLL1 clock is selected
0110	PLL2 clock is selected
0111	PLL3 clock is selected
1000	SSCG PLL0 clock is selected
1001	SSCG PLL1 clock is selected
1010	SSCG PLL2 clock is selected
1011	SSCG PLL3 clock is selected
1100	Prohibit (Fast-CR clock is selected)
1101	Prohibit (Fast-CR clock is selected)
1110	Prohibit (Fast-CR clock is selected)
1111	Clock is tied to low

6. Usage Precautions

The section explains the precautions when using the clock system.

The implementation of PLL1-3 and SSCG0-3 is dependent of product variation.

Please refer to the TRM of the each product.

If you select a clock that does not exist, Fast CR clock is selected.

The following registers for non-existent clocks no longer exist and become the reserve area.

SYSC_PLLxCGCNTR

SYSC_SSCGxCGCNTR

- The change of the PLL/SSCG PLL configuration

The PLL/SSCG PLL configurations have to be set before PLL/SSCG PLL clock enable setting. Changing the PLL/SSCG PLL configurations are prohibited after PLL/SSCG PLL clock enable setting.

Set the same configurations to RUN and PSS profiles if PLL/SSCG PLL clocks are enabled in PSS.

- The change of the clock gear configuration

The clock gear configurations have to be set before PLL/SSCG PLL clock enable setting. Changing the clock gear configurations are prohibited after PLL/SSCG PLL clock enable setting

- The operation of the clock gear

Poll the clock gear status flag during clock gear UP/DOWN operation and wait for the clock gear stop status.

- The internal operating clock

Do not access the peripheral resource whose internal operating clock is disabled.

- Peripherals with independent clock control the following peripherals have independent clock control from clock system.

- Hardware watchdog timer
- Software watchdog timer
- RTC
- CAN prescaler
- EICU

- The selection of Domain clock

Do not use Sub clock for the domain clock.

For more details, refer to the each chapter of peripheral.

CHAPTER 6: Low Power Consumption

This chapter explains the functions and operations for low power consumption.

1. Overview
2. Configuration
3. Explanation of Operation
4. Operation Procedure
5. Registers
6. Other

LOWPOWER-TXXPT03P01R01L08-E1-XX

1. Overview

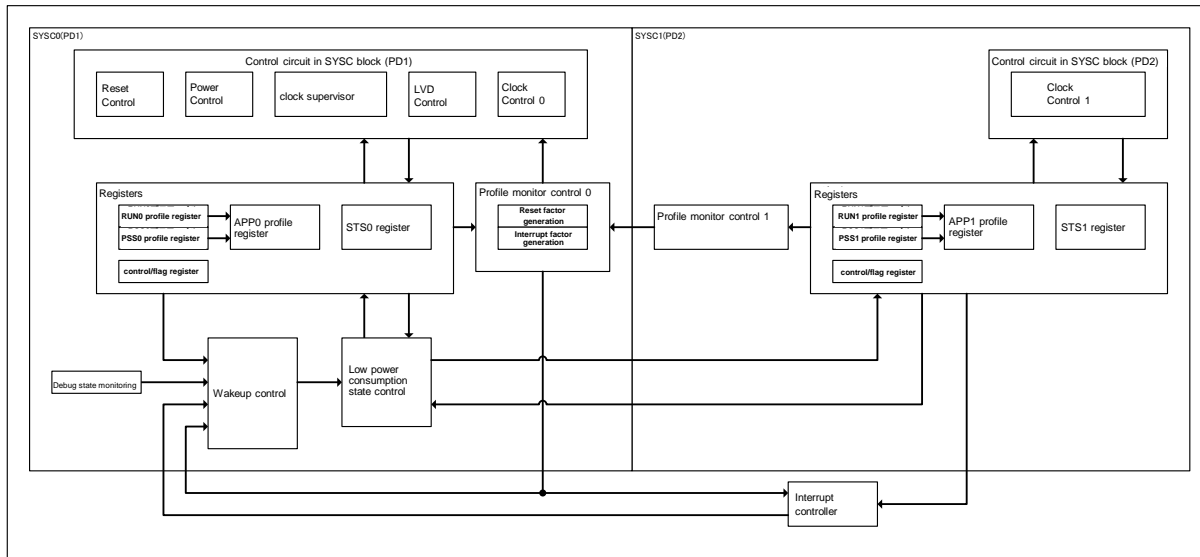

This section provides an overview of low power consumption.

This product has a wide variety of power consumption settings and can control power consumption according to the situation.

2. Configuration

This section explains the configuration for low power consumption.

Figure 2-1 Block Diagram of Low Power Consumption Control

■ SYSC (SYStem Controller 0/1)

This is the name for a collection of blocks including the clock, reset, and LVD control blocks.

■ Registers

The RUN/PSS profile setting register is updated to the APP profile register, and these results can be confirmed with the STS register. For the detailed functions of the registers, see section Registers.

■ Wakeup control

This block controls factors for the CPU in returning from the program stop state.

■ Low power consumption state control

This block manages and controls the low power consumption states.

■ Profile monitoring control 0/1

This block monitors the contents of the RUN/PSS profile.

■ Reset/Interrupt factor generation

The block generates a reset or interrupt factor when there is a profile error.

■ Debug state monitoring

The block determines the occurrence of the debug state.

3. Explanation of Operation

This section explains the operations for low power consumption.

3.1. Low Power Consumption State

This section explains low power consumption states.

Broadly, there are 2 chip states.

- RUN (Normal Operation)
- PSS (Power Saving State)

RUN

This is the state in which the CPU is operating programs or has stopped programs.

The program stop state is a state in which RUN overrides PSS enable and the WFI instruction is executed.

The CPU operates in this state (programs are operating) after an initialization reset.

In this state, a RUN profile update and a transition to PSS are possible.

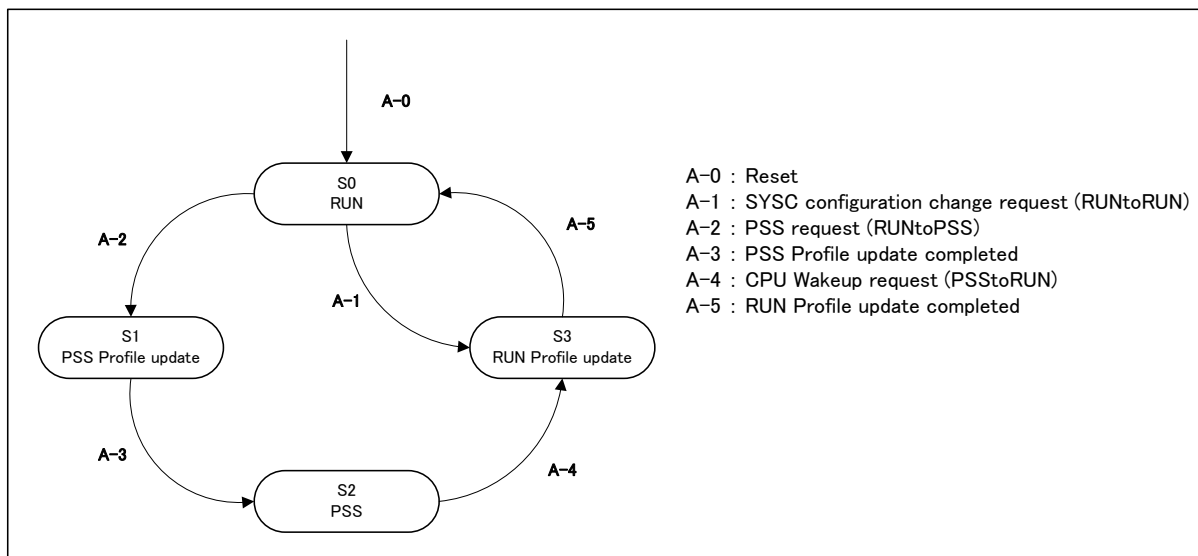

PSS

This is the state in which the CPU has stopped programs and can set low power consumption.

Access becomes impossible since the Flash macro is in low power state.

A variety of low power consumption states are supported through freely changed profile settings.

Figure 3-1 State Transition Diagram

- S0 : RUN
- S1 : Updating PSS Profile (Updating system by the setting in PSS Profile Registers)
- S2 : PSS
- S3 : Updating RUN Profile (Updating system by the setting in RUN Profile Registers)

You can set the following items freely with RUN/PSS.

- Clock related
 - Source clock oscillation enable/stop
 - Clock domain control (source selection, division, and oscillation enable and stop of each domain clock)
- CSV setting
 - ON/OFF setting
- LVD setting
 - ON/OFF setting
 - Detection voltage
 - Interrupt/Reset selection
- Regulator setting
 - Output voltage setting
 - Mode selection
- Each power domain
 - Power supply ON/OFF

3.2. Power Supply Domain

This section shows the configuration of a power supply domain.

Hierarchy

This product has the following power supply domains.

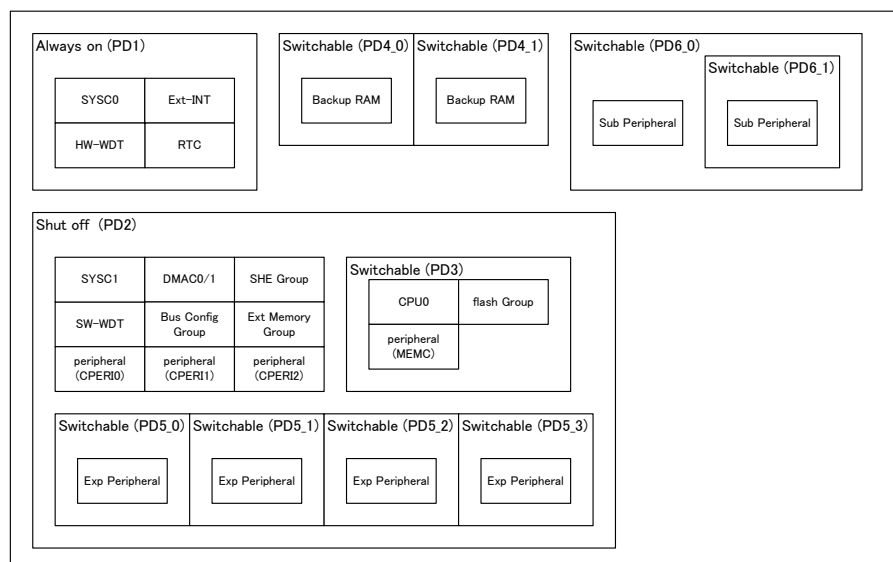

- Always ON power supply domain (PD1)
- Peripheral power supply domain (PD2)
- Core power supply domain (PD3)
- Backup RAM power supply domain (PD4_0/1)
- Extended Peripheral power supply domain (PD5_0-3)
- Sub Peripheral power supply domain (PD6_0/1)

Power is always supplied to the Always ON power supply domain (PD1). Other domains can select their supply of power. Some power supply domains have a parent-child relationship. PD2 and PD3 can have only settings that are the same. To turn OFF the power supply of the Core power supply domain or Peripheral power supply domain (PD2/PD3), you need to turn OFF the power supply of the Extended Peripheral domain (PD5_0-3). The same relationship also applies to a Sub Peripheral power supply domain (PD6_0) and another Sub Peripheral power supply domain (PD6_1).

Table 3-1 List of Power Supply Domain States

State	PD1	PD2	PD3	PD4_0/1	PD5_0-3	PD6_0	PD6_1
RUN	ON	ON	ON	ON/OFF	ON	ON	ON
	ON	ON	ON	ON/OFF	OFF	ON	ON
PSS	ON	ON	ON	ON/OFF	ON	ON	ON
	ON	ON	ON	ON/OFF	OFF	ON	ON
	ON	OFF	OFF	ON/OFF	OFF	ON	ON
	ON	OFF	OFF	ON/OFF	OFF	ON	OFF
	ON	OFF	OFF	ON/OFF	OFF	OFF	OFF

Whether to use the PD3, PD5_0-3, or PD6_1 power supply domain depends on the user.

Figure 3-2 Block Diagram of Power Supply Domain**Supply of Power**

The supply method is different for each power supply domain.

1. Internal regulator supply area
PD1, PD4_0, PD4_1, PD6_0, PD6_1
2. External regulator supply area
PD2, PD5_0, PD5_1, PD5_2, PD5_3

Startup and shutdown sequences

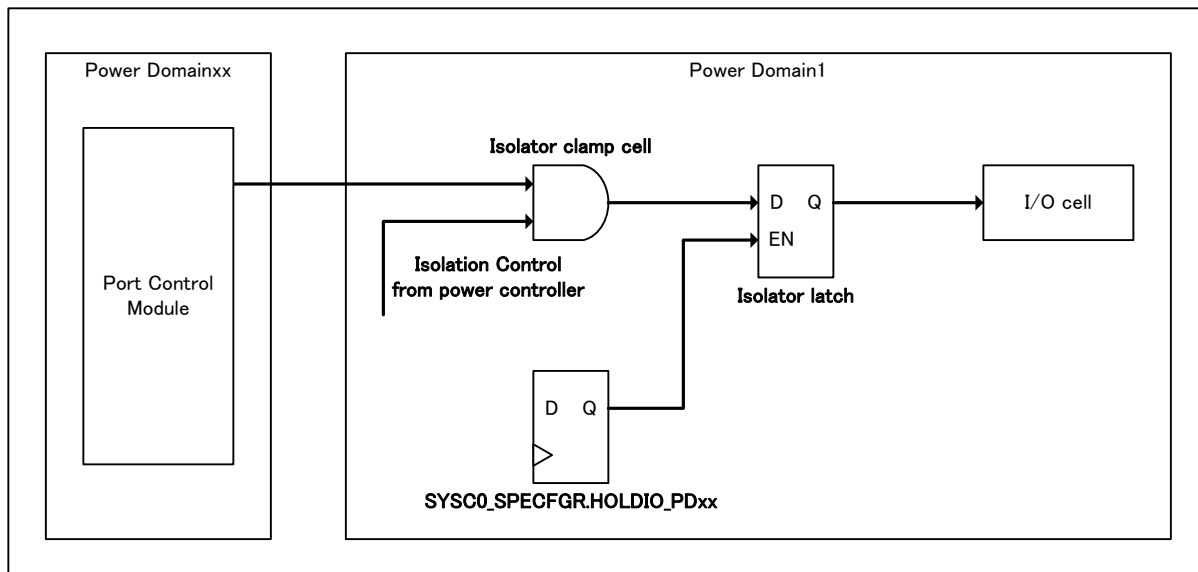

To start up the power supply, turning ON all Power Supply Domains power supply or external power simultaneously.

To shut down the power supply, turning OFF all Power Supply Domains power supply simultaneously.

I/O Control when Power Supply is OFF

Turning OFF the power supply of power domain also turns OFF the power supply of the circuit controlling I/O in the power domain. A latch to retain an I/O control signal is available for retaining the I/O control state at that time.

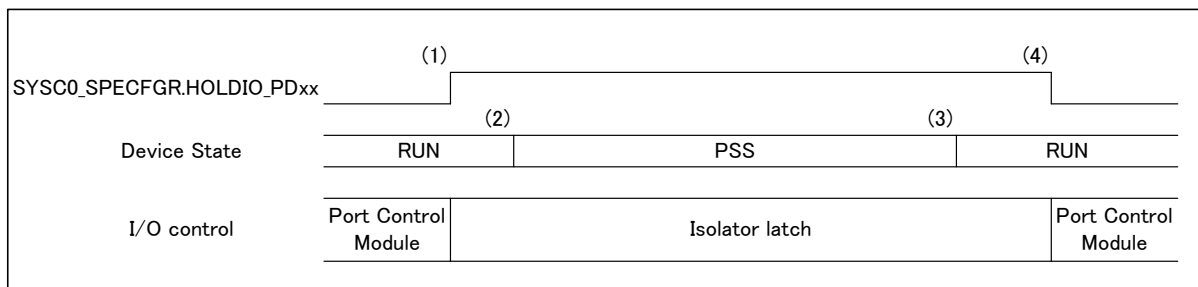

The following figure shows the circuit configuration of the I/O control block.

Figure 3-3 I/O Control Circuit Configuration

Note:

- PDxx = PD2/PD5_0/PD5_1/PD5_2/PD5_3/PD6_0/PD6_1

Output of the isolator clamp cell becomes fixed by control from the power controller when the PDxx power supply is turned OFF. Therefore (to prevent a signal from PDxx from having midpoint potential and destroying the PD1 cell), control for the I/O cell becomes fixed. To prevent this, the isolator latch is inserted between the I/O cell and isolator clamp cell. Before the PDxx power supply is turned OFF, register control retains a control signal for the I/O cell. As a result, the I/O cell state is retained even when the PDxx power supply is turned OFF.

The following figure shows an example of I/O control when the PDxx power supply is turned OFF.

Figure 3-4 I/O Control Time Chart

- (1) Write "1" to SYSC0_SPECFGR.HOLDIO_PDxx before a transition to PSS (turning OFF the PDxx power supply).
- (2) Upon receipt of the PSS transition trigger, there is a transition to PSS.
- (3) Factors such as interrupts cause the CPU to return from PSS and transition to RUN.
- (4) After updating the I/O control register with the user program, write "0" to SYSC0_SPECFGR.HOLDIO_PDxx.

3.3. Profile Setting Items

This section explains profile setting items.

Programs can freely set both RUN and PSS, except for some settings.

Table 3-2 shows parameters that can be set with the RUN/PSS profile in each mode.

Table 3-2 List of RUN/PSS Profile Setting Parameters

Category	Setting Item	RUN Setting (Initial Value)	RUN Setting	PSS Setting	Control Block
Power	Power domain 6_1 power supply control	ON	ON	Enable control	SYSC0
	Power domain 6_0 power supply control	ON	ON	Enable control	SYSC0

3.4. Profile

This section explains profiles.

For detailed descriptions of the profiles, see "List of RUN/PSS Profile Setting Parameters" For a profile update, the control circuit changes individual settings after software has started the update. A combination with a problem in the profile settings is called a profile error. A profile in the profile error state cannot be updated. For details on profile errors, see "Profile errors." Also, you can check the profile error state with the register.

This notation will be used in the following sections.

- X: Don't care
- 0/1: Active value
- C: Object to be compare

3.4.1. Profile errors

The following table shows descriptions of profile errors.

Table 3-3 List of Profile Errors

Classification	Error Description	Target State RUN/PSS	Error Flag
Clock	The PLL input clock stops when PLL0/SSCG0 clock oscillation enable is set.	RUN/PSS	SYSC0_SYSRUNPEFR:PEF0 SYSC0_SYSPSSPEFR:PEF0
	The selected source clock of clock domain 0/MCUC clock domain is a clock for which oscillation is disabled.	RUN/PSS	SYSC0_SYSRUNPEFR:PEF1 SYSC0_SYSPSSPEFR:PEF1
	The source clock for clock domain 0/MCUC clock domain was fixed at "L" in RUN.	RUN	SYSC0_SYSRUNPEFR:PEF2
	The PLL0/SSCG0 setting was changed in the PLL0/SSCG0 oscillation state.	RUN/PSS	SYSC0_SYSRUNPEFR:PEF3 SYSC0_SYSPSSPEFR:PEF3
CSV	CSV operation was enabled while monitoring/reference clock oscillation was disabled.	RUN/PSS	SYSC0_SYSRUNPEFR:PEF4 SYSC0_SYSPSSPEFR:PEF4
	The oscillation of the monitoring clock did not stop simultaneously when CSV operation in progress was disabled.	RUN/PSS	SYSC0_SYSRUNPEFR:PEF5 SYSC0_SYSPSSPEFR:PEF5
SW-WDT	The clock used by the software watchdog has stopped.	RUN/PSS	SYSC0_SYSRUNPEFR:PEF6 SYSC0_SYSPSSPEFR:PEF6
HW-WDT	The clock used by the hardware watchdog has stopped.	PSS	SYSC0_SYSPSSPEFR:PEF7
Clock Regulator	The regulator mode changed to standby during PLL oscillation enable.	PSS	SYSC0_SYSPSSPEFR:PEF8
Clock Power	The set source clock of clock domain 0 was any clock other than the high-speed CR clock, with the RUN profile that is set at the return time from the PSS that powered OFF PD2 (when a Security reevaluation is necessary).	PSS	SYSC0_SYSPSSPEFR:PEF9
Power	Power domain restrictions (hierarchical relationship/combination) were ignored.	PSS	SYSC0_SYSPSSPEFR:PEF10

Notes:

- If sub/PLL/SSCG is not implemented, those items are inapplicable for profile error.

3.4.1.1 The PLL0/SSCG0 input clock stops when PLL0/SSCG0 clock oscillation enable is set.

3.5. Interrupts

This section explains interrupts.

The following table shows interrupts that lead to low power consumption.

Table 3-4 List of Interrupts

Generation Condition	Factor Register	Enabling Condition	Clearing Condition
When a RUN profile update is completed	SYSC0_SYSSTSR: RUNDFO	Writing "1" to the SYSC0_SYSINTER:RUNDIE0 bit	Writing "1" to the SYSC0_SYSCILR:RUNDCLR 0 bit
When the RUN profile register contents have an error and the RUN profile update trigger is enabled	SYSC0_SYSERRIR1: RUNERRIF0	Always enabled because of the NMI level	Writing "1" to the SYSC0_SYSERRICLR1:RUNE RRICLR0 bit
When the RUN profile register contents have an error during a transition to PSS (execution of the WFI instruction)	SYSC0_SYSERRIR1: RUNWKERRIF0	Always enabled because of the NMI level	Writing "1" to the SYSC0_SYSERRICLR1:RUNW KERRICLR0 bit
When the PSS profile register contents have an error during a transition to PSS (execution of the WFI instruction)	SYSC0_SYSERRIR1: PSSERRIF0	Always enabled because of the NMI level	Writing "1" to the SYSC0_SYSERRICLR1:PSSE RRICLR0 bit
When the value written to the PSS update enable register is invalid	SYSC0_SYSERRIR1: PSENERRIF0	Always enabled because of the NMI level	Writing "1" to the SYSC0_SYSERRICLR1:PSSE NERRICLR0 bit
When a transition cancellation occurs during a PSS transition	SYSC0_SYSERRIR1: PSSTRGCIF0	Always enabled because of the NMI level	Writing "1" to the SYSC0_SYSERRICLR1:PSSTR GCICLR0 bit
When the value written to the RUN Profile Update Trigger Register is invalid	SYSC0_SYSERRIR1: RUNTRGERRIF	Always enabled because of the NMI level	Writing "1" to the SYSC0_SYSERRICLR1:RUNT RGERRICLR bit
When the RUN profile is updated again during a RUN profile update	SYSC0_SYSERRIR1: TRGERRIF	Always enabled because of the NMI level	Writing "1" to the SYSC0_SYSERRICLR1:TRGE RRICLR bit

3.6. Bus Error Response

This section explains bus error responses.

A bus error response is made when a register is accessed in the following circumstances.

1. An invalid value was written to the protection key setting register.
2. The protection target register was write-accessed without protection being released. (Each SCT register is a target only during the oscillation stabilization wait time.)
3. The protection key setting register was write-accessed while the protection was being released.
4. The protection target register was write-accessed from anything other than the master that released the protection key.
5. The RUN profile register group (SYSC0) was write-accessed during a RUN profile update. In this case, the written data becomes invalid.
6. The RUN/PSS profile register group (SYSC1) was write-accessed after PSEN became valid. In this case, the written data becomes invalid.
7. The RUN profile register group (SYSC1) was write-accessed after RUN profile update enable register (SYSC1_RUNENR) became valid. In this case, the written data becomes invalid.
8. The RUN/PSS profile register group (SYSC1) was write-accessed after PSS profile update enable register became valid. In this case, the written data became invalid.

4. Operation Procedure

The section explains the operation procedures for low power consumption.

4.1. RUN Profile Update

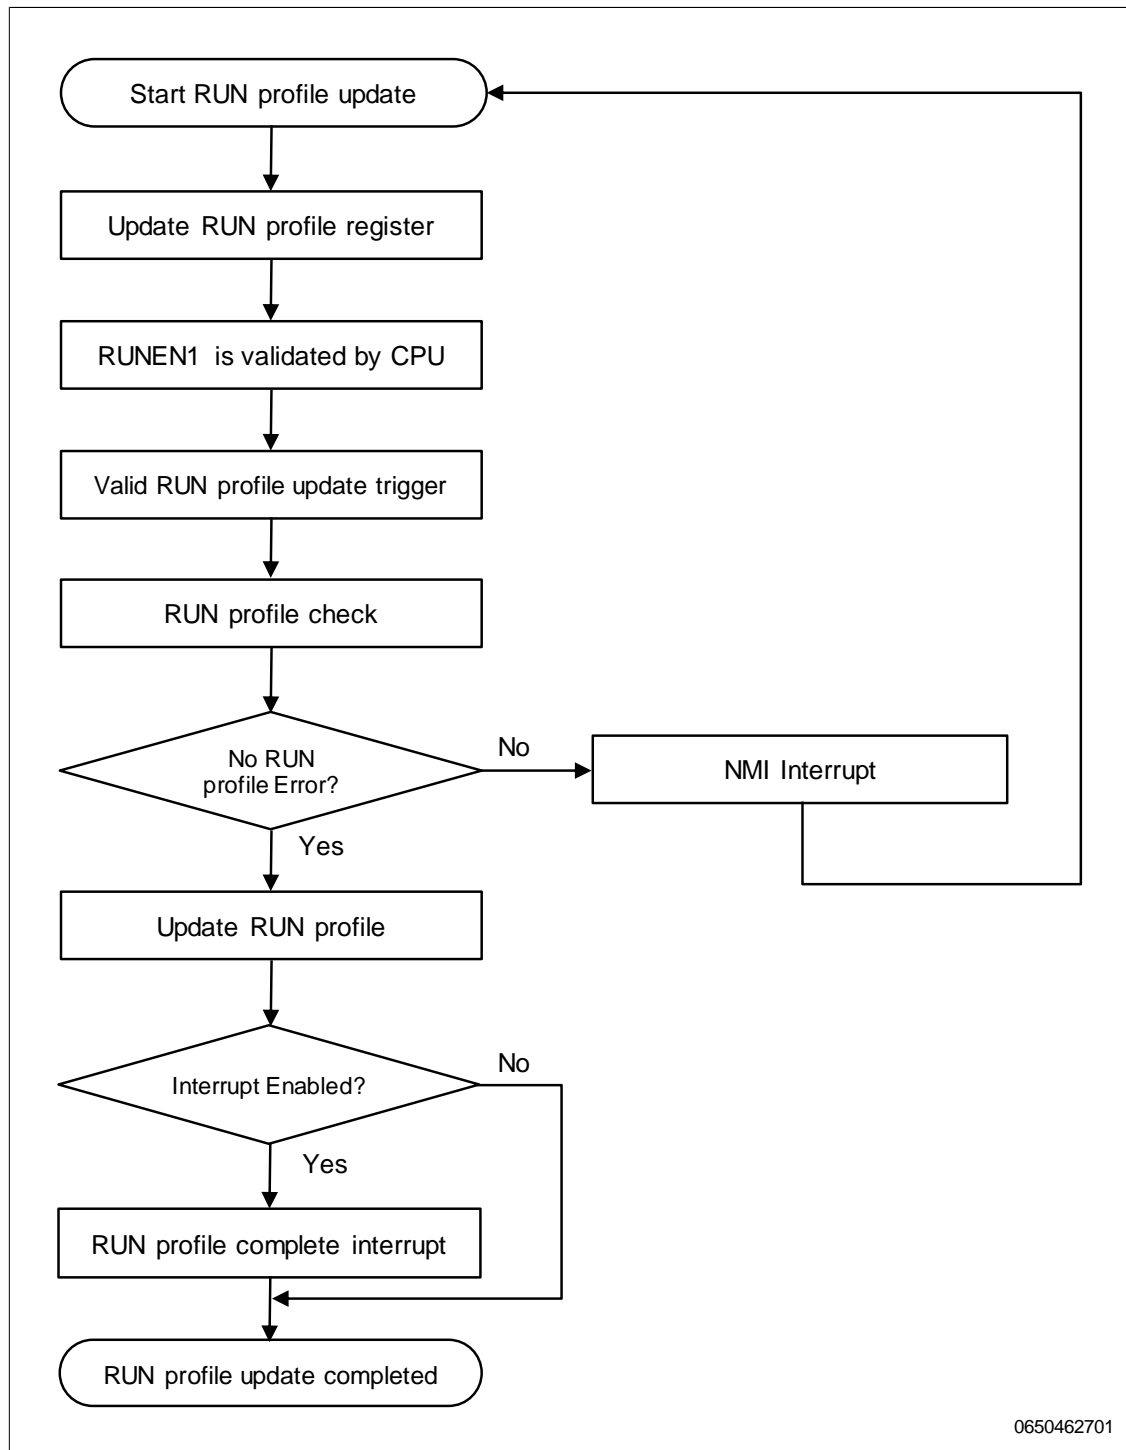

The section explains an example of an operation procedure for RUN profile update.

The following example explains an operation procedure for RUN profile update.

1. The user prepares a new RUN profile (register settings).
2. Write 0xAB to RUN profile update enable register (SYSC1_RUNENR).
3. Start a profile update by writing 0xAB to the RUN profile update trigger register (SYSC0_TRGRUNCNTR:APPLY_RUN).
4. The control circuit confirms the new RUN profile contents. If the contents of settings have any problem, a profile error occurs, and an error interrupt (NMI) is generated. At the same time, "1" is set in system error interrupt factor register 1 (SYSC0_SYSERRIR1:RUNERRIF0). The new profile contents are discarded, and the circuit operates with the contents of the profile currently in use.
5. When the new RUN profile contents have no problem, the control circuit reflects the profile contents as follows.
 1. The circuit sets "1" in the system status register (SYSC0_SYSSTSR:RUNSTS0).
 2. The circuit copies the RUN profile contents to the APP profile.
 3. The copying reflects the following: clock oscillation enable/stop (also including oscillation stabilization wait), CSV setting changes, LVD setting changes, clock operation settings (source clock change, division, ON/OFF of each clock source), ON/OFF of each power domain, and clock stop settings (stopping a source clock).
 4. When the RUN profile update is completed, the circuit clears the system status register (SYSC0_SYSSTSR:RUNSTS0) to "0" and sets "1" in the system status register (SYSC0_SYSSTSR:RUNDF0). Also, if the system status interrupt enable register (SYSC0_SYSINTER:RUNDIE0) is enabled, an interrupt is generated.

Notes:

- Any attempt to update a RUN profile again while a new RUN profile is being updated causes the generation of a system error interrupt (SYSC0_SYSERRIR1:RUNTRGERRIF). Furthermore, the RUN profile of the re-update attempt becomes invalid.
- Before updating the RUN profile, confirm in the flags of the profile status register (SYSC0_SYSPROSTSR:RUNPSTS) that there is no profile error. Any update of a RUN profile in the profile error state causes the generation of an NMI interrupt. Furthermore, the RUN profile settings are discarded.

Figure 4-1 RUN Profile Update Operation Flowchart

4.2. Transition from RUN to PSS

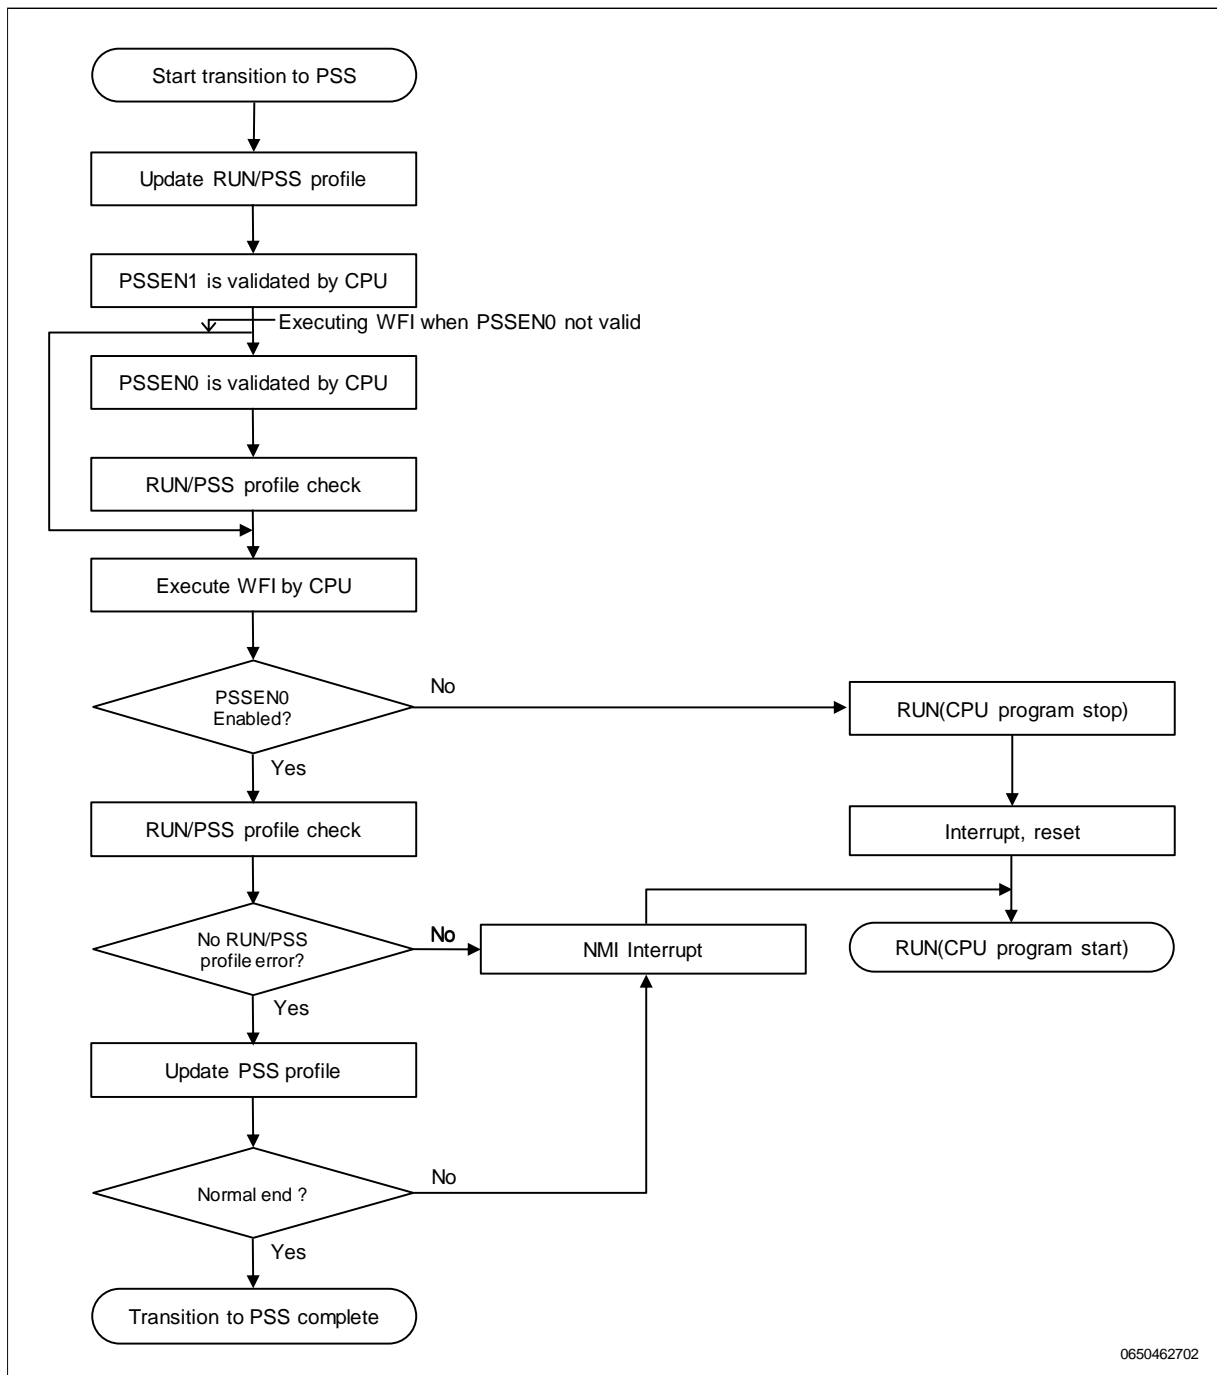

This section explains an example of an operation procedure for a transition from RUN to PSS.

The following example explains an operation procedure for the transition to PSS.

1. The user prepares a new PSS profile and RUN profile (register settings). For the RUN profile, make settings for returning from PSS.
2. Write 0xBA to the PSS profile update enable register (SYSC1_PSSSEN:PSSEN1).
3. Write 0xBA to the PSS profile update enable register (SYSC0_PSSSEN:PSSEN0).
4. Have the CPU execute the WFI instruction. A profile update begins, with the instruction as a trigger.
5. Confirm the contents of the PSS/RUN profile to update. If the contents of the RUN/PSS profile settings have a problem, the system error interrupt flag register (SYSC0_SYSERRIR1:RUNWKERRIF0/PSSEIRIF0) becomes valid. If either of the profiles has an error, an NMI interrupt is generated. The interrupt cannot be made invalid. Check the flag register contents for a description of the profile error, and correct the part that has the problem.
6. When the PSS profile contents have no problem, the control circuit reflects the profile contents as follows.
 1. The circuit sets the PSS profile setting state of the CPU (SYSC0_SYSSTSR:PSSSTS0) to "1".
 2. The circuit copies the PSS profile contents to the APP profile.
 3. The circuit checks whether a WAKEUP request has been generated. If a WAKEUP request has been generated, the transition to PSS is canceled. Then, an NMI interrupt is generated, and the system error interrupt factor register (SYSC0_SYSERRIR1:PSSTRGCIF0) is set to "1".
 4. The circuit handles the following: clock oscillation enable/stop (also including oscillation stabilization wait), CSV setting changes, LVD setting changes, clock operation settings (source clock change, division, ON/OFF of each clock source), ON/OFF of each power domain, and clock stop settings (stopping a source clock).
 5. The circuit sets the PSS profile setting state (SYSC0_SYSSTSR:PSSSTS0) to "0" and the PSS profile completion flag (SYSC0_SYSSTSR:PSSSDF0) "1".
7. The transition to PSS is completed. If the regulator settings have been changed at the same time, the settings have changed.

■ Notes:

- If the WFI instruction is executed without the PSS profile update enable register (SYSC0_PSSSEN:PSSEN0) enabled, there is no transition to PSS. The CPU remains in RUN (programs stopped). To return from WFI, return with an interrupt, reset, etc.
- To turn OFF PD2, enable the HOLD data latch setting bit. If you do not set it, I/O state can not be retained.
- When returning to Run mode, Main_OSC must be valid. Therefore, be sure to enable Main_OSC setting of the RUN mode profile before entering the PSS mode.

Figure 4-2 RUN to PSS Operation Flowchart

■ Prepare Wakeup from PSS Mode by Interrupt

There are multiple ways to setup interrupts for wakeup from PSS mode. The major steps that apply in most cases are described in the following list.

Table 4-1 Steps to prepare Wakeup from PSS by Interrupt

Step	Purpose	Action
S1	Make sure that the CPU accepts interrupts.	Set the I-flag in PSR of the CPU core to "0". This enables any interrupt that might occur.
S2	If it is intended to finish pending interrupts before PSS mode, wait for the indication from IRCn.	Poll the IRCn_IRQST:nIRQ flag. While reading "0", not all ISRs are finished. Once the logic value "1" is read, the IRC will not accept any subsequent interrupts. (*1)
S3	Configure the desired wake-up sources.	Enable the interrupts that are intended for wake-up, disable others. (*2)
S4	Remove the lock from IRC.	Write to any of the registers that are listed in the description of IRCn_IRQST:nIRQ. - IRCn_IRQVAr - IRCn_IRQPL0-127 - IRCn_IRQS0-15 - IRCn_IRQR0-15 - IRCn_IRQCES0-15 - IRCn_IRQCEC0-15 - IRCn_IRQCE0-15 - IRCn_IRQHC - IRCn_IRQPLM - IRCn_CSR
S5	Prepare the transition from RUN to PSS mode	Follow the steps for transition to PSS mode as described above.
S6	Transition to PSS mode	Execute the WFI instruction.

Notes:

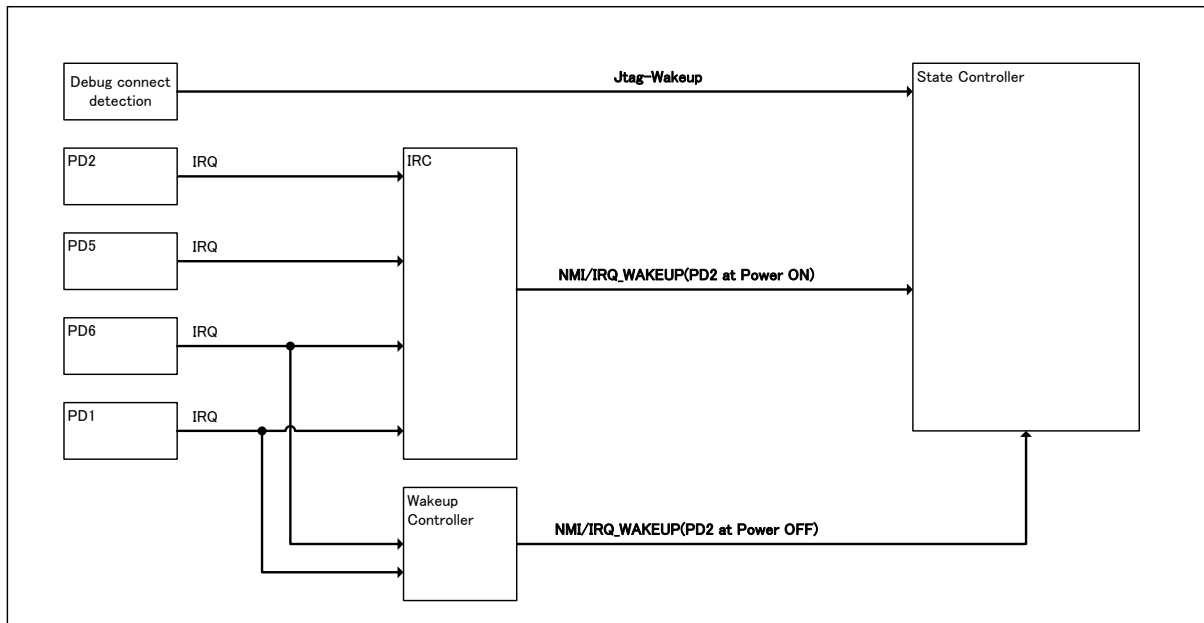

- (*1): If the read access in step S2 returns a pending interrupt request, the processor will execute the interrupt service routine. After return from interrupt, the IRQ interrupt status bit nIRQ will show "end of return from interrupt instruction".
- (*2): If the interrupt should be used for wakeup without a specific interrupt service routine, this can be achieved by setting the I-Flag to "1" before S3. It must be considered that any write access to one of the registers listed in S4 will remove the lock from the IRC.

4.3. Transition from PSS to RUN

This section explains an example of an operation procedure for a transition from PSS to RUN.

The following figure is a schematic diagram of the Wakeup circuit.

Figure 4-3 Schematic Diagram of Wakeup Circuit

The return factors have some restrictions due to disconnection of the power supply. The following table shows factors in returning from PSS.

Table 4-1 Factors in Returning from PSS (Interrupts)

Power Supply State						Interrupt Return Factor	Return Path
PD1	PD2/3	PD4_x	PD5_x	PD6_0	PD6_1		
ON	ON	ON/OFF	ON	ON	ON	Peripheral interrupt (PD1) Peripheral interrupt (PD2) Peripheral interrupt (PD5) Peripheral interrupt (PD6)	IRC
ON	ON	ON/OFF	OFF	ON	ON	Peripheral interrupt (PD1) Peripheral interrupt (PD2) Peripheral interrupt (PD6)	IRC
ON	OFF	ON/OFF	OFF	ON	ON	Peripheral interrupt (PD1) Peripheral interrupt (PD6)	Wakeup Controller
ON	OFF	ON/OFF	OFF	ON	OFF	Peripheral interrupt (PD1) Peripheral interrupt (PD6)	Wakeup Controller
ON	OFF	ON/OFF	OFF	OFF	OFF	Peripheral interrupt (PD1)	Wakeup Controller

■ Peripheral interrupt (PD1): External interrupt, RTC, NMI, low-voltage detection *1, HW-WDT *1

■ Peripheral interrupt (PD2): Interrupt of peripheral mounted resource, SW-WDT, etc.

- Peripheral interrupt (PD5): Interrupt of extended peripheral, etc.
- Peripheral interrupt (PD6): Interrupt of Sub peripheral, etc.
- *1 Where used as an interrupt when an abnormality is detected

Register settings (JTAG return register) can be return factors when a tool is connected.

The following example shows a procedure that returns CPU from PSS to RUN.

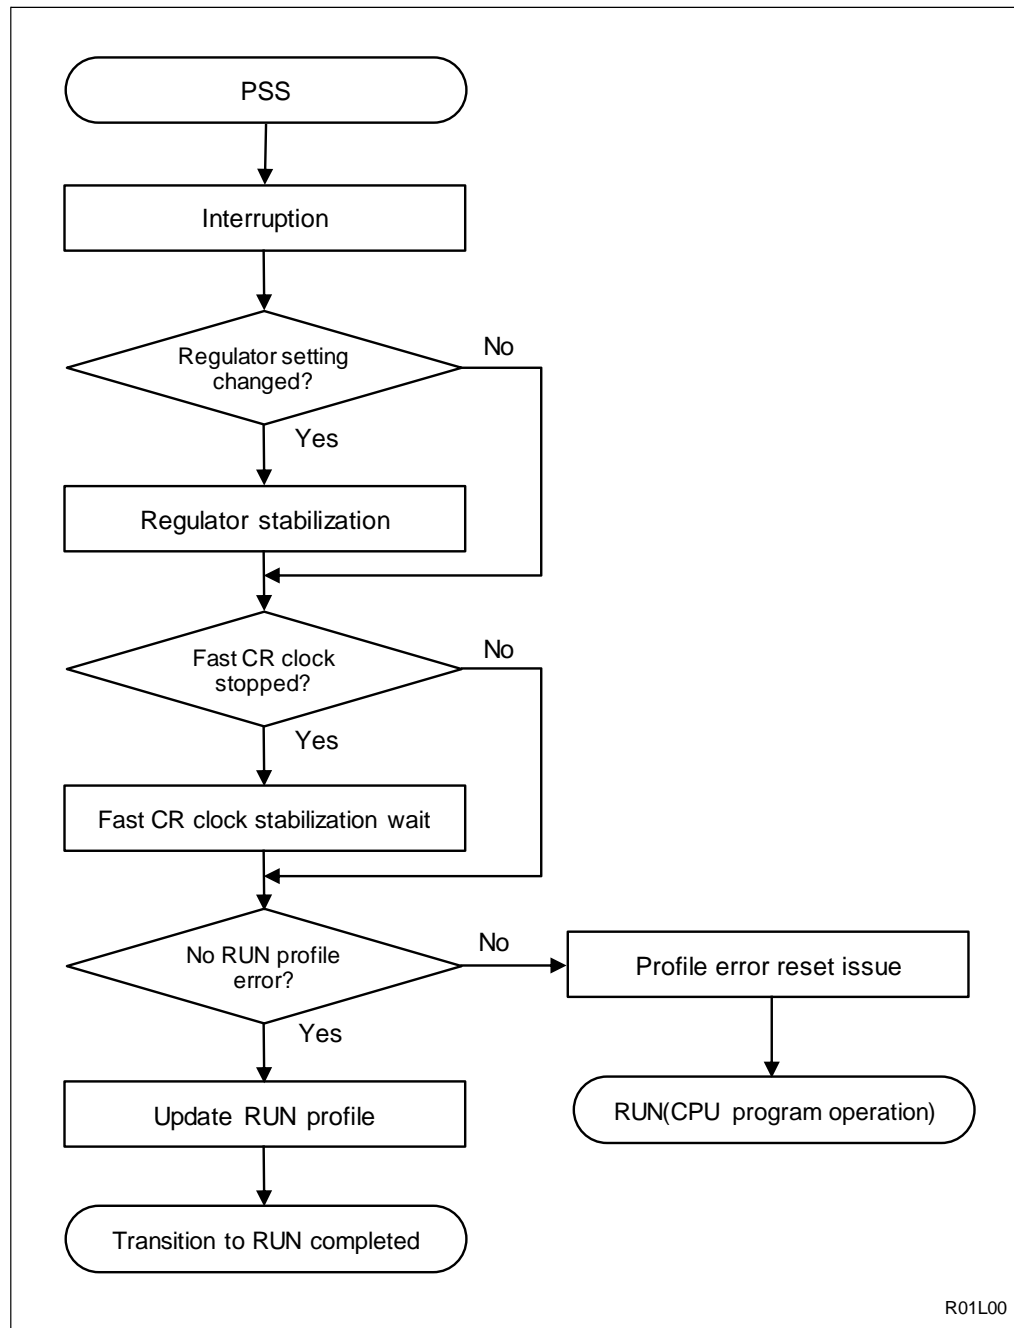

1. Generate a return factor. After the control circuit recognizes the return factor, the CPU starts to return.
2. If the high-speed CR clock has stopped, the CPU waits for oscillation of the high-speed CR clock to stabilize.
3. If the contents of the RUN profile settings have a problem (bit error, etc.), a profile error reset is generated.
4. When the RUN profile contents have no problem, the control circuit reflects the profile contents as follows.
 1. The circuit sets the RUN profile setting state (SYSC0_SYSSTSR:RUNSTS(product specification)) to "1".
 2. The circuit copies the RUN profile contents to the APP profile.
 3. The circuit handles the following: clock oscillation enable/stop (also including oscillation stabilization wait), CSV setting changes, LVD setting changes, clock operation settings (source clock change, division, ON/OFF of each clock source), ON/OFF of each power domain, and clock stop settings (stopping a source clock). The circuit sets the RUN profile setting state (SYSC0_SYSSTSR:RUNSTS(product specification)) to "0".
5. CPU waits for Flash macro to stabilize from low power state to normal state. Stabilize wait time will occur for regulator if voltage/mode change occurs.
6. There is a transition to RUN, and the CPU starts program operations.

Notes:

- If a profile error occurs, the RUN profile settings have the initial values.
- Disable PSEN when updating profile register. Written data is invalid while write-access occurs to profile register when PSEN is enabled. Bus error will occur.
- If the power domain 6 is turned OFF in PSS mode, it is prohibited to enable PLL/SSCG oscillation. After the power domain 6 is turn ON in RUN mode, please enable PLL/SSCG oscillation in RUN profile updating.

The following figure is a flowchart of PSS to RUN transition operations.

Figure 4-4 PSS to RUN Operation Flowchart

5. Registers

This section explains the low power consumption registers.

The system controller registers consist of the following register groups.

■ SYSC0

- Protection register group
- RUN profile register group
- PSS profile register group
- APP profile register group
- STS profile register group
- System register group
- Clock supervisor register group
- Reset control register group
- Source clock timer register group for low-speed CR
- Source clock timer register group for high-speed CR
- Source clock timer register group for main oscillation
- Source clock timer register group for sub oscillation
- Clock control register group
- Special setting register group
- Debug register group

■ MCU CONFIG

- Read interruption at one time

■ SYSC1

- Protection register group
- RUN profile register group
- PSS profile register group
- APP profile register group
- STS profile register group

- For details on the clock supervisor register group in the above items, see the following chapter: "CLOCK SUPERVISOR."

- For details on the reset control register group in the above items, see the following chapter: "RESET."

- For details on the respective source clock timer register groups in the above items, see the following chapter: "SOURCE CLOCK TIMER."

- For details on the clock control register group in the above items, see the following chapter: "CLOCK SYSTEM."

About "x" Used for Register names

- PLL number 0/1/2/3 will substitute for PLL"x".
- SSCG number 0/1/2/3 will substitute for SSCG"x".
-

Notes:

- *Protection is applied to the SYSC register. To write to the register, the protection key must first be unlocked. Invalid written data is discarded. The following shows an example of the procedure for accessing the SYSC register.*
 1. The accessing master unlocks the protection key.
 2. The master that unlocked the protection key writes to the SYSC register.

3. The hardware locks the protection key.
Repeat steps 1 to 3 until completing the required settings.
- *The following shows protection effective conditions.*
 1. The protection target register was write-accessed from the master that released the protection key.
 2. The protection target register was write-accessed from anything other than the master that unlocked the protection key.
 - *Protection range of SYSC0_PROTKEYR is 0xB060_0080-0xB060_06FC.*
 - *Protection range of SYSC1_PROTKEYR is 0xB030_0080-0xB030_027C.*
 - *Protection is not applied to the debug register group.*
 - *PLL number 0/1/2/3 will substitute for PLL"x".*
 - *SSCG number 0/1/2/3 will substitute for SSCG"x".*

SYSC0 Register groups

Table 5-1 Protection Register Group

Abbreviated Register Name	Register Name	Reference
SYSC0_PROTKEYR	Protection key setting register	5.1.1

Table 5-2 RUN Profile Register Group

Abbreviated Register Name	Register Name	Reference
SYSC0_RUNPDCFGFR	RUN power domain setting register	5.2.1
SYSC0_RUNCKSRER	RUN clock source enable register	5.2.2
SYSC0_RUNCKSELR	RUN clock selection register	5.2.3
SYSC0_RUNCKER	RUN clock enable register	5.2.4
SYSC0_RUNCKDIVR	RUN clock divider register	5.2.5
SYSC0_RUNPLLxCNTR	RUN PLLx control register	5.2.6
SYSC0_RUNSSCGxCNTR0	RUN SSCGx control register 0	5.2.7
SYSC0_RUNSSCGxCNTR1	RUN SSCGx control register 1	5.2.8
SYSC0_RUNLVDCFGFR	RUN low-voltage detection setting register	5.2.9
SYSC0_RUNCSVCFGR	RUN clock supervisor setting register	5.2.10
SYSC0_RUNREGCFGR	RUN regulator setting register	5.2.11
SYSC0_TRGRUNCNTR	RUN profile update trigger register	5.2.12

x=0, 1, 2, 3

Table 5-3 PSS Profile Register Group

Abbreviated Register Name	Register Name	Reference
SYSC0_PSSPDCFGFR	PSS power domain setting register	5.3.1
SYSC0_PSSCKSRER	PSS clock source enable register	5.3.2
SYSC0_PSSCKSELR	PSS clock selection register	5.3.3
SYSC0_PSSCKER	PSS clock enable register	5.3.4
SYSC0_PSSCKDIVR	PSS clock divider register	5.3.5
SYSC0_PSSPLLxCNTR	PSS PLLx control register	5.3.6
SYSC0_PSSSSCGxCNTR0	PSS SSCGx control register 0	5.3.7
SYSC0_PSSSSCGxCNTR1	PSS SSCGx control register 1	5.3.8
SYSC0_PSSLVDCFGFR	PSS low-voltage detection setting register	5.3.9
SYSC0_PSSCSVCFGR	PSS clock supervisor setting register	5.3.10
SYSC0_PSSREGCFGR	PSS regulator setting register	5.3.11
SYSC0_PSSSEN	PSS profile update enable register	5.3.12

x=0, 1, 2, 3

Table 5-4 APP Profile Register Group

Abbreviated Register Name	Register Name	Reference
SYSC0_APPPDCFGR	APP power domain setting register	5.4.1
SYSC0_APPCKSRER	APP clock source enable register	5.4.2
SYSC0_APPCKSELR	APP clock selection register	5.4.3
SYSC0_APPCKER	APP clock enable register	5.4.4
SYSC0_APPCKDIVR	APP clock divider register	5.4.5
SYSC0_APPPLLxCNTR	APP PLLx control register	5.4.6
SYSC0_APPSSCGxCNTR0	APP SSCGx control register 0	5.4.7
SYSC0_APPSSCGxCNTR1	APP SSCGx control register 1	5.4.8
SYSC0_APPLVDCFGR	APP low-voltage detection setting register	5.4.9
SYSC0_APPCSVCFGR	APP clock supervisor setting register	5.4.10
SYSC0_APPREGCFGR	APP regulator setting register	5.4.11

x=0, 1, 2, 3

Table 5-5 STS Profile Register Group

Abbreviated Register Name	Register Name	Reference
SYSC0_STSPDCFGR	STS power domain setting register	5.5.1
SYSC0_STSCKSRER	STS clock source enable register	5.5.2
SYSC0_STSCKSELR	STS clock selection register	5.5.3
SYSC0_STSCKER	STS clock enable register	5.5.4
SYSC0_STSCKDIVR	STS clock divider register	5.5.5

5.1. Protection Register Group (SYSC0)

The register in this group is a control register for accessing SYSC0 registers.

5.1.1. Protection Key Setting Register (SYSC0_PROTKEYR)

The SYSC0_PROTKEYR register has settings for unlocking the protection of SYSC0 registers.

bit	31	0
Field	PROTKEY	
R/W Attribute	R,W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] PROTKEY: Protection Unlock Setting Bits

These bits compose the register for unlocking protection keys.

Write

bit31:0	Description
0x5CAC_CE55	Unlock
Other than above	Invalid

Read

bit31:0	Description
0x0000_0000	Locked state
0xFFFF_FFFF	Unlocked state

Note:

- This register permits word access only. Any other access is invalid.

5.2. RUN Profile Register Group (SYSC0)

The registers in this group are RUN profile control setting registers.

5.2.1. RUN Power Domain Setting Register (SYSC0_RUNPDCFGR)

The SYSC0_RUNPDCFGR register sets power ON or OFF for each power domain.

bit	31	30	29	28	27	26	25	24
Field	Reserved						PD6_1 EN	PD6_0 EN
R/W Attribute	R0,WX						R1,WX	R1,WX
Protection Attribute	WPS							
Initial Value	000000						1	1

[bit31:26] Reserved: Reserved Bits

[bit25] PD6_1EN: Power Domain 6_1 Power Supply Control Bit

This bit controls power supply to power domain 6_1.

Bit	Description
0	-
1	Supply power.

[bit24] PD6_0 EN: Power Domain 6_0 Power Supply Control Bit

This bit controls power supply to power domain 6_0.

Bit	Description
0	-
1	Supply power.

[bit23] PD5_3 EN: Power Domain 5_3 Power Supply Control Bit

This bit controls power supply to power domain 5_3.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit22] PD5_2 EN: Power Domain 5_2 Power Supply Control Bit

This bit controls power supply to power domain 5_2.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit21] PD5_1 EN: Power Domain 5_1 Power Supply Control Bit

This bit controls power supply to power domain 5_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit20] PD5_0 EN: Power Domain 5_0 Power Supply Control Bit

This bit controls power supply to power domain 5_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit19:18] Reserved: Reserved Bits
[bit17] PD4_1 EN: Power Domain 4_1 Power Supply Control Bit

This bit controls power supply to power domain 4_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit16] PD4_0 EN: Power Domain 4_0 Power Supply Control Bit

This bit controls power supply to power domain 4_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit15:13] Reserved: Reserved Bits**[bit12] PD3 EN: Power Domain 3 Power Supply Control Bit**

This bit controls power supply to power domain 3.

Bit	Description
0	-
1	Supply power.

[bit11:9] Reserved: Reserved Bits**[bit8] PD2 EN: Power Domain 2 Power Supply Control Bit**

This bit controls power supply to power domain 2.

Bit	Description
0	-
1	Supply power.

[bit7:0] Reserved: Reserved Bits

5.2.2. RUN Clock Source Enable Register (SYSC0_RUNCKSRER)

The SYSC0_RUNCKSRER register sets whether to enable or disable oscillation of the source clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16

Initial Value	0000				0	1	1	1

[bit31:20] Reserved: Reserved Bits

[bit19] SSCG3EN: SSCG PLL3 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL3 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL3 clock.
1	Enable oscillation of the SSCG PLL3 clock.

[bit18] SSCG2EN: SSCG PLL2 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL2 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL2 clock.
1	Enable oscillation of the SSCG PLL2 clock.

[bit17] SSCG1EN: SSCG PLL1 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL1 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL1 clock.
1	Enable oscillation of the SSCG PLL1 clock.

[bit16] SSCG0EN: SSCG PLL0 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL0 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL0 clock.
1	Enable oscillation of the SSCG PLL0 clock.

[bit15:12] Reserved: Reserved Bits**[bit11] PLL3EN: PLL3 Clock Oscillation Enable Bit**

This bit controls oscillation of the PLL3 clock.

Bit	Description
0	Disable oscillation of the PLL3 clock.
1	Enable oscillation of the PLL3 clock.

[bit10] PLL2EN: PLL2 Clock Oscillation Enable Bit

This bit controls oscillation of the PLL2 clock.

Bit	Description
0	Disable oscillation of the PLL2 clock.
1	Enable oscillation of the PLL2 clock.

[bit9] PLL1EN: PLL1 Clock Oscillation Enable Bit

This bit controls oscillation of the PLL1 clock.

Bit	Description
0	Disable oscillation of the PLL1 clock.
1	Enable oscillation of the PLL1 clock.

[bit8] PLL0EN: PLL0 Clock Oscillation Enable Bit

This bit controls oscillation of the PLL0 clock.

Bit	Description
0	Disable oscillation of the PLL0 clock.
1	Enable oscillation of the PLL0 clock.

[bit7:4] Reserved: Reserved Bits

[bit3] SOSSEN: Sub Clock Oscillation Enable Bit

This bit controls oscillation of the sub clock.

Bit	Description
0	Disable oscillation of the sub clock.
1	Enable oscillation of the sub clock.

[bit2] MOSCEN: Main Clock Oscillation Enable Bit

This bit controls oscillation of the main clock.

Bit	Description
0	Disable oscillation of the main clock.
1	Enable oscillation of the main clock.

[bit1] SCROSCEN: Low-Speed CR Clock Oscillation Enable Bit

This bit controls oscillation of the low-speed CR clock.

Bit	Description
0	-
1	Enable oscillation of the low-speed CR clock.

[bit0] CROSCEN: High-Speed CR Clock Oscillation Enable Bit

This bit controls oscillation of the high-speed CR clock.

Bit	Description
0	-
1	Enable oscillation of the high-speed CR clock.

The SYSC0_RUNCKSELR register sets the clock source for the clock domain.

bit	31							8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved					CDMCUCCSL		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					000		

These bits select the source clock for the clock domain MCUC.

bit2:0	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG PLL0 clock
110	Setting Prohibited
111	Clock fixed at "L"

5.2.4. RUN Clock Enable Register (SYSC0_RUNCKER)

The SYSC0_RUNCKER register sets whether to stop or enable an internal clock.

bit	31										8									
Field	Reserved																			
R/W Attribute	R0,WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000_00000000																			

bit	7			6		5		4		3		2		1		0				
Field	Reserved												ENCLK MCUCP		ENCLK MCUCH					
R/W Attribute	R0,WX												R1,WX		R1,WX					
Protection Attribute	WPS																			
Initial Value	000000												1		1					

[bit31:2] Reserved: Reserved Bits

[bit1] ENCLKMCUCP: MCUconfig APB Clock Oscillation Enable Bit

This bit sets whether to enable or disable oscillation of the APB clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit0] ENCLKMCUCH: MCUconfig AHB Clock Oscillation Enable Bit

This bit sets whether to enable or disable oscillation of the MCUconfig AHB clock.

Bit	Description
0	-
1	Enable clock oscillation.

The SYSC0_RUNCKDIVR register sets the division ratio of the clock.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8	
Field	Reserved					MCUCPDIV			
R/W Attribute	R0,WX					R/W			
Protection Attribute	WPS								
Initial Value	0000					0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			MCUCHDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

These bits set the division ratio of the PCOM clock from the HCOM clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] MCUCHDIV: MCUconfig AHB Clock Divider Setting Bits

These bits set the division ratio from the source clock of the clock domain MCUC.

bit4:0	Description
0_0000	No division
0_0001	Divided by 2
0_0010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.2.6. RUN PLLx Control Register (SYSC0_RUNPLLxCNTR)

The SYSC0_RUNPLLxCNTR register sets the division, multiplication rate, etc. for PLLx.

bit	31	30	29	28	27	26	25	24
Field	PLLx ISEL	Reserved						
R/W Attribute	R/W	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	PLLxDIVN							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLLxDIVM			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						PLLxDIVL	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] PLLxISEL: PLLx Input Clock Selection Bit

This bit sets the clock to supply to PLLx.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] PLLxDIVN: PLLx Clock N-multiplier Setting Bits

These bits set the multiplication rate of the PLLx clock.

bit23:16	Description
0000_0000	Setting prohibited
...	...
0000_1100	Setting prohibited
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	Setting prohibited
...	...
1100_1111	Setting prohibited

[bit15:12] Reserved: Reserved Bits

[bit11:8] PLLxDIVM: PLLx Clock M-Divider Setting Bits

These bits set the division ratio for PLLx clock output.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] PLLxDIVL: PLLx Input Clock Divider Setting Bits

These bits set the division ratio of the PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.2.7. RUN SSCGx Control Register 0 (SYSC0_RUNSSCGxCNTR0)

The SYSC0_RUNSSCGxCNTR0 register sets the division, multiplication rate, etc. for SSCG PLLx.

bit	31	30	29	28	27	26	25	24
Field	SSCGx ISEL	Reserved						
R/W Attribute	R/W	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	SSCGxDIVN							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8
Field	Reserved				SSCGxDIVM			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						SSCGxDIVL	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] SSCGxISEL: SSCG PLLx Input Clock Selection Bit

This bit sets the clock to supply to SSCG PLLx.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] SSCGxDIVN: SSCG PLLx Clock N-multiplier Setting Bits

These bits set the N multiplication rate of the SSCG PLLx clock.

bit23:16	Description
0000_0000	Setting prohibited
...	...
0000_1100	Setting prohibited
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	Setting prohibited
...	...
1100_1111	Setting prohibited

[bit15:12] Reserved: Reserved Bits**[bit11:8] SSCGxDIVM: SSCG PLLx Clock M-Division Setting Bits**

These bits set the division ratio for SSCG PLLx clock output.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] SSCGxDIVL: SSCG PLLx Input Clock Divider Setting Bits

These bits set the division ratio of the SSCG PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.2.8. RUN SSCGx Control Register 1 (SYSC0_RUNSSCGxCNTR1)

The SYSC0_RUNSSCGxCNTR1 register sets modulation enable, the modulation mode, etc. for SSCG PLLx.

bit	31	30	29	28	27	26	25	24
Field	Reserved							SSCGx SSEN
R/W Attribute	R0,WX							R/W
Protection Attribute	WPS							
Initial Value	0000000							0

bit	23	22	21	20	19	18	17	16
Field	Reserved					SSCGxFREQ		SSCGx MODE
R/W Attribute	R0,WX					R/W		R/W
Protection Attribute	WPS							
Initial Value	00000					00		0

bit	15	14	13	12	11	10	9	8
Field	Reserved						SSCGxRATE	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

bit	7	6	5	4	3	2	1	0
Field	SSCGxRATE							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00101001							

[bit31:25] Reserved: Reserved Bits

[bit24] SSCGxSSEN: SSCG PLLx modulation Enable Setting Bit

This bit controls SSCG PLLx modulation.

Bit	Description
0	Disable modulation.
1	Enable modulation.

[bit23:19] Reserved: Reserved Bits

[bit18:17] SSCGxFREQ: SSCG PLLx Clock modulation Frequency Selection Bits

These bits set the modulation frequency of the SSCG PLLx clock.

bit18:17	Description
00	$F_{mod} = (1/1024) \times F_{in}$
01	$F_{mod} = (1/2048) \times F_{in}$
10 or 11	$F_{mod} = (1/4096) \times F_{in}$

* F_{in} : SSCG reference clock frequency, F_{mod} : Modulation frequency

[bit16] SSCGxMODE: SSCG PLLx modulation Mode Setting Bit

This bit sets the modulation mode of the SSCG PLLx clock.

Bit	Description
0	Set Down spread mode.
1	Set Center spread mode.

- Down spread

- Center spread

033665_0a1474782d146e0d1c3a274d2b_5863_r1_52-0451_4000_020507_a

[bit15:10] Reserved: Reserved Bits

[bit9:0] SSCGxRATE: SSCG PLLx Clock modulation Ratio Control Bits

These bits set the modulation ratio of the SSCG PLLx clock.

bit9:0	Description
00_0010_1001	Modulation ratio of 0.5%
00_0101_0010	Modulation ratio of 1.0%
00_1010_0100	Modulation ratio of 2.0%
00_1111_0110	Modulation ratio of 3.0%
01_0100_1000	Modulation ratio of 4.0%
01_1001_1010	Modulation ratio of 5.0%
Others	Setting prohibited

5.2.9. RUN Low-Voltage Detection Setting Register (SYSC0_RUNLVDCFGR)

The SYSC0_RUNLVDCFGR register sets each internal low-voltage detection.

bit	31	30	29	28	27	26	25	24
Field	Reserved	LVDL1S	Reserved			LVDL1V		LVDL1E
R/W Attribute	R0,WX	(product specification)	R0,WX			(product specification)		(product specification)
Protection Attribute	WPS							
Initial Value	0	(product specification)	000			(product specification)		(product specification)

bit	23	22	21	20	19	18	17	16
Field	Reserved	LVDL2S	Reserved			LVDL2V		LVDL2E
R/W Attribute	R0,WX	(product specification)	R0,WX			(product specification)		(product specification)
Protection Attribute	WPS							
Initial Value	0	(product specification)	000			(product specification)		(product specification)

bit	15	14	13	12	11	10	9	8
Field	Reserved	LVDH1S	Reserved	LVDH1V			LVDH1E	
R/W Attribute	R0,WX	(product specification)	R0,WX	(product specification)			(product specification)	
Protection Attribute	WPS							
Initial Value	0	(product specification)	0	(product specification)			(product specification)	

bit	7	6	5	4	3	2	1	0
Field	Reserved	LVDH2S	Reserved	LVDH2V			LVDH2E	
R/W Attribute	R0,WX	(product specification)	R0,WX	(product specification)			(product specification)	
Protection Attribute	WPS							
Initial Value	0	(product specification)	0	(product specification)			(product specification)	

[bit31] Reserved: Reserved Bit

[bit30] LVDL1S: Internal Low-Voltage Detection Operation Selection Bit

This bit selects an operation for the internal low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit29:27] Reserved: Reserved Bits**[bit26:25] LVDL1V: Internal Low-Voltage Detection Voltage Setting Bits**

These bits set the detection voltage for internal low-voltage detection.

bit18:17	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit24] LVDL1E: Internal Low-Voltage Detection Operation Enable Bit

This bit enables the internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit23] Reserved: Reserved Bit**[bit22] LVDL2S: Extended Internal Low-Voltage Detection Operation Selection Bit**

This bit selects an operation for the extended internal low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit21:19] Reserved: Reserved Bits

[bit18:17] LVDL2V: Extended Internal Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended internal low-voltage detection.

Bit	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended Internal Low-Voltage Detection Operation Enable Bit

This bit enables the extended internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit15] Reserved: Reserved Bit
[bit14] LVDH1S: External Low-Voltage Detection Operation Selection Bit

This bit selects an operation for the external low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit13] Reserved: Reserved Bit

[bit12:9] LVDH1V: External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for external low-voltage detection.

Bit	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit8] LVDH1E: External Low-Voltage Detection Operation Enable Bit

This bit sets the external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit7] Reserved: Reserved Bit**[bit6] LVDH2S: Extended External Low-Voltage Detection Operation Selection Bit**

This bit selects an operation for the extended external low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit5] Reserved: Reserved Bit

[bit4:1] LVDH2V: Extended External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended external low-voltage detection.

Bit	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit0] LVDH2E: Extended External Low-Voltage Detection Operation Enable Bit

This bit sets the extended external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

5.2.10. RUN Clock Supervisor Setting Register (SYSC0_RUNCSVCFGR)

The SYSC0_RUNCSVCFGR register sets whether to enable or disable operation of each clock supervisor.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3 CSVE	SSCG2 CSVE	SSCG1 CSVE	SSCG0 CSVE
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3 CSVE	PLL2 CSVE	PLL1 CSVE	PLL0 CSVE
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved				SCR CSVE	FCR CSVE	SO CSVE	MO CSVE
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

[bit31:20] Reserved: Reserved Bits

[bit19] SSCG3CSVE: SSCG PLL3 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit18] SSCG2CSVE: SSCG PLL2 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit17] SSCG1CSVE: SSCG PLL1 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit16] SSCG0CSVE: SSCG PLL0 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit15:12] Reserved: Reserved Bits
[bit11] PLL3CSVE: PLL3 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit10] PLL2CSVE: PLL2 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit9] PLL1CSVE: PLL1 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit8] PLL0CSVE: PLL0 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit7:4] Reserved : Reserved Bits**[bit3] SCRCSE : Low-Speed CR Clock Supervisor Enable Bit**

This bit sets whether to enable or disable the Low-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit2] FCRCSE : High-Speed CR Clock Supervisor Enable Bit

This bit sets whether to enable or disable the High-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit1] SOCSVE: Sub Clock Supervisor Enable Bit

This bit sets whether to enable or disable the sub clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit0] MOCSVE: Main Clock Supervisor Enable Bit

This bit sets whether to enable or disable the main clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

5.2.11. RUN Regulator Setting Register (SYSC0_RUNREGCFGR)

The SYSC0_RUNREGCFGR register sets the regulator mode and output voltage.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	RMSEL	Reserved						RVSEL
R/W Attribute	R0,WX	R0,WX						R/W
Protection Attribute	WPS							
Initial Value	0	000000						(product specification)

[bit31:8] Reserved: Reserved Bits

[bit7] RMSEL: Regulator Mode Setting Bit

This bit indicates the regulator mode setting.

Bit	Description
0	Main mode
1	-

[bit6:1] Reserved: Reserved Bits

[bit0] RVSEL: Regulator Output Voltage Setting Bits

These bits set the regulator output voltage.

Bit	Description
0	1.20V
1	1.25V

The SYSC0 TRGRUNCNTR register is a RUN profile update trigger.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

	7	6	5	4	3	2	1	0
Field	APPLY_RUN							
R/W Attribute	R0,W							
Protection Attribute	WPS							
Initial Value	00000000							

These bits compose the RUN profile update start register.

bit7:0	Description
During write operation	When "0xAB" is written: Start updating the RUN profile. When other than "0xAB" is written: Invalid
During read operation	"0x00" is always read.

- If the value written in this register is invalid, an error flag (SYSC0_SYSERRIR1:RUNTRGERRIF is "1") is enabled.
- If the RUN profile is updated, it cannot be re-updated until that the update process completes. If "0xAB" is written in this register during a RUN profile update, an error flag (SYSC0_SYSERRIR1:TRGERRIF is "1") is enabled.

5.3. PSS Profile Register Group (SYSC0)

The registers in this group are PSS profile control setting registers.

5.3.1. PSS Power Domain Setting Register (SYSC0_PSSPDCFGR)

The SYSC0_PSSPDCFGR register sets power ON or OFF for each power domain.

bit	31	30	29	28	27	26	25	24
Field	Reserved						PD6_1 EN	PD6_0 EN
R/W Attribute	R0,WX						R/W	R/W
Protection Attribute	WPS							
Initial Value	000000						1	1

bit	23	22	21	20	19	18	17	16
Field	PD5_3 EN	PD5_2 EN	PD5_1 EN	PD5_0 EN	Reserved		PD4_1 EN	PD4_0 EN

bit	15	14	13	12	11	10	9	8
Field	Reserved			PD3 EN	Reserved			PD2 EN
R/W Attribute	R0,WX			R/W	R0,WX			R/W
Protection Attribute	WPS							
Initial Value	000			1	000			1

bit	7	6	5	4	3	2	1	0
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:26] Reserved: Reserved Bits

[bit25] PD6_1EN: Power Domain 6_1 Power Supply Control Bit

This bit controls power supply to power domain 6_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit24] PD6_0 EN: Power Domain 6_0 Power Supply Control Bit

This bit controls power supply to power domain 6_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit23] PD5_3 EN: Power Domain 5_3 Power Supply Control Bit

This bit controls power supply to power domain 5_3.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit22] PD5_2 EN: Power Domain 5_2 Power Supply Control Bit

This bit controls power supply to power domain 5_2.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit21] PD5_1 EN: Power Domain 5_1 Power Supply Control Bit

This bit controls power supply to power domain 5_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit20] PD5_0 EN: Power Domain 5_0 Power Supply Control Bit

This bit controls power supply to power domain 5_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit19:18] Reserved: Reserved Bits**[bit17] PD4_1 EN: Power Domain 4_1 Power Supply Control Bit**

This bit controls power supply to power domain 4_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit16] PD4_0 EN: Power Domain 4_0 Power Supply Control Bit

This bit controls power supply to power domain 4_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit15:13] Reserved: Reserved Bits
[bit12] PD3 EN: Power Domain 3 Power Supply Control Bit

This bit controls power supply to power domain 3.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit11:9] Reserved: Reserved Bits
[bit8] PD2 EN: Power Domain 2 Power Supply Control Bit

This bit controls power supply to power domain 2.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit7:0] Reserved: Reserved Bits

5.3.2. PSS Clock Source Enable Register (SYSC0_PSSCKSRER)

The SYSC0_PSSCKSRER sets whether to enable or disable oscillation of the source clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3 EN	SSCG2 EN	SSCG1 EN	SSCG0 EN
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3EN	PLL2EN	PLL1EN	PLL0EN
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved				SOSCEN	MOSC EN	SCROSC EN	CROSC EN
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	1	1	1

[bit31:20] Reserved: Reserved Bits

[bit19] SSCG3EN: SSCG PLL3 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL3 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL3 clock.
1	Enable oscillation of the SSCG PLL3 clock.

[bit18] SSCG2EN: SSCG PLL2 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL2 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL2 clock.
1	Enable oscillation of the SSCG PLL2 clock.

[bit17] SSCG1EN: SSCG PLL1 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL1 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL1 clock.
1	Enable oscillation of the SSCG PLL1 clock.

[bit16] SSCG0EN: SSCG PLL0 Clock Oscillation Enable Bit

This bit controls oscillation of the SSCG PLL0 clock.

Bit	Description
0	Disable oscillation of the SSCG PLL0 clock.
1	Enable oscillation of the SSCG PLL0 clock.

[bit15:12] Reserved: Reserved Bits
[bit11] PLL3EN: PLL3 Clock Oscillation Enable Bit

This bit controls oscillation of the PLL3 clock.

Bit	Description
0	Disable oscillation of the PLL3 clock.
1	Enable oscillation of the PLL3 clock.

[bit10] PLL2EN: PLL2 Clock Oscillation Enable Bit

This bit controls oscillation of the PLL2 clock.

Bit	Description
0	Disable oscillation of the PLL2 clock.
1	Enable oscillation of the PLL2 clock.

[bit9] PLL1EN: PLL1 Clock Oscillation Enable Bit

This bit controls oscillation of the PLL1 clock.

Bit	Description
0	Disable oscillation of the PLL1 clock.
1	Enable oscillation of the PLL1 clock.

[bit8] PLL0EN: PLL0 Clock Oscillation Enable Bit

This bit controls oscillation of the PLL0 clock.

Bit	Description
0	Disable oscillation of the PLL0 clock.
1	Enable oscillation of the PLL0 clock.

[bit7:4] Reserved: Reserved Bits

[bit3] SOSSEN: Sub Clock Oscillation Enable Bit

This bit controls oscillation of the sub clock.

Bit	Description
0	Disable oscillation of the sub clock.
1	Enable oscillation of the sub clock.

[bit2] MOSCEN: Main Clock Oscillation Enable Bit

This bit controls oscillation of the main clock.

Bit	Description
0	Disable oscillation of the main clock.
1	Enable oscillation of the main clock.

[bit1] SCROSCEN: Low-Speed CR Clock Oscillation Enable Bit

This bit controls oscillation of the low-speed CR clock.

Bit	Description
0	Disable oscillation of the low-speed CR clock.
1	Enable oscillation of the low-speed CR clock.

[bit0] CROSCEN: High-Speed CR Clock Oscillation Enable Bit

This bit controls oscillation of the high-speed CR clock.

Bit	Description
0	Disable oscillation of the high-speed CR clock.
1	Enable oscillation of the high-speed CR clock.

5.3.3. PSS Clock Selection Register (SYSC0_PSSCKSELR)

The SYSC0_PSSCKSELR register sets the clock source for the clock domain.

bit	31									8
Field	Reserved									
R/W Attribute	R0,WX									
Protection Attribute	WPS									
Initial Value	00000000_00000000_00000000									

bit	7	6	5	4	3	2	1	0
Field	Reserved					CDMCUCCSL		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					000		

[bit31:3] Reserved: Reserved Bits

[bit2:0] CDMCUCCSL: Clock Domain MCUC Clock Selection Bits

These bits select the source clock for the clock domain MCUC.

bit2:0	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG PLL0 clock
110	Setting Prohibited
111	Clock fixed at "L"

5.3.4. PSS Clock Enable Register (SYSC0_PSSCKER)

The SYSC0_PSSCKER register sets whether to stop or enable an internal clock.

bit	31										8									
Field	Reserved																			
R/W Attribute	R0,WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000_00000000																			

bit	7				6		5		4		3		2		1		0	
Field	Reserved														ENCLK MCUCP		ENCLK MCUCH	
R/W Attribute	R0,WX														R/W		R/W	
Protection Attribute	WPS																	
Initial Value	000000														1		1	

[bit31:2] Reserved: Reserved Bits

[bit1] ENCLKMCUCP: MCUconfig APB Clock Oscillation Enable Bit

This bit sets whether to enable or disable oscillation of the MCUconfig APB clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit0] ENCLKMCUCH: MCUconfig AHB Clock Oscillation Enable Bit

This bit sets whether to enable or disable oscillation of the MCUconfig AHB clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.3.5. PSS Clock Divider Register (SYSC0_PSSCKDIVR)

The SYSC0_PSSCKDIVR register sets the clock division ratio.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8	
Field	Reserved					MCUCPDIV			
R/W Attribute	R0,WX					R/W			
Protection Attribute	WPS								
Initial Value	0000					0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			MCUCHDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:12] Reserved: Reserved Bits

[bit11:8] MCUCPDIV: MCUconfig APB Clock Divider Setting Bits

These bits set the division ratio of the PCOM clock from the HCOM clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] MCUCHDIV: MCUconfig AHB Clock Divider Setting Bits

These bits set the division ratio from the source clock of the clock domain MCUC.

bit4:0	Description
0_0000	No division
0_0001	Divided by 2
0_0010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.3.6. PSS PLLx Control Register (SYSC0_PSSPLLxCNTR)

The SYSC0_PSSPLLxCNTR register sets the division, multiplication rate, etc. for PLLx.

bit	31	30	29	28	27	26	25	24
Field	PLLx ISEL	Reserved						
R/W Attribute	R/W	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	PLLxDIVN							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLLxDIVM			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						PLLxDIVL	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] PLLxISEL: PLLx Input Clock Selection Bit

This bit sets the clock to supply to PLLx.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] PLLxDIVN: PLLx Clock N-multiplier Setting Bits

These bits set the multiplication rate of the PLLx clock.

bit23:16	Description
0000_0000	Setting prohibited
...	...
0000_1100	Setting prohibited

bit23:16	Description
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	Setting prohibited
...	...
1100_1111	Setting prohibited

[bit15:12] Reserved: Reserved Bits

[bit11:8] PLLxDIVM: PLLx Clock M-Divider Setting Bits

These bits set the division ratio for PLLx clock output.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] PLLxDIVL: PLLx Input Clock Divider Setting Bits

These bits set the division ratio of the PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.3.7. PSS SSCGx Control Register 0 (SYSC0_PSSSSCGxCNTR0)

The SYSC0_PSSSSCGxCNTR0 register sets the division, multiplication rate, etc. for SSCG PLLx.

bit	31	30	29	28	27	26	25	24
Field	SSCGx ISEL	Reserved						
R/W Attribute	R/W	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	SSCGxDIVN							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8
Field	Reserved				SSCGxDIVM			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						SSCGxDIVL	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] SSCGxISEL: SSCG PLLx Input Clock Selection Bit

This bit sets the clock to supply to SSCG PLLx.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] SSCGxDIVN: SSCG PLLx Clock N-multiplier Setting Bits

These bits set the N multiplication rate of the SSCG PLLx clock.

bit23:16	Description
0000_0000	Setting prohibited
...	...
0000_1100	Setting prohibited

bit23:16	Description
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	Setting prohibited
...	...
1100_1111	Setting prohibited

[bit15:12] Reserved: Reserved Bits

[bit11:8] SSCGxDIVM: SSCG PLLx Clock M-Division Setting Bits

These bits set the division ratio for SSCG PLLx clock output.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] SSCGxDIVL: SSCG PLLx Input Clock Divider Setting Bits

These bits set the division ratio of the SSCG PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.3.8. PSS SSCGx Control Register 1 (SYSC0_PSSSSCGxCNTR1)

The SYSC0_PSSSSCGxCNTR1 register sets modulation enable, the modulation mode, etc. for SSCG PLLx.

bit	31	30	29	28	27	26	25	24
Field	Reserved							SSCGx SSEN
R/W Attribute	R0,WX							R/W
Protection Attribute	WPS							
Initial Value	0000000							0

bit	23	22	21	20	19	18	17	16
Field	Reserved					SSCGxFREQ		SSCGx MODE
R/W Attribute	R0,WX					R/W		R/W
Protection Attribute	WPS							
Initial Value	00000					00		0

bit	15	14	13	12	11	10	9	8
Field	Reserved						SSCGxRATE	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

bit	7	6	5	4	3	2	1	0
Field	SSCGxRATE							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00101001							

[bit31:25] Reserved: Reserved Bits

[bit24] SSCGxSSEN: SSCG PLLx modulation Enable Setting Bit

This bit controls SSCG PLLx modulation.

Bit	Description
0	Disable modulation.
1	Enable modulation.

[bit23:19] Reserved: Reserved Bits

[bit18:17] SSCGxFREQ: SSCG PLLx Clock modulation Frequency Selection Bits

These bits set the modulation frequency of the SSCG PLL clock.

bit18:17	Description
00	$F_{mod} = (1/1024) \times F_{in}$
01	$F_{mod} = (1/2048) \times F_{in}$
10 or 11	$F_{mod} = (1/4096) \times F_{in}$

* F_{in} : SSCG reference clock frequency, F_{mod} : Modulation frequency

[bit16] SSCGxMODE: SSCG PLLx modulation Mode Setting Bit

This bit sets the modulation mode of the SSCG PLL clock.

Bit	Description
0	Set Down spread mode.
1	Set Center spread mode.

- Down spread

- Center spread

at0002_0a147d792b14e4e51a3a2214d5a_5862_0_531491_4893_1225527_x

[bit15:10] Reserved: Reserved Bits

[bit9:0] SSCGxRATE: SSCG PLLx Clock modulation Ratio Control Bits

These bits set the modulation ratio of the SSCG PLL clock.

bit9:0	Description
00_0010_1001	Modulation ratio of 0.5%
00_0101_0010	Modulation ratio of 1.0%
00_1010_0100	Modulation ratio of 2.0%
00_1111_0110	Modulation ratio of 3.0%
01_0100_1000	Modulation ratio of 4.0%
01_1001_1010	Modulation ratio of 5.0%
Others	Setting prohibited

5.3.9. PSS Low-Voltage Detection Setting Register (SYSC0_PSSLVDCFGR)

The SYSC0_PSSLVDCFGR register sets each internal low-voltage detection.

bit	31	30	29	28	27	26	25	24
Field	Reserved	LVDL1S	Reserved			LVDL1V		LVDL1E
R/W Attribute	R0,WX	(product specification)	R0,WX			(product specification)		(product specification)
Protection Attribute	WPS							
Initial Value	0	(product specification)	000			(product specification)		(product specification)

bit	23	22	21	20	19	18	17	16
Field	Reserved	LVDL2S	Reserved			LVDL2V		LVDL2E
R/W Attribute	R0,WX	(product specification)	R0,WX			(product specification)		(product specification)
Protection Attribute	WPS							
Initial Value	0	(product specification)	000			(product specification)		(product specification)

bit	15	14	13	12	11	10	9	8
Field	Reserved	LVDH1S	Reserved	LVDH1V			LVDH1E	
R/W Attribute	R0,WX	(product specification)	R0,WX	(product specification)			(product specification)	
Protection Attribute	WPS							
Initial Value	0	(product specification)	0	(product specification)			(product specification)	

bit	7	6	5	4	3	2	1	0
Field	Reserved	LVDH2S	Reserved	LVDH2V			LVDH2E	
R/W Attribute	R0,WX	(product specification)	R0,WX	(product specification)			(product specification)	
Protection Attribute	WPS							
Initial Value	0	(product specification)	0	(product specification)			(product specification)	

[bit31] Reserved: Reserved Bit

[bit30] LVDL1S: Internal Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the internal low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit29:27] Reserved: Reserved Bits

[bit26:25] LVDL1V: Internal Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for internal low-voltage detection.

Bit	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit24] LVDL1E: Internal Low-Voltage Detection Operation Enable Bit

This bit sets the internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit23] Reserved: Reserved Bit

[bit22] LVDL2S: Extended Internal Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the extended internal low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit21:19] Reserved: Reserved Bits**[bit18:17] LVDL2V: Extended Internal Low-Voltage Detection Voltage Setting Bits**

These bits set the detection voltage for extended internal low-voltage detection.

Bit	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended Internal Low-Voltage Detection Operation Enable Bit

This bit sets the extended internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit15] Reserved: Reserved Bit**[bit14] LVDH1S: External Low-Voltage Detection Operation Selection Bit**

This bit selects an operation when the external low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit13] Reserved: Reserved Bit

[bit12:9] LVDH1V: External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for external low-voltage detection.

Bit	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit8] LVDH1E: External Low-Voltage Detection Operation Enable Bit

This bit sets the external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit7] Reserved: Reserved Bit

[bit6] LVDH2S: Extended External Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the extended external low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit5] Reserved: Reserved Bit

[bit4:1] LVDH2V: Extended External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended external low-voltage detection.

Bit	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit0] LVDH2E: Extended External Low-Voltage Detection Operation Enable Bit

This bit sets the extended external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

5.3.10. PSS Clock Supervisor Setting Register (SYSC0_PSSCSVCFGR)

The SYSC0_PSSCSVCFGR register sets whether to enable or disable operation of each clock supervisor.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3 CSVE	SSCG2 CSVE	SSCG1 CSVE	SSCG0 CSVE
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3 CSVE	PLL2 CSVE	PLL1 CSVE	PLL0 CSVE
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved				SCR CSVE	CR CSVE	SO CSVE	MO CSVE
R/W Attribute	R0,WX				R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

[bit31:20] Reserved: Reserved Bits

[bit19] SSCG3CSVE: SSCG PLL3 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit18] SSCG2CSVE: SSCG PLL2 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit17] SSCG1CSVE: SSCG PLL1 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit16] SSCG0CSVE: SSCG PLL0 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit15:12] Reserved: Reserved Bits**[bit11] PLL3CSVE: PLL3 Clock Supervisor Enable Bit**

This bit sets whether to enable or disable the PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit10] PLL2CSVE: PLL2 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit9] PLL1CSVE: PLL1 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit8] PLL0CSVE: PLL0 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit7:4] Reserved: Reserved Bits
[bit3] SCRCSE : Low-Speed CR Clock Supervisor Enable Bit

This bit sets whether to enable or disable the sub clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit2] CRCSVE : High-Speed CR Clock Supervisor Enable Bit

This bit sets whether to enable or disable the main clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit1] SOCSVE: Sub Clock Supervisor Enable Bit

This bit sets whether to enable or disable the sub clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit0] MOCSVE: Main Clock Supervisor Enable Bit

This bit sets whether to enable or disable the main clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

5.3.11. PSS Regulator Setting Register (SYSC0_PSSREGCFGR)

The SYSC0_PSSREGCFGR register sets the regulator mode and output voltage.

bit	31										8									
Field	Reserved																			
R/W Attribute	R0,WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000_00000000																			

bit	7			6		5		4		3		2		1		0		
Field	RMSEL		Reserved												RVSEL			
R/W Attribute	R/W		R0,WX												R,WX			
Protection Attribute	WPS																	
Initial Value	0		000000												(product specification)			

[bit31:8] Reserved: Reserved Bits

[bit7] RMSEL: Regulator Mode Setting Bit

This bit set the regulator mode setting.

Bit	Description
0	Main mode
1	Standby mode

Main mode is normal operation in regulator.

Standby mode is low power operation in regulator.

In 'Standby mode', current consumption in PSS mode can be reduced than Main mode by setting this bit.

Note: Specific value of current consumption depend on each product.

Please refer to Datasheet for any device-specific information.

[bit6:1] Reserved: Reserved Bits

[bit0] RVSEL: Regulator Output Voltage Setting Bits

These bits indicate the regulator output voltage.

Bit	Description
0	1.20V
1	1.25V

Note:

- The setting of this bit will be as same as SYSC0_RUNREGCFGR .RVSEL.

5.3.12. PSS Profile Update Enable Register (SYSC0_PSSENR)

This register enables PSS profile updates.

bit	31	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

	7	6	5	4	3	2	1	0
Field	PSSEN0							
R/W Attribute	R,W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] PSSEN0: PSS profile Update Enable Setting Bits

These bits compose the PSS profile update start register.

bit7:0	Description
During write operation	When "0xBA" is written: Write "0xBA" to the register and PSSEN will be valid. When "0x00" is written: Write "0x00" to the register and PSSEN will be invalid. When other than "0xBA"/"0x00" is written: Invalid
During read operation	When "0xBA" is written: "0xBA" is read. Otherwise: "0x00" is read.

Notes:

- If the value written in this register invalid, an error flag (SYSC0_SYSERRIR1:PSSERRRIF0 is "1") is enabled.
- This register permits byte access only. Any other access is invalid. If the above is not complied with, a bus error occurs.

5.4. APP Profile Register Group (SYSC0)

The registers in this group are APP profile control setting registers.

5.4.1. APP Power Domain Setting Register (SYSC0_APPPDCFGR)

The SYSC0_APPPDCFGR register indicates the ON/OFF of the power domain which is going to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved						PD6_1 EN	PD6_0 EN
R/W Attribute	R0,WX						R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000000						1	1

bit	23	22	21	20	19	18	17	16
Field	PD5_3 EN	PD5_2 EN	PD5_1 EN	PD5_0 EN	Reserved		PD4_1 EN	PD4_0 EN
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R0,WX		R,WX	R,WX
Protection Attribute	WPS							
Initial Value	1	1	1	1	00		1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved			PD3 EN	Reserved			PD2 EN
R/W Attribute	R0,WX			R,WX	R0,WX			R,WX
Protection Attribute	WPS							
Initial Value	000			1	000			1

bit	7	6	5	4	3	2	1	0
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:26] Reserved: Reserved Bits

[bit25] PD6_1EN: Power Control Bit for Power Domain 6_1

This bit sets the ON/OFF of power domain 6_1 when it is updated.

Bit	Description
0	OFF
1	ON

[bit24] PD6_0 EN: Power Control Bit for Power Domain 6_0

This bit sets the ON/OFF of power domain 6_0 when it is updated.

Bit	Description
0	OFF
1	ON

[bit23] PD5_3 EN: Power Control Bit for Power Domain 5_3

This bit sets the ON/OFF of power domain 5_3 when it is updated.

Bit	Description
0	OFF
1	ON

[bit22] PD5_2 EN: Power Control Bit for Power Domain 5_2

This bit sets the ON/OFF of power domain 5_2 when it is updated.

Bit	Description
0	OFF
1	ON

[bit21] PD5_1 EN: Power Control Bit for Power Domain 5_1

This bit sets the ON/OFF of power domain 5_1 when it is updated.

Bit	Description
0	OFF
1	ON

[bit20] PD5_0 EN: Power Control Bit for Power Domain 5_0

This bit sets the ON/OFF of power domain 5_0 when it is updated.

Bit	Description
0	OFF
1	ON

[bit19:18] Reserved: Reserved Bits

[bit17] PD4_1 EN: Power Control Bit for Power Domain 4_1

This bit sets the ON/OFF of power domain 4_1 when it is updated.

Bit	Description
0	OFF
1	ON

[bit16] PD4_0 EN: Power Control Bit for Power Domain 4_0

This bit sets the ON/OFF of power domain 4_0 when it is updated.

Bit	Description
0	OFF
1	ON

[bit15:13] Reserved: Reserved Bits**[bit12] PD3 EN: Power Control Bit for Power Domain 3**

This bit sets the ON/OFF of power domain 3 when it is updated.

Bit	Description
0	OFF
1	ON

[bit11:9] Reserved: Reserved Bits**[bit8] PD2 EN: Power Control Bit for Power Domain 2**

This bit sets the ON/OFF of power domain 2 when it is updated.

Bit	Description
0	OFF
1	ON

[bit7:0] Reserved: Reserved Bits

5.4.2. APP Clock Source Enable Register (SYSC0_APPCKSRER)

The SYSC0_APPCKSRER register indicates the value for setting whether to enable/disable oscillation of the internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3 EN	SSCG2 EN	SSCG1 EN	SSCG0 EN
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3EN	PLL2EN	PLL1EN	PLL0EN
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved				SOSCEN	MOSC EN	SCROSC EN	CROSC EN
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	1	1	1

[bit31:20] Reserved: Reserved Bits

[bit19] SSCG3EN: SSCG PLL3 Clock Oscillation Enable Bit

This bit indicates the set value of the SSCG PLL3 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit18] SSCG2EN: SSCG PLL2 Clock Oscillation Enable Bit

This bit indicates the set value of the SSCG PLL2 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit17] SSCG1EN: SSCG PLL1 Clock Oscillation Enable Bit

This bit indicates the set value of the SSCG PLL1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit16] SSCG0EN: SSCG PLL0 Clock Oscillation Enable Bit

This bit indicates the set value of the SSCG PLL0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit15:12] Reserved: Reserved Bits**[bit11] PLL3EN: PLL3 Clock Oscillation Enable Bit**

This bit indicates the set value of the PLL3 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] PLL2EN: PLL2 Clock Oscillation Enable Bit

This bit indicates the set value of the PLL2 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] PLL1EN: PLL1 Clock Oscillation Enable Bit

This bit indicates the set value of the PLL1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] PLL0EN: PLL0 Clock Oscillation Enable Bit

This bit indicates the set value of the PLL0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7:4] Reserved: Reserved Bits

[bit3] SOSCCN: Sub Clock Oscillation Enable Bit

This bit indicates the set value of the sub clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit2] MOSCCN: Main Clock Oscillation Enable Bit

This bit indicates the set value of the main clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit1] SCROSCN: Low-Speed CR Clock Oscillation Enable Bit

This bit indicates the set value of the low-speed CR clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit0] CROSCN: High-Speed CR Clock Oscillation Enable Bit

This bit indicates the set value of the high-speed CR clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.4.4. APP Clock Enable Register (SYSC0_APPCKER)

The SYSC0_APPCKER register indicates the value for setting whether to enable/disable oscillation of the internal operating clock to be updated.

bit	31										8									
Field	Reserved																			
R/W Attribute	R0,WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000_00000000																			

bit	7				6		5		4		3		2		1		0	
Field	Reserved														ENCLK MCUCP		ENCLK MCUCH	
R/W Attribute	R0,WX														R,WX		R,WX	
Protection Attribute	WPS																	
Initial Value	000000														1		1	

[bit31:2] Reserved: Reserved Bits

[bit1] ENCLKMCUCP: MCU config APB Clock Oscillation Enable Bit

This bit indicates the set value of the MCU config APB clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit0] ENCLKMCUCH: MCU config AHB Clock Oscillation Enable Bit

This bit indicates the set value of the MCU config AHB clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit4:0] MCUCHDIV: MCU config AHB Clock Divider Setting Bits

These bits indicate the division set value of the clock domain MCUC.

bit4:0	Description
0_0000	No division
0_0001	Divided by 2
0_0010	Divided by 3
...	...
1_1101	Divided by 30
1_1110	Divided by 31
1_1111	Divided by 32

5.4.6. APP PLLx Control Register (SYSC0_APPPLLxCNTR)

The SYSC0_APPPLLxCNTR register indicates the division and the multiplier of the PLLx to be updated.

bit	31	30	29	28	27	26	25	24
Field	PLLx ISEL	Reserved						
R/W Attribute	R,WX	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	PLLxDIVN							
R/W Attribute	R,WX							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8	
Field	Reserved					PLLxDIVM			
R/W Attribute	R0,WX					R,WX			
Protection Attribute	WPS								
Initial Value	0000					0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						PLLxDIVL	
R/W Attribute	R0,WX						R,WX	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] PLLxISEL: PLLx Input Clock Selection Bit

This bit indicates the setting of input source clock to PLLx to be updated.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] PLLxDIVN: NPLLx Clock N-multiplier Ratio Setting Bits

These bits set the multiplication rate of the NPLLx clock.

bit23:16	Description
0000_0000	prohibited
...	...
0000_1100	prohibited
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	prohibited
...	...
1100_1111	prohibited

[bit15:12] Reserved: Reserved Bits

[bit11:8] PLLxDIVM: PLLx Clock M-Divider Setting Bits

These bits set the division ratio for PLLx clock output.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] PLLxDIVL: PLLx Input Clock Divider Setting Bits

These bits set the division ratio of the PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.4.7. APP SSCGx Control Register 0 (SYSC0_APPSSCGxCNTR0)

The SYSC0_APPSSCGxCNTR0 register indicates the set values of the division, multiplication rate, etc. for SSCG PLLx to be updated.

bit	31	30	29	28	27	26	25	24
Field	SSCGx ISEL	Reserved						
R/W Attribute	R,WX	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	SSCGxDIVN							
R/W Attribute	R,WX							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8
Field	Reserved				SSCGxDIVM			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						SSCGxDIVL	
R/W Attribute	R0,WX						R,WX	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] SSCGxISEL: SSCG PLLx Input Clock Selection Bit

This bit sets the clock to supply to SSCG PLLx.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] SSCGxDIVN: SSCG PLLx Clock N-multiplier Setting Bits

These bits set the N multiplication rate of the SSCG PLLx clock.

bit23:16	Description
0000_0000	Setting prohibited
...	...
0000_1100	Setting prohibited
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	Setting prohibited
...	...
1100_1111	Setting prohibited

[bit15:12] Reserved: Reserved Bits
[bit11:8] SSCGxDIVM: SSCG PLLx Clock M-Division Setting Bits

These bits set the division ratio for SSCG PLLx clock output.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] SSCGxDIVL: SSCG PLLx Input Clock Divider Setting Bits

These bits set the division ratio of the SSCG PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.4.8. APP SSCGx Control Register 1 (SYSC0_APPSSCGxCNTR1)

The SYSC0_APPSSCGxCNTR1 register indicates the set values for modulation enable, the modulation mode, etc. for SSCG PLLx to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved							SSCGx SSEN
R/W Attribute	R0,WX							R,WX
Protection Attribute	WPS							
Initial Value	0000000							0

bit	23	22	21	20	19	18	17	16
Field	Reserved					SSCGxFREQ		SSCGx MODE
R/W Attribute	R0,WX					R,WX		R,WX
Protection Attribute	WPS					WPS		
Initial Value	00000					00		0

bit	15	14	13	12	11	10	9	8
Field	Reserved							SSCGxRATE
R/W Attribute	R0,WX							R,WX
Protection Attribute	WPS							
Initial Value	000000							00

bit	7	6	5	4	3	2	1	0
Field	SSCGxRATE							
R/W Attribute	R,WX							
Protection Attribute	WPS							
Initial Value	00101001							

[bit31:25] Reserved: Reserved Bits

[bit24] SSCGxSSEN: SSCG PLLx modulation Enable Setting Bit

This bit controls SSCG PLLx modulation.

Bit	Description
0	Disable modulation.
1	Enable modulation.

[bit23:19] Reserved: Reserved Bits

[bit18:17] SSCGxFREQ: SSCG PLLx Clock modulation Frequency Selection Bits

These bits set the modulation frequency of the SSCG PLLx clock.

bit18:17	Description
00	$F_{mod} = (1/1024) \times F_{in}$
01	$F_{mod} = (1/2048) \times F_{in}$
10 or 11	$F_{mod} = (1/4096) \times F_{in}$

* F_{in} : SSCG reference clock frequency, F_{mod} : Modulation frequency

[bit16] SSCGxMODE: SSCG PLLx modulation Mode Setting Bit

This bit sets the modulation mode of the SSCG PLLx clock.

Bit	Description
0	Set Down spread mode.
1	Set Center spread mode.

- Down spread

- Center spread

0356a0_03a1474702014a6e6d11c36271402a_3863_r1_52-481_u000_020507_a

[bit15:10] Reserved: Reserved Bits

[bit9:0] SSCGxRATE: SSCG PLLx Clock modulation Ratio Control Bits

These bits set the modulation ratio of the SSCG PLLx clock.

bit9:0	Description
00_0010_1001	Modulation ratio of 0.5%
00_0101_0010	Modulation ratio of 1.0%
00_1010_0100	Modulation ratio of 2.0%
00_1111_0110	Modulation ratio of 3.0%
01_0100_1000	Modulation ratio of 4.0%
01_1001_1010	Modulation ratio of 5.0%
Others	Setting prohibited

5.4.9. APP Low-Voltage Detection Setting Register (SYSC0_APPLVDCFGR)

The SYSC0_APPLVDCFGR register indicates the set values for each internal low-voltage detection to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved	LVDL1S	Reserved			LVDL1V		LVDL1E
R/W Attribute	R0,WX	R,WX	R0,WX			R,WX		R,WX
Protection Attribute	WPS							
Initial Value	0	(product specification)	000			(product specification)		(product specification)

bit	23	22	21	20	19	18	17	16
Field	Reserved	LVDL2S	Reserved			LVDL2V		LVDL2E
R/W Attribute	R0,WX	R,WX	R0,WX			R,WX		R,WX
Protection Attribute	WPS							
Initial Value	0	(product specification)	000			(product specification)		(product specification)

bit	15	14	13	12	11	10	9	8
Field	Reserved	LVDH1S	Reserved	LVDH1V			LVDH1E	
R/W Attribute	R0,WX	R,WX	R0,WX	R,WX			R,WX	
Protection Attribute	WPS							
Initial Value	0	(product specification)	0	(product specification)			(product specification)	

bit	7	6	5	4	3	2	1	0
Field	Reserved	LVDH2S	Reserved	LVDH2V			LVDH2E	
R/W Attribute	R0,WX	R,WX	R0,WX	R,WX			R,WX	
Protection Attribute	WPS							
Initial Value	0	(product specification)	0	(product specification)			(product specification)	

[bit31] Reserved: Reserved Bit

[bit30] LVDL1S: Internal Low-Voltage Detection Operation Selection Bit

This bit selects an operation for the internal low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit29:27] Reserved: Reserved Bits

[bit26:25] LVDL1V: Internal Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for internal low-voltage detection.

Bit26:25	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit24] LVDL1E: Internal Low-Voltage Detection Operation Enable Bit

This bit enables the internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit23] Reserved: Reserved Bit**[bit22] LVDL2S: Extended Internal Low-Voltage Detection Operation Selection Bit**

This bit selects an operation for the extended internal low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit21:19] Reserved: Reserved Bits

[bit18:17] LVDL2V: Extended Internal Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended internal low-voltage detection.

Bit18:17	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended Internal Low-Voltage Detection Operation Enable Bit

This bit enables the extended internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit15] Reserved: Reserved Bit

[bit14] LVDH1S: External Low-Voltage Detection Operation Selection Bit

This bit selects an operation for the external low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit13] Reserved: Reserved Bit

[bit12:9] LVDH1V: External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for external low-voltage detection.

Bit12:9	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit8] LVDH1E: External Low-Voltage Detection Operation Enable Bit

This bit sets the external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit7] Reserved: Reserved Bit**[bit6] LVDH2S: Extended External Low-Voltage Detection Operation Selection Bit**

This bit selects an operation for the extended external low-voltage detection.

Bit	Description
0	Reset.
1	Interrupt.

[bit5] Reserved: Reserved Bit

[bit4:1] LVDH2V: Extended External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended external low-voltage detection.

Bit4:1	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit0] LVDH2E: Extended External Low-Voltage Detection Operation Enable Bit

This bit sets the extended external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

5.4.10. APP Clock Supervisor Setting Register (SYSC0_APPCSVCFGR)

The SYSC0_APPCSVCFGR register indicates the value for setting whether to enable or disable operation of each clock supervisor to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3 CSVE	SSCG2 CSVE	SSCG1 CSVE	SSCG0 CSVE
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3 CSVE	PLL2 CSVE	PLL1 CSVE	PLL0 CSVE
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved				SCR CSVE	CR CSVE	SO CSVE	MO CSVE
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

[bit31:20] Reserved: Reserved Bits

[bit19] SSCG3CSVE: SSCG PLL3 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit18] SSCG2CSVE: SSCG PLL2 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit17] SSCG1CSVE: SSCG PLL1 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit16] SSCG0CSVE: SSCG PLL0 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the SSCG PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit15:12] Reserved: Reserved Bits
[bit11] PLL3CSVE: PLL3 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit10] PLL2CSVE: PLL2 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit9] PLL1CSVE: PLL1 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit8] PLL0CSVE: PLL0 Clock Supervisor Enable Bit

This bit sets whether to enable or disable the PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit7:4] Reserved: Reserved Bits**[bit3] SCRCsVE : Low-Speed CR Clock Supervisor Enable Bit**

This bit displays whether to enable or disable the low-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit2] CRCSVE: High-Speed CR Clock Supervisor Enable Bit

This bit displays whether to enable or disable the high-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit1] SOCSVE: Sub Clock Supervisor Enable Bit

This bit sets whether to enable or disable the sub clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit0] MOCSVE: Main Clock Supervisor Enable Bit

This bit sets whether to enable or disable the main clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

5.4.11. APP Regulator Setting Register (SYSC0_APPREGCFGR)

The SYSC0_APPREGCFGR register indicates the set values for the regulator mode and output voltage to be updated.

bit	31							8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	RMSEL	Reserved						RVSEL
R/W Attribute	R,WX	R0,WX						R,WX
Protection Attribute	WPS							
Initial Value	0	000000						(product specification)

[bit31:8] Reserved: Reserved Bits

[bit7] RMSEL: Regulator Mode Setting Bit

This bit indicates the regulator mode setting.

Bit	Description
0	Main mode
1	Standby mode

[bit6:1] Reserved: Reserved Bits

[bit0] RVSEL: Regulator Output Voltage Setting Bits

These bits set the regulator output voltage.

Bit	Description
0	1.20V
1	1.25V

5.5. STS Profile Register Group (SYSC0)

The registers in this group are STS profile control setting registers.

5.5.1. STS Power Domain Setting Register (SYSC0_STSPDCFGR)

The SYSC0_STSPDCFGR register indicates the set value of power ON or OFF for each power domain.

bit	31	30	29	28	27	26	25	24
Field	Reserved						PD6_1 EN	PD6_0 EN
R/W Attribute	R0,WX						R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000000						1	1

bit	23	22	21	20	19	18	17	16
Field	PD5_3 EN	PD5_2 EN	PD5_1 EN	PD5_0 EN	Reserved		PD4_1 EN	PD4_0 EN
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R0,WX		R,WX	R,WX
Protection Attribute	WPS							
Initial Value	1	1	1	1	00		1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved			PD3 EN	Reserved			PD2 EN
R/W Attribute	R0,WX			R,WX	R0,WX			R,WX
Protection Attribute	WPS							
Initial Value	000			1	000			1

bit	7	6	5	4	3	2	1	0
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:26] Reserved: Reserved Bits

[bit25] PD6_1EN: Power Domain 6_1 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 6_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit24] PD6_0 EN: Power Domain 6_0 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 6_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit23] PD5_3 EN: Power Domain 5_3 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 5_3.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit22] PD5_2 EN: Power Domain 5_2 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 5_2.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit21] PD5_1 EN: Power Domain 5_1 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 5_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit20] PD5_0 EN: Power Domain 5_0 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 5_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit19:18] Reserved: Reserved Bits
[bit17] PD4_1 EN: Power Domain 4_1 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 4_1.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit16] PD4_0 EN: Power Domain 4_0 Power Supply Control Bit

This bit indicates the set value for the power supply control of power domain 4_0.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit15:13] Reserved: Reserved Bits**[bit12] PD3 EN: Power Domain 3 Power Supply Control Bit**

This bit indicates the set value for the power supply control of power domain 3.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit11:9] Reserved: Reserved Bits**[bit8] PD2 EN: Power Domain 2 Power Supply Control Bit**

This bit indicates the set value for the power supply control of power domain 2.

Bit	Description
0	Shut off power supply.
1	Supply power.

[bit7:0] Reserved: Reserved Bits

5.5.2. STS Clock Source Enable Register (SYSC0_STSCSRER)

The SYSC0_STSCSRER register indicates the value for setting whether to enable/disable oscillation of the source clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	SSCG3 RDY	SSCG2 RDY	SSCG1 RDY	SSCG0 RDY	SSCG3 EN	SSCG2 EN	SSCG1 EN	SSCG0 EN
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	PLL3 RDY	PLL2 RDY	PLL1 RDY	PLL0 RDY	PLL3EN	PLL2EN	PLL1EN	PLL0EN
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	SOSC RDY	MOSC RDY	SCROSC RDY	CROSC RDY	SOSCEN	MOSC EN	SCROSC EN	CROSC EN
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	1	1	1

[bit31:24] Reserved: Reserved Bits

[bit23] SSCG3RDY: SSCG PLL3 Clock Oscillation Stabilization Bit

This bit indicates the status of the SSCG PLL3 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit22] SSCG2RDY: SSCG PLL2 Clock Oscillation Stabilization Bit

This bit indicates the status of the SSCG PLL2 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit21] SSCG1RDY: SSCG PLL1 Clock Oscillation Stabilization Bit

This bit indicates the status of the SSCG PLL1 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit20] SSCG0RDY: SSCG PLL0 Clock Oscillation Stabilization Bit

This bit indicates the status of the SSCG PLL0 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit19] SSCG3EN: SSCG PLL3 Clock Oscillation Enable Bit

This bit indicates the set value for SSCG PLL3 clock oscillation control.

Bit	Description
0	Disable oscillation of the SSCG PLL3 clock.
1	Enable oscillation of the SSCG PLL3 clock.

[bit18] SSCG2EN: SSCG PLL2 Clock Oscillation Enable Bit

This bit indicates the set value for SSCG PLL2 clock oscillation control.

Bit	Description
0	Disable oscillation of the SSCG PLL2 clock.
1	Enable oscillation of the SSCG PLL2 clock.

[bit17] SSCG1EN: SSCG PLL1 Clock Oscillation Enable Bit

This bit indicates the set value for SSCG PLL1 clock oscillation control.

Bit	Description
0	Disable oscillation of the SSCG PLL1 clock.
1	Enable oscillation of the SSCG PLL1 clock.

[bit16] SSCG0EN: SSCG PLL0 Clock Oscillation Enable Bit

This bit indicates the set value for SSCG PLL0 clock oscillation control.

Bit	Description
0	Disable oscillation of the SSCG PLL0 clock.
1	Enable oscillation of the SSCG PLL0 clock.

[bit15] PLL3RDY: PLL3 Clock Oscillation Stabilization Bit

This bit indicates the status of the PLL3 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit14] PLL2RDY: PLL2 Clock Oscillation Stabilization Bit

This bit indicates the status of the PLL2 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit13] PLL1RDY: PLL1 Clock Oscillation Stabilization Bit

This bit indicates the status of the PLL1 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit12] PLL0RDY: PLL0 Clock Oscillation Stabilization Bit

This bit indicates the status of the PLL0 clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

[bit11] PLL3EN: PLL3 Clock Oscillation Enable Bit

This bit indicates the set value for PLL3 clock oscillation control.

Bit	Description
0	Disable oscillation of the PLL3 clock.
1	Enable oscillation of the PLL3 clock.

[bit10] PLL2EN: PLL2 Clock Oscillation Enable Bit

This bit indicates the set value for PLL2 clock oscillation control.

Bit	Description
0	Disable oscillation of the PLL2 clock.
1	Enable oscillation of the PLL2 clock.

[bit9] PLL1EN: PLL1 Clock Oscillation Enable Bit

This bit indicates the set value for PLL1 clock oscillation control.

Bit	Description
0	Disable oscillation of the PLL1 clock.
1	Enable oscillation of the PLL1 clock.

[bit8] PLL0EN: PLL0 Clock Oscillation Enable Bit

This bit indicates the set value for PLL0 clock oscillation control.

Bit	Description
0	Disable oscillation of the PLL0 clock.
1	Enable oscillation of the PLL0 clock.

[bit7] SOSCRDY: Sub Clock Oscillation Stabilization Bit

This bit indicates the status of the sub clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

Note:

- This bit is read as "1" if stabilization is completed and sub clock is stable.

[bit6] MOSCRDY: Main Clock Oscillation Stabilization Bit

This bit indicates the status of the main clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

Note:

- This bit is read as "1" if stabilization is completed and main clock is stable.

[bit5] SCROSCRDY: Low-Speed CR Clock Oscillation Stabilization Bit

This bit indicates the status of the low-speed CR clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

Note:

- This bit is read as "1" if stabilization is completed and Low-speed CR clock is stable.

[bit4] CROSCRDY: High-Speed CR Clock Oscillation Stabilization Bit

This bit indicates the status of the high-speed CR clock oscillation.

Bit	Description
0	Stabilization wait or oscillation stop state
1	Stable state

Note:

- This bit is read as "1" if stabilization is completed and High-speed CR clock is stable.

[bit3] SOSSEN: Sub Clock Oscillation Enable Bit

This bit indicates the set value for sub clock oscillation control.

Bit	Description
0	Disable oscillation of the sub clock.
1	Enable oscillation of the sub clock.

[bit2] MOSSEN: Main Clock Oscillation Enable Bit

This bit indicates the set value for main clock oscillation control.

Bit	Description
0	Disable oscillation of the main clock.
1	Enable oscillation of the main clock.

[bit1] SCROSCEN: Low-Speed CR Clock Oscillation Enable Bit

This bit indicates the set value for low-speed CR clock oscillation control.

Bit	Description
0	Disable oscillation of the low-speed CR clock.
1	Enable oscillation of the low-speed CR clock.

[bit0] CROSCEN: High-Speed CR Clock Oscillation Enable Bit

This bit indicates the set value for high-speed CR clock oscillation control.

Bit	Description
0	Disable oscillation of the high-speed CR clock.
1	Enable oscillation of the high-speed CR clock.

5.5.3. STS Clock Selection Register (SYSC0_STSCKSELR)

The SYSC0_STSCKSELR register indicates the set values of the clock source for the clock domain.

bit	31										8									
Field	Reserved																			
R/W Attribute	R0,WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000_00000000																			

bit	7		6		5		4		3		2		1		0	
Field	Reserved		CDMCUCCM				Reserved		CDMCUCCSL							
R/W Attribute	R0,WX		R,WX				R0,WX		R,WX							
Protection Attribute	WPS															
Initial Value	0		000				0		000							

[bit31:7] Reserved: Reserved Bits

[bit6:4] CDMCUCCM: Clock Domain MCUC Clock Selection Status Bits

These bits indicate the selection status of the source clock for the clock domain MCUC.

bit6:4	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG PLL0 clock
110	Setting Prohibited
111	Clock fixed at "L"

[bit3] Reserved: Reserved Bit

[bit2:0] CDMCUCCSL: Clock Domain MCUC Clock Selection Bits

These bits indicate the value for selection of the source clock for the clock domain MCUC.

bit2:0	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG PLL0 clock
110	Setting Prohibited
11x	Clock fixed at "L"

5.5.4. STS Clock Enable Register (SYSC0_STSCKER)

The SYSC0_STSCKER register indicates the set value for stopping or enabling the internal clock.

bit	31									8
Field	Reserved									
R/W Attribute	R0,WX									
Protection Attribute	WPS									
Initial Value	00000000_00000000_00000000									

bit	7	6	5	4	3	2	1	0
Field	Reserved						ENCLK MCUCP	ENCLK MCUCH
R/W Attribute	R0,WX						R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000000						1	1

[bit31:2] Reserved: Reserved Bits

[bit1] ENCLKMCUCP: MCUconfig APB Clock Oscillation Enable Bit

This bit indicates the value for setting whether to enable/disable MCUconfig APB clock oscillation.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit0] ENCLKMCUCH: MCUconfig AHB Clock Oscillation Enable Bit

This bit indicates the value for setting whether to enable/disable MCUconfig AHB clock oscillation.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

The SYSC0 STSCKER register indicates the set value of a clock division ratio.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved				MCUCPDIV			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			MCUCHDIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

These bits indicate the set value of the division ratio of the PCOM clock from the HCOM clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit4:0] MCUCHDIV: MCUconfig AHB Clock Division Setting Bits

These bits indicate the set value of the division ratio from the source clock of the clock domain MCUC.

bit4:0	Description
0_0000	No division
0_0001	Divided by 2
0_0010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.5.6. STS PLLx Control Register (SYSC0_STSPLLxCNTR)

The SYSC0_STSPLLxCNTR register indicates the set values of the division ratio, multiplication rate, etc. for PLLx.

bit	31	30	29	28	27	26	25	24
Field	PLLx ISEL	Reserved						
R/W Attribute	R,WX	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	PLLxDIVN							
R/W Attribute	R,WX							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8	
Field	Reserved					PLLxDIVM			
R/W Attribute	R0,WX					R,WX			
Protection Attribute	WPS								
Initial Value	0000					0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						PLLxDIVL	
R/W Attribute	R0,WX						R,WX	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] PLLxISEL: PLLx Input Clock Selection Bit

This bit indicates the value for setting the clock to supply to PLLx.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] PLLxDIVN: PLLx Clock N-Multiplication Rate Setting Bits

These bits indicate the set value of the N multiplication rate of the PLLx clock.

bit23:16	Description
0000_0000	Setting prohibited
...	...
0000_1100	Setting prohibited
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	Setting prohibited
...	...
1100_1111	Setting prohibited

[bit15:12] Reserved: Reserved Bits

[bit11:8] PLLxDIVM: PLLx Output Clock M-Division Ratio Setting Bits

These bits indicate the set value of the M division ratio of the PLLx output clock.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] PLLxDIVL: PLLx Clock L-Division Ratio Setting Bits

These bits indicate the set value of the L division ratio of the PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.5.7. STS SSCGx Control Register 0 (SYSC0_STSSSCGxCNTR0)

The SYSC0_STSSSCGxCNTR0 register indicates the set values of the division ratio, multiplication rate, etc. for SSCG PLLx.

bit	31	30	29	28	27	26	25	24
Field	SSCGx ISEL	Reserved						
R/W Attribute	R,WX	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	SSCGxDIVN							
R/W Attribute	R,WX							
Protection Attribute	WPS							
Initial Value	00001101							

bit	15	14	13	12	11	10	9	8
Field	Reserved				SSCGxDIVM			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0001			

bit	7	6	5	4	3	2	1	0
Field	Reserved						SSCGxDIVL	
R/W Attribute	R0,WX						R,WX	
Protection Attribute	WPS							
Initial Value	000000						00	

[bit31] SSCGxISEL: SSCG PLLx Input Clock Selection Bit

This bit indicates the value for setting the clock to supply to SSCG PLLx.

Bit	Description
0	Main clock
1	High-speed CR clock

[bit30:24] Reserved: Reserved Bits

[bit23:16] SSCGxDIVN: SSCG PLLx Clock N-multiplier Setting Bits

These bits indicate the set value of the N multiplication rate of the SSCG PLLx clock.

bit23:16	Description
0000_0000	Setting prohibited
...	...
0000_1100	Setting prohibited
0000_1101	Multiply by 13
0000_1110	Multiply by 14
...	...
1100_0110	Multiply by 198
1100_0111	Multiply by 199
1100_1000	Multiply by 200
1100_1001	Setting prohibited
...	...
1100_1111	Setting prohibited

[bit15:12] Reserved: Reserved Bits**[bit11:8] SSCGxDIVM: SSCG PLLx Clock M-Division Setting Bits**

These bits indicate the set value of the M division ratio of the SSCG PLLx output clock.

bit11:8	Description
000x	Divided by 2
0010	Divided by 4
0011	Divided by 6
0100	Divided by 8
0101	Divided by 10
0110	Divided by 12
0111	Divided by 14
1000	Divided by 16
1001	Divided by 18
1010	Divided by 20
1011	Divided by 22
1010	Divided by 24
1101	Divided by 26
1110	Divided by 28
1111	Divided by 30

[bit7:2] Reserved: Reserved Bits

[bit1:0] SSCGxDIVL: SSCG PLLx Input Clock Division Setting Bits

These bits indicate the set value of the L division ratio of the SSCG PLLx input clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 6

5.5.8. STS SSCGx Control Register 1 (SYSC0_STSSSCGxCNTR1)

The SYSC0_STSSSCGxCNTR1 register indicates the set values for modulation enable, the modulation mode, etc. for SSCG PLLx.

bit	31	30	29	28	27	26	25	24
Field	Reserved							SSCGx SSEN
R/W Attribute	R0,WX							R,WX
Protection Attribute	WPS							
Initial Value	0000000							0

bit	23	22	21	20	19	18	17	16
Field	Reserved					SSCGxFREQ		SSCGx MODE
R/W Attribute	R0,WX					R,WX		R,WX
Protection Attribute	WPS					WPS		
Initial Value	00000					00		0

bit	15	14	13	12	11	10	9	8
Field	Reserved							SSCGxRATE
R/W Attribute	R0,WX							R,WX
Protection Attribute	WPS							
Initial Value	000000							00

bit	7	6	5	4	3	2	1	0
Field	SSCGxRATE							
R/W Attribute	R,WX							
Protection Attribute	WPS							
Initial Value	00101001							

[bit31:25] Reserved: Reserved Bits

[bit24] SSCGxSSEN: SSCG PLLx modulation Enable Setting Bit

This bit indicates the set value for SSCG PLLx clock modulation control.

Bit	Description
0	Disable modulation.
1	Enable modulation.

[bit23:19] Reserved: Reserved Bits

[bit18:17] SSCGxFREQ: SSCG PLLx Clock modulation Frequency Selection Bits

These bits indicate the set value of the modulation frequency of the SSCG PLLx clock.

bit18:17	Description
00	$F_{\text{mod}} = (1/1024) \times F_{\text{in}}$
01	$F_{\text{mod}} = (1/2048) \times F_{\text{in}}$
10 or 11	$F_{\text{mod}} = (1/4096) \times F_{\text{in}}$

* Fin: SSCG reference clock frequency, Fmod: Modulation frequency

[bit16] SSCGxMODE: SSCG PLLx modulation Mode Setting Bit

This bit indicates the set value for the modulation mode of the SSCG PLLx clock.

Bit	Description
0	Set Down spread mode.
1	Set Center spread mode.

- Down spread

- Center spread

u3dnc6_ba1474702b14eba0fa1ca3ab221e60a_5063_d_53c491_u000_r235827_a

[bit15:10] Reserved: Reserved Bits

[bit9:0] SSCGxRATE: SSCG PLLx Clock modulation Ratio Control Bits

These bits indicate the set value of the modulation ratio of the SSCG PLLx clock.

bit9:0	Description
00_0010_1001	Modulation ratio of 0.5%
00_0101_0010	Modulation ratio of 1.0%
00_1010_0100	Modulation ratio of 2.0%
00_1111_0110	Modulation ratio of 3.0%
01_0100_1000	Modulation ratio of 4.0%
01_1001_1010	Modulation ratio of 5.0%
Others	Setting prohibited

5.5.9. STS Low-Voltage Detection Setting Register (SYSC0_STSLVDCFGR)

The SYSC0_STSLVDCFGR register indicates the set values for each internal low-voltage detection.

bit	31	30	29	28	27	26	25	24
Field	LVDL1R	LVDL1S	Reserved			LVDL1V		LVDL1E
R/W Attribute	R,WX	R,WX	R0,WX			R,WX		R,WX
Protection Attribute	WPS							
Initial Value	(product specification)	(product specification)	000			(product specification)		(product specification)

bit	23	22	21	20	19	18	17	16
Field	LVDL2R	LVDL2S	Reserved			LVDL2V		LVDL2E
R/W Attribute	R,WX	R,WX	R0,WX			R,WX		R,WX
Protection Attribute	WPS							
Initial Value	(product specification)	(product specification)	000			(product specification)		(product specification)

bit	15	14	13	12	11	10	9	8
Field	LVDH1R	LVDH1S	Reserved	LVDH1V			LVDH1E	
R/W Attribute	R,WX	R,WX	R0,WX	R,WX			R,WX	
Protection Attribute	WPS							
Initial Value	(product specification)	(product specification)	0	(product specification)			(product specification)	

bit	7	6	5	4	3	2	1	0
Field	LVDH2R	LVDH2S	Reserved	LVDH2V			LVDH2E	
R/W Attribute	R,WX	R,WX	R0,WX	R,WX			R,WX	
Protection Attribute	WPS							
Initial Value	(product specification)	(product specification)	0	(product specification)			(product specification)	

[bit31] LVDL1R: Internal Low-Voltage Detection Operation Status Bit

This bit shows the operation status of internal low-voltage detection.

Bit	Description
0	Stabilization wait or monitoring stop status
1	Monitoring status

[bit30] LVDL1S: Internal Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the internal low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit29:27] Reserved: Reserved Bits**[bit26:25] LVDL1V: Internal Low-Voltage Detection Voltage Setting Bits**

These bits set the detection voltage for internal low-voltage detection.

Bit	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit24] LVDL1E: Internal Low-Voltage Detection Operation Enable Bit

This bit sets the internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit23] LVDL2R: Extended Internal Low-Voltage Detection Operation Status Bit

This bit shows the operation status of extended internal low-voltage detection.

Bit	Description
0	Stabilization wait or monitoring stop status
1	Monitoring status

[bit22] LVDL2S: Extended Internal Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the extended internal low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit21:19] Reserved: Reserved Bits
[bit18:17] LVDL2V: Extended Internal Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended internal low-voltage detection.

Bit	Description
00	(product specification)
01	(product specification)
10	(product specification)
11	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit16] LVDL2E: Extended Internal Low-Voltage Detection Operation Enable Bit

This bit sets the extended internal low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit15] LVDH1R: External Low-Voltage Detection Operation Status Bit

This bit shows the operation status of external low-voltage detection.

Bit	Description
0	Stabilization wait or monitoring stop status
1	Monitoring status

[bit14] LVDH1S: External Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the external low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit13] Reserved: Reserved Bit**[bit12:9] LVDH1V: External Low-Voltage Detection Voltage Setting Bits**

These bits set the detection voltage for external low-voltage detection.

Bit	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After the detection voltage is changed, low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit8] LVDH1E: External Low-Voltage Detection Operation Enable Bit

This bit sets the external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

[bit7] LVDH2R: Extended External Low-Voltage Detection Operation Status Bit

This bit shows the operation status of extended external low-voltage detection.

Bit	Description
0	Stabilization wait or monitoring stop status
1	Monitoring status

[bit6] LVDH2S: Extended External Low-Voltage Detection Operation Selection Bit

This bit selects an operation when the extended external low-voltage detection occurs.

Bit	Description
0	Reset.
1	Interrupt.

[bit5] Reserved: Reserved Bit

[bit4:1] LVDH2V: Extended External Low-Voltage Detection Voltage Setting Bits

These bits set the detection voltage for extended external low-voltage detection.

Bit	Description
0000	(product specification)
0001	(product specification)
0010	(product specification)
0011	(product specification)
0100	(product specification)
0101	(product specification)
0110	(product specification)
0111	(product specification)
1xxx	(product specification)

Note:

- After changing the detection voltage, a low-voltage cannot be detected until the low-voltage detection stability time elapses.

[bit0] LVDH2E: Extended External Low-Voltage Detection Operation Enable Bit

This bit sets the extended external low-voltage detection operation.

Bit	Description
0	Stop operation.
1	Enable operation.

Note:

- After this setting is changed from "0" (stop operation) to "1" (enable operation), low-voltage detection is unavailable until the low-voltage detection stability time elapses.

5.5.10. STS Clock Supervisor Setting Register (SYSC0_STSCSVCFGR)

The SYSC0_STSCSVCFGR register indicates the value for setting whether to enable/disable operation of each clock supervisor.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3 CSVE	SSCG2 CSVE	SSCG1 CSVE	SSCG0 CSVE
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3 CSVE	PLL2 CSVE	PLL1 CSVE	PLL0 CSVE
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved				SCR CSVE	FCR CSVE	SO CSVE	MO CSVE
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

[bit31:20] Reserved: Reserved Bits

[bit19] SSCG3CSVE: SSCG PLL3 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the SSCG PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit18] SSCG2CSVE: SSCG PLL2 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the SSCG PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit17] SSCG1CSVE: SSCG PLL1 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the SSCG PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit16] SSCG0CSVE: SSCG PLL0 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the SSCG PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit15:12] Reserved: Reserved Bits
[bit11] PLL3CSVE: PLL3 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the PLL3 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit10] PLL2CSVE: PLL2 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the PLL2 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit9] PLL1CSVE: PLL1 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the PLL1 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit8] PLL0CSVE: PLL0 Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the PLL0 clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit7:4] Reserved: Reserved Bits**[bit3] SCRCsVE : Low-Speed CR Clock Supervisor Enable Bit**

This bit indicates the value for setting whether to enable/disable the low-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit2] FCRCsVE : High-Speed CR Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the high-speed CR clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit1] SOCSVE: Sub Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the sub clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

[bit0] MOCSVE: Main Clock Supervisor Enable Bit

This bit indicates the value for setting whether to enable/disable the main clock supervisor.

Bit	Description
0	Disable the clock supervisor.
1	Enable the clock supervisor.

5.5.11. STS Regulator Setting Register (SYSC0_STSREGCFGR)

The SYSC0_STSREGCFGR register indicates the set values for the regulator mode and output voltage.

bit	31							8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	RMSEL	Reserved						RVSEL
R/W Attribute	R,WX	R0,WX						R,WX
Protection Attribute	WPS							
Initial Value	0	000000						(product specification)

[bit31:8] Reserved: Reserved Bits

[bit7] RMSEL: Regulator Mode Setting Bit

This bit indicates the set value for the regulator mode.

Bit	Description
0	Main mode
1	Standby mode

[bit6:1] Reserved: Reserved Bits

[bit0] RVSEL: Regulator Output Voltage Setting Bits

These bits indicate the set value of the regulator output voltage.

Bit	Description
0	1.20V
1	1.25V

5.6. System Register Group (SYSC0)

The registers in this group are system control-related registers.

5.6.1. System ID Register (SYSC0_SYSIDR)

The SYSC0_SYSIDR register displays model information.

bit	31	0
Field	CHIPID	
R/W Attribute	R,WX	
Protection Attribute	WPS	
Initial Value	Product Specification	

[bit31:0] CHIPID: Chip ID Display Bits

Refer to the product hardware manual.

5.6.2. Platform ID Register (SYSC0_SYSPFIDR)

The SYSC0_SYSPFIDR register indicates platform information.

bit	31	0
Field	PFID	
R/W attribute	R,WX	
Protection Attribute	WPS	
Initial Value	Product Specification	

[bit31:0] PFID: Platform ID Display Bits

This bit is a specific fixed value. The value has no meaning.

Write access has no effect.

5.6.3. System Status Register (SYSC0_SYSSTSR)

The SYSC0_SYSSTSR register indicates each transition control status, the CPU status, the system operation status, and the transition control completion flag.

bit	31				8			
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	PSSSTS0	RUNSTS0	PSSDF0	RUNDF0	Reserved		CPUSTS0	DVSTS0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R0,WX		R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	00		0	1

[bit31:8] Reserved: Reserved Bits

[bit7] PSSSTS0: PSS profile Update Status Bit

This bit indicates the PSS profile update status.

Bit	Description
0	The PSS profile update has completed, or the profile was not updated.
1	The PSS profile is being updated.

Note:

- This register does not become "1" immediately after the PSS profile update. The register becomes "1" after operation of the internal circuit.

[bit6] RUNSTS0: RUN profile Update Status Bit

This bit indicates the RUN profile update status.

Bit	Description
0	The RUN profile update has completed, or the profile was not updated.
1	The RUN profile is being updated.

Note:

- This register does not become "1" immediately after the RUN profile update. The register becomes "1" after operation of the internal circuit.

[bit5] PSSDF0: PSS profile Update Completion Flag Bit

This bit is the PSS profile update completion flag.

Bit	Description
0	The PSS profile is being updated, or there is no update.
1	The PSS profile has been completed.

Notes:

- To clear this register, write "1" in SYSC0_SYSICLR:PSSDFCLR0.
- The flags of this register and the PSSSTS0 register may appear to be "1" at circuit operation. This state shows that the PSS profile update has completed.

[bit4] RUNDF0: RUN profile Update Completion (Main Status Control) Flag Bit

This bit is the RUN profile update completion (main status control) flag.

Bit	Description
0	The RUN profile is being updated, or there is no update.
1	The RUN profile has been completed.

Notes:

- To clear this register, write "1" in SYSC0_SYSICLR:RUNDFCLR0.
- To use this register as an interrupt, write "1" in SYSC0_SYSINTER:RUNDIE0.
- The flags of this register and the RUNSTS0 register may appear to be "1" at circuit operation. This state shows that the RUN profile update has completed.

[bit3:2] Reserved: Reserved Bits**[bit1] CPUSTS0: CPU0 Device Status Bit**

This bit indicates the device status of CPU0.

Bit	Description
0	Operation status
1	WFI status

[bit0] DVSTS0: Device Status Bit

This bit indicates the device status.

Bit	Description
0	PSS
1	RUN

5.6.4. System Status Interrupt Enable Register (SYSC0_SYSINTER)

The SYSC0_SYSINTER register sets whether RUN profile execution completion interrupts are enabled.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved			RUNDIE0	Reserved			
R/W Attribute	R0,WX			R/W	R0,WX			
Protection Attribute	WPS							
Initial Value	000			0	0000			

[bit31:5] Reserved: Reserved Bits

[bit4] RUNDIE0: RUN profile Update Completion Interrupt Enable Bit

This bit enables RUN profile update completion interrupts.

Bit	Description
0	Disable
1	Enable

[bit3:0] Reserved: Reserved Bits

5.6.5. System Status Flag and Interrupt Clear Register (SYSC0_SYSCCLR)

The SYSC0_SYSCCLR register clears the RUN/PSS profile completion flag.

bit	31										8									
Field	Reserved																			
R/W Attribute	R0,WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000_00000000																			

bit	7				6		5		4		3		2		1		0			
Field	Reserved				PSSDFCL R0		RUNDFCL R0		Reserved											
R/W Attribute	R0,WX				R0,W		R0,W		R0,WX											
Protection Attribute	WPS																			
Initial Value	00				0		0		0000											

[bit31:6] Reserved: Reserved Bits

[bit5] PSSDFCLR0: PSS profile Update Completion Flag Clear Bit

This bit clears the PSS profile update completion flag.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit4] RUNDFCLR0: RUN profile Update Completion Flag Clear Bit

This bit clears the RUN profile update completion flag.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit3:0] Reserved: Reserved Bits

5.6.6. System Error Interrupt Factor Register 0 (SYSC0_SYSEIRR0)

The SYSC0_SYSEIRR0 register retains the factors of low-voltage detection (interrupt) and clock supervisor interrupt requests.

bit	31	30	29	28	27	26	25	24
Field	Reserved		LVDH2IF	LVDH1IF	Reserved		LVDL2IF	LVDL1IF
R/W Attribute	R0,WX		R,WX	R,WX	R0,WX		R,WX	R,WX
Protection Attribute	WPS							
Initial Value	00		0	0	00		0	0

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3IF	SSCG2IF	SSCG1IF	SSCG0IF
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3IF	PLL2IF	PLL1IF	PLL0IF
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved						SOSCIF	MOSCIF
R/W Attribute	R0,WX						R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000000						0	0

[bit31:30] Reserved: Reserved Bits

[bit29] LVDH2IF: Extended External Low-Voltage Detection Interrupt Request Bit

This bit retains the fact that an interrupt request was generated at the detection of extended external low voltage.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit28] LVDH1IF: External Low-Voltage Detection Interrupt Request Bit

This bit retains the fact that an interrupt request was generated at the detection of external low voltage.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit27:26] Reserved: Reserved Bits**[bit25] LVDL2IF: Extended Internal Low-Voltage Detection Interrupt Request Bit**

This bit retains the fact that an interrupt request was generated at the detection of extended internal low voltage.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit24] LVDL1IF: Internal Low-Voltage Detection Interrupt Request Bit

This bit retains the fact that an interrupt request was generated at the detection of internal low voltage.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit23:20] Reserved: Reserved Bits**[bit19] SSCG3IF: SSCG PLL3 Abnormality Detection Error Interrupt Request Bit**

This bit retains the fact that an interrupt request was generated for an SSCG PLL3 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit18] SSCG2IF: SSCG PLL2 Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL2 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit17] SSCG1IF: SSCG PLL1 Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL1 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit16] SSCG0IF: SSCG PLL0 Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for an SSCG PLL0 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit15:12] Reserved: Reserved Bits
[bit11] PLL3IF: PLL3 Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a PLL3 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit10] PLL2IF: PLL2 Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a PLL2 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit9] PLL1IF: PLL1 Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a PLL1 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit8] PLL0IF: PLL0 Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a PLL0 abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit7:2] Reserved: Reserved Bits**[bit1] SOSCIF: Sub Oscillation Abnormality Detection Error Interrupt Request Bit**

This bit retains the fact that an interrupt request was generated for a sub oscillation abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit0] MOSCIF: Main Oscillation Abnormality Detection Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a main oscillation abnormality detection error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

5.6.7. System Error Interrupt Factor Register 1 (SYSC0_SYSEERRIR1)

The SYSC0_SYSEERRIR1 register retains the factors of profile error interrupt requests.

bit	31				8			
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved	PSSERRIF 0	RUNWKE RRIF0	RUNERRI F0	PSSENER RIF0	PSSTRGC IF0	RUNTRGE RRIF	TRGERRI F
R/W Attribute	R0,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

[bit31:7] Reserved: Reserved Bits

[bit6] PSSERRIF0: PSS profile Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a PSS profile error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit5] RUNWKERRIF0: RUN profile (PSS Recovery Time) Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a RUN profile error.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit4] RUNERRIF0: RUN profile Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for an error during a RUN profile update.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit3] PSSENERRIF0: PSS profile Update Enable Write Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a write error in the PSS profile update enable register (SYSC0_PSSSEN:PSSEN0).

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit2] PSSTRGCIF0: PSS Trigger cancel Interrupt Request Bit

This bit retains the fact that a cancel request was generated during a PSS profile update.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit1] RUNTRGERRIF: RUN profile Update Enable Write Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a write error in the RUN profile update enable register.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

[bit0] TRGERRIF: Trigger Error Interrupt Request Bit

This bit retains that fact that an interrupt request was generated for a trigger error that caused an attempt to update the RUN profile again during a RUN profile update.

Bit	Description
0	No interrupt request is detected.
1	An interrupt request is detected.

5.6.8. System Error Interrupt Factor Clear Register 0 (SYSC0_SYERRICLR0)

The SYSC0_SYERRICLR0 register clears low-voltage detection (interrupt) and clock supervisor (interrupt) requests.

bit	31	30	29	28	27	26	25	24
Field	Reserved		LVDH2 ICLR	LVDH1 ICLR	Reserved		LVDL2 ICLR	LVDL1 ICLR
R/W Attribute	R0,WX		R0,W	R0,W	R0,WX		R0,W	R0,W
Protection Attribute	WPS							
Initial Value	00		0	0	00		0	0

bit	23	22	21	20	19	18	17	16
Field	Reserved				SSCG3 ICLR	SSCG2 ICLR	SSCG1 ICLR	SSCG0 ICLR
R/W Attribute	R0,WX				R0,W	R0,W	R0,W	R0,W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3 ICLR	PLL2 ICLR	PLL1 ICLR	PLL0 ICLR
R/W Attribute	R0,WX				R0,W	R0,W	R0,W	R0,W
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved						SOSC ICLR	MOSC ICLR
R/W Attribute	R0,WX						R0,W	R0,W
Protection Attribute	WPS							
Initial Value	000000						0	0

[bit31:30] Reserved: Reserved Bits

[bit29] LVDH2ICLR: Extended External Low-Voltage Detection Interrupt Factor Clear Bit

This bit clears the interrupt factor of the detection of extended external low voltage.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit28] LVDH1ICLR: External Low-Voltage Detection Interrupt Factor Clear Bit

This bit clears the interrupt factor of the detection of external low voltage.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit27:26] Reserved: Reserved Bits**[bit25] LVDL2ICLR: Extended Internal Low-Voltage Detection Interrupt Factor Clear Bit**

This bit clears the interrupt factor of the detection of extended internal low voltage.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit24] LVDL1ICLR: Internal Low-Voltage Detection Interrupt Factor Clear Bit

This bit clears the interrupt factor of the detection of internal low voltage.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit23:20] Reserved: Reserved Bits**[bit19] SSCG3ICLR: SSCG PLL3 Abnormality Detection Error Interrupt Factor Clear Bit**

This bit clears the interrupt factor of an SSCG PLL3 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit18] SSCG2ICLR: SSCG PLL2 Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of an SSCG PLL2 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit17] SSCG1ICLR: SSCG PLL1 Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of an SSCG PLL1 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit16] SSCG0ICLR: SSCG PLL0 Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of an SSCG PLL0 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit15:12] Reserved: Reserved Bits
[bit11] PLL3ICLR: PLL3 Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of a PLL3 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit10] PLL2ICLR: PLL2 Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of a PLL2 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit9] PLL1ICLR: PLL1 Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of a PLL1 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit8] PLL0ICLR: PLL0 Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of a PLL0 abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit7:2] Reserved: Reserved Bits**[bit1] SOSCICLR: Sub Oscillation Abnormality Detection Error Interrupt Factor Clear Bit**

This bit clears the interrupt factor of a sub oscillation abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit0] MOSCICLR: Main Oscillation Abnormality Detection Error Interrupt Factor Clear Bit

This bit clears the interrupt factor of a main oscillation abnormality detection error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

5.6.9. System Error Interrupt Factor Clear Register 1 (SYSC0_SYSEERRICLR1)

The SYSC0_SYSEERRICLR1 register clears profile error interrupt requests.

bit	31								8			
Field	Reserved											
R/W Attribute	R0,WX											
Protection Attribute	WPS											
Initial Value	00000000_00000000_00000000											

bit	7		6		5		4		3		2		1		0	
Field	Reserved		PSSERR ICLR0		RUNWKE RR ICLR0		RUNERRI CLR0		PSSENER R ICLR0		PSSTRGC ICLR0		RUNTRGE RR ICLR		TRGERRI CLR	
R/W Attribute	R0,WX		R0,W		R0,W		R0,W		R0,W		R0,W		R0,W		R0,W	
Protection Attribute	WPS															
Initial Value	0		0		0		0		0		0		0		0	

[bit31:7] Reserved: Reserved Bits

[bit6] PSSERRICLR0: PSS profile Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a PSS profile error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit5] RUNWKERRICLR0: RUN profile (PSS Recovery Time) Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a RUN profile error.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit4] RUNERRICLR0: RUN profile Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for an error during a RUN profile update.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit3] PSSENERRICLR0: PSS profile Update Enable Write Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a write error in the PSS profile update enable register (SYSC0_PSENENR:PSENENR0).

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit2] PSSTRGCICLR0: PSS Trigger cancel Interrupt Request Bit

This bit retains the fact that a cancel request was generated in a PSS profile update.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

[bit1] RUNTRGERRICLR: RUN profile Update Enable Write Error Interrupt Request Bit

This bit retains the fact that an interrupt request was generated for a write error in the RUN profile update enable register.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During Read Operation	The read value is always "0".

[bit0] TRGERRICLR: Trigger Error Interrupt Request Bit

This bit retains that fact that an interrupt request was generated for a trigger error that caused an attempt to update the RUN profile again during a RUN profile update.

Bit	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the interrupt factor.
During read operation	The read value is always "0".

5.6.10. Profile Status Register (SYSC0_SYSPROSTSR)

The SYSC0_SYSPROTSR register indicates the error status of each profile.

bit	31									8
Field	Reserved									
R/W Attribute	R0,WX									
Protection Attribute	WPS									
Initial Value	00000000_00000000_00000000									

bit	7	6	5	4	3	2	1	0
Field	Reserved					PSSPSTS	RUNWKP STS	RUNPSTS
R/W Attribute	R0,WX					R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	00000					0	0	0

[bit31:3] Reserved: Reserved Bits

[bit2] PSSPSTS: PSS profile Setting Status Bit

This bit indicates the PSS profile setting status during a transition from RUN to PSS.

Bit	Description
0	There is no PSS profile error.
1	There is a PSS profile error.

Note:

- We recommend confirming that there is no problem in the PSS profile by checking this register value before the transition to PSS.

[bit1] RUNWKPSTS: RUN profile (PSS Recovery Time) Setting Status Bit

This bit indicates the RUN profile setting status during a transition from PSS to RUN.

Bit	Description
0	There is no RUN profile error.
1	There is a RUN profile error.

Note:

- We recommend confirming that there is no problem in the RUN profile by checking this register value before the transition to PSS.

[bit0] RUNPSTS: RUN profile Setting Status Bit

This bit indicates the RUN profile setting status.

Bit	Description
0	There is no RUN profile error.
1	There is a RUN profile error.

Note:

- *We recommend confirming that there is no problem in the RUN profile by checking this register value when updating the RUN profile.*

5.6.11. RUN Profile Error Flag Register (SYSC0_SYSRUNPEFR)

The SYSC0_SYSRUNPEFR register indicates each RUN profile error flag.

bit	31								8			
Field	Reserved											
R/W Attribute	R0,WX											
Protection Attribute	WPS											
Initial Value	00000000_00000000_00000000											

bit	7		6	5	4	3	2	1	0
Field	Reserved	PEF6	PEF5	PEF4	PEF3	PEF2	PEF1	PEF0	
R/W Attribute	R0,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	
Protection Attribute	WPS								
Initial Value	0	0	0	0	0	0	0	0	

[bit31:7] Reserved: Reserved Bits

[bit6:0] PEF<n>: Profile Error Flag Bits

These bits indicate the error status of each RUN profile. For detailed contents of profile errors, see "Profile error."

bit6:0	Status
0	There is no error.
1	There is an error.

<n> is a number from 6 to 0.

5.6.12. PSS Profile Error Flag Register (SYSC0_SYSPSSPEFR)

The SYSC0_SYSPSSPEFR register indicates each PSS profile error flag.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved					PEF10	PEF9	PEF8
R/W Attribute	R0,WX					R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	00000					0	0	0

bit	7	6	5	4	3	2	1	0
Field	PEF7	PEF6	PEF5	PEF4	PEF3	Reserved	PEF1	PEF0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R0,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

[bit31:11] [bit2] Reserved: Reserved Bits

[bit10:3,bit1:0] PEF<n>: Profile Error Flag Bits

These bits indicate each PSS profile error status. For detailed contents of profile errors, see "Profile error."

bit10:3, bit1:0	Status
0	There is no error.
1	There is an error.

<n> is a number from the following: 10 to 3 and 1 to 0.

5.7. Special Setting Register Group (SYSC0)

The registers in this group are special setting registers.

5.7.1. System Special Setting Register (SYSC0_SPECFGR)

The SYSC0_SPECFGR register sets special settings.

bit	31	30	29	28	27	26	25	24
Field	HOLDIO _PD6_1	HOLDIO _PD6_0	HOLDIO _PD5_3	HOLDIO _PD5_2	HOLDIO _PD5_1	HOLDIO _PD5_0	Reserved	HOLDIO _PD2
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R0,WX	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	PSSPAD CTRL	IO3RSTC	IO35RSTC	Reserved				
R/W Attribute	R/W	R/W	R/W	R0,WX				
Protection Attribute	WPS							
Initial Value	0	1	1	00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved						EXVRST CNT	BRAM SC
R/W Attribute	R0,WX						R/W	R/W
Protection Attribute	WPS							
Initial Value	000000						0	0

bit	7	6	5	4	3	2	1	0
Field	EX5VRSTCNT				EX12VRSTCNT			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	1110				1110			

[bit31] HOLDIO_PD6_1 : Setting Bit for Power Domain 6_1 HOLD Data Latch

This bit sets whether to retain I/O control in power domain 6_1 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

[bit30] HOLDIO_PD6_0 : Setting Bit for Power Domain 6_0 HOLD Data Latch

This bit sets whether to retain I/O control in power domain 6_0 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

[bit29] HOLDIO_PD5_3 : Setting Bit for Power Domain 5_3 HOLD Data Latch

This bit sets whether to retain I/O control in power domain 5_3 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

[bit28] HOLDIO_PD5_2 : Setting Bit for Power Domain 5_2 HOLD Data Latch

This bit sets whether to retain I/O control in power domain 5_2 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

[bit27] HOLDIO_PD5_1 : Setting Bit for Power Domain 5_1 HOLD Data Latch

This bit sets whether to retain I/O control in power domain 5_1 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

[bit25] Reserved: Reserved Bits**[bit26] HOLDIO_PD5_0 : Setting Bit for Power Domain 5_0 HOLD Data Latch**

This bit sets whether to retain I/O control in power domain 5_0 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

[bit24] HOLDIO_PD2: Power Domain 2 HOLD Data Latch Setting Bit

This bit sets whether to retain I/O control in power domain 2 when shutting off the power supply.

Bit	Description
0	Do not retain control.
1	Retain control.

Note:

- Make the decision on the model side about whether to use this setting.

[bit23] PSSPADCTRL: PSS-Time Port configuring Bit

This bit sets whether to perform Hi-z control of I/O at the PSS time.

Bit	Description
0	Do not perform Hi-z control.
1	Perform Hi-z control.

[bit22] IO3RSTC : I/O3V Reset configuring Bit

This bit sets 3V I/O reset control.

Bit	Description
0	I/O reset released
1	I/O reset asserted

[bit21] IO35RSTC : I/O5/3V Reset configuring Bit

This bit sets 5/3V I/O reset control.

Bit	Description
0	I/O reset released
1	I/O reset asserted

[bit20:10] Reserved
[bit9] EXVRSTCNT : Reset Level configuring Bit for External Power Supply Control

This bit sets requested reset level to the external power supply control.

Bit	Description
0	External power supply control is reset by LVDH1
1	External power supply control is not reset by LVDH1

Note:

- This bit is reset by RSTX_POWER. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

[bit8] BRAMSC: Backup RAM Standby Setting Bit

This bit controls SLEEP setting for Backup RAM while PSS.

Bit	Description
0	Disable SLEEP control for Backup RAM while PSS
1	Enable SLEEP control for Backup RAM while PSS

[bit7:4] EX5VRSTCNT: 5/3.3V External Power Supply Stabilization Time Setting Bits

These bits set the stabilization time for 5/3.3V external power supply.

bit7:4	High-Speed CR Clock	
	4MHz (ms)	8MHz (ms)
0000	1.0	0.5
0001	2.0	1.0
0010	3.0	1.5
0011	4.0	2.0
0100	5.0	2.5
0101	6.0	3.0
0110	7.0	3.5
0111	8.0	4.0
1000	9.0	4.5
1001	10.0	5.0
1010	12.0	6.0
1011	14.0	7.0
1100	16.0	8.0
1101	18.0	9.0
1110	20.0	10.0
1111	30.0	15.0

Note:

- These bits are reset by RSTX_POWER. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

[bit3:0] EX12VRSTCNT: 1.2V External Power Supply Stabilization Time Setting Bits

These bits set the stabilization time for 1.2V external power supply.

bit3:0	High-Speed CR Clock	
	4MHz (ms)	8MHz (ms)
0000	1.0	0.5
0001	2.0	1.0
0010	3.0	1.5
0011	4.0	2.0
0100	5.0	2.5
0101	6.0	3.0
0110	7.0	3.5
0111	8.0	4.0
1000	9.0	4.5
1001	10.0	5.0
1010	12.0	6.0
1011	14.0	7.0
1100	16.0	8.0
1101	18.0	9.0
1110	20.0	10.0
1111	30.0	15.0

Note:

- These bits are reset by RSTX_POWER. Refer Section 3.2.3 Reset of circuit in surrounding in CHAPTER RESET.

Bit	Description
0	Not connected
1	Connected

5.8.2. JTAG Setting Register (SYSC0_JTAGCNFG)

The SYSC0_JTAGCNFG register indicates the completion of debugger settings (for BootROM).

bit	31								8
Field	Reserved								
R/W Attribute	R0,WX								
Protection Attribute	-								
Initial Value	00000000_00000000_00000000								

bit	7	6	5	4	3	2	1	0
Field	Reserved							Reserved
R/W Attribute	R0,WX							R/W
Protection Attribute	-							
Initial Value	0000000							1

[bit31:1] Reserved: Reserved Bits

[bit0] Reserved: Reserved Bit

Do not write any data to this bit.

The SYSC0_JTAGWAKEUP register sets whether to enable recovery of a debugger connection.

5.9. MCU_Config_Group Interrupt Batch Read Register Group (MCG_IRS)

The multiple interrupt requests that are assigned to MCU_CONFIG_GROUP can be collectively read from the registers in this group. When returning from the standby, It is possible to confirm from these registers which interrupt requests occur.

5.9.1. MCU_Config_Group Interrupt Request Status Register0 (MCG_IRSR0)

The MCG_IRSR0 register displays interrupt signals in the MCU_CONFIG_GROUP at once.

bit	31	30	29	28	27	26	25	24
Field	Reserved							IRQ_PW
R/W Attribute	R0,WX							R,WX
Protection Attribute	-							
Initial Value	0000000							0

bit	23	22	21	20	19	18	17	16
Field	Reserved				IRQ_ SCT_ SUB	IRQ_ SCT_ MAIN	IRQ_ SCT_ SCR	IRQ_ SCT_ CR
R/W Attribute	R0,WX				R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0000				0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				Reserved	IRQ_RTC	IRQ_SCU	IRQ_HWDG
R/W Attribute	R0,WX				R0,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0000				0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved			Reserved	NMI_EXTINT	NMI_HWDG	NMI_SCU	NMI_LVD
R/W Attribute	R0,WX			R0,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	000			0	0	0	0	0

[bit31:25] Reserved: Reserved Bits

[bit24] IRQ_PW: Partial wakeup Interrupt Detection Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit23:20] Reserved: Reserved Bits

[bit19] IRQ_SCT_SUB: Sub Source Clock Timer Interrupt Detection Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit18] IRQ_SCT_MAIN: Main Source Clock Timer Interrupt Detection Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit17] IRQ_SCT_SCR: Low-Speed Source Clock Timer Interrupt Detection Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit16] IRQ_SCT_CR: High-Speed Source Clock Timer Interrupt Detection Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit15:11] Reserved: Reserved Bits**[bit10] IRQ_RTC: RTC 0.5 Seconds Interrupt Detection Status**

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit9] IRQ_SCU: RUN profile Update Complete Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit8] IRQ_HWDG: Hardware Watchdog Timer advance warning Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit7:4] Reserved: Reserved Bits

[bit3] NMI_EXTINT: NMI Detection Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit2] NMI_HWDOG: Hardware Watchdog Timer Detection Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit1] NMI_SCU: Profile Error Detection Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit0] NMI_LVD: Low Power Detection Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

5.9.2. MCU_Config_Group Interrupt Request Status Register1 (MCG_IRSR1)

The MCG_IRSR1 register displays interrupt signals in the MCU_CONFIG_GROUP at once.

bit	31	0
Field	IRQ_EXTINT[31:0]	
R/W Attribute	R,WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] IRQ_EXTINT: External Interrupt Detection Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

5.9.3. MCU_Config_Group Interrupt Request Status Register2 (MCG_IRSR2)

The MCG_IRSR2 register displays interrupt signals in the MCU_CONFIG_GROUP at once.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection								
Attribute	-							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved					IRQ_ RLT2	IRQ_ RLT1	IRQ_ RLT0
R/W Attribute	R0,WX					R,WX	R,WX	R,WX
Protection								
Attribute	-							
Initial Value	00000					0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved						IRQ_CRCAL	IRQ_EICU
R/W Attribute	R0,WX						R,WX	R,WX
Protection								
Attribute	-							
Initial Value	000000						0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved			IRQ_RAMIC	IRQ_RAMTE	IRQ_RAMTC	IRQ_RAMSE	NMI_RAMDE
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection								
Attribute	-							
Initial Value	000			0	0	0	0	0

[bit31:19] Reserved: Reserved Bits

[bit18] IRQ_RLT2: Reload Timer ch2 Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit17] IRQ_RLT1: Reload Timer ch1 Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit16] IRQ_RLT0: Reload Timer ch0 Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit15:10] Reserved: Reserved Bits**[bit9] IRQ_CRCAL: CR Calibration Complete Interrupt Status**

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit8] IRQ_EICU: EICU Complete Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit7:5] Reserved: Reserved Bits**[bit4] IRQ_RAMIC: BackUP-RAM Initialization End Interrupt Status**

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit3] IRQ_RAMTE: BackUP-RAM Diagnosis Error Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit2] IRQ_RAMTC: BackUP-RAM Diagnosis End Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit1] IRQ_RAMSE: BackUP-RAM Single-Bit Error Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit0] NMI_RAMDE: BackUP-RAM double-Bit Error Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

5.9.4. MCU_Config_Group Interrupt Request Status Register3 (MCG_IRSR3)

The MCG_IRSR3 register displays interrupt signals in the MCU_CONFIG_GROUP at once.

bit	31	30	29	28	27	26	25	24
Field	Reserved	IRQ_ MCAN2_ INT1	IRQ_ MCAN1_ INT1	IRQ_ MCAN0_ INT1	Reserved	IRQ_ MCAN2_ INT0	IRQ_ MCAN1_ INT0	IRQ_ MCAN0_ INT0
R/W Attribute	R0,WX	R,WX	R,WX	R,WX	R0,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	Reserved	IRQ_ MCAN2_ SE	IRQ_ MCAN1_ SE	IRQ_ MCAN0_ SE	Reserved	NMI_ MCAN2_ DE	NMI_ MCAN1_ DE	NMI_ MCAN0_ DE
R/W Attribute	R0,WX	R,WX	R,WX	R,WX	R0,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved					IRQ_ MFS2_ SIRQ	IRQ_ MFS1_ SIRQ	IRQ_ MFS0_ SIRQ
R/W Attribute	R0,WX					R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	00000					0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved	IRQ_ MFS2_ RIRQ	IRQ_ MFS1_ RIRQ	IRQ_ MFS0_ RIRQ	Reserved	IRQ_ MFS2_ TIRQ	IRQ_ MFS1_ TIRQ	IRQ_ MFS0_ TIRQ
R/W Attribute	R0,WX	R,WX	R,WX	R,WX	R0,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

[bit31] Reserved: Reserved Bit

[bit30] IRQ_MCAN2_INT1: CAN-FD ch2 Interrupt 1 Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit29] IRQ_MCAN1_INT1: CAN-FD ch1 Interrupt 1 Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit28] IRQ_MCAN0_INT1: CAN-FD ch0 Interrupt 1 Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit27] Reserved: Reserved Bit
[bit26] IRQ_MCAN2_INT0: CAN-FD ch2 Interrupt 0 Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit25] IRQ_MCAN1_INT0: CAN-FD ch1 Interrupt 0 Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit24] IRQ_MCAN0_INT0: CAN-FD ch0 Interrupt 0 Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit23] Reserved: Reserved Bit
[bit22] IRQ_MCAN2_SE: CAN-FD ch2 RAM ECC Single-Bit Error Detection Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit21] IRQ_MCAN1_SE: CAN-FD ch1 RAM ECC Single-Bit Error Detection Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit20] IRQ_MCAN0_SE: CAN-FD ch0 RAM ECC Single-Bit Error Detection Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit19] Reserved: Reserved Bit

[bit18] NMI_MCAN2_DE: CAN-FD ch2 RAM ECC double-Bit Error Detection Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit17] NMI_MCAN1_DE: CAN-FD ch1 RAM ECC double-Bit Error Detection Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit16] NMI_MCAN0_DE: CAN-FD ch0 RAM ECC double-Bit Error Detection Interrupt Status (NMI Level)

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit15:11] Reserved: Reserved Bits

[bit10] IRQ_MFS2_SIRQ: MFS ch2 Sync Field Detection Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurred.

[bit9] IRQ_MFS1_SIRQ: MFS ch1 Sync Field Detection Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit8] IRQ_MFS0_SIRQ: MFS ch0 Sync Field Detection Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit7] Reserved: Reserved Bit
[bit6] IRQ_MFS2_RIRQ: MFS ch2 Reception Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit5] IRQ_MFS1_RIRQ: MFS ch1 Reception Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit4] IRQ_MFS0_RIRQ: MFS ch0 Reception Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit3] Reserved: Reserved Bit
[bit2] IRQ_MFS2_TIRQ: MFS ch2 Transmission Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit1] IRQ_MFS1_TIRQ: MFS ch1 Transmission Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit0] IRQ_MFS0_TIRQ: MFS ch0 Transmission Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

5.9.5. MCU_Config_Group Interrupt Request Status Register4 (MCG_IRSR4)

The MCG_IRSR4 register displays an interrupt signals in MCU_CONFIG_GROUP at once.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection								
Attribute	-							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,WX							
Protection								
Attribute	-							
Initial Value	00000000							

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,WX							
Protection								
Attribute	-							
Initial Value	00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved	IRQ_ MFS2_ REIRQ	IRQ_ MFS1_ REIRQ	IRQ_ MFS0_ REIRQ	Reserved	IRQ_ MFS2_ TEIRQ	IRQ_ MFS1_ TEIRQ	IRQ_ MFS0_ TEIRQ
R/W Attribute	R0,WX	R,WX	R,WX	R,WX	R0,WX	R,WX	R,WX	R,WX
Protection								
Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

[bit31:7] Reserved: Reserved Bits

[bit6] IRQ_MFS2_REIRQ: MFS ch2 Reception Error Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit5] IRQ_MFS1_REIRQ: MFS ch1 Reception Error Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit4] IRQ_MFS0_REIRQ: MFS ch0 Reception Error Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit3] Reserved: Reserved Bit**[bit2] IRQ_MFS2_TEIRQ: MFS ch2 Transmission Error Interrupt Status**

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit1] IRQ_MFS1_TEIRQ: MFS ch1 Transmission Error Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

[bit0] IRQ_MFS0_TEIRQ: MFS ch0 Transmission Error Interrupt Status

Bit	Description
0	The interrupt does not occur.
1	The interrupt occurs.

5.10. Protection Register Group (SYSC1)

The register in this group is a control register for accessing SYSC1 registers.

5.10.1. Protection Key Setting Register (SYSC1_PROTKEYR)

The SYSC1_PROTKEYR register has settings for unlocking the protection of SYSC1 registers.

bit	31	0
Field	PROTKEY	
R/W Attribute	R,W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0]PROTKEY: Protection Unlock Setting Bits

These bits compose the register for unlocking protection keys.

Write

bit31:0	Description
0x5CAC_CE55	Unlock
Other than above	Invalid

Read

bit31:0	Description
0x0000_0000	Locked state
0xFFFF_FFFF	Unlocked state

Note:

- Only word access is valid to this register. Any other access is invalid.

5.11. RUN Profile Register Group (SYSC1)

The registers in this group are RUN profile control setting registers.

5.11.1. RUN Clock Selection Register 0 (SYSC1_RUNCKSELR0)

The SYSC1_RUNCKSELR0 register sets the clock source for the clock domain.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	0000							

bit	23	22	21	20	19	18	17	16	
Field	Reserved				LAPP1A CSL	Reserved			LAPP0A CSL
R/W Attribute	R0,WX				R/W	R0,WX			R/W
Protection Attribute	WPS								
Initial Value	000				0	000			0

bit	15	14	13	12	11	10	9	8
Field	Reserved			LCP1A CSL	Reserved			LCP0A CSL
R/W Attribute	R0,WX			R/W	R0,WX			R/W
Protection Attribute	WPS							
Initial Value	000			0	000			0

bit	7	6	5	4	3	2	1	0
Field	Reserved					CD0CSL		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					000		

[bit31:28] Reserved: Reserved Bits

[bit27:24] HSSPICSL: HSSPI Clock Selection Bits

These bits select the source clock for HSSPI clock.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:21] Reserved: Reserved Bits

[bit20] LAPP1ACSL : LAPP1A Clock Selection Bit

This bit selects the source clock for LAPP1A clock.

bit20	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit19:17] Reserved: Reserved Bits

[bit16] LAPP0ACSL : LAPP0A Clock Selection Bit

This bit selects the source clock for LAPP0A clock.

bit16	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit15:13] Reserved: Reserved Bits**[bit12] LCP1ACSL : LCP1A Clock Selection Bit**

This bit selects the source clock for LCP1A clock.

bit12	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit11:9] Reserved: Reserved Bits**[bit8] LCP0ACSL : LCP0A Clock Selection Bit**

This bit selects the source clock for LCP0A clock.

bit8	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit7:3] Reserved: Reserved Bits**[bit2:0] CD0CSL: Clock Domain 0 Clock Selection Bits**

These bits select the source clock for clock domain 0.

bit2:0	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	Setting prohibited
111	Clock fixed at "L"

5.11.2. RUN Clock Selection Register 1 (SYSC1_RUNCKSELR1)

The SYSC1_RUNCKSELR1 register sets the clock source for the clock domain.

bit	31	30	29	28	27	26	25	24
Field	Reserved				CD4CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved				CD3CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8	
Field	Reserved					CD2CSL			
R/W Attribute	R0,WX					R/W			
Protection Attribute	WPS								
Initial Value	0000					0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved				CD1CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

[bit31:28] Reserved: Reserved Bits

[bit27:24] CD4CSL: Clock Domain 4 Clock Selection Bits

These bits select the source clock for clock domain 4.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:20] Reserved: Reserved Bits**[bit19:16] CD3CSL: Clock Domain 3 Clock Selection Bits**

These bits select the source clock for clock domain 3.

bit19:16	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit15:12] Reserved: Reserved Bits

[bit11:8] CD2CSL: Clock Domain 2 Clock Selection Bits

These bits select the source clock for clock domain 2.

bit11:8	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit7:4] Reserved: Reserved Bits

[bit3:0] CD1CSL: Clock Domain 1 Clock Selection Bits

These bits select the source clock for clock domain 1.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

5.11.3. RUN Clock Selection Register 2 (SYSC1_RUNCKSELR2)

The SYSC1_RUNCKSELR2 register sets the clock source for the clock domain.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved					TRCCSL		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					000		

bit	7	6	5	4	3	2	1	0
Field	Reserved				CD5CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

[bit31:11] Reserved: Reserved Bits

[bit10:8] TRCCSL: TRC Clock Selection Bits

These bits select the source clock for TRC clock.

bit10:8	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	PLL1 clock
111	Clock fixed at "L"

[bit7:4] Reserved: Reserved Bits

[bit3:0] CD5CSL: Clock Domain 5 Clock Selection Bits

These bits select the source clock for clock domain 5.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

5.11.4. RUN Clock Source Enable Register 0 (SYSC1_RUNCKER0)

The SYSC1_RUNCKER0 register sets whether to enable/disable oscillation of the internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	ENCLK LAPP1A	ENCLK LAPP0A	ENCLK LCP1A	ENCLK LCP0A	ENCLK LAPP1	ENCLK LAPP0	ENCLK LCP1	ENCLK LCP0
R/W Attribute	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX
Protection Attribute	WPS

Initial Value	1	1	1	1	000			1

[bit31] ENCLKLAPP1A: LAPP1A Clock Oscillation Enable Bit

This bit sets the LAPP1A clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit30] ENCLKLAPP0A: LAPP0A Clock Oscillation Enable Bit

This bit sets the LAPP0A clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit29] ENCLKLCP1A: LCP1A Clock Oscillation Enable Bit

This bit sets the LCP1A clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit28] ENCLKLCP0A: LCP0A Clock Oscillation Enable Bit

This bit sets the LCP0A clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit27] ENCLKLAPP1: LAPP1 Clock Oscillation Enable Bit

This bit sets the LAPP1 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit26] ENCLKLAPP0: LAPP0 Clock Oscillation Enable Bit

This bit sets the LAPP0 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit25] ENCLKLCP1: LCP1 Clock Oscillation Enable Bit

This bit sets the LCP1 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit24] ENCLKLCP0: LCP0 Clock Oscillation Enable Bit

This bit sets the LCP0 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit23] ENCLKLCP: LCP Clock Oscillation Enable Bit

This bit sets the LCP clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit22] Reserved: Reserved Bit**[bit21] ENCLKLLPBM2: LLPBM2 Clock Oscillation Enable Bit**

This bit sets the LLPBM2 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit20] ENCLKLLPBM: LLPBM Clock Oscillation Enable Bit

This bit sets the LLPBM clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit19] ENCLKHAPP1B1: HAPP1B1 Clock Oscillation Enable Bit

This bit sets the HAPP1B1 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit18] ENCLKHAPP1B0: HAPP1B0 Clock Oscillation Enable Bit

This bit sets the HAPP1B0 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit17] ENCLKHAPP0A1: HAPP0A1 Clock Oscillation Enable Bit

This bit sets the HAPP0A1 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit16] ENCLKHAPP0A0: HAPP0A0 Clock Oscillation Enable Bit

This bit sets the HAPP0A0 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit15] Reserved: Reserved Bit
[bit14] ENCLKSYSC1: ENCLKSYSC1 Clock Oscillation Enable Bit

This bit sets the ENCLKSYSC1 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit13:12] Reserved: Reserved Bits
[bit11] ENCLKEXTBUS: ENCLKEXTBUS Clock Oscillation Enable Bit

This bit sets the ENCLKEXTBUS clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit10] ENCLKMEMC: ENCLKMEMC Clock Oscillation Enable Bit

This bit sets the ENCLKMEMC clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit9] ENCLKDMA: ENCLKDMA Clock Oscillation Enable Bit

This bit sets the ENCLKDMA clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKHPM: ENCLKHPM Clock Oscillation Enable Bit

This bit sets the ENCLKHPM clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit7] ENCLKHPM2: ENCLKHPM2 Clock Oscillation Enable Bit

This bit sets the ENCLKHPM2 clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit6] ENCLKTRC: ENCLKTRC Clock Oscillation Enable Bit

This bit sets the ENCLKTRC clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit5] ENCLKDBG: ENCLKDBG Clock Oscillation Enable Bit

This bit sets the ENCLKDBG clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit4] ENCLKATB: ENCLKATB Clock Oscillation Enable Bit

This bit sets the ENCLKATB clock.

Bit	Description
0	-
1	Enable clock oscillation.

[bit3:1] Reserved: Reserved Bits**[bit0] ENCLKCPU0: ENCLKCPU0 Clock Oscillation Enable Bit**

This bit sets the ENCLKCPU0 clock.

Bit	Description
0	-
1	Enable clock oscillation.

5.11.5. RUN Clock Source Enable Register 1 (SYSC1_RUNCKER1)

The SYSC1_RUNCKER1 register sets whether to enable/disable oscillation of the internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved			ENCLK CD3B1	ENCLK CD3B0	ENCLK CD3A1	ENCLK CD3A0	ENCLK CD3
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	Reserved			ENCLK CD2B1	ENCLK CD2B0	ENCLK CD2A1	ENCLK CD2A0	ENCLK CD2
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD1B1	ENCLK CD1B0	ENCLK CD1A1	ENCLK CD1A0	ENCLK CD1
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

Field	Reserved							ENCLK HSSPI
R/W Attribute	R0,WX							R/W
Protection Attribute	WPS							
Initial Value	0000000							1

[bit31:29] Reserved: Reserved Bits

[bit28] ENCLKCD3B1: CD3B1 Clock Oscillation Enable Bit

This bit sets the CD3B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit27] ENCLKCD3B0: CD3B0 Clock Oscillation Enable Bit

This bit sets the CD3B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit26] ENCLKCD3A1: CD3A1 Clock Oscillation Enable Bit

This bit sets the CD3A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit25] ENCLKCD3A0: CD3A0 Clock Oscillation Enable Bit

This bit sets the CD3A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit24] ENCLKCD3: CD3 Clock Oscillation Enable Bit

This bit sets the CD3 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit23:21] Reserved: Reserved Bits**[bit20] ENCLKCD2B1: CD2B1 Clock Oscillation Enable Bit**

This bit sets the CD2B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit19] ENCLKCD2B0: CD2B0 Clock Oscillation Enable Bit

This bit sets the CD2B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit18] ENCLKCD2A1: CD2A1 Clock Oscillation Enable Bit

This bit sets the CD2A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit17] ENCLKCD2A0: CD2A0 Clock Oscillation Enable Bit

This bit sets the CD2A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit16] ENCLKCD2: CD2 Clock Oscillation Enable Bit

This bit sets the CD2 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit15:13] Reserved: Reserved Bits
[bit12] ENCLKCD1B1: CD1B1 Clock Oscillation Enable Bit

This bit sets the CD1B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit11] ENCLKCD1B0: CD1B0 Clock Oscillation Enable Bit

This bit sets the CD1B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit10] ENCLKCD1A1: CD1A1 Clock Oscillation Enable Bit

This bit sets the CD1A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit9] ENCLKCD1A0: CD1A0 Clock Oscillation Enable Bit

This bit sets the CD1A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit8] ENCLKCD1: CD1 Clock Oscillation Enable Bit

This bit sets the CD1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit7:1] Reserved: Reserved Bits**[bit0] ENCLKHSSPI: HSSPI Clock Oscillation Enable Bit**

This bit sets the HSSPI clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.11.6. RUN Clock Source Enable Register 2 (SYSC1_RUNCKER2)

The SYSC1_RUNCKER2 register sets whether to enable/disable oscillation of the internal operating clock.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD5B1	ENCLK CD5B0	ENCLK CD5A1	ENCLK CD5A0	ENCLK CD5
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved			ENCLK CD4B1	ENCLK CD4B0	ENCLK CD4A1	ENCLK CD4A0	ENCLK CD4
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

[bit31:13] Reserved: Reserved Bits

[bit12] ENCLKCD5B1: CD5B1 Clock Oscillation Enable Bit

This bit sets the CD5B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit11] ENCLKCD5B0: CD5B0 Clock Oscillation Enable Bit

This bit sets the CD5B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit10] ENCLKCD5A1: CD5A1 Clock Oscillation Enable Bit

This bit sets the CD5A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit9] ENCLKCD5A0: CD5A0 Clock Oscillation Enable Bit

This bit sets the CD5A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit8] ENCLKCD5: CD5 Clock Oscillation Enable Bit

This bit sets the CD5 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit7:5] Reserved: Reserved Bits**[bit4] ENCLKCD4B1: CD4B1 Clock Oscillation Enable Bit**

This bit sets the CD4B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit3] ENCLKCD4B0: CD4B0 Clock Oscillation Enable Bit

This bit sets the CD4B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit2] ENCLKCD4A1: CD4A1 Clock Oscillation Enable Bit

This bit sets the CD4A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit1] ENCLKCD4A0: CD4A0 Clock Oscillation Enable Bit

This bit sets the CD4A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit0] ENCLKCD4: CD4 Clock Oscillation Enable Bit

This bit sets the CD4 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

5.11.7. RUN Clock Divider Register 0 (SYSC1_RUNCKDIVR0)

The SYSC1_RUNCKDIVR0 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved					HPMDIV		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					000		

bit	23	22	21	20	19	18	17	16
Field	Reserved			TRCDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved		DBGDIV		Reserved		ATBDIV	
R/W Attribute	R0,WX		R/W		R0,WX		R/W	
Protection Attribute	WPS							
Initial Value	00		00		00		00	

bit	7	6	5	4	3	2	1	0
Field	Reserved			SYSDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:27] Reserved: Reserved Bits

[bit26:24] HPMDIV: HPM Clock Divider Setting Bits

These bits set the division ratio of the HPM clock, DMA clock, and MEMC clock from the SYS clock.

bit26:24	Description
000	No division
001	Divided by 2
010	Divided by 3
011	Divided by 4
100	Divided by 5
101	Divided by 6
110	Divided by 7
111	Divided by 8

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit23:21] Reserved: Reserved Bits
[bit20:16] TRCDIV: TRC Clock Divider Setting Bits

These bits set the division ratio of the TRC clock from the source clock (clock domain TRC).

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
.
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:14] Reserved: Reserved Bits
[bit13:12] DBGDIV: DBG Clock Divider Setting Bits

These bits set the division ratio of the DBG clock from the ATB clock.

bit13:12	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:10] Reserved: Reserved Bits

[bit9:8] ATBDIV [1:0]: ATB Clock Divider Setting Bits

These bits set the division ratio of the ATB clock from the SYS clock.

bit9:8	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] SYSDIV: SYS Clock Divider Setting Bits**

These bits set the division ratio of the CPU0 clock from the source clock (clock domain 0).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.8. RUN Clock Divider Register 1 (SYSC1_RUNCKDIVR1)

The SYSC1_RUNCKDIVR1 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	HAPP1B1DIV				HAPP1B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	HAPP0A1DIV				HAPP0A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	7	6	5	4	3	2	1	0
Field	SYSC1DIV				Reserved	EXTBUSDIV		
R/W Attribute	R/W				R0,WX	R/W		
Protection Attribute	WPS							
Initial Value	0000				0	000		

[bit31:28] HAPP1B1DIV: HAPP1B1 Clock Divider Setting Bits

These bits set the division ratio of the HAPP1B1 clock from the HAPP1B0 clock.

bit31:28	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit27:24] HAPP1B0DIV: HAPP1B0 Clock Divider Setting Bits

These bits set the division ratio of the HAPP1B0 clock from the HPM clock.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit23:20] HAPP0A1DIV: HAPP0A1 Clock Divider Setting Bits

These bits set the division ratio of the HAPP0A1 clock from the HAPP0A0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] HAPPOA0DIV: HAPPOA0 Clock Divider Setting Bits

These bits set the division ratio of the HAPPOA0 clock from the HPM clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:4] SYSC1DIV: SYSC1 Clock Divider Setting Bits

These bits set the division ratio of the SYSC1 clock from the HPM clock.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit3] Reserved: Reserved Bit

[bit2:0] EXTBUSDIV: EXTBUS Clock Divider Setting Bits

These bits set the division ratio of the EXTBUS clock from the HPM clock.

bit2:0	Description
000	No division
001	Divided by 2
010	Divided by 4
011	Divided by 8
100	Divided by 16
101	Divided by 32
110	Divided by 64
111	Divided by 128

Note:

- *When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.*

5.11.9. RUN Clock Divider Register 2 (SYSC1_RUNCKDIVR2)

The SYSC1_RUNCKDIVR2 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved				LAPP1DIV			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved				LAPP0DIV			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved				LCP1DIV			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	LCP0DIV				Reserved		LCPDIV	
R/W Attribute	R/W				R0,WX		R/W	
Protection Attribute	WPS							
Initial Value	0000				00		00	

[bit31:28] Reserved: Reserved Bits

[bit27:24] LAPP1DIV: LAPP1 Clock Divider Setting Bits

These bits set the division ratio of the LAPP1 clock from the CPU clock.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit23:20] Reserved: Reserved Bits**[bit19:16] LAPP0DIV: LAPP0 Clock Divider Setting Bits**

These bits set the division ratio of the LAPP0 clock from the CPU clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] Reserved: Reserved Bits**[bit11:8] LCP1DIV: LCP1 Clock Divider Setting Bits**

These bits set the division ratio of the LCP1 clock from the CPU clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:4] LCP0DIV: LCP0 Clock Divider Setting Bits

These bits set the division ratio of the LCP0 clock from the CPU clock.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit3:2] Reserved: Reserved Bits

[bit1:0] LCPDIV: LCP Clock Divider Setting Bits

These bits set the division ratio of the LCP clock from the CPU clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.10. RUN Clock Divider Register 3 (SYSC1_RUNCKDIVR3)

The SYSC1_RUNCKDIVR3 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved			LAPP1ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	23	22	21	20	19	18	17	16
Field	Reserved			LAPP0ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved			LCP1ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	7	6	5	4	3	2	1	0
Field	Reserved			LCP0ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:29] Reserved: Reserved Bits

[bit28:24] LAPP1ADIV: LAPP1A Clock Divider Setting Bits

These bits set the division ratio of the LAPP1A clock from the CPU/PLL0 clock.

bit28:24	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit23:21] Reserved: Reserved Bits

[bit20:16] LAPP0ADIV: LAPP0A Clock Divider Setting Bits

These bits set the division ratio of the LAPP0A clock from the CPU/PLL0 clock.

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit15:13] Reserved: Reserved Bits

[bit12:8] LCP1ADIV: LCP1A Clock Divider Setting Bits

These bits set the division ratio of the LCP1A clock from the CPU/PLL0 clock.

bit12:8	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit7:5] Reserved: Reserved Bits

[bit4:0] LCP0ADIV: LCP0A Clock Divider Setting Bits

These bits set the division ratio of the LCP0A clock from the CPU/PLL0 clock.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.11.11. RUN Clock Divider Register 4 (SYSC1_RUNCKDIVR4)

The SYSC1_RUNCKDIVR4 register sets the division ratio of each internal operating clock.

bit	31							8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved			HSSPIDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:5] Reserved: Reserved Bits

[bit4:0] HSSPIDIV: HSSPI Clock Divider Setting Bits

These bits set the division ratio of the HSSPI clock from the source clock (HSSPI clock domain).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.12. RUN Clock Divider Register 5 (SYSC1_RUNCKDIVR5)

The SYSC1_RUNCKDIVR5 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD1B1DIV				CD1B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD1A1DIV				CD1A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD1DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD1B1DIV: CD1B1 Clock Divider Setting Bits

These bits set the division ratio of the CD1B1 clock from the CD1B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD1B0DIV: CD1B0 Clock Divider Setting Bits

These bits set the division ratio of the CD1B0 clock from the CD1 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD1A1DIV: CD1A1 Clock Divider Setting Bits

These bits set the division ratio of the CD1A1 clock from the CD1A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD1A0DIV: CD1A0 Clock Divider Setting Bits

These bits set the division ratio of the CD1A0 clock from the CD1 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] CD1DIV: CD1 Clock Divider Setting Bits**

These bits set the division ratio of the CD1 clock from the source clock (clock domain 1).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.13. RUN Clock Divider Register 6 (SYSC1_RUNCKDIVR6)

The SYSC1_RUNCKDIVR6 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD2B1DIV				CD2B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD2A1DIV				CD2A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD2DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD2B1DIV: CD2B1 Clock Divider Setting Bits

These bits set the division ratio of the CD2B1 clock from the CD2B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD2B0DIV: CD2B0 Clock Divider Setting Bits

These bits set the division ratio of the CD2B0 clock from the CD2 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD2A1DIV: CD2A1 Clock Divider Setting Bits

These bits set the division ratio of the CD2A1 clock from the CD2A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD2A0DIV: CD2A0 Clock Divider Setting Bits

These bits set the division ratio of the CD2A0 clock from the CD2 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD2DIV: CD2 Clock Divider Setting Bits

These bits set the division ratio of the CD2 clock from the source clock (clock domain 2).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.14. RUN Clock Divider Register 7 (SYSC1_RUNCKDIVR7)

The SYSC1_RUNCKDIVR7 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD3B1DIV				CD3B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD3A1DIV				CD3A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD3DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD3B1DIV: CD3B1 Clock Divider Setting Bits

These bits set the division ratio of the CD3B1 clock from the CD3B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD3B0DIV: CD3B0 Clock Divider Setting Bits

These bits set the division ratio of the CD3B0 clock from the CD3 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD3A1DIV: CD3A1 Clock Divider Setting Bits

These bits set the division ratio of the CD3A1 clock from the CD3A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD3A0DIV: CD3A0 Clock Divider Setting Bits

These bits set the division ratio of the CD3A0 clock from the CD3 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] CD3DIV: CD3 Clock Divider Setting Bits**

These bits set the division ratio of the CD3 clock from the source clock (clock domain 3).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.15. RUN Clock Divider Register 8 (SYSC1_RUNCKDIVR8)

The SYSC1_RUNCKDIVR8 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD4B1DIV				CD4B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD4A1DIV				CD4A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD4DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD4B1DIV: CD4B1 Clock Divider Setting Bits

These bits set the division ratio of the CD4B1 clock from the CD4B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD4B0DIV: CD4B0 Clock Divider Setting Bits

These bits set the division ratio of the CD4B0 clock from the CD4 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD4A1DIV: CD4A1 Clock Divider Setting Bits

These bits set the division ratio of the CD4A1 clock from the CD4A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD4A0DIV: CD4A0 Clock Divider Setting Bits

These bits set the division ratio of the CD4A0 clock from the CD4 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD4DIV: CD4 Clock Divider Setting Bits

These bits set the division ratio of the CD4 clock from the source clock (clock domain 4).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.16. RUN Clock Divider Register 9 (SYSC1_RUNCKDIVR9)

The SYSC1_RUNCKDIVR9 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD5B1DIV				CD5B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD5A1DIV				CD5A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD5DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD5B1DIV: CD5B1 Clock Divider Setting Bits

These bits set the division ratio of the CD5B1 clock from the CD5B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD5B0DIV: CD5B0 Clock Divider Setting Bits

These bits set the division ratio of the CD5B0 clock from the CD5 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD5A1DIV: CD5A1 Clock Divider Setting Bits

These bits set the division ratio of the CD5A1 clock from the CD5A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD5A0DIV: CD5A0 Clock Divider Setting Bits

These bits set the division ratio of the CD5A0 clock from the CD5 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] CD5DIV: CD5 Clock Divider Setting Bits**

These bits set the division ratio of the CD5 clock from the source clock (clock domain 5).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.11.17. RUN Profile Update Enable Register (SYSC1_RUNENR)

The SYSC1_RUNENR register sets the profile update enable.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	RUNEN1							
R/W Attribute	R,W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:8] Reserved : Reserved Bits

[bit7:0] RUNEN1 : RUN Profile Update Enable Bit

This bit is the RUN profile update enable register.

bit7:0	Description
During write operation	When "0xAB" is written: RUN profile update enable When "0x00" is written: RUN profile update prohibited When other than "0xAB" is written: Disable
During read operation	When "0xAB" is read: RUN profile update enable is valid When "0x00" is read: Invalid

Notes:

- *This register is cleared to "0x00" by hardware after RUN profile (configuration of SYSC1 register) is updated.*
- *This register permits byte access only. Any other access is invalid. If the above is not complied with, a bus error occurs.*

5.12. PSS Profile Register Group (SYSC1)

The registers in this group are PSS profile control setting registers.

5.12.1. PSS Clock Selection Register 0 (SYSC1_PSSCKSELR0)

The SYSC1_PSSCKSELR0 register sets the clock source for the clock domain.

bit	31	30	29	28	27	26	25	24
Field	Reserved				HSSPICSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved			LAPP1A CSL	Reserved			LAPP0A CSL
R/W Attribute	R0,WX			R/W	R0,WX			R/W
Protection Attribute	WPS							
Initial Value	000			0	000			0

bit	15	14	13	12	11	10	9	8
Field	Reserved			LCP1A CSL	Reserved			LCP0A CSL
R/W Attribute	R0,WX			R/W	R0,WX			R/W
Protection Attribute	WPS							
Initial Value	000			0	000			0

bit	7	6	5	4	3	2	1	0
Field	Reserved					CD0CSL		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					000		

[bit31:28] Reserved: Reserved Bits

[bit27:24] HSSPICSL: HSSPI Clock Selection Bits

These bits select the source clock for HSSPI.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock

bit27:24	Description
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:21] Reserved: Reserved Bits

[bit20] LAPP1ACSL: LAPP1A Clock Selection Bit

This bit selects the source clock for LAPP1A.

bit20	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit19:17] Reserved: Reserved Bits

[bit16] LAPP0ACSL: LAPP0A Clock Selection Bit

This bit selects the source clock for LAPP0A.

bit16	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit15:13] Reserved: Reserved Bits

[bit12] LCP1ACSL: LCP1A Clock Selection Bit

This bit selects the source clock for LCP1A.

bit12	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit11:9] Reserved: Reserved Bits**[bit8] LCP0ACSL: LCP0A Clock Selection Bit**

This bit selects the source clock for LCP0A.

bit8	Description
0	CD0 clock
1	PLL0 clock

Note:

- When it is attempted to change the clock selection by this bit, both PLL0 clock and CD0 clock must be supplied.

[bit7:3] Reserved: Reserved Bits**[bit2:0] CD0CSL: Clock Domain 0 Clock Selection Bits**

These bits select the source clock for clock domain 0.

bit2:0	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	Setting prohibited
111	Clock fixed at "L"

Notes:

- To use the source clock selection "Clock fixed at "L"", following bit must be also set to '0'.
 SYSC1_PSSCKER0:ENCLKLAPP1A
 SYSC1_PSSCKER0:ENCLKLAPP0A
 SYSC1_PSSCKER0:ENCLKLCP1A
 SYSC1_PSSCKER0:ENCLKLCP0A
 Please refer to section 5.12.4 for the definition of the bits.

5.12.2. PSS Clock Selection Register 1 (SYSC1_PSSCKSELR1)

The SYSC1_PSSCKSELR1 register sets the clock source for the clock domain.

bit	31	30	29	28	27	26	25	24
Field	Reserved				CD4CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved				CD3CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved				CD2CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved				CD1CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

[bit31:28] Reserved: Reserved Bits

[bit27:24] CD4CSL: Clock Domain 4 Clock Selection Bits

These bits select the source clock for clock domain 4.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock

bit27:24	Description
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:20] Reserved: Reserved Bits

[bit19:16] CD3CSL: Clock Domain 3 Clock Selection Bits

These bits select the source clock for clock domain 3.

bit19:16	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit15:12] Reserved: Reserved Bits

[bit11:8] CD2CSL: Clock Domain 2 Clock Selection Bits

These bits select the source clock for clock domain 2.

bit11:8	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock

bit11:8	Description
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit7:4] Reserved: Reserved Bits

[bit3:0] CD1CSL: Clock Domain 1 Clock Selection Bits

These bits select the source clock for clock domain 1.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

The SYSC1 PSSCKSELR2 register sets the clock source for the clock domain.

bit	7	6	5	4	3	2	1	0
Field	Reserved				CD5CSL			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit10:8	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	PLL1 clock
111	Clock fixed at "L"

[bit3:0] CD5CSL: Clock Domain 5 Clock Selection Bits

These bits select the source clock for clock domain 5.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

5.12.4. PSS Clock Source Enable Register 0 (SYSC1_PSSCKER0)

The SYSC1_PSSCKER0 register sets whether to enable/disable oscillation of the internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	ENCLK LAPP1A	ENCLK LAPP0A	ENCLK LCP1A	ENCLK LCP0A	ENCLK LAPP1	ENCLK LAPP0	ENCLK LCP1	ENCLK LCP0
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	1	1	1	1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	ENCLK LCP	Reserved	ENCLK LLPBM2	ENCLK LLPBM	ENCLK HAPP1B1	ENCLK HAPP1B0	ENCLK HAPP0A1	ENCLK HAPP0A0
R/W Attribute	R/W	R0,WX	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	1	0	1	1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved	ENCLK SYSC1	Reserved		ENCLK EXTBUS	ENCLK MEMC	ENCLK DMA	ENCLK HPM
R/W Attribute	R0,WX	R/W	R0,WX		R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	1	00		1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	ENCLK HPM2	ENCLK TRC	ENCLK DBG	ENCLK ATB	Reserved			ENCLK CPU0
R/W Attribute	R/W	R/W	R/W	R/W	R0,WX			R0,WX
Protection Attribute	WPS							
Initial Value	1	1	1	1	000			0

[bit31] ENCLKLAPP1A: LAPP1A Clock Oscillation Enable Bit

This bit sets the LAPP1A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit30] ENCLKLAPP0A: LAPP0A Clock Oscillation Enable Bit

This bit sets the LAPP0A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit29] ENCLKLCP1A: LCP1A Clock Oscillation Enable Bit

This bit sets the LCP1A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit28] ENCLKLCP0A: LCP0A Clock Oscillation Enable Bit

This bit sets the LCP0A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit27] ENCLKLAPP1: LAPP1 Clock Oscillation Enable Bit

This bit sets the LAPP1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit26] ENCLKLAPP0: LAPP0 Clock Oscillation Enable Bit

This bit sets the LAPP0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit25] ENCLKLCP1: LCP1 Clock Oscillation Enable Bit

This bit sets the LCP1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit24] ENCLKLCP0: LCP0 Clock Oscillation Enable Bit

This bit sets the LCP0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit23] ENCLKLCP: LCP Clock Oscillation Enable Bit

This bit sets the LCP clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit22] Reserved: Reserved Bit**[bit21] ENCLKLLPBM2: LLPBM2 Clock Oscillation Enable Bit**

This bit sets the LLPBM2 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit20] ENCLKLLPBM: LLPBM Clock Oscillation Enable Bit

This bit sets the LLPBM clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit19] ENCLKHAPP1B1: HAPP1B1 Clock Oscillation Enable Bit

This bit sets the HAPP1B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit18] ENCLKHAPP1B0: HAPP1B0 Clock Oscillation Enable Bit

This bit sets the HAPP1B0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit17] ENCLKHAPP0A1: HAPP0A1 Clock Oscillation Enable Bit

This bit sets the HAPP0A1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit16] ENCLKHAPP0A0: HAPP0A0 Clock Oscillation Enable Bit

This bit sets the HAPP0A0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit15] Reserved: Reserved Bit
[bit14] ENCLKSYSC1: ENCLKSYSC1 Clock Oscillation Enable Bit

This bit sets the ENCLKSYSC1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit13:12] Reserved: Reserved Bits
[bit11] ENCLKEXTBUS: ENCLKEXTBUS Clock Oscillation Enable Bit

This bit sets the ENCLKEXTBUS clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] ENCLKMEMC: ENCLKMEMC Clock Oscillation Enable Bit

This bit sets the ENCLKMEMC clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] ENCLKDMA: ENCLKDMA Clock Oscillation Enable Bit

This bit sets the ENCLKDMA clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKHPM: ENCLKHPM Clock Oscillation Enable Bit

This bit sets the ENCLKHPM clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7] ENCLKHPM2: ENCLKHPM2 Clock Oscillation Enable Bit

This bit sets the ENCLKHPM2 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit6] ENCLKTRC: ENCLKTRC Clock Oscillation Enable Bit

This bit sets the ENCLKTRC clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit5] ENCLKDBG: ENCLKDBG Clock Oscillation Enable Bit

This bit sets the ENCLKDBG clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit4] ENCLKATB: ENCLKATB Clock Oscillation Enable Bit

This bit sets the ENCLKATB clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit3:1] Reserved: Reserved Bits**[bit0] ENCLKCPU0: ENCLKCPU0 Clock Oscillation Enable Bit**

This bit sets the ENCLKCPU0 clock.

Bit	Description
0	Disable clock oscillation.
1	-

5.12.5. PSS Clock Source Enable Register 1 (SYSC1_PSSCKER1)

The SYSC1_PSSCKER1 register sets whether to enable/disable oscillation of the internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved			ENCLK CD3B1	ENCLK CD3B0	ENCLK CD3A1	ENCLK CD3A0	ENCLK CD3
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	Reserved			ENCLK CD2B1	ENCLK CD2B0	ENCLK CD2A1	ENCLK CD2A0	ENCLK CD2
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD1B1	ENCLK CD1B0	ENCLK CD1A1	ENCLK CD1A0	ENCLK CD1
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved							ENCLK HSSPI
R/W Attribute	R0,WX							R/W
Protection Attribute	WPS							
Initial Value	0000000							1

[bit31:29] Reserved: Reserved Bits

[bit28] ENCLKCD3B1: CD3B1 Clock Oscillation Enable Bit

This bit sets the CD3B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit27] ENCLKCD3B0: CD3B0 Clock Oscillation Enable Bit

This bit sets the CD3B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit26] ENCLKCD3A1: CD3A1 Clock Oscillation Enable Bit

This bit sets the CD3A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit25] ENCLKCD3A0: CD3A0 Clock Oscillation Enable Bit

This bit sets the CD3A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit24] ENCLKCD3: CD3 Clock Oscillation Enable Bit

This bit sets the CD3 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit23:21] Reserved: Reserved Bits**[bit20] ENCLKCD2B1: CD2B1 Clock Oscillation Enable Bit**

This bit sets the CD2B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit19] ENCLKCD2B0: CD2B0 Clock Oscillation Enable Bit

This bit sets the CD2B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit18] ENCLKCD2A1: CD2A1 Clock Oscillation Enable Bit

This bit sets the CD2A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit17] ENCLKCD2A0: CD2A0 Clock Oscillation Enable Bit

This bit sets the CD2A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit16] ENCLKCD2: CD2 Clock Oscillation Enable Bit

This bit sets the CD2 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit15:13] Reserved: Reserved Bits
[bit12] ENCLKCD1B1: CD1B1 Clock Oscillation Enable Bit

This bit sets the CD1B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit11] ENCLKCD1B0: CD1B0 Clock Oscillation Enable Bit

This bit sets the CD1B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit10] ENCLKCD1A1: CD1A1 Clock Oscillation Enable Bit

This bit sets the CD1A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit9] ENCLKCD1A0: CD1A0 Clock Oscillation Enable Bit

This bit sets the CD1A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit8] ENCLKCD1: CD1 Clock Oscillation Enable Bit

This bit sets the CD1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit7:1] Reserved: Reserved Bits**[bit0] ENCLKHSSPI: HSSPI Clock Oscillation Enable Bit**

This bit sets the HSSPI clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.12.6. PSS Clock Source Enable Register 2(SYSC1_PSSCKER2)

The SYSC1_PSSCKER2 register sets whether to enable/disable oscillation of the internal operating clock.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD5B1	ENCLK CD5B0	ENCLK CD5A1	ENCLK CD5A0	ENCLK CD5
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved			ENCLK CD4B1	ENCLK CD4B0	ENCLK CD4A1	ENCLK CD4A0	ENCLK CD4
R/W Attribute	R0,WX			R/W1	R/W1	R/W1	R/W1	R/W1
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

[bit31:13] Reserved: Reserved Bits

[bit12] ENCLKCD5B1: CD5B1 Clock Oscillation Enable Bit

This bit sets the CD5B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit11] ENCLKCD5B0: CD5B0 Clock Oscillation Enable Bit

This bit sets the CD5B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit10] ENCLKCD5A1: CD5A1 Clock Oscillation Enable Bit

This bit sets the CD5A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit9] ENCLKCD5A0: CD5A0 Clock Oscillation Enable Bit

This bit sets the CD5A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit8] ENCLKCD5: CD5 Clock Oscillation Enable Bit

This bit sets the CD5 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit7:5] Reserved: Reserved Bits**[bit4] ENCLKCD4B1: CD4B1 Clock Oscillation Enable Bit**

This bit sets the CD4B1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit3] ENCLKCD4B0: CD4B0 Clock Oscillation Enable Bit

This bit sets the CD4B0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit2] ENCLKCD4A1: CD4A1 Clock Oscillation Enable Bit

This bit sets the CD4A1 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit1] ENCLKCD4A0: CD4A0 Clock Oscillation Enable Bit

This bit sets the CD4A0 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

[bit0] ENCLKCD4: CD4 Clock Oscillation Enable Bit

This bit sets the CD4 clock.

Bit	Description
0	Setting '0' is prohibited.
1	Enable clock oscillation.

5.12.7. PSS Clock Divider Register 0 (SYSC1_PSSCKDIVR0)

The SYSC1_PSSCKDIVR0 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved					HPMDIV		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					000		

bit	23	22	21	20	19	18	17	16
Field	Reserved			TRCDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved		DBGDIV		Reserved		ATBDIV	
R/W Attribute	R0,WX		R/W		R0,WX		R/W	
Protection Attribute	WPS							
Initial Value	00		00		00		00	

bit	7	6	5	4	3	2	1	0
Field	Reserved			SYSDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:27] Reserved: Reserved Bits

[bit26:24] HPMDIV: HPM Clock Divider Setting Bits

These bits set the division ratio of the HPM clock, DMA clock, and MEMC clock from the SYS clock.

bit26:24	Description
000	No division
001	Divided by 2
010	Divided by 3
011	Divided by 4
100	Divided by 5
101	Divided by 6
110	Divided by 7
111	Divided by 8

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit23:21] Reserved: Reserved Bits
[bit20:16] TRCDIV: TRC Clock Divider Setting Bits

These bits set the division ratio of the TRC clock from the source clock (clock domain TRC).

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
.
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:14] Reserved: Reserved Bits
[bit13:12] DBGDIV: DBG Clock Divider Setting Bits

These bits set the division ratio of the DBG clock from the ATB clock.

bit13:12	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:10] Reserved: Reserved Bits

[bit9:8] ATBDIV [1:0]: ATB Clock Divider Setting Bits

These bits set the division ratio of the ATB clock from the SYS clock.

bit9:8	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] SYSDIV: SYS Clock Divider Setting Bits**

These bits set the division ratio of the CPU0 clock from the source clock (clock domain 0).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.12.8. PSS Clock Divider Register 1 (SYSC1_PSSCKDIVR1)

The SYSC1_PSSCKDIVR1 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	HAPP1B1DIV				HAPP1B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	HAPP0A1DIV				HAPP0A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	7	6	5	4	3	2	1	0
Field	SYSC1DIV				Reserved	EXTBUSDIV		
R/W Attribute	R/W				R0,WX	R/W		
Protection Attribute	WPS							
Initial Value	0000				0	000		

[bit31:28] HAPP1B1DIV: HAPP1B1 Clock Divider Setting Bits

These bits set the division ratio of the HAPP1B1 clock from the HAPP1B0 clock.

bit31:28	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit27:24] HAPP1B0DIV: HAPP1B0 Clock Divider Setting Bits

These bits set the division ratio of the HAPP1B0 clock from the HPM clock.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit23:20] HAPP0A1DIV: HAPP0A1 Clock Divider Setting Bits

These bits set the division ratio of the HAPP0A1 clock from the HAPP0A0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] HAPP0A0DIV: HAPP0A0 Clock Divider Setting Bits

These bits set the division ratio of the HAPP0A0 clock from the HPM clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:8] Reserved: Reserved Bits

[bit7:4] SYSC1DIV: SYSC1 Clock Divider Setting Bits

These bits set the division ratio of the SYSC1 clock from the HPM clock.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit3] Reserved: Reserved Bit

[bit2:0] EXTBUSDIV: EXTBUS Clock Divider Setting Bits

These bits set the division ratio of the EXTBUS clock from the HPM clock.

bit2:0	Description
000	No division
001	Divided by 2
010	Divided by 4
011	Divided by 8
100	Divided by 16
101	Divided by 32
110	Divided by 64
111	Divided by 128

5.12.9. PSS Clock Divider Register 2 (SYSC1_PSSCKDIVR2)

The SYSC1_PSSCKDIVR2 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved				LAPP1DIV			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved				LAPP0DIV			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved				LCP1DIV			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	LCP0DIV				Reserved		LCPDIV	
R/W Attribute	R/W				R0,WX		R/W	
Protection Attribute	WPS							
Initial Value	0000				00		00	

[bit31:28] Reserved: Reserved Bits

[bit27:24] LAPP1DIV: LAPP1 Clock Divider Setting Bits

These bits set the division ratio of the LAPP1 clock from the CPU clock.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit23:20] Reserved: Reserved Bits

[bit19:16] LAPP0DIV: LAPP0 Clock Divider Setting Bits

These bits set the division ratio of the LAPP0 clock from the CPU clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] Reserved: Reserved Bits

[bit11:8] LCP1DIV: LCP1 Clock Divider Setting Bits

These bits set the division ratio of the LCP1 clock from the CPU clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:4] LCP0DIV: LCP0 Clock Divider Setting Bits

These bits set the division ratio of the LCP0 clock from the CPU clock.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit3:2] Reserved: Reserved Bits

[bit1:0] LCPDIV: LCP Clock Divider Setting Bits

These bits set the division ratio of the LCP clock from the CPU clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

5.12.10. PSS Clock Divider Register 3 (SYSC1_PSSCKDIVR3)

The SYSC1_PSSCKDIVR3 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved			LAPP1ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	23	22	21	20	19	18	17	16
Field	Reserved			LAPP0ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved			LCP1ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	7	6	5	4	3	2	1	0
Field	Reserved			LCP0ADIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:29] Reserved: Reserved Bits

[bit28:24] LAPP1ADIV: LAPP1A Clock Divider Setting Bits

These bits set the division ratio of the LAPP1A clock from the CPU/PLL0 clock.

bit28:24	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit23:21] Reserved: Reserved Bits**[bit20:16] LAPP0ADIV: LAPP0A Clock Divider Setting Bits**

These bits set the division ratio of the LAPP0A clock from the CPU/PLL0 clock.

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit15:13] Reserved: Reserved Bits**[bit12:8] LCP1ADIV: LCP1A Clock Divider Setting Bits**

These bits set the division ratio of the LCP1A clock from the CPU/PLL0 clock.

bit12:8	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit7:5] Reserved: Reserved Bits**[bit4:0] LCP0ADIV: LCP0A Clock Divider Setting Bits**

These bits set the division ratio of the LCP0A clock from the CPU/PLL0 clock.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.12.11. PSS Clock Divider Register 4 (SYSC1_PSSCKDIVR4)

The SYSC1_PSSCKDIVR4 register sets the division ratio of each internal operating clock.

bit	31							8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved			HSSPIDIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:5] Reserved: Reserved Bits

[bit4:0] HSSPIDIV: HSSPI Clock Divider Setting Bits

These bits set the division ratio of the HSSPI clock from the source clock (HSSPI clock domain).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- *When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.*

5.12.12. PSS Clock Divider Register 5 (SYSC1_PSSCKDIVR5)

The SYSC1_PSSCKDIVR5 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD1B1DIV				CD1B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD1A1DIV				CD1A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD1DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD1B1DIV: CD1B1 Clock Divider Setting Bits

These bits set the division ratio of the CD1B1 clock from the CD1B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD1B0DIV: CD1B0 Clock Divider Setting Bits

These bits set the division ratio of the CD1B0 clock from the CD1 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD1A1DIV: CD1A1 Clock Divider Setting Bits

These bits set the division ratio of the CD1A1 clock from the CD1A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD1A0DIV: CD1A0 Clock Divider Setting Bits

These bits set the division ratio of the CD1A0 clock from the CD1 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] CD1DIV: CD1 Clock Divider Setting Bits**

These bits set the division ratio of the CD1 clock from the source clock (clock domain 1).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.12.13. PSS Clock Divider Register 6 (SYSC1_PSSCKDIVR6)

The SYSC1_PSSCKDIVR6 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD2B1DIV				CD2B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD2A1DIV				CD2A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD2DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD2B1DIV: CD2B1 Clock Divider Setting Bits

These bits set the division ratio of the CD2B1 clock from the CD2B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD2B0DIV: CD2B0 Clock Divider Setting Bits

These bits set the division ratio of the CD2B0 clock from the CD2 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD2A1DIV: CD2A1 Clock Divider Setting Bits

These bits set the division ratio of the CD2A1 clock from the CD2A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD2A0DIV: CD2A0 Clock Divider Setting Bits

These bits set the division ratio of the CD2A0 clock from the CD2 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD2DIV: CD2 Clock Divider Setting Bits

These bits set the division ratio of the CD2 clock from the source clock (clock domain 2).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.12.14. PSS Clock Divider Register 7 (SYSC1_PSSCKDIVR7)

The SYSC1_PSSCKDIVR7 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD3B1DIV				CD3B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD3A1DIV				CD3A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD3DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD3B1DIV: CD3B1 Clock Divider Setting Bits

These bits set the division ratio of the CD3B1 clock from the CD3B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD3B0DIV: CD3B0 Clock Divider Setting Bits

These bits set the division ratio of the CD3B0 clock from the CD3 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD3A1DIV: CD3A1 Clock Divider Setting Bits

These bits set the division ratio of the CD3A1 clock from the CD3A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD3A0DIV: CD3A0 Clock Divider Setting Bits

These bits set the division ratio of the CD3A0 clock from the CD3 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] CD3DIV: CD3 Clock Divider Setting Bits**

These bits set the division ratio of the CD3 clock from the source clock (clock domain 3).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.12.15. PSS Clock Divider Register 8 (SYSC1_PSSCKDIVR8)

The SYSC1_PSSCKDIVR8 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD4B1DIV				CD4B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD4A1DIV				CD4A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD4DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD4B1DIV: CD4B1 Clock Divider Setting Bits

These bits set the division ratio of the CD4B1 clock from the CD4B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD4B0DIV: CD4B0 Clock Divider Setting Bits

These bits set the division ratio of the CD4B0 clock from the CD4 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD4A1DIV: CD4A1 Clock Divider Setting Bits

These bits set the division ratio of the CD4A1 clock from the CD4A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD4A0DIV: CD4A0 Clock Divider Setting Bits

These bits set the division ratio of the CD4A0 clock from the CD4 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits
[bit4:0] CD4DIV: CD4 Clock Divider Setting Bits

These bits set the division ratio of the CD4 clock from the source clock (clock domain 4).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.12.16. PSS Clock Divider Register 9 (SYSC1_PSSCKDIVR9)

The SYSC1_PSSCKDIVR9 register sets the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD5B1DIV				CD5B0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD5A1DIV				CD5A0DIV			
R/W Attribute	R/W				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD5DIV				
R/W Attribute	R0,WX			R/W				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD5B1DIV: CD5B1 Clock Divider Setting Bits

These bits set the division ratio of the CD5B1 clock from the CD5B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit19:16] CD5B0DIV: CD5B0 Clock Divider Setting Bits

These bits set the division ratio of the CD5B0 clock from the CD5 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit15:12] CD5A1DIV: CD5A1 Clock Divider Setting Bits

These bits set the division ratio of the CD5A1 clock from the CD5A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit11:8] CD5A0DIV: CD5A0 Clock Divider Setting Bits

These bits set the division ratio of the CD5A0 clock from the CD5 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

[bit7:5] Reserved: Reserved Bits**[bit4:0] CD5DIV: CD5 Clock Divider Setting Bits**

These bits set the division ratio of the CD5 clock from the source clock (clock domain 5).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

Note:

- When it is attempted to change the division ratio by this bit, follow the restriction written in section 6.3.

5.12.17. PSS Profile Update Enable Register (SYSC1_PSSENR)

The SYSC1_PSSSENCR register sets the profile update enable.

bit	31	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	PSSN1							
R/W Attribute	R,W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:8] Reserved : Reserved Bits

[bit7:0] PSSEN1 : PSS Profile Update Enable Bit

This bit is the PSS profile update enable register.

bit7:0	Description
During write operation	When "0xBA" is written: PSSEN is valid When "0x00" is written: PSSEN is invalid Other: Write operation is invalid
During read operation	When "0xBA" is written: "0xBA" is read Other: "0x00" is read

Notes:

- This register is cleared to "0x00" by hardware after PSS profile (configuration of SYSC1 register) is updated.
- This register permits byte access only. Any other access is invalid. If the above is not complied with, a bus error occurs.

5.13. APP Profile Register Group (SYSC1)

The registers in this group are APP profile control setting registers.

5.13.1. APP Clock Selection Register 0 (SYSC1_APPCKSELR0)

The SYSC1_APPCKSELR0 register indicates the set values of the clock source for the clock domain to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved				HSSPICSL			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved			LAPP1A CSL	Reserved			LAPP0A CSL
R/W Attribute	R0,WX			R,WX	R0,WX			R,WX
Protection Attribute	WPS							
Initial Value	000			0	000			0

bit	15	14	13	12	11	10	9	8
Field	Reserved			LCP1A CSL	Reserved			LCP0A CSL
R/W Attribute	R0,WX			R,WX	R0,WX			R,WX
Protection Attribute	WPS							
Initial Value	000			0	000			0

bit	7	6	5	4	3	2	1	0
Field	Reserved					CD0CSL		
R/W Attribute	R0,WX					R,WX		
Protection Attribute	WPS							
Initial Value	00000					000		

[bit31:28] Reserved: Reserved Bits

[bit27:24] HSSPICSL: HSSPI Clock Selection Bits

These bits indicate the set value of HSSPI clock to be updated.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)

bit27:24	Description
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:21] Reserved: Reserved Bits

[bit20] LAPP1ACSL: LAPP1A Clock Selection Bits

These bits indicate the set value of LAPP1A clock to be updated.

bit20	Description
0	CD0 clock
1	PLL0 clock

[bit19:17] Reserved: Reserved Bits

[bit16] LAPP0ACSL: LAPP0A Clock Selection Bits

These bits indicate the set value of LAPP0A clock to be updated.

bit16	Description
0	CD0 clock
1	PLL0 clock

[bit15:13] Reserved: Reserved Bits

[bit12] LCP1ACSL: LCP1A Clock Selection Bits

These bits indicate the set value of LCP1A clock to be updated.

bit12	Description
0	CD0 clock
1	PLL0 clock

[bit11:9] Reserved: Reserved Bits

[bit8] LCP0ACSL: LCP0A Clock Selection Bits

These bits indicate the set value of LCP0A clock to be updated.

bit8	Description
0	CD0 clock
1	PLL0 clock

[bit7:3] Reserved: Reserved Bits**[bit2:0] CD0CSL: Clock Domain 0 Clock Selection Bits**

These bits indicate the set value of clock domain 0 to be updated.

bit2:0	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	Setting prohibited
111	Clock fixed at "L"

5.13.2. APP Clock Selection Register 1 (SYSC1_APPCKSELR1)

The SYSC1_APPCKSELR1 register indicates the set values of the clock source for the clock domain to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved				CD4CSL			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved				CD3CSL			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved				CD2CSL			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved				CD1CSL			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

[bit31:28] Reserved: Reserved Bits

[bit27:24] CD4CSL: Clock Domain 4 Clock Selection Bits

These bits indicate the set value of clock domain 4 to be updated.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock

bit27:24	Description
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:20] Reserved: Reserved Bits

[bit19:16] CD3CSL: Clock Domain 3 Clock Selection Bits

These bits indicate the set value of clock domain 3 to be updated.

bit19:16	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit15:12] Reserved: Reserved Bits

[bit11:8] CD2CSL: Clock Domain 2 Clock Selection Bits

These bits indicate the set value of clock domain 2 to be updated.

bit11:8	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock

bit11:8	Description
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit7:4] Reserved: Reserved Bits

[bit3:0] CD1CSL: Clock Domain 1 Clock Selection Bits

These bits indicate the set value of clock domain 1 to be updated.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

The SYSC1_APPCKSELR2 register indicates the set values of the clock source for the clock domain to be updated.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved					TRCCSL		
R/W Attribute	R0,WX					R,WX		
Protection Attribute	WPS							
Initial Value	00000					000		

bit	7	6	5	4	3	2	1	0
Field	Reserved				CD5CSL			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit10:8	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	PLL1 clock
111	Clock fixed at "L"

[bit3:0] CD5CSL: Clock Domain 5 Clock Selection Bits

These bits indicate the set value of clock domain 5 to be updated.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

5.13.4. APP Clock Source Enable Register0 (SYSC1_APPCKER0)

The SYSC1_APPCKER0 register indicates the value for setting whether to enable/disable oscillation of the internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	ENCLK LAPP1A	ENCLK LAPP0A	ENCLK LCP1A	ENCLK LCP0A	ENCLK LAPP1	ENCLK LAPP0	ENCLK LCP1	ENCLK LCP0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	1	1	1	1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	ENCLK LCP	Reserved	ENCLK LLPBM2	ENCLK LLPBM	ENCLK HAPP1B1	ENCLK HAPP1B0	ENCLK HAPP0A1	ENCLK HAPP0A0
R/W Attribute	R,WX	R0,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	1	0	1	1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved	ENCLK SYSC1	Reserved		ENCLK EXTBUS	ENCLK MEMC	ENCLK DMA	ENCLK HPM
R/W Attribute	R0,WX	R,WX	R0,WX		R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	1	00		1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	ENCLK HPM2	ENCLK TRC	ENCLK DBG	ENCLK ATB	Reserved			ENCLK CPU0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R0,WX			R,WX
Protection Attribute	WPS							
Initial Value	1	1	1	1	000			1

[bit31] ENCLKLAPP1A: LAPP1A Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP1A clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit30] ENCLKLAPP0A: LAPP0A Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP0A clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit29] ENCLKLCP1A: LCP1A Clock Oscillation Enable Bit

This bit indicates the set value of the LCP1A clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit28] ENCLKLCP0A: LCP0A Clock Oscillation Enable Bit

This bit indicates the set value of the LCP0A clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit27] ENCLKLAPP1: LAPP1 Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit26] ENCLKLAPP0: LAPP0 Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit25] ENCLKLCP1: LCP1 Clock Oscillation Enable Bit

This bit indicates the set value of the LCP1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit24] ENCLKLCP0: LCP0 Clock Oscillation Enable Bit

This bit indicates the set value of the LCP0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit23] ENCLKLCP: LCP Clock Oscillation Enable Bit

This bit indicates the set value of the LCP clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit22] Reserved: Reserved Bit**[bit21] ENCLKLLPBM2: LLPBM2 Clock Oscillation Enable Bit**

This bit indicates the set value of the LLPBM2 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit20] ENCLKLLPBM: LLPBM Clock Oscillation Enable Bit

This bit indicates the set value of the LLPBM clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit19] ENCLKHAPP1B1: HAPP1B1 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP1B1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit18] ENCLKHAPP1B0: HAPP1B0 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP1B0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit17] ENCLKHAPP0A1: HAPP0A1 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP0A1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit16] ENCLKHAPP0A0: HAPP0A0 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP0A0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit15] Reserved: Reserved Bit
[bit14] ENCLKSYSC1: ENCLKSYSC1 Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKSYSC1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit13:12] Reserved: Reserved Bits
[bit11] ENCLKEXTBUS: ENCLKEXTBUS Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKEXTBUS clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] ENCLKMEMC: ENCLKMEMC Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKMEMC clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] ENCLKDMA: ENCLKDMA Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKDMA clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKHPM: ENCLKHPM Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKHPM clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7] ENCLKHPM2: ENCLKHPM2 Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKHPM2 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit6] ENCLKTRC: ENCLKTRC Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKTRC clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit5] ENCLKDBG: ENCLKDBG Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKDBG clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit4] ENCLKATB: ENCLKATB Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKATB clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit3:1] Reserved: Reserved Bits**[bit0] ENCLKCPU0: ENCLKCPU0 Clock Oscillation Enable Bit**

This bit indicates the set value of the ENCLKCPU0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.13.5. APP Clock Source Enable Register1 (SYSC1_APPCKER1)

The SYSC1_APPCKER1 register indicates the value for setting whether to enable/disable oscillation of the internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved			ENCLK CD3B1	ENCLK CD3B0	ENCLK CD3A1	ENCLK CD3A0	ENCLK CD3
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	Reserved			ENCLK CD2B1	ENCLK CD2B0	ENCLK CD2A1	ENCLK CD2A0	ENCLK CD2
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD1B1	ENCLK CD1B0	ENCLK CD1A1	ENCLK CD1A0	ENCLK CD1
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved							ENCLK HSSPI
R/W Attribute	R0,WX							R,WX
Protection Attribute	WPS							
Initial Value	0000000							1

[bit31:29] Reserved: Reserved Bits

[bit28] ENCLKCD3B1: CD3B1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3B1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit27] ENCLKCD3B0: CD3B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3B0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit26] ENCLKCD3A1: CD3A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3A1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit25] ENCLKCD3A0: CD3A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3A0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit24] ENCLKCD3: CD3 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit23:21] Reserved: Reserved Bits**[bit20] ENCLKCD2B1: CD2B1 Clock Oscillation Enable Bit**

This bit indicates the set value of the CD2B1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit19] ENCLKCD2B0: CD2B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2B0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit18] ENCLKCD2A1: CD2A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2A1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit17] ENCLKCD2A0: CD2A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2A0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit16] ENCLKCD2: CD2 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit15:13] Reserved: Reserved Bits
[bit12] ENCLKCD1B1: CD1B1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1B1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit11] ENCLKCD1B0: CD1B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1B0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] ENCLKCD1A1: CD1A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1A1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] ENCLKCD1A0: CD1A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1A0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKCD1: CD1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7:1] Reserved: Reserved Bits**[bit0] ENCLKHSSPI: ENCLKHSSPI Clock Oscillation Enable Bit**

This bit indicates the set value of the ENCLKHSSPI clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.13.6. APP Clock Source Enable Register2 (SYSC1_APPCKER2)

The SYSC1_APPCKER2 register indicates the value for setting whether to enable/disable oscillation of the internal operating clock to be updated.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD5B1	ENCLK CD5B0	ENCLK CD5A1	ENCLK CD5A0	ENCLK CD5
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved			ENCLK CD4B1	ENCLK CD4B0	ENCLK CD4A1	ENCLK CD4A0	ENCLK CD4
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

[bit31:13] Reserved: Reserved Bits

[bit12] ENCLKCD5B1: CD5B1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5B1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit11] ENCLKCD5B0: CD5B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5B0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] ENCLKCD5A1: CD5A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5A1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] ENCLKCD5A0: CD5A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5A0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKCD5: CD5 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7:5] Reserved: Reserved Bits**[bit4] ENCLKCD4B1: CD4B1 Clock Oscillation Enable Bit**

This bit indicates the set value of the CD4B1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit3] ENCLKCD4B0: CD4B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4B0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit2] ENCLKCD4A1: CD4A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4A1 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit1] ENCLKCD4A0: CD4A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4A0 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit0] ENCLKCD4: CD4 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4 clock to be updated.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.13.7. APP Clock Divider Register 0 (SYSC1_APPCKDIVR0)

The SYSC1_APPCKDIVR0 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved					HPMDIV		
R/W Attribute	R0,WX					R,WX		
Protection Attribute	WPS							
Initial Value	00000					000		

bit	23	22	21	20	19	18	17	16
Field	Reserved			TRCDIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved		DBGDIV		Reserved		ATBDIV	
R/W Attribute	R0,WX		R,WX		R0,WX		R,WX	
Protection Attribute	WPS							
Initial Value	00		00		00		00	

bit	7	6	5	4	3	2	1	0
Field	Reserved			SYSDIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:27] Reserved: Reserved Bits

[bit26:24] HPMDIV: HPM Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HPM clock, DMA clock, or MEMC clock from the SYS clock to be updated.

bit26:24	Description
000	No division
001	Divided by 2
010	Divided by 3
011	Divided by 4
100	Divided by 5
101	Divided by 6
110	Divided by 7
111	Divided by 8

[bit23:21] Reserved: Reserved Bits

[bit20:16] TRCDIV: TRC Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the TRC clock from the source clock (clock domain TRC) to be updated.

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
.
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit15:14] Reserved: Reserved Bits

[bit13:12] DBGDIV: DBG Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the DBG clock from the ATB clock to be updated.

bit13:12	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

[bit11:10] Reserved: Reserved Bits

[bit9:8] ATBDIV [1:0]: ATB Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the ATB clock from the SYS clock to be updated.

bit9:8	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

[bit7:5] Reserved: Reserved Bits

[bit4:0] SYSDIV: SYS Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CPU0 clock from the source clock (clock domain 0).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.13.8. APP Clock Divider Register 1 (SYSC1_APPCKDIVR1)

The SYSC1_APPCKDIVR1 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	HAPP1B1DIV				HAPP1B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	HAPP0A1DIV				HAPP0A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	7	6	5	4	3	2	1	0
Field	SYSC1DIV				Reserved	EXTBUSDIV		
R/W Attribute	R,WX				R0,WX	R,WX		
Protection Attribute	WPS							
Initial Value	0000				0	000		

[bit31:28] HAPP1B1DIV: HAPP1B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP1B1 clock from the HAPP1B0 clock to be updated.

bit31:28	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit27:24] HAPP1B0DIV: HAPP1B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP1B0 clock from the HPM clock to be updated.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit23:20] HAPP0A1DIV: HAPP0A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP0A1 clock from the HAPP0A0 clock to be updated.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] HAPP0A0DIV: HAPP0A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP0A0 clock from the HPM clock to be updated.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:8] Reserved: Reserved Bits

[bit7:4] SYSC1DIV: SYSC1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the SYSC1 clock from the HPM clock to be updated.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit3] Reserved: Reserved Bit

[bit2:0] EXTBUSDIV: EXTBUS Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the EXTBUS clock from the HPM clock to be updated.

bit2:0	Description
000	No division
001	Divided by 2
010	Divided by 4
011	Divided by 8
100	Divided by 16
101	Divided by 32
110	Divided by 64
111	Divided by 128

5.13.9. APP Clock Divider Register 2 (SYSC1_APPCKDIVR2)

The SYSC1_APPCKDIVR2 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved				LAPP1DIV			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved				LAPP0DIV			
R/W Attribute	R0,WX				R, WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8	
Field	Reserved					LCP1DIV			
R/W Attribute	R0,WX					R,WX			
Protection Attribute	WPS								
Initial Value	0000					0000			

bit	7	6	5	4	3	2	1	0
Field	LCP0DIV				Reserved		LCPDIV	
R/W Attribute	R,WX				R0,WX		R,WX	
Protection Attribute	WPS							
Initial Value	0000				00		00	

[bit31:28] Reserved: Reserved Bits

[bit27:24] LAPP1DIV: LAPP1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LAPP1 clock from the CPU clock to be updated.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit23:20] Reserved: Reserved Bits

[bit19:16] LAPP0DIV: LAPP0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LAPP0 clock from the CPU clock to be updated.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] Reserved: Reserved Bits

[bit11:8] LCP1DIV: LCP1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LCP1 clock from the CPU clock to be updated.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:4] LCP0DIV: LCP0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LCP0 clock from the CPU clock to be updated.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit3:2] Reserved: Reserved Bits**[bit1:0] LCPDIV: LCP Clock Divider Setting Bits**

These bits indicate the set value of the division ratio of the LCP clock from the CPU clock to be updated.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

5.13.10. APP Clock Divider Register 3 (SYSC1_APPCKDIVR3)

The SYSC1_APPCKDIVR3 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved			LAPP1ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	23	22	21	20	19	18	17	16
Field	Reserved			LAPP0ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved			LCP1ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	7	6	5	4	3	2	1	0
Field	Reserved			LCP0ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:29] Reserved: Reserved Bits

[bit28:24] LAPP1ADIV: LAPP1A Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LAPP1A clock from the CPU/PLL0 clock to be updated.

bit28:24	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit23:21] Reserved: Reserved Bits**[bit20:16] LAPP0ADIV: LAPP0A Clock Divider Setting Bits**

These bits indicate the set value of the division ratio of the LAPP0A clock from the CPU/PLL0 clock to be updated.

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit15:13] Reserved: Reserved Bits**[bit12:8] LCP1ADIV: LCP1A Clock Divider Setting Bits**

These bits indicate the set value of the division ratio of the LCP1A clock from the CPU/PLL0 clock to be updated.

bit12:8	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit7:5] Reserved: Reserved Bits

[bit4:0] LCP0ADIV: LCP0A Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LCP0A clock from the CPU/PLL0 clock to be updated.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.13.11. APP Clock Divider Register 4 (SYSC1_APPCKDIVR4)

The SYSC1_APPCKDIVR4 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31							8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved			HSSPIDIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:5] Reserved: Reserved Bits

[bit4:0] HSSPIDIV: HSSPI Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HSSPI clock from the source clock (HSSPI clock domain) to be updated.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.13.12. APP Clock Divider Register 5 (SYSC1_APPCKDIVR5)

The SYSC1_APPCKDIVR5 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	24
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000	

bit	23	22	21	20	19	18	17	16
Field	CD1B1DIV				CD1B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD1A1DIV				CD1A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD1DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD1B1DIV: CD1B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1B1 clock from the CD1B0 clock to be updated.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD1B0DIV: CD1B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1B0 clock from the CD1 clock to be updated.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD1A1DIV: CD1A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1A1 clock from the CD1A0 clock to be updated.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD1A0DIV: CD1A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1A0 clock from the CD1 clock to be updated.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD1DIV: CD1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1 clock from the source clock (clock domain 1) to be updated.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.13.13. APP Clock Divider Register 6 (SYSC1_APPCKDIVR6)

The SYSC1_APPCKDIVR6 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD2B1DIV				CD2B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD2A1DIV				CD2A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD2DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD2B1DIV: CD2B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2B1 clock from the CD2B0 clock to be updated.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD2B0DIV: CD2B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2B0 clock from the CD2 clock to be updated.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD2A1DIV: CD2A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2A1 clock from the CD2A0 clock to be updated.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD2A0DIV: CD2A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2A0 clock from the CD2 clock to be updated.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD2DIV: CD2 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2 clock from the source clock (clock domain 2) to be updated.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.13.14. APP Clock Divider Register 7 (SYSC1_APPCKDIVR7)

The SYSC1_APPCKDIVR7 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD3B1DIV				CD3B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD3A1DIV				CD3A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD3DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD3B1DIV: CD3B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3B1 clock from the CD3B0 clock to be updated.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD3B0DIV: CD3B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3B0 clock from the CD3 clock to be updated.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD3A1DIV: CD3A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3A1 clock from the CD3A0 clock to be updated.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD3A0DIV: CD3A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3A0 clock from the CD3 clock to be updated.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD3DIV: CD3 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3 clock from the source clock (clock domain 3) to be updated.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.13.15. APP Clock Divider Register 8 (SYSC1_APPCKDIVR8)

The SYSC1_APPCKDIVR8 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD4B1DIV				CD4B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD4A1DIV				CD4A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD4DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD4B1DIV: CD4B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4B1 clock from the CD4B0 clock to be updated.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD4B0DIV: CD4B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4B0 clock from the CD4 clock to be updated.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD4A1DIV: CD4A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4A1 clock from the CD4A0 clock to be updated.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD4A0DIV: CD4A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4A0 clock from the CD4 clock to be updated.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD4DIV: CD4 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4 clock from the source clock (clock domain 4) to be updated.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.13.16. APP Clock Divider Register 9 (SYSC1_APPCKDIVR9)

The SYSC1_APPCKDIVR9 register indicates the set values of the division ratio of each internal operating clock to be updated.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD5B1DIV				CD5B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD5A1DIV				CD5A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD5DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD5B1DIV: CD5B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5B1 clock from the CD5B0 clock to be updated.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD5B0DIV: CD5B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5B0 clock from the CD5 clock to be updated.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD5A1DIV: CD5A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5A1 clock from the CD5A0 clock to be updated.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD5A0DIV: CD5A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5A0 clock from the CD5 clock to be updated.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD5DIV: CD5 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5 clock from the source clock (clock domain 4) to be updated.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14. STS Profile Register Group (SYSC1)

The registers in this group are the STS profile control setting registers.

5.14.1. STS Clock Selection Register 0 (SYSC1_STSCKSELR0)

The SYSC1_STSCKSELR0 register indicates the set values of the clock source for the clock domain.

bit	31	30	29	28	27	26	25	24
Field	HSSPICM				HSSPICSL			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved		LAPP1A CM	LAPP1A CSL	Reserved		LAPP0A CM	LAPP0A CSL
R/W Attribute	R0,WX		R,WX	R,WX	R0,WX		R,WX	R,WX
Protection Attribute	WPS							
Initial Value	00		0	0	00		0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved		LCP1A CM	LCP1A CSL	Reserved		LCP0A CM	LCP0A CSL
R/W Attribute	R0,WX		R,WX	R,WX	R0,WX		R,WX	R,WX
Protection Attribute	WPS							
Initial Value	00		0	0	00		0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved	CD0CM			Reserved	CD0CSL		
R/W Attribute	R0,WX	R,WX			R0,WX	R,WX		
Protection Attribute	WPS							
Initial Value	0	000			0	000		

[bit31:28] HSSPICM: HSSPI Clock Selection Status Bits

These bits indicate the selection status of HSSPI clock.

bit31:28	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock

bit31:28	Description
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit27:24] HSSPICSL: HSSPI Clock Selection Bits

These bits indicate the set value of HSSPI clock.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:22] Reserved: Reserved Bits

[bit21] LAPP1ACM: LAPP1A Clock Selection Status Bit

This bit indicates the selection status of LAPP1A clock.

bit21	Description
0	CD0 clock
1	PLL0 clock

[bit20] LAPP1ACSL: LAPP1A Clock Selection Bit

This bit indicates the set value of LAPP1A clock.

bit20	Description
0	CD0 clock
1	PLL0 clock

[bit19:18] Reserved: Reserved Bits**[bit17] LAPP0ACM: LAPP0A Clock Selection Status Bit**

This bit indicates the selection status of LAPP0A clock.

bit17	Description
0	CD0 clock
1	PLL0 clock

[bit16] LAPP0ACSL: LAPP0A Clock Selection Bit

This bit indicates the set value of LAPP0A clock.

bit16	Description
0	CD0 clock
1	PLL0 clock

[bit15:14] Reserved: Reserved Bits**[bit13] LCP1ACM: LCP1A Clock Selection Status Bit**

This bit indicates the selection status of LCP1A clock.

bit13	Description
0	CD0 clock
1	PLL0 clock

[bit12] LCP1ACSL: LCP1A Clock Selection Bit

This bit indicates the set value of LCP1A clock.

bit12	Description
0	CD0 clock
1	PLL0 clock

[bit11:10] Reserved: Reserved Bits

[bit9] LCP0ACM: LCP0A Clock Selection Status Bit

This bit indicates the selection status of LCP0A clock.

bit9	Description
0	CD0 clock
1	PLL0 clock

[bit8] LCP0ACSL: LCP0A Clock Selection Bit

This bit indicates the set value of LCP0A clock.

bit8	Description
0	CD0 clock
1	PLL0 clock

[bit7] Reserved: Reserved Bit
[bit6:4] CD0CM: Clock Domain 0 Clock Selection Status Bits

These bits indicate the selection status of clock domain 0.

bit6:4	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	Setting prohibited
111	Clock fixed at "L"

[bit3] Reserved: Reserved Bit
[bit2:0] CD0CSL: Clock Domain 0 Clock Selection Bits

These bits indicate the set value of clock domain 0.

bit2:0	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	Setting prohibited
111	Clock fixed at "L"

5.14.2. STS Clock Selection Register 1 (SYSC1_STSCKSELR1)

The SYSC1_STSCKSELR1 register indicates the set values of the clock source for the clock domain.

bit	31	30	29	28	27	26	25	24
Field	CD4CM				CD4CSL			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	CD3CM				CD3CSL			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD2CM				CD2CSL			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	CD1CM				CD1CSL			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

[bit31:28] CD4CM: Clock Domain 4 Clock Selection Status Bits

These bits indicate the selection status of clock domain 4.

bit31:28	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited

bit31:28	Description
1110	Setting prohibited
1111	Clock fixed at "L"

[bit27:24] CD4CSL: Clock Domain 4 Clock Selection Bits

These bits indicate the set value of clock domain 4.

bit27:24	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit23:20] CD3CM: Clock Domain 3 Clock Selection Status Bits

These bits indicate the selection status of clock domain 3.

bit23:20	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit19:16] CD3CSL: Clock Domain 3 Clock Selection Bits

These bits indicate the set value of clock domain 3.

bit19:16	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit15:12] CD2CM: Clock Domain 2 Clock Selection Status Bits

These bits indicate the selection status of clock domain 2.

bit15:12	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit11:8] CD2CSL: Clock Domain 2 Clock Selection Bits

These bits indicate the set value of clock domain 2.

bit11:8	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit7:4] CD1CM: Clock Domain 1 Clock Selection Status Bits

These bits indicate the selection status of clock domain 1.

bit7:4	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit3:0] CD1CSL: Clock Domain 1 Clock Selection Bits

These bits indicate the set value of clock domain 1.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

5.14.3. STS Clock Selection Register 2 (SYSC1_STSCKSELR2)

The SYSC1_STSCKSELR2 register indicates the set values of the clock source for the clock domain.

bit	31										16									
Field	Reserved																			
R/W Attribute	R0,WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000																			

bit	15				14		13		12		11		10		9		8			
Field	Reserved		TRCCM				Reserved		TRCCSL											
R/W Attribute	R0,WX		R,WX				R0,WX		R,WX											
Protection Attribute	WPS																			
Initial Value	0		000				0		000											

bit	7			6		5		4		3		2		1		0	
Field	CD5CM								CD5CSL								
R/W Attribute	R0,WX								R,WX								
Protection Attribute	WPS																
Initial Value	0000								0000								

[bit31:15] Reserved: Reserved Bits

[bit14:12] TRCCM: TRC Clock Selection Status Bits

These bits indicate the selection status of TRC clock.

bit14:12	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	PLL1 clock
111	Clock fixed at "L"

[bit11] Reserved: Reserved Bit

[bit10:8] TRCCSL: TRC Clock Selection Bits

These bits select the source clock for TRC clock.

bit10:8	Description
000	High-speed CR clock
001	Low-speed CR clock
010	Main clock
011	Sub clock (Do not use this setting)
100	PLL0 clock
101	SSCG0 clock
110	PLL1 clock
111	Clock fixed at "L"

[bit7:4] CD5CM: Clock Domain 5 Clock Selection Status Bits

These bits indicate the selection status of clock domain 5.

bit7:4	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

[bit3:0] CD5CSL: Clock Domain 5 Clock Selection Bits

These bits indicate the set value of clock domain 5.

bit3:0	Description
0000	High-speed CR clock
0001	Low-speed CR clock
0010	Main clock
0011	Sub clock (Do not use this setting)
0100	PLL0 clock
0101	PLL1 clock
0110	PLL2 clock
0111	PLL3 clock
1000	SSCG PLL0 clock
1001	SSCG PLL1 clock
1010	SSCG PLL2 clock
1011	SSCG PLL3 clock
1100	Setting prohibited
1101	Setting prohibited
1110	Setting prohibited
1111	Clock fixed at "L"

5.14.4. STS Clock Source Enable Register 0(SYSC1_STSCKER0)

The SYSC1_STSCKER0 register indicates the value for setting whether to enable/disable oscillation of the internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	ENCLK LAPP1A	ENCLK LAPP0A	ENCLK LCP1A	ENCLK LCP0A	ENCLK LAPP1	ENCLK LAPP0	ENCLK LCP1	ENCLK LCP0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	1	1	1	1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	ENCLK LCP	Reserved	ENCLK LLPBM2	ENCLK LLPBM	ENCLK HAPP1B1	ENCLK HAPP1B0	ENCLK HAPP0A1	ENCLK HAPP0A0
R/W Attribute	R,WX	R0,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	1	0	1	1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved	ENCLK SYSC1	Reserved		ENCLK EXTBUS	ENCLK MEMC	ENCLK DMA	ENCLK HPM
R/W Attribute	R0,WX	R,WX	R0,WX		R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	0	1	00		1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	ENCLK HPM2	ENCLK TRC	ENCLK DBG	ENCLK ATB	Reserved			ENCLK CPU0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R0,WX			R,WX
Protection Attribute	WPS							
Initial Value	1	1	1	1	000			1

[bit31] ENCLKLAPP1A: LAPP1A Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP1A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit30] ENCLKLAPP0A: LAPP0A Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP0A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit29] ENCLKLCP1A: LCP1A Clock Oscillation Enable Bit

This bit indicates the set value of the LCP1A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit28] ENCLKLCP0A: LCP0A Clock Oscillation Enable Bit

This bit indicates the set value of the LCP0A clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit27] ENCLKLAPP1: LAPP1 Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit26] ENCLKLAPP0: LAPP0 Clock Oscillation Enable Bit

This bit indicates the set value of the LAPP0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit25] ENCLKLCP1: LCP1 Clock Oscillation Enable Bit

This bit indicates the set value of the LCP1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit24] ENCLKLCP0: LCP0 Clock Oscillation Enable Bit

This bit indicates the set value of the LCP0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit23] ENCLKLCP: LCP Clock Oscillation Enable Bit

This bit indicates the set value of the LCP clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit22] Reserved: Reserved Bit**[bit21] ENCLKLLPBM2: LLPBM2 Clock Oscillation Enable Bit**

This bit indicates the set value of the LLPBM2 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit20] ENCLKLLPBM: LLPBM Clock Oscillation Enable Bit

This bit indicates the set value of the LLPBM clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit19] ENCLKHAPP1B1: HAPP1B1 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP1B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit18] ENCLKHAPP1B0: HAPP1B0 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP1B0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit17] ENCLKHAPP0A1: HAPP0A1 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP0A1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit16] ENCLKHAPP0A0: HAPP0A0 Clock Oscillation Enable Bit

This bit indicates the set value of the HAPP0A0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit15] Reserved: Reserved Bit
[bit14] ENCLKSYSC1: ENCLKSYSC1 Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKSYSC1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit13:12] Reserved: Reserved Bits
[bit11] ENCLKEXTBUS: ENCLKEXTBUS Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKEXTBUS clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] ENCLKMEMC: ENCLKMEMC Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKMEMC clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] ENCLKDMA: ENCLKDMA Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKDMA clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKHPM: ENCLKHPM Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKHPM clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7] ENCLKHPM2: ENCLKHPM2 Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKHPM2 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit6] ENCLKTRC: ENCLKTRC Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKTRC clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit5] ENCLKDBG: ENCLKDBG Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKDBG clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit4] ENCLKATB: ENCLKATB Clock Oscillation Enable Bit

This bit indicates the set value of the ENCLKATB clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit3:1] Reserved: Reserved Bits**[bit0] ENCLKCPU0: ENCLKCPU0 Clock Oscillation Enable Bit**

This bit indicates the set value of the ENCLKCPU0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.14.5. STS Clock Source Enable Register 1(SYSC1_STSCKER1)

The SYSC1_STSCKER1 register indicates the value for setting whether to enable/disable oscillation of the internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved			ENCLK CD3B1	ENCLK CD3B0	ENCLK CD3A1	ENCLK CD3A0	ENCLK CD3
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	Reserved			ENCLK CD2B1	ENCLK CD2B0	ENCLK CD2A1	ENCLK CD2A0	ENCLK CD2
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD1B1	ENCLK CD1B0	ENCLK CD1A1	ENCLK CD1A0	ENCLK CD1
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved							ENCLK HSSPI
R/W Attribute	R0,WX							R,WX
Protection Attribute	WPS							
Initial Value	0000000							1

[bit31:29] Reserved: Reserved Bits

[bit28] ENCLKCD3B1: CD3B1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit27] ENCLKCD3B0: CD3B1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit26] ENCLKCD3A1: CD3A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3A1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit25] ENCLKCD3A0: CD3A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3A0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit24] ENCLKCD3: CD3 Clock Oscillation Enable Bit

This bit indicates the set value of the CD3 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit23:21] Reserved: Reserved Bits**[bit20] ENCLKCD2B1: CD2B1 Clock Oscillation Enable Bit**

This bit indicates the set value of the CD2B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit19] ENCLKCD2B0: CD2B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2B0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit18] ENCLKCD2A1: CD2A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2A1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit17] ENCLKCD2A0: CD2A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2A0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit16] ENCLKCD2: CD2 Clock Oscillation Enable Bit

This bit indicates the set value of the CD2 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit15:13] Reserved: Reserved Bits
[bit12] ENCLKCD1B1: CD1B1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit11] ENCLKCD1B0: CD1B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1B0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] ENCLKCD1A1: CD1A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1A1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] ENCLKCD1A0: CD1A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1A0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKCD1: CD1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7:1] Reserved: Reserved Bits**[bit0] ENCLKHSSPI: HSSPI Clock Oscillation Enable Bit**

This bit indicates the set value of the HSSPI clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.14.6. STS Clock Source Enable Register 2(SYSC1_STSCER2)

The SYSC1_STSCER2 register indicates the value for setting whether to enable/disable oscillation of the internal operating clock.

bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved			ENCLK CD5B1	ENCLK CD5B0	ENCLK CD5A1	ENCLK CD5A0	ENCLK CD5
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved			ENCLK CD4B1	ENCLK CD4B0	ENCLK CD4A1	ENCLK CD4A0	ENCLK CD4
R/W Attribute	R0,WX			R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000			1	1	1	1	1

[bit31:13] Reserved: Reserved Bits

[bit12] ENCLKCD5B1: CD5B1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit11] ENCLKCD5B0: CD5B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5B0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit10] ENCLKCD5A1: CD5A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5A1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit9] ENCLKCD5A0: CD5A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5A0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit8] ENCLKCD5: CD5 Clock Oscillation Enable Bit

This bit indicates the set value of the CD5 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit7:5] Reserved: Reserved Bits**[bit4] ENCLKCD4B1: CD4B1 Clock Oscillation Enable Bit**

This bit indicates the set value of the CD4B1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit3] ENCLKCD4B0: CD4B0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4B0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit2] ENCLKCD4A1: CD4A1 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4A1 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit1] ENCLKCD4A0: CD4A0 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4A0 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

[bit0] ENCLKCD4: CD4 Clock Oscillation Enable Bit

This bit indicates the set value of the CD4 clock.

Bit	Description
0	Disable clock oscillation.
1	Enable clock oscillation.

5.14.7. STS Clock Divider Register 0 (SYSC1_STSCKDIVR0)

The SYSC1_STSCKDIVR0 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved					HPMDIV		
R/W Attribute	R0,WX					R,WX		
Protection Attribute	WPS							
Initial Value	00000					000		

bit	23	22	21	20	19	18	17	16
Field	Reserved			TRCDIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved		DBGDIV		Reserved		ATBDIV	
R/W Attribute	R0,WX		R,WX		R0,WX		R,WX	
Protection Attribute	WPS							
Initial Value	00		00		00		00	

bit	7	6	5	4	3	2	1	0
Field	Reserved			SYSDIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:27] Reserved: Reserved Bits

[bit26:24] HPMDIV: HPM Clock Frequency Divider Setting Bits

These bits indicate the set value of the division ratio of the HPM clock, DMA clock, or MEMC clock from the SYS clock.

bit26:24	Description
000	No division
001	Divided by 2
010	Divided by 3
011	Divided by 4
100	Divided by 5
101	Divided by 6
110	Divided by 7
111	Divided by 8

[bit23:21] Reserved: Reserved Bits

[bit20:16] TRCDIV: TRC Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the TRC clock from the source clock (clock domain TRC).

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
.
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit15:14] Reserved: Reserved Bits

[bit13:12] DBGDIV: DBG Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the DBG clock from the ATB clock.

bit13:12	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

[bit11:10] Reserved: Reserved Bits

[bit9:8] ATBDIV [1:0]: ATB Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the ATB clock from the SYS clock.

bit9:8	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

[bit7:5] Reserved: Reserved Bits

[bit4:0] SYSDIV: SYS Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CPU0 clock or CPERI clock from the source clock (clock domain 0).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14.8. STS Clock Divider Register 1 (SYSC1_STSCCKDIVR1)

The SYSC1_STSCCKDIVR1 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	HAPP1B1DIV				HAPP1B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	HAPP0A1DIV				HAPP0A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	7	6	5	4	3	2	1	0
Field	SYSC1DIV				Reserved	EXTBUSDIV		
R/W Attribute	R,WX				R0,WX	R,WX		
Protection Attribute	WPS							
Initial Value	0000				0	000		

[bit31:28] HAPP1B1DIV: HAPP1B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP1B1 clock from the HAPP1B0 clock.

bit31:28	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit27:24] HAPP1B0DIV: HAPP1B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP1B0 clock from the HPM clock.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit23:20] HAPP0A1DIV: HAPP0A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP0A1 clock from the HAPP0A0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] HAPP0A0DIV: HAPP0A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HAPP0A0 clock from the HPM clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:8] Reserved: Reserved Bits

[bit7:4] SYSC1DIV: SYSC1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the SYSC1 clock from the HPM clock.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit3] Reserved: Reserved Bit

[bit2:0] EXTBUSDIV: EXTBUS Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the EXTBUS clock from the HPM clock.

bit2:0	Description
000	No division
001	Divided by 2
010	Divided by 4
011	Divided by 8
100	Divided by 16
101	Divided by 32
110	Divided by 64
111	Divided by 128

5.14.9. STS Clock Divider Register 2 (SYSC1_STSCKDIVR2)

The SYSC1_STSCKDIVR2 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved				LAPP1DIV			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	23	22	21	20	19	18	17	16
Field	Reserved				LAPP0DIV			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	Reserved				LCP1DIV			
R/W Attribute	R0,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	LCP0DIV				Reserved		LCPDIV	
R/W Attribute	R,WX				R0,WX		R,WX	
Protection Attribute	WPS							
Initial Value	0000				00		00	

[bit31:28] Reserved: Reserved Bits

[bit27:24] LAPP1DIV: LAPP1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LAPP1 clock from the CPU clock.

bit27:24	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit23:20] Reserved: Reserved Bits

[bit19:16] LAPP0DIV: LAPP0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LAPP0 clock from the CPU clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] Reserved: Reserved Bits

[bit11:8] LCP1DIV: LCP1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LCP1 clock from the CPU clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:4] LCP0DIV: LCP0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LCP0 clock from the CPU clock.

bit7:4	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
0011	Divided by 4
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit3:2] Reserved: Reserved Bits**[bit1:0] LCPDIV: LCP Clock Divider Setting Bits**

These bits indicate the set value of the division ratio of the LCP clock from the CPU clock.

bit1:0	Description
00	No division
01	Divided by 2
10	Divided by 4
11	Divided by 8

5.14.10. STS Clock Divider Register 3 (SYSC1_STSCCKDIVR3)

The SYSC1_STSCCKDIVR3 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved			LAPP1ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	23	22	21	20	19	18	17	16
Field	Reserved			LAPP0ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	15	14	13	12	11	10	9	8
Field	Reserved			LCP1ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

bit	7	6	5	4	3	2	1	0
Field	Reserved			LCP0ADIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:29] Reserved: Reserved Bits

[bit28:24] LAPP1ADIV: LAPP1A Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the LAPP1A clock from the CPU/PLL0 clock.

bit28:24	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit23:21] Reserved: Reserved Bits**[bit20:16] LAPP0ADIV: LAPP0A Clock Divider Setting Bits**

These bits indicate the set value of the division ratio of the LAPP0A clock from the CPU/PLL0 clock.

bit20:16	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit15:13] Reserved: Reserved Bits**[bit12:8] LCP1ADIV: LCP1A Clock Divider Setting Bits**

These bits indicate the set value of the division ratio of the LCP1A clock from the CPU/PLL0 clock.

bit12:8	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

[bit7:5] Reserved: Reserved Bits**[bit4:0] LCP0ADIV: LCP0A Clock Divider Setting Bits**

These bits indicate the set value of the division ratio of the LCP0A clock from the CPU/PLL0 clock.

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
00011	Divided by 4
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14.11. STS Clock Divider Register 4 (SYSC1_STSCKDVR4)

The SYSC1_STSCCKDIVR4 register indicates the set values of the division ratio of each internal operating clock.

bit	31							8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000_00000000_00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved			HSSPIDIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:5] Reserved: Reserved Bits

[bit4:0] HSSPIDIV: HSSPI Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the HSSPI clock from the source clock (HSSPI clock domain).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14.12. STS Clock Divider Register 5 (SYSC1_STSCKDIVR5)

The SYSC1_STSCKDIVR5 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD1B1DIV				CD1B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD1A1DIV				CD1A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD1DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD1B1DIV: CD1B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1B1 clock from the CD1B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD1B0DIV: CD1B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1B0 clock from the CD1 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD1A1DIV: CD1A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1A1 clock from the CD1A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD1A0DIV: CD1A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1A0 clock from the CD1 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD1DIV: CD1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD1 clock from the source clock (clock domain 1).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14.13. STS Clock Divider Register 6 (SYSC1_STSCCKDIVR6)

The SYSC1_STSCCKDIVR6 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD2B1DIV				CD2B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD2A1DIV				CD2A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD2DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD2B1DIV: CD2B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2B1 clock from the CD2B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD2B0DIV: CD2B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2B0 clock from the CD2 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD2A1DIV: CD2A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2A1 clock from the CD2A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD2A0DIV: CD2A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2A0 clock from the CD2 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD2DIV: CD2 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD2 clock from the source clock (clock domain 2).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14.14. STS Clock Divider Register 7 (SYSC1_STSCKDIVR7)

The SYSC1_STSCKDIVR7 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD3B1DIV				CD3B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD3A1DIV				CD3A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD3DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD3B1DIV: CD3B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3B1 clock from the CD3B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD3B0DIV: CD3B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3B0 clock from the CD3 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD3A1DIV: CD3A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3A1 clock from the CD3A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD3A0DIV: CD3A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3A0 clock from the CD3 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD3DIV: CD3 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD3 clock from the source clock (clock domain 3).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14.15. STS Clock Divider Register 8 (SYSC1_STSCCKDIVR8)

The SYSC1_STSCCKDIVR8 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD4B1DIV				CD4B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD4A1DIV				CD4A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD4DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved: Reserved Bits

[bit23:20] CD4B1DIV: CD4B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4B1 clock from the CD4B0 clock.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD4B0DIV: CD4B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4B0 clock from the CD4 clock.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD4A1DIV: CD4A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4A1 clock from the CD4A0 clock.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD4A0DIV: CD4A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4A0 clock from the CD4 clock.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved: Reserved Bits

[bit4:0] CD4DIV: CD4 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD4 clock from the source clock (clock domain 4).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

5.14.16. STS Clock Divider Register 9 (SYSC1_STSCKDIVR9)

The SYSC1_STSCKDIVR9 register indicates the set values of the division ratio of each internal operating clock.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	CD5B1DIV				CD5B0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	15	14	13	12	11	10	9	8
Field	CD5A1DIV				CD5A0DIV			
R/W Attribute	R,WX				R,WX			
Protection Attribute	WPS							
Initial Value	0000				0000			

bit	7	6	5	4	3	2	1	0
Field	Reserved			CD5DIV				
R/W Attribute	R0,WX			R,WX				
Protection Attribute	WPS							
Initial Value	000			00000				

[bit31:24] Reserved : Reserved Bits

[bit23:20] CD5B1DIV : CD5B1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5B1 clock of the CD5B0.

bit23:20	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit19:16] CD5B0DIV : CD5B0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5B0 clock of the CD5.

bit19:16	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit15:12] CD5A1DIV : CD5A1 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5A1 clock of the CD5A0.

bit15:12	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit11:8] CD5A0DIV : CD5A0 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5A0 clock of the CD5.

bit11:8	Description
0000	No division
0001	Divided by 2
0010	Divided by 3
...	...
1101	Divided by 14
1110	Divided by 15
1111	Divided by 16

[bit7:5] Reserved : Reserved Bits

[bit4:0] CD5DIV : CD5 Clock Divider Setting Bits

These bits indicate the set value of the division ratio of the CD5 clock of the source clock (clock domain 5).

bit4:0	Description
00000	No division
00001	Divided by 2
00010	Divided by 3
...	...
11101	Divided by 30
11110	Divided by 31
11111	Divided by 32

6. Other

This section describes the precautions on use of low-power consumption.

6.1. Restrictions on Transitioning to the PSS

This section describes restrictions on transitioning to the PSS.

1. When transitioning to the PSS, create a 1:1:1:1 relationship among the CPU clock (CLK_CPU), the Memory Configuration clock (CLK_MEMC), the SCU clock (Fast CR clock), and the MCUCH clock (CLK_SYSC0H) in PSS profile. The loss of this relationship among these clocks may cause abnormal operation.
2. When using in the following condition, Fast CR clock must be enabled.
 - Use PSS mode without PD2 shutdown
 - Use peripherals in PD6 at PSS mode shutdown

Fast CR clock is enabled when it sets SYSC0_PSSCKSRER. CROSCEN=1.

6.2. Limitation when Changing the Setting of Regulator

Following shows the limitation when changing the setting of regulator.

Output voltage and regulator mode can not be changed while RUN mode.

PSS is only changeable, but mode and output voltage can not be changed simultaneously.

6.3. Restriction to use “Clock fixed at L” and changing clock division ratio

Do not execute a profile update which changes the division ratio when the source clock of belonging clock domain is selected to "Clock fixed at L". This restriction must be kept not only RUN to RUN profile update but also RUN to PSS and PSS to RUN.

Example:

NG

[PSS] Clock fixed at "L" divide 32	→	[RUN] PLL0 clock divide 2
--	---	---------------------------------

OK

[PSS] Clock fixed at "L" divide 2	→	[RUN] PLL0 clock divide 2
---	---	---------------------------------

NG

[RUN] Clock fixed at "L" divide 16	→	[RUN] PLL0 clock divide 4
--	---	---------------------------------

OK

[RUN] Clock fixed at "L" divide 16	→	[RUN] PLL0 clock divide 16	→	[RUN] PLL0 clock divide 4
--	---	----------------------------------	---	---------------------------------

"→" means a profile update.

CHAPTER 7: Low-voltage Detection

This chapter explains the low-voltage detection.

5. Operation Examples
6. Precautions for Using This Device

LVD-TXXPT03P01R01L06-E1-XX

1. Overview

This section provides an overview of the low-voltage detection.

1.1. Features

Internal Low-Voltage Detection

- Function, detection voltage:
Please see (Product specification).
- Operation: Always active.
The RAM contents after a power-on reset cannot be guaranteed.

Core Power Supply Low-Voltage Detection

The Core power supply low-voltage detection circuit has two channels.

- Function, detection voltage:
Please see (Product specification).
- Operation: Always active.
The RAM contents after a Core power supply low-voltage detection reset cannot be guaranteed.

3.3/5.0 V Power Supply Low-Voltage Detection

The 3.3/5.0 V power supply low-voltage detection circuit has two channels.

- Function: A 3.3/5.0 V power supply low-voltage detection reset or interrupt is generated upon the detection of a voltage within plus or minus the detection error value in volts from the preset detection voltage.
- Operation: Operation can be switched between the active and inactive states by user settings.
The selection to generate an interrupt or reset is also available.
Furthermore, the settings for RUN/PSS can be switched using a profile.
In the case where a reset is generated, the reset is issued after all clocks are stopped in order to guarantee the RAM contents after an external low-voltage detection reset.
For details, see the chapter "RESET."

The following registers are defined below as "LVD registers."

Table 7-1 LVD Registers

RUN low-voltage detection setting register (SYSC0_RUNLVDCFGR)
PSS low-voltage detection setting register (SYSC0_PSSLVDCFGR)
APP low-voltage detection setting register (SYSC0_APPLVDCFGR)
STS low-voltage detection setting register (SYSC0_STSLVDCFGR)

The following bits are defined below as "LVD operation select bits."

Table 7-2 LVD Operation Select Bits

LVDL1S	Core power supply low-voltage detection operation select bit ch1
LVDL2S	Core power supply low-voltage detection operation select bit ch2
LVDH1S	3.3/5.0 V power supply low-voltage detection operation select bit ch1
LVDH2S	3.3/5.0 V power supply low-voltage detection operation select bit ch2

The following bits are defined below as "LVD ready bits."

Table 7-3 LVD Ready Bits

LVDL1R	Core power supply low-voltage detection ready bit ch1
LVDL2R	Core power supply low-voltage detection ready bit ch2
LVDH1R	3.3/5.0 V power supply low-voltage detection ready bit ch1
LVDH2R	3.3/5.0 V power supply low-voltage detection ready bit ch2

The following bits are defined below as "LVD reset source bits."

Table 7-4 LVD Reset Source Bits

LVDL1E	Core power supply low-voltage detection operation enable bit ch1
LVDL2E	Core power supply low-voltage detection operation enable bit ch2
LVDH1E	3.3/5.0 V power supply low-voltage detection operation enable bit ch1
LVDH2E	3.3/5.0 V power supply low-voltage detection operation enable bit ch2

Notes:

- In the TRAVEO™ T1G Family Hardware Manual Platform Part series, functions are mapped as follows:
 Core power supply low-voltage detection ch1: 1.2V internal regulator voltage monitoring
 Core power supply low-voltage detection ch2: 1.2V external power supply monitoring
 3.3/5.0 V power supply external low-voltage detection ch1: 5.0 V external power supply monitoring
 3.3/5.0 V power supply external low-voltage detection ch2: 3.3 V external power supply monitoring
- In the TRAVEO™ T1G Family Hardware Manual Platform Part series, a low-voltage detection interrupt corresponds to an NMI.
- The values for the LVD operation select bits vary depending on the chip.
- For example, if a register value is fixed, only the functions indicated by the register value can be used.
- Also, since operation in the initial state varies depending on the initial value, see explanation of registers.

2. Configuration and Block Diagrams

This section explains block diagrams of the low-voltage detection.

Figure 2-1, Figure 2-2, and Figure 2-3 are configuration diagrams of the low-voltage detection.

Configuration Diagrams of the Low-Voltage Detection

Figure 2-1 Overall Diagram

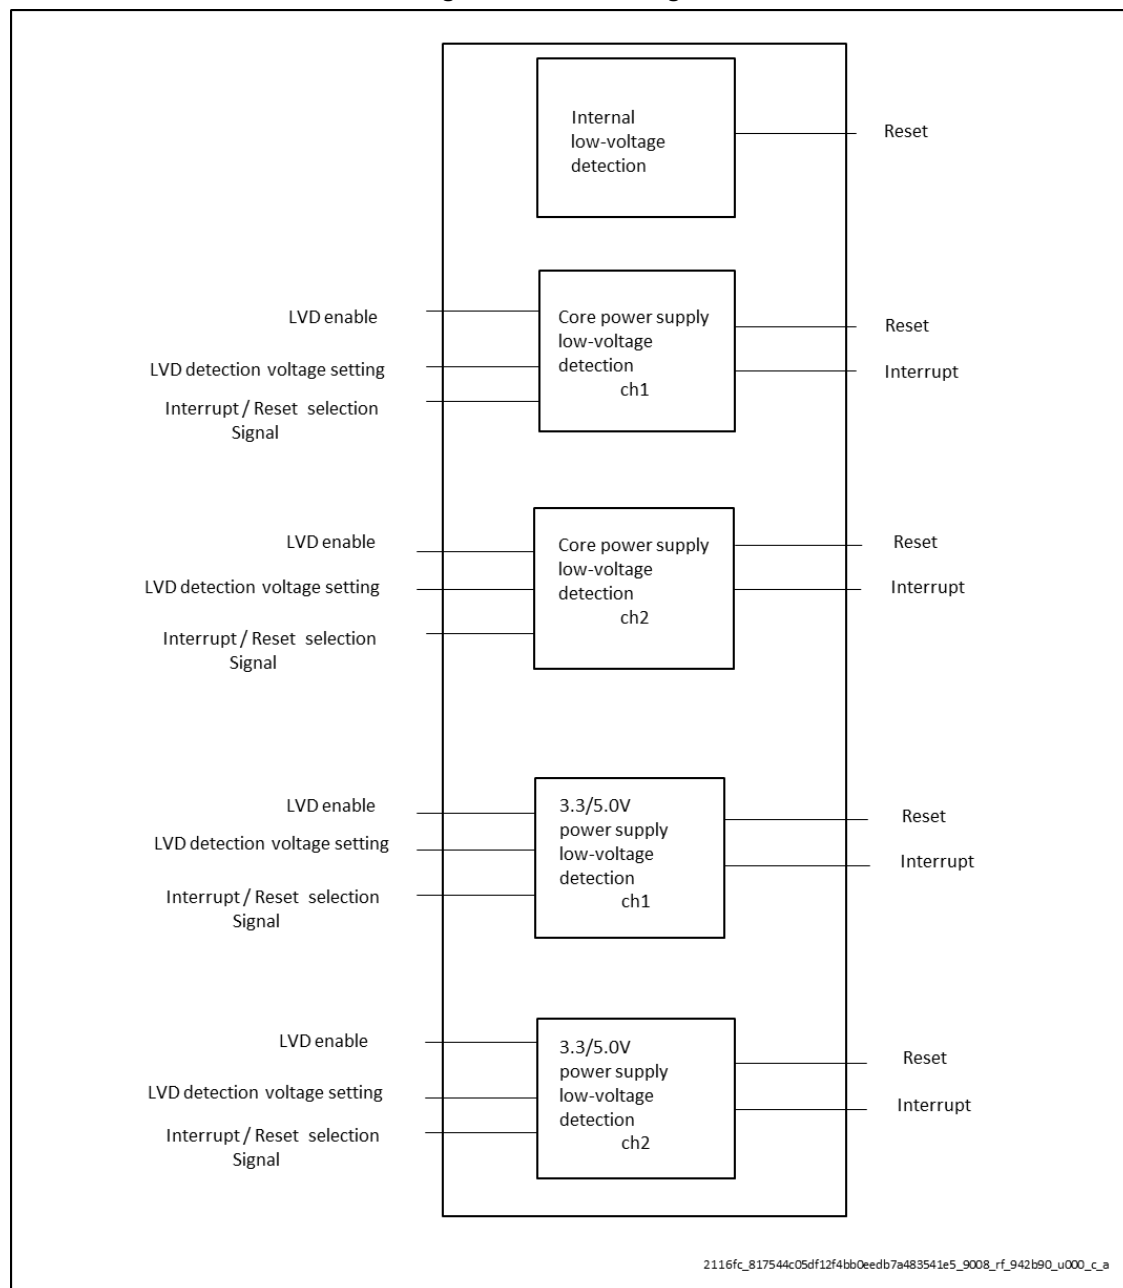

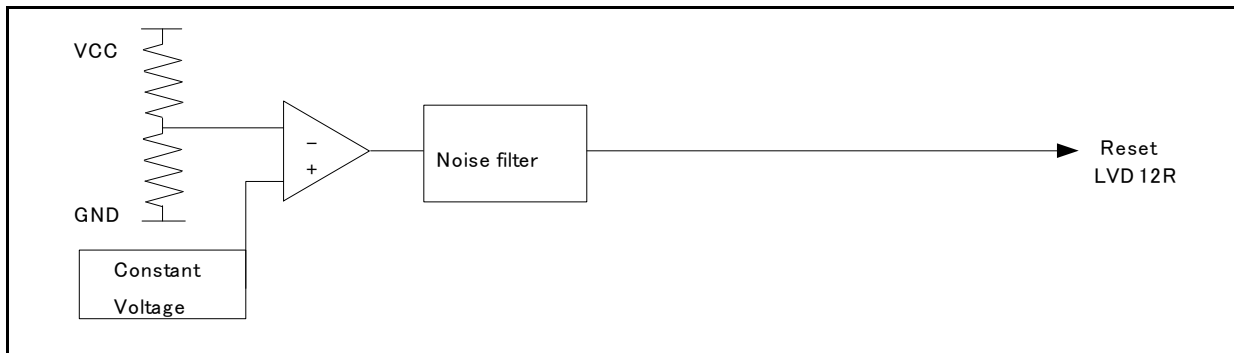

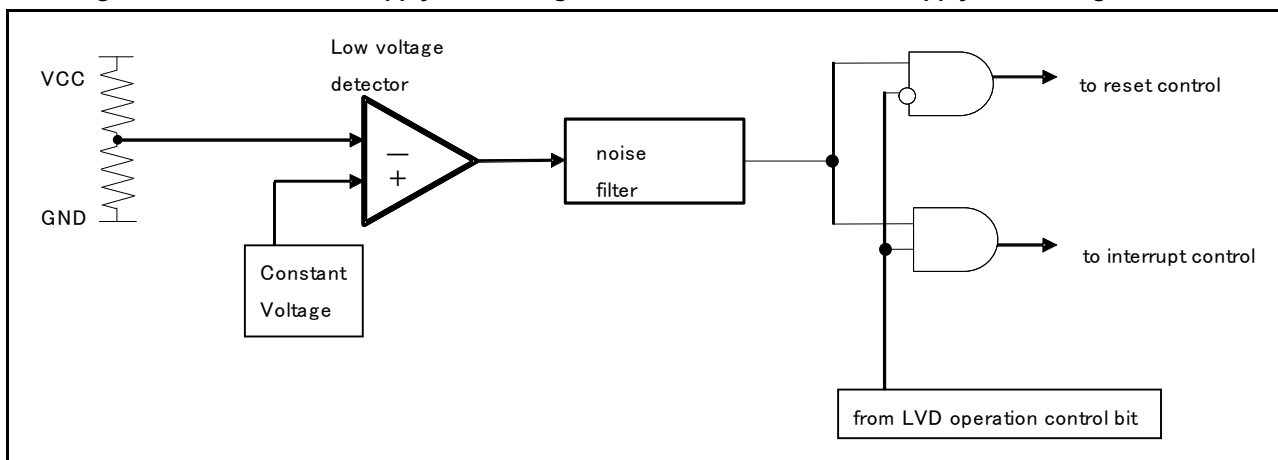

Figure 2-2 Internal Low-Voltage Detection**Figure 2-3 Core Power Supply Low-Voltage Detection, 3.3/5.0 V Power Supply Low-Voltage Detection**

3. Explanation of Operation

This section explains the operation of the low-voltage detection.

Internal Low-Voltage Detection Circuit

The internal low-voltage detection circuit enters the monitoring state after power-on and remains in this state. It detects a low voltage when the internal supply voltage drops below the detection voltage. Upon detecting a low voltage, it generates a reset. The low-voltage detection is released when the internal supply voltage becomes higher than the release voltage.

Explanation of the Internal Low-Voltage Detection Operation

The low-voltage detection voltage is fixed. The circuit enters the monitoring state after power-on and remains in this state.

Internal Low-Voltage Detection Reset

An internal low-voltage reset is generated when the internal supply voltage drops below the set voltage. For details, see the chapter "RESET."

Core Power Supply Low-Voltage Detection Circuit, 3.3/5.0 V Power Supply Low-Voltage Detection Circuit

The 3.3/5.0 V power supply low-voltage detection circuit operates in the same way as the core power supply low-voltage detection circuit.

The low-voltage detection circuit enters the monitoring state after power-on. It detects a low voltage when the monitored supply voltage drops below the detection voltage. Either an interrupt or reset can be selected to be generated upon the detection of a low voltage. The low-voltage detection is released when the monitored supply voltage becomes higher than the release voltage.

Explanation of Operation

The available selections are whether to enable or disable the low-voltage detection, the low-voltage detection voltage, and whether to generate a reset or interrupt when a low voltage is detected. Executing the RUN/PSS profile changes the settings. After the execution of the profile, the low-voltage detection status register reflects the settings. After power-on or a change in its settings, the low-voltage detection circuit is given a stabilization wait time (about 260 us). During the stabilization wait time, the LVD ready bit becomes "0" and the detection result is masked. After the stabilization wait time has elapsed, the bit becomes "1" and supply voltage monitoring begins.

Interrupt Operation

If an interrupt has been selected to be generated upon the detection of a low voltage, the LVD interrupt source bit becomes "1" when the external supply voltage drops below the set voltage. At this point, an interrupt is generated.

Clearing an Interrupt Factor

To clear the low-voltage detection interrupt factor, write "1" to the LVD interrupt source clear bit. This clears the low-voltage detection interrupt factor. Note that if "1" is written to the LVD interrupt source

clear bit while the supply voltage is still below the preset detection voltage, the low-voltage detection interrupt factor is not cleared, so the interrupt request is retained.

Reset Operation

If a reset has been selected to be generated upon the detection of a low voltage, the LVD reset source bit becomes "1" and a reset is generated when the external supply voltage drops below the set voltage. For details, see the chapter "RESET."

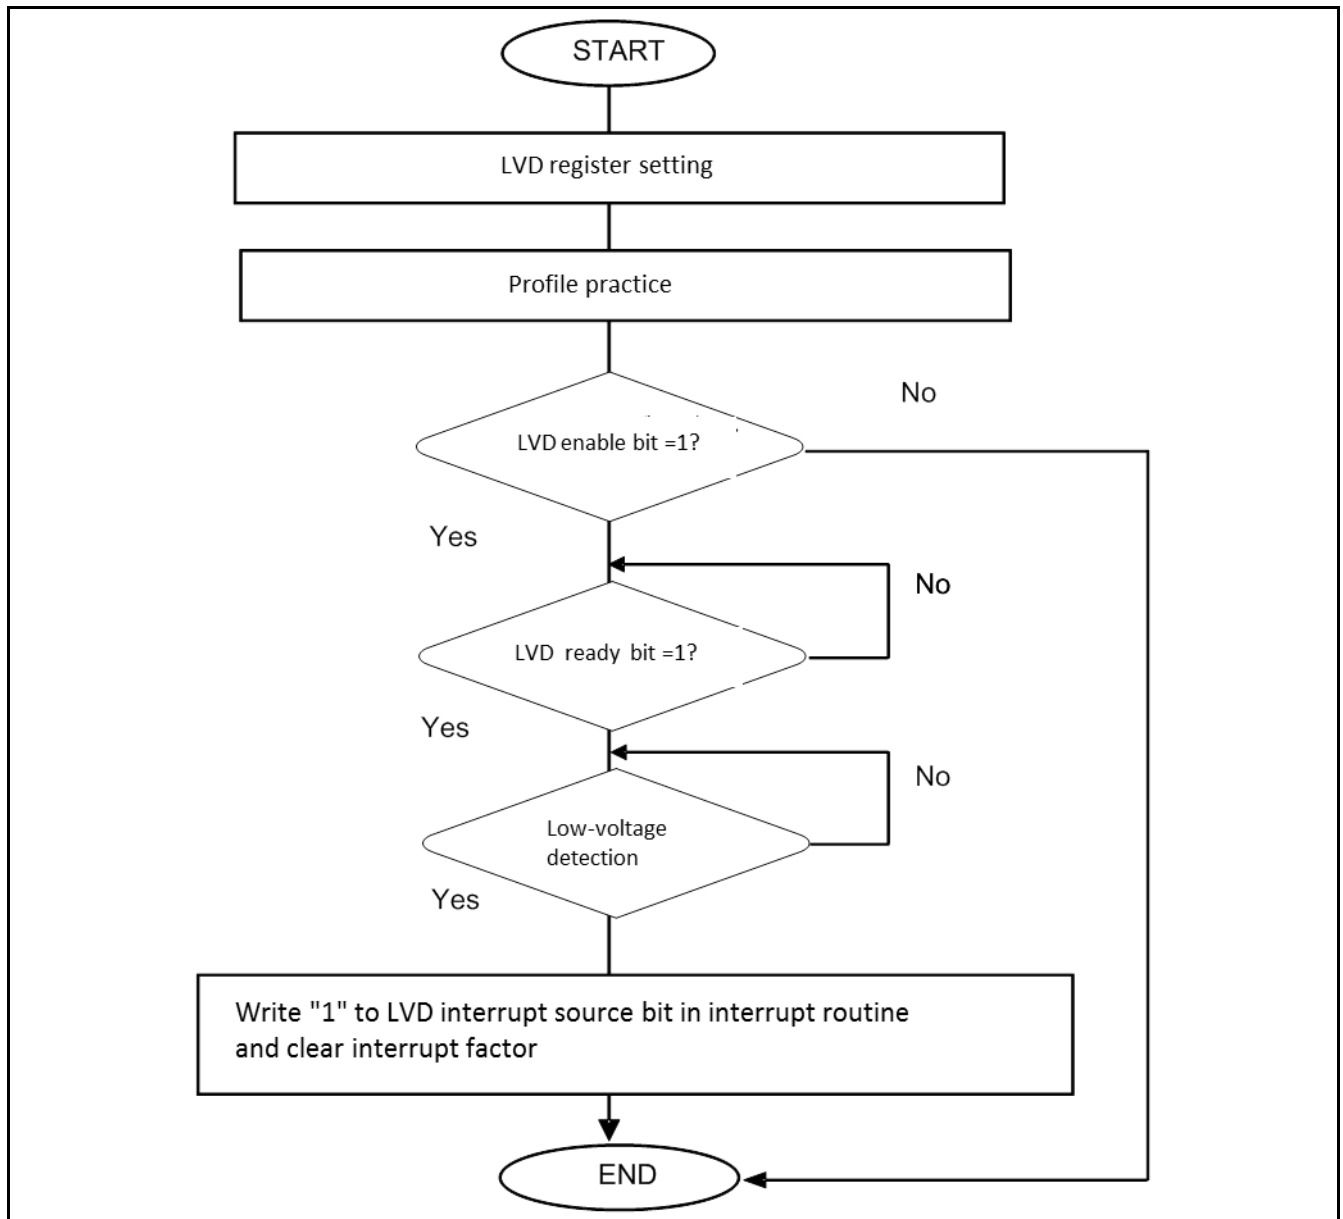

Reset will occur when LVD operation select bit is changed from "interrupt generation" to "reset generation" while interrupt is generated by low voltage detection circuit due to external supply voltage being lower than detection voltage.

4. Setting Procedure Examples

This section explains setting procedure examples of the low-voltage detection.

Setting the Low-Voltage Detection for Interrupts

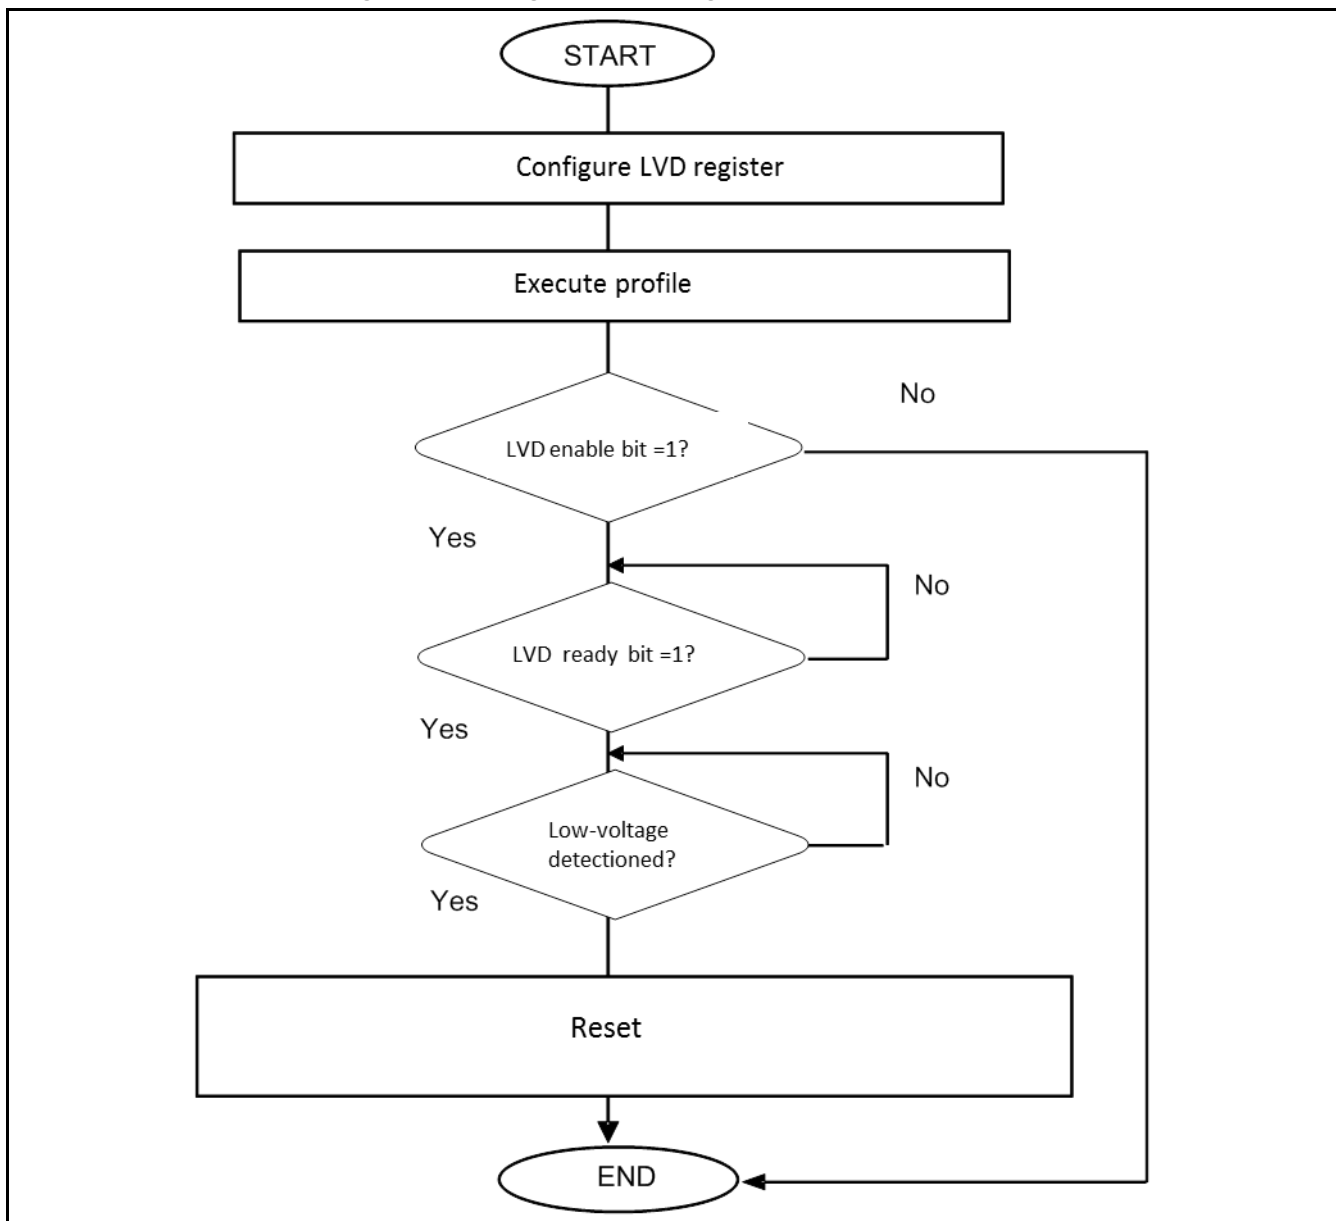

Figure 4-1 Setting the Low-Voltage Detection for Interrupts

The execution of a profile applies the low-voltage detection settings made for the profile register.

Low-voltage monitoring begins when the LVD ready bit becomes "1". Then, an interrupt is generated upon the detection of a low voltage.

To return from the interrupt, clear the interrupt factor by writing "1" to the LVD interrupt source clear bit at the end of the interrupt routine.

Setting the Low-Voltage Detection for Resets**Figure 4-2 Setting the Low-Voltage Detection for Resets**

The execution of a profile applies the low-voltage detection settings made for the profile register. Low-voltage monitoring begins when the LVD ready bit becomes "1". Then, a reset is generated upon the detection of a low voltage.

5. Operation Examples

This section explains operation examples of the low-voltage detection.

If low-voltage detection interrupts are enabled, the detection flag is set and an interrupt is generated upon the detection of a low voltage, as shown in the following timing chart.

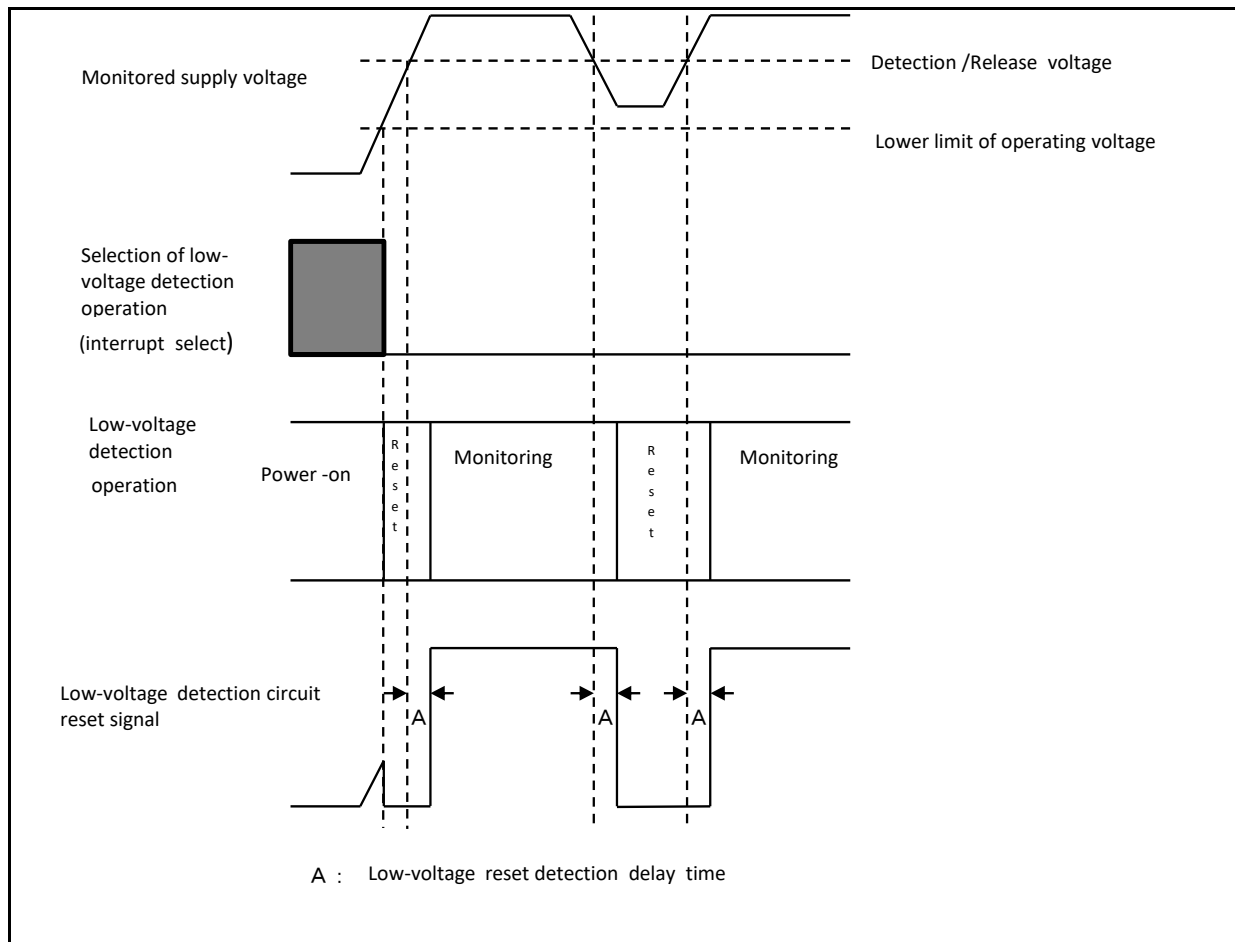

Figure 5-1 Timing Chart When Low-Voltage Detection Interrupts Are Enabled

When the detection circuit for resets is enabled

If the detection circuit for resets is enabled, a reset is generated upon the detection of a low voltage, as shown in the following timing chart.

Figure 5-2 Timing Chart When the Detection Circuit for Resets Is Enabled

When the register setting value is changed

Set the LVD enable bit to 0 before changing the detection voltage.

If the register setting value has changed, the detection signal of the LVD macro is masked until the LVD ready bit becomes "1", as shown below.

Figure 5-3 Timing Chart When the Register Setting Value Is Changed

The change in the register value described here refers to the following bits.

LVDL1E	Core power supply low-voltage detection operation enable bit ch1
LVDL2E	Core power supply low-voltage detection operation enable bit ch2
LVDH1E :	3.3V/5.0V power supply low-voltage detection operation enable bit ch1
LVDH2E :	3.3V/5.0V power supply low-voltage detection operation enable bit ch2

6. Precautions for Using This Device

This section explains precautions on use of the low-voltage detection.

Operation during the PSS

- False detection during the PSS may occur in the following cases.
 - *Do not change the settings when CR is stopped in the PSS.*
- If a low-voltage detection reset is selected, a hard reset is generated when a low voltage is detected in the PSS. If an interrupt is selected, the PSS is released, and the system returns from the interrupt. For details on the hard reset, see the chapter on resets.

Masking of a Detection Result

- Following any low-voltage setting change, the detection result is masked for about 260 us.

CHAPTER 8: Clock Supervisor

This chapter shows the functions and operations of the clock supervisor.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Example
5. Registers
6. Precautions for Using This Device

CSV-TXXPT03P01R01L09-E1-XX

1. Overview

This device is equipped with several instances of two different types of clock supervisors. The used type of clock supervisor depends on the clock signal which is to be monitored.

1. Detector for stopped clock or abnormal frequency of the monitored clock.

This type of clock supervisor detects two possible errors in clock operation: a stopped clock or a clock operating in an abnormal frequency range. There are clock counters for both the monitored clock and the reference clock. Parameters for each counter define the frequency of the reference clock as well as the upper and lower limit for the frequency of the monitored clock. In case the dedicated frequency range comparator detects a stopped clock or a clock outside the frequency range, an abnormal state is signalled. Then, it depends on register settings and on the way, the monitored clock is used on the device, whether a reset or an interrupt is generated.

2. Detector for stopped clock only.

This type of clock supervisor detects a stopped clock operation for the monitored clock. When the rising edge of the monitored clock does not occur, the clock supervisor signals an abnormal state. In this case, a reset is generated.

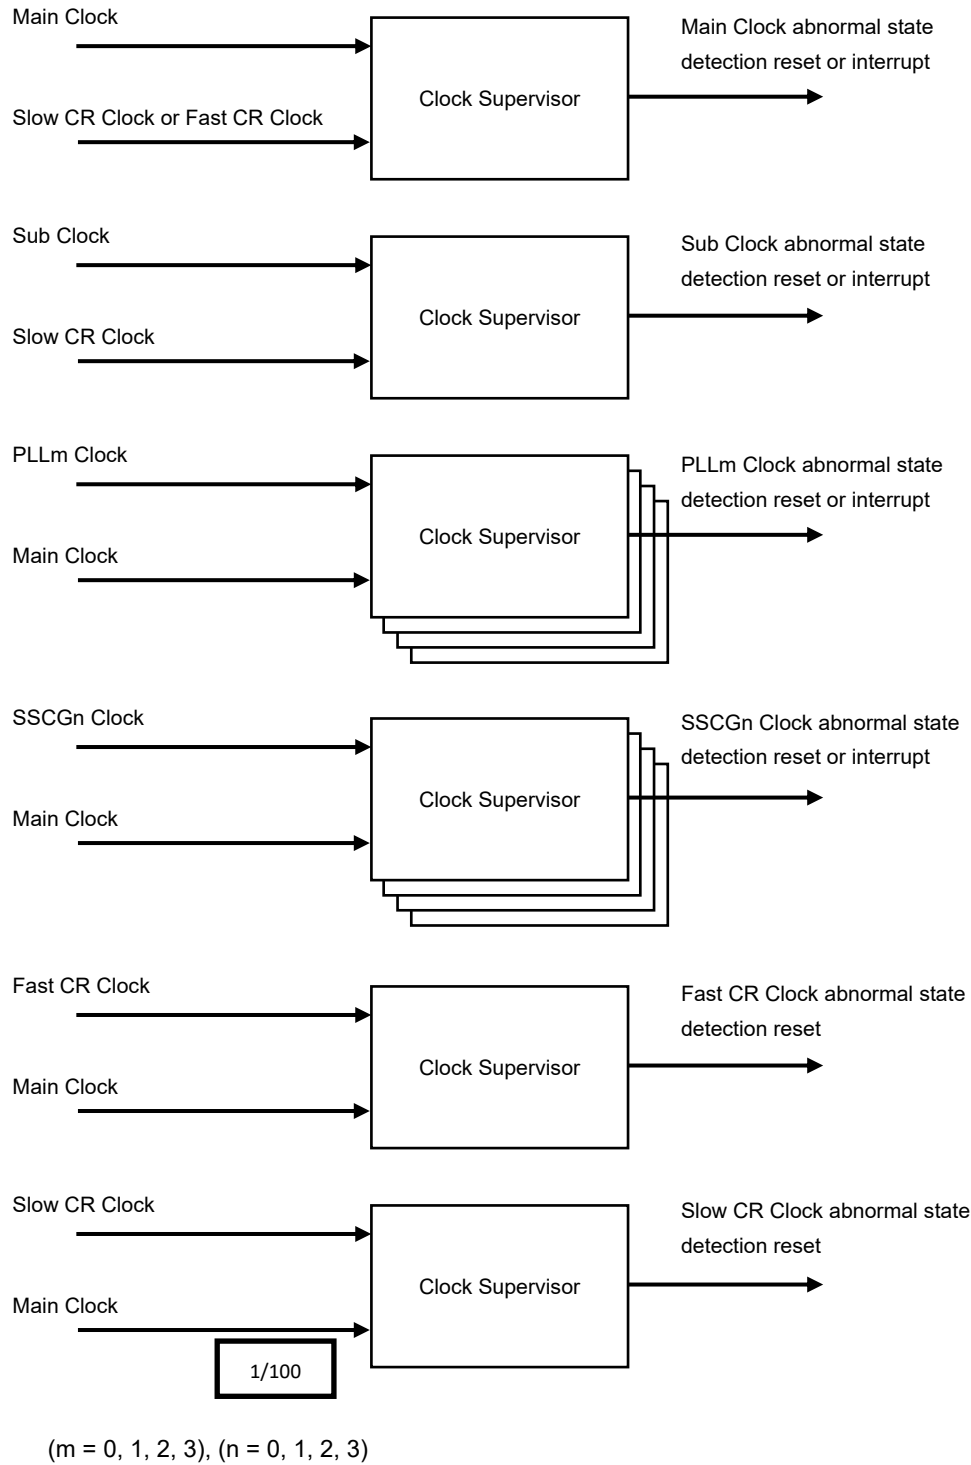

Table 1-1 Overview of Clock Supervisor Instances

Monitored Clock	Reference Clock	Clock Supervisor Type
Main clock	Selection from Fast CR clock or Slow CR clock	Detector for stopped clock or abnormal frequency of the monitored clock
Sub clock	Slow CR clock	
PLL0 clock	Main clock	
PLL1 clock	Main clock	
PLL2 clock	Main clock	
PLL3 clock	Main clock	
SSCG0 clock	Main clock	
SSCG1 clock	Main clock	
SSCG2 clock	Main clock	
SSCG3 clock	Main clock	
Fast CR clock	Main clock	Detector for stopped clock only.
Slow CR clock	Main clock divided by 100	

2. Configuration

The following figure is a block diagram of the clock supervisor.

Figure 2-1: Clock Supervisor Configuration

Main Clock Supervisor

- Main clock supervisor can detect stop or frequency range abnormality of the main clock.
- The reference clock is the Fast CR clock or the Slow CR clock.
- Upon detecting an abnormality of the main clock, the supervisor generates a reset or interrupt.

Sub Clock Supervisor

- Sub clock supervisor can detect stop or frequency range abnormality of the sub clock.
- The reference clock is the Slow CR clock.
- Upon detecting an abnormality of the sub clock, the supervisor generates a reset or interrupt.

PLLm Clock Supervisor

- The PLLm clock supervisor can detect stop or frequency range abnormality of the PLLm clock.
- The reference clock is the main clock.
- Upon detecting an abnormality of the PLLm clock, the supervisor generates a reset or interrupt.

SSCG PLLn Clock Supervisor

- The SSCG clock supervisor can detect stop or frequency range abnormality of the SSCG clock.
- The reference clock is the main clock.
- Upon detecting an abnormality of the SSCG clock, the supervisor generates a reset or interrupt.

Fast CR Clock Supervisor

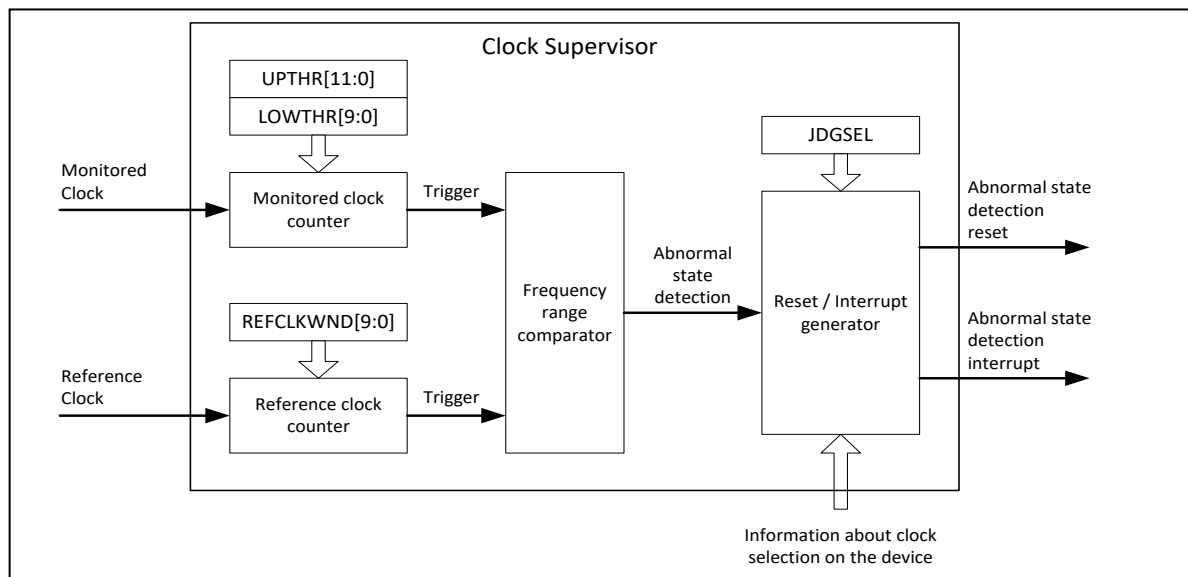

- The Fast CR clock supervisor can detect stop of the Fast CR clock.
- The reference clock is the main clock.
- Upon detecting an abnormality of the Fast CR clock, the supervisor generates a reset.

Slow CR Clock Supervisor

- The Slow CR clock supervisor can detect stop of the Slow CR clock.
- The reference clock uses the clock divided by 100 of the main clock.
- Upon detecting an abnormality of the Slow CR clock, the supervisor generates a reset.

2.1. Detector for Stopped Clock or Abnormal Frequency of the Monitored Clock

Figure 2-2: Block Diagram of Clock Supervisor for stopped clock or abnormal frequency of the monitored clock

Monitored Clock Counter

There are 2 down counters for counting with the monitored clock. The counters load the values that are set in the upper-limit threshold value bits (UPTHR[11:0]) and lower-limit threshold value bits (LOWTHR[9:0]), and count down. When a counter value reaches "0", the counter sends a trigger to the frequency range comparator to make a comparison. The counter reloads the register values and restarts counting down when the frequency comparator makes the comparison.

Reference Clock Counter

There is a down counter for counting with the reference clock. The counter loads the value that is set in the reference clock count period bits (REFCLKWND[9:0]), and counts down. When the counter value reaches "0", the counter sends a trigger to the frequency range comparator to make a comparison. The counter reloads the register value and restarts counting down when the frequency range comparator makes the comparison.

Frequency Range Comparator

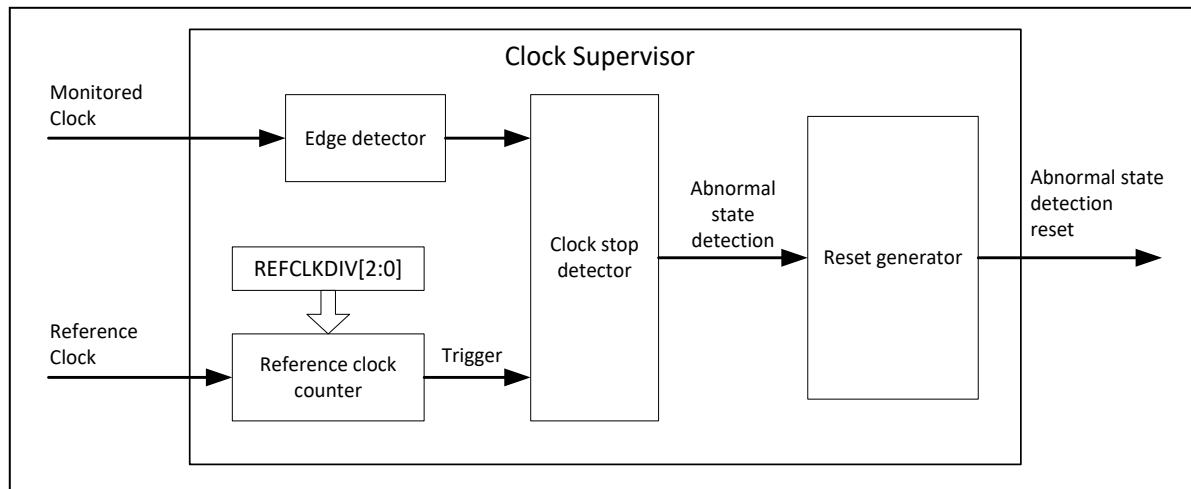

The frequency range comparator compares frequency ranges according to triggers from the monitored clock counters and reference clock counter. The lower-limit threshold value bits (LOWTHR[9:0]) and upper-limit threshold value bits (UPTHR[11:0]) of the monitored clock counters set a frequency range. The comparator judges a range outside this frequency range to be an abnormality.

Reset/Interrupt Generator

Upon detecting an abnormality of a clock, the reset/interrupt generator determines whether to generate a reset or interrupt according to the use status of the monitored clock.

2.2. Detector for Stopped Clock Only

Figure 2-3: Block Diagram of Detector for Stopped Clock Only

Reference Clock Counter

There is a counter for counting with the reference clock. The counter divides the reference clock according to the setting value of the reference clock divide setting (REFCLKDIV[2:0]),

Edge detection

The edge detection detects the rising edge of the monitored clock.

Clock stop Detection Judgment

The clock stop detection judgment judges the presence of rising edge of the monitored clock within the period of the clock that is divided by the reference clock. It judges as normal when it detects a rising edge.

It judges as abnormal when it cannot detect a rising edge.

Reset Generator

Upon detecting an abnormality of a clock, the reset generator generates a reset.

3. Explanation of Operation

This section explains the operation of the clock supervisor.

Main Clock Supervisor

- Main clock supervisor setting register 0 (SYSC_CSMOCFGR0) and main clock supervisor setting register 1 (SYSC_CSMOCFGR1) are used for settings.
- Reset generation or interrupt generation can be selected with the judgment selection bit (JDGSEL).
- Upon detecting an abnormality of the main clock and generating a reset, the main clock supervisor can confirm it with the main clock supervisor reset detection bit (CSVMOR) in the user reset factor register (SYSC_RSTCAUSEUR).
- Upon detecting an abnormality of the main clock and generating an interrupt, the main clock supervisor sets the MOSCIF bit in system error interrupt factor register 0 (SYSC0_SYSERRIR0).

Sub Clock Supervisor

- Sub clock supervisor setting register 0 (SYSC_CSVSOCFGR0) and sub clock supervisor setting register 1 (SYSC_CSVSOCFGR1) are used for settings.
- Reset generation or interrupt generation can be selected with the judgment selection bit (JDGSEL).
- Upon detecting an abnormality of the sub clock and generating a reset, the sub clock supervisor can confirm it with the sub clock supervisor reset detection bit (CSVSOR) in the user reset factor register (SYSC_RSTCAUSEUR).
- Upon detecting an abnormality of the sub clock and generating an interrupt, the sub clock supervisor sets the SOSCIF bit in system error interrupt factor register 0 (SYSC0_SYSERRIR0).

PLL Clock Supervisor

- PLLm clock supervisor setting register 0 (SYSC_CSVPLLmCFGR0) and PLLm clock supervisor setting register 1 (SYSC_CSVPLLmCFGR1) are used for settings.
- In case of PLL0, If PLL0 clock is selected for clock domain 0 or MCUC clock domain when abnormal state is detected by CSV, CSV generates a reset. CSV generates an interrupt under other conditions.
- In case of PLL1, PLL2 or PLL3, reset generation or interrupt generation can be selected with the judgment selection bit (JDGSEL).
- Upon detecting an abnormality of the PLL clock and generating a reset, the PLL clock supervisor can confirm it with the PLL clock supervisor reset detection bit (CSVPR) in the user reset factor register (SYSC_RSTCAUSEUR).
- Upon detecting an abnormality of the PLL clock and generating an interrupt, the PLL clock supervisor sets the PLLmIF bit in system error interrupt factor register 0 (SYSC0_SYSERRIR0).

SSCG PLL Clock Supervisor

- SSCG PLLn clock supervisor setting register 0 (SYSC_CSVSPnCFGR0) and SSCG PLLn clock supervisor setting register 1 (SYSC_CSVSPnCFGR1) are used for settings.
- In case of PLL0, If SSCG clock is selected for clock domain 0 or MCUC clock domain when abnormal state is detected by CSV, CSV generates a reset. CSV generates an interrupt under other conditions.
- In case of SSCG1, SSCG2 or SSCG3, reset generation or interrupt generation can be selected with the judgment selection bit (JDGSEL).
- Upon detecting an abnormality of the SSCG PLL clock and generating a reset, the SSCG PLL clock supervisor can confirm it with the SSCG PLL clock supervisor reset detection bit (CSVSR) in the user reset factor register (SYSC_RSTCAUSEUR).
- Upon detecting an abnormality of the SSCG PLL clock and generating an interrupt, the SSCG PLL clock supervisor sets the SSCGnIF bit in system error interrupt factor register 0 (SYSC0_SYSERRIR0).

Fast CR Clock Supervisor

- Fast CR clock supervisor setting register (SYSC_CSVFCRCFGR) is used for settings.
- Upon detecting an abnormality of the Fast CR clock and generating a reset, the Fast CR clock supervisor can confirm it with the Fast CR clock supervisor reset detection bit (CSVFCRR) in the user reset factor register (SYSC_RSTCAUSEUR).

Slow CR Clock Supervisor

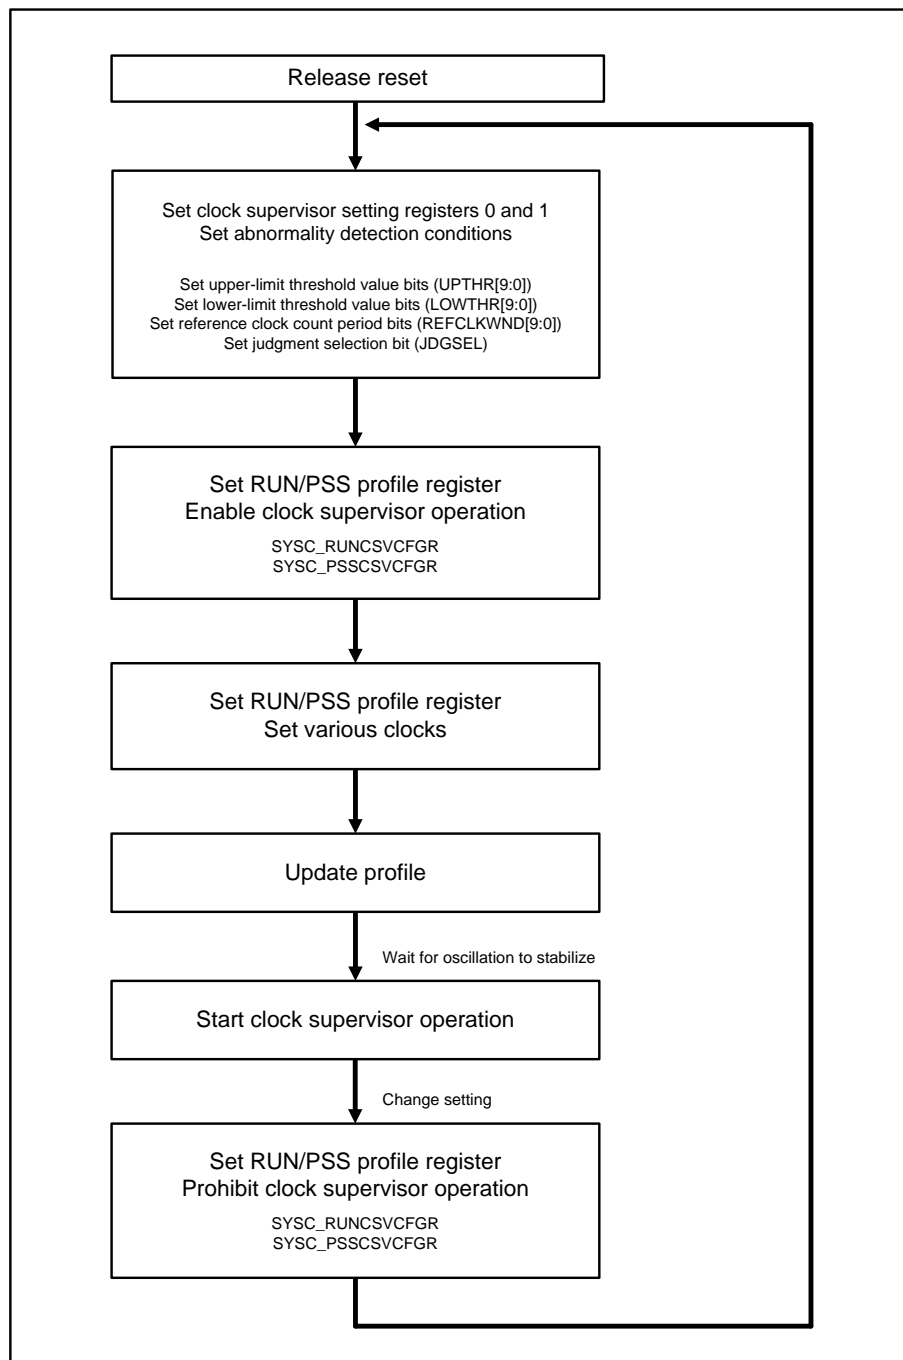

- Slow CR clock supervisor setting register (SYSC_CSVSCRCFGR) is used for settings.
- Upon detecting an abnormality of the Slow CR clock and generating a reset, the Slow CR clock supervisor can confirm it with the Slow CR clock supervisor reset detection bit (CSVSCRR) in the user reset factor register (SYSC_RSTCAUSEUR).

4. Setting Procedure Example

This section shows an example of the clock supervisor setting procedure.

The following figure shows an example of the clock supervisor setting procedure.

Figure 4-1 Example of Clock Supervisor Setting Procedure

Note:

- For details on clock settings, see the following chapters: "CLOCK SYSTEM" and "LOW POWER CONSUMPTION."

- After the hard reset is released, all clock supervisors are in the operation disabled state.
- Profile settings are used to enable/disable the main clock supervisor and PLL clock supervisor. Any violation in the profile settings is judged to be a profile error.
- For details on profile errors, see the following chapter: "LOW POWER CONSUMPTION."
- The clock supervisor does not operate until monitored clock and reference clock oscillation have stabilized.
- The clock supervisor can detect artificially the clock abnormality detection state by gating the monitored clock for self-testing.

5. Registers

This section lists the clock supervisor registers.

The clock supervisor registers are as follows:

These registers are subject to the SYSC0 protection register.

The response to any writing done to reserved bit is a bus error.

- RUN profile registers
- PSS profile registers
- APP profile registers
- STS profile registers
- CSV configuration register group

For details on the RUN profile registers, PSS profile registers, APP profile registers, and STS profile registers, see the following chapter: "LOW POWER CONSUMPTION."

Table 5-1 List of Clock Supervisor Registers (CSV Configuration Registers)

Abbreviated Register Name	Register Name	Reference
SYSC_CSVMOCFGR0	Main clock supervisor setting register 0	5.1
SYSC_CSVMOCFGR1	Main clock supervisor setting register 1	5.2
SYSC_CSVSOCFGR0	Sub clock supervisor setting register 0	5.3
SYSC_CSVSOCFGR1	Sub clock supervisor setting register 1	5.4
SYSC_CSVPLL0CFGR0	PLL0 clock supervisor setting register 0	5.5
SYSC_CSVPLL0CFGR1	PLL0 clock supervisor setting register 1	5.6
SYSC_CSVPLL1CFGR0	PLL1 clock supervisor setting register 0	5.5

5.1. Main Clock Supervisor Setting Register 0 (SYSC_CSMOCFGR0)

Main clock supervisor setting register 0 (SYSC_CSMOCFGR0) sets the upper-limit threshold value and lower-limit threshold value of a frequency range.

Bit	31	30	29	28	27	26	25	24
Field	Reserved				UPTHR[11:8]			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

Bit	23	22	21	20	19	18	17	16
Field	UPTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved						LOWTHR[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	LOWTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:28] Reserved: Reserved bits

[bit27:16] UPTHR[11:0]: Upper-limit threshold value bits

These bits set the clock upper-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value exceeds the upper-limit threshold value, the state is judged as abnormal.

[bit15:10] Reserved: Reserved bits

[bit9:0] LOWTHR[9:0]: Lower-limit threshold value bits

These bits set the clock lower-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value falls below the lower-limit threshold value, the state is judged as abnormal.

Notes:

- *This register must not be modified during operation of the main clock supervisor. The response to any writing done here is a bus error.*
- *For the lower-limit threshold value bits (LOWTHR), set a value larger than that obtained from dividing the reference clock cycle by the monitored clock cycle.*
- *Set the upper-limit threshold value bit (UPTHR) value to be greater than the lower-limit threshold value bit (LOWTHR) value.*

5.2. Main Clock Supervisor Setting Register 1 (SYSC_CSVMOFCGR1)

Main clock supervisor setting register 1 (SYSC_CSVMOFCGR1) can set a reference clock count period. It can also select whether to generate a reset or interrupt at the abnormal state detection time.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							REFCLKSEL
R/W Attribute	R0, WX							R/W
Protection Attribute	WPS							
Initial Value	0000000							0

Bit	23	22	21	20	19	18	17	16
Field	Reserved							JDGSEL
R/W Attribute	R0, WX							R/W
Protection Attribute	WPS							
Initial Value	0000000							0

Bit	15	14	13	12	11	10	9	8
Field	Reserved						REFCLKWND[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	REFCLKWND[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:25] Reserved: Reserved bits

[bit24] REFCLKSEL: Reference clock selection bit

The reference clock can be selected with this bit.

Bit	Description
0	Slow CR clock
1	Fast CR clock

[bit23:17] Reserved: Reserved bits

[bit16] JDGSEL: Judgment selection bit

This bit selects a reset condition when abnormal state is detected by CSV.

Bit	Description
0	Main clock is selected for clock domain 0 or for MCUC clock domain or for software watchdog timer.
1	Main clock is selected for clock domain 0 or for MCUC clock domain.

- *If it is not the above condition when an abnormal state is detected by CSV. CSV generates interrupt.*

[bit15:10] Reserved: Reserved bits**[bit9:0] REFCLKWND[9:0]: Reference clock Count period bits**

These bits set the reference clock count value used to trigger a comparison by the frequency range comparator.

Note:

- *This register must not be modified during operation of the main clock supervisor. The response to any writing done here is a bus error.*

5.3. Sub Clock Supervisor Setting Register 0 (SYSC_CSVSOCFGR0)

Sub clock supervisor setting register 0 (SYSC_CSVSOCFGR0) sets the upper-limit threshold value and lower-limit threshold value of a frequency range.

Bit	31	30	29	28	27	26	25	24
Field	Reserved				UPTHR[11:8]			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

Bit	23	22	21	20	19	18	17	16
Field	UPTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved						LOWTHR[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	LOWTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:28] Reserved: Reserved bits

[bit27:16] UPTHR[11:0]: Upper-limit threshold value bits

These bits set the clock upper-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value exceeds the upper-limit threshold value, the state is judged as abnormal.

[bit15:10] Reserved: Reserved bits

[bit9:0] LOWTHR[9:0]: Lower-limit threshold value bits

These bits set the clock lower-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value falls below the lower-limit threshold value, the state is judged as abnormal.

Notes:

- *This register must not be modified during operation of the sub clock supervisor. The response to any writing done here is a bus error.*
- *For the lower-limit threshold value bits (LOWTHR), set a value larger than that obtained from dividing the reference clock cycle by the monitored clock cycle.*
- *Set the upper-limit threshold value bit (UPTHR) value to be greater than the lower-limit threshold value bit (LOWTHR) value.*

5.4. Sub Clock Supervisor Setting Register 1 (SYSC_CSVSOCFGR1)

Sub clock supervisor setting register 1 (SYSC_CSVSOCFGR1) can set a reference clock count period. It can also select whether to generate a reset or interrupt at the abnormal state detection time.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							JDGSEL
R/W Attribute	R0,WX							R/W
Protection Attribute	WPS							
Initial Value	00000000							0

Bit	15	14	13	12	11	10	9	8
Field	Reserved						REFCLKWND[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	REFCLKWND[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:17] Reserved: Reserved bits

[bit16] JDGSEL: Judgment selection bit

This bit selects a reset condition when abnormal state is detected by CSV.

Bit	Description
0	Sub clock is selected for clock domain 0 or for MCUC clock domain or for software watchdog timer.
1	Sub clock is selected for clock domain 0 or for MCUC clock domain.

- If it is not the above condition when an abnormal state is detected by CSV, CSV generates interrupt.

[bit15:10] Reserved: Reserved bits

[bit9:0] REFCLKWND[9:0]: Reference clock count period bits

These bits set the reference clock cycle used to trigger a comparison by the frequency range comparator.

Note:

- *This register must not be modified during operation of the sub clock supervisor. The response to any writing done here is a bus error.*

5.5. PLLm Clock Supervisor Setting Register 0 (SYSC_CSVPLLmCFGR0)

PLLm clock supervisor setting register 0 (SYSC_CSVPLLmCFGR0) sets the upper-limit threshold value and lower-limit threshold value of a frequency range.

Bit	31	30	29	28	27	26	25	24
Field	Reserved				UPTHR[11:8]			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

Bit	23	22	21	20	19	18	17	16
Field	UPTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved						LOWTHR[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	LOWTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:28] Reserved: Reserved bits

[bit27:16] UPTHR[11:0]: Upper-limit threshold value bits

These bits set the clock upper-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value exceeds the upper-limit threshold value, the state is judged as abnormal.

[bit15:10] Reserved: Reserved bits

[bit9:0] LOWTHR[9:0]: Lower-limit threshold value bits

These bits set the clock lower-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value falls below the lower-limit threshold value, the state is judged as abnormal.

Notes:

- *This register must not be modified during operation of the PLL clock supervisor. The response to any writing done here is a bus error.*
- *For the lower-limit threshold value bits (LOWTHR), set a value larger than that obtained from dividing the reference clock cycle by the monitored clock cycle.*
- *Set the upper-limit threshold value bit (UPTHR) value to be greater than the lower-limit threshold value bit (LOWTHR) value.*

5.6. PLLm Clock Supervisor Setting Register 1 (SYSC_CSVPLLmCFGR1)

PLLm clock supervisor setting register 1 (SYSC_CSVPLLmCFGR1) sets a reference clock count period.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							JDGSEL
R/W Attribute	R0,WX							R/W
Protection Attribute	WPS							
Initial Value	00000000							0

Bit	15	14	13	12	11	10	9	8
Field	Reserved						REFCLKWND[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	REFCLKWND[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:17] Reserved: Reserved bits

[bit16] JDGSEL: Judgment selection bit

This bit selects a reset condition when abnormal state is detected by CSV.

Bit	Description
0	Main clock is selected for clock domain 0 , MCUC clock domain or software watchdog timer.
1	Main clock is selected for clock domain 0 or MCUC clock domain

- If it is not the above condition when an abnormal state is detected by CSV, CSV generates interrupt.

[bit15:10] Reserved: Reserved bits**[bit9:0] REFCLKWND[9:0]: Reference clock count period bits**

These bits set the reference clock count value used to trigger a comparison by the frequency range comparator.

Note:

- *This register must not be modified during operation of the PLL clock supervisor. The response to any writing done here is a bus error.*

5.7. SSCG PLLn Clock Supervisor Setting Register 0 (SYSC_CSVSPnCFGR0)

SSCG PLLn clock supervisor setting register 0 (SYSC_CSVSPnCFGR0) sets the upper-limit threshold value and lower-limit threshold value of a frequency range.

Bit	31	30	29	28	27	26	25	24
Field	Reserved				UPTHR[11:8]			
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0000			

Bit	23	22	21	20	19	18	17	16
Field	UPTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved						LOWTHR[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	LOWTHR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:28] Reserved: Reserved bits

[bit27:16] UPTHR[11:0]: Upper-limit threshold value bits

These bits set the clock upper-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value exceeds the upper-limit threshold value, the state is judged as abnormal.

[bit15:10] Reserved: Reserved bits

[bit9:0] LOWTHR[9:0]: Lower-limit threshold value bits

These bits set the clock lower-limit threshold value for comparison with the monitored clock count value. If the monitored clock counter value falls below the lower-limit threshold value, the state is judged as abnormal.

Notes:

- *This register must not be modified during operation of the SSCG PLL clock supervisor. The response to any writing done here is a bus error.*
- *For the lower-limit threshold value bits (LOWTHR), set a value larger than that obtained from dividing the reference clock cycle by the monitored clock cycle.*
- *Set the upper-limit threshold value bit (UPTHR) value to be greater than the lower-limit threshold value bit (LOWTHR) value.*

5.8. SSCG PLLn Clock Supervisor Setting Register 1 (SYSC_CSVSPnCFGR1)

SSCG PLLn clock supervisor setting register 1 (SYSC_CSVSPnCFGR1) can set a reference clock count period. It can also select whether to generate a reset or interrupt at the abnormal state detection time.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							JDGSEL
R/W Attribute	R0,WX							R/W
Protection Attribute	WPS							
Initial Value	00000000							0

Bit	15	14	13	12	11	10	9	8
Field	Reserved						REFCLKWND[9:8]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	7	6	5	4	3	2	1	0
Field	REFCLKWND[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:17] Reserved: Reserved bits

[bit16] JDGSEL: Judgment selection bit

This bit selects a reset condition when abnormal state is detected by CSV.

Bit	Description
0	Main clock is selected for clock domain 0 , MCUC clock domain or software watchdog timer.
1	Main clock is selected for clock domain 0 or MCUC clock domain

- If it is not the above condition when an abnormal state is detected by CSV, CSV generates interrupt.

[bit15:10] Reserved: Reserved bits**[bit9:0] REFCLKWND[9:0]: Reference clock count period bits**

These bits set the reference clock cycle used to trigger a comparison by the frequency range comparator.

Note:

- *This register must not be modified during operation of the SSCG PLL clock supervisor. The response to any writing done here is a bus error.*

5.9. Fast CR Clock Supervisor Setting Register (SYSC_CSVFCRCFGR)

Fast CR clock supervisor setting register (SYSC_CSVFCRCFGR) can select a monitored clock division setting. It can also select a reference clock division setting.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	7	6	5	4	3	2	1	0
Field	Reserved					REFCLKDIV[2:0]		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					010		

[bit31:3] Reserved: Reserved bits

[bit2:0] REFCLKDIV[2:0]: Reference clock division setting bits

The judgment trigger signal divided from the reference clock is input to the clock stop detection circuit. These bits set the division value of the judgment trigger signal.

Bits	Description
000	Divided by 4
001	Divided by 8
010	Divided by 16 (initial value)
011	Divided by 32
100	Divided by 64
others	Divided by 128

Note:

- *This register must not be modified during operation of the Fast CR clock supervisor. The response to any writing done here is a bus error.*

5.10. Slow CR Clock Supervisor Setting Register (SYSC_CSVSCRCFGR)

Slow CR clock supervisor setting register (SYSC_CSVSCRCFGR) can select a monitored clock division setting. It can also select a reference clock division setting.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	7	6	5	4	3	2	1	0
Field	Reserved					REFCLKDIV[2:0]		
R/W Attribute	R0,WX					R/W		
Protection Attribute	WPS							
Initial Value	00000					010		

[bit31:3] Reserved: Reserved bits

[bit2:0] REFCLKDIV[2:0]: Reference clock division setting bits

The judgment trigger signal divided from the reference clock is input to the clock stop detection circuit. These bits set the division value of the judgment trigger signal.

Bits	Description
000	Divided by 4
001	Divided by 8
010	Divided by 16 (initial value)
011	Divided by 32
100	Divided by 64
others	Divided by 128

Note:

- *This register must not be modified during operation of the Slow CR clock supervisor. The response to any writing done here is a bus error.*

5.11. Clock Supervisor Output Enable Register (SYSC_CSVOUTER)

The clock supervisor output enable register (SYSC_CSVOUTER) enables output of the abnormality detection bit to a port.

Bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	WPS	
Attribute		
Initial Value	00000000 00000000 00000000	

Bit	7	6	5	4	3	2	1	0
Field	Reserved							OUTEN
R/W Attribute	R0,WX							R/W
Protection	WPS							
Attribute								
Initial Value	00000000							0

[bit31:1] Reserved: Reserved bits

[bit0] OUTEN: Clock supervisor output enable bit

This bit is the enable bit for outputting the abnormality detection bit to a port.

Bit	Description
0	Does not enable output of the abnormality detection bit from a port.
1	Enables output of the abnormality detection bit from a port.

For output ports, see the list of pin functions in "Overview" and the chapter of "I/O PORT."

Note:

- This bit is cleared to "0" by to a power-on reset, an internal power supply low-voltage detection reset, the terminal INITX input reset, a RAM retain low-voltage detection reset and an illegal mode detection reset. It is not affected by other types of reset.

5.12. Clock Supervisor Test Register (SYSC_CSVTESTR)

The clock supervisor test register (SYSC_CSVTESTR) can perform function tests using input clock gating.

Bit	31	30	29	28	27	26	25	24
Field	Reserved						SCRCLK GATE	FCRCLK GATE
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						0	0

Bit	23	22	21	20	19	18	17	16
Field	Reserved				SP3CLK GATE	SP2CLK GATE	SP1CLK GATE	SP0CLK GATE
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	Reserved				PLL3CLK GATE	PLL2CLK GATE	PLL1CLK GATE	PLL0CLK GATE
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	Reserved				SO1CLK GATE	MO1CLK GATE	SO0CLK GATE	MO0CLK GATE
R/W Attribute	R0,WX				R/W			
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

[bit31:26] Reserved: Reserved bits

[bit25] SCRCLKGATE: SCR CR clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit24] FCRCLKGATE: FCR CR clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit23:20] Reserved: Reserved bits
[bit19] SP3CLKGATE: SSCG PLL3 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit18] SP2CLKGATE: SSCG PLL2 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit17] SP1CLKGATE: SSCG PLL1 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit16] SP0CLKGATE: SSCG PLL0 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit15:12] Reserved: Reserved bits
[bit11] PLL3CLKGATE: PLL3 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit10] PLL2CLKGATE: PLL2 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit9] PLL1CLKGATE: PLL1 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit8] PLL0CLKGATE: PLL0 clock supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit7:4] Reserved: Reserved bits**[bit3] SO1CLKGATE: Sub clock 1 supervisor test bit**

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit2] MO1CLKGATE: Main clock 1 supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit1] SO0CLKGATE: Sub clock 0 supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating (clock shutoff)

[bit0] MO0CLKGATE: Main clock 0 supervisor test bit

This bit can be used for function tests using input clock gating.

Bit	Description
0	Normal operation
1	Input clock gating

6. Precautions for Using This Device

This section explains precautions for using the clock supervisor.

- Profile settings are used to enable/disable operations of the clock supervisor. For details on the profile settings, see the following chapter: "LOW POWER CONSUMPTION."
- To operate the clock supervisor, enable oscillation of the monitored clock and reference clock.
- To stop the clock supervisor, simultaneously stop oscillation of the monitored clock.
- After a reset is generated by the detection type clock supervisor of stop or frequency range abnormality of the clock, MCU will operate with FastCR clock. At this time, CSV cause clock must not be selected again. In addition, please disable the enable of the source clock oscillation of the clock that abnormality is detected.
- To protect hardware, clock supervisor setting registers 0 and 1 must not be modified during operation of the clock supervisor. To change either of them, do so only after disabling operation of the clock supervisor. The response to any writing done here is a bus error.

CHAPTER 9: Source Clock Timer

This chapter explains the functions and operations of the source clock timer.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Example
5. Registers
6. Precautions for Using this Device

SCT-TXXPT03P01R01L07-E1-XX

1. Overview

This section provides an overview of the source clock timer.

The source clock timer is a timer for gating the clock output until the end of the clock oscillation stabilization wait time. After the clock oscillation stabilizes, this timer can be used as an ordinary timer. The 4 source clocks are the high-speed CR clock, low-speed CR clock, main clock, and sub clock, and they can be used separately.

High-Speed CR Clock Timer

The high-speed CR clock timer counts the internal high-speed CR clock. This timer is used to count time to wait for the high-speed CR clock oscillation to stabilize.

The high-speed CR clock timer has an oscillation stabilization wait time.

Low-Speed CR Clock Timer

The low-speed CR clock timer counts the internal low-speed CR clock. This timer is used to count time to wait for the low-speed CR clock oscillation to stabilize.

The low-speed CR clock timer has an oscillation stabilization wait time.

Main Clock Timer

The main clock timer counts the main clock. This timer is used to count time to wait for the main clock oscillation to stabilize.

The main clock timer has an initial value for the oscillation stabilization wait time.

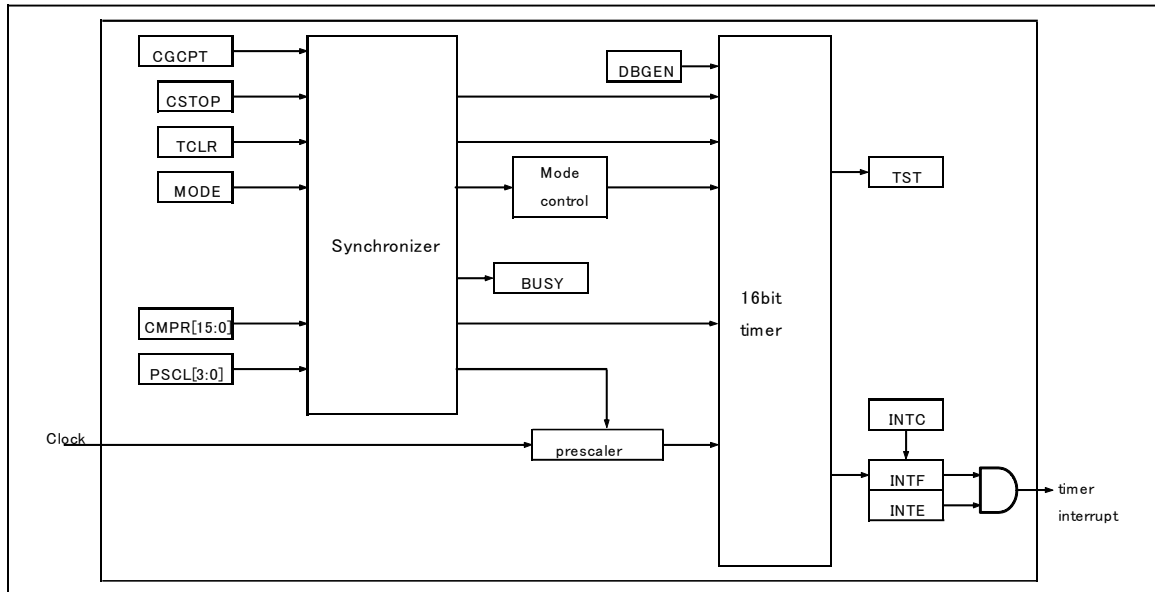

Sub Clock Timer

The sub clock timer counts the sub clock. This timer is used to count time to wait for the sub clock oscillation to stabilize. The sub clock timer has an initial value for the oscillation stabilization wait time.

2. Configuration

This section shows a block diagram of the source clock timer.

Figure 2-1 Block Diagram of Source Clock Timer

Setting Synchronization Block

- The setting synchronization block synchronizes the start of the source clock timer or the resetting of the timer. The timer setting capture bit (CGCPT) is set to "1" to acquire the contents of the timer settings.

Mode Control Block

- The mode control block controls the operation mode of the 16-bit timer.
- The 2 operation modes for the source clock timer are single-shot mode and continuous mode. One of the modes is selected with the mode control bit (MODE).
- Single-shot mode: This mode clears the value to "0x0000" and stops counting up when the count value of the 16-bit timer exceeds the compare value.
- Continuous mode: This mode clears the value to "0x0000" and restarts counting up when the count value of the 16-bit timer exceeds the compare value.
- The mode control bit (MODE) is used to select an operation mode.
- If the debug enable bit (DBGEN) is set to "1", the timer stops when operation stops at a breakpoint during debugging.

Prescaler

- The prescaler divides the input clock. For division, a power of 2 can be selected with the prescale bits (PSCL[3:0]). The range for the selection is from no division (divided by 1) to divided by 32768. The divided clock is supplied to the 16-bit timer.

16-Bit Timer

- The 16-bit timer is configured as a 16-bit counter and 16-bit comparator. This timer counts the clock supplied from the prescaler. The interrupt flag bit (INTF) is set to "1" and the count value is cleared to "0x0000" when the count value exceeds the set value for the compare value bits (CMPR[15:0]).

- In single-shot mode, the interrupt flag bit (INTF) is set to "1" only once. In continuous mode, "1" is set at a regular interval.

3. Explanation of Operation

This section explains the operations of the source clock timer.

Oscillation Stabilization Wait Operation

- Main, Fast-CR and Slow-CR source clock timers start the oscillation stabilization wait operation when a hard reset is released or oscillation is enabled. The source clock timers gate the clock output until the oscillation stabilization wait time ends.
- Sub source clock timer starts the oscillation stabilization wait operation when oscillation is enabled. The source clock timer gates the clock output until the oscillation stabilization wait time ends.
- If data is written to a trigger register, timer compare prescaler register, interrupt enable register, or interrupt clear register during the oscillation stabilization wait operation, release the sequence protection in privileged mode. If the above is not complied with, a bus error is returned.
- During the oscillation stabilization wait operation, the source clock timer operates in single-shot mode.

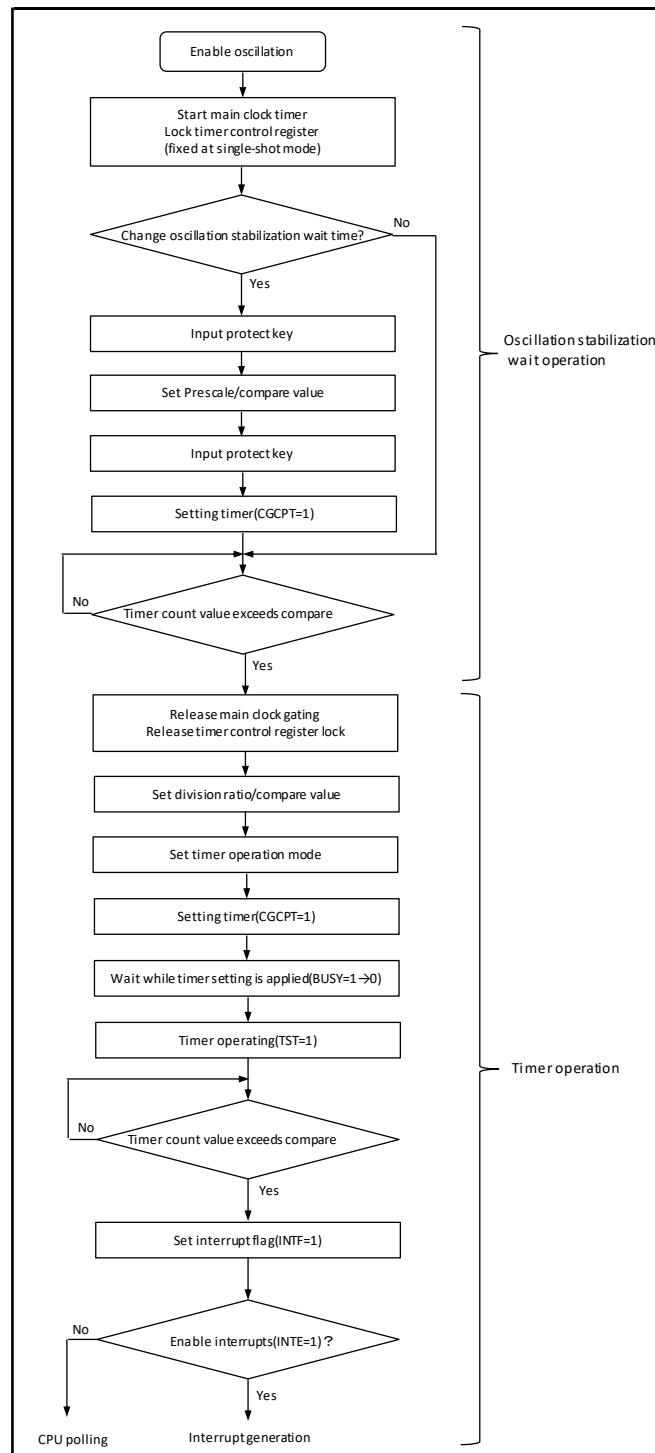

Timer Operation

- After the clock oscillation stabilizes, the source clock timer can be used as an ordinary timer.
- This timer can generate an interrupt within a certain period.

4. Setting Procedure Example

This section shows an example of the source clock timer setting procedure.

Figure 4-1 Example of Main Clock Timer Setting Procedure

5. Registers

This section lists the source clock timer registers.

List of High-Speed CR Clock Timer Registers

Table 5-1 List of High-Speed CR Clock Timer Registers

Abbreviated Register Name	Register Name	Reference
SYSC_FCRCTTRGR	High-speed CR clock timer trigger register	5.1
SYSC_FCRCTCNTR	High-speed CR clock timer control register	5.2
SYSC_FCRCTCPR	High-speed CR clock timer compare prescaler register	5.3
SYSC_FCRCTSTR	High-speed CR clock timer status register	5.4
SYSC_FCRCTINTER	High-speed CR clock timer interrupt enable register	5.5
SYSC_FCRCTICLR	High-speed CR clock timer interrupt clear register	5.6

List of Low-Speed CR Clock Timer Registers

Table 5-2 List of Low-Speed CR Clock Timer Registers

Abbreviated Register Name	Register Name	Reference
SYSC_SCRCTTRGR	Low-speed CR clock timer trigger register	5.7
SYSC_SCRCTCNTR	Low-speed CR clock timer control register	5.8
SYSC_SCRCTCPR	Low-speed CR clock timer compare prescaler register	5.9
SYSC_SCRCTSTR	Low-speed CR clock timer status register	5.10
SYSC_SCRCTINTER	Low-speed CR clock timer interrupt enable register	5.11
SYSC_SCRCTICLR	Low-speed CR clock timer interrupt clear register	5.12

List of Main Clock Timer Registers

Table 5-3 List of Main Clock Timer Registers

Abbreviated Register Name	Register Name	Reference
SYSC_MOCTTRGR	Main clock timer trigger register	5.13
SYSC_MOCTCNTR	Main clock timer control register	5.14
SYSC_MOCTCPR	Main clock timer compare prescaler register	5.15
SYSC_MOCTSTR	Main clock timer status register	5.16
SYSC_MOCTINTER	Main clock timer interrupt enable register	5.17
SYSC_MOCTICLR	Main clock timer interrupt clear register	5.18

List of Sub Clock Timer Registers

Table 5-4 List of Sub Clock Timer Registers

Abbreviated Register Name	Register Name	Reference
SYSC_SOCTTRGR	Sub clock timer trigger register	5.19
SYSC_SOCTCNTR	Sub clock timer control register	5.20
SYSC_SOCTCPR	Sub clock timer compare prescaler register	5.21
SYSC_SOCTSTR	Sub clock timer status register	5.22
SYSC_SOCTINTER	Sub clock timer interrupt enable register	5.23
SYSC_SOCTICLR	Sub clock timer interrupt clear register	5.24

0x0000_000C	SYSC_SOCTSTR 00000000_00000000_00000000_00000000
0x0000_0010	SYSC_SOCTINTER 00000000_00000000_00000000_00000000
0x0000_0014	SYSC_SOCTICLR 00000000_00000000_00000000_00000000

The following tables list the initial values of the compare prescaler registers of the main clock timer and sub clock timer.

Main Oscillation Stabilization Wait Time (at 4 MHz)	Initial Value of SYSC_MOCTCPR
8.19 [ms]	00000000_00000110_00000010_00000000

Sub Oscillation Stabilization Wait Time (at 32 kHz)	Initial Value of SYSC_SOCTCPR
8.0 [ms]	00000000_00000110_00000000_00000100
16.0 [ms]	00000000_00000110_00000000_00001000

Notes:

- The registers are protected by protection key setting register (SYSC0_PROTKEYR). For details on the protection, see the following chapter: "Low-power Consumption."
- Access to reserved address results bus error response.

5.1. High-Speed CR Clock Timer Trigger Register (SYSC_FCRCTTRGR)

The high-speed CR clock timer trigger register (SYSC_FCRCTTRGR) is used to clear the count value of the timer, stop counting, and change the timer settings.

Bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	- (WPS)	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved					TCLR	CSTOP	CGCPT
R/W Attribute	R0,WX					R0,W	R0,W	R0,W
Protection Attribute	- (WPS)							
Initial Value	00000					0	0	0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:3] Reserved: Reserved Bits

[bit2] TCLR: Timer Clear Bit

This bit clears the count value of the high-speed CR clock timer and stops the timer operation.

Bit	Description
0	No effect
1	Clear the timer count.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" clears the count value of the high-speed CR clock timer.

[bit1] CSTOP: Count Stop Bit

This bit stops the counting of the high-speed CR clock timer.

Bit	Description
0	No effect
1	Stop the timer counting.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" stops the high-speed CR clock timer.

[bit0] CGCPT: Timer Setting Capture Bit

This bit is used to change the high-speed CR clock timer settings and to start the timer counting. Setting this bit to "1" causes the high-speed CR clock timer to acquire the changed setting contents.

Bit	Description
0	No effect
1	Change the timer settings. / Start the timer counting.

5.2. High-Speed CR Clock Timer Control Register (SYSC_FCRCTCNTR)

The high-speed CR clock timer control register (SYSC_FCRCTCNTR) selects the operation mode of the timer and sets whether the counter operates or stops during debugging.

Bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved						DBGEN	MODE
R/W Attribute	R0,WX						R/W	R/W
Protection	-							
Attribute								
Initial Value	000000						0	0

[bit31:2] Reserved: Reserved Bits

[bit1] DBGEN: Debug Enable Bit

This bit sets the operation of the high-speed CR clock timer counter during debugging.

Bit	Description
0	Continue the count operation at the breakpoint.
1	Stop the count operation at the breakpoint.

Note:

- This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.

[bit0] MODE: Mode Control Bit

This bit selects the operation mode of the high-speed CR clock timer.

Single-shot mode clears the count and stops the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Continuous mode clears the count and restarts the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Bit	Description
0	Single-shot mode
1	Continuous mode

Notes:

- *Setting the timer setting capture bit (CGCPT) to "1" after this bit is set changes the operation mode of the high-speed CR clock timer.*
- *This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.*

5.3. High-Speed CR Clock Timer Compare Prescaler Register (SYSC_FCRCTCPR)

The high-speed CR clock timer compare prescaler register (SYSC_FCRCTCPR) selects the division ratio of the input clock and sets the compare value of the timer.

Bit	31	24
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000	

bit	23	22	21	20	19	18	17	16
Field	Reserved				PSCL[3:0]			
R/W Attribute	R0,WX				R/W			
Protection Attribute	- (WPS)							
Initial Value	0000				0110			

bit	15	0
Field	CMPR[15:0]	
R/W Attribute	R/W	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00011110	

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:20] Reserved: Reserved Bits

[bit19:16] PSCL[3:0]: Prescale Bits

These bits select the division ratio of the input clock of the high-speed CR clock timer.

Bits				Description
0	0	0	0	No division (divided by 1)
0	0	0	1	Divided by 2
0	0	1	0	Divided by 4
0	0	1	1	Divided by 8
0	1	0	0	Divided by 16
0	1	0	1	Divided by 32
0	1	1	0	Divided by 64
0	1	1	1	Divided by 128
1	0	0	0	Divided by 256
1	0	0	1	Divided by 512
1	0	1	0	Divided by 1024
1	0	1	1	Divided by 2048
1	1	0	0	Divided by 4096
1	1	0	1	Divided by 8192
1	1	1	0	Divided by 16384
1	1	1	1	Divided by 32768

Note:

- Setting the timer setting capture bit (CGCPT) to "1" after these bits are set changes the division ratio of the high-speed CR clock timer.

[bit15:0] CMPR[15:0]: Compare Value Bits

These bits set the compare value of the high-speed CR clock timer.

The interrupt flag bit (INTF) of the high-speed CR clock timer is set to "1" when the count value of the high-speed CR clock timer exceeds the compare value.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" after these bits are set changes the compare value of the high-speed CR clock timer.

Oscillation stabilization wait time of the high-speed CR clock

Prescale PSCL[3:0]	Compare Value CMPR[15:0]	Oscillation Stabilization Wait Time (High-Speed CR Clock Cycle x Prescale Value x Compare Value)
0110 (divided by 64)	0x001E(30)	Product specification

5.4. High-Speed CR Clock Timer Status Register (SYSC_FCRCTSTR)

The high-speed CR clock timer status register (SYSC_FCRCTSTR) indicates the update status of a timer reset, the operation status of the timer, and an interrupt flag.

bit	31											8
Field	Reserved											
R/W Attribute	R0,WX											
Protection Attribute	-											
Initial Value	00000000_00000000_00000000											

bit	7	6	5	4	3	2	1	0
Field	Reserved					BUSY	TST	INTF
R/W Attribute	R0,WX					R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	00000					0	0	0

[bit31:3] Reserved: Reserved Bits

[bit2] BUSY: Setting Update Status Bit

This bit indicates the timer setting update status of the high-speed CR clock timer.

If the timer setting capture bit (CGCPT) is set to "1", this setting value remains "1" until the timer setting update is completed.

Bit	Description
0	Setting completed
1	Setting update in progress

Note:

- Registers other than the interrupt enable register and interrupt clear register of the high-speed CR clock timer must not be changed when the read value of this bit is "1".

[bit1] TST: Timer Status Bit

This bit indicates the operation status of the high-speed CR clock timer.

Bit	Description
0	Timer stopped
1	Timer operating

[bit0] INTF: Interrupt Flag Bit

This bit is the interrupt flag bit of the high-speed CR clock timer.

"1" is set when the high-speed CR clock timer value exceeds the set value in the compare bits (CMPR[15:0]). At this time, if the interrupt enable bit (INTE) is "1", the high-speed CR clock timer generates an interrupt request.

To clear the interrupt flag bit to "0", set the interrupt clear bit (INTC) to "1".

Bit	Description
0	No interrupt factor is detected.
1	An interrupt factor is detected.

Note:

- *This bit can be set only while the timer is operating. It cannot be set during the oscillation stabilization wait operation.*

5.5. High-Speed CR Clock Timer Interrupt Enable Register (SYSC_FCRCTINTER)

The high-speed CR clock timer interrupt enable register (SYSC_FCRCTINTER) sets whether to enable or disable interrupts of the timer.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							INTE
R/W Attribute	R0,WX							R/W
Protection	- (WPS)							
Attribute								
Initial Value	00000000							0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:1] Reserved: Reserved Bits

[bit0] INTE: Interrupt Enable Bit

This bit sets whether to enable or disable interrupts of the high-speed CR clock timer.

Bit	Description
0	Disable interrupts.
1	Enable interrupts.

5.6. High-Speed CR Clock Timer Interrupt Clear Register (SYSC_FCRCTICLR)

The high-speed CR clock timer interrupt clear register (SYSC_FCRCTICLR) clears an interrupt flag to "0".

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							INTC
R/W Attribute	R0,WX							R0,W
Protection	- (WPS)							
Attribute								
Initial Value	00000000							0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:1] Reserved: Reserved Bits

[bit0] INTC: Interrupt Clear Bit

This bit clears the interrupt flag bit (INTF) of the high-speed CR clock timer to "0".

Bit	Description
0	No effect
1	Clear the interrupt flag bit (INTF) to "0".

5.7. Low-Speed CR Clock Timer Trigger Register (SYSC_SCRCTTRGR)

The low-speed CR clock timer trigger register (SYSC_SCRCTTGR) is used to clear the count value of the timer, stop counting, and change the timer settings.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	- (WPS)	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved					TCLR	CSTOP	CGCPT
R/W Attribute	R0,WX					R0,W	R0,W	R0,W
Protection Attribute	- (WPS)							
Initial Value	00000					0	0	0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:3] Reserved: Reserved Bits

[bit2] TCLR: Timer Clear Bit

This bit clears the count value of the low-speed CR clock timer and stops the timer operation.

Bit	Description
0	No effect
1	Clear the timer count.

Note:

- *Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" clears the count value of the low-speed CR clock timer.*

[bit1] CSTOP: Count Stop Bit

This bit stops the counting of the low-speed CR clock timer.

Bit	Description
0	No effect
1	Stop the timer counting.

Note:

- *Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" stops the low-speed CR clock timer.*

[bit0] CGCPT: Timer Setting Capture Bit

This bit is used to change the low-speed CR clock timer settings and to start the timer counting. Setting this bit to "1" causes the low-speed CR clock timer to acquire the changed setting contents.

Bit	Description
0	No effect
1	Change the timer settings. / Start the timer counting.

5.8. Low-Speed CR Clock Timer Control Register (SYSC_SCRCTCNTR)

The low-speed CR clock timer control register (SYSC_SCRCTCNTR) selects the operation mode of the timer and sets whether the counter operates or stops during debugging.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved						DBGEN	MODE
R/W Attribute	R0,WX						R/W	R/W
Protection	-							
Attribute								
Initial Value	000000						0	0

[bit31:2] Reserved: Reserved Bits

[bit1] DBGEN: Debug Enable Bit

This bit sets the operation of the low-speed CR clock timer counter during debugging.

Bit	Description
0	Continue the count operation at the breakpoint.
1	Stop the count operation at the breakpoint.

Note:

- This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.

[bit0] MODE: Mode Control Bit

This bit selects the operation mode of the low-speed CR clock timer.

Single-shot mode clears the count and stops the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Continuous mode clears the count and restarts the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Bit	Description
0	Single-shot mode
1	Continuous mode

Notes:

- *Setting the timer setting capture bit (CGCPT) to "1" after this bit is set changes the operation mode of the low-speed CR clock timer.*
- *This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.*

5.9. Low-Speed CR Clock Timer Compare Prescaler Register (SYSC_SCRCTCPR)

The low-speed CR clock timer compare prescaler register (SYSC_SCRCTCPR) selects the division ratio of the input clock and sets the compare value of the timer.

bit	31	24
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000	

bit	23	22	21	20	19	18	17	16
Field	Reserved				PSCL[3:0]			
R/W Attribute	R0,WX				R/W			
Protection Attribute	- (WPS)							
Initial Value	0000				0110			

bit	15	0
Field	CMPR[15:0]	
R/W Attribute	R/W	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00000001	

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:20] Reserved: Reserved Bits

[bit19:16] PSCL[3:0]: Prescale Bits

These bits select the division ratio of the input clock of the low-speed CR clock timer.

Bits				Description
0	0	0	0	No division (divided by 1)
0	0	0	1	Divided by 2
0	0	1	0	Divided by 4
0	0	1	1	Divided by 8
0	1	0	0	Divided by 16
0	1	0	1	Divided by 32
0	1	1	0	Divided by 64
0	1	1	1	Divided by 128
1	0	0	0	Divided by 256
1	0	0	1	Divided by 512
1	0	1	0	Divided by 1024
1	0	1	1	Divided by 2048
1	1	0	0	Divided by 4096
1	1	0	1	Divided by 8192
1	1	1	0	Divided by 16384
1	1	1	1	Divided by 32768

Note:

- Setting the timer setting capture bit (CGCPT) to "1" after these bits are set changes the division ratio of the low-speed CR clock timer.

[bit15:0] CMPR[15:0]: Compare Value Bits

These bits set the compare value of the low-speed CR clock timer.

The interrupt flag bit (INTF) is set to "1" when the count value of the low-speed CR clock timer exceeds the compare value.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" after these bits are set changes the compare value of the low-speed CR clock timer.

Oscillation stabilization wait time of the low-speed CR clock

Prescale PSCL[3:0]	Compare Value CMPR[15:0]	Oscillation Stabilization Wait Time (Low-Speed CR Clock Cycle x Prescale Value x Compare Value)
0110 (divided by 64)	0x0001(1)	Product specification

5.10. Low-Speed CR Clock Timer Status Register (SYSC_SCRCTSTR)

The low-speed CR clock timer status register (SYSC_SCRCTSTR) indicates the update status of a timer reset, the operation status of the timer, and an interrupt flag.

bit	31													8
Field	Reserved													
R/W Attribute	R0,WX													
Protection	-													
Attribute														
Initial Value	00000000_00000000_00000000													

bit	7	6	5	4	3	2	1	0
Field	Reserved					BUSY	TST	INTF
R/W Attribute	R0,WX					R,WX	R,WX	R,WX
Protection	-							
Attribute								
Initial Value	00000					0	0	0

[bit31:3] Reserved: Reserved Bits

[bit2] BUSY: Setting Update Status Bit

This bit indicates the setting update status of the low-speed CR clock timer.

If the timer setting capture bit (CGCPT) is set to "1", this setting value remains "1" until the timer setting update is completed.

Bit	Description
0	Setting completed
1	Setting update in progress

Note:

- Registers other than the interrupt enable register and interrupt clear register of the low-speed CR clock timer must not be changed when the read value of this bit is "1".

[bit1] TST: Timer Status Bit

This bit indicates the operation status of the low-speed CR clock timer.

Bit	Description
0	Timer stopped
1	Timer operating

[bit0] INTF: Interrupt Flag Bit

This bit is the interrupt flag bit of the low-speed CR clock timer.

"1" is set when the low-speed CR clock timer value exceeds the set value in the compare bits (CMPR[15:0]). At this time, if the interrupt enable bit (INTE) is "1", the low-speed CR clock timer generates an interrupt request.

To clear the interrupt flag bit to "0", set the interrupt clear bit (INTC) to "1".

Bit	Description
0	No interrupt factor is detected.
1	An interrupt factor is detected.

Note:

- *This bit can be set only while the timer is operating. It cannot be set during the oscillation stabilization wait operation.*

5.11. Low-Speed CR Clock Timer Interrupt Enable Register (SYSC_SCRCTINTER)

The low-speed CR clock timer interrupt enable register (SYSC_SCRCTINTER) sets whether to enable or disable interrupts of the timer.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							INTE
R/W Attribute	R0,WX							R/W
Protection	- (WPS)							
Attribute								
Initial Value	00000000							0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:1] Reserved: Reserved Bits

[bit0] INTE: Interrupt Enable Bit

This bit sets whether to enable or disable interrupts of the low-speed CR clock timer.

Bit	Description
0	Disable interrupts.
1	Enable interrupts.

5.12. Low-Speed CR Clock Timer Interrupt Clear Register (SYSC_SCRCTICLR)

The low-speed CR clock timer interrupt clear register (SYSC_SCRCTICLR) clears an interrupt flag to "0".

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							INTC
R/W Attribute	R0,WX							R0,W
Protection	- (WPS)							
Attribute								
Initial Value	00000000							0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:1] Reserved: Reserved Bits

[bit0] INTC: Interrupt Clear Bit

This bit clears the interrupt flag bit (INTF) of the low-speed CR clock timer to "0".

Bit	Description
0	No effect
1	Clear the interrupt flag bit (INTF) to "0".

5.13. Main Clock Timer Trigger Register (SYSC_MOCTTRGR)

The main clock timer trigger register (SYSC_MOCTTRGR) is used to clear the count value of the timer, stop counting, and change the timer settings.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	- (WPS)	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved					TCLR	CSTOP	CGCPT
R/W Attribute	R0,WX					R0,W	R0,W	R0,W
Protection Attribute	- (WPS)							
Initial Value	00000					0	0	0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:3] Reserved: Reserved Bits

[bit2] TCLR: Timer Clear Bit

This bit clears the count value of the main clock timer and stops the timer operation.

Bit	Description
0	No effect
1	Clear the timer count.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" clears the count value of the main clock timer.

[bit1] CSTOP: Count Stop Bit

This bit stops the counting of the main clock timer.

Bit	Description
0	No effect
1	Stop the timer counting.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" stops the main clock timer.

[bit0] CGCPT: Timer Setting Capture Bit

This bit is used to change the main clock timer settings and to start the timer counting. Setting this bit to "1" causes the main clock timer to acquire the changed setting contents.

Bit	Description
0	No effect
1	Change the timer settings. / Start the timer counting.

5.14. Main Clock Timer Control Register (SYSC_MOCTCNTR)

The main clock timer control register (SYSC_MOCTCNTR) selects the operation mode of the timer and sets whether the counter operates or stops during debugging.

bit	31											8
Field	Reserved											
R/W Attribute	R0,WX											
Protection	-											
Attribute												
Initial Value	00000000_00000000_00000000											

bit	7	6	5	4	3	2	1		0	
Field	Reserved						DBGEN		MODE	
R/W Attribute	R0,WX						R/W		R/W	
Protection	-									
Attribute										
Initial Value	000000						0		0	

[bit31:2] Reserved: Reserved Bits

[bit1] DBGEN: Debug Enable Bit

This bit sets the operation of the main clock timer counter during debugging.

Bit	Description
0	Continue the count operation at the breakpoint.
1	Stop the count operation at the breakpoint.

Note:

- This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.

[bit0] MODE: Mode Control Bit

This bit selects the operation mode of the main clock timer.

Single-shot mode clears the count and stops the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Continuous mode clears the count and restarts the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Bit	Description
0	Single-shot mode
1	Continuous mode

Notes:

- *Setting the timer setting capture bit (CGCPT) to "1" after this bit is set changes the operation mode of the main clock timer.*
- *This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.*

5.15. Main Clock Timer Compare Prescaler Register (SYSC_MOCTCPR)

The main clock timer compare prescaler register (SYSC_MOCTCPR) selects the division ratio of the input clock and sets the compare value of the timer.

bit	31	24
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000	

bit	23	22	21	20	19	18	17	16
Field	Reserved				PSCL[3:0]			
R/W Attribute	R0,WX				R/W			
Protection Attribute	- (WPS)							
Initial Value	0000				0110			

bit	15	0
Field	CMPR[15:0]	
R/W Attribute	R/W	
Protection	- (WPS)	
Attribute		
Initial Value	00000010_00000000	

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:20] Reserved: Reserved Bits

[bit19:16] PSCL[3:0]: Prescale Bits

These bits select the division ratio of the input clock of the main clock timer.

Bits				Description
0	0	0	0	No division (divided by 1)
0	0	0	1	Divided by 2
0	0	1	0	Divided by 4
0	0	1	1	Divided by 8
0	1	0	0	Divided by 16
0	1	0	1	Divided by 32
0	1	1	0	Divided by 64
0	1	1	1	Divided by 128
1	0	0	0	Divided by 256
1	0	0	1	Divided by 512
1	0	1	0	Divided by 1024
1	0	1	1	Divided by 2048
1	1	0	0	Divided by 4096
1	1	0	1	Divided by 8192
1	1	1	0	Divided by 16384
1	1	1	1	Divided by 32768

Note:

- Setting the timer setting capture bit (CGCPT) to "1" after these bits are set changes the division ratio of the main clock timer.

[bit15:0] CMPR[15:0]: Compare Value Bits

These bits set the compare value of the main clock timer.

The interrupt flag bit (INTF) is set to "1" when the count value of the main clock timer exceeds the compare value.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" after these bits are set changes the compare value of the main clock timer.

Oscillation stabilization wait time of the main clock

Prescale PSCL[3:0]	Compare Value CMPR[15:0]	Oscillation Stabilization Wait Time (Main Clock Cycle x Prescale Value x Compare Value)
0110 (divided by 64)	0x0200(512)	8.19 [ms]

5.16. Main Clock Timer Status Register (SYSC_MOCTSTR)

The main clock timer status register (SYSC_MOCTSTR) indicates the update status of a timer reset, the operation status of the timer, and an interrupt flag.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved					BUSY	TST	INTF
R/W Attribute	R0,WX					R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	00000					0	0	0

[bit31:3] Reserved: Reserved Bits

[bit2] BUSY: Setting Update Status Bit

This bit indicates the setting update status of the main clock timer.

If the timer setting capture bit (CGCPT) is set to "1", this setting value remains "1" until the timer setting update is completed.

Bit	Description
0	Setting completed
1	Setting update in progress

Note:

- *Registers other than the interrupt enable register and interrupt clear register of the main clock timer must not be changed when the read value of this bit is "1".*

[bit1] TST: Timer Status Bit

This bit indicates the operation status of the main clock timer.

Bit	Description
0	Timer stopped
1	Timer operating

[bit0] INTF: Interrupt Flag Bit

This bit is the interrupt flag bit of the main clock timer.

"1" is set when the main clock timer value exceeds the set value in the compare bits (CMPR[15:0]). At this time, if the interrupt enable bit (INTE) is "1", the main clock timer generates an interrupt request.

To clear the interrupt flag bit to "0", set the interrupt clear bit (INTC) to "1".

Bit	Description
0	No interrupt factor is detected.
1	An interrupt factor is detected.

Note:

- *This bit can be set only while the timer is operating. It cannot be set during the oscillation stabilization wait operation.*

5.17. Main Clock Timer Interrupt Enable Register (SYSC_MOCTINTER)

The main clock timer interrupt enable register (SYSC_MOCTINTER) sets whether to enable or disable interrupts of the timer.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							INTE
R/W Attribute	R0,WX							R/W
Protection	- (WPS)							
Attribute								
Initial Value	00000000							0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:1] Reserved: Reserved Bits

[bit0] INTE: Interrupt Enable Bit

This bit sets whether to enable or disable interrupts of the main clock timer.

Bit	Description
0	Disable interrupts.
1	Enable interrupts.

5.18. Main Clock Timer Interrupt Clear Register (SYSC_MOCTICLR)

The main clock timer interrupt clear register (SYSC_MOCTICLR) clears an interrupt flag.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	- (WPS)	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							INTC
R/W Attribute	R0,WX							R0,W
Protection Attribute	- (WPS)							
Initial Value	00000000							0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:1] Reserved: Reserved Bits

[bit0] INTC: Interrupt Clear Bit

This bit clears the interrupt flag bit (INTF) of the main clock timer to "0".

Bit	Description
0	No effect
1	Clear the interrupt flag bit (INTF) to "0".

5.19. Sub Clock Timer Trigger Register (SYSC_SOCTTRGR)

The sub clock timer trigger register (SYSC_SOCTTRGR) is used to clear the count value of the timer, stop counting, and change the timer settings.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	- (WPS)	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved					TCLR	CSTOP	CGCPT
R/W Attribute	R0,WX					R0,W	R0,W	R0,W
Protection Attribute	- (WPS)							
Initial Value	00000					0	0	0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:3] Reserved: Reserved Bits

[bit2] TCLR: Timer Clear Bit

This bit clears the count value of the sub clock timer and stops the timer operation.

Bit	Description
0	No effect
1	Clear the timer count.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" clears the count value of the main clock timer.

[bit1] CSTOP: Count Stop Bit

This bit stops the counting of the sub clock timer.

Bit	Description
0	No effect
1	Stop the timer counting.

Note:

- Setting the timer setting capture bit (CGCPT) to "1" at the same time as this bit is set to "1" stops the main clock timer.

[bit0] CGCPT: Timer Setting Capture Bit

This bit is used to change the sub clock timer settings and to start the timer counting. Setting this bit to "1" causes the sub clock timer to acquire the changed setting contents.

Bit	Description
0	No effect
1	Change the timer settings. / Start the timer counting.

5.20. Sub Clock Timer Control Register (SYSC_SOCTCNTR)

The sub clock timer control register (SYSC_SOCTCNTR) selects the operation mode of the timer and sets whether the counter operates or stops during debugging.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved						DBGEN	MODE
R/W Attribute	R0,WX						R/W	R/W
Protection	-							
Attribute								
Initial Value	000000						0	0

[bit31:2] Reserved: Reserved Bits

[bit1] DBGEN: Debug Enable Bit

This bit sets the operation of the sub clock timer counter during debugging.

Bit	Description
0	Continue the count operation at the breakpoint.
1	Stop the count operation at the breakpoint.

Note:

- This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.

[bit0] MODE: Mode Control Bit

This bit selects the operation mode of the sub clock timer.

Single-shot mode clears the count and stops the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Continuous mode clears the count and restarts the count operation when the timer counter value exceeds the compare value (CMPR[15:0]).

Bit	Description
0	Single-shot mode
1	Continuous mode

Notes:

- *Setting the timer setting capture bit (CGCPT) to "1" after this bit is set changes the operation mode of the main clock timer.*
- *This bit cannot be written during the oscillation stabilization wait operation. If writing is attempted, a bus error is returned.*

5.21. Sub Clock Timer Compare Prescaler Register (SYSC_SOCTCPR)

The sub clock timer compare prescaler register (SYSC_SOCTCPR) selects the division ratio of the input clock and sets the compare value of the timer.

bit	31	24
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)

[bit0] INTF: Interrupt Flag Bit

This bit is the interrupt flag bit of the sub clock timer.

"1" is set when the sub clock timer value exceeds the set value in the compare bits (CMPR[15:0]). At this time, if the interrupt enable bit (INTE) is "1", the main clock timer generates an interrupt request.

To clear the interrupt flag bit to "0", set the interrupt clear bit (INTC) to "1".

Bit	Description
0	No interrupt factor is detected.
1	An interrupt factor is detected.

Note:

- *This bit can be set only while the timer is operating. It cannot be set during the oscillation stabilization wait operation.*

5.23. Sub Clock Timer Interrupt Enable Register (SYSC_SOCTINTER)

The sub clock timer interrupt enable register (SYSC_SOCTINTER) sets whether to enable or disable interrupts of the timer.

bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection	- (WPS)	
Attribute		
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							INTE
R/W Attribute	R0,WX							R/W
Protection	- (WPS)							
Attribute								
Initial Value	00000000							0

The attribute during the oscillation stabilization wait operation is enclosed in parentheses ().

[bit31:1] Reserved: Reserved Bits

[bit0] INTE: Interrupt Enable Bit

This bit sets whether to enable or disable interrupts of the sub clock timer.

Bit	Description
0	Disable interrupts.
1	Enable interrupts.

Bit	Description
0	No effect
1	Clear the interrupt flag bit (INTF) to "0".

6. Precautions for Using this Device

This section explains precautions for using the source clock timer.

- When the oscillation stabilization wait time for each source clock changed, please set the value under standard value range. Refer to the datasheet for detail information for standard value of the oscillation stabilization wait time.

CHAPTER 10: Real Time Clock

This chapter explains the function and operation of the Real Time Clock.

1. Overview
2. Configuration and Block Diagram
3. Operation of the Real Time Clock
4. Registers
5. Usage Precaution

RTC-TXXPT03P01R01L11-E1-XX

1. Overview

The Real Time Clock (RTC) consists of two modules, the Timer module and the Calibration module. This section lists the features of the Timer and Calibration modules.

The Real Time Clock (RTC) Timer module provides the current real time (HH/MM/SS) and the Calibration module calibrates Sub clock or Slow CR clock with respect to the Main oscillator clock.

Features of the RTC Timer Module

The features of the RTC Timer module are:

- It provides counting of real-time, comprising hour, minute and second counters
- It can operate in low-power mode
- Possible source clocks are:
 - Main oscillation (4 MHz)
 - Sub oscillation (32 kHz)
 - RC oscillation (to 100 kHz)
- It has a configurable Sub-second counter (RTC time base, normally half-second intervals) to calibrate the RTC for an applied source clock
- Precise source clock switching is synchronized with the Sub-second counter
- Interrupt sources are:
 - Half-second
 - One second
 - One minute
 - One hour
 - One day

Features of the Calibration Module

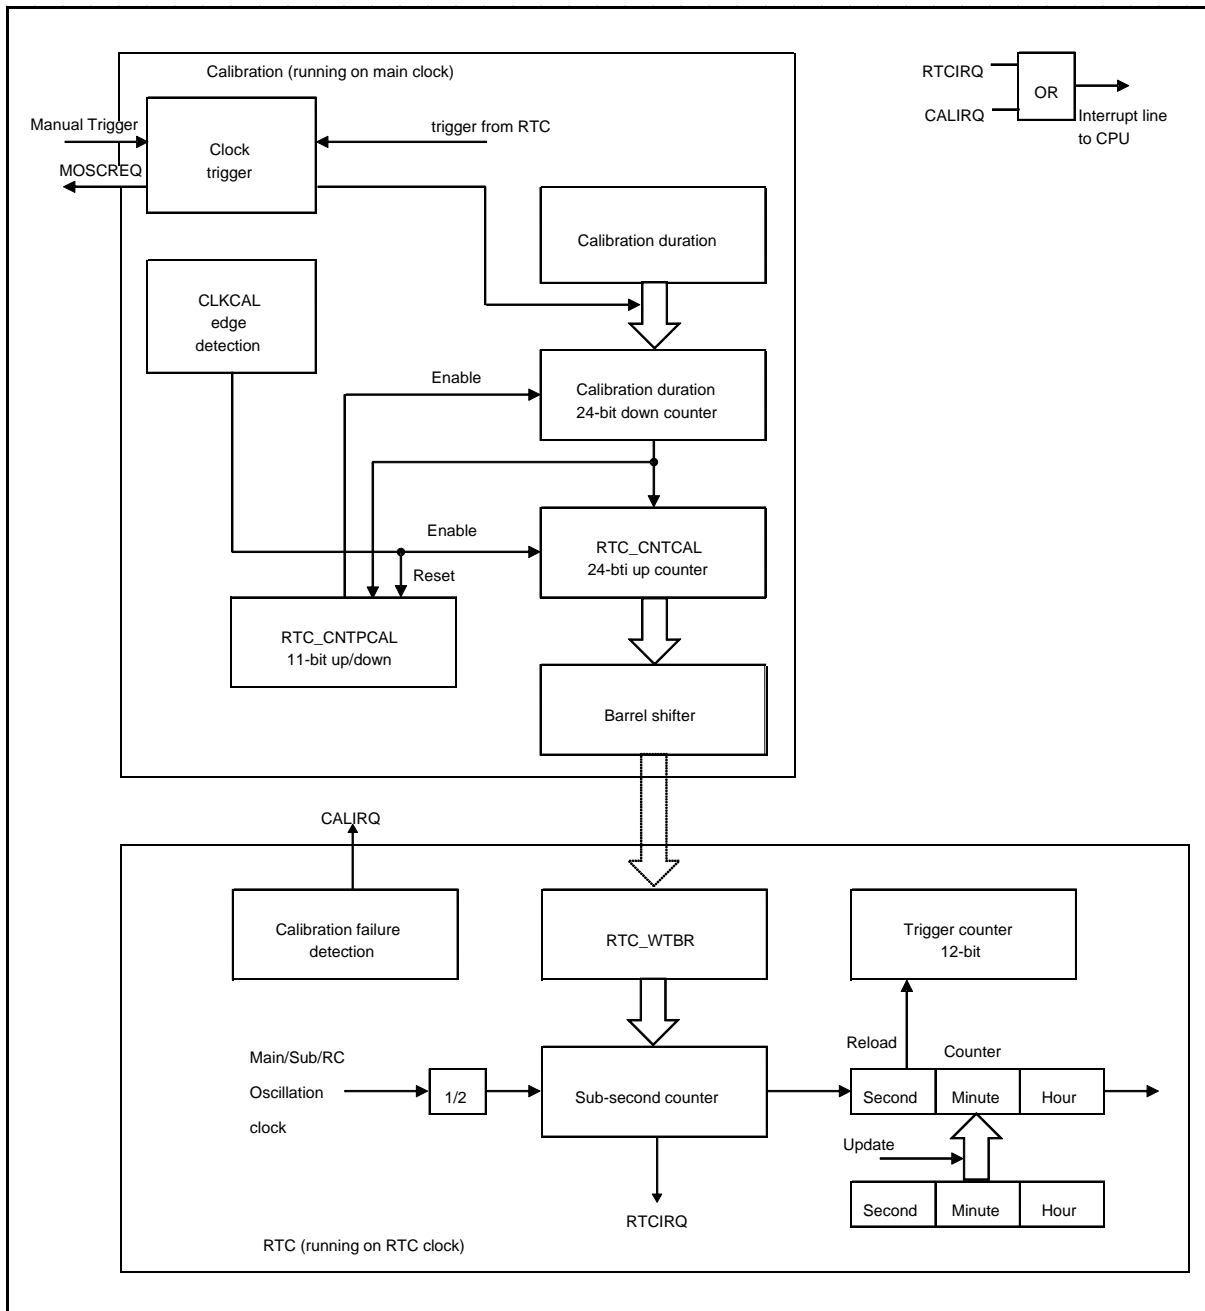

- The automatic cyclic calibration/measurement of Sub clock (CLK_SUB) or Slow CR clock (CLK_SRC) against Main clock (CLK_MAIN)
- The automatic correction of the RTC Sub-second counter value to keep accurate time
- Low-power modes due to Automatic wake-up/sleep of Main oscillation before/after Calibration phase
- An averaging method to prevent accumulation errors (Automatic modulation of Sub-second counter reload value)
- A configurable calibration interval for cyclic calibration (12-bit counter, counting seconds from RTC)
- A configurable calibration duration (i.e. 250 ms divided by 1/2/4/8/16)
- Automatic/Manual trigger for calibration
- Interrupt sources (to wake up the MCU from low-power mode):
 - Calibration done
 - Calibration failure (missing Main clock)
- Support for MCU debug mode

2. Configuration and Block Diagram

This section shows a block diagram of Real Time Clock.

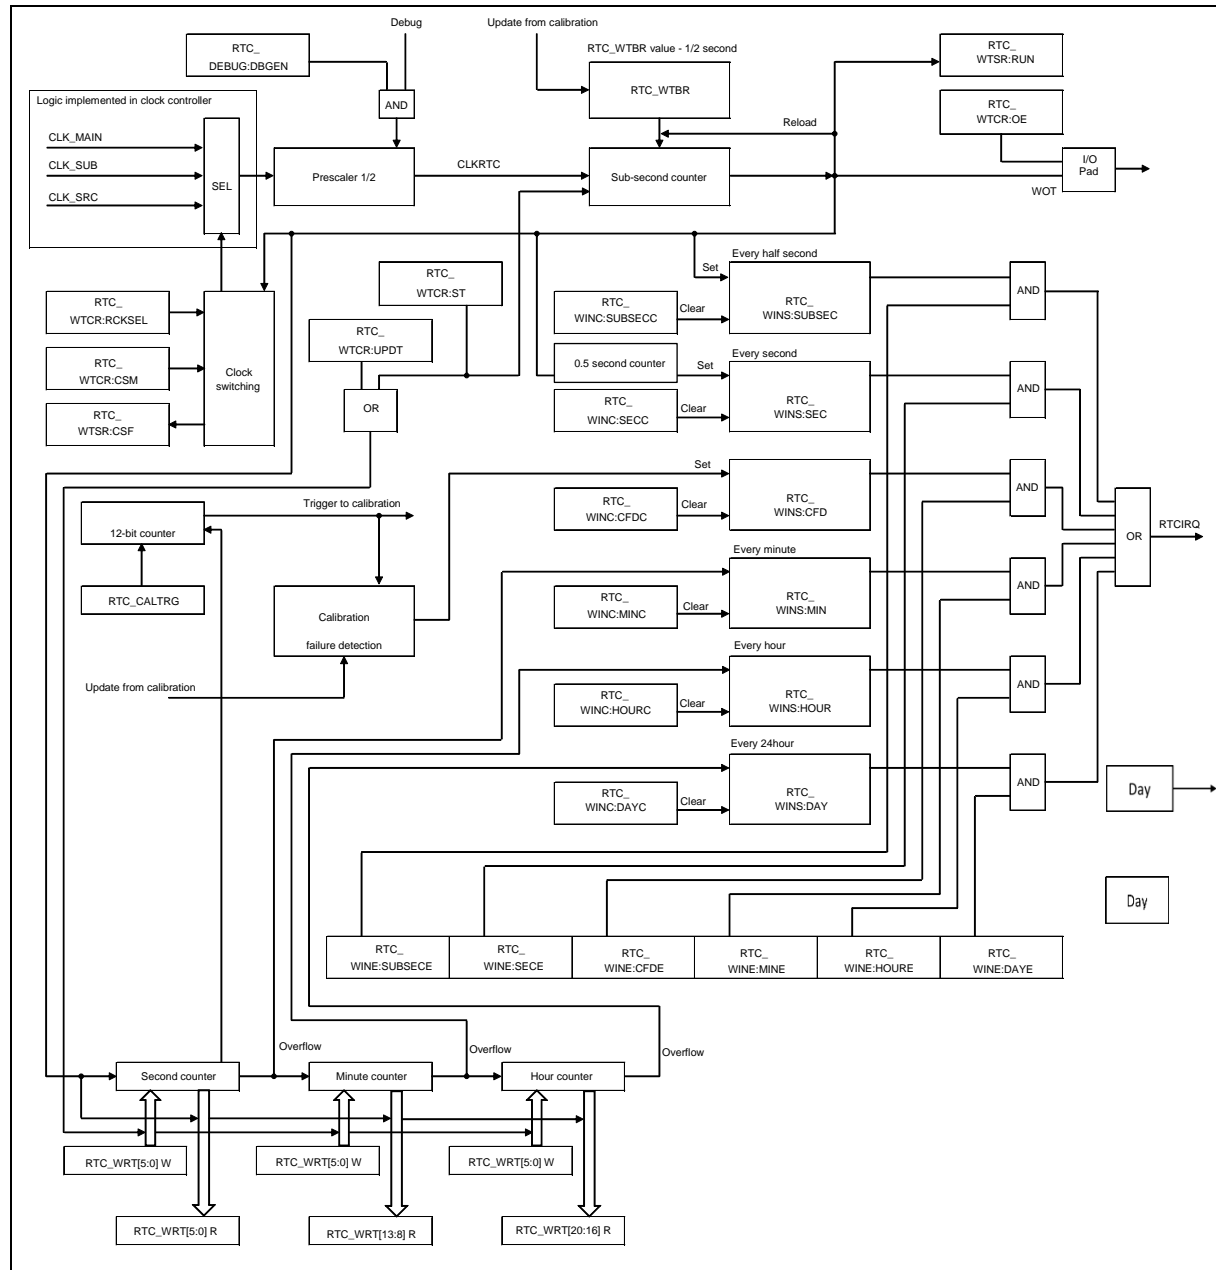

Block Diagram of Real Time Clock

Figure 2-4 Partial Wake Up Trigger Module Diagram

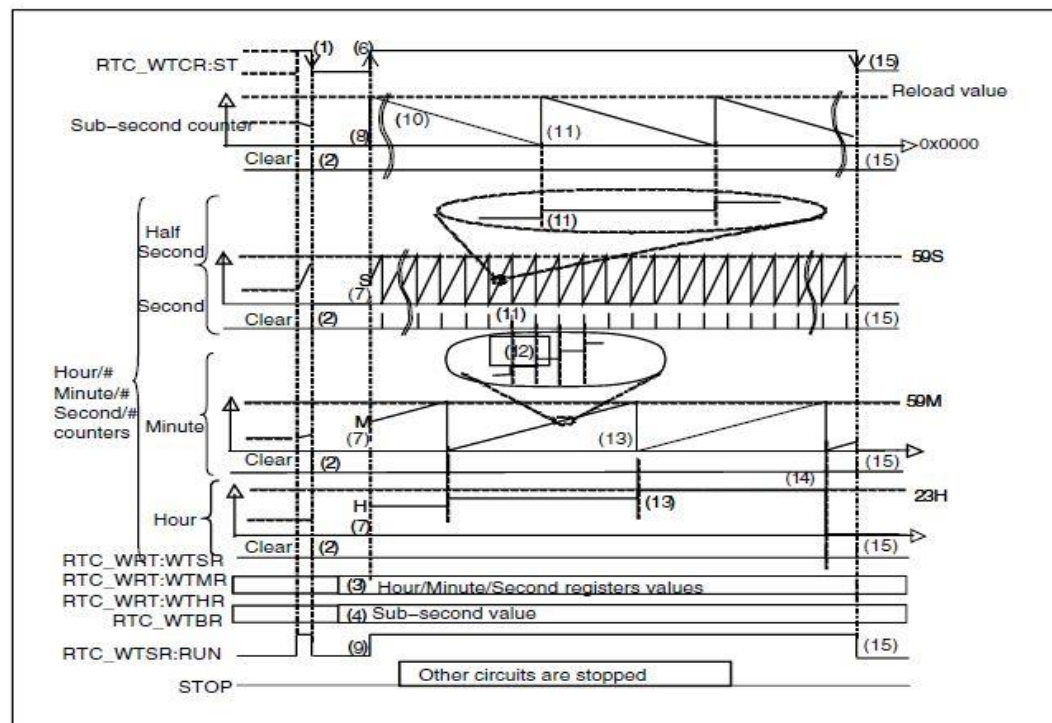

3. Operation of the Real Time Clock

This section describes the RTC Timer module and Calibration module operation.

RTC Timer Module Operation

Figure 3-1 RTC Timer Module Operation

The operation of the RTC Timer module, shown in Figure 3-1, is described as follows:

1. The software writes the start bit RTC_WTCR:ST to '1' and then '0'. (register initialization operation)
2. This resets the Sub-second counter to '0'. While RTC_WTCR:ST is '0' all counters for Sub-second, Second, Minute, and Hour are stopped.
3. The software writes Hour, Minute, and Second values to the Real Time Register, RTC_WRT.
4. The software writes the appropriate values to the Sub-Second Register, RTC_WTBR.
5. The interrupt request bits (RTC_WINS:SEC, RTC_WINS:MIN, RTC_WINS:HOURL, RTC_WINS:DAY, and RTC_WINS:SUBSEC) are cleared to '0', and the interrupt request enable bits (RTC_WINE:SECE, RTC_WINE:MINE, RTC_WINE:HOURE, RTC_WINE:DAYE and RTC_WINE:SUBSECE) are set to '1' i.e. interrupts enabled.
6. The software writes the start bit RTC_WTCR:ST to '1' to start the RTC counting operation.
7. This (RTC_WTCR:ST = '1') causes the values of the Real Time Register RTC_WRT to be loaded to the Hour/Minute/Second timers.
8. The value of the Sub-Second Register RTC_WTBR is loaded to the Sub-second counter.
9. With the second rising edge of CLK_RTC the run flag RTC_WTSR:RUN is set to '1'.
10. The Sub-second counter begins counting on the CLK_RTC. This could be the Main clock (CLK_MAIN) divided by 2 (4/2 MHz), Sub clock (CLK_SUB) divided by 2 (32.768/2 kHz) or Slow CR clock (CLK_SRC) divided by 2 (100/2 kHz).
11. When the Sub-second counter reaches '0', the value of the Sub-Second Register is loaded to the Sub-second counter, generating a sub-second interrupt request, i.e. the RTC_WINS:SUBSEC flag is set. For each other half-second interrupt, a one-second interrupt is generated, i.e. the RTC_WINS:SEC flag is set, and the Second counter is incremented.

12. When the Second counter reaches 59, it is cleared the next time it counts up, at which point the Minute counter counts up, generating a 1-minute interrupt request.
13. When the Minute counter reaches 59, it is cleared the next time it counts up, at which point the Hour counter counts up, generating a 1-hour interrupt request.
14. When the Hour counter reaches 23, it is cleared the next time it counts up, at which point a 1-day interrupt request is generated.
15. Writing RTC_WTCR:ST to '0' resets and stops the Sub-second counter and the Hour/Minute/Second counters.

Note:

- *To operate the RTC in low-power mode, the selected CLKRTC must remain enabled in the System Controller's Power Saving State (PSS) profile.*

Figure 3-2 WOT Pin Operation

Calibration Operation

The Calibration module provides automatic (and manual) RTC calibration. The module is able to operate in all run modes of the MCU if configured accordingly. The Main oscillation clock is used as an accurate time reference signal to measure the (normally) less accurate clock used for the RTC (CLKCAL). If the Main oscillator is switched off (e.g. during low-power mode), the Calibration module will temporarily switch it on, execute the calibration and switch it off afterwards to ensure low-current consumption.

Two counters operate during a calibration cycle to measure CLKCAL. The Calibration clock counter measures full clock cycles of CLKCAL and returns the value in RTC_CNTCAL. The second counter measures the period length of CLKCAL by counting Main clock cycles between two rising edges. This value is returned in RTC_CNTPCAL. Both counters operate during a configurable measurement window duration (RTC_DURMW), which is normally set up for 0.25 s. This allows the counted CLKCAL cycles to be directly used as the reload value for the Sub-second counter. During Automatic Calibration mode this value is transferred to the Sub-second counter by hardware means only, i.e. no software interaction is required.

Due to the cyclic and automatic re-calibration of the RTC Sub-second counter, any static and dynamic deviation of the RTC clock can be compensated for, resulting in very accurate RTC timing behavior. In the Calibration module, a novel method that positions the measurement window relative to CLKCAL actually modulates the Sub-second counter. This modulation can compensate for deviations that normally accumulate over time (caused by the limited resolution of the Sub-second counter to count only full CLKRTC cycles).

The following steps describe how to set up the Calibration module. The calibration operation is shown in Figure 3-3:

1. Configure the measurement window duration time for a calibration cycle in RTC_DURMW (normally 1,000,000 for 0.25 s and 4 MHz Main clock). During this time the clock to be calibrated (CLKCAL) is measured. The longer the measurement window, the higher the accuracy of the Calibration value i.e. the RTC timing.
2. Set the Calibration Value Scaling (RTC_WTCR:SCAL) with respect to the value set in the RTC_DURMW. For the normal measurement window of 0.25 s, scaling is not required (RTC_WTCR:SCAL must be set to '0'). Select the clock to be calibrated by configuring RTC_WTCR:CCKSEL.
3. Set RTC_WINE:CALDE to '0' or '1' to disable or enable interrupt generation after a calibration cycle has finished. This may wake up the MCU in low-power mode.

Automatic Calibration:

1. Write the Calibration trigger counter value to RTC_CALTRG to configure the time interval between two calibration cycles. For low-power mode, this also defines the intervals to wake up the Main oscillator.
2. Set RTC_WTCR:ENUP to '1' to enable the automatic transfer of the measured calibration value to the Sub-Second Register (RTC_WTBR) at the end of every calibration cycle.
3. Set RTC_WTCR:ACAL to '1', to enable Automatic Calibration. When the RTC is operating (RTC_WTSR:RUN) = '1', the Calibration trigger counter will run and generate cyclic calibration trigger events.
4. Set RTC_WINE:CFDE to '1' to enable interrupt generation (and MCU wake-up) in case of a calibration failure. An interrupt request will be generated when a calibration failure is detected if RTC_WTBR is not updated within one second after the hardware trigger. This happens when the Main clock is missing.

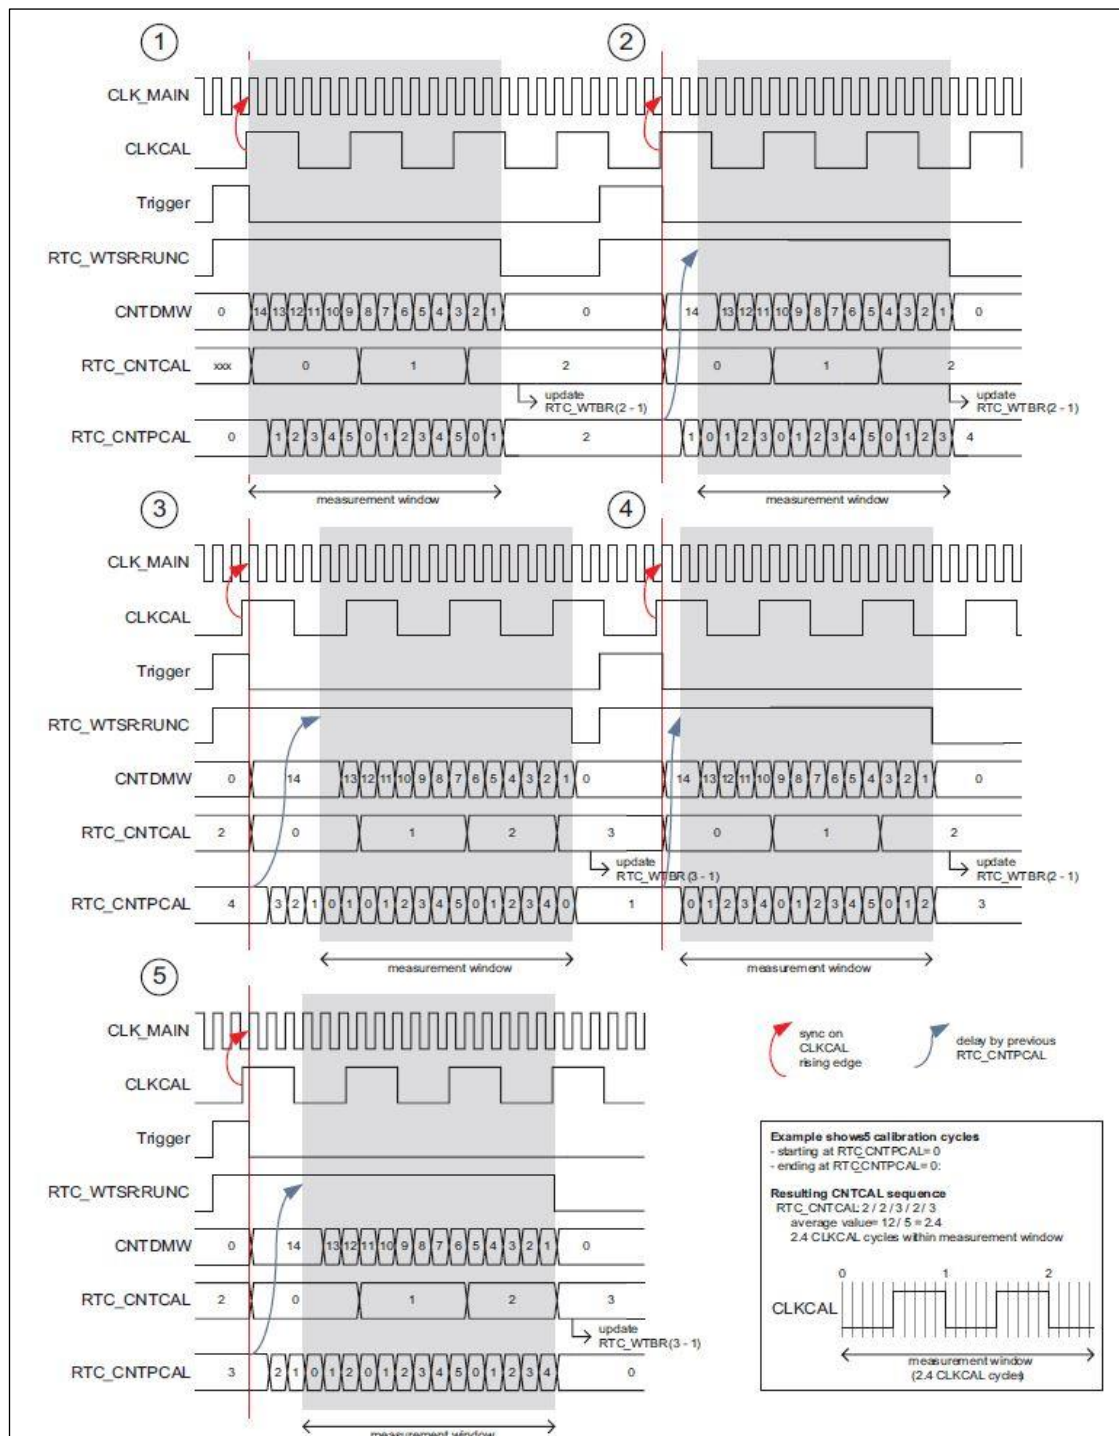

Manual Calibration:

1. Set RTC_WTCR:ACAL to '0' to disable Automatic Calibration and allow the calibration to be triggered by a Manual trigger.
2. Set RTC_WTCR:ENUP to '0' or '1' to disable or enable the updating of the Sub-Second Register (RTC_WTBR) with the calibration value at the end of the Manual Calibration.
3. Clear the Calibration done flag (RTC_WINS:CALD) by writing RTC_WINC:CALDC to '1'.
4. Set RTC_WTCR:MTRG to '1' - this triggers the calibration by software.
5. If RTC_WTCR:ENUP is disabled, read the RTC_CNTCAL value after a Calibration-done interrupt. If necessary, scale the read value according to the programmed Calibration duration value. Write the scaled value to the RTC_WTBR register.
6. If RTC_WTCR:ENUP is enabled, the Calibration module will scale the value according to the configuration in RTC_WTCR:SCAL and update.

Note:

- *For Automatic Calibration in low-power mode, ensure a valid stabilization time for CLK_MAIN oscillation is configured. Information about stabilization time can be found in CHAPTER 9.*

Figure 3-3 Calibration Operation

Note:

- Simplified drawing without oscillation stabilization time.

Figure 3-4 Cyclic Calibration

Cyclic Calibration

Cyclic Calibration, as shown in Figure 3-4, is done in Automatic Calibration mode. The Calibration trigger counter reloads the value configured in RTC_CALTRG and decrements on every second pulse from the RTC. It generates a calibration trigger when it expires. Then Main oscillator start request (MOSCREQ) is asserted to switch on the Main oscillation, which is available after specified stabilization time. The calibration now operates with the Main clock (CLK_MAIN). At the end of a Calibration cycle and with Automatic RTC_WTBR update enabled (RTC_WTCR:ENUP = '1'), RTC_WTBR will be updated with the measured (and scaled) value of RTC_CNTCAL. The Main oscillator start request (MOSCREQ) de-asserts at the end of the calibration to switch off the Main oscillator in low-power mode. As the Calibration trigger counter reloads after it expires, the Calibration operation repeats cyclically. If the Main clock is missing after MOSCREQ is asserted, a Calibration Failure Detection (CFD) interrupt is generated (if RTC_WINE:CFDE = '1'). The Calibration Trigger Register (RTC_CALTRG) value defines the duration between two calibrations.

4. Registers

This section describes the registers of real time clock.

Registers of the RTC

The following registers are available for the RTC:

Table 4-1 Registers of Real Time Clock

Abbreviated expressions	Register Name	Reference
RTC_WTCR	Timer Control Register	4.1
RTC_WTSR	Timer Status Register	4.2
RTC_WINS	Interrupt Status Register	4.3
RTC_WINE	Interrupt Enable Register	4.4
RTC_WINC	Interrupt Clear Register	4.5
RTC_WTBR	Sub-Second Register	4.6
RTC_WRT	Real Time Register	4.7
RTC_RTR1	Real Time Register1	4.8
RTC_CNTCAL	Calibration Clock Counter Register	4.9
RTC_CNTPCAL	Calibration Clock Period Counter Register	4.10
RTC_DURMW	Calibration Duration Register	4.11
RTC_CALTRG	Calibration Trigger Register	4.12
RTC_DEBUG	Debug Register	4.13
RTC_PWUTRGCR	Partial Wake Up Trigger Control Register	4.14
RTC_PWUTRGSR	Partial Wake Up Trigger Status Register	4.15

Memory Layout of the RTC Registers

Table 4-2 Memory Layout of RTC Registers

Offset	Register Name / Initial Value
0x0000_0000	RTC_WTCR 00000000_00000000_00000000_00000000
0x0000_0004	RTC_WTSR 00000000_00000000_00000000_00000000
0x0000_0008	RTC_WINS 00000000_00000000_00000000_00000000
0x0000_000C	RTC_WINE 00000000_00000000_00000000_00000000
0x0000_0010	RTC_WINC 00000000_00000000_00000000_00000000
0x0000_0014	RTC_WTBR 00000000_00000000_00000000_00000000
0x0000_0018	RTC_WRT 00000000_00000000_00000000_00000000
0x0000_001C	RTC_RTR1 00000000_00000000_00000000_00000000
0x0000_0020	RTC_CNTCAL 00000000_00000000_00000000_00000000
0x0000_0024	RTC_CNTPCAL 00000000_00000000_00000000_00000000
0x0000_0028	RTC_DURMW 00000000_00000000_00000000_00000000
0x0000_002C	RTC_CALTRG 00000000_00000000_00000000_00000000
0x0000_0030	RTC_DEBUG 00000000_00000000_00000000_00000000
0x0000_0034	RTC_PWUTRGCR 00000010_00000000_00000000_00000000
0x0000_0038	RTC_PWUTRGSR 00000000_00000000_00000000_00000000

Note:

- All RTC registers and counters are initialized only by the PONR, INITX, IMR, LVDL1R, RVD, CSVMOR, CSVSOR and CSVSCRR.

4.1. Timer Control Register (RTC_WTCR)

The Timer Control Register contains various control bits for the RTC including start, stop, mode and clock selection.

BIT_OFFSET	31	30	29	28	27	26	25	24

[bit31:16] Reserved

[bit15] UPCAL: Update calibration period counter

This bit is used to update the Calibration Period Counter (RTC_CNTPCAL). By setting this bit to '1', the RTC_CNTPCAL (write) register value is written to the RTC_CNTPCAL counter at the next Calibration trigger (which can be either Automatic or Manual).

Bit	Description
0	The update has been completed
1	Update the RTC_CNTPCAL counter with the value of the RTC_CNTPCAL (write) register

UPCAL is set by software and cleared by hardware after the completion of an update. Writing '0' by software will not effect this bit.

To make sure that update is done properly, the software should not change the RTC_CNTPCAL (write) register value before UPCAL is de-asserted by hardware.

Setting UPCAL to `1` has higher priority than setting it to `0` (in case both updates come at the same time).

[bit14:12] SCAL[2:0]: Scale calibrated value

These bits are used to scale the Calibration value in (RTC_CNTCAL), which is determined by the Calibration module, before it is transferred to the Sub-Second Register.

Bits	Description
000	No change
001	Multiply by 2
010	Multiply by 4
011	Multiply by 8
100	Multiply by 16
Others	Prohibited

SCAL should be configured w.r.t the value set in the corresponding Calibration Duration Register (RTC_DURMW).

For $RTC_DURMW = (0.25s)/x$, where $x = \{1, 2, 4, 8, 16\}$

Configure SCAL accordingly to match `x`

e.g. $RTC_DURMW = (0.25s)/2 = 0.125s$

set SCAL = `001`

Note:

- Because of the internal clock synchronization, it takes certain period (several Main clock period and several bus clock period) that the written value is reflected to the bit.

[bit11] CCKSEL: Clock select for calibration

This bit is used to select the Calibration clock (CLKCAL).

Bit	Description
0	Sub clock (CLK_SUB) is used as CLKCAL
1	Slow CR clock (CLK_SRC) is used as CLKCAL

[bit10] ENUP: Enable/Disable calibration value update

This bit is used to enable/disable the transfer of the calibration value in Calibration Clock Counter Register (RTC_CNTCAL) to the RTC Sub-Second Register (RTC_WTBR) after the completion of a calibration cycle.

Bit	Description
0	Calibration value (RTC_CNTCAL) update to RTC_WTBR is disabled
1	Calibration value (RTC_CNTCAL) update to RTC_WTBR is enabled

This bit is valid only when the Automatic Calibration mode is disabled (RTC_WTCR:ACAL is '0').

Multiple triggers during calibration are ignored. Reading this bit always returns '0'. This bit is cleared by the hardware at the start of calibration.

Note:

- *Because of the internal clock synchronization, it takes certain period (several Main clock period and several bus clock period) that the written value is reflected to the bit.*

[bit9] MTRG: Manual trigger for calibration

This bit is used to trigger a software calibration cycle.

Bit	Description
0	No trigger
1	Manual trigger

This bit is valid only when the Automatic Calibration mode is disabled (RTC_WTCR:ACAL is '0').

Multiple triggers during calibration are ignored.

Reading this bit always returns '0'. This bit is cleared by the hardware at the start of calibration.

[bit8] ACAL: Automatic calibration

This bit is used to enable/disable Automatic Calibration mode.

Bit	Description
0	Automatic Calibration disabled. A manual trigger (RTC_WTCR:MTRG) can be used to trigger calibration
1	Automatic Calibration enabled. The RTC will cyclically trigger the Automatic Calibration. The intervals are configured in the Calibration Trigger Register (RTC_CALTRG)

Switching ACAL will reset the ongoing Calibration.

In addition changing ACAL from '0' to '1' reloads the Calibration trigger counter with the RTC_CALTRG value

Notes:

- *For a detailed description of the Automatic RTC Calibration, refer to Section 3 'Operation of the Real Time Clock' and Section 5 'Usage Precaution'.*
- *Because of the internal clock synchronization, it takes certain period (several Main clock period and several bus clock period) that the written value is reflected to the bit.*

[bit7:6] Reserved

[bit5:4] RCKSEL[1:0]: Clock select for RTC

These bits are used to select the input clock for the RTC (CLKRTC).

Bits	Description
00	Main clock (CLK_MAIN/2) is selected as CLKRTC
01	Sub clock (CLK_SUB/2) is selected as CLKRTC
10	Slow CR clock (CLK_SRC/2) is selected as CLKRTC
11	Prohibited

Note:

- It's necessary to write in register when RTC_WTSR:CLK_STS is 0. When CLK_STS is 1, the writing value is ignored.

[bit3] CSM: Clock switching mode

This bit is used to configure the clock switching mode when RTC_WTCR:RCKSEL is changed.

Bit	Description
0	Precise switch
1	Immediate switch

Note:

- It's necessary to write in register when RTC_WTSR:CLK_STS is 0. When CLK_STS is 1, the writing value is ignored.

Precise switch - Clock switching is done when the Sub-second counter reloads from RTC_WTBR i.e. after half second.

Immediate switch - Clock switching is done immediately when RTC_WTCR:RCKSEL is changed.

Precise clock switching allows the setting of the new RTC_WTBR value w.r.t. the next CLKRTC. To guarantee correct functionality, the CPU must ensure that the new RTC_WTBR and new RCKSEL are set before the Sub-second counter reaches '0' (ideally use the half-second interrupt).

[bit2] UPDT: Update

This bit is used to update the time value. By setting it to '1', the Second/Minute/Hour register values are written to the Second/Minute/Hour counters respectively.

Bit	Description
0	The update has been completed
1	Update the Hour/Minute/Second counters with the values of the Hour/Minute/Second registers, respectively

UPDT is set by software and is cleared by hardware after the completion of an update. Writing '0' by software will not effect this bit.

Updating by the CPU has a higher priority than updating by hardware (in case both updates come at the same time). Refer to section 5 'Usage Precaution'.

[bit1] OE: Output enable

This bit is used to enable/disable the WOT external pin.

Bit	Description
0	The WOT external pin can be used as a General-purpose I/O or for another peripheral block
1	The WOT external pin serves as the output for the Sub-second counter

[bit0] ST: Start

This bit is used to start/stop the RTC.

Bit	Description
0	The Real Time Clock module stops operating, and the Sub-second counter and the Hour/Minute/Second counters are stopped
1	The settings of the Hour/Minute/Second registers are loaded to the Hour/Minute/Second counters, and the RTC module starts to operate

Notes:

- When writing "1" to the start bit (ST) from RTC stop state (ST=0) (RTC operation start), do not write "1" to the update bit (UPDT) at the same time as the start bit. (While ST=0, writing "1" as byte immediate value to the ST bit and the UPDT bit at the same time is prohibited.)
- To write "1" to the update bit (UPDT), do it while RTC is working (ST=1).
- While the update bit (UPDT) is "1", writing "0" to the start bit (ST) (RTC stop) is prohibited.

4.2. Timer Status Register (RTC_WTSR)

The Timer Status Register contains various status bits for the RTC.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

BIT_OFFSET	23	22	21	20	19	18	17	16
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

BIT_OFFSET	15	14	13	12	11	10	9	8
BIT_NAME	Reserved							RUNC
ACCESS_TYPE	R0,WX							R,WX
PROT_TYPE	-							
INITIAL_VALUE	0000000							0

BIT_OFFSET	7	6	5	4	3	2	1	0
BIT_NAME	CLK_ST S	Reserved					CSF	RUN
ACCESS_TYPE	R,WX	R0,WX					R,W	R,WX
PROT_TYPE	-							
INITIAL_VALUE	000000						0	0

[bit31:9] Reserved

[bit8] RUNC: RUN calibration

This bit indicates the status of the Calibration.

Bit	Description
0	The Calibration is inactive
1	The Calibration is in progress

This register bit is updated on CLK_MAIN. RUNC is set to '1' when Calibration is started by an Automatic or Manual trigger. RUNC is set to '0' when the Calibration Duration Counter expires or Calibration is reset.

[bit7] CLK_STS: Clock switching status

This bit indicates the status of the clock switching.

Bit	Description
0	The clock switching is inactive
1	The clock switching is in progress

[bit6:2] Reserved

[bit1] CSF: Clock switched flag

This bit indicates the status of switching the RTC input clock.

Bit	Description
0	The input clock for RTC has not been switched
1	The input clock for RTC has been switched

This bit is set by hardware and cleared by software.

CSF indicates the switching of the RTC input clock in precise mode(RTC_WTCR:CSM is '0'). When RTC_WTCR:RCKSEL is changed(i.e. the clock on which the RTC will run) in precise mode (RTC_WTCR:CSM is '0'), the clock source will be switched after the Sub-second counter expires. Even though reading RTC_WTCR:RCKSEL will give the updated configuration, the CSF flag will only be set at the actual internal clock switching.

To use this bit, it has to be first cleared. Then write the new clock setting to RTC_WTCR:RCKSEL and check if CSF is set to '1'.

Update by CPU has higher priority than update by hardware (in case both updates come at the same time).

[bit0] RUN: RUN

This bit indicates the status of the RTC Timer module.

Bit	Description
0	The RTC Timer module is inactive
1	The RTC Timer module is active

This register bit is updated on CLKRTC. RUN will go low at the second rising edge of the RTC clock after RTC_WTCR:ST has been set to '0'. It will rise again at the second rising edge of RTC clock after RTC_WTCR:ST has been set to '1'.

4.3. Interrupt Status Register (RTC_WINS)

The Interrupt Status Register contains various status bits that can trigger an interrupt.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

BIT_OFFSET	23	22	21	20	19	18	17	16

PROT_TYPE	-							
INITIAL_VALUE	0	0	0	0	0	0	0	0

[bit31:7] Reserved

[bit6] CALD: Calibration done

This bit is set when a Calibration cycle has finished. If the CALD interrupt is enabled (RTC_WINE:CALDE is '1'), an interrupt request is generated.

Bit	Description
0	Calibration is not triggered or in progress
1	Calibration is done

The Calibration Done flag will be set independently of the Calibration value update bit (RTC_WTCR:ENUP).

This bit is set to '1' at the Calibration Done event and is cleared by writing '1' to RTC_WINC:CALDC.

[bit5] CFD: Calibration failure detection

This bit is set when a calibration failure is detected. If the CFD interrupt is enabled (RTC_WINE:CFDE is `1'), an interrupt request is generated.

Bit	Description
0	No calibration failure
1	Calibration failure

The Calibration Failure Detection flag is set if the RTC_WTBR register is not updated by hardware within one second after an Automatic Calibration trigger event while the Calibration value update feature is enabled (RTC_WTCR:ENUP is `1').

The Calibration Failure Detection feature could also be used in Manual Calibration mode. This requires the issuing of the Manual trigger in time to ensure that the Calibration Duration Counter has elapsed before the next update of the Second counter.

The Calibration Failure Detection flag indicates that the Main clock is not available and calibration cannot be executed.

This bit is cleared by writing '1' to RTC_WINC:CFDC.

[bit4] DAY: Day flag

This bit is set when one day has elapsed. If the DAY interrupt is enabled (RTC_WINE:DAYE is `1'), an interrupt request is generated.

Bit	Description
0	No interrupt requests
1	The Hour counter has exceeded 24 hours

This bit is set to '1' at one-day intervals, i.e. when the Hour counter overflows. This bit is cleared by writing '1' to RTC_WINC:DAYC.

[bit3] HOUR: Hour flag

This bit is set when one hour has elapsed. If the HOUR interrupt is enabled (RTC_WINE:HOURE is `1'), an interrupt request is generated.

Bit	Description
0	No interrupt requests
1	The Hour counter has been updated

This bit is set to '1' at one-hour intervals, i.e. when the Minute counter overflows. This bit is cleared by writing '1' to RTC_WINC:HOUREC.

[bit2] MIN: Minute flag

This bit is set when one minute has elapsed. If the MIN interrupt is enabled (RTC_WINE:MINE is `1'), an interrupt request is generated.

Bit	Description
0	No interrupt requests
1	The Minute counter has been updated

This bit is set to '1' at one-minute intervals, i.e. when the Second counter overflows. This bit is cleared by writing '1' to RTC_WINC:MINC.

[bit1] SEC: Second flag

This bit is set when one second has elapsed. If the SEC interrupt is enabled (i.e. RTC_WINE:SECE is '1'), an interrupt request is generated.

Bit	Description
0	No interrupt requests
1	The Second counter has been updated

This bit is set to '1' at one-second intervals. This bit is cleared by writing '1' to RTC_WINC:SECC.

[bit0] SUBSEC: Sub-second flag

This bit is set when one half second has elapsed. If the SUBSEC interrupt is enabled (RTC_WINE:SUBLECE is '1'), an interrupt request is generated.

Bit	Description
0	No interrupt requests
1	The Sub-second counter has expired

This bit is set to '1' at half-second intervals, i.e. when the Sub-second counter expires. This bit is cleared by writing '1' to RTC_WINC:SUBLECC.

4.4. Interrupt Enable Register (RTC_WINE)

The Interrupt Enable Register contains various enable/disable bits for the interrupts.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX

[bit6] CALDE: Calibration done interrupt enable

This bit is used to enable interrupt requests at Calibration done (RTC_WINS:CALD).

Bit	Description
0	Interrupt requests at Calibration Done are disabled
1	Interrupt requests at Calibration Done are enabled

[bit5] CFDE: Calibration failure detection interrupt enable

This bit is used to enable interrupt requests at Calibration Failure Detection (RTC_WINS:CFD).

Bit	Description
0	Interrupt requests at Calibration Failure Detection are disabled
1	Interrupt requests at Calibration Failure Detection are enabled

[bit4] DAYE: Day interrupt enable

This bit is used to enable interrupt requests at one-day (24 hour) intervals (RTC_WINS:DAY).

Bit	Description
0	Interrupt requests at one-day (24 hour) intervals are disabled
1	Interrupt requests at one-day (24 hour) intervals are enabled

[bit3] HOURE: Hour interrupt enable

This bit is used to enable interrupt requests at one-hour intervals (RTC_WINS:HOURE).

Bit	Description
0	Interrupt requests at one-hour intervals are disabled
1	Interrupt requests at one-hour intervals are enabled

[bit2] MINE: Minute interrupt enable

This bit is used to enable interrupt requests at one-minute intervals (RTC_WINS:MIN).

Bit	Description
0	Interrupt requests at one-minute intervals are disabled
1	Interrupt requests at one-minute intervals are enabled

[bit1] SECE: Second interrupt enable

This bit is used to enable interrupt requests at one-second intervals (RTC_WINS:SEC).

Bit	Description
0	Interrupt requests at one-second intervals are disabled
1	Interrupt requests at one-second intervals are enabled

[bit0] SUBSECE: Sub-second interrupt enable

This bit is used to enable interrupt requests at half-second intervals (RTC_WINS:SUBSEC).

Bit	Description
0	Interrupt requests at half-second intervals are disabled
1	Interrupt requests at half-second intervals are enabled

4.5. Interrupt Clear Register (RTC_WINC)

The Interrupt Clear Register contains various clear bits for the Interrupt Status Register (RTC_WINS).

BIT_OFFSET	31	30	29	28	27	26	25	24

[bit6] CALDC: CALD interrupt clear

This bit is used to clear interrupt requests at Calibration Done.

Bit	Description
0	No effect
1	Clears RTC_WINS:CALD

Reading this bit always returns '0'.

[bit5] CFDC: CFD interrupt clear

This bit is used to clear interrupt requests at Calibration Failure Detection.

Bit	Description
0	No effect
1	Clears RTC_WINS:CFD

Reading this bit always returns '0'.

[bit4] DAYC: Day interrupt clear

This bit is used to clear the Day Interrupt flag.

Bit	Description
0	No effect
1	Clears RTC_WINS:DAY

Reading this bit always returns '0'.

[bit3] HOURC: Hour interrupt clear

This bit is used to clear the Hour Interrupt flag.

Bit	Description
0	No effect
1	Clears RTC_WINS:HOURL

Reading this bit always returns '0'.

[bit2] MINC: Minute interrupt clear

This bit is used to clear the Minute Interrupt flag.

Bit	Description
0	No effect
1	Clears RTC_WINS:MIN

Reading this bit always returns '0'.

[bit1] SECC: Second interrupt clear

This bit is used to clear the Second Interrupt flag.

Bit	Description
0	No effect
1	Clears RTC_WINS:SEC

Reading this bit always returns '0'.

[bit0] SUBSECC: Sub-second interrupt clear

This bit is used to clear interrupt requests at half-second interval.

Bit	Description
0	No effect
1	Clears RTC_WINS:SUBSEC

Reading this bit always returns '0'.

4.6. Sub-Second Register (RTC_WTBR)

The Sub-Second Register stores the reload value for the Sub-second counter that divides the CLKRTC to generate the RTC's time base. The reload value is usually set so that the Sub-second counter will count exactly half a second.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	-							
INITIAL_VALUE	00000000

BIT_OFFSET	7	6	5	4	3	2	1	0
BIT_NAME	WTBR[7:0]							
ACCESS_TYPE	R,W							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

[bit31:24] Reserved

[bit23:0] WTBR[23:0]: Sub-second register

The Sub-Second Register holds the value to be reloaded to the Sub-second counter. When the Sub-second counter value becomes '0' the value of WTBR is reloaded to the Sub-second counter.

This register is also updated by the calibration circuit when RTC_WTCR:ENUP is set (even in low-power mode). Updating by the CPU has higher priority than updating by hardware (in case both updates come at the same time).

Note:

- The required value depends on the RTC clock that is used (CLKRTC) and can be calculated with the formula on the following page.

Table 4-3 Example Configuration of RTC_WTBR Register for Different Clock Configurations

	RTC_WTBR:WTBR[23:0]
Main oscillator, 4MHz	0x0F423F
RC oscillator, 100kHz	0x0061A7
Sub oscillator, 32.768kHz	0x001FFF

Calculation formula:

$$\text{RTC_WTBR:WTBR}[23:0] = f_{\text{CLKRTC}} \times 0.5 \text{ s} - 1$$

fCLKRTC: CLKRTC frequency [Hz]

4.7. Real Time Register (RTC_WRT)

The Real Time Register (RTC_WRT) stores the time information i.e. Second/Minute/Hour values. Reading this register returns the counter values. This register is write accessible; however, the written data is loaded into the counters when the RTC is started (RTC_WTCR:ST set to '1') and each time the RTC_WTCR:UPDT bit is set to '1'.

BIT_OFFSET	31	30	29	28	27	26	25	24

BIT_NAME	Reserved		WTSR[5:0]					
ACCESS_TYPE	R0,WX		R,W					
PROT_TYPE	-							
INITIAL_VALUE	00		000000					

[bit31:21] Reserved

[bit20:16] WTHR[4:0]: Hour register

The Hour bits are used to (initially) set the RTC Hour counter value and to read the actual Hour value.

The written value is transferred to the Hour counter by setting '1' to the update bit (RTC_WTCR:UPDT) or start bit (RTC_WTCR:ST).

Reading the Hour bits returns the latest Hour counter value, not the written value. The Hour counter value is saved to the hour bits every time the Sub-second counter expires, i.e. at intervals of half a second.

[bit15:14] Reserved

[bit13:8] WTMR[5:0]: Minute register

The minute bits are used to (initially) set the RTC Minute counter value and to read the actual Minute value.

The written value is transferred to the Minute counter by setting `1' to the update bit (RTC_WTCR:UPDT) or start bit (RTC_WTCR:ST).

Reading the Minute bits returns the latest Minute counter value, not the written value. The Minute counter value is saved to the minute bits every time the Sub-second counter expires, i.e. at intervals of half a second.

[bit7:6] Reserved**[bit5:0] WTSR[5:0]: Second register**

The second bits are used to (initially) set the RTC Second counter value and read the actual Second value.

The written value is transferred to the Second counter by setting `1' to the update bit (RTC_WTCR:UPDT) or start bit (RTC_WTCR:ST).

Reading the Second bits returns the latest Second counter value, not the written value. The Second counter value is saved to the second bits every time the Sub-second counter expires, i.e. at intervals of half a second.

Note:

- *RTC_WRT is initialized only by the power-on reset, low-voltage reset and external resets, and not by any other reset except for unused bits.*

4.8. Real Time Clock Real Time Register1 (RTC_RTR1)

Real-time register (RTC_RTR1) is used to read and to update time information of the real time clock.

BIT_OFFSET	31	30	29	28	27	26	25	24

ACCESS_TYPE	R,W							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

[bit31:16] Reserved

[bit15:0] WTDR[15:0]: Date Bit

These bits show the count value of the day of the real time clock. The writing value is reflected in the count of the day of the real time clock when writing it.

Note:

- These bits show day information of the real time clock by 16 bits. Do not access these bits with byte width because an appropriate value cannot be read.

4.9. Calibration Clock Counter Register (RTC_CNTCAL)

The Calibration Clock Counter Register gives the value of counted CLKCAL cycles of a calibration cycle. The Calibration module controls the Calibration clock counter which is active during the measurement window duration. The counted value can be used to update the Sub-Second Register automatically or manually depending on configurations. Reading this register simply returns the counter value.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	-

BIT_NAME	CNTCAL[7:0]							
ACCESS_TYPE	R,WX							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

[bit31:24] Reserved

[bit23:0] CNTCAL[23:0]: Calibration clock counter register

This register returns the value of the Calibration clock counter. The Calibration clock counter counts full clock cycles of the clock to be calibrated, i.e. CLKCAL. The counting is controlled by the Calibration Module and is active during the Calibration measurement window duration (RTC_DURMW).

This unscaled value can be used to manually update the Sub-Second Register. For the Automatic update of RTC_WTBR (RTC_WTCR:ENUP is set to `1'), the value is scaled according to the configured scaling (RTC_WTCR:SCAL) and written to RTC_WTBR. This register always returns the unscaled value.

The CNTCAL Register is updated with the Calibration clock counter value at the end of a calibration cycle i.e. when the measurement window duration has elapsed. The Calibration Done flag (RTC_WINS:CALD) and/or interrupt can be used to determine the end of a calibration cycle.

Notes:

- *For a manual update of the RTC_WTBR register, the software should scale the CNTCAL value w.r.t the configured measurement window duration (RTC_DURMW) and then subtract '1' before writing it to the Sub-Second Register. (Scaling Factor X CNTCAL value) - 1.*
- *For more details on the RTC_WTSR:SCAL value calculation, see the description of RTC_WTCR:SCAL*
- *For a detailed description of the Automatic RTC Calibration, refer to Sections 3 and 5.*

4.10. Calibration Clock Period Counter Register (RTC_CNTPCAL)

The Calibration Clock Period Counter Register gives the value of the last Calibration clock period of a Calibration cycle. The Calibration clock period counter measures the period length of CLKCAL by counting cycles of the Main clock. The Calibration module controls the Calibration clock period counter which is active during the measurement window duration. The counter is reset with each positive edge of CLKCAL. The counted value at the end of a calibration cycle is used to delay the start of the next calibration duration measurement window. Reading this register simply returns the counter value. Writing this register allows the setting of the Calibration clock period counter.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	-

ACCESS_TYPE	R0,WX					R,W		
PROT_TYPE	-							
INITIAL_VALUE	00000					000		

BIT_OFFSET	7	6	5	4	3	2	1	0
BIT_NAME	CNTPCAL[7:0]							
ACCESS_TYPE	R,W							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

[bit31:11] Reserved

[bit10:0] CNTPCAL[10:0]: Calibration clock period register

In this register the value to be loaded to the Calibration clock period counter before a calibration cycle is set and the value of the Calibration clock period counter after a calibration cycle is read.

The Calibration clock period counter counts the number of positive edges of CLK_MAIN between two positive edges of CLKCAL within a calibration measurement window duration. This is controlled by the Calibration Module during a calibration cycle. The counter value at the end of the calibration cycle is the remainder of the last CLKCAL period that was not counted by the Calibration clock counter (returned by RTC_CNTCAL). This value is then used for the next calibration cycle.

There are separate read and write registers.

CNTPCAL (read) register is updated with the Calibration clock period counter value at the end of a calibration cycle. The Calibration Done flag (RTC_WINS:CALD) and/or interrupt can be used to determine the end of a calibration cycle.

By setting '1' to RTC_WTCR:UPCAL, the CNTPCAL (write) register value is written to the CNTPCAL counter at the next calibration trigger (which can be either Automatic or Manual).

If RTC_WTCR:ACAL is changed during an ongoing calibration, the calibration will be stopped and the CNTPCAL counter will get an intermediate value. To make sure the value is not used for the next calibration cycle, software must update the CNTPCAL counter (e.g. by writing '0').

Note:

- *For a detailed description of the Automatic RTC Calibration, refer to Sections 3 and 5.*

4.11. Calibration Duration Register (RTC_DURMW)

The Calibration Duration Register stores the reload value of the Calibration Duration Counter (CNTDMW). This value is loaded into the Calibration Duration Counter at the calibration trigger. The value determines the calibration measurement window duration during which CLKCAL is measured.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	-

PROT_TYPE	-							
INITIAL_VALUE	00000000							

BIT_OFFSET	7	6	5	4	3	2	1	0
BIT_NAME	DURMW[7:0]							
ACCESS_TYPE	R/W							
PROT_TYPE	-							
INITIAL_VALUE	00000000							

[bit31:24] Reserved

[bit23:0] DURMW[23:0]: Calibration duration register

This register stores the reload value of the Calibration duration counter. The counter is controlled by the Calibration Module and is used to determine the measurement window. During the active measurement window CLKCAL is measured by the Calibration clock counter and Calibration clock period counter.

Notes:

1. *RTC_DURMW should be programmed w.r.t. CLK_MAIN to achieve a measurement duration of exactly 0.25 s. This would result in a calibration value for CLKCAL, determined by the Calibration clock counter, that perfectly matches the required setting for the Sub-Second Register (RTC_WTBR) i.e. for half a second.*

2. Due to the fixed clock prescaler of 2 for the RTC clock (CLKRTC), measuring for 0.25 s returns a calibration value for 0.5 s. Shorter measurement window durations are possible, but should be a half, quarter, etc., of the normal duration of 0.25 s. By configuring the scaling feature accordingly (RTC_WTCR:SCAL), the RTC_CNTCAL value of shorter measurement windows can be scaled to match the Sub-second counter requirements for 0.5 s.

Table 4-4 Example Configuration of RTC_DURMW Register for Different RTC_WTCR:SCAL Configurations at fCLK_MAIN, 4 MHz

RTC_WTCR:SCAL	RTC_DURMW:DURMW[23:0]
'000'	0x0F4240
'001'	0x07A120
'010'	0x03D090
'011'	0x01E848
'100'	0x00F424

Calculation Formula:

$$\text{RTC_DURMW:DURMW}[23:0] = \text{fCLK_MAIN} / (2^{\text{SCAL}}) \times 0.25 \text{ s}$$

where,

fCLK_MAIN: CLK_MAIN frequency [Hz]

4.12. Calibration Trigger Register (RTC_CALTRG)

The Calibration Trigger Register stores the reload value of the 12-bit Calibration trigger counter, which is used to generate cyclic trigger events for Automatic Calibration. This register defines the time interval in seconds between two consecutive calibration cycles (In fact, the actual time interval is $RTC_CALTRG+1$). In low-power mode, the counter cyclically triggers the Calibration Module to switch on the Main oscillation and execute a calibration cycle.

BIT_OFFSET	31	30	29	28	27	26	25	24

INITIAL_VALUE	00000000							

[bit31:12] Reserved

[bit11:0] CALTRG[11:0]: Calibration trigger register

This register stores the reload value of the 12-bit programmable Calibration trigger counter.

In Automatic Calibration mode (RTC_WTCR:ACAL is set to `1'), the Calibration trigger counter is decremented on each RTC Second interval. When the counter reaches zero, a calibration trigger is issued to the Calibration Module.

In Manual Calibration mode, this timer is not used.

Note:

- While the actual time interval (in seconds) between two consecutive calibration cycles is $RTC_CALTRG:CALTRG [11:0] + 1$, the register value is actually $RTC_CALTRG :CALTRG [11:0] - 1$.

4.13. Debug Register (RTC_DEBUG)

The Debug Register has configuration bits for debug functionality.

BIT_OFFSET	31	30	29	28	27	26	25	24

[bit31:1] Reserved: Reservation Bit

[bit0] BUSY: Busy status

BUSY	Reload Value Setting Bit to 8ms Counter
Writing	Writing is invalid.
Reading	"0" : Update completion "1" : State of BUSY The transfer from the bus clock to the RTC clock is done when writing it in RTC_PWUTRGCR. It shows for "1" this bit while updating it by the clock transfer. The bus error is returned when writing it in RTC_PWUTRGCR in the state of BUSY.

5. Usage Precaution

This section describes the precautions to be considered when using the real time clock.

Cautions

- If '1' is written to the update bit (RTC_WTCR:UPDT) at the same time the update completes, the update bit (RTC_WTCR:UPDT) is set to '0'
- If the peripheral clock is stopped after updating the Hour/Minute/Second counters using the update bit (RTC_WTCR:UPDT), read the Hour/Minute/Second Registers to confirm that they have been updated before stopping the peripheral clock
- To reset the Hour, Minute, Second and Sub-second counters before starting the RTC
 - Write '1' to the start bit (RTC_WTCR:ST)
 - Wait until RUN (RTC_WTSR:RUN) is set to '1'
 - Write '0' to the start bit (RTC_WTCR:ST)
- The RTC module Sub-Second Register stores the reload value for the Sub-second counter. This value is reloaded after the Sub-second counter reaches '0'. When modifying the Sub-Second Register, ensure that a reload operation is not performed during the write operation. However, if a Sub-Second Register update is done immediately after an RTC second interrupt, there should be enough time to securely modify the registers until the next reload operation (next second interrupt) even if RTC_WTCR:ST is not set to '0' and the module is in operation
- If a reload has occurred during the updating of the Sub-Second Register (RTC_WTBR), an unexpected value may be reloaded to the Sub-second counter. Therefore, the Sub-Second Register (RTC_WTBR) should be updated with the start bit (RTC_WTCR:ST) set to '0'
- When updating the Hour/Minute/Second registers using the RTC_WTCR:ST bit, the following must be taken into account: The new value is written into the registers with the rising edge of the RUN bit. This RUN bit is clocked by the CLKRTC. To ensure that the update is done properly, write the new values into the registers, set RTC_WTCR:ST to '0', wait for the RUN bit to go low and then start the circuit again by setting RTC_WTCR:ST to '1'. RUN will go low at the second rising edge of the CLKRTC after RTC_WTCR:ST has been set to '0'. It will rise again at the second rising edge of CLKRTC after RTC_WTCR:ST has been set to '1'. If this operation is to be repeated several times directly after each other, wait for RUN to go high before setting RTC_WTCR:ST to low again
- If a carry operation occurs (e.g. Second counter overflows and Minute counter increments) while reading the Real Timer Register (RTC_WRT), inconsistent values may be read. To avoid this, the interrupts (RTC_WINS:SUBSEC, RTC_WINS:SEC, RTC_WINS:MIN, RTC_WINS:HOURL, RTC_WINS:DAY) should be used to read the time (HH/MM/SS)
- Register(RTC_WTSR:RUNC) value is changed asynchronously with the bus clock. Therefore register value should read more than once.
- Changing the below register during the operation of calibration is prohibited.
 1. RTC_WTCR.CCKSEL

2. RTC_CNTPCAL.CNTPCAL

3. RTC_DURMW.DURMW

4. RTC_CALTRG.CALTRG

- If a calibration function is used, there is limit to clock frequency of RTC clock and CLK_SYSC0H clock.

RTC Clock * 2 < CLK_SYSC0H clock

Consider the accuracy of clock.

CHAPTER 11: CR Calibration

This chapter explains CR calibration.

1. Overview
2. Configuration
3. Explanation of Operation
4. Registers

CRCALIB-TXXPT03P01R01L06-E1-XX

1. Overview

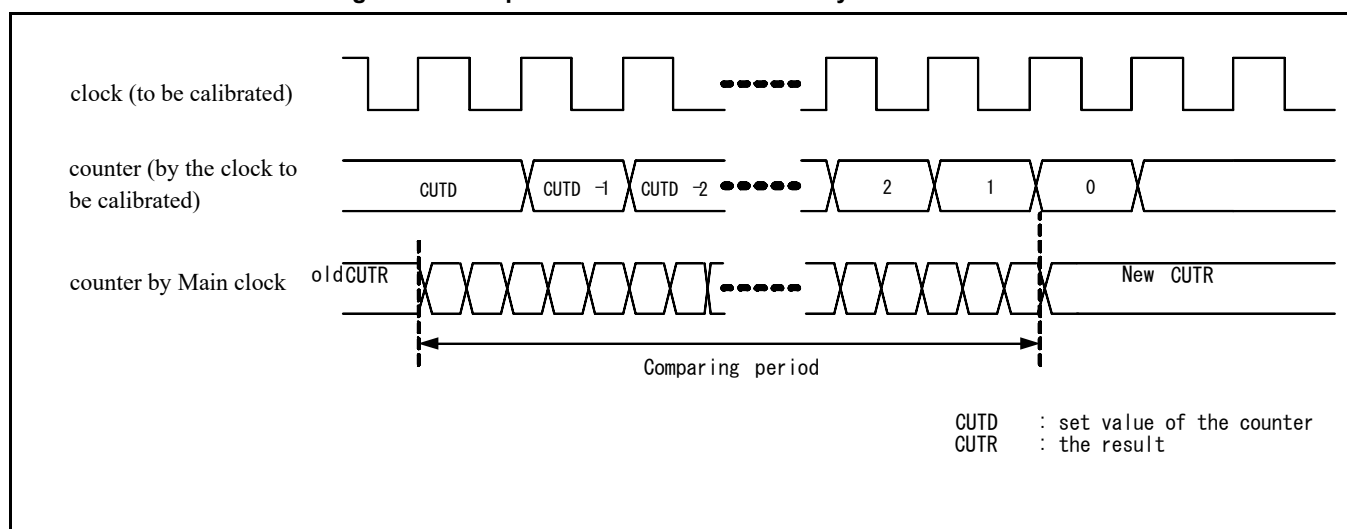

This section provides an overview of CR calibration.

The high-speed CR oscillator can correct frequencies by configuring trimming. A trimming value can be determined from the calculation of a count value for correcting the frequency of the high-speed CR oscillation circuit.

CR Oscillation Correction

Measurement of a clock error can be done by driving the counter driven by the main clock and measuring it for the set period of the counter driven by the CR clock (Figure 1-1).

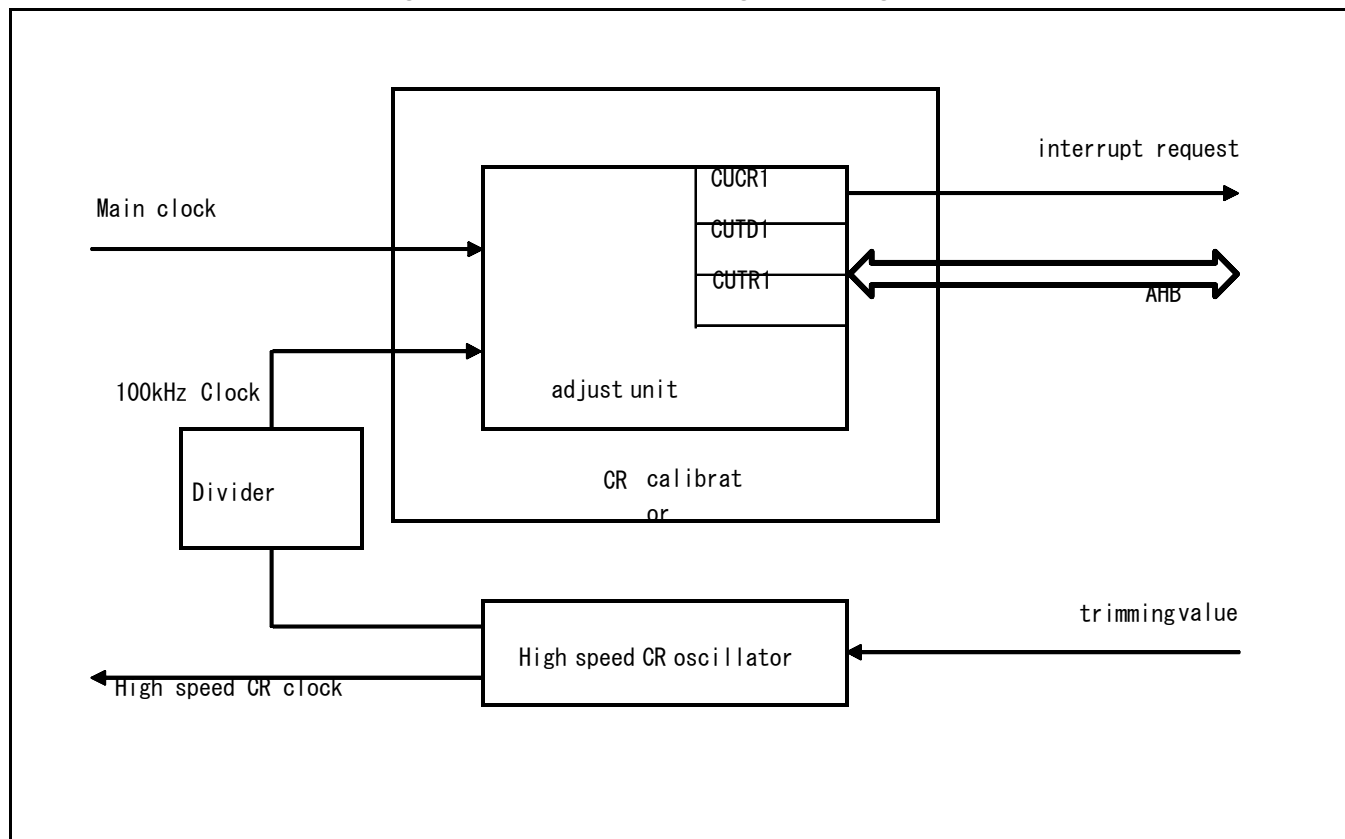

Figure 1-1 Comparison of Counters Driven by Each Clock

2. Configuration

This section explains the configuration for CR calibration.

Figure 2-1 CR Calibration Configuration Diagram

Note:

- For details on the setting of a trimming value, see the description of the high-speed CR oscillation control register (SYSC_CRCNTR) in the following chapter: "Clock System".

3. Explanation of Operation

This section explains the operation for CR calibration.

This explanation shows measurement of the CR clock frequency (error measurement). The measurement uses the following registers. For details, see Section 4.

- Correction unit control register (CUCR1)
Controls the correction unit.
- CR clock timer data register 1 (CUTD1)
Stores the set value of the measurement period. (CR clock driving)
- Main oscillation timer data register (CUTR1)
Stores the main oscillation timer count results.

3.1. CR Clock Frequency Calculation

Frequency Calculation Procedure

1. Set the CR clock timer data register 1 (CUTD1).
2. Set "1" in the interrupt enable bit (CUCR1.INTEN).
3. Set "1" in the correction start bit (CUCR1.STRT).
4. Run a loop to wait for an interrupt.
5. Generate an interrupt.
6. Read the main oscillation timer data register 1 (CUTR1).
7. The ratio of "main clock frequency:CR clock frequency" can be calculated with "CUTR1:CUTD1".

3.2. CR Clock Frequency Correction

This section shows frequency correction procedures.

Perform frequency correction in the following 2 steps by using the TRC bits for low-resolution trimming and TRF bits for high-resolution trimming.

Step 1: TRC Frequency Trimming (Low-Resolution Adjustment)

1. Set 0b11111 in the TRF bits.
2. Set 0b00000 in the TRC bits to measure the frequency. Let the measured frequency be FC0.
3. Set 0b11111 in the TRC bits to measure the frequency. Let the measured frequency be FC31.
4. Calculate the TRC code according to the following formula.

$$TC0 = 1/FC0, TC31 = 1/FC31$$

$$CODE = (TC0 - 10^*) / ((TC0 - TC31) / 31) \text{ (Round down to an integer.)}$$

$$*: 10[\mu s] \text{ (Cycle time for 100kHz)}$$
5. Use the code calculated by the above formula to measure the frequency.
 If the measured value is 100 kHz or higher, proceed to Step 2.
 If the measured value is 100kHz or lower, add 1 to the calculated code and repeat the step of 5.

Step 2: TRF Frequency Trimming (High-Resolution Adjustment)

1. Set the TRC code calculated in Step 1.
2. Set 0b00000 in the TRF bits to measure the frequency. Let the measured frequency be FF0.
3. Set 0b11111 in the TRF bits to measure the frequency. Let the measured frequency be FF31.
4. Calculate the TRF code according to the following formula.

$$TF0 = 1 / FF0, TF31 = 1 / FF31$$

$$CODE = (TF0 - 10) / ((TF0 - TF31) / 31) \text{ (Round down to an integer.)}$$

$$*: 10[\mu s] \text{ (Cycle time for 100kHz)}$$
5. Use the code calculated by the above formula to measure the frequency. Let the measured frequency be FA.
 If the measured value is 100 kHz or higher, perform the step of 11.
 If the measured value is 100 kHz or lower, perform the step of 12.
6. Subtract 1 from the calculated code and use it to measure the frequency. Let the measured frequency be FB.
 If $|FA - 100kHz| < |FB - 100kHz|$ is true, set the calculated code and complete the correction.
 If $|FA - 100kHz| > |FB - 100kHz|$ is true, replace the frequency of FB with FA and then repeat the step of 11.
7. Add 1 to the calculated code and use it to measure the frequency. Let the measured frequency be FB.
 If $|100kHz - FA| < |100kHz - FB|$ is true, set the calculated code and complete the correction.
 If $|100kHz - FA| > |100kHz - FB|$ is true, replace the frequency of FB with FA and then repeat the step of 12.

4. Registers

This section explains the CR calibration registers.

Table 4-1 lists the registers.

Table 4-1 Register List

Abbreviated Register Name	Register Name	Reference
CU_CUCR1	Correction unit control register 1	4.1
CU_CUTD1	CR oscillation timer register 1	4.2
CU_CUTR1	Main oscillation timer register 1	4.3
CU_CUCRC1	Correction unit control clear register 1	4.4

Table 4-2 shows a register map.

Table 4-2 Register Map

Offset	Register Name
0x0000_0000	CU_CUCR1 11111111_00000000
0x0000_0002	CU_CUTD1 11000011_01010000
0x0000_0004	CU_CUTR1 00000000_00000000_00000000_00000000
0x0000_0008	CU_CUCRC1 00000000_00000000_00000000_00000000

4.1. Correction Unit Control Register 1 (CU_CUCR1) (Calibration Unit Control Register 1)

This register sets the start of correction of the CR oscillation correction unit, and the clearing and enabling of interrupts.

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R1,WX							
Protection Attribute	-							
Initial Value	11111111							

Bit	7	6	5	4	3	2	1	0
Field	Reserved	Reserved		STRT	Reserved		INT	INTEN
R/W Attribute	R/W0	R0,WX		R,W	R0,WX		R,W	R/W
Protection Attribute	-							
Initial Value	0	00		0	00		0	0

[bit15:8] Reserved: Reserved Bits

[bit7] Reserved: Reserved Bit

Always write "0" to this bit. Normal operation is not guaranteed when "1" is written.

[bit6:5] Reserved: Reserved Bits

[bit4] STRT (calibration STaRT): Correction Start

This bit starts the 100 kHz drive counter generated from the main clock and CR clock. The INT bit is set to "1" at the completion of comparison.

If "0" is set, the comparison is aborted. Writing "1" during the comparison does not have any effect. The bit is cleared to "0" when the comparison is completed.

Bit	Description
0	Abort comparison.
1	Start comparison (during the comparison).

[bit3:2] Reserved: Reserved Bits

[bit1] INT (calibration INTerrupt): Interrupt

This bit is set to "1" at the completion of comparison. If the INTEN bit setting is "1", an interrupt is generated. Writing "0" clears it. If the INTC bit setting for CU_CUCRC1 register is "1", this bit will be cleared by "0".

[bit0] INTEN (calibration INTerrupt ENable): Enabling Interrupts

This bit sets whether to generate an interrupt for an INT bit setting.

Bit	Description
0	Disable interrupts.
1	Enable interrupts.

4.2. CR Clock Timer Data Register 1 (CU_CUTD1) (Calibration Unit Timer Data Register 1)

This register sets the drive period of the counter driven by the CR clock.

Bit	15	0
Field	TDD	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11000011_01010000	

[bit15:0] TDD (Timer Data Data): Timer Data

These bits set the comparison period with a number of CR clocks.

bit15:0	Description
	Number of CR Clocks
0x0000	65536
0x0001	1
0x0002	2
0x0003	3
...	...
0xC350	50000
...	...
0xFFFFD	65533
0xFFFFE	65534
0xFFFFF	65535

4.3. Main Oscillation Timer Data Register 1 (CU_CUTR1) (Calibration Unit Timer Result Register 1)

This register displays the number of counters driven by the main clock during the set period of CUTD1.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	-							
Initial Value	00000000							

Bit	23	0
Field	TDR	
R/W Attribute	R,WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000	

[bit31:24] Reserved: Reserved Bits

[bit23:0] TDR (Timer Data Register): Timer Data

These bits display the number of counts that were counted in the comparison period. Read them after the comparison is completed.

If the value read during the comparison is undefined, writing with this value is invalid.

bit23:0	Description
	Number of Main Clock Counts
0x00_0000	0
0x00_0001	1
0x00_0002	2
0x00_0003	3
...	...
0xFF_FFFD	16777213
0xFF_FFFE	16777214
0xFF_FFFF	16777215

4.4. Correction Unit Control Clear Register 1 (CU_CUCRC1) (Calibration Unit Control Register Clear Register 1)

This register clears interrupts of the CR oscillation correction unit.

Bit	31	8
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	Reserved						INTC	Reserved
R/W Attribute	R0,WX						R0,W	R0,WX
Protection Attribute	-							
Initial Value	000000						0	0

[bit31:2] Reserved: Reserved Bits

[bit1] INTC (INT Clear): Interrupt Clear

The read value is "0". If "1" is written, the INT bit in the CUCR1 register is cleared.

Bit	Description
0	No effect
1	Clear interrupts.

[bit0] Reserved: Reserved Bit

CHAPTER 12: Backup RAM Interface

This chapter provides an overview and explanation of the configuration, operation, and registers of the interface between Backup RAMs.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure
5. Registers
6. Precautions for Using Device

BURAM-TXXPT03P01R01L06-E1-XX

1. Overview

This section explains the features of the Backup RAM interface.

Target RAMs

- Backup RAM0: size is product specific
- Backup RAM1: size is product specific

RAMECC Function

RAMECC detects byte errors of up to 2 bits for data being read from and written to RAM. When RAMECC detects 1-bit errors, it corrects those errors.

- Interrupt function
 - RAMECC detects double-bit errors and generates RAM double-bit error interrupt signals.
 - RAMECC detects single-bit errors and generates RAM single-bit error interrupt signals.
- Test mode
 - Generation of pseudo-errors
 - ECC generation function disabled
 - ECC test function disabled
 - Access to the ECC area enabled

RAM Diagnosis Function

The RAM diagnosis function diagnoses and initializes the RAM. The following RAM diagnoses are selected and applied. (More than one can be selected.)

- Unique (as unique data, address information (below) is written in 52 bits containing the ECC bit.)
 - Address information
 - $((\text{address} \& 0x0000000F) \ll 48)$
 - $+ ((\text{address} \& 0x000000FF) \ll 40)$
 - $+ ((\text{address} \& 0x000000FF) \ll 32)$
 - $+ ((\text{address} \& 0x000000FF) \ll 24)$
 - $+ ((\text{address} \& 0x000000FF) \ll 16)$
 - $+ ((\text{address} \& 0x000000FF) \ll 8)$
 - $+ (\text{address} \& 0x000000FF)$
- Checker
- March (performed with all "0" and then with all "1")
- Interrupt function
 - Generates an interrupt signal triggered by diagnosis end. (RAM diagnosis end interrupt)
 - Generates an interrupt signal when an error is detected. (RAM diagnosis error interrupt)

RAM Initialization

The following types of RAM initialization are selected and applied.

- Writing all "0"
- Writing all "1"

- Interrupt function
 - Generates an interrupt signal triggered by initialization end. (RAM initialization end interrupt)

Bus Error Response

- Unprivileged write access
- Writing in lock state
- Access violation to an unlocked register
- Access to powered-off RAM
- Access to undefined or reserved area

2. Configuration

This section explains the configuration of Backup RAM.

Figure 2-1 Backup RAM Interface Block Diagram

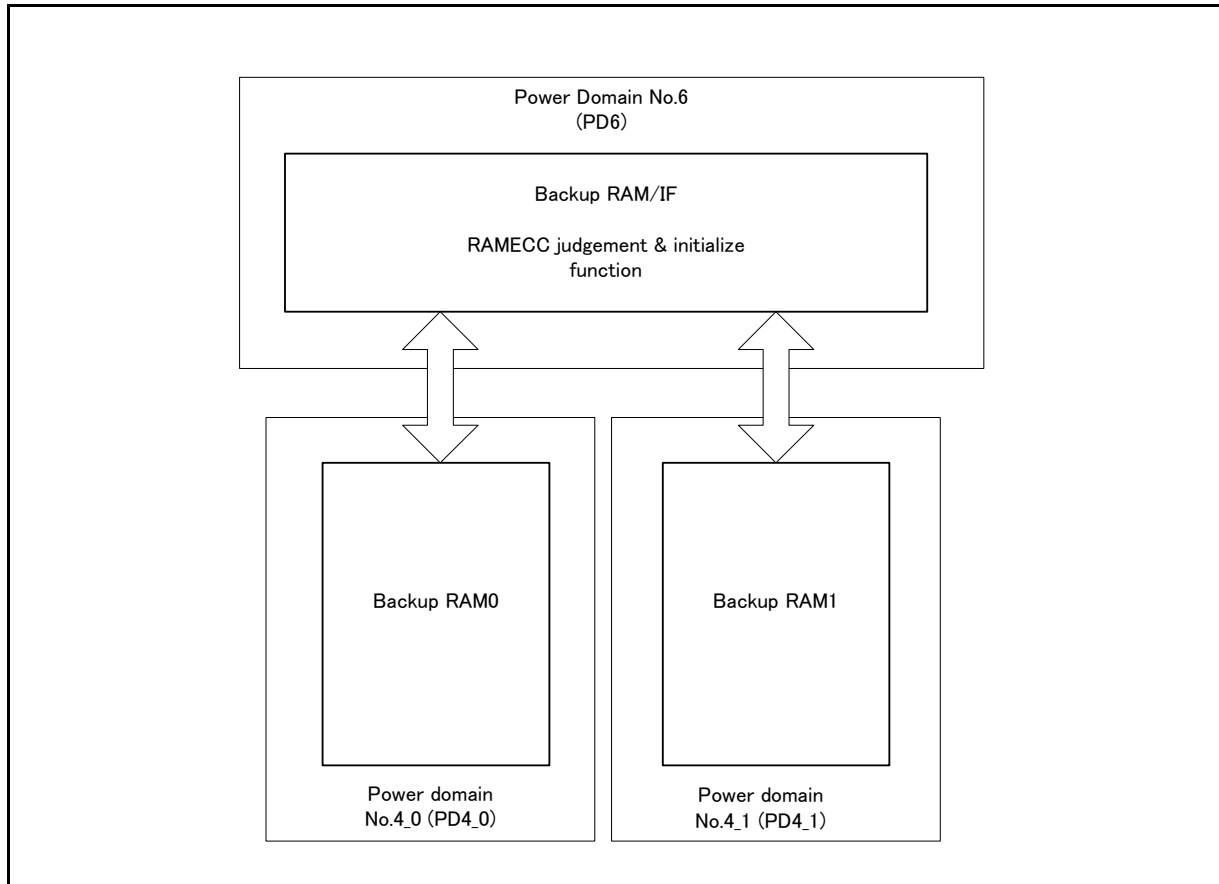

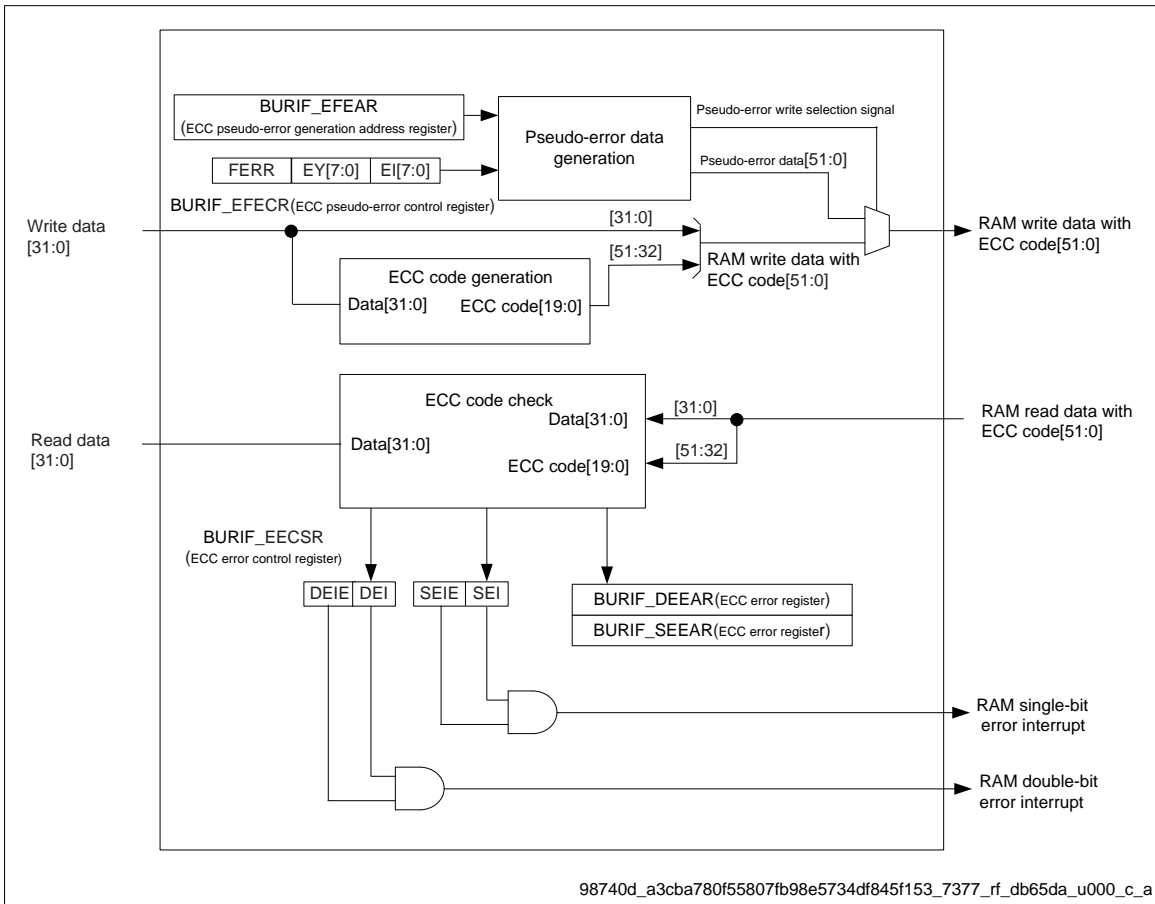

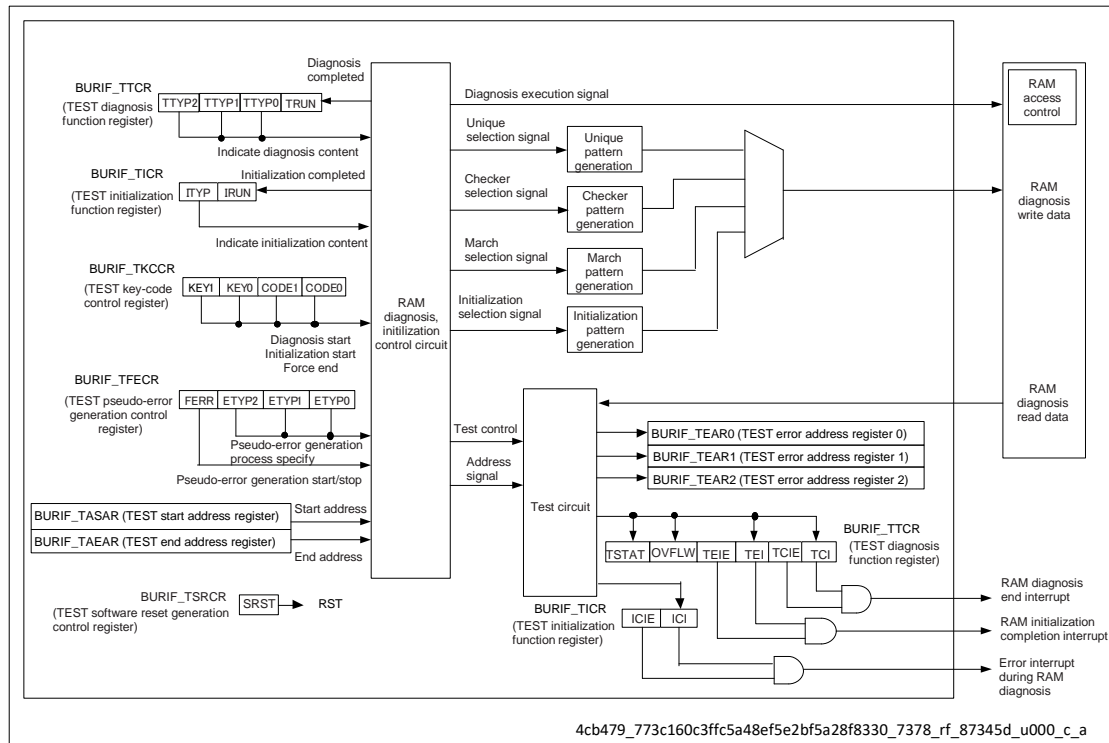

Figure 2-2 RAMECC Function Block Diagram

Figure 2-3 RAMECC Diagnosis Function Block Diagram

3. Explanation of Operation

This section explains the operation of the Backup RAM interface.

- 3.1. RAMECC Function**
- 3.2. RAM Diagnosis**
- 3.3. RAM Initialization**
- 3.4. Required Number of Cycles**
- 3.5. Bus Error Response**

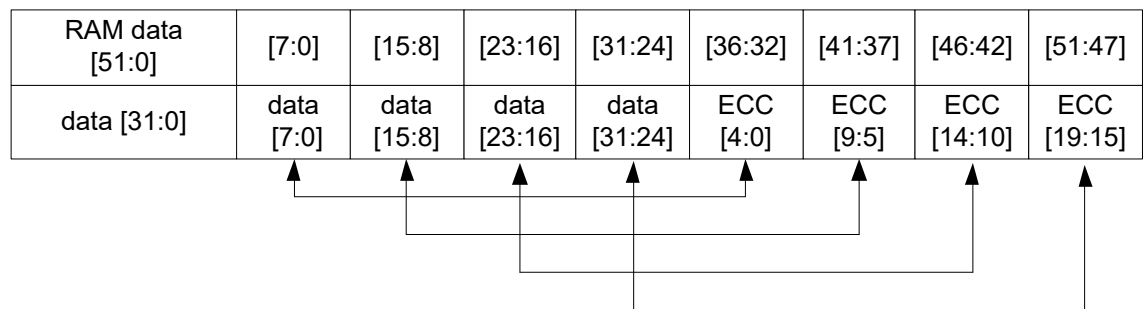

3.1. RAMECC Function

This section explains the RAMECC function.

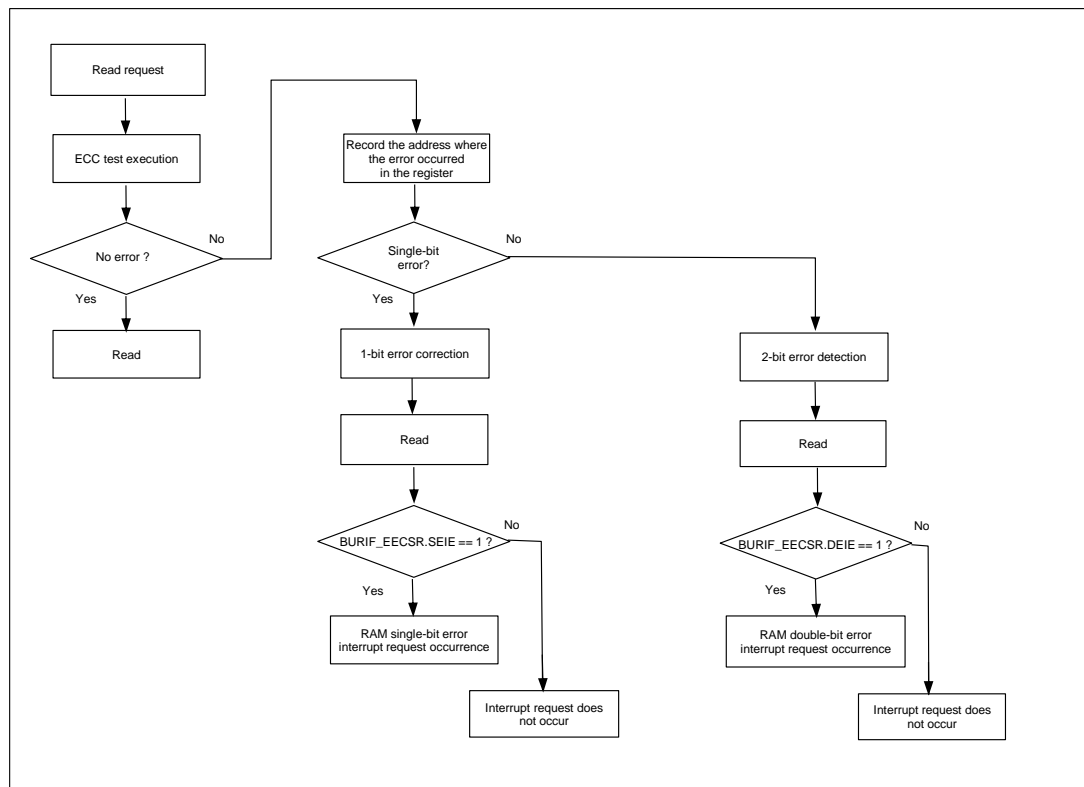

Generation of ECC

The RAMECC function is constantly running. (It does stop, however, when RAM diagnosis is being performed.) Upon the detection of a 1-bit error, the error occurrence address is held in the BURIF_SEEAR register. Upon the detection of a 2-bit error, the error occurrence address is held in the BURIF_DEEAR register. Error occurrence addresses that are currently held in the registers are not overwritten upon the subsequent detection of errors, and the initial values will be maintained.

The ECC code matrix records a set of 5 redundant bits for each byte as an ECC code.

The operation flow chart is shown below.

Interrupt-Related Registers

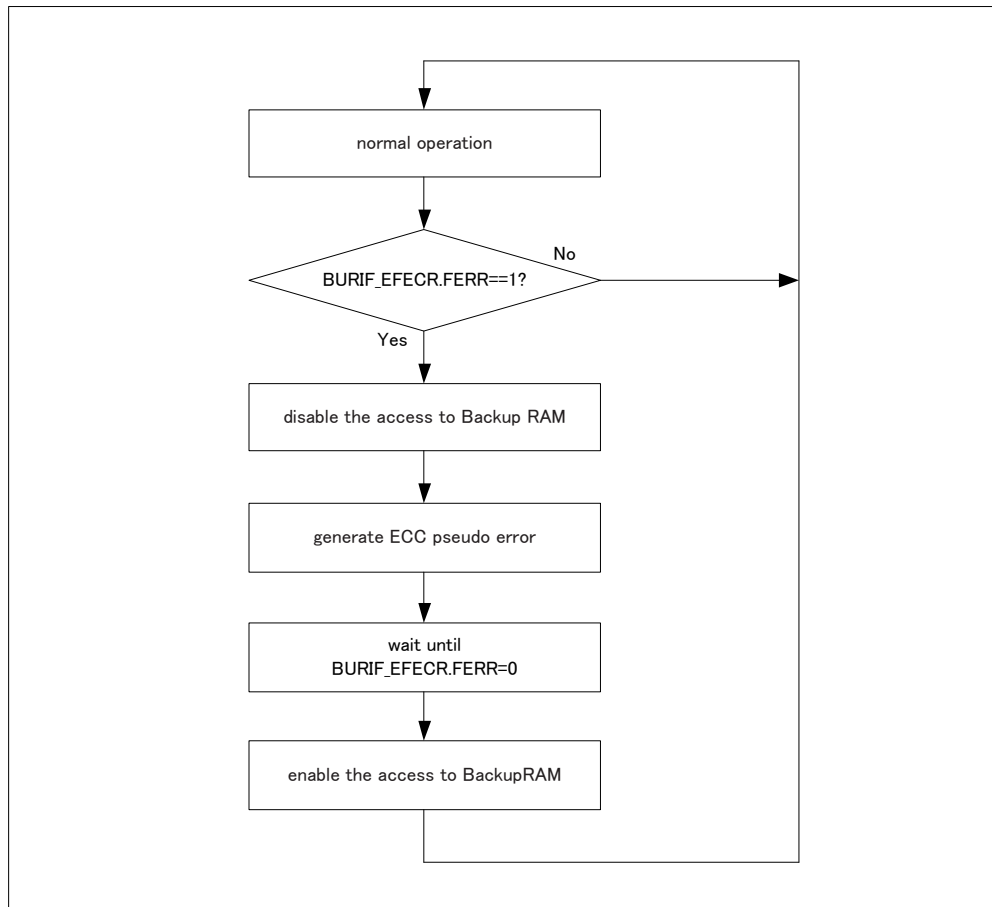

To generate an interrupt, write "1" to the interrupt generation enable bit (DEIE or SEIE) in the ECC error control register (BURIF_EECSR) in accordance with the purpose, and set the RAMECC interrupt vector. The interrupt request flag is not cleared automatically. For this reason, clear it by software using DEICLR or SEICLR of the event clear register (BURIF_EVENTCLR) before returning from the interrupt processing.

Test Mode

Pseudo-errors are generated for software debugging. ECC pseudo-errors are generated by the application of the following steps.

1. Specify the address for pseudo-error generation in the ECC pseudo-error generation address register (BURIF_EFEAR).
2. Set the byte and bit for pseudo-error generation in the ECC pseudo-error generation control register (BURIF_EFECCR).
 - (A) Specify the byte position of pseudo-error generation in EY[7:0]
 - (B) Specify the bit position of pseudo-error generation in EI[7:0]
3. Write "1" to the FERR bit in the ECC pseudo-error generation control register (BURIF_EFECCR).

The operation flow chart is shown below.

Erroneous data is deliberately written to the address specified by the ECC pseudo-error generation address register (BURIF_EFEAR) according to the contents of EY[7:0] and EI[7:0]. Data writing is followed by reading, at which point a pseudo-error is detected. The operation proceeds automatically after "1" is written to the FERR bit.

Note:

- *An error of 3 bits or more is detected as a single-bit error, which may result in an unintended correction. Accesses are blocked during ECC pseudo-error generation. Accesses should be attempted only after ECC pseudo-error processing has finished.*

Other test modes include the following functions.

- ECC generation function disabled
- ECC test function disabled
- Access to the ECC area enabled

To enable a test mode, use the ECC data path control register (BURIF_EDPCR) and the ECC test mode key code control register (BURIF_ECCTKCCR).

1. In the ECC test mode key code control register (BURIF_ECCTKCCR), write "1" to a desired test enable bit (TM_ESKPG, TM_ESKPC, or TM_EEACC), and then consecutively write 0x0, 0x1, 0x2, and 0x3 to the KEY bits in that order.
2. Check bits (TM_ESKPG, TM_ESKPC, and TM_EEACC) in the status register (BURIF_STATUS) to confirm that the setting of the ECC test mode key code control register (BURIF_ECCTKCCR) is correctly reflected.
3. Write "1" to the SKPG, SKPC, or EACC bit in the ECC data path control register (BURIF_EDPCR) to enable the test.

3.2. RAM Diagnosis

This section explains the RAM diagnosis.

RAM Diagnosis Procedure

RAM diagnosis consists of the following steps.

1. Unique (as unique data, address information (below) is written in 52 bits containing the ECC bit.)
 - Address information
 - ((address & 0x0000000F) << 48)
 - + ((address & 0x000000FF) << 40)
 - + ((address & 0x000000FF) << 32)
 - + ((address & 0x000000FF) << 24)
 - + ((address & 0x000000FF) << 16)
 - + ((address & 0x000000FF) << 8)
 - + (address & 0x000000FF)
2. Checker
3. March (performed with all "0" and then with all "1")

Only the above order of steps is allowed. The diagnosis is performed according to the setting of the TYP[2:0] bits in the TEST diagnosis function register (BURIF_TTCR). With the default setting, the unique and checker diagnoses are performed. The march diagnosis sets the RAM content to all "1" when finished. Other diagnoses leave some values in RAM. A read access without prior initialization or a write access results in an ECC error. Make sure to perform a read access after initialization or a write access.

The scope of RAM diagnosis is specified by the TEST start address register (BURIF_TASAR) and the TEST end address register (BURIF_TAEAR). A RAM diagnosis must be performed according to the following procedure.

1. Before starting a diagnosis, read TRUN in the TEST diagnosis function register (BURIF_TTCR) and IRUN in the TEST initialization function register (BURIF_TICR) to confirm that their values are "0".
If BURIF_TTCR.TRUN or BURIF_TICR.IRUN is other than "0":
 - Wait until BURIF_TTCR.TRUN = 0, and then clear BURIF_TTCR.TCI.
 - Wait until BURIF_TICR.IRUN = 0, and then clear BURIF_TICR.ICI.
2. In the TEST key code control register (BURIF_TKCCR), consecutively write "02h", "42h", "82h", and "C2h," in that order, to start the diagnosis. When all the RAM diagnoses end, the TRUN bit of the TEST diagnosis function register (BURIF_TTCR) becomes "0" to exit the RAM diagnosis. The diagnosis results are retained in the TEST error address registers 0 to 2 (TEAR0 to TEAR2) and in the TEST diagnosis function register (BURIF_TTCR). The diagnosis data remains in the RAM. Moreover, RAM diagnosis is forcibly terminated by consecutively writing "00h", "40h", "80h", and "C0h," in that order, to the TEST key code

control register (BURIF_TKCCR). The RAM diagnosis is terminated even if it has not been completed. In this case, the diagnosis result is not guaranteed.

Interrupt-Related Registers

To generate an interrupt, write "1" to an interrupt generation enable bit (TEIE or TCIE) in the TEST diagnosis function register (BURIF_TTCR) in accordance with the purpose, and then set the RAMECC interrupt vector. The interrupt request flag is not cleared automatically. For this reason, clear it by software using TEICLR or TCICLR of the event clear register (BURIF_EVENTCLR) before returning from the interrupt processing.

Procedure for Generating a RAM Diagnosis Pseudo-Error

This function deliberately generates a pseudo-error for software debugging.

A RAM diagnosis pseudo-error is generated by applying the following steps.

1. Set the error type in the pseudo-error generation control register (BURIF_TFECR).
 - (A) Set a diagnosis pattern in BURIF_TFECR.ETYP[2:0] for pseudo-error generation.
 - (B) Specify a diagnosis pattern for pseudo-error generation by writing BURIF_TFECR.FERR = 1.
2. Set the start of diagnosis processing in the TEST diagnosis function register (BURIF_TTCR).
 - (A) Set the diagnosis pattern to be applied in BURIF_TTCR.TTYP[2:0].
 - (B) In the TEST key code control register (BURIF_TKCCR), consecutively write "02h", "42h", "82h", and "C2h," in that order, to set the diagnosis pattern using the operation start procedure.

3.3. RAM Initialization

This section explains RAM initialization.

Operation for RAM Initialization

RAM initialization is done in either of the following ways.

- Writing all "0" (default)
- Writing all "1"

This is specified by the ITYP bit in the TEST initialization function register (BURIF_TICR). The value corresponding to the write value is written in the ECC area. The scope of RAM initialization is specified by the TEST start address register (BURIF_TASAR) and the TEST end address register (BURIF_TAEAR). RAM initialization must be performed by applying the following procedure.

1. Before starting initialization, read TRUN in the TEST diagnosis function register (BURIF_TTCR) and IRUN in the TEST initialization function register (BURIF_TICR) to confirm that their values are "0".
If BURIF_TTCR.TRUN or BURIF_TICR.IRUN is not "0":
 - Wait until BURIF_TTCR.TRUN = 0, and then clear BURIF_TTCR.TCI.
 - Wait until BURIF_TICR.IRUN = 0, and then clear BURIF_TICR.ICI.
2. Write to the TEST key code control register (BURIF_TKCCR) 4 times consecutively in the order of "01h", "41h", "81h", and then "C1h" to start the initialization. When RAM initialization ends, the IRUN bit in the TEST initialization function register (BURIF_TICR) goes to "0" and RAM initialization ends. RAM initialization is forcibly terminated by writing 4 times consecutively in the order of "00h", "40h", "80h", and then "C0h" in the TEST key code control register (BURIF_TKCCR). The RAM initialization is terminated even if it has not yet been completed. In this case, the initialization result is not guaranteed.

Interrupt-Related Registers

To generate an interrupt, write "1" to the interrupt generation enable bit (ICIE) in the TEST initialization function register (BURIF_TICR) in accordance with the purpose, and then set the interrupt vector. The interrupt request flag is not cleared automatically. For this reason, clear it by software using the event clear register (BURIF_EVENTCLR.ICICLR) before returning from the interrupt processing.

3.4. Required Number of Cycles

This section explains the required number of cycles.

In the example shown below, the number of cycles required for RAM diagnosis and initialization is calculated.

Backup RAM
16 K word address (64 KB)

RAM Diagnosis (Uniqueness)

For a 1-word address:

- Write (1 cycle)
- Read 1 (1 cycle)
- Read 2 (1 cycle)

The above processing is required for each word address (for 16K). The resulting number of cycles is as follows.

$$\left(\frac{1}{\text{write}} + \frac{1}{\text{read1}} + \frac{1}{\text{read2}} \right) \times \frac{16384}{16\text{Kword}} + 1 = \frac{49153}{\text{result}}$$

RAM Diagnosis (Checker)

For a 1-word address:

- Write 1 (1 cycle)
- Read 1 (1 cycle)

The above processing is required for each word address (for 16 K). In addition, 5 writes and 4 reads are required for a word address for the partial write function.

- Write 2 (1 x 5 cycles)
- Read 2 (2 x 4 cycles)

These cycles are required. Furthermore, the same processing is repeated with different data. This gives the total number of cycles for the following.

$$\left(\left(\frac{1}{\text{write1}} + \frac{1}{\text{read1}} \right) \times \frac{16384}{16\text{Kword}} + 1 + \frac{5}{\text{write2}} + \frac{8}{\text{read2}} \right) \times \frac{2}{\text{repeat}} = \frac{65564}{\text{result}}$$

RAM Diagnosis (March)

Each word address requires 3 writes and 2 reads.

- Write (1 x 3 cycles)
- Read (2 x 2 cycles)

The above processing is required for each of the word addresses (16 K). Furthermore, the same processing is repeated with different data. This leads to the total number of cycles for the following.

$$\left(\frac{3}{\text{write}} + \frac{4}{\text{read1}} \right) \times \frac{16384}{16\text{Kword}} \times \frac{2}{\text{repeat}} = \frac{229376}{\text{result}}$$

RAM Initialization

For a 1-word address:

- Write (1 cycle)

The above processing is required for each word address (for 16K). The resulting number of cycles is as follows.

$$\frac{1}{\text{write}} \times \frac{16384}{16\text{Kword}} = \frac{16384}{\text{result}}$$

3.5. Bus Error Response

This section explains the bus error response.

The Backup RAM interface returns a bus error under the following conditions:

1. Unprivileged write access to the Backup RAM interface register
2. Write access to the Backup RAM interface register in the lock state (BURIF_STATUS.LOCKSTATUS=1)
3. Write access to a value other than the unlock and lock values in the BURIF_UNLOCK register
4. Write access other than 32-bit access to the BURIF_UNLOCK register
5. Access to powered-off Backup RAM
6. Write access to an undefined or reserved space

4. Setting Procedure

This section describes the setting procedure for the Backup RAM interface registers.

Figure 4-1 Register Setting Flow

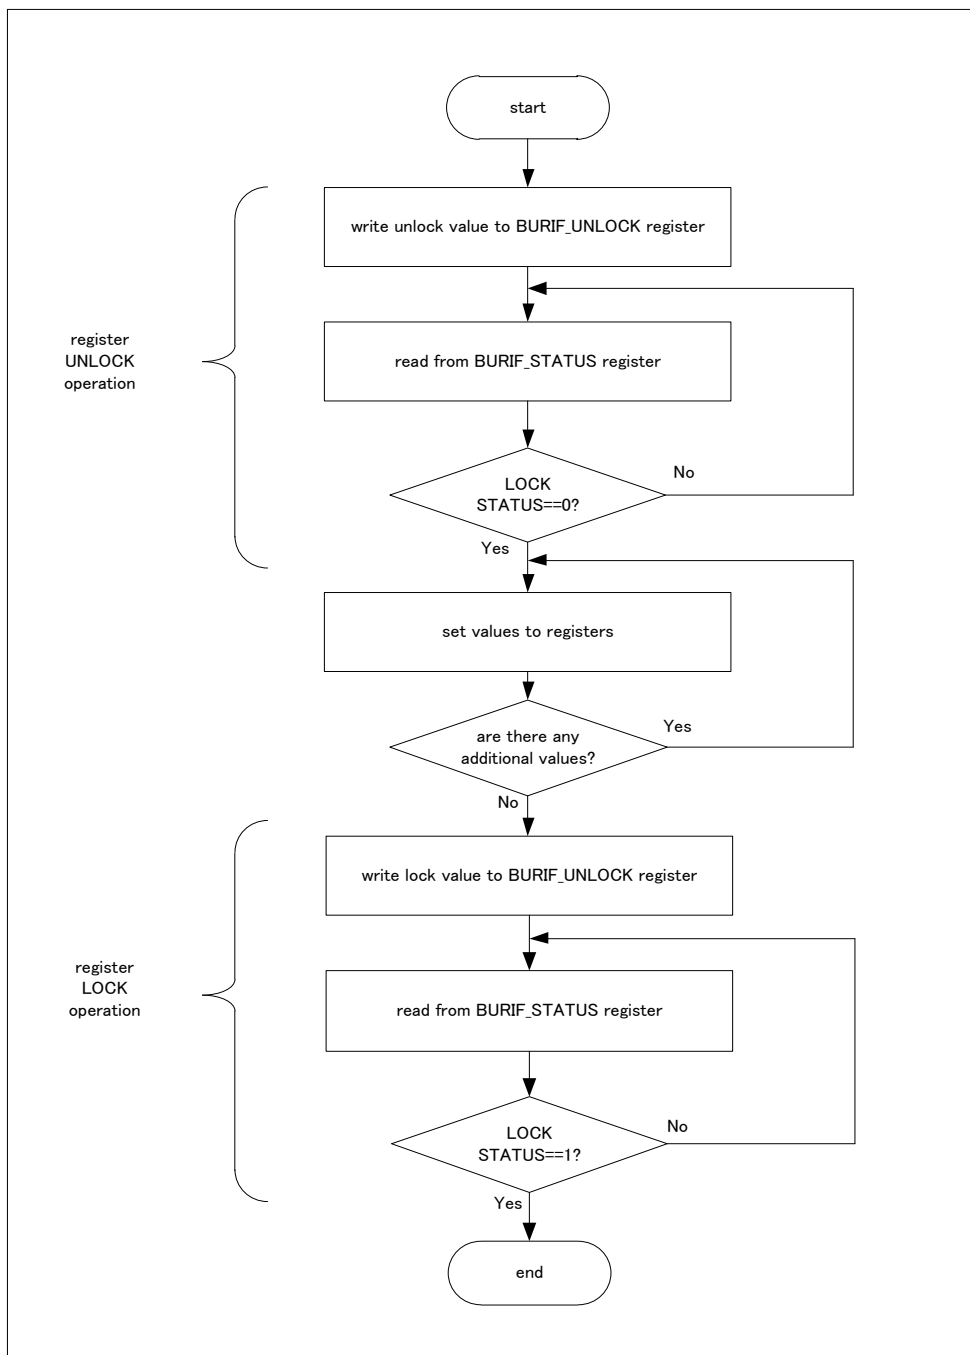

Figure 4-2 Setting Flow of ECC Test Mode Key Code Control Register

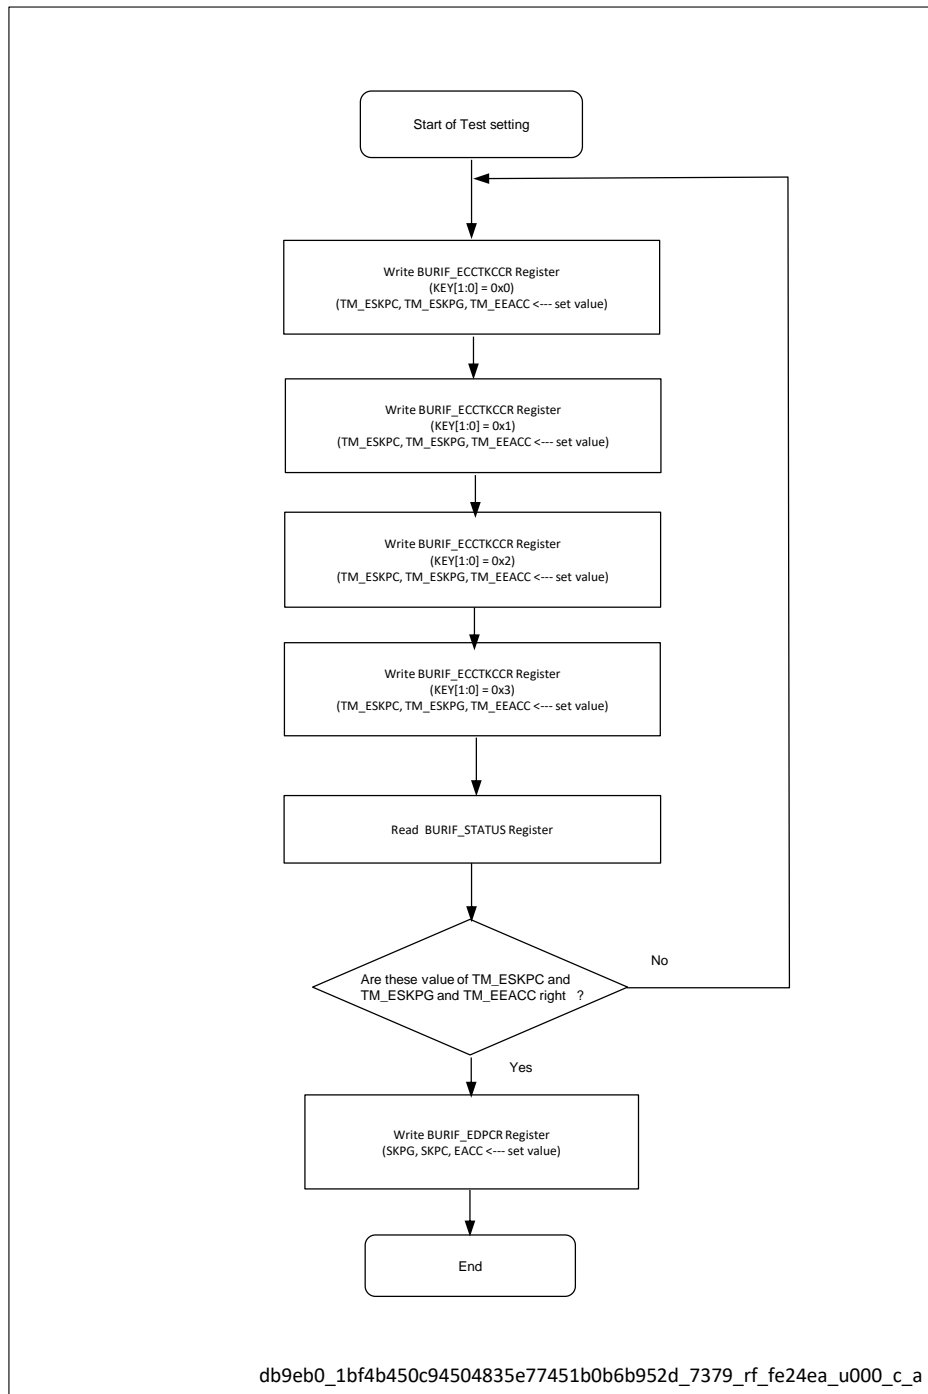

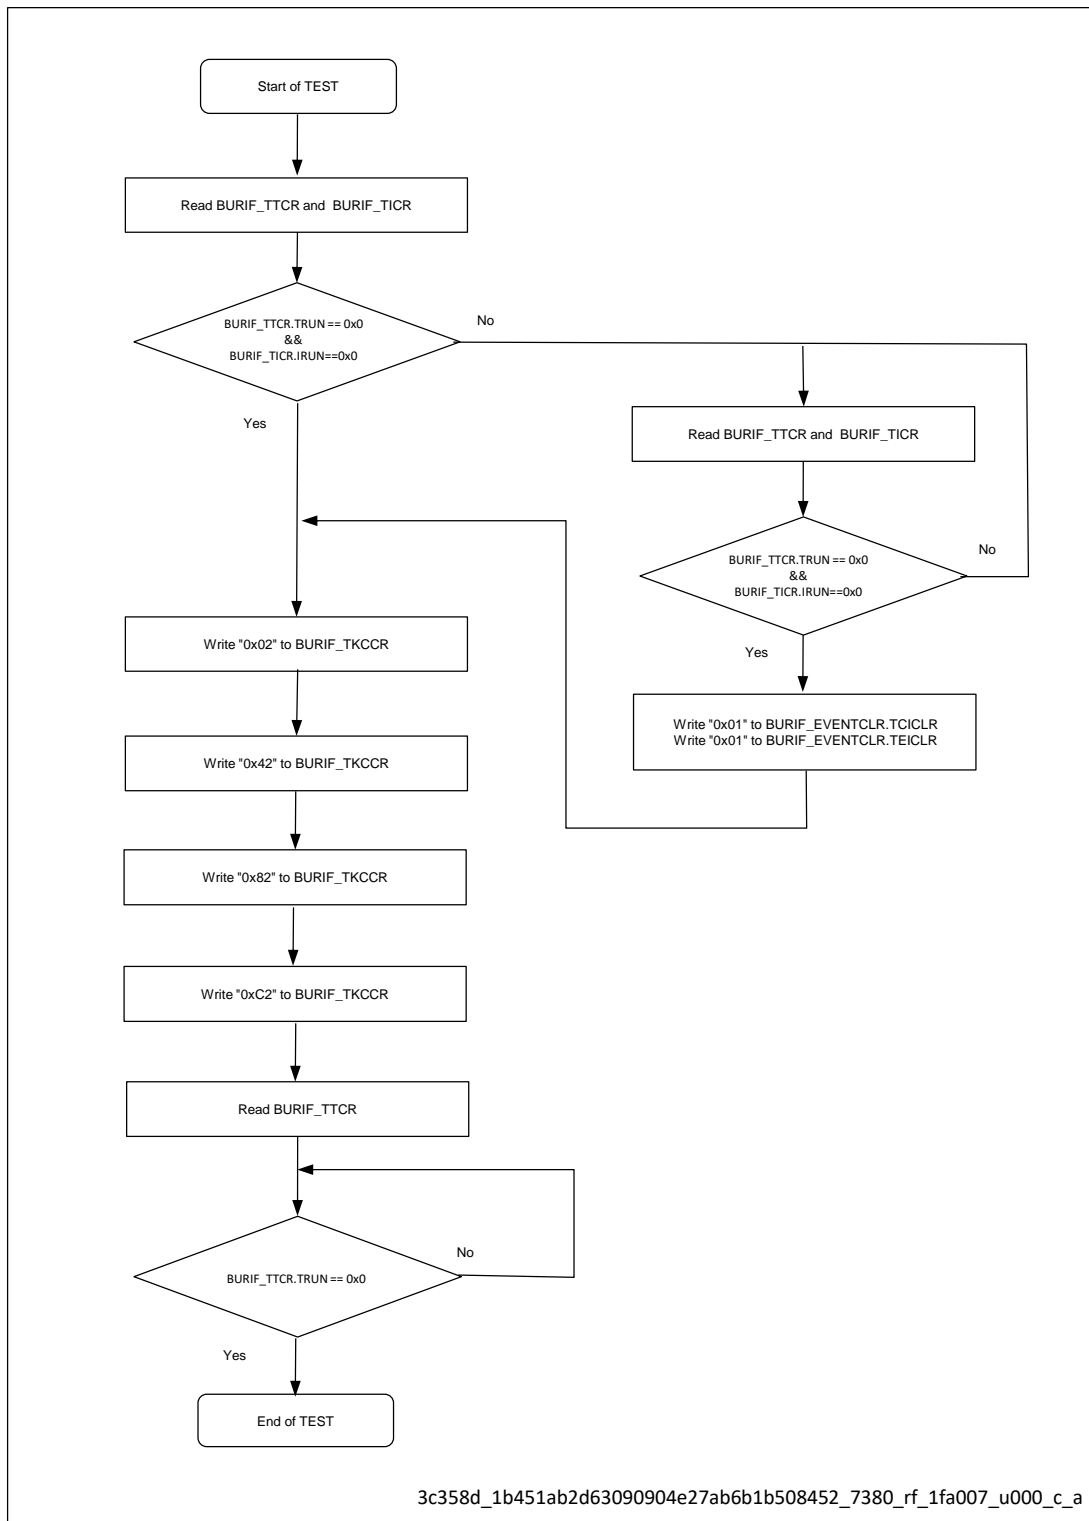

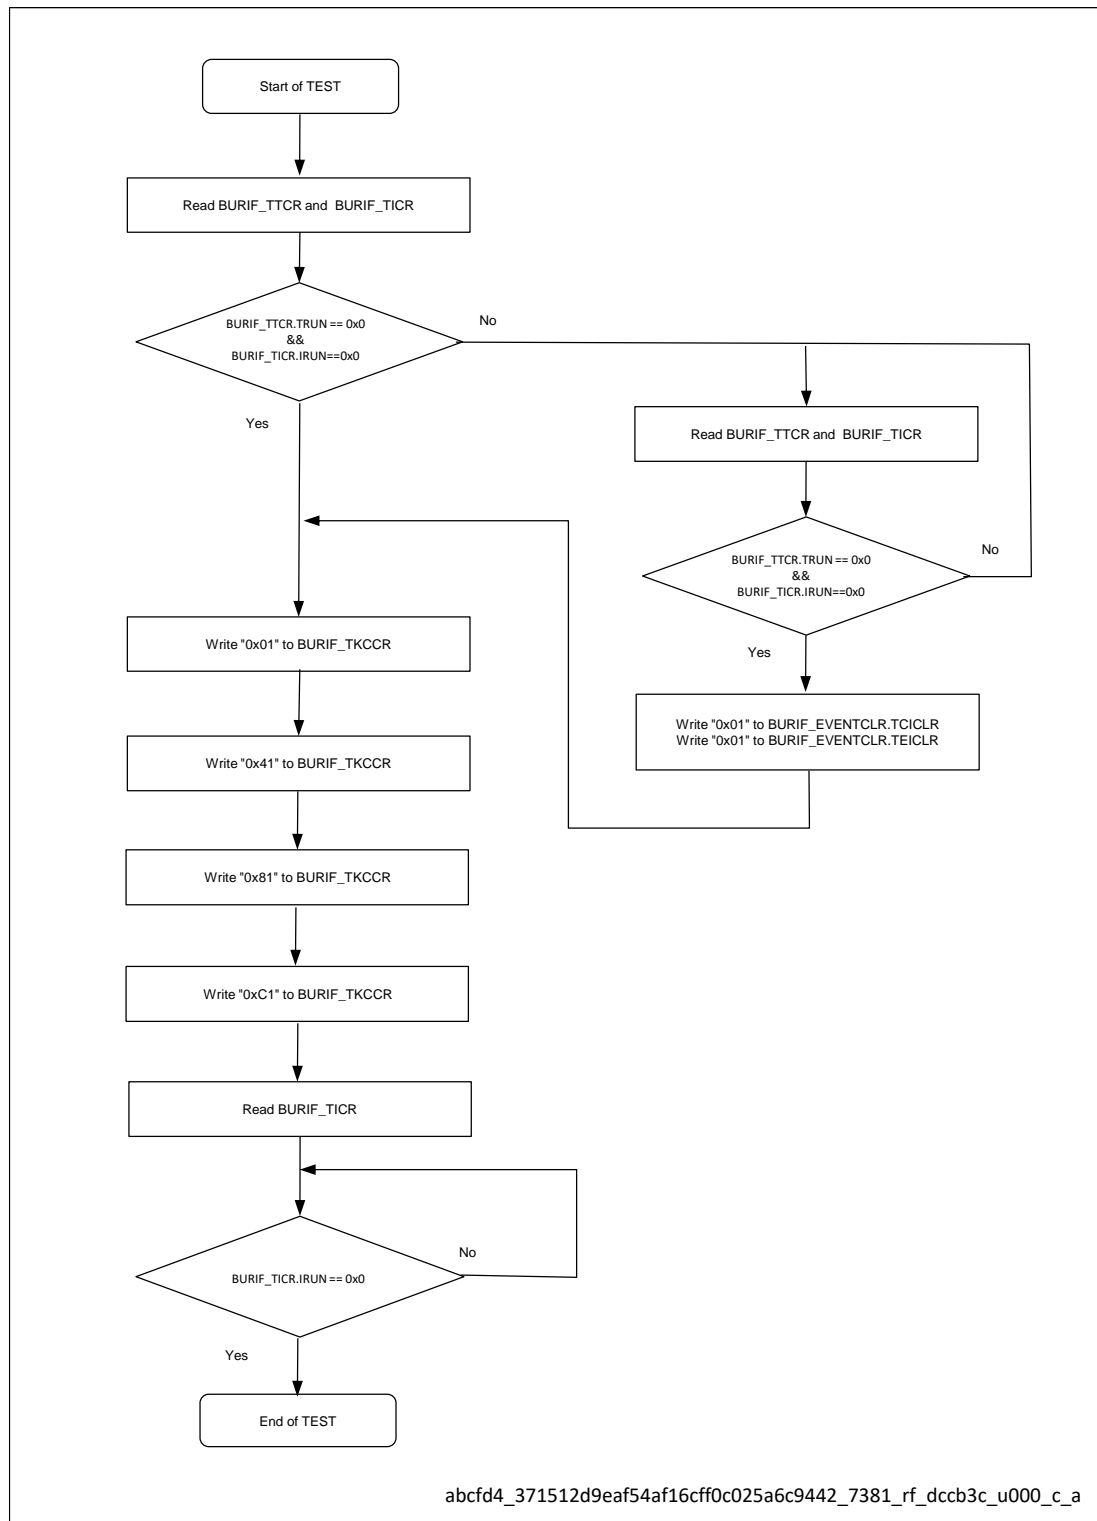

Figure 4-3 Setting Flow of RAM Self Diagnosis

Figure 4-4 Setting Flow of RAM Initialization

5. Registers

This chapter provides a list of the Backup RAM interface registers.

Table 5-1 Backup RAM Interface Registers

Abbreviated Register Name	Register Name	Reference
BURIF_UNLOCK	BURAMIF unlock register	5.1
BURIF_STATUS	BURAMIF status register	5.2
BURIF_DEEAR	BURAMIF double-bit ECC error address register	5.3
BURIF_SEEAR	BURAMIF single-bit ECC error address register	5.4
BURIF_EFEAR	BURAMIF ECC pseudo-error generation address register	5.5
BURIF_EECSR	BURAMIF ECC error control register	5.6
BURIF_EFECDR	BURAMIF ECC pseudo-error generation control register	5.7
BURIF_EDPCR	BURAMIF ECC data path control register	5.8
BURIF_ECCTKCCR	BURAMIF ECC test mode key code control register	5.9
BURIF_TEAR0	BURAMIF TEST error address register 0	5.10
BURIF_TEAR1	BURAMIF TEST error address register 1	5.11
BURIF_TEAR2	BURAMIF TEST error address register 2	5.12
BURIF_TASAR	BURAMIF TEST start address register	5.13
BURIF_TAEAR	BURAMIF TEST end address register	5.14
BURIF_TTCR	BURAMIF TEST diagnosis function register	5.15
BURIF_TICR	BURAMIF TEST initialization function register	5.16
BURIF_TFECDR	BURAMIF TEST pseudo-error generation control register	5.18
BURIF_TKCCR	BURAMIF TEST key code control register	5.19
BURIF_TSRCDR	BURAMIF TEST software reset generation control register	5.17
BURIF_EVENTCLR	BURAMIF event clear register	5.20

Table 5-2 Register Memory Layout

Address	+3	+2	+1	+0
0x0000_0000	BURIF_UNLOCK 00000000_00000000_00000000_00000000			
0x0000_0004	BURIF_STATUS 00000000_00000000_00000001_00000000			
0x0000_0008	BURIF_SEEAR 00000000_00000000		BURIF_DEEAR 00000000_00000000	
0x0000_000C	BURIF_EECSR 00000000	Reserved 00000000	BURIF_EFEAR 00000000_00000000	
0x0000_0010	BURIF_EDPCR 00000000	BURIF_EFECR 00000000_00000000_00000000		
0x0000_0014	Reserved 00000000	Reserved 00000000	Reserved 00000000	BURIF_ECCTKCCR 00000000
0x0000_0018	BURIF_TEAR0 00000000_00000000_00000000_00000000			
0x0000_001C	BURIF_TEAR1 00000000_00000000_00000000_00000000			
0x0000_0020	BURIF_TEAR2 00000000_00000000_00000000_00000000			
0x0000_0024	BURIF_TAEAR 0****111_11111111		BURIF_TASAR 00000000_00000000	
0x0000_0028	BURIF_TFECR 00000000	BURIF_TICR 00000000	BURIF_TTCR 00000000_00001100	
0x0000_002C	BURIF_TSRCR 00000000	Reserved 00000000	Reserved 00000000	BURIF_TKCCR 00000000
0x0000_0030	BURIF_EVENTCLR 00000000_00000000_00000000_00000000			

Notes:

- An asterisk means that BURIF_TAEAR initial Value changes according to RAM size.
 - 00000111_11111111 8KB
 - 00001111_11111111 16KB
 - 00011111_11111111 32KB
 - 00111111_11111111 64KB
 - 01111111_11111111 128KB

5.1. BURAMIF Unlock Register (BURIF_UNLOCK)

This register locks or unlocks write accesses to the Backup RAM interface registers. Writing the unlock value (0xACC55ECC) to this register enables write accesses to the registers. After setting the registers, writing the lock value (0x5ECCB10C) to this register disables write access to the registers. Writing to this register can be done only by privileged accesses in word units.

Bit	31	0
Field	UNLOCK[31:0]	
R/W Attribute	R0,W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] UNLOCK: Lock/Unlock Bits

UNLOCK	Lock/Unlock Bit
During Write Operation	<p>These bits lock and unlock write accesses to the registers.</p> <p>0xACC55ECC: LOCKSTATUS in BURIF_STATUS becomes "0", and write access to the Backup RAM interface registers is enabled.</p> <p>0x5ECCB10C: LOCKSTATUS in BURIF_STATUS becomes "1", and write access to the Backup RAM interface registers is disabled.</p> <p>Other values: An error is generated.</p> <p>For details, see "Figure 4-1 Register Setting Flow"</p>
During Read Operation	"0" is always read.

5.2. BURAMIF Status Register (BURIF_STATUS)

This register contains the LOCKSTATUS bit that indicates the lock/unlock status of the Backup RAM interface registers. This register also contains the status signals that indicate the ECC area access enable, ECC generation function disable, and ECC test function disable that are test modes.

Bit	31							8
Field	Reserved							LOCK STATUS
R/W Attribute	R0,W0							R,WX
Protection Attribute	-							
Initial Value	00000000_00000000_00000000							1

Bit	7	6	5	4	3	2	1	0
Field	Reserved					TM_ ESKPG	TM_ ESKPC	TM_ EEACC
R/W Attribute	R0,W0					R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	00000					0	0	0

[bit31:9] Reserved: Reserved Bits

[bit8] LOCKSTATUS: Lock Status Bit

LOCK STATUS	Lock Status Bit
During Write Operation	No effect
During Read Operation	0: Backup RAM interface registers are unlocked. 1: Backup RAM interface registers are locked. (initial value)

[bit7:3] Reserved: Reserved Bits

[bit2] TM_ESKPG: ECC Generation Function Disable Status Bit

TM_ESKPG	ECC Generation Function Disable Status Bit
During Write Operation	No effect
During Read Operation	<p>0: Disabling of the test-mode ECC generation function is not allowed (initial value). Writing "1" to BURIF_EDPCR.SKPG does not allow disabling of the test-mode ECC generation function.</p> <p>1: Disabling of the test-mode ECC generation function is allowed. Writing "1" to BURIF_EDPCR.SKPG allows disabling of the test-mode ECC generation function.</p>

[bit1] TM_ESKPC: ECC Test Function Disable Status Bit

TM_ESKPC	ECC Test Function Disable Status Bit
During Write Operation	No effect
During Read Operation	0: Disabling of the test-mode ECC test function is not allowed (initial value). Writing "1" to BURIF_EDPCR.SKPC does not allow disabling of the test-mode ECC test function. 1: Disabling of the test-mode ECC test function is allowed. Writing "1" to BURIF_EDPCR.SKPC allows disabling of the test-mode ECC test function.

[bit0] TM_EEACC: ECC Area Access Enable Status Bit

TM_EEACC	ECC Area Access Enable Status Bit
During Write Operation	No effect
During Read Operation	0: Access to the test-mode ECC area is not allowed (initial value). Writing "1" to BURIF_EDPCR.EACC does not enable access to the test-mode ECC area. 1: Access to test-mode ECC area is allowed. Writing "1" to BURIF_EDPCR.EACC enables access to the test-mode ECC area.

5.3. BURAMIF Double-Bit ECC Error Address Register (BURIF_DEEAR)

The double-bit ECC error address register holds the address of a 2-bit error detected by an ECC test of the Backup RAM.

Bit	15	14	13	12	11	10	9	8
Field	Reserved	ERR_ADDR[14:8]						
R/W Attribute	R0,W0	R,WX						
Protection Attribute	-							
Initial Value	0	0000000						

Bit	7	6	5	4	3	2	1	0
Field	ERR_ADDR[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit15] Reserved: Reserved Bit

[bit14:0] ERR_ADDR: Double-Bit Error Occurrence Address Bits

These bits hold the address of a 2-bit error detected by the ECC test. The error occurrence address that is currently held in the register is not overwritten upon subsequent detections of the above condition, and the initial value will be maintained.

Notes:

- *ERR_ADDR is an offset in word units (RAM address).*
- *Obtain the absolute address by adding {ERR_ADDR << 2} to the base address.*
- *The effective address of ERR_ADDR changes according to RAM size.*
 - 64KB Effective address: ERR_ADDR[13:0]

5.4. BURAMIF Single-Bit ECC Error Address Register (BURIF_SEEAR)

The single-bit ECC error address register holds the address of a 1-bit error detected by the ECC test for Backup RAM.

Bit	15	14	13	12	11	10	9	8
Field	Reserved	ERR_ADDR[14:8]						
R/W Attribute	R0,W0	R,WX						
Protection Attribute	-							
Initial Value	0	0000000						

Bit	7	6	5	4	3	2	1	0
Field	ERR_ADDR [7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit15] Reserved: Reserved Bit

[bit14:0] ERR_ADDR: Single-Bit Error Occurrence Address Bits

These bits hold the address of a 1-bit error detected by the ECC test. The error occurrence address that is currently held in the register is not overwritten upon subsequent detections of the above condition, and the initial value will be maintained.

Notes:

- *ERR_ADDR is an offset in word units (RAM address).*
- *Obtain the absolute address by adding {ERR_ADDR << 2} to the base address.*
- *The effective address of ERR_ADDR changes according to RAM size.*
 - 64KB Effective address: ERR_ADDR[13:0]

5.5. BURAMIF ECC Pseudo-Error Generation Address Register (BURIF_EFEAR)

The ECC pseudo-error generation address register specifies the address that generates a pseudo-error for Backup RAM. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	15	14	13	12	11	10	9	8
Field	ERR_ADDR[14:8]							
R/W Attribute	R0,W0							
Protection Attribute	WP							
Initial Value	0							

Bit	7	6	5	4	3	2	1	0
Field	ERR_ADDR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WP							
Initial Value	00000000							

[bit15] Reserved: Reserved Bit

[bit14:0] ERR_ADDR: Pseudo-Single-Bit Error Occurrence Address Setting Bits

These bits specify the address that generates a pseudo ECC error generation for Backup RAM. When BURIF_EFECR.FERR = 1, these bits generate a write access to the address and deliberately include an error in the data to be written according to the BURIF_EFECR setting, which generates an ECC error.

Notes:

- *ERR_ADDR is an offset in word units (RAM address).*
- *Obtain the absolute address by adding {ERR_ADDR << 2} to the base address.*
- *The effective address of ERR_ADDR changes according to RAM size.*
- 64KB Effective address: ERR_ADDR[13:0]

5.6. BURAMIF ECC Error Control Register (BURIF_EECSR)

This register indicates whether 1-bit error correction or 2-bit error detection has occurred during an ECC test for Backup RAM. This register specifies whether interrupts by 2-bit error detection are enabled.

Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	7	6	5	4	3	2	1	0
Field	Reserved				DEIE	DEI	SEIE	SEI
R/W Attribute	R0,W0				R/W	R,W	R/W	R,W
Protection Attribute	WP							
Initial Value	0000				0	0	0	0

[bit7:4] Reserved: Reserved Bits

[bit3] DEIE: Double-Bit-Error-Caused Interrupt Enable Bit

DEIE	Double-Bit-Error-Caused Interrupt Enable Bit
During Write Operation	0: Disable interrupts. 1: Enable Interrupts.
During Read Operation	The value set in this bit is read.

[bit2] DEI: Double-Bit Error Occurrence Bit

DEI	Double-Bit Error Occurrence Bit
During Write Operation	0: Clear this bit. 1: No effect.
During Read Operation	0: Double-bit error has not occurred. 1: Double-bit error has occurred.

[bit1] SEIE: Single-Bit-Error-Caused Interrupt Enable Bit

SEIE	Single-Bit-Error-Caused Interrupt Enable Bit
During Write Operation	0: Disable interrupts. 1: Enable Interrupts.
During Read Operation	The value set in this bit is read.

[bit0] SEI: Single-Bit Error Occurrence Bit

SEI	Single-Bit Error Occurrence Bit
During Write Operation	0: Clear this bit. 1: No effect.
During Read Operation	0: Single-bit error has not occurred. 1: Single-bit error has occurred.

5.7. BURAMIF ECC Pseudo-Error Generation Control Register (BURIF_EFECR)

The ECC pseudo-error generation control register specifies the content of the Backup RAM pseudo-error to be generated in the form of a generation byte and generation bit. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	23	22	21	20	19	18	17	16
Field	Reserved							FERR
R/W Attribute	R0,W0							R/W
Protection Attribute	WP							
Initial Value	0000000							0

Bit	15	14	13	12	11	10	9	8
Field	EY[7:0]							
R/W Attribute	R/W							
Protection Attribute	WP							
Initial Value	00000000							

Bit	7	6	5	4	3	2	1	0
Field	EI[7:0]							
R/W Attribute	R/W							
Protection Attribute	WP							
Initial Value	00000000							

[bit23:17] Reserved: Reserved Bits

[bit16] FERR: Pseudo-Error Generation Enable Bit

This bit enables the generation of pseudo-ECC-errors.

FERR	Pseudo-Error Generation Enable Bit
During Write Operation	0: No effect. When generation of pseudo-ECC-errors is completed, this bit is automatically cleared to "0" by the hardware. 1: Enable generation of pseudo-ECC-errors.
During Read Operation	0: Generation of pseudo-ECC-errors is the disabled status. (Normal operation) 1: Generation of pseudo-ECC-errors is the enabled status.

[bit15:8] EY7 to EY0: Pseudo-Error Generation Byte Setting Bits

These bits specify the byte position of the pseudo-ECC-error generation in Backup RAM.

EY7 to EY0	Target Bytes in RAM
EY0	RAM data [7:0]
EY1	RAM data [15:8]
EY2	RAM data [23:16]
EY3	RAM data [31:24]
EY4	RAM data [36:32]
EY5	RAM data [41:37]
EY6	RAM data [46:42]
EY7	RAM data [51:47]

For example, if EY2 = 1 while the other bits are "0", the target byte for pseudo-error generation is RAM data [23:16], and the other data will not have errors. If EY2 = EY3 = 1 while the other bits are "0", the target bytes for pseudo-error generation is RAM data [31:16].

[bit7:0] EI7 to EI0: Pseudo-Error Generation Bit Setting Bits

These bits specify the bit position of the pseudo-ECC-error generation in Backup RAM.

EI7 to EI0	Target bits in RAM
EI0	[0]
EI1	[1]
EI2	[2]
EI3	[3]
EI4	[4]
EI5	[5]
EI6	[6]
EI7	[7]

For example, if EY2 = 1 and EI4 = 1 while the other bits are "0", the target bit for pseudo-error generation is RAM data [20], and this single-bit error will be corrected. If EY2 = 1 and EI4 = EI7 = 1 while the other bits are "0", the target bits for pseudo-error generation are RAM data [23] and RAM data [20], and a double-bit error will be detected. If EY2 = EY3 = 1 and EI4 = 1 while the other bits are "0", the target bits for pseudo-error generation are RAM data [28] and RAM data [20], and single-bit errors in these bytes will be corrected.

5.8. BURAMIF ECC Data Path Control Register (BURIF_EDPCR)

The ECC data path control register controls disabling of the ECC generation function, disabling of the ECC test function, and enabling of access to the ECC area. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	7	6	5	4	3	2	1	0
Field	Reserved					SKPG	SKPC	EACC
R/W Attribute	R0,W0					R,W	R,W	R,W
Protection Attribute	WP							
Initial Value	00000					0	0	0

[bit7:3] Reserved: Reserved Bits

[bit2] SKPG: ECC Generation Function Disable Bit

This bit allows disabling of the ECC generation function.

SKPG	ECC Generation Function Disable Bit
During Write Operation	0: Use the ECC generation function. (Normal operation) 1: Do not use the ECC generation function.
During Read Operation	The value set in this bit is read.

This bit is effective only when BURIF_STATUS.TM_ESKPG = "H". When it is "L", writing is also disabled.

[bit1] SKPC: ECC Test Function Disable Bit

This bit allows disabling of the ECC test function.

SKPC	ECC Test Function Disable Bit
During Write Operation	0: Use the ECC test function. (Normal operation) 1: Do not use the ECC test function.
During Read Operation	The value set in this bit is read.

This bit is effective only when BURIF_STATUS.TM_ESKPC = "H". When it is "L", writing is also disabled.

[bit0] EACC: ECC Area Access Enable Bit

This bit enables access to the ECC area.

EACC	ECC Area Access Enable Bit
During Write Operation	0: The access area is the data area. (Normal operation) 1: The access area is the ECC area.
During Read Operation	The value set in this bit is read.

This bit is effective only when BURIF_STATUS.TM_EEACC = "H". When it is "L", writing is also disabled.

5.9. BURAMIF ECC Test Mode Key Code Control Register (BURIF_ECCTKCCR)

The ECC test mode key code control register is used to enable ECC pseudo-error generation for Backup RAM, access to the ECC area, and disabling of the ECC generation test function. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	7	6	5	4	3	2	1	0
Field	KEY[1:0]		Reserved			TM_	TM_	TM_
						ESKPG	ESKPC	EEACC
R/W Attribute	R0,W		R0,W0			R0,W	R0,W	R0,W
Protection Attribute	WP							
Initial Value	00		000			0	0	0

[bit7:6] KEY: Key Code Control

KEY	Key Code Control Bit
During Write Operation	These bits control the key code. Writing values to these bits in the order of 0b00, 0b01, 0b10, and 0b11 enables the setting values of TM_ESKPG, TM_ESKPC, and TM_EEACC. For details on the procedure for setting these bits, see ","
During Read Operation	"0" is always read.

[bit5:3] Reserved: Reserved Bits

[bit2] TM_ESKPG: ECC Generation Function Skip Enable Bit

TM_ESKPG	ECC Generation Function Skip Enable Bit
During Write Operation	0: Enable the ECC generation function, regardless of the BURIF_EDPCR.SKPG value. Moreover, writing to BURIF_EDPCR.SKPG by software is disabled. 1: Enable skipping of the ECC generation function. Moreover, BURIF_EDPCR.SKPG= 1 enables skipping of the ECC generation function.
During Read Operation	"0" is always read.

[bit1] TM_ESKPC: ECC Test Function Skip Enable Bit

TM_ESKPC	ECC Test Function Skip Enable Bit
During Write Operation	0: Disable skipping of the ECC test function, regardless of the BURIF_EDPCR.SKPC value. Moreover, writing to BURIF_EDPCR.SKPC by software is disabled. 1: Enable skipping of the ECC test function. Moreover, BURIF_EDPCR.SKPC= 1 enables skipping of the ECC test function.
During Read Operation	"0" is always read.

[bit0] TM_EEACC: ECC Area Access Enable Bit

TM_EEACC	ECC Area Access Enable Bit
During Write Operation	0: Access only the DATA area, regardless of the BURIF_EDPCR.EACC value. Moreover, writing to BURIF_EDPCR.EACC by software is disabled. 1: Enable access to the ECC area. Moreover, BURIF_EDPCR.EACC= 1 enables access to the ECC area.
During Read Operation	"0" is always read.

Note:

- Set the same values in the TM_ESKPG, TM_ESKPC and TM_EEACC bits while KEY bit operation is being performed. For details on the procedure for setting these bits, see "Figure 4-2 Setting Flow of ECC Test Mode Key Code Control Register"

5.10. BURAMIF TEST Error Address Register 0 (BURIF_TEAR0)

TEST error address register 0 contains the address at which a RAM diagnosis error has occurred in Backup RAM. This register also contains the source flag indicating the diagnosis pattern in which the error has occurred.

Bit	31	30	29	28	27	26	25	24
Field	TER[2:0]			Reserved				
R/W Attribute	R,WX			R0,W0				
Protection Attribute	-							
Initial Value	000			00000				

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved	ERR_ADDR[14:8]						
R/W Attribute	R0,W0	R,WX						
Protection Attribute	-							
Initial Value	0	0000000						

Bit	7	6	5	4	3	2	1	0
Field	ERR_ADDR[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit31:29] TER: Diagnosis Error Factor Indication

TER	Diagnosis Error Factor Indication Bit
During Write Operation	Writing is disabled.
During Read Operation	<p>These bits contain the diagnosis pattern in which an error has occurred during RAM diagnosis. ERR_ADDR[14:0] is effective only when any of these bits is set to "1".</p> <p>0b001: Error occurred in the march diagnosis</p> <p>0b010: Error occurred in the checker diagnosis</p> <p>0b100: Error occurred in the unique diagnosis</p> <p>0b000: No error occurred</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to "000") these bits.</p> <p>Note:</p> <p>When any of these bits becomes "1", even if an error occurs while another diagnosis is being performed, the corresponding error source bit does not become "1".</p>

[bit23:15] Reserved: Reserved Bits

[bit14:0] ERR_ADDR: Error Occurrence Address

ERR_ADDR	Error Occurrence Address Bit
During Write Operation	Writing is disabled.
During Read Operation	These bits contain the address at which an error occurred during RAM diagnosis. These bits are effective only when TER is other than "000". A RAM diagnosis start instruction triggers the hardware to initialize (clear to "0b0000000000000000") these bits.

Notes:

- When any of the TER bits becomes "1", even if an error occurs while another diagnosis is being performed, the corresponding error source bit does not become "1".
- ERR_ADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {ERR_ADDR << 2} to the base address.
- The effective address of ERR_ADDR changes according to RAM size.
 - 64KB Effective address: ERR_ADDR[13:0]

5.11. BURAMIF TEST Error Address Register 1 (BURIF_TEAR1)

TEST error address register 1 contains the address of an error that has occurred during Backup RAM diagnosis only if the address differs from that in BURIF_TEAR0. This register also contains the source flag indicating the diagnosis pattern in which the error has occurred.

Bit	31	30	29	28	27	26	25	24
Field	TER[2:0]			Reserved				
R/W Attribute	R,WX			R0,W0				
Protection Attribute	-							
Initial Value	000			00000				

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved	ERR_ADDR[14:8]						
R/W Attribute	R0,W0	R,WX						
Protection Attribute	-							
Initial Value	0	0000000						

Bit	7	6	5	4	3	2	1	0
Field	ERR_ADDR[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit31:29] TER: Diagnosis Error Factor Indication

TER	Diagnosis Error Factor Indication Bit
During Write Operation	Writing is disabled.
During Read Operation	<p>These bits contain the diagnosis pattern in which an error has occurred during RAM diagnosis. ERR_ADDR[14:0] is effective only when any of these bits is set to "1".</p> <p>0b001: Error occurred in the march diagnosis 0b010: Error occurred in the checker diagnosis 0b100: Error occurred in the unique diagnosis 0b000: No error occurred</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to "000") these bits.</p> <p>Note: When any of these bits becomes "1", even if an error occurs while another diagnosis is being performed, the corresponding error source bit does not become "1".</p>

[bit23:15] Reserved: Reserved Bits

[bit14:0] ERR_ADDR: Error Occurrence Address

ERR_ADDR	Error Occurrence Address Bit
During Write Operation	Writing is disabled.
During Read Operation	<p>These bits contain the address at which an error occurred during RAM diagnosis. These bits are effective only when TER is not "000".</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to "0b0000000000000000") these bits.</p>

Notes:

- When any of the TER bits becomes "1", even if an error occurs while another diagnosis is being performed, the corresponding error source bit does not become "1".
- ERR_ADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {ERR_ADDR << 2} to the base address.
- The effective address of ERR_ADDR changes according to RAM size.
 - 64KB Effective address: ERR_ADDR[13:0]

5.12. BURAMIF TEST Error Address Register 2 (BURIF_TEAR2)

TEST error address register 2 contains the address of an error that has occurred during Backup RAM diagnosis only if the address differs from those in BURIF_TEAR0 and BURIF_TEAR1. This register also contains the source flag indicating the diagnosis pattern in which the error has occurred.

Bit	31	30	29	28	27	26	25	24
Field	TER[2:0]			Reserved				
R/W Attribute	R,WX			R0,W0				
Protection Attribute	-							
Initial Value	000			00000				

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial Value	00000000							

Bit	15	14	13	12	11	10	9	8
Field	Reserved	ERR_ADDR[14:8]						
R/W Attribute	R0,WX	R,WX						
Protection Attribute	-							
Initial Value	0	0000000						

Bit	7	6	5	4	3	2	1	0
Field	ERR_ADDR[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit31:29] TER: Diagnosis Error Factor Indication

TER	Diagnosis Error Factor Indication Bit
During Write Operation	Writing is disabled.
During Read Operation	<p>These bits contain the diagnosis pattern in which an error has occurred during RAM diagnosis. ERR_ADDR[14:0] is effective only when any of these bits is set to "1".</p> <p>0b001: Error occurred in the march diagnosis</p> <p>0b010: Error occurred in the checker diagnosis</p> <p>0b100: Error occurred in the unique diagnosis</p> <p>0b000: No error occurred</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to "000") these bits.</p> <p>Note:</p> <p>When any of these bits becomes "1", even if an error occurs while another diagnosis is being performed, the corresponding error source bit does not become "1".</p>

[bit23:15] Reserved: Reserved Bits

[bit14:0] ERR_ADDR: Error Occurrence Address

ERR_ADDR	Error Occurrence Address Bit
During Write Operation	Writing is disabled.
During Read Operation	These bits contain the address at which an error occurred during RAM diagnosis. These bits are effective only when TER is not "000". A RAM diagnosis start instruction triggers the hardware to initialize (clear to "0b0000000000000000") these bits.

Notes:

- When any of the TER bits becomes "1", even if an error occurs while another diagnosis is being performed, the corresponding error source bit does not become "1".
- ERR_ADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {ERR_ADDR << 2} to the base address.
- The effective address of ERR_ADDR changes according to RAM size.
 - 64KB Effective address: ERR_ADDR[13:0]

5.13. BURAMIF TEST Start Address Register (BURIF_TASAR)

The TEST start address register specifies the start address of RAM diagnosis and the initialization of Backup RAM. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	15	14	13	12	11	10	9	8
Field	Reserved	SADDR[14:8]						
R/W Attribute	R0,W0	R/W						
Protection Attribute	-	WP						
Initial Value	0	0000000						

Bit	7	6	5	4	3	2	1	0
Field	SADDR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WP							
Initial Value	00000000							

[bit15] Reserved: Reserved Bit

[bit14:0] SADDR: RAM Diagnosis Start Address

SADDR	RAM Diagnosis Start Address Bit
During Write Operation	The start address for RAM diagnosis and initialization can be set.
During Read Operation	The start address for RAM diagnosis and initialization being set can be read.

Notes:

- SADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {SADDR << 2} to the base address.
- A value outside the Backup RAM area and a value such that BURIF_TASAR.SADDR > BURIF_TAEAR.EADDR cannot be set.
- The effective address of SADDR changes according to RAM size.
 - 64KB Effective address: SADDR[13:0]

5.14. BURAMIF TEST End Address Register (BURIF_TAEAR)

The TEST end address register specifies the end address for RAM diagnosis and the initialization of Backup RAM. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	15	14	13	12	11	10	9	8
Field	Reserved	EADDR[14:8]						
R/W Attribute	R0,W0	R/W						
Protection Attribute	-	WP						
Initial Value	0	****111						

Bit	7	6	5	4	3	2	1	0
Field	EADDR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WP							
Initial Value	11111111							

[bit15] Reserved: Reserved Bit

[bit14:0] EADDR: RAM Diagnosis End Address

EADDR	RAM Diagnosis End Address Bit
During Write Operation	The end address for RAM diagnosis and initialization can be set.
During Read Operation	The end address for RAM diagnosis and initialization being set can be read.

Notes:

- EADDR is an offset in word units (RAM address).
- Obtain the absolute address by adding {EADDR << 2} to the base address.
- A value outside the Backup RAM area and a value such that BURIF_TASAR.SADDR > BURIF_TAEAR.EADDR cannot be set.
- The effective address of EADDR changes according to RAM size.
- The "*" display of the initial value means that the initial value of EADDR changes according to RAM size.
- 64KB Effective address: EADDR[13:0]
- EADDR initial Value changes according to RAM size.
- 00111111_11111111 64KB

5.15. BURAMIF TEST Diagnosis Function Register (BURIF_TTCR)

The TEST diagnosis function register contains the specification of the RAM diagnosis content of Backup RAM, the diagnosis result, and the diagnosis status. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	15	14	13	12	11	10	9	8
Field	Reserved						TSTAT	OVFLW
R/W Attribute	R0,W0						R,WX	R,WX
Protection Attribute	WP							
Initial Value	000000						0	0

Bit	7	6	5	4	3	2	1	0
Field	TEIE	TEI	TCIE	TCI	TTYP		TRUN	
R/W Attribute	R/W	R,W	R/W	R,W	R/W		R,WX	
Protection Attribute	WP							
Initial Value	0	0	0	0	110		0	

[bit15:10] Reserved: Reserved Bits

[bit9] TSTAT: RAM Diagnosis Error Detection

TSTAT	RAM Diagnosis Error Detection Bit
During Write Operation	No effect
During Read Operation	0: No error has been detected during RAM diagnosis. 1: An error has been detected during RAM diagnosis. A RAM diagnosis start instruction triggers the hardware to initialize (clear to "0") this bit.

[bit8] OVFLW: RAM Diagnosis Error Overflow

OVFLW	RAM Diagnosis Error Overflow Bit
During Write Operation	No effect
During Read Operation	0: RAM diagnosis errors have occurred at 3 or fewer addresses. 1: RAM diagnosis errors have occurred at 4 or more addresses. A RAM diagnosis start instruction triggers the hardware to initialize (clear to "0") this bit.

[bit7] TEIE: Enable Error Occurrence Interrupt during Diagnosis

TEIE	Diagnosis-Time Error Generation Interrupt Enable Bit
During Write Operation	0: Disable interrupts triggered by RAM diagnosis errors. 1: Enable interrupts triggered by RAM diagnosis errors. An interrupt occurs for TTCR.TEI=1.
During Read Operation	The enable/disable setting for error interrupts during diagnosis can be read.

[bit6] TEI: Error Occurrence during Diagnosis

TEI	Diagnosis-Time Error Generation Bit
During Write Operation	0: Clear this bit. 1: No effect.
During Read Operation	0: No error has occurred during RAM diagnosis. 1: An error has occurred during RAM diagnosis.

[bit5] TCIE: Diagnosis End Factor Interrupt Enable

TCIE	Diagnosis End Factor Interrupt Enable Bit
During Write Operation	0: Disable interrupts triggered by RAM diagnosis end. 1: Enable interrupts triggered by RAM diagnosis end. An interrupt occurs for TTCR.TCI=1.
During Read Operation	The enable/disable setting for diagnosis end factor interrupts can be read.

[bit4] TCI: Diagnosis End

TCI	Diagnosis End Bit
During Write Operation	0: Clear this bit. 1: No effect.
During Read Operation	0: The diagnosis has not completed or has been stopped. 1: RAM diagnosis has been completed. This bit is not set for forcible stop by the key code.

[bit3:1] TTYP: RAM Diagnosis Contents Specification

TTYP	RAM Diagnosis Contents Specification Bit
During Write Operation	0bxx1: March diagnosis is performed. 0bxx0: March diagnosis is not performed. 0bx1x: Checker diagnosis is performed. 0bx0x: Checker diagnosis is not performed. 0b1xx: Unique diagnosis is performed. 0b0xx: Unique diagnosis is not performed. RAM diagnoses are performed in the following order. Unique diagnosis (The address itself is used as the data.) Checker diagnosis March diagnosis (all "0" and then all "1")
During Read Operation	The setting value for the RAM diagnosis type to be performed can be read.

[bit0] TRUN: RAM Diagnosis Operation Status

TRUN	RAM Diagnosis Operation Status Bit
During Write Operation	No effect
During Read Operation	0: RAM diagnosis is not in progress. 1: RAM diagnosis is in progress.

Note:

- Set this register before starting RAM diagnosis.

5.16. BURAMIF TEST Initialization Function Register (BURIF_TICR)

The TEST initialization function register contains the specification of the RAM initialization content for the Backup RAM, the initialization result, and the initialization status. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	7	6	5	4	3	2	1	0
Field	Reserved				ICIE	ICI	ITYP	IRUN
R/W Attribute	R0,W0				R/W	R,W	R/W	R,WX
Protection Attribute	WP							
Initial Value	0000				0	0	0	0

[bit7:4] Reserved: Reserved Bits

[bit3] ICIE: RAM Initialization End Factor Interrupt Enable

ICIE	RAM Initialization End Factor Interrupt Enable Bit
During Write Operation	0: Disable interrupts triggered by RAM initialization end. 1: Enable interrupts triggered by RAM initialization end.
During Read Operation	The enable/disable setting of initialization end factor interrupts can be read.

[bit2] ICI: RAM Initialization End

ICI	RAM Initialization End Bit
During Write Operation	0: Clear this bit. 1: No effect.
During Read Operation	0: Initialization has not been completed or has not been started. 1: RAM initialization has been completed. This bit is not set for forcible stop by the key code.

[bit1] ITYP: RAM Initialization Contents Specification

ITYP	RAM Initialization Contents Specification Bit
During Write Operation	0: Initialize with all "0's". 1: Initialize with all "1's".
During Read Operation	The initialization content specification setting can be read.

[bit0] IRUN: RAM Initialization Operation Status

IRUN	RAM Initialization Operation Status Bit
During Write Operation	No effect
During Read Operation	0: Initialization is not in progress. 1: Initialization is in progress.

5.17. BURAMIF TEST Software Reset Generation Control Register (BURIF_TSRCCR)

The TEST software reset generation control register specifies the generation of software reset for initializing the internal circuit of the RAM diagnosis of Backup RAM. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	7	6	5	4	3	2	1	0
Field	SRST	Reserved						
R/W Attribute	R0,W	R0,W0						
Protection Attribute	WP							
Initial Value	0	0000000						

[bit7] SRST: Software Reset

SRST	Software Reset Bit
During Write Operation	0: No effect 1: Reset all circuits related to RAM diagnosis except for this register.
During Read Operation	"0" is always read.

[bit6:0] Reserved: Reserved Bits

5.18. BURAMIF TEST Pseudo-Error Generation Control Register (BURIF_TFECR)

The TEST pseudo-error generation control register generates pseudo-errors during the RAM diagnosis of Backup RAM. This register can specify the RAM diagnosis in which the error is generated. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	7	6	5	4	3	2	1	0
Field	Reserved				FERR	ETYP[2:0]		
R/W Attribute	R0,W0				R/W	R/W		
Protection Attribute	WP							
Initial Value	0000				0	000		

[bit7:4] Reserved: Reserved Bits

[bit3] FERR: RAM Diagnosis Pseudo-Error Generation Enable

FERR	RAM Diagnosis Pseudo-Error Generation Enable Bit
During Write Operation	0: Disable generation of pseudo-errors. (Normal operation) 1: Enable generation of pseudo-errors. Erroneous data is deliberately written in accordance with the ETYP setting.
During Read Operation	The enable/disable setting for the generation of pseudo-errors can be read.

[bit2:0] ETYP: Pseudo-Error Generation Processing Specification

ETYP	Pseudo-Error Generation Processing Specification Bit
During Write Operation	0bxx1: Pseudo-errors are generated during march diagnosis. 0bx1x: Pseudo-errors are generated during checker diagnosis. 0b1xx: Pseudo-errors are generated during unique diagnosis. 0b000: Generates no pseudo error.
During Read Operation	This bit can read the setting value for the diagnosis in which the pseudo-error is generated.

5.19. BURAMIF TEST Key Code Control Register (BURIF_TKCCR)

The TEST key code control register is used to start RAM diagnosis and initialization of Backup RAM, and to execute their forced termination. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	7	6	5	4	3	2	1	0
Field	KEY[1:0]		Reserved				CODE[1:0]	
R/W Attribute	R0,W		R0,W0				R/W	
Protection Attribute	WP							
Initial Value	00		0000				00	

[bit7:6] KEY: Key Code Control

KEY	Key Code Control Bit
During Write Operation	<p>These bits control the key code.</p> <p>The operation specified in the CODE bits is performed by writing in the order of 0b00, 0b01, 0b10, and 0b11.</p> <p>If access is made to a register other than the key code control register during a key code operation, repeat the operation from the beginning.</p> <p>For details on the procedure for setting these bits, see "Figure 4-3 Setting Flow of RAM Self Diagnosis" and "Figure 4-4 Setting Flow of RAM Initialization".</p>
During Read Operation	"0" is always read.

[bit5:2] Reserved: Reserved Bits

[bit1:0] CODE: Operation Specification

CODE	Operation Instruction Bit
During Write Operation	<p>0b00: Forced termination</p> <p>0b01: Activation of initialization</p> <p>0b10: Activation of diagnosis</p> <p>0b11: Setting prohibited</p>
During Read Operation	The setting value for the operation instruction can be read.

Notes:

- Set the same value for the CODE bits when KEY bits operation is in progress.
- Setting the value 0b11 to the CODE bits is prohibited.

5.20. BURAMIF Event Clear Register (BURIF_EVENTCLR)

This register is used for clearing events relating to ECC error detection, RAM diagnosis, and RAM initialization of Backup RAM. Writing to this register is possible only when privileged access is available and BURIF_STATUS.LOCKSTATUS is "0".

Bit	31	30	29	28	27	26	25	24
Field	Reserved					DEI CLR	Reserved	SEI CLR
R/W Attribute	R0,W0					R0,W	R0,W0	R0,W
Protection Attribute	WP							
Initial Value	00000					0	0	0

Bit	23	22	21	20	19	18	17	16
Field	Reserved					ICI CLR	Reserved	
R/W Attribute	R0,W0					R0,W	R0,W0	
Protection Attribute	WP							
Initial Value	00000					0	00	

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	WP							
Initial Value	00000000							

Bit	7	6	5	4	3	2	1	0
Field	Reserved	TEI CLR	Reserved	TCI CLR	Reserved			
R/W Attribute	R0,W0	R0,W	R0,W0	R0,W	R0,W0			
Protection Attribute	WP							
Initial Value	0	0	0	0	0000			

[bit31:27] Reserved: Reserved Bits

[bit26] DEICLR: Double-Bit Error Occurrence Clear Bit

DEICLR	Double-Bit Error Occurrence Clear Bit
During Write Operation	1: Clear the BURIF_EECSR. DEI bit. 0: No effect.
During Read Operation	"0" is always read.

[bit25] Reserved: Reserved Bit

[bit24] SEICLR: Single-Bit Error Occurrence Clear Bit

SEICLR	Single-Bit Error Occurrence Clear Bit
During Write Operation	1: Clear the BURIF_EECSR. SEI bit. 0: No effect.
During Read Operation	"0" is always read.

[bit23:19] Reserved: Reserved Bits
[bit18] ICICLR: RAM Initialization End Clear Bit

ICICLR	RAM Initialization End Clear Bit
During Write Operation	1: Clear the BURIF_TICR. ICI bit. 0: No effect.
During Read Operation	"0" is always read.

[bit18:7] Reserved: Reserved Bits
[bit6] TEICLR: Error Occurrence during Diagnosis Clear Bit

TEICLR	Error Occurrence During Diagnostic Bit
During Write Operation	1: Clear the BURIF_TTCR. TEI bit. 0: No effect.
During Read Operation	"0" is always read.

[bit5] Reserved: Reserved Bit
[bit4] TCICLR: Diagnosis End Clear Bit

TCICLR	Diagnosis End Bit
During Write Operation	1: Clear the BURIF_TTCR. TCI bit. 0: No effect.
During Read Operation	"0" is always read.

[bit3:0] Reserved: Reserved Bits

6. Precautions for Using Device

This section explains precautions for using the Backup RAM.

- Power domain control for Backup RAM depends on profile setting. To detail profile setting information, please refer to the Chapter "LOW-POWER CONSUMPTION".
- When Backup RAM power restores, the completion for the profile setting needs to be confirmed through profile update status register, or start to access Backup RAM after confirmed profile update completion interrupt register.
- Backup RAM can configure SLEEP setting during transfer to PSS. To detail SLEEP control information, please refer to the Chapter "LOW-POWER CONSUMPTION".
- When Backup RAM returns from SLEEP setting, start to access Backup RAM after confirmed that PSS had transferred to RUN status through the device status register of the system status register.

CHAPTER 13: External Interrupt

This chapter explains the functions and operations of external interrupts.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Example
5. Registers

EXTIRQ-TXXPT03P01R01L05-E1-XX

1. Overview

This section provides an overview of external interrupts.

External Interrupt Functions

The external interrupt functions detect signal input to the external interrupt pin and generate interrupt requests.

- External interrupt requests available at 5 levels (H, L, rising edge, falling edge, and both (rising and falling) edges)
- External interrupt supports (product specification) pin
- Noise filter bypass possible
- Non-maskable interrupt supported
- DMA supports to (product specification) channels

2. Configuration

This section explains the configuration for external interrupts.

Figure 2-1 External Interrupt Block Diagram

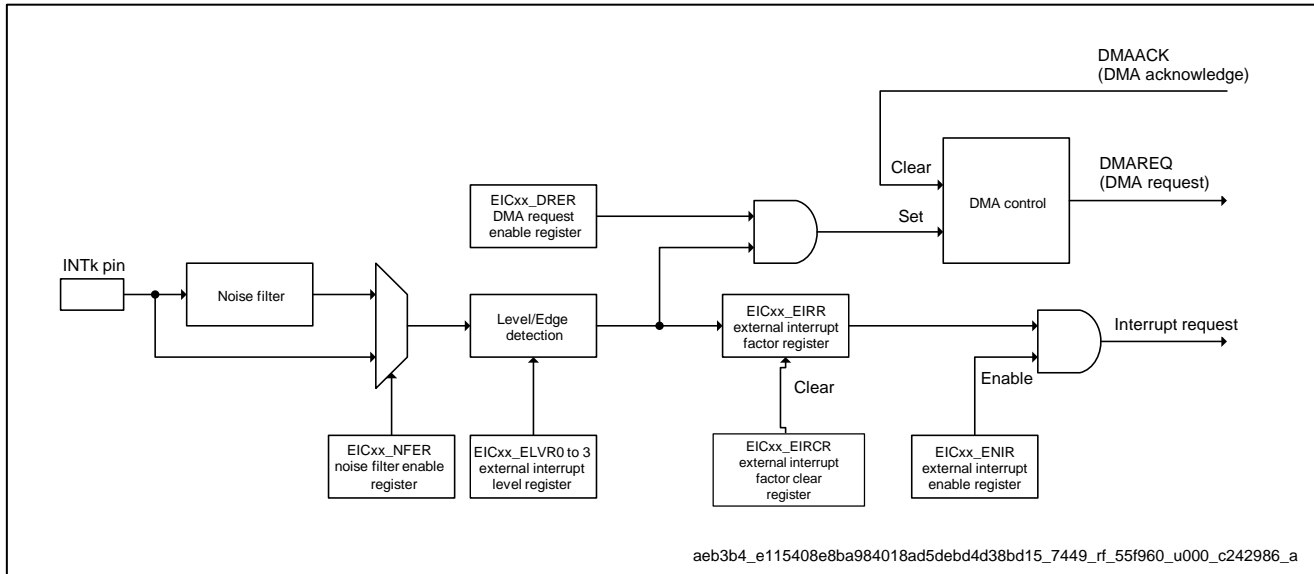

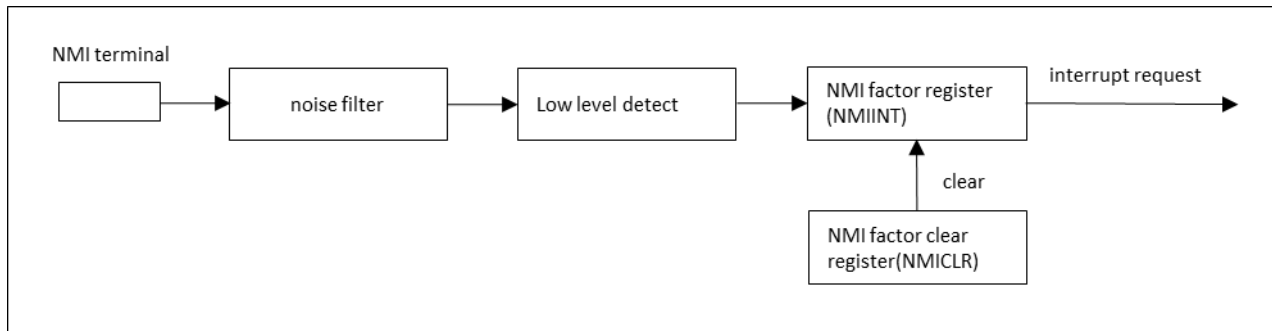

Figure 2-2 NMI (Non-Maskable Interrupt) Block Diagram

3. Explanation of Operation

This section explains the operations of external interrupts.

Clearing of Interrupt Flag

Clear the interrupt flag EICxx_EIRR:ER in the interrupt handler to use it as an external interrupt. If it is not cleared after the first interrupt handler is completed, the same handler is executed again.

Even after the interrupt flag is cleared, if level detection is specified as an event input, the flag is set again as long as the input pin keeps it at the active level. In such cases, clear the requested external factor or interrupt enable bit. Clearing by software has priority over the hardware settings.

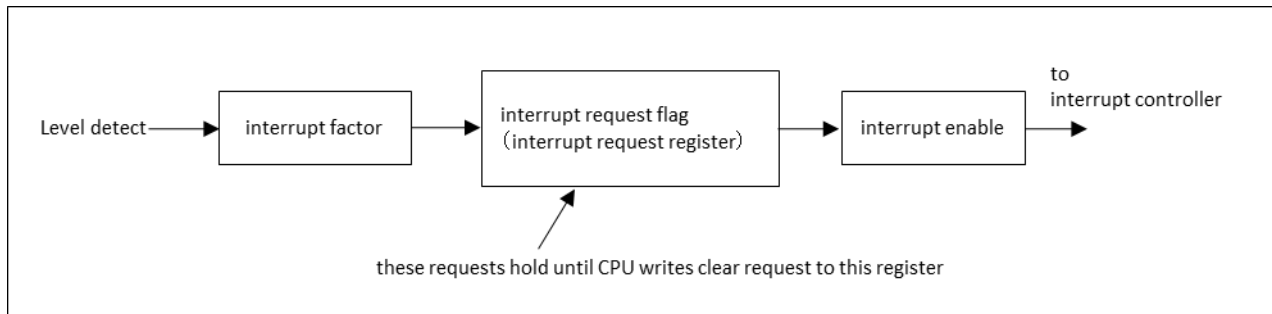

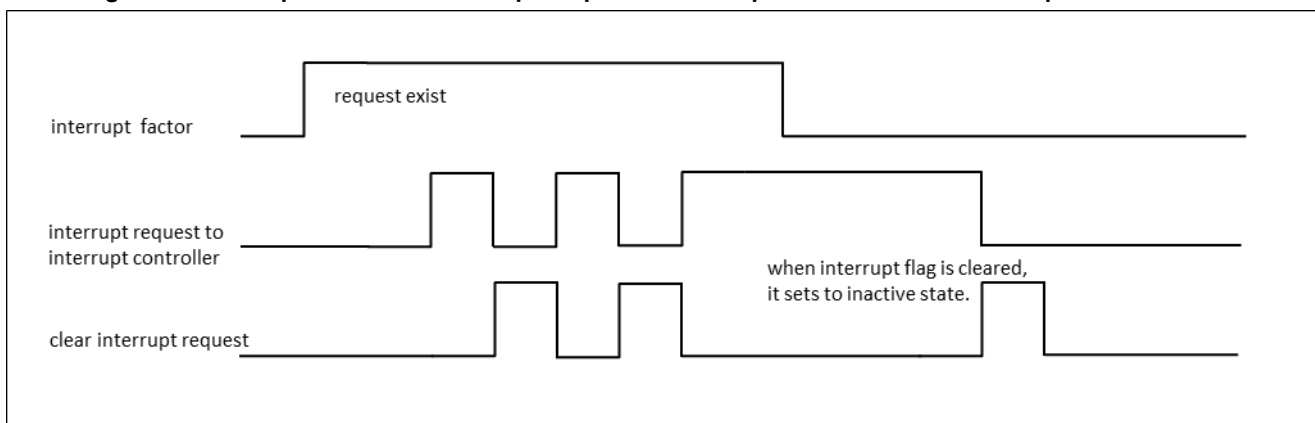

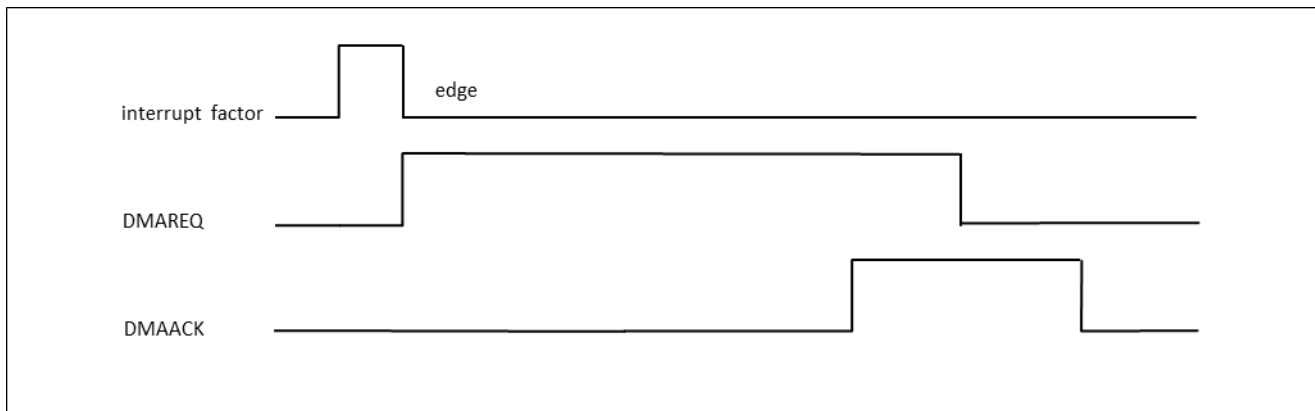

Noise Filter

The noise filter removes noise from the signals input through the INT pin.

External Interrupt Request Level

If edge detection is specified as an event input and the noise filter is enabled, a rule applies to the pulse width of an input signal to be recognized as an input edge. For the minimum value of the pulse width, see the TRAVEO™ T1G Family Hardware Manual Platform Part data sheet.

If level detection is specified as an event input and the specified level is input, the interrupt flag retains even after a change of the input signal to the inactive level. See Figure 3-2. Clear the interrupt flag to clear the request.

Figure 3-1 Clearing of Interrupt Factor Register at Level Setting Time**Figure 3-2 Interrupt Factor and Interrupt Request to Interrupt Controller while Interrupts Are Enabled****Figure 3-3 Interrupt Factor and DMAREQ to DMA while DMA Is Enabled**

4. Setting Procedure Example

This section shows an example of the external interrupt setting procedure.

External Interrupt Programming Procedure

Use the following procedure to configure the existing registers in the external interrupt block.

1. Set disable in the bits that are the target of the external interrupt enable register (EICxx_ENIR).
2. Set the bits that are the target of an external interrupt level setting register (EICxx_ELVR0 to 3) or the noise filter enable register (EICxx_NFER).
3. Confirm write and read the bits that are the target of an external interrupt level setting register (EICxx_ELVR0 to 3) or the noise filter enable register (EICxx_NFER).
4. Clear the bits that are the target of the external interrupt factor register (EICxx_EIRR).
5. Set enable in the bits that are the target of the external interrupt enable register (EICxx_ENIR).

Notes:

- *The enable register must be disabled before the registers in this module are configured. Also, be sure to clear the factor register before enabling the enable register.*
- *This prevents an interrupt factor from being incorrectly generated when the registers are configured or when interrupts are enabled.*

5. Registers

This section lists the registers.

Register List

The following table lists the external interrupt and NMI controller registers.

The additional character xx in the register name indicates the unit.

EIC00 supports channels 0 to 31.

EIC01 supports channels 32 to 63.

EIC02 supports channels 64 to 95.

EIC03 supports channels 96 to 127.

Table 5-1 List of External Interrupt/NMI Controller Registers

Abbreviated Register Name	Register Name	Reference
EICxx_ENIR	External interrupt enable register	5.1
EICxx_ENISR	External interrupt enable set register	5.2
EICxx_ENICR	External interrupt enable clear register	5.3
EICxx_EIRR	External interrupt factor register	5.4
EICxx_EIRCR	External interrupt factor clear register	5.5
EICxx_NFER	Noise filter enable register	5.6
EICxx_NFESR	Noise filter enable set register	5.7
EICxx_NFECR	Noise filter enable clear register	5.8
EICxx_ELVRO to 3	External interrupt level register	5.9
EICxx_NMIR	Non-maskable interrupt register	5.10
EICxx_DRER	DMA request enable register	5.11
EICxx_DRESR	DMA request enable set register	5.12
EICxx_DRECR	DMA request enable clear register	5.13
EICxx_DRFR	DMA request flag register	5.14

Table 5-2 External Interrupt Register Memory Map shows the register address map.

Table 5-2 External Interrupt Register Memory Map

Offset	+3	+2	+1	+0
0x00000000	EICxx_ENIR 00000000_00000000_00000000_00000000

[bit31:0] EN31 to EN0: External Interrupt Enable Bits

These bits set enable for external interrupts of each channel.

Bit	Description
0	Disable generation of external interrupt factors.
1	Enable generation of external interrupt factors.

Note:

- This register can be set/cleared not only by writing "1" or "0" directly to the EICxx_ENIR register but also by writing "1" to the EICxx_ENISR/EICxx_ENICR register.

5.2. External Interrupt Enable Set Register (EICxx_ENISR)

This register is used for set control of the external interrupt enable register.

bit	31	30	29	28	27	26	25	24
Field	ENS31	ENS30	ENS29	ENS28	ENS27	ENS26	ENS25	ENS24
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	ENS23	ENS22	ENS21	ENS20	ENS19	ENS18	ENS17	ENS16
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	ENS15	ENS14	ENS13	ENS12	ENS11	ENS10	ENS9	ENS8
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	ENS7	ENS6	ENS5	ENS4	ENS3	ENS2	ENS1	ENS0
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] ENS31 to ENS0: External Interrupt Enable Set Bits

These bits configure the set control of the EICxx_ENIR register.

ENS31 to ENS0	Description
During write operation	When "0" is written: Invalid When "1" is written: Set the EICxx_ENIR:ENn bit to "1".
During read operation	The read value is always "0".

5.3. External Interrupt Enable Clear Register (EICxx_ENICR)

This register is used for the clear control of the external interrupt enable register.

bit	31	30	29	28	27	26	25	24
Field	ENC31	ENC30	ENC29	ENC28	ENC27	ENC26	ENC25	ENC24
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	ENC23	ENC22	ENC21	ENC20	ENC19	ENC18	ENC17	ENC16
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	ENC15	ENC14	ENC13	ENC12	ENC11	ENC10	ENC9	ENC8
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	ENC7	ENC6	ENC5	ENC4	ENC3	ENC2	ENC1	ENC0
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] ENC31 to ENC0: External Interrupt Enable Clear Bits

These bits configure the clear control of the EICxx_ENIR register.

ENC31 to ENC0	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the EICxx_ENIR:ENn bit to "0".
During read operation	The read value is always "0".

5.4. External Interrupt Factor Register (EICxx_EIRR)

This register indicates the status when a pin detects an external interrupt factor.

bit	31	30	29	28	27	26	25	24
Field	ER31	ER30	ER29	ER28	ER27	ER26	ER25	ER24
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WP							
Initial Value	X	X	X	X	X	X	X	X

bit	23	22	21	20	19	18	17	16
Field	ER23	ER22	ER21	ER20	ER19	ER18	ER17	ER16
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WP							
Initial Value	X	X	X	X	X	X	X	X

bit	15	14	13	12	11	10	9	8
Field	ER15	ER14	ER13	ER12	ER11	ER10	ER9	ER8
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WP							
Initial Value	X	X	X	X	X	X	X	X

bit	7	6	5	4	3	2	1	0
Field	ER7	ER6	ER5	ER4	ER3	ER2	ER1	ER0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	WP							
Initial Value	X	X	X	X	X	X	X	X

[bit31:0] ER31 to ER0: External Interrupt Factor Detection Bits

These bits retain the detection of an external interrupt request.

ER31 to ER0	Description
0	No external interrupt factor is detected.
1	An external interrupt factor is detected.

5.5. External Interrupt Factor Clear Register (EICxx_EIRCR)

This register is used for the clear control of the external interrupt factor register.

bit	31	30	29	28	27	26	25	24
Field	ERC31	ERC30	ERC29	ERC28	ERC27	ERC26	ERC25	ERC24
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	ERC23	ERC22	ERC21	ERC20	ERC19	ERC18	ERC17	ERC16
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	ERC15	ERC14	ERC13	ERC12	ERC11	ERC10	ERC9	ERC8
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	ERC7	ERC6	ERC5	ERC4	ERC3	ERC2	ERC1	ERC0
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] ERC31 to ERC0: External Interrupt Factor Clear Bits

These bits configure the clear control of the EICxx_EIRR register.

ERC31 to ERC0	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the EICxx_EIRR:ERn bit to "0".
During read operation	The read value is always "0".

5.6. Noise Filter Enable Register (EICxx_NFER)

This register can set whether to use the noise filter for a corresponding external interrupt factor.

bit	31	30	29	28	27	26	25	24
Field	NFE31	NFE30	NFE29	NFE28	NFE27	NFE26	NFE25	NFE24
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	NFE23	NFE22	NFE21	NFE20	NFE19	NFE18	NFE17	NFE16
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	NFE15	NFE14	NFE13	NFE12	NFE11	NFE10	NFE9	NFE8
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	NFE7	NFE6	NFE5	NFE4	NFE3	NFE2	NFE1	NFE0
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] NFE31 to NFE0: Noise Filter Enable Bits

These bits configure the noise filter control of each external interrupt.

NFE31 to NFE0	Description
0	Disable the noise filter.
1	Enable the noise filter.

Note:

- This register can be set/cleared not only by writing "1" or "0" directly to the EICxx_NFER register but also by writing "1" to the EICxx_NFESR/EICxx_NFECSR register.

5.7. Noise Filter Enable Set Register (EICxx_NFESR)

This register is used for the set control of the noise filter enable register.

bit	31	30	29	28	27	26	25	24
Field	NFES31	NFES30	NFES29	NFES28	NFES27	NFES26	NFES25	NFES24
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	NFES23	NFES22	NFES21	NFES20	NFES19	NFES18	NFES17	NFES16
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	NFES15	NFES14	NFES13	NFES12	NFES11	NFES10	NFES9	NFES8
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	NFES7	NFES6	NFES5	NFES4	NFES3	NFES2	NFES1	NFES0
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] NFES31 to NFES0: Noise Filter Enable Set Bits

These bits configure the set control of the EICxx_NFER register.

NFES31 to NFES0	Description
During write operation	When "0" is written: Invalid When "1" is written: Set the EICxx_NFER:NFE _n bit to "1".
During read operation	The read value is always "0".

5.8. Noise Filter Enable Clear Register (EICxx_NFECR)

This register is used for the clear control of the noise filter enable register.

bit	31	30	29	28	27	26	25	24
Field	NFEC31	NFEC30	NFEC29	NFEC28	NFEC27	NFEC26	NFEC25	NFEC24
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	NFEC23	NFEC22	NFEC21	NFEC20	NFEC19	NFEC18	NFEC17	NFEC16
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	NFEC15	NFEC14	NFEC13	NFEC12	NFEC11	NFEC10	NFEC9	NFEC8
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	NFEC7	NFEC6	NFEC5	NFEC4	NFEC3	NFEC2	NFEC1	NFEC0
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] NFEC31 to NFEC0: Noise Filter Enable Clear Bits

These bits configure the clear control of the EICxx_NFER register.

NFEC31 to NFEC0	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the EICxx_NFER:NFEEn bit to "0".
During read operation	The read value is always "0".

5.9. External Interrupt Level Registers (EICxx_ELVR0 to 3)

These registers select the level and edge of the signals to be detected as external interrupt requests.

bit	31	30	29	28	27	26	25	24
Field	Reserved	LC7	LB7	LA7	Reserved	LC6	LB6	LA6
R/W Attribute	R0, WX	R/W	R/W	R/W	R0, WX	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	Reserved	LC5	LB5	LA5	Reserved	LC4	LB4	LA4
R/W Attribute	R0, WX	R/W	R/W	R/W	R0, WX	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved	LC3	LB3	LA3	Reserved	LC2	LB2	LA2
R/W Attribute	R0, WX	R/W	R/W	R/W	R0, WX	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved	LC1	LB1	LA1	Reserved	LC0	LB0	LA0
R/W Attribute	R0, WX	R/W	R/W	R/W	R0, WX	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] LC7 to LC0/LB7 to LB0/LA7 to LA0: Level Selection Bits for External Interrupt Request Detection

These bits select the level and edge of the signals to be detected as external interrupt requests.

EICxx_ELVRm.LCn	EICxx_ELVRm.LBn	EICxx_ELVRm.LAn	Description
0	0	0	Input of the L level to the pin
0	0	1	Input of the H level to the pin
0	1	0	Input of a rising edge to the pin
0	1	1	Input of a falling edge to the pin
1	X	X	Both edges (rising edge and falling edge)

* m=0 to 3, n=7 to 0

Setting	Description
EICxx_ELVR3	LC/LB/LA7
EICxx_ELVR3	LC/LB/LA6
EICxx_ELVR3	LC/LB/LA5
EICxx_ELVR3	LC/LB/LA4
EICxx_ELVR3	LC/LB/LA3

Setting		Description
EICxx_ELVR3	LC/LB/LA2	INT26 interrupt level setting
EICxx_ELVR3	LC/LB/LA1	INT25 interrupt level setting
EICxx_ELVR3	LC/LB/LA0	INT24 interrupt level setting
EICxx_ELVR2	LC/LB/LA7	INT23 interrupt level setting
EICxx_ELVR2	LC/LB/LA6	INT22 interrupt level setting
EICxx_ELVR2	LC/LB/LA5	INT21 interrupt level setting
EICxx_ELVR2	LC/LB/LA4	INT20 interrupt level setting
EICxx_ELVR2	LC/LB/LA3	INT19 interrupt level setting
EICxx_ELVR2	LC/LB/LA2	INT18 interrupt level setting
EICxx_ELVR2	LC/LB/LA1	INT17 interrupt level setting
EICxx_ELVR2	LC/LB/LA0	INT16 interrupt level setting
EICxx_ELVR1	LC/LB/LA7	INT15 interrupt level setting
EICxx_ELVR1	LC/LB/LA6	INT14 interrupt level setting
EICxx_ELVR1	LC/LB/LA5	INT13 interrupt level setting
EICxx_ELVR1	LC/LB/LA4	INT12 interrupt level setting
EICxx_ELVR1	LC/LB/LA3	INT11 interrupt level setting
EICxx_ELVR1	LC/LB/LA2	INT10 interrupt level setting
EICxx_ELVR1	LC/LB/LA1	INT9 interrupt level setting
EICxx_ELVR1	LC/LB/LA0	INT8 interrupt level setting
EICxx_ELVR0	LC/LB/LA7	INT7 interrupt level setting
EICxx_ELVR0	LC/LB/LA6	INT6 interrupt level setting
EICxx_ELVR0	LC/LB/LA5	INT5 interrupt level setting
EICxx_ELVR0	LC/LB/LA4	INT4 interrupt level setting
EICxx_ELVR0	LC/LB/LA3	INT3 interrupt level setting
EICxx_ELVR0	LC/LB/LA2	INT2 interrupt level setting
EICxx_ELVR0	LC/LB/LA1	INT1 interrupt level setting
EICxx_ELVR0	LC/LB/LA0	INT0 interrupt level setting

5.10. Non-Maskable Interrupt Register (EICxx_NMIR)

This register configures the non-maskable interrupt register.

bit	31	16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WP	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved							NMICLR
R/W Attribute	R0, WX							R0, W
Protection Attribute	WP							
Initial Value	00000000							0

bit	7	6	5	4	3	2	1	0
Field	Reserved							NMIINT
R/W Attribute	R0, WX							R, WX
Protection Attribute	WP							
Initial Value	00000000							0

[bit31:9] Reserved: Reserved Bits

[bit8] NMICLR: Non-Maskable Interrupt Clear Bit

This bit configures the clear control of non-maskable interrupts.

NMICLR	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the EICxx_NMIR:NMIINT bit to "0".
During read operation	The read value is always "0".

[bit7:1] Reserved: Reserved Bits

[bit0] NMIINT: Non-Maskable Interrupt Request Detection Bit

This bit retains the detection of a non-maskable interrupt request.

Bit	Description
0	No non-maskable interrupt request is detected.
1	A non-maskable interrupt request is detected.

5.11. DMA Request Enable Register (EICxx_DRER)

This register enables DMA for external interrupt requests.

bit	31	30	29	28	27	26	25	24
Field	DRE31	DRE30	DRE29	DRE28	DRE27	DRE26	DRE25	DRE24
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	DRE23	DRE22	DRE21	DRE20	DRE19	DRE18	DRE17	DRE16
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	DRE15	DRE14	DRE13	DRE12	DRE11	DRE10	DRE9	DRE8
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	DRE7	DRE6	DRE5	DRE4	DRE3	DRE2	DRE1	DRE0
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] DRE31 to DRE0: DMA Request Enable Bits

These bits set enable for DMA requests for external interrupts.

Bit	Description
0	Disable DMA.
1	Enable DMA.

Note:

- This register can be set/cleared not only by writing "1" or "0" directly to the EICxx_DRER register but also by writing "1" to the EICxx_DRESR/EICxx_DRECR register.

5.12. DMA Request Enable Set Register (EICxx_DRESR)

This register is used for the set control of the DMA request enable register.

bit	31	30	29	28	27	26	25	24
Field	DRES31	DRES30	DRES29	DRES28	DRES27	DRES26	DRES25	DRES24
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	DRES23	DRES22	DRES21	DRES20	DRES19	DRES18	DRES17	DRES16
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	DRES15	DRES14	DRES13	DRES12	DRES11	DRES10	DRES9	DRES8
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	DRES7	DRES6	DRES5	DRES4	DRES3	DRES2	DRES1	DRES0
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] DRES31 to DRES0: DMA Request Enable Set Bits

These bits configure the set control of the EICxx_DRER register.

DRES31 to DRES0	Description
During write operation	When "0" is written: Invalid When "1" is written: Set the EICxx_DRER:DREn bit to "1".
During read operation	The read value is always "0".

5.13. DMA Request Enable Clear Register (EICxx_DRECR)

This register is used for the clear control of the DMA request enable register.

bit	31	30	29	28	27	26	25	24
Field	DREC31	DREC30	DREC29	DREC28	DREC27	DREC26	DREC25	DREC24
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	DREC23	DREC22	DREC21	DREC20	DREC19	DREC18	DREC17	DREC16
R/W Attribute	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W	R0, W

[bit31:0] DREC31 to DREC0: DMA Request Enable Clear Bits

These bits configure the clear control of the EICxx_DRER register.

DREC31 to DREC0	Description
During write operation	When "0" is written: Invalid When "1" is written: Clear the EICxx_DRER:DREn to "0".
During read operation	The read value is always "0".

5.14. DMA Request Flag Register (EICxx_DRFR)

This register indicates the status about when a DMA request is detected.

bit	31	30	29	28	27	26	25	24
Field	DRF31	DRF30	DRF29	DRF28	DRF27	DRF26	DRF25	DRF24

Initial Value	X	X	X	X	X	X	X	X

[bit31:0] DRF31 to DRF0: DMA Request Detection Bits

These bits retain the detection of a DMA request.

DRF31 to DRF0	Description
0	No DMA request is detected.
1	A DMA request is detected.

Notes:

- Depending on the response from DMA, the EICxx_DRFR register bits are cleared.
- An EICxx_DRFR register bit is set when EICxx_DRER is enabled and a pin detects an interrupt event.

CHAPTER 14: Hardware Watchdog Timer

This section describes the Hardware watchdog timer.

1. Overview
2. Configuration and Block Diagram
3. Explanation of Operation
4. Setting Procedure Example
5. Operation Examples
6. Register List
7. Precautions for Using This Device

HWDT-TXXPT03P01R01L08-E1-XX

1. Overview

This section provides an overview of the Hardware watchdog timer.

The Hardware watchdog timer is positioned in the MCU configuration group, used for detecting a runaway state caused by a user program, also the Hardware watchdog timer is used to monitor control of the entire system performed by the CPU.

Hardware Watchdog Timer Features

- Detecting a runaway state caused by a user program generates a reset request. (*a)
- Clearing the hard reset starts the hardware watchdog timer. (*a)
- The watchdog counter source clock is selected from 2 types. (*a)
(High-speed CR clock (default) or low-speed CR clock)
- The BootROM program is used to set registers. (*a)
- It operates as a 32-bit watchdog counter.
- Different initializations between soft reset and hard reset can be applied.
- Soft reset clears only the watchdog counter.
- Hard reset initializes the watchdog counter, register setting, and internal circuits.
- It monitors the watchdog counter clear protection trigger sequence.
- The window watchdog function is implemented.
- Different operation settings are possible for each device state (RUN and PSS).
- It monitors the watchdog register write protection sequence.
- The majority circuits for bits that affect important functions are implemented.
- It can generate the watchdog reset request or watchdog interrupt request (NMI) in response to a watchdog error.
- It can generate a prior warning interrupt request before the reset request or interrupt request (NMI).
- It provides the function for outputting the watchdog counter monitor bit for the MCU output pin so that the watchdog timer counter can be observed from the outside. (Support target of this function is different depends on product specification. For details, see "Output of the Watchdog Counter Monitor Bit for MCU Output Pin" in 3 Explanation of Operation.)
- The watchdog counter can be stopped in the debugging state of the processor.

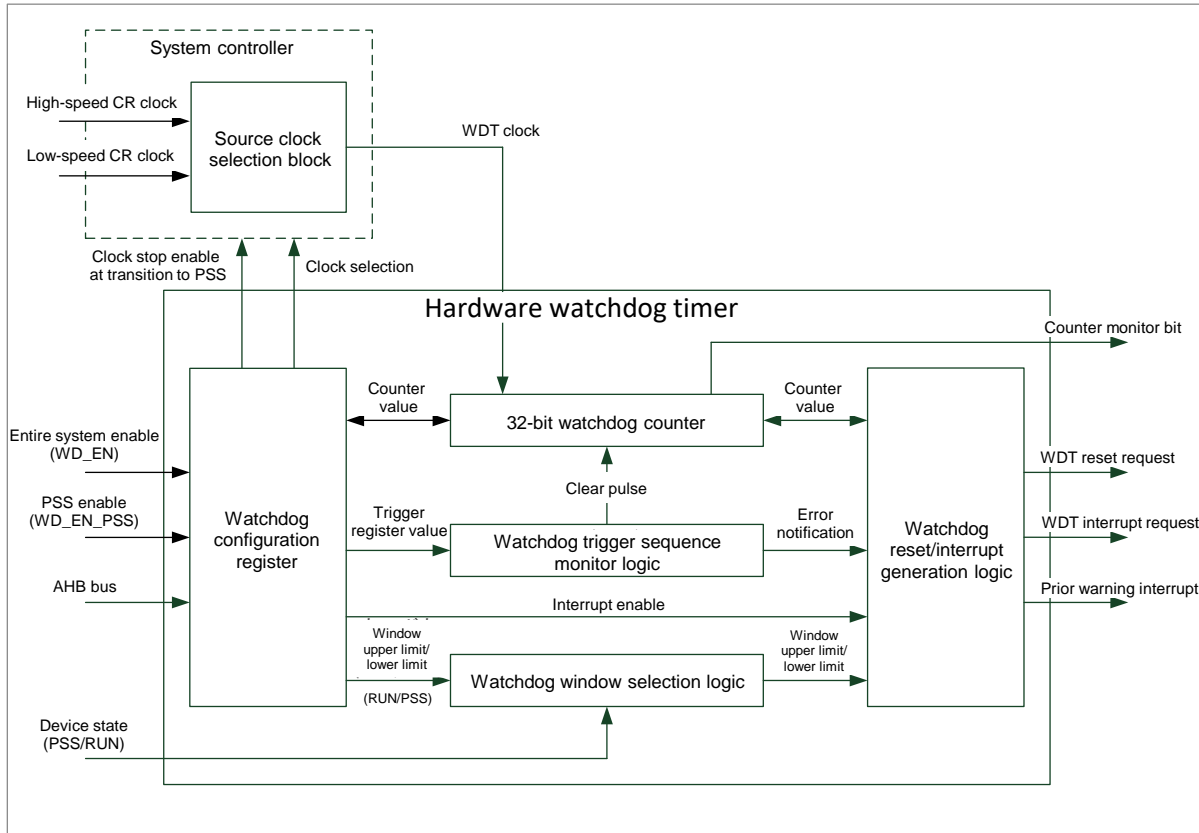

Notes:

- The notation (*a) indicates a feature that is specific to the hardware watchdog timer compared with the software watchdog.
- A watchdog error is a factor that causes the watchdog reset request or watchdog interrupt request (NMI).
- The use of the watchdog interrupt request (NMI) is prohibited except when used as a test function. (This is prohibited because if such use is allowed, ***security*** will be compromised during the execution of an application.)
- Figure 3-6 shows the operation of the test function of the Hardware watchdog.

2. Configuration and Block Diagram

This section describes the block diagrams of the Hardware watchdog timer.

Figure 2-1 Hardware Watchdog Timer Block Diagram

- **Watchdog configuration register:**
In this block, the set value of each register is stored. I/O operations for information including the counter value for read operation, trigger register value necessary for clearing the counter, and window upper limit/lower limit values are performed.
- **32-bit watchdog counter:**
This is the block of the 32-bit up counter.

It provides the function for outputting the watchdog counter monitor bit for the MCU output pin.
- **Watchdog window selection logic:**
This block fetches the window upper limit value and lower limit value for each device state (RUN and PSS) and selects a window setting according to the device state transition.
- **Watchdog reset/interrupt generation logic:**
This block generates the watchdog reset request, watchdog interrupt request (NMI), and prior warning interrupt request.

3. Explanation of Operation

This section describes operation of the Hardware watchdog timer.

Hardware Watchdog Timer Functions

The Hardware watchdog timer implements the following functions.

Reset Request Generation when Hardware Failure Causes Runaway State

The hardware watchdog timer performs monitoring to assure that there is no runaway state caused by a user program. The timer starts monitoring when it is activated by clearing a hard reset. If the watchdog counter is not cleared in the range between the upper limit value and the lower limit value of the window specified beforehand, this state is judged to be a runaway state caused by a user program. In this case, to the entire MCU, a reset request or an interrupt request (NMI) is generated.

Note:

- Detectable runaway states caused by hardware failures include, for example, one in which the BootROM program goes out of control as a result of a memory bit error after a hard reset is cleared.

Hardware Watchdog Timer Start by Clearing Hard Reset

Clearing a hard reset starts the hardware watchdog timer. Specifically, operation starts by using the clock generated by the high-speed CR oscillation circuit immediately after the hardware watchdog is canceled.

Hardware Watchdog Timer Control by CPU

The hardware watchdog timer monitors control by CPU over the entire system. The number of hardware watchdog timers to be mounted in the MCU is 1.

Watchdog Counter Source Clock Selection (2 Types)

The hardware watchdog timer sets values in the CLKSEL bits in the hardware watchdog configuration register (HWDG_CFG) to select a source clock for the watchdog counter from among 2 types of source clocks. Specifically, it selects a source clock from the high-speed CR clock or low-speed CR clock.

(The initial setting is for the high-speed CR clock.)

Selection of a source clock is a clock request to the system controller. Source clock switching is performed on the clock system side of the system controller. For details on the procedure, see "7. Precautions for Using This Device Switching of watchdog counter source clock."

Register Setting by BootROM Program

Hardware watchdog timer registers can be set by using the BootROM program.

32-Bit Watchdog Counter

The Hardware watchdog timer operates by using the 32-bit watchdog counter (up counter) (the initial value is 0x0000_0000).

The watchdog counter operates when all the following conditions are met.

1. The device is operating in user mode.
2. The watchdog counter has not reached the window upper limit value.
3. The device state is RUN and the WDENRUN bit is "1".
(See "6.15 Hardware Watchdog Configuration Register (HWDG_CFG).")
4. The device state is PSS and the WDENPSS bit is "1".
(See "6.15 Hardware Watchdog Configuration Register (HWDG_CFG).")

Note:

- When the watchdog counter reaches the window upper limit value, the count operation stops.

The following Table 3-1 shows the relationship between the window upper limit value and count time.

Table 3-1 Relationship between Hardware Window Upper Limit Value of Watchdog Timer and Count Time

Input Clock Frequency	Window Upper Limit Value	Count Time	Remarks
8MHz	0x0100_0000	About 2.1 s	It operates at the initial value of the Hardware watchdog upper RUN setting register (HWDG_RUNULS).
12MHz	0x0100_0000	About 1.4 s	
8MHz	0x8000_0000	About 268 s	It operates at the initial value of the Hardware watchdog upper PSS setting register (HWDG_PSSULS).
12MHz	0x8000_0000	About 178 s	

Note:

- The above table is an example involving high-speed CR clock frequencies of 8 MHz and 12 MHz.

Different Initializations between Soft Reset and Hard Reset

For the Hardware watchdog timer, different initializations between soft reset and hard reset can be applied. The following Table 3-2 Ranges of Initialization for Soft Reset and Hard Reset shows the ranges of initialization for soft reset and hard reset.

Table 3-2 Ranges of Initialization for Soft Reset and Hard Reset

Conditions	Reset Name	Range of Initialization
1	Soft reset	Watchdog counter
2	Hard reset	Watchdog counter and settings for all registers

Watchdog Counter Clear Protection Trigger Sequence

The Hardware watchdog timer monitors the watchdog counter clear protection trigger sequence to clear the watchdog counter.

The watchdog counter clear protection trigger sequence must meet the following conditions.

- Write data to the Hardware watchdog trigger 1 register (HWDG_TRG1) after writing data to the Hardware watchdog trigger 0 register (HWDG_TRG0).
- Do not execute the watchdog counter clear protection trigger sequence when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is "0".
- The value to be written to the Hardware watchdog trigger 0 register (HWDG_TRG0) must match the Hardware watchdog trigger 0 configuration register (HWDG_TRG0CFG).
- The value to be written to the Hardware watchdog trigger 1 register (HWDG_TRG1) must match the Hardware watchdog trigger 1 configuration register (HWDG_TRG1CFG).
- The watchdog counter must already have reached the window lower limit value when the watchdog counter clear protection trigger sequence is completed.

Note:

- For details on the watchdog counter clear protection trigger sequence, see Figure 3-2.

Window Watchdog Function

The window watchdog function is a function for setting a range in which the watchdog counter value can be cleared with upper limit and lower limit values. The following shows the range in which the watchdog counter can be cleared for 2 set values.

$$(\text{Window lower limit value}) \leq (\text{watchdog counter}) < (\text{window upper limit value})$$

For example, suppose that a runaway state occurs as a result of a user program and the watchdog counter clear protection trigger sequence is executed continuously. In this case, you can set a value other than 0x00000000 as a window lower limit value to detect the continuous watchdog counter clear as an abnormal operation.

The window setting for RUN is defined with the following 2 registers.

Hardware watchdog lower limit RUN current register (HWDG_RUNLLC)

Hardware watchdog upper limit RUN current register (HWDG_RUNULC)

The window setting for PSS is defined with the following 2 registers.

Hardware watchdog lower limit PSS current register (HWDG_PSSLLC)

Hardware watchdog upper limit PSS current register (HWDG_PSSULC)

Different Operation Settings for Each Device State (RUN and PSS)

The Hardware watchdog timer can make different operation settings for each device state (RUN and PSS). The operation setting is switched to the RUN or PSS operation setting according to the device state transition.

RUN operation setting

- When the LOCK bit and WDENRUN bit in the Hardware watchdog configuration register (HWDG_CFG) are set to "1", operation is performed by using the window setting for RUN.
- When the watchdog counter is not cleared in the range between the window upper limit value and lower limit value, or there is a violation in the watchdog counter clear protection trigger sequence, a watchdog error is detected. The watchdog reset request or watchdog interrupt request (NMI) is generated for this watchdog error. (For details on watchdog errors, see "7 Precautions for Using This Device Watchdog Error.")

PSS operation setting

- The window setting is switched to the window setting for PSS when the device state transitions from RUN to PSS. When the WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG) is set to "1", operation is performed by using the window setting for PSS.
- When the device state transitions from PSS to RUN, the enable bit is switched from the WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG) to the WDENRUN bit in the same register. However, the window setting is not switched immediately. Use of the window setting for PSS continues until the watchdog counter clear protection trigger sequence is executed.

Refer to Figure 3-4 and Figure 3-5 for the details on the watchdog operation in RUN and PSS, respectively.

Notes:

- *Certainly set the same value in upper limit registers and lower limit registers.*
- *Set the same value following two lower limit registers.*
 - Hardware watchdog lower limit PSS setting register (HWDG_PSSLLS)
 - Hardware watchdog lower limit RUN setting register (HWDG_RUNLLS)
- *Set the same value following two upper limit registers*
 - Hardware watchdog upper limit PSS setting register (HWDG_PSSULS)
 - Hardware watchdog upper limit RUN setting register (HWDG_RUNULS)
- *The limitation is needed, when device state change from RUN to PSS. Because the watchdog timer continues to use the window setting for PSS until the watchdog counter clear protection trigger sequence is performed. When WDENPSS bit is "0", the watchdog timer perform the same operation. So it needs same limitation.*

Figure 3-4 is shown about the hardware watchdog operation in RUN. Figure 3-5 is shown about the hardware watchdog operation in PSS.

Please refer to Figure 3-5.

Watchdog Register Write Protection Sequence

The Hardware watchdog timer monitors the watchdog register write protection sequence to write a setting value in the register.

The watchdog register write protection sequence must meet the following conditions.

- It writes a setting value in the register after writing data in the Hardware watchdog protection register (HWDG_PROT).
- It writes data in the Hardware watchdog protection register (HWDG_PROT) in privileged mode.
- The value written in the Hardware watchdog protection register (HWDG_PROT) must match the lock release key for register write protection 0xEDAC_CE55.
- It does not write a setting value in any register in another module after writing data in the Hardware watchdog protection register (HWDG_PROT).
- It does not write data in the Hardware watchdog protection register (HWDG_PROT) twice in a row.
- It writes a value in the register when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is "0" and the mode is privileged mode.

Note:

- *For details on the watchdog register write protection sequence, see Figure 3-1 Setting Procedure for Watchdog Register Write Protection Sequence.*

Table 3-3 Key Value for Register Programming

Key Value	Target Register	Purpose
0xEDAC_CE55	HWDG_PROT:KEY	Releasing protection lock for register write

Notes:

- *The watchdog register write protection sequence is unnecessary for the Hardware watchdog trigger 0/1 register (HWDG_TRG0 and HWDG_TRG1).*
- *Setting the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) to "1" prevents the following registers from being rewritten.*
 - Hardware watchdog interrupt configuration register (HWDG_INT)
 - Hardware watchdog trigger 0 configuration register (HWDG_TRG0CFG)
 - Hardware watchdog trigger 1 configuration register (HWDG_TRG1CFG)
 - Hardware watchdog lower limit RUN setting register (HWDG_RUNLLS)
 - Hardware watchdog upper limit RUN setting register (HWDG_RUNULS)
 - Hardware watchdog lower limit PSS setting register (HWDG_PSSLLS)
 - Hardware watchdog upper limit PSS setting register (HWDG_PSSULS)
 - Hardware watchdog reset delay counter register (HWDG_RSTDLY)
 - Hardware watchdog configuration register (HWDG_CFG)

Majority Circuits for Bits That Affect Important Functions

The Hardware watchdog timer has majority circuits for bits that affect important functions. The majority circuit consists of 3 FFs. When the bit in an FF bit is inverted due to noise or because of another factor, the correct value can be selected by majority decision among the 3 FFs.

The bits that are equipped with majority circuits are as follows.

- RSTEN bit (*1)
- LOCK bit (*2)

Notes:

- The notation (*1) indicates a bit in the Hardware watchdog interrupt configuration register (HWDG_INT).
- The notation (*2) indicates a bit in the Hardware watchdog configuration register (HWDG_CFG).

Generation of Watchdog Reset Request or Watchdog Interrupt Request (NMI)

The Hardware watchdog timer generates the watchdog reset request or watchdog interrupt request (NMI) when detecting a watchdog error. Use the watchdog interrupt request (NMI) as a test function. (For example, you can use the watchdog interrupt request (NMI) to set a break point at the beginning of an interrupt handler.)

Also, the Hardware watchdog timer can generate the prior warning interrupt request before the watchdog reset request (or watchdog interrupt request (NMI)). (For example, you can use the prior warning interrupt request so that the processor can save important data to the memory before the watchdog reset request is generated.)

The Hardware watchdog timer generates these requests by using the following procedure.

- When a watchdog error occurs, the IRQFLAG bit in the Hardware watchdog interrupt configuration register (HWDG_INT) is set. At this time, if the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT) is "1", the prior warning interrupt request is generated.
- As many cycles as are set in the Hardware watchdog reset delay counter register (HWDG_RSTDLY) are inserted between the prior warning interrupt request and the watchdog reset interrupt request or watchdog interrupt request (NMI) as a delay time.
- Once the prior warning interrupt request is generated, the watchdog counter cannot be cleared with the watchdog counter clear protection trigger sequence. Also, if a new watchdog error occurs, it is ignored.
- After the elapse of the time corresponding to the number of cycles for delay time set in the Hardware watchdog reset delay counter register (HWDG_RSTDLY), the watchdog reset request or watchdog interrupt request (NMI) is generated. If the Hardware watchdog reset delay counter register (HWDG_RSTDLY) is 0x0000, no delay time occurs.

Notes:

- When you generate the prior warning interrupt request, set the Hardware watchdog reset delay counter register (HWDG_RSTDLY) to a value other than 0x0000.

- *The use of the watchdog interrupt request (NMI) is prohibited except when used as a test function. (This is prohibited because if such use is allowed, safety will be compromised during the execution of an application.) Figure 3-6 shows the operation of the test function of the Hardware watchdog.*
- *Insertion of a number of cycles equal to that for the delay time set in the Hardware watchdog reset delay counter register (HWDG_RSTDLTY) is valid only for 1 watchdog reset request or watchdog interrupt request (NMI). (It remains invalid until the next hard reset occurs.)*

Output of the Watchdog Counter Monitor Bit for MCU Output Pin

The Hardware watchdog timer outputs the watchdog counter monitor bit to the outside so that watchdog counter operation can be monitored from the outside. You can select any 1 bit in the watchdog counter (32 bits) by setting the OBSSEL[4:0] bits in the Hardware watchdog configuration register (HWDG_CFG).

Support of this function is different depends on product specification.

Watchdog Counter Stop in Debugging State of Processor

The watchdog counter stops when the processor enters the debugging state. When the processor returns from the debugging state, the watchdog counter resumes operation from the point where it had stopped.

Note:

- *For the definition of the debugging state of the processor, see the material from ARM(R) (Cortex™-R5 Revision:r1p2 Technical Reference Manual (ARM DDI 0460D)).*

Differences between Software Watchdog and Hardware Watchdog

The following Table 3-4 Differences between Software Watchdog and Hardware Watchdog shows the main differences between the software watchdog and hardware watchdog.

Table 3-4 Differences between Software Watchdog and Hardware Watchdog

Item	Software Watchdog	Hardware Watchdog
Watchdog Counter	32-bit up counter	Same as on left
Different Initializations between Soft Reset and Hard Reset	Supported	Same as on left
Trigger Sequence for Watchdog Counter Clear	Supported	Same as on left
Window Watchdog Function	Supported	Same as on left
Different Operation Settings for Each Device State (RUN and PSS)	Supported	Same as on left
Watchdog Counter Source Clock Selection	4 types - High-speed CR clock - Low-speed CR clock - Sub clock - Main clock	2 types - High-speed CR clock - Low-speed CR clock
Watchdog Register Write Protection Sequence	Supported (However, prevention of rewriting of the window setting by the LOCK bit is not supported.)	Same as on left (However, prevention of rewriting of the window setting by the LOCK bit is supported.)
Majority Circuits for Bits That Affect Important Functions	Supported (4 target bits)	Same as on left (2 target bits)
Reset Request or Interrupt Request (NMI) Generation	Supported	Same as on left
Prior Warning Interrupt Request Generation	Supported	Same as on left
Output of Watchdog Counter Monitor Bit for MCU Output Pin	Supported	Supported
Watchdog Counter Stop in the Debugging State of the Processor	Supported	Same as on left
Watchdog Error Conditions	5 types	Same as on left
Bus Error Response Conditions	8 types	Same as on left
Watchdog Timer Start	Register write by a user program	Hard reset clear
Register Setting Value Write	User program	BootROM program
Watchdog Counter Enable Bit Control	Register write by a user program	Constantly operation (Fixed hardware)

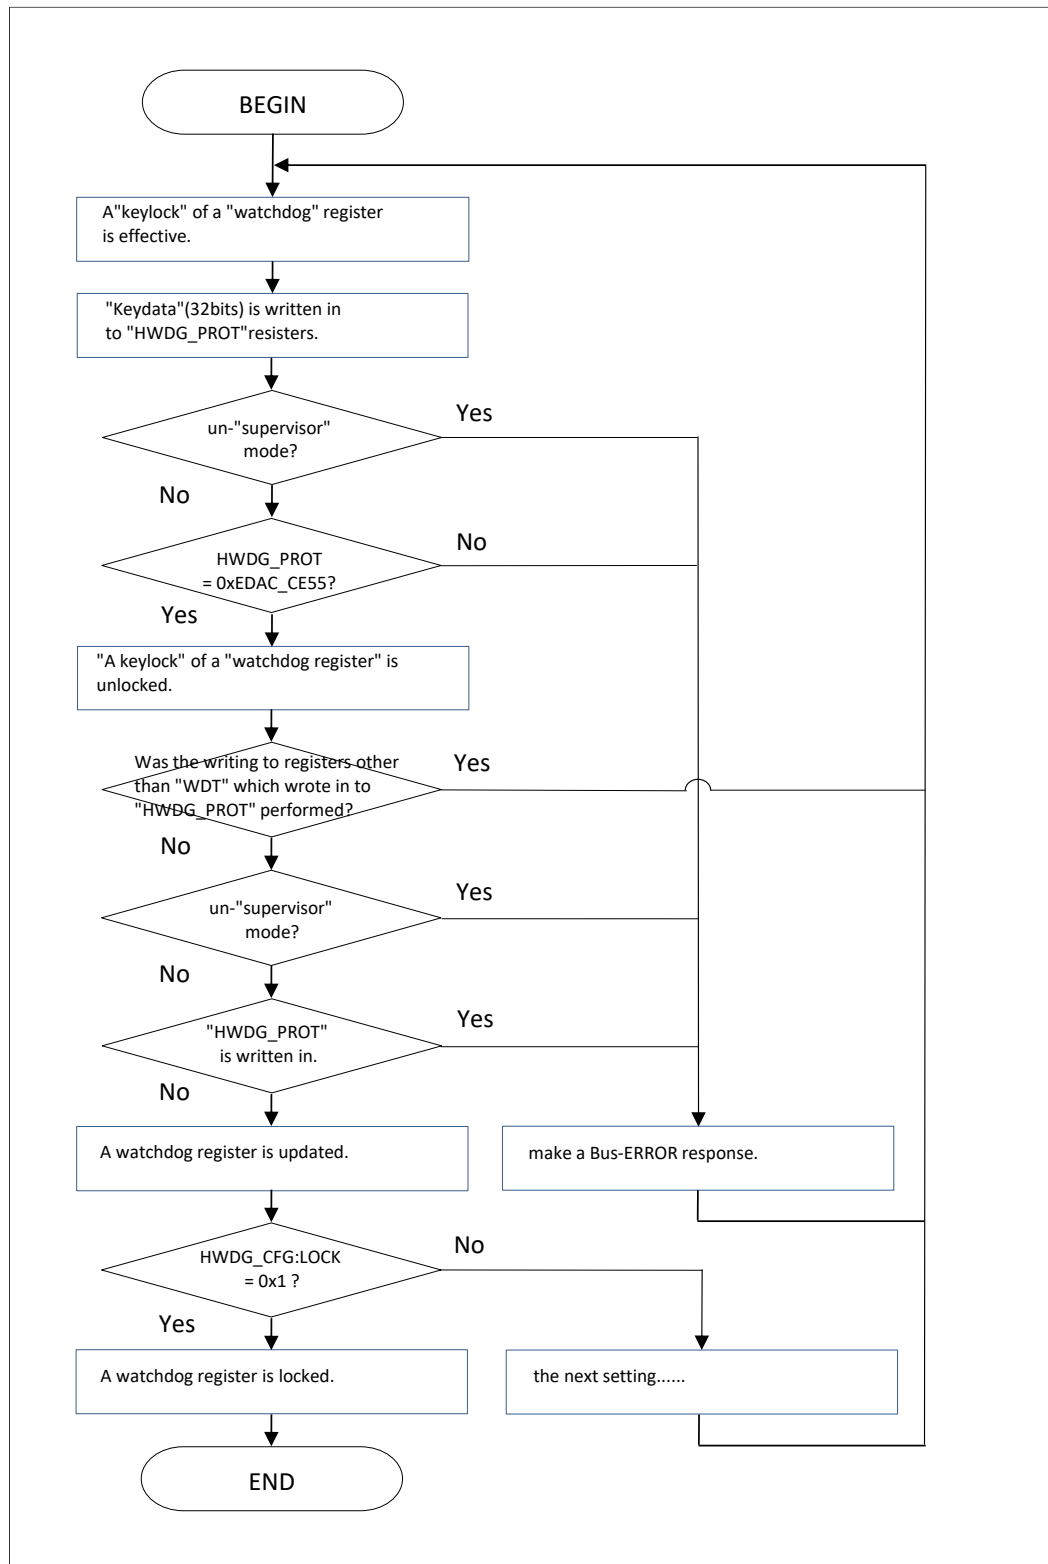

Notes:

- *Unlike the case of the software watchdog timer, for the hardware watchdog timer, the BootROM program sets register during the initial operation setting. (Write and read operation from the CPU can also be performed.)*
- *The following register setting values are determined by a marker in the flash memory (BootROM marker).*
 - HWDG_INT
 - HWDG_TRG0CFG
 - HWDG_TRG1CFG
 - HWDG_RUNLLS
 - HWDG_RUNULS
 - HWDG_PSSLLS
 - HWDG_PSSULS
 - HWDG_RSTDLY
 - HWDG_CFG

For details on the registers, see "6.Register List"

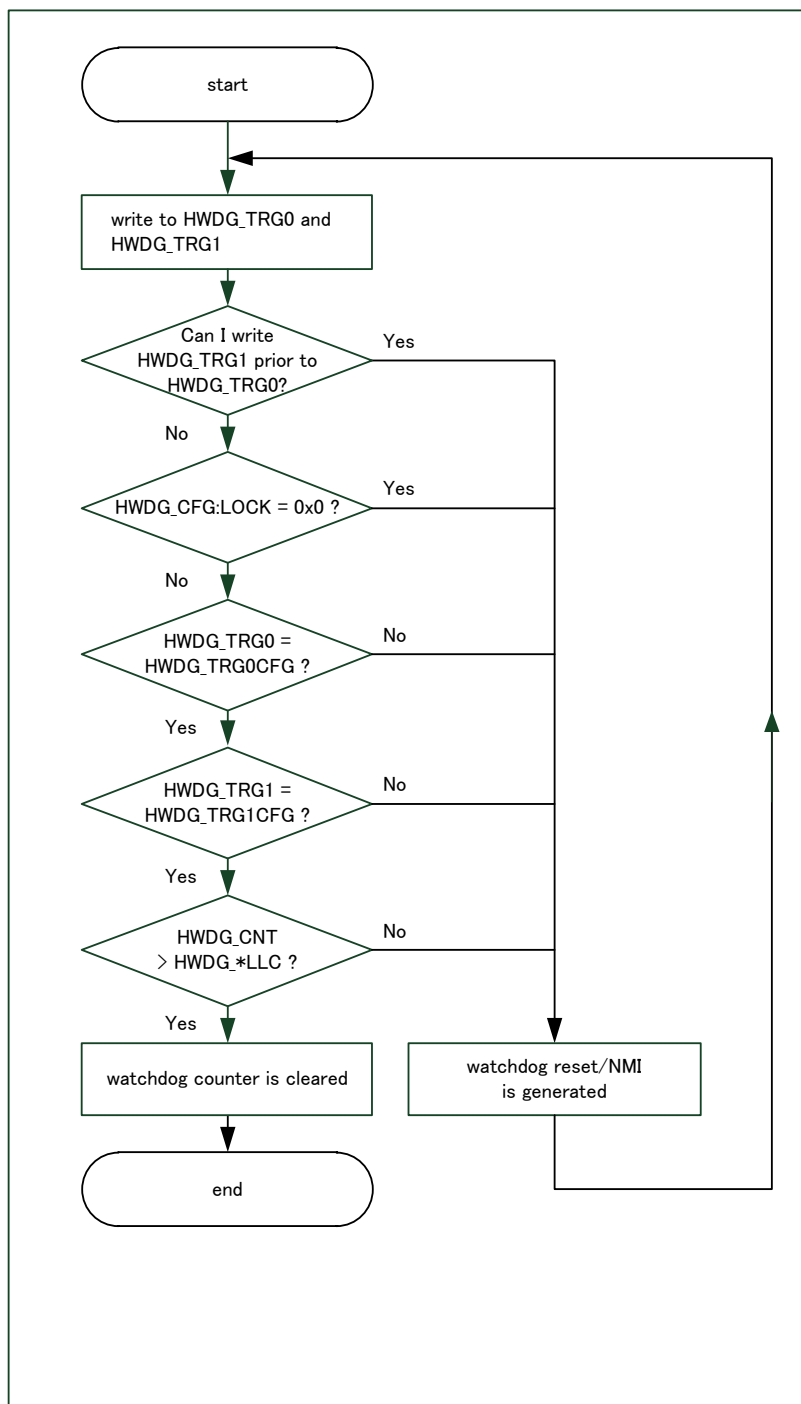

The following figure shows the watchdog register write protection sequence setting procedure.

Figure 3-1 Setting Procedure for Watchdog Register Write Protection Sequence

The following figure shows the watchdog counter clear protection trigger sequence setting procedure.

Figure 3-2 Setting Procedure for Watchdog Counter Clear Protection Trigger Sequence

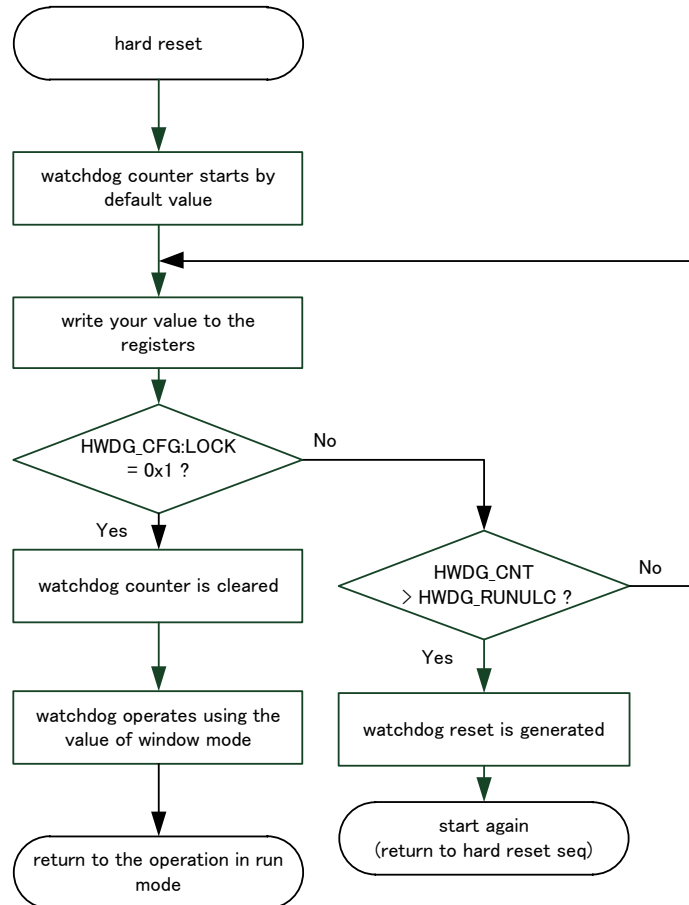

Note:

- The notation * in Figure 3-2 Setting Procedure for Watchdog Counter Clear Protection Trigger Sequence is replaced with device state RUN or PSS.

The following figure shows the Hardware watchdog timer startup procedure.

Figure 3-3 Startup of Hardware Watchdog Timer

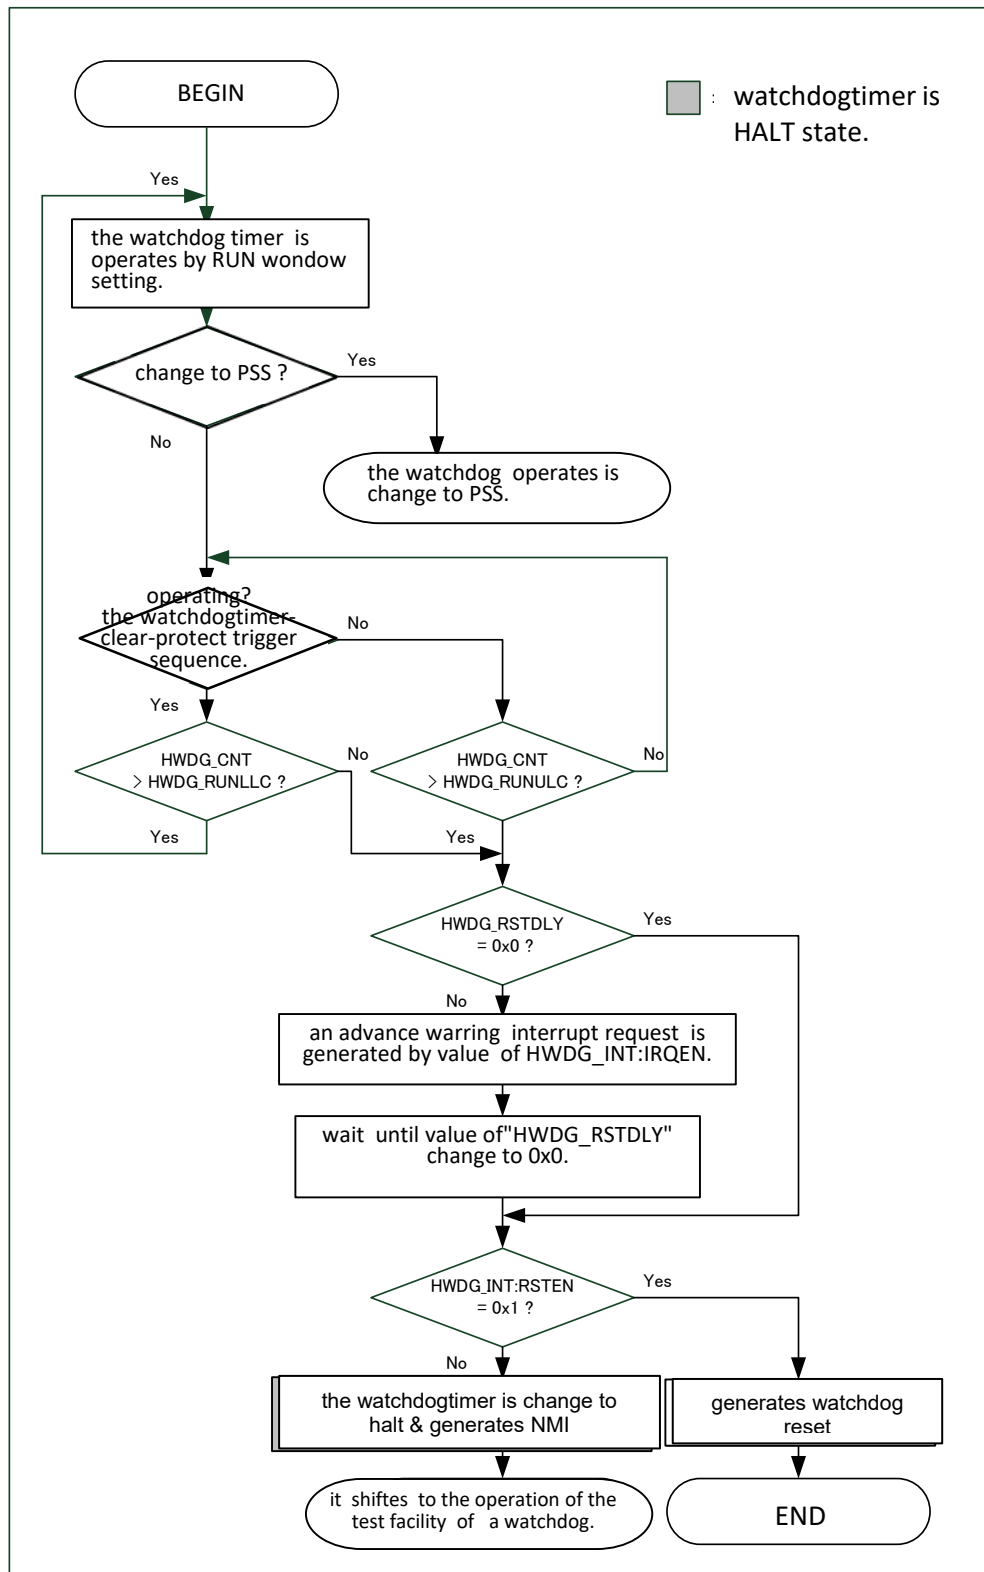

1. The hard reset initializes the hardware watchdog timer. Then, immediately after the hard reset is cleared, the operating state is indicated.
2. The default window setting indicates the window lower limit value (= 0x0000_0000) and window upper limit value (= 0x0100_0000).
3. You can change the register setting as long as the LOCK bit in the hardware watchdog configuration register (HWDG_CFG) is "0". However, complete the setting change within the time it takes to reach the window upper limit value.
4. Setting the LOCK bit in the hardware watchdog configuration register (HWDG_CFG) to "1" clears the watchdog counter.

Note:

- The hardware watchdog timer operates by using the default window setting regardless of the set values of the registers and the device state (RUN or PSS) as long as the LOCK bit in the hardware watchdog configuration register (HWDG_CFG) is "0".

The following figure shows the Hardware watchdog operation in RUN.

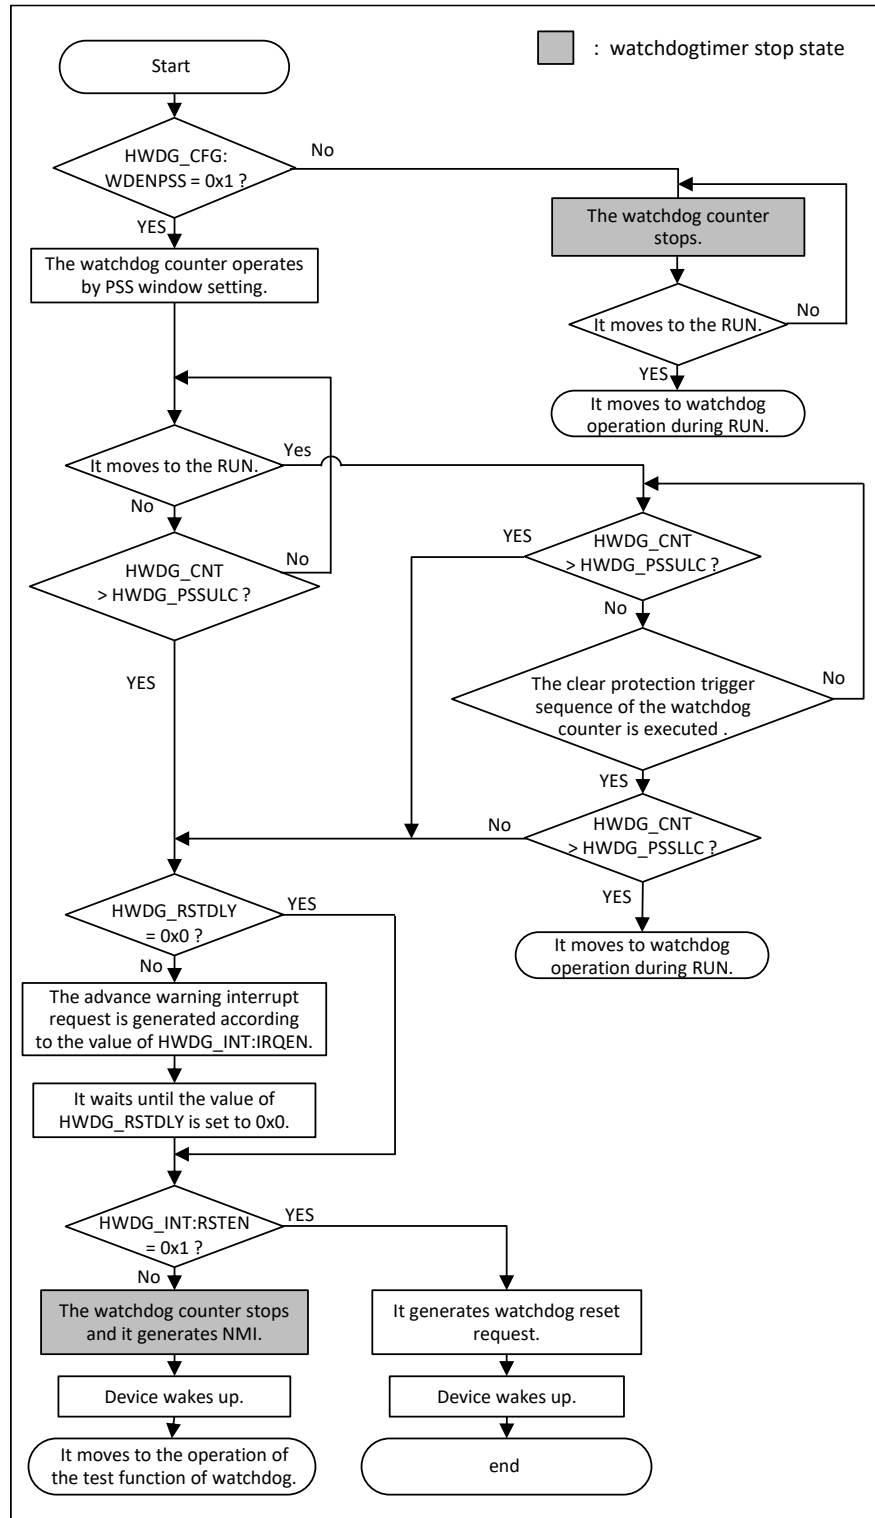

Figure 3-4 Hardware Watchdog Operation in RUN

1. The watchdog counter in RUN always operates.
2. When the device state transitions from RUN to PSS, the processing transitions to the operation of the watchdog in PSS. For details, see Figure 3-5.
3. During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Do this to clear the watchdog counter periodically.
4. If a runaway state caused by a user program occurs and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI).
5. According to the value of the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Hardware watchdog reset delay counter register (HWDG_RSTDLY) are inserted.
6. After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3-6.

The following figure shows the Hardware watchdog operation in PSS.

Figure 3-5 Hardware Watchdog Operation in PSS

1. The watchdog counter in PSS operates or stops according to the value of the WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG).

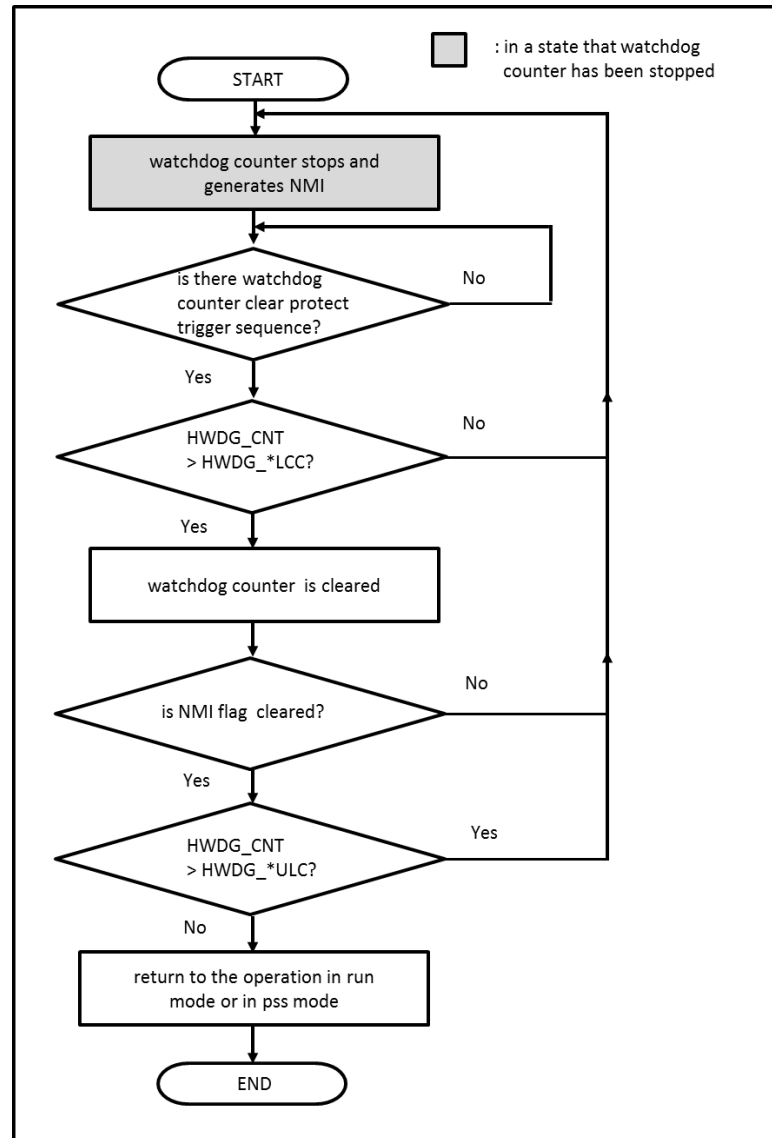

2. When the device state transitions from PSS to RUN, the watchdog counter operation is started immediately. However, the PSS window setting continues to be used until the watchdog counter clear protection trigger sequence is executed.
3. During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Continuously clearing the watchdog counter needs to be done periodically.
4. If a runaway state caused by a user program and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI).
5. According to the value of the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Hardware watchdog reset delay counter register (HWDG_RSTDLY) are inserted.
6. After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3-6.

Note:

- *If the watchdog counter clear protection trigger sequence is executed during operation with the PSS window setting, this means that the device state has already returned from PSS to RUN.*

The following figure shows the operation of the test function of the Hardware watchdog.

Figure 3-6 Operation of Hardware Watchdog Test Function

1. The watchdog counter is in the stop state.
2. If the watchdog counter clear protection trigger sequence is executed in the stop state of the watchdog counter and the window lower limit value has already been reached at this time, the watchdog counter is cleared. (If this occurs outside the counter range, no special change occurs.)
3. When the NMIFLAG bit in the Hardware watchdog interrupt configuration register (HWDG_INT) is cleared, the watchdog interrupt request (NMI) is cleared.
4. When the watchdog counter has not reached the window upper limit value, processing returns to operation in RUN or PSS. When it has already reached the window upper limit value, no special change occurs.

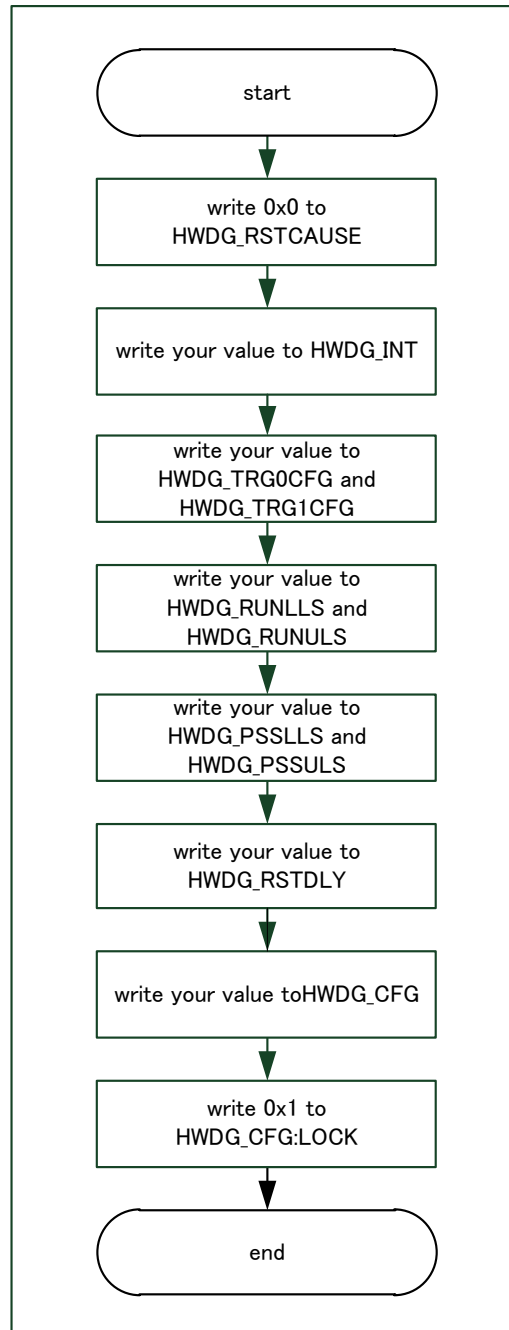

Note:

The notation * in Figure 3-6 means "RUN" or "PSS".

4. Setting Procedure Example

This section explains an example of a procedure for setting the Hardware watchdog timer.

Figure 4-1 Example of Hardware Watchdog Timer Register Setting Procedure

Note:

- In Figure 4-1, the setting order can be changed except for the step of setting the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) to "1".

- *Hardware watchdog timer is configured by boot program, and this is determined by value of BootROM marker. For detail of boot program and BootROM marker, see BootROM Software Interface chapter.
Therefore, user program has to execute only "write 0x0 to HWDG_RSTCAUSE".*

5. Operation Examples

This section describes examples of operating the Hardware watchdog timer.

Figure 5-1 Example of Operating Hardware Watchdog Timer (When Operation in PSS Is Enabled)

1. After power-on, the hardware watchdog timer starts operation. (The initial value of the window upper limit is 0x01000000.)
2. After writing setting values in the registers, the LOCK bit in the hardware watchdog configuration register (HWDG_CFG) is set to "1". At this time, the watchdog counter is automatically cleared, and it starts up-counting from 0x00000000.
3. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
4. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
5. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
6. The device state transitions from RUN to PSS. At this time, switching to the PSS window setting occurs.
7. The device state returns from PSS to RUN. At this time, the switching to the RUN window setting does not occur immediately.
8. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared. At this time, the switching to the RUN window setting occurs.
9. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
10. When the watchdog counter reaches the window upper limit value, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Notes:

- *The window setting is not immediately switched to the window setting for RUN when the device state is returned from PSS to RUN.*
- *Before the transition from RUN to PSS, be sure to clear the watchdog counter.*

Figure 5-2 Example of Operating Hardware Watchdog Timer (When Operation in PSS Is Disabled)

1. After power-on, the hardware watchdog timer starts operation. (The initial value of the window upper limit is 0x0100_0000.)
2. After writing setting values in the registers, the LOCK bit in the hardware watchdog configuration register (HWDG_CFG) is set to "1". At this time, the watchdog counter is automatically cleared, and it starts up-counting from 0x00000000.
3. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
4. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
5. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
6. Switching to the PSS window setting occurs.
7. The device state transitions from RUN to PSS. At this time, the Hardware watchdog timer stops operation.
8. The device state returns from PSS to RUN. At this time, the Hardware watchdog timer immediately starts operation. The switching to the RUN window setting does not occur immediately.
9. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared. At this time, the switching to the RUN window setting occurs.
10. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
11. When the watchdog counter reaches the window upper limit value, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Notes:

- The window setting is not immediately switched to the window setting for RUN when the device state is returned from PSS to RUN.
- After the device state returned from PSS to RUN, the watchdog counter is cleared. At this time, the switching to the RUN window setting occurs.
- Certainly set the same value in upper limit registers and lower limit registers.
- Set the same value following two lower limit registers.

- Hardware watchdog lower limit PSS setting register (HWDG_PSSLLS)
- Hardware watchdog lower limit RUN setting register (HWDG_RUNLLS)
- *Set the same value following two upper limit registers*
 - Hardware watchdog upper limit PSS setting register (HWDG_PSSULS)
 - Hardware watchdog upper limit RUN setting register (HWDG_RUNULS)
- *The limitation is needed, when device state change from PSS to RUN. Because the window setting don't change immediately. When device state change from RUN to PSS, clear the watchdog counter.*

6. Register List

This section explains the registers of the Hardware watchdog timer.

Table 6-1 List of Hardware Watchdog Timer Registers

Abbreviated Register Name	Register Name	Reference
HWDG_PROT	Hardware watchdog protection register	6.1
HWDG_CNT	Hardware watchdog counter register	6.2
HWDG_RSTCAUSE	Hardware watchdog reset source register	6.3
HWDG_TRG0	Hardware watchdog trigger 0 register	6.4
HWDG_TRG1	Hardware watchdog trigger 1 register	6.5
HWDG_INT	Hardware watchdog interrupt configuration register	6.6
HWDG_INTCLR	Hardware watchdog interrupt clear register	6.7
HWDG_TRG0CFG	Hardware watchdog trigger 0 configuration register	6.8
HWDG_TRG1CFG	Hardware watchdog trigger 1 configuration register	6.9
HWDG_RUNLLS	Hardware watchdog lower limit RUN setting register	6.10
HWDG_RUNULS	Hardware watchdog upper limit RUN setting register	6.11
HWDG_PSSLLS	Hardware watchdog lower limit PSS setting register	6.12
HWDG_PSSULS	Hardware watchdog upper limit PSS setting register	6.13
HWDG_RSTDLY	Hardware watchdog reset delay counter register	6.14
HWDG_CFG	Hardware watchdog configuration register	6.15
HWDG_RUNLLC	Hardware watchdog lower limit RUN current register	6.16
HWDG_RUNULC	Hardware watchdog upper limit RUN current register	6.17
HWDG_PSSLLC	Hardware watchdog lower limit PSS current register	6.18
HWDG_PSSULC	Hardware watchdog upper limit PSS current register	6.19

Table 6-2 Register Memory Layout of Hardware Watchdog Timer

Offset	Register Name			
	+3	+2	+1	+0
0x0000_0000	HWDG_PROT 00000000_00000000_00000000_00000000			
0x0000_0004	-	-	-	-

0x0000_004C	HWDG_RUNLLC 00000000_00000000_00000000_00000000			
0x0000_0050	HWDG_RUNULC 00000001_00000000_00000000_00000000			
0x0000_0054	HWDG_PSSLLC 00000000_00000000_00000000_00000000			
0x0000_0058	HWDG_PSSULC 10000000_00000000_00000000_00000000			

Note:

- "X" indicates an undefined value.

6.1. Hardware Watchdog Protection Register (HWDG_PROT)

This register is used to execute the watchdog register write protection sequence. Write the correct key (0xEDAC_CE55) to this register before performing write access to each register. (However, the Hardware watchdog trigger 0/1 register (HWDG_TRG0 and HWDG_TRG1) are excluded.) Writing the correct key releases the write protection lock for subsequent register access. Write access to each register enables write protection lock for the registers. (Read access to each register does not affect the lock.) For write access to this register, you must write 32-bit data.

Bit	31	0
Field	KEY[31:0]	
R/W Attribute	R, W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] KEY[31:0]: Protection Bits

KEY[31:0]	Description
During write operation	When 0xEDAC_CE55 is written: Protection lock for register write is released. When a value other than 0xEDAC_CE55 is written: Protection lock for register write is not released.
During read operation	When 0xFFFF_FFFF is read: Protection lock for register write has been released. When 0x0000_0000 is read: Protection lock for register write has been enabled.

Notes:

- An AHB transfer error response is generated when write access to this register is performed under any of the conditions below. (This error response invokes the CPU exception handler.)
 - A wrong key is written to this register.
 - Non-32-bit data is written to this register.
 - Data is written to this register twice in a row.
- For details on the watchdog register write protection sequence, see Figure 3-1.
- A protect key will be locked again by writing to the address where is in the same group area (MCU Config Group), however protect key will not be locked by writing to no protect target register (HWDG_TRG0/1) in Hardware Watchdog.

6.2. Hardware Watchdog Counter Register (HWDG_CNT)

This register indicates the current up count value of the watchdog counter.

Bit	31	0
Field	WDGCNT[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGCNT[31:0]: Watchdog Counter Bits

WDGCNT[31:0]	Description
During write operation	Invalid
During read operation	Returns the current watchdog counter value. The watchdog counter value is sampled by using the bus clock.

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.3. Hardware Watchdog Reset Factor Register (HWDG_RSTCAUSE)

When performing write access to this register, follow the watchdog register write protection sequence. This register is the status register that indicates the factor of the watchdog reset request or watchdog interrupt request (NMI). This register is not initialized by reset. After a watchdog reset, the value is maintained. To check the factor of the watchdog reset request, read this register.

Bit	31						8
Field	Reserved						
R/W Attribute	R0, WX						
Protection Attribute	WPS						
Initial Value	00000000_00000000_00000000						

Bit	7	5	4	3	2	1	0
Field	Reserved		RST CAUSE4	RST CAUSE3	RST CAUSE2	RST CAUSE1	RST CAUSE0
R/W Attribute	R0, WX		R, W	R, W	R, W	R, W	R, W
Protection Attribute	WPS						
Initial Value	000		X	X	X	X	X

[bit31:5] Reserved: Reserved Bits

[bit4] RSTCAUSE4: Reset Factor Bit 4

If the watchdog counter clear protection trigger sequence is executed when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is "0", this bit is set to "1".

RSTCAUSE4	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

[bit3] RSTCAUSE3: Reset Factor Bit 3

If the watchdog counter clear protection trigger sequence is executed before the watchdog counter reaches the window lower limit value, this bit is set to "1".

RSTCAUSE3	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

[bit2] RSTCAUSE2: Reset Factor Bit 2

When the watchdog counter reaches the window upper limit value, this bit is set to "1".

RSTCAUSE2	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

When the prior warning interrupt request is used, RSTCAUSE2 cannot be cleared during the period from the occurrence of a prior warning interrupt until a watchdog reset or watchdog interrupt (NMI).

[bit1] RSTCAUSE1: Reset Factor Bit 1

When there is a violation of the watchdog counter clear protection trigger sequence, this bit is set to "1". For details, see Figure 3-2.

RSTCAUSE1	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

[bit0] RSTCAUSE0: Reset Factor Bit 0

If the value written in the Hardware watchdog trigger 0/1 register (HWDG_TRG0 or HWDG_TRG1) does not match a proper value, this bit is set to "1".

RSTCAUSE0	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

Notes:

- When using the Hardware watchdog timer, be sure to clear this register.
- The value in this register becomes valid when the watchdog reset request is generated.

6.4. Hardware Watchdog Trigger 0 Register (HWDG_TRG0)

When performing write access to this register, you do not need to follow the watchdog register write protection sequence. This register is used to execute the watchdog counter clear protection trigger sequence. Write the value defined in the Hardware watchdog trigger 0 configuration register (HWDG_TRG0CFG) to this register. When a value other than the one in the Hardware watchdog trigger 0 configuration register (HWDG_TRG0CFG) is written, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Bit	31							8
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	-							
Initial Value	00000000_00000000_00000000							

Bit	7	6	5	4	3	2	1	0
Field	WDGTRG0[7:0]							
R/W Attribute	R0, W							
Protection Attribute	-							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG0[7:0]: Watchdog Trigger 0 Bits

These bits are used to execute the watchdog counter clear protection trigger sequence to clear the watchdog counter.

WDGTRG0[7:0]	Description
During write operation	<p>When the HWDG_TRG0CFG value is written: 1 condition for executing the watchdog counter clear protection trigger sequence is met.</p> <p>When a value other than the HWDG_TRG0CFG value is written: A watchdog error is generated.</p>
During read operation	Reads 0b00000000.

Note:

- Figure 3-2 shows the flow of the watchdog counter clear protection trigger sequence.

6.5. Hardware Watchdog Trigger 1 Register (HWDG_TRG1)

When performing write access to this register, you do not need to follow the watchdog register write protection sequence. This register is used to execute the watchdog counter clear protection trigger sequence. Write the value defined in the Hardware watchdog trigger 1 configuration register (HWDG_TRG1CFG) to this register. When a value other than the one in the Hardware watchdog trigger 1 configuration register (HWDG_TRG1CFG) is written, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Bit	31								8
Field	Reserved								
R/W Attribute	R0, WX								
Protection Attribute	-								
Initial Value	00000000_00000000_00000000								

Bit	7	6	5	4	3	2	1	0
Field	WDGTRG1[7:0]							
R/W Attribute	R0, W							
Protection Attribute	-							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG1[7:0]: Watchdog Trigger 1 Bits

These bits are used to execute the watchdog counter clear protection trigger sequence to clear the watchdog counter.

WDGTRG1[7:0]	Description
During write operation	<p>When the HWDG_TRG1CFG value is written: 1 condition for executing the watchdog counter clear protection trigger sequence is met.</p> <p>When a value other than the HWDG_TRG1CFG value is written: A watchdog error is generated.</p>
During read operation	Reads 0b00000000.

Note:

- *Figure 3-2 shows the flow of the watchdog counter clear protection trigger sequence.*

6.6. Hardware Watchdog Interrupt Configuration Register (HWDG_INT)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to make settings related to the watchdog resetrequest (NMI) and prior warning interrupt request. This register also includes interrupt status flags.

Bit	31	18	17	16
Field	Reserved		RSTEN	IRQEN
R/W Attribute	R0, WX		R/W	R/W
Protection Attribute	WPS			
Initial Value	000000_00000000		1	0

Bit	15	2	1	0
Field	Reserved		NMI FLAG	IRQ FLAG
R/W Attribute	R0, WX		R, WX	R, WX
Protection Attribute	WPS			
Initial Value	000000_00000000		0	0

[bit31:18] Reserved: Reserved Bits

[bit17] RSTEN: Reset/NMI Enable Bit

This bit is used to generate either the watchdog reset request or watchdog interrupt request (NMI) in response to a watchdog error. Prohibiting setting this bit to "0" except for the purpose of using it as a test function. (If this bit is set to "0" during application execution, security is compromised.) This bit is equipped with a majority circuit with 3 FFs as a measure against a bit invert caused by the effects of noise or another factor.

RSTEN	Description
During write operation	When "0" is written: The watchdog interrupt request (NMI) is generated. When "1" is written: The watchdog reset request is generated.
During read operation	Set value read

[bit16] IRQEN: Prior warning Interrupt Enable Bit

This bit is used to enable generation of the prior warning interrupt request.

IRQEN	Description
During write operation	When "0" is written: The prior warning interrupt request is not generated. When "1" is written: The prior warning interrupt request is generated.
During read operation	Set value read

[bit15:2] Reserved: Reserved Bits

[bit1] NMIFLAG: NMI Flag

This bit is set by a watchdog error when the RSTEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT) is "0". When the RSTEN bit in the Hardware watchdog interrupt clear register (HWDG_INT) is "1", the watchdog reset request is generated. You can clear this bit by writing "1" to the NMICLR bit in the Hardware watchdog interrupt configuration register (HWDG_INTCLR).

NMIFLAG	Description
During write operation	Invalid
During read operation	When "0" is read: No detection of a watchdog error (NMI) is indicated. When "1" is read: Detection of a watchdog error (NMI) is indicated.

[bit0] IRQFLAG: IRQ Flag

This bit is set by a watchdog error. The prior warning interrupt is generated when the IRQEN bit in the Hardware watchdog interrupt clear register (HWDG_INT) is "1". You can clear this bit by writing "1" to the IRQCLR bit in the Hardware watchdog interrupt configuration register (HWDG_INTCLR).

IRQFLAG	Description
During write operation	Invalid
During read operation	When "0" is read: No detection of a watchdog error (IRQ) is indicated. When "1" is read: Detection of a watchdog error (IRQ) is indicated.

Notes:

- For details on the watchdog interrupt request (NMI), see "3 Explanation of Operation Generation of watchdog reset request or watchdog interrupt request (NMI)."
- For details on watchdog errors, see "7 Precautions for Using This Device Watchdog Error."

IRQCLR	Description
During write operation	When "0" is written: Invalid When "1" is written: The IRQ flag is cleared.
During read operation	"0" is read.

6.8. Hardware Watchdog Trigger 0 Configuration Register (HWDG_TRG0CFG)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to define a valid value to be written to the Hardware watchdog trigger 0 register (HWDG_TRG0) when the watchdog counter clear protection trigger sequence is performed.

Bit	31								8
Field	Reserved								
R/W Attribute	R0, WX								
Protection Attribute	WPS								
Initial Value	00000000_00000000_00000000								

Bit	7	6	5	4	3	2	1	0
Field	WDGTRG0CFG[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG0CFG[7:0]: Watchdog Trigger 0 Configuration Bits

These bits are used to define a value to be written to the Hardware watchdog trigger 0 register (HWDG_TRG0) for execution of the watchdog counter clear protection trigger sequence.

WDGTRG0CFG[7:0]	Description
During write operation	Set value written
During read operation	Set value read

6.9. Hardware Watchdog Trigger 1 Configuration Register (HWDG_TRG1CFG)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to define a valid value to be written to the Hardware watchdog trigger 1 register (HWDG_TRG1) when the watchdog counter clear protection trigger sequence is performed.

Bit	31	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	WDGTRG1CFG[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG1CFG[7:0]: Watchdog Trigger 1 Configuration Bits

These bits are used to define a value to be written to the Hardware watchdog trigger 1 register (HWDG_TRG1) for execution of the watchdog counter clear protection trigger sequence.

WDGTRG1CFG[7:0]	Description
During write operation	Set value written
During read operation	Set value read

6.10. Hardware Watchdog Lower Limit RUN Setting Register (HWDG_RUNLLS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window lower limit value for RUN is written to this register. However, this register value is different from the window lower limit value for RUN that is actually used. For details on how to reflect this register value in the window lower limit value for RUN actually used, see "6.16 Hardware Watchdog Lower Limit RUN Current Register (HWDG_RUNLLC)." You cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	31	0
Field	WDGRUNLLS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGRUNLLS[31:0]: Window Lower Limit Value for RUN Set Bits

These bits are used to define the window lower limit value for RUN. The reading of these bits returns the set value regardless of the Hardware watchdog configuration register (HWDG_CFG) LOCK bit value.

WDGRUNLLS[31:0]	Description
During write operation	When "0" is written to all 32 bits: The window function is disabled. When any value except "0" is written: The window function is enabled.
During read operation	Set value read

Note:

- This register value is different from the window lower limit value that is actually used. The window lower limit value actually used is the value in the Hardware watchdog lower limit RUN current register (HWDG_RUNLLC).

6.11. Hardware Watchdog Upper Limit RUN Setting Register (HWDG_RUNULS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window upper limit value for RUN is written to this register. However, this register value is different from the window upper limit value for RUN that is actually used. For details on how to reflect this register value in the window upper limit value for RUN actually used, see "6.17 Hardware Watchdog Upper Limit RUN Current Register (HWDG_RUNULC)." You cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	31	0
Field	WDGRUNULS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000001_00000000_00000000_00000000	

[bit31:0] WDGRUNULS[31:0]: Window Upper Limit Value for RUN Set Bits

These bits are used to define the window upper limit value for RUN. The reading of these bits returns the set value regardless of the Hardware watchdog configuration register (HWDG_CFG) LOCK bit value.

WDGRUNULS[31:0]	Description
During write operation	Set value written
During read operation	Set value read

Note:

- This register value is different from the window upper limit value that is actually used. The window upper limit value actually used is the value in the Hardware watchdog upper limit RUN current register (HWDG_RUNULC).

6.12. Hardware Watchdog Lower Limit PSS Setting Register (HWDG_PSSLLS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window lower limit value for PSS is written to this register. However, this register value is different from the window lower limit value for PSS that is actually used. For details on how to reflect this register value in the window lower limit value for PSS actually used, see "6.18 Hardware Watchdog Lower Limit PSS Current Register (HWDG_PSSLLC)." You cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	31	0
Field	WDGPSSLLS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGPSSLLS[31:0]: Window Lower Limit Value for PSS Set Bits

These bits are used to define the window lower limit value for PSS. The reading of these bits returns the set value regardless of the Hardware watchdog configuration register (HWDG_CFG) LOCK bit value.

WDGPSSLLS[31:0]	Description
During write operation	When "0" is written to all 32 bits: The window function is disabled. When any value except "0" is written: The window function is enabled.
During read operation	Set value read

Note:

- This register value is different from the window lower limit value that is actually used. The window lower limit value actually used is the value in the Hardware watchdog lower limit PSS current register (HWDG_PSSLLC).

6.13. Hardware Watchdog Upper Limit PSS Setting Register (HWDG_PSSULS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window upper limit value for PSS is written to this register. However, this register value is different from the window upper limit value for PSS that is actually used. For details on how to reflect this register value in the window upper limit value for PSS actually used, see "6.19 Hardware Watchdog Upper Limit PSS Current Register (HWDG_PSSULC)." You cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	31	0
Field	WDGPSSULS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	10000000_00000000_00000000_00000000	

[bit31:0] WDGPSSULS[31:0]: Window Upper Limit Value for PSS Set Bits

These bits are used to define the window upper limit value for PSS. The reading of these bits returns the set value regardless of the Hardware watchdog configuration register (HWDG_CFG) LOCK bit value.

WDGPSSULS[31:0]	Description
During write operation	Set value written
During read operation	Set value read

Note:

- This register value is different from the window upper limit value that is actually used. The window upper limit value actually used is the value in the Hardware watchdog upper limit PSS current register(HWDG_PSSULC).

6.14. Hardware Watchdog Reset Delay Counter Register (HWDG_RSTDLY)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to set the number of cycles for the delay time from the occurrence of a watchdog error to the watchdog reset request or watchdog interrupt request (NMI). The reference clock for the delay time is the source clock of the watchdog counter. When the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT) is "1", this register indicates the number of cycles for the delay time from the prior warning interrupt request to the watchdog reset request or watchdog interrupt request (NMI).

Bit	bit31	bit16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

Bit	bit15	bit0
Field	WDGRSTDLY[15:0]	
R/W Attribute	R0, W	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

[bit31:16] Reserved: Reserved Bits

[bit15:0] WDGRSTDLY[15:0]: Reset/NMI Delay Counter Bits

These bits define the number of cycles for the delay time that is to be inserted before generation of the watchdog reset request or watchdog interrupt request (NMI). The reference clock for this delay time is the source clock of the watchdog counter.

WDGRSTDLY[15:0]	Description
During write operation	Set value written
During read operation	0x0000 is read.

6.15. Hardware Watchdog Configuration Register (HWDG_CFG)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to make the operation settings of the Hardware watchdog timer.

Bit	bit31	bit25	bit24
Field	Reserved		LOCK

Field	Reserved		ALLOWS TOP CLK	WDEN PSS	WDEN RUN
R/W Attribute	R0, WX		R, WX	R, WX	R, WX
Protection Attribute	WPS				
Initial Value	00000		X	X	X

[bit31:25] Reserved: Reserved Bits

[bit24] LOCK: Lock Bit

You can write data to this bit only once. This register is used to prevent rewriting of the set values of various registers. When this bit is "0", you can rewrite the setting values of various registers. When this bit is set to "1" the watchdog counter is automatically cleared. This bit is equipped with a majority circuit with 3 FFs as a measure against a bit invert caused by the effects of noise or another factor.

This bit is set up by BootROM software.

LOCK	Description
During write operation	When "0" is written: Invalid When "1" is written: The set values of the registers are locked.
During read operation	When "0" is read: The lock for the register set values is disabled. When "1" is read: The lock for the register set values is enabled.

[bit23:21] Reserved: Reserved Bits

[bit20:16] OBSSEL[4:0]: Watchdog Counter Monitor Bit Output Selection Bits

These bits are used for selecting any 1 bit in the watchdog counter (32 bits) as the output of the watchdog counter monitor bit. (Support target of this function is different depends on product specification. For details, see "Output of the Watchdog Counter Monitor Bit for MCU Output Pin" in 3 Explanation of Operation.)

OBSSEL[4:0]	Description
During write operation	When 0b00000 is written: Bit 0 is selected for the monitor output. When 0b00001 is written: Bit 1 is selected for the monitor output. When 0b00010 is written: Bit 2 is selected for the monitor output. . . . When 0b11111 is written: Bit 31 is selected for the monitor output.
During read operation	Set value read

Note:

- If products do not support "Output of watchdog counter monitor bit for MCU output pin", any data written to these bits does not affect operation.

[bit15:10] Reserved: Reserved Bits

[bit9:8] CLKSEL[1:0]: Clock Selection Bits

These bits are used to select the source clock for the watchdog counter. When activated, the watchdog counter starts its operation as the high-speed CR clock. For details on clock switching, see "7 Precautions for Using This Device Switching of watchdog counter source clock.

CLKSEL[1:0]	Description
During write operation	When 0bX0 is written: The high-speed CR clock is selected. When 0bX1 is written: The low-speed CR clock is selected. Writing data in CLKSEL[1] bits does not affect operation.
During read operation	Set value read

[bit7:3] Reserved: Reserved Bits

[bit2] ALLOWSTOPCLK: Clock Stop for PSS Enable Bit

This bit is used to enable transition to PSS that involves the source clock stop of the watchdog counter. This bit is valid only when the WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG) is "1". (This bit is fixed by hardware, "0" is always read.)

This bit indicates the inverted value of the PSS enable signal.

See This section describes the block diagrams of the Hardware watchdog timer.

ALLOWSTOPCLK	Description
During write operation	Invalid
During read operation	When "0" is read: Watchdog clock stop in PSS is disabled. When "1" is read: Watchdog clock stop in PSS is enabled.

[bit1] WDENPSS: Watchdog Counter for PSS Enable Bit

This bit is used to enable the watchdog counter in PSS. This bit is enabled when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set to "1". (This bit is fixed by hardware, "0" is always read.)

WDENPSS	Description
During write operation	Invalid
During read operation	When "0" is read: The watchdog counter in PSS is disabled. When "1" is read: The watchdog counter in PSS is enabled.

[bit0] WDENRUN: Watchdog Counter for RUN Enable Bit

This bit is used to enable the watchdog counter in RUN. This bit is enabled when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set to "1".

This bit indicates the value of the entire system enable signal.

See This section describes the block diagrams of the Hardware watchdog timer.

WDENRUN	Description
During write operation	Invalid
During read operation	When "0" is read: The watchdog counter in RUN is disabled. When "1" is read: The watchdog counter in RUN is enabled.

Note:

- When the ALLOWSTOPCLK bit in the Hardware watchdog configuration register (HWDG_CFG) is "1", transition to PSS that involves clock stop is enabled. However, in case of transition from RUN to PSS during reset delay counter operation, the reset delay counter is stopped until a return from PSS to RUN occurs.

6.16. Hardware Watchdog Lower Limit RUN Current Register (HWDG_RUNLLC)

This register is used to read the window lower limit value for RUN that is actually used. This register fetches the set value in the Hardware watchdog lower limit RUN setting register (HWDG_RUNLLS) when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set. You cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	bit31	bit0
Field	WDGRUNLLC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGRUNLLC[31:0]: Window Lower Limit for RUN Current Bits

These bits are used to define the window lower limit value for RUN. The reading of these bits returns the initial value, until the Hardware watchdog configuration register (HWDG_CFG) LOCK bit is set.

WDGRUNLLC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.17. Hardware Watchdog Upper Limit RUN Current Register (HWDG_RUNULC)

This register is used to read the window upper limit value for RUN that is actually used. This register fetches the set value in the Hardware watchdog upper limit RUN setting register (HWDG_RUNULS) when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set. Also, you cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	bit31	bit0
Field	WDGRUNULC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000001_00000000_00000000_00000000	

[bit31:0] WDGRUNULC[31:0]: Window Upper Limit for RUN Current Bits

These bits are used to define the window upper limit value for RUN. The reading of these bits returns the initial value, until the Hardware watchdog configuration register (HWDG_CFG) LOCK bit is set.

WDGRUNULC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.18. Hardware Watchdog Lower Limit PSS Current Register (HWDG_PSSLLC)

This register is used to read the window lower limit value for PSS that is actually used. This register fetches the set value in the Hardware watchdog lower limit PSS setting register (HWDG_PSSLLS) when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set. You cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	bit31	bit0
Field	WDGPSSLLC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGPSSLLC[31:0]: Window Lower Limit for PSS Current Bits

These bits are used to define the window lower limit value for PSS. The reading of these bits returns the initial value, until the Hardware watchdog configuration register (HWDG_CFG) LOCK bit is set.

WDGPSSLLC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.19. Hardware Watchdog Upper Limit PSS Current Register (HWDG_PSSULC)

This register is used to read the window upper limit value for PSS that is actually used. This register fetches the set value in the Hardware watchdog upper limit PSS setting register (HWDG_PSSULS) when the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set. You cannot change the set value of this register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set.

Bit	bit31	bit0
Field	WDGPSSULC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	10000000_00000000_00000000_00000000	

[bit31:0] WDPSSULC[31:0]: Window Upper Limit for PSS Current Bits

These bits are used to define the window upper limit value for PSS. The reading of these bits returns the initial value, until the Hardware watchdog configuration register (HWDG_CFG) LOCK bit is set.

WDGPSSULC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- Write access to this register generates an AHB transfer error response.

7. Precautions for Using This Device

This section describes precautions on the use of the Hardware watchdog timer.

Watchdog Window Setting

For the Hardware watchdog timer, you can make 2 types of window setting, the setting for RUN and setting for PSS. The user must make an appropriate window setting for each device state.

When the device transitions from PSS to RUN, the Hardware watchdog timer continues operation using the PSS window setting until the watchdog counter clear protection trigger sequence is executed. The watchdog counter clear protection trigger sequence switches the window setting to the RUN window setting. You can control the watchdog function in each device state with the WDENRUN bit and WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG).

Notes:

- When WDENPSS bit is "0", the watchdog timer perform the same operation. So certainly set the same value in upper limit registers and lower limit registers.
- Set the same value following two upper limit registers.
 - Hardware watchdog lower limit PSS setting register (HWDG_PSSLLS)
 - Hardware watchdog lower limit RUN setting register (HWDG_RUNLLS)
- Set the same value following two upper limit registers.
 - Hardware watchdog upper limit PSS setting register (HWDG_PSSULS)
 - Hardware watchdog upper limit RUN setting register (HWDG_RUNULS)

Switching of Watchdog Counter Source Clock

The system controller controls the switching of the watchdog counter source clock since the source clock control of the watchdog counter is a part of the system setting information (profile). To change the watchdog counter source clock, follow the sequence below.

1. Setting the CLKSEL bit in the Hardware watchdog configuration register (HWDG_CFG) sets the new source clock of the watchdog counter. Then, writing data to the following registers finalizes the window setting.
2. Hardware watchdog lower limit RUN setting register (HWDG_RUNLLS)
3. Hardware watchdog upper limit RUN setting register (HWDG_RUNULS)
4. Hardware watchdog lower limit PSS setting register (HWDG_PSSLLS)
5. Hardware watchdog upper limit PSS setting register (HWDG_PSSULS)
6. Setting the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) to "1" locks rewriting of the register set values.
7. Writing 0xAB to the RUN profile update trigger register of the system controller (SYSC0_TRGRUNCNTR) executes RUN profile update. At this point in time, the source clock of the watchdog counter is switched to the new source clock selected by the CLKSEL bit of the Hardware watchdog configuration register (HWDG_CFG).

Watchdog Error

A watchdog error is generated under the following conditions. This watchdog error generates the watchdog reset request/interrupt request (NMI).

1. An incorrect value is written to the Hardware watchdog trigger 0/1 register (HWDG_TRG0 or HWDG_TRG1).
2. The watchdog counter clear protection trigger sequence is violated.
3. The watchdog counter clear protection trigger sequence is not executed before the watchdog counter reaches the window upper limit value.
4. The watchdog counter clear protection trigger sequence is executed before the watchdog counter reaches the window lower limit value.
5. The watchdog counter clear protection trigger sequence is executed while the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is still "0".

Factors for Bus Error Responses (Data Abort)

A bus error response is generated in the following cases.

- Access (read or write) to an address where no register exists
- Violation of the watchdog register write protection sequence
- Write access to a register with the read-only attribute (indicated as R, WX)
- Write access to a register after the LOCK bit in the Hardware watchdog configuration register (HWDG_CFG) is set to "1"
- Write access with an incorrect value to the Hardware watchdog protection register (HWDG_PROT)
- Byte/Half-word write access to the Hardware watchdog protection register (HWDG_PROT)
- Write access to a register in non-privileged mode
 - (Except for the Hardware watchdog trigger 0/1 register (HWDG_TRG0 and HWDG_TRG1))

Watchdog Timer Operation in Standby State of Processor

The Hardware watchdog timer operates using the RUN window setting in the following case.

- Without a valid key being written to the PSS profile update enable register (SYSC0_PSSSEN.PSSSEN0 and SYSC1_PSSSEN.PSSSEN1), the processor transitions to the standby state by executing a wait for interrupt (WFI) instruction.

CHAPTER 15: Software Watchdog Timer

This section describes the Software watchdog timer.

1. Overview
2. Configuration and Block Diagram

4. Setting Procedure Example
5. Operation Examples
6. Register List
7. Precautions for Using This Device

SWDT-TXXPT03P01R01L08-E1-XX

1. Overview

This section provides an overview of the Software watchdog timer.

The Software watchdog timer is positioned in the SYSC1 group, used for detecting a runaway state caused by a user program, also the Software watchdog timer monitors user program by the CPU.

Software Watchdog Timer Features

- Detecting a runaway state of the software generates a reset request. (*a)
- A user program starts the software watchdog timer. (*a)
- The watchdog counter source clock is selected from 4 types. (*a)
(High-speed CR clock (default), low-speed CR clock, sub clock, or main clock)
- A user program is used to set registers. (*a)
- It operates as a 32-bit watchdog counter.
- Different initializations between soft reset and hard reset can be applied.
- Soft reset clears only the watchdog counter.
- Hard reset initializes the watchdog counter, register setting, and internal circuits.
- It monitors the watchdog counter clear protection trigger sequence.
- The window watchdog function is implemented.
- Different operation settings are possible for each device state (RUN and PSS).
- It monitors the watchdog register write protection sequence.
- The majority circuits for bits that affect important functions are implemented.
- It can generate the watchdog reset request or watchdog interrupt request (NMI) in response to a watchdog error.
- It can generate a prior warning interrupt request before the reset request or interrupt request (NMI).
- It provides the function for outputting the watchdog counter monitor bit for the MCU output pin so that the watchdog timer counter can be observed from the outside. (Support target of this function is different depends on product specification. For details, see "Output of the Watchdog Counter Monitor Bit for MCU Output Pin" in 3 Explanation of Operation.
- The watchdog counter can be stopped in the debugging state of the processor.

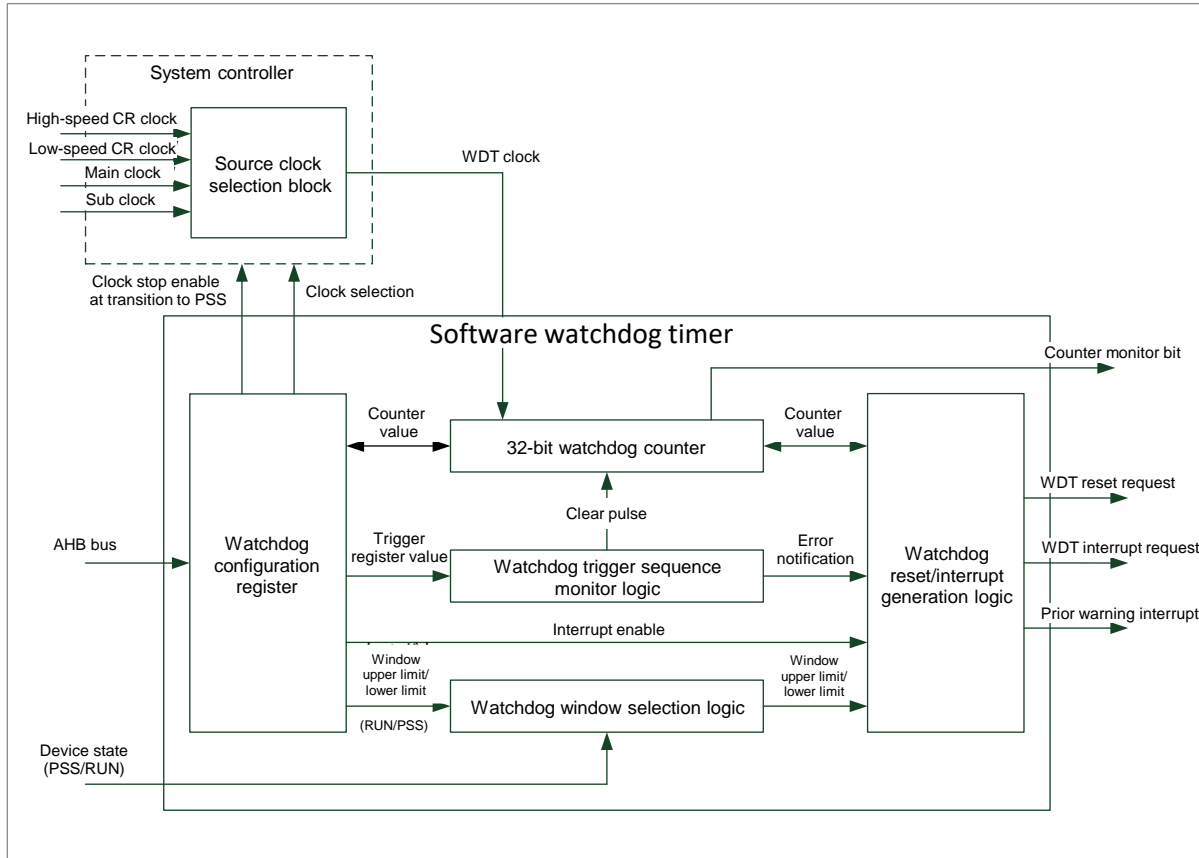

Notes:

- The notation (*a) indicates a feature that is specific to the software watchdog timer compared with the hardware watchdog.
- A watchdog error is a factor that causes the watchdog reset request or watchdog interrupt request (NMI).

2. Configuration and Block Diagram

This section describes the block diagrams of the Software watchdog timer.

Figure 2-1 Software Watchdog Timer Block Diagram

- **Watchdog configuration register:**
In this block, the set value of each register is stored. I/O operations for information including the counter value for read operation, trigger register value necessary for clearing the counter, and window upper limit/lower limit values are performed.
- **32-bit watchdog counter:**
This is the block of the 32-bit up counter.

It provides the function for outputting the watchdog counter monitor bit for the MCU output pin.
- **Watchdog window selection logic:**
This block fetches the window upper limit value and lower limit value for each device state (RUN and PSS) and selects a window setting according to the device state transition.
- **Watchdog reset/interrupt generation logic:**
This block generates the watchdog reset request, watchdog interrupt request (NMI), and prior warning interrupt request.

3. Explanation of Operation

This section describes operation of the Software watchdog timer.

Software Watchdog Timer Functions

The Software watchdog timer implements the following functions.

Reset Request Generation by Detection of Runaway State of Software

The software watchdog timer monitors user program execution by the CPU. The timer starts the monitoring when it is activated by a user program. If the watchdog counter is not cleared within the range between the upper limit value and the lower limit value of the window specified beforehand, this state is judged to be a runaway state of a user program. In this case, a reset request or an interrupt request (NMI) is generated.

Note:

- *For example, after the watchdog timer is activated by a user program, it can detect a software runaway state in which a user program goes out of control as a result of an abnormal change in the program counter (PC).*

Software Watchdog Timer Start by User Program

A user program starts the software watchdog timer. Specifically, operation is started by setting the LOCK bit in the software watchdog configuration register (SWDG_CFG).

Software Watchdog Timer Control by CPU

The software watchdog timer monitors control by CPU over the entire system. The number of software watchdog timers to be mounted in the MCU is 1.

Watchdog Counter Source Clock Selection (4 Types)

The software watchdog timer sets values in the CLKSEL[1:0] bits in the software watchdog configuration register (SWDG_CFG) to select a source clock for the watchdog counter from among 4 types of source clocks. Specifically, it selects a source clock from the high-speed CR clock, low-speed CR clock, sub clock, or main clock. (The initial setting is for the high-speed CR clock.)

Selection of a source clock is a clock request to the system controller. Source clock switching is performed on the clock system side of the system controller. For details on the procedure, see "7. Precautions for Using This Device Switching of watchdog counter source clock."

Register Setting by User Program

Use a user program to set software watchdog timer registers.

32-Bit Watchdog Counter

The Software watchdog timer operates by using the 32-bit watchdog counter (up counter) (the initial value is 0x0000_0000).

The watchdog counter operates when all the following conditions are met.

1. The device is operating in user mode.
2. The watchdog counter has not reached the window upper limit value.
3. The device state is RUN and the WDENRUN bit is "1".
(See "6.15 Software Watchdog Configuration Register (SWDG_CFG).")
4. The device state is PSS and the WDENPSS bit is "1".
(See "6.15 Software Watchdog Configuration Register (SWDG_CFG).")

Note:

- When the watchdog counter reaches the window upper limit value, the count operation stops.

The following Table 3-1 shows the relationship between the window upper limit value and count time.

Table 3-1 Relationship between Software Window Upper Limit Value of Watchdog Timer and Count Time

Input Clock Frequency	Window Upper Limit Value	Count Time	Remarks
8MHz	0x0100_0000	About 2.1 s	It operates at the initial value of the Software watchdog upper RUN setting register (SWDG_RUNULS).
12MHz	0x0100_0000	About 1.4 s	
8MHz	0x8000_0000	About 268 s	It operates at the initial value of the Software watchdog upper PSS setting register (SWDG_PSSULS).
12MHz	0x8000_0000	About 178 s	

Note:

- The above table is an example involving high-speed CR clock frequencies of 8 MHz and 12 MHz.

Different Initializations between Soft Reset and Hard Reset

For the Software watchdog timer, different initializations between soft reset and hard reset can be applied. The following Table 3-2 Ranges of Initialization for Soft Reset and Hard Reset shows the ranges of initialization for soft reset and hard reset.

Table 3-2 Ranges of Initialization for Soft Reset and Hard Reset

Conditions	Reset Name	Range of Initialization
1	Soft reset	Watchdog counter
2	Hard reset	Watchdog counter and settings for all registers

Watchdog Counter Clear Protection Trigger Sequence

The Software watchdog timer monitors the watchdog counter clear protection trigger sequence to clear the watchdog counter.

The watchdog counter clear protection trigger sequence must meet the following conditions.

- Write data to the Software watchdog trigger 1 register (SWDG_TRG1) after writing data to the Software watchdog trigger 0 register (SWDG_TRG0).
- Do not execute the watchdog counter clear protection trigger sequence when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is "0".
- The value to be written to the Software watchdog trigger 0 register (SWDG_TRG0) must match the Software watchdog trigger 0 configuration register (SWDG_TRG0CFG).
- The value to be written to the Software watchdog trigger 1 register (SWDG_TRG1) must match the Software watchdog trigger 1 configuration register (SWDG_TRG1CFG).
- The watchdog counter must already have reached the window lower limit value when the watchdog counter clear protection trigger sequence is completed.

Note:

- *For details on the watchdog counter clear protection trigger sequence, see Figure 3-2.*

Window Watchdog Function

The window watchdog function is a function for setting a range in which the watchdog counter value can be cleared with upper limit and lower limit values. The following shows the range in which the watchdog counter can be cleared for 2 set values.

$$(\text{Window lower limit value}) \leq (\text{watchdog counter}) < (\text{window upper limit value})$$

For example, suppose that a runaway state of a user program occurs and the watchdog counter clear protection trigger sequence is executed continuously. In this case, you can set a value other than 0x00000000 as a window lower limit value to detect the continuous watchdog counter clear as an abnormal operation.

The window setting for RUN is defined with the following 2 registers.

Software watchdog lower limit RUN current register (SWDG_RUNLLC)

Software watchdog upper limit RUN current register (SWDG_RUNULC)

The window setting for PSS is defined with the following 2 registers.

Software watchdog lower limit PSS current register (SWDG_PSSLLC)

Software watchdog upper limit PSS current register (SWDG_PSSULC)

Different Operation Settings for Each Device State (RUN and PSS)

The Software watchdog timer can make different operation settings for each device state (RUN and PSS). The operation setting is switched to the RUN or PSS operation setting according to the device state transition.

RUN operation setting

- When the LOCK bit and WDENRUN bit in the Software watchdog configuration register (SWDG_CFG) are set to "1", operation is performed by using the window setting for RUN.
- When the watchdog counter is not cleared in the range between the window upper limit value and lower limit value, or there is a violation in the watchdog counter clear protection trigger sequence, a watchdog error is detected. The watchdog reset request or watchdog interrupt request (NMI) is generated for this watchdog error. (For details on watchdog errors, see "7 Precautions for Using This Device Watchdog Error.")

PSS operation setting

- The window setting is switched to the window setting for PSS when the device state transitions from RUN to PSS. When the WDENPSS bit in the Software watchdog configuration register (SWDG_CFG) is set to "1", operation is performed by using the window setting for PSS.
- When the device state transitions from PSS to RUN, the enable bit is switched from the WDENPSS bit in the Software watchdog configuration register (SWDG_CFG) to the WDENRUN bit in the same register. However, the window setting is not switched immediately. Use of the window setting for PSS continues until the watchdog counter clear protection trigger sequence is executed.

Refer to Figure 3-4 and Figure 3-5 for the details on the watchdog operation in RUN and PSS, respectively.

Notes:

- *Certainly set the same value in upper limit registers and lower limit registers.*
- *Set the same value following two upper limit registers.*
 - Software watchdog lower limit PSS setting register (SWDG_PSSLLS)
 - Software watchdog lower limit RUN setting register (SWDG_RUNLLS)
- *Set the same value following two upper limit registers*
 - Software watchdog upper limit PSS setting register (SWDG_PSSULS)
 - Software watchdog upper limit RUN setting register (SWDG_RUNULS)
- *The limitation is needed, when device state change from RUN to PSS. Because the watchdog timer continues to use the window setting for PSS until the watchdog counter clear protection trigger sequence is performed. When WDENPSS bit is "0", the watchdog timer perform the same operation. So it needs same limitation.*

Figure 3-4 is shown about the software watchdog operation in RUN. Figure 3-5 is shown about the software watchdog operation in PSS.

Please refer to Figure 3-5.

Watchdog Register Write Protection Sequence

The Software watchdog timer monitors the watchdog register write protection sequence to write a setting value in the register.

The watchdog register write protection sequence must meet the following conditions.

- It writes a setting value in the register after writing data in the Software watchdog protection register (SWDG_PROT).
- It writes data in the Software watchdog protection register (SWDG_PROT) in privileged mode.
- The value written in the Software watchdog protection register (SWDG_PROT) must match the lock release key for register write protection 0xEDAC_CE55.
- It does not write a setting value in any register in another module after writing data in the Software watchdog protection register (SWDG_PROT).
- It does not write data in the Software watchdog protection register (SWDG_PROT) twice in a row.
- It writes a value in the register when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is "0" and the mode is privileged mode.

Note:

- *For details on the watchdog register write protection sequence, see Figure 3-1 Setting Procedure for Watchdog Register Write Protection Sequence.*

Table 3-3 Key Value for Register Programming

Key Value	Target Register	Purpose
0xEDAC_CE55	SWDG_PROT:KEY	Releasing protection lock for register write

Notes:

- *The watchdog register write protection sequence is unnecessary for the Software watchdog trigger 0/1 register (SWDG_TRG0 and SWDG_TRG1).*
- *Setting the LOCK bit in the Software watchdog configuration register (SWDG_CFG) to "1" prevents the following registers from being rewritten.*
 - Software watchdog interrupt configuration register (SWDG_INT)
 - Software watchdog trigger 0 configuration register (SWDG_TRG0CFG)
 - Software watchdog trigger 1 configuration register (SWDG_TRG1CFG)
 - Software watchdog reset delay counter register (SWDG_RSTDLY)
 - Software watchdog configuration register (SWDG_CFG)

Majority Circuits for Bits That Affect Important Functions

The Software watchdog timer has majority circuits for bits that affect important functions. The majority circuit consists of 3 FFs. When the bit in an FF bit is inverted due to noise or because of another factor, the correct value can be selected by majority decision among the 3 FFs.

The bits that are equipped with majority circuits are as follows.

- RSTEN bit (*1)
- LOCK bit (*2)
- WDENPSS bit (*2)
- WDENRUN bit (*2)

Notes:

- The notation (*1) indicates a bit in the Software watchdog interrupt configuration register (SWDG_INT).
- The notation (*2) indicates a bit in the Software watchdog configuration register (SWDG_CFG).

Generation of Watchdog Reset Request or Watchdog Interrupt Request (NMI)

The Software watchdog timer generates the watchdog reset request or watchdog interrupt request (NMI) when detecting a watchdog error. Use the watchdog interrupt request (NMI) as a test function. (For example, you can use the watchdog interrupt request (NMI) to set a break point at the beginning of an interrupt handler.)

Also, the Software watchdog timer can generate the prior warning interrupt request before the watchdog reset request (or watchdog interrupt request (NMI)). (For example, you can use the prior warning interrupt request so that the processor can save important data to the memory before the watchdog reset request is generated.)

The Software watchdog timer generates these requests by using the following procedure.

- When a watchdog error occurs, the IRQFLAG bit in the Software watchdog interrupt configuration register (SWDG_INT) is set. At this time, if the IRQEN bit in the Software watchdog interrupt configuration register (SWDG_INT) is "1", the prior warning interrupt request is generated.
- As many cycles as are set in the Software watchdog reset delay counter register (SWDG_RSTDLY) are inserted between the prior warning interrupt request and the watchdog reset interrupt request or watchdog interrupt request (NMI) as a delay time.
- Once the prior warning interrupt request is generated, the watchdog counter cannot be cleared with the watchdog counter clear protection trigger sequence. Also, if a new watchdog error occurs, it is ignored.
- After the elapse of the time corresponding to the number of cycles for delay time set in the Software watchdog reset delay counter register (SWDG_RSTDLY), the watchdog reset request or watchdog interrupt request (NMI) is generated. If the Software watchdog reset delay counter register (SWDG_RSTDLY) is 0x0000, no delay time occurs.

Notes:

- *When you generate the prior warning interrupt request, set the Software watchdog reset delay counter register (SWDG_RSTDLY) to a value other than 0x0000.*
- *The use of the watchdog interrupt request (NMI) is prohibited except when used as a test function. (This is prohibited because if such use is allowed, security will be compromised during the execution of an application.) Figure 3-6 shows the operation of the test function of the Software watchdog.*
- *Insertion of a number of cycles equal to that for the delay time set in the Software watchdog reset delay counter register (SWDG_RSTDLY) is valid only for 1 watchdog reset request or watchdog interrupt request (NMI). (It remains invalid until the next hard reset occurs.)*

Output of the Watchdog Counter Monitor Bit for MCU Output Pin

The Software watchdog timer outputs the watchdog counter monitor bit to the outside so that watchdog counter operation can be monitored from the outside. You can select any 1 bit in the watchdog counter (32 bits) by setting the OBSSEL[4:0] bits in the Software watchdog configuration register (SWDG_CFG).

Support of this function is different depends on product specification.

Watchdog Counter Stop in Debugging State of Processor

The watchdog counter stops when the processor enters the debugging state. When the processor returns from the debugging state, the watchdog counter resumes operation from the point where it had stopped.

Note:

- *For the definition of the debugging state of the processor, see the material from ARM(R) (Cortex™-R5 Revision:r1p2 Technical Reference Manual (ARM DDI 0460D)).*

Differences between Software Watchdog and Hardware Watchdog

The following Table 3-4 Differences between Software Watchdog and Hardware Watchdog shows the main differences between the software watchdog and hardware watchdog.

Table 3-4 Differences between Software Watchdog and Hardware Watchdog

Item	Software Watchdog	Hardware Watchdog
Watchdog Counter	32-bit up counter	Same as on left
Different Initializations between Soft Reset and Hard Reset	Supported	Same as on left
Trigger Sequence for Watchdog Counter Clear	Supported	Same as on left
Window Watchdog Function	Supported	Same as on left
Different Operation Settings for Each Device State (RUN and PSS)	Supported	Same as on left
Watchdog Counter Source Clock Selection	4 types - High-speed CR clock - Low-speed CR clock - Sub clock - Main clock	2 types - High-speed CR clock - Low-speed CR clock
Watchdog Register Write Protection Sequence	Supported (However, prevention of rewriting of the window setting by the LOCK bit is not supported.)	Same as on left (However, prevention of rewriting of the window setting by the LOCK bit is supported.)
Majority Circuits for Bits That Affect Important Functions	Supported (4 target bits)	Same as on left (2 target bits)
Reset Request or Interrupt Request (NMI) Generation	Supported	Same as on left
Prior Warning Interrupt Request Generation	Supported	Same as on left
Output of Watchdog Counter Monitor Bit for MCU Output Pin	Supported	Supported
Watchdog Counter Stop in the Debugging State of the Processor	Supported	Same as on left
Watchdog Error Conditions	5 types	Same as on left
Bus Error Response Conditions	8 types	Same as on left
Watchdog Timer Start	Register write by a user program	Hard reset clear
Register Setting Value Write	User program	BootROM program

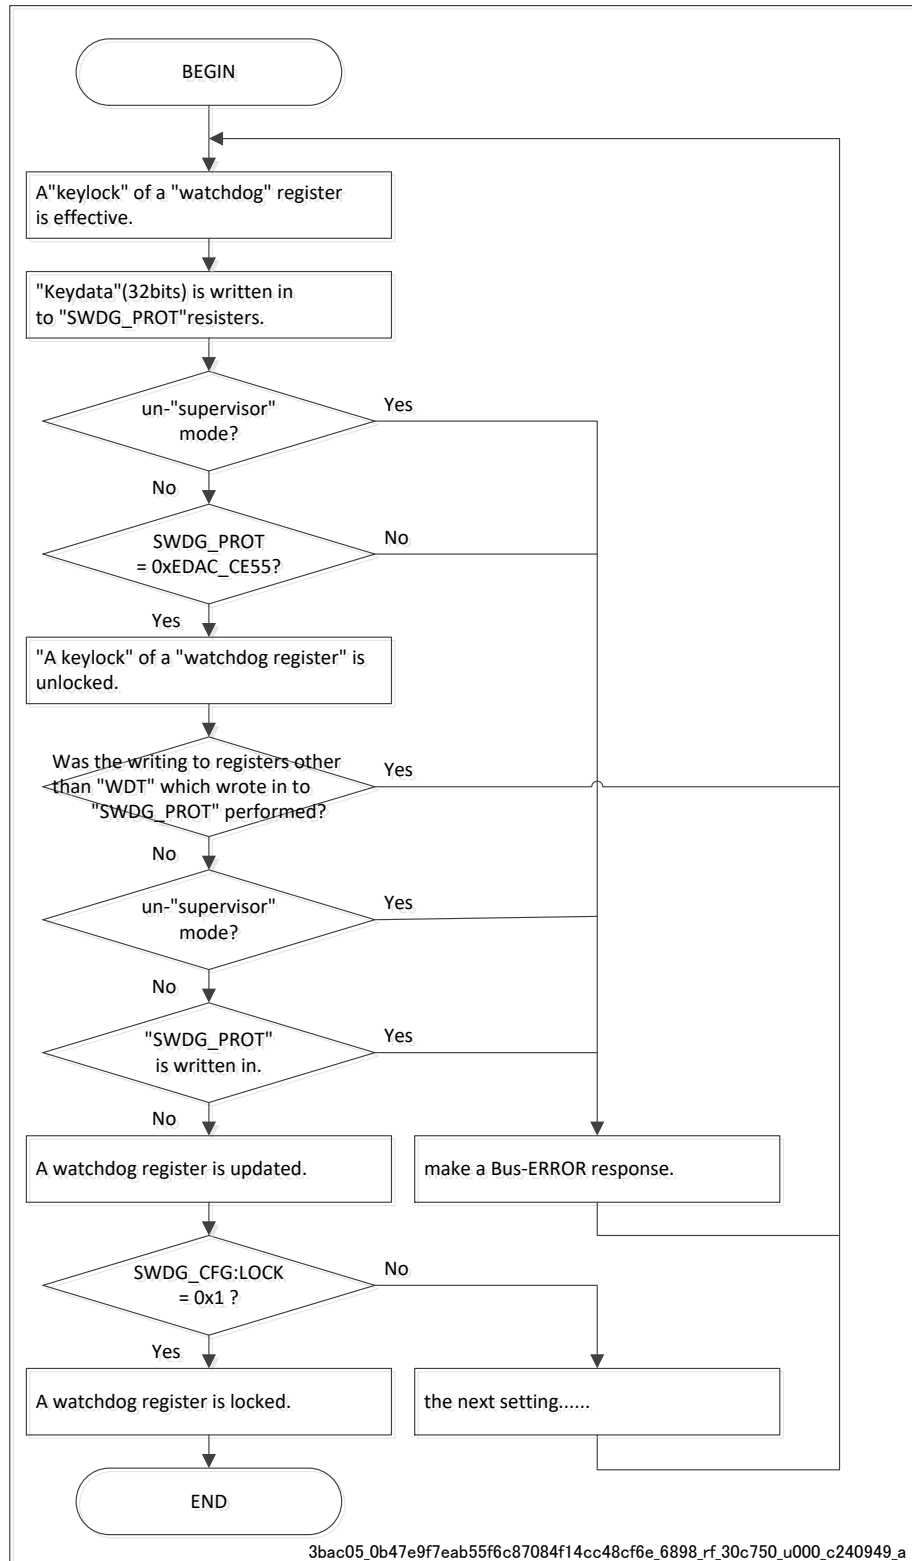

Item	Software Watchdog	Hardware Watchdog
Watchdog Counter Enable Bit Control	Register write by a user program	Constantly operation (Fixed hardware)

Note:

- Unlike the case of the software watchdog timer, for the hardware watchdog timer, the BootROM program sets registers during the initial operation setting. (Write and read operation from the CPU can also be performed.)

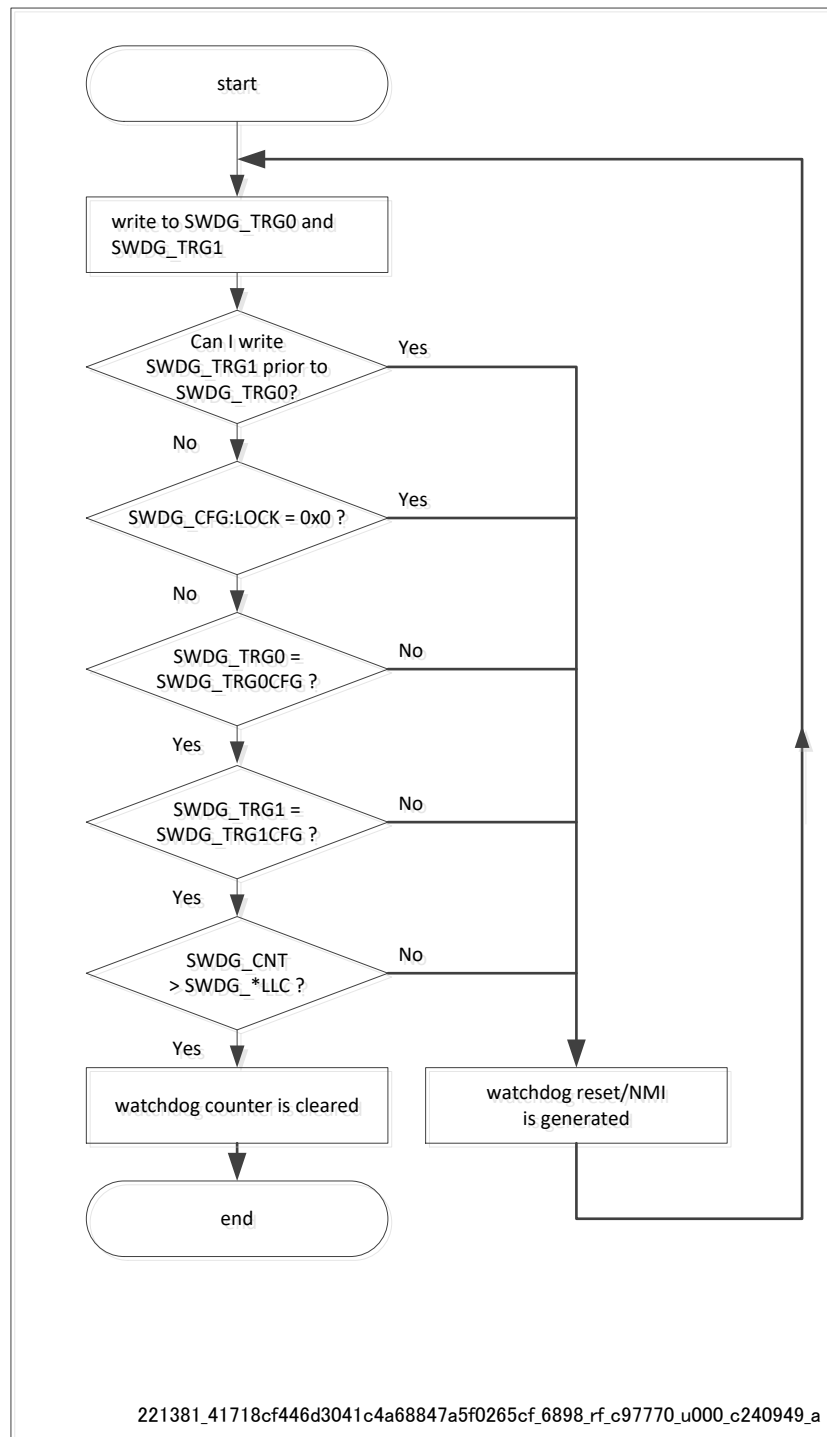

The following figure shows the watchdog register write protection sequence setting procedure.

Figure 3-1 Setting Procedure for Watchdog Register Write Protection Sequence

The following figure shows the watchdog counter clear protection trigger sequence setting procedure.

Figure 3-2 Setting Procedure for Watchdog Counter Clear Protection Trigger Sequence

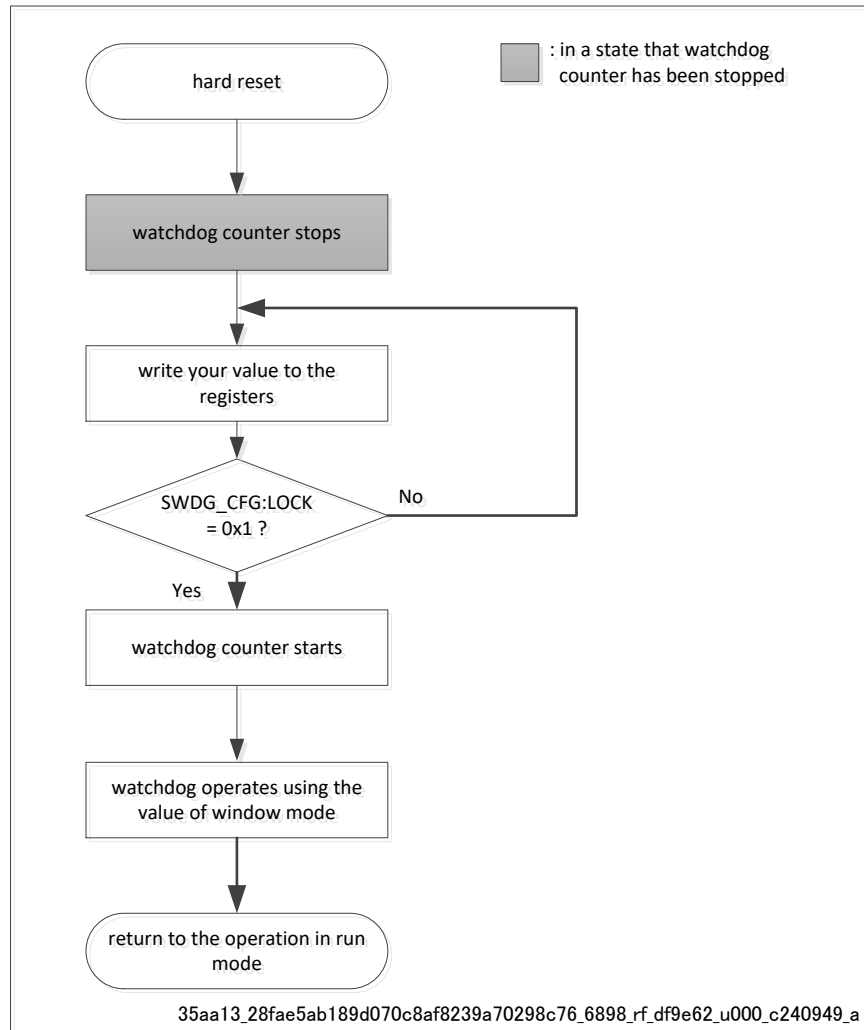

Note:

- The notation * in Figure 3-2 Setting Procedure for Watchdog Counter Clear Protection Trigger Sequence is replaced with device state RUN or PSS.

The following figure shows the Software watchdog timer startup procedure.

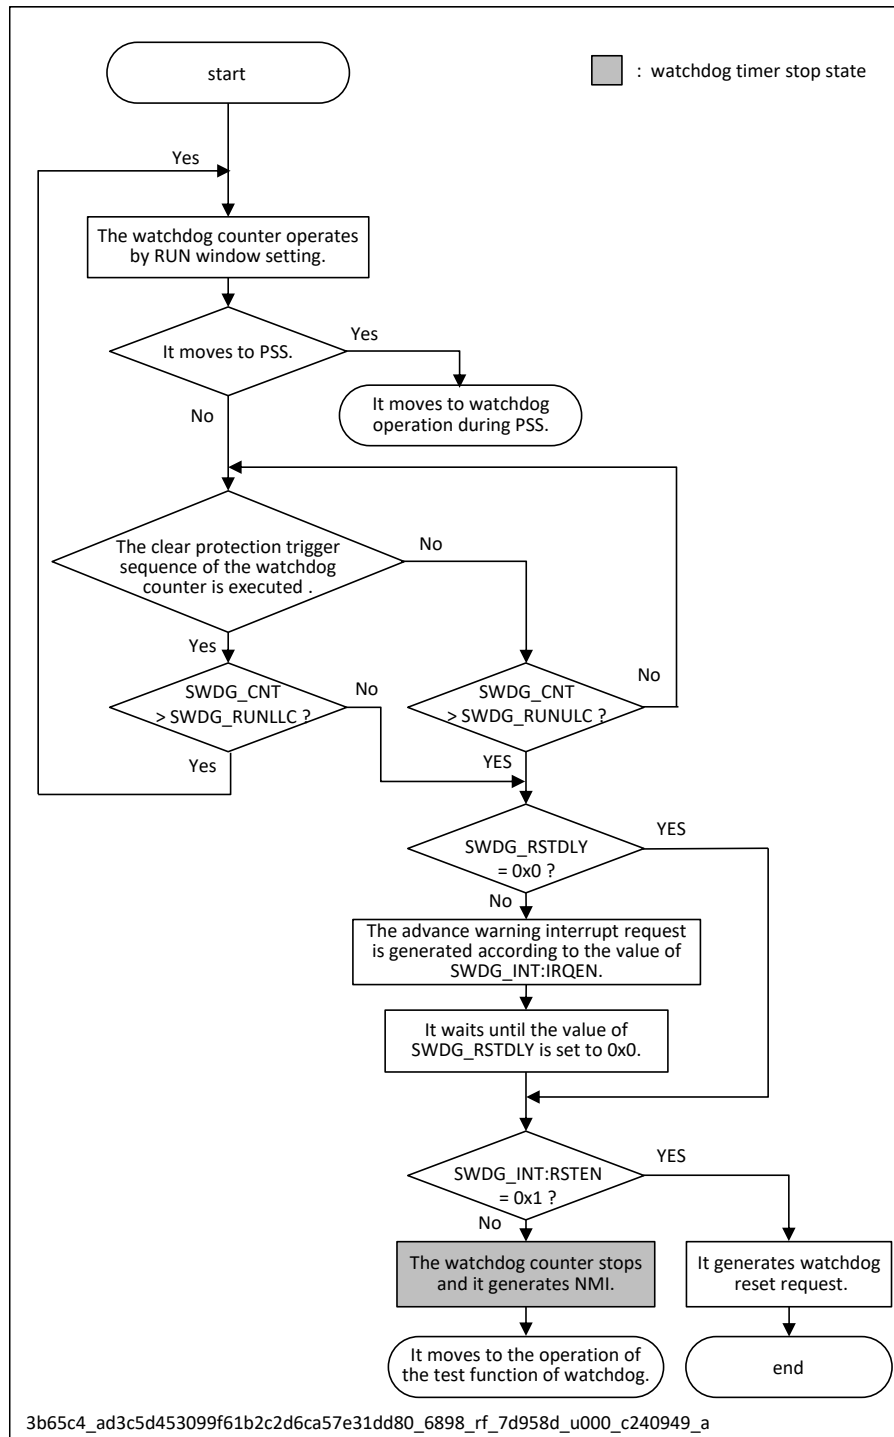

Figure 3-3 Startup of Software Watchdog Timer

1. The hard reset initializes the software watchdog timer. Then, immediately after the hard reset is cleared, the stop state is indicated.
2. You can change the register setting as long as the LOCK bit in the software watchdog configuration register (SWDG_CFG) is "0".
3. Setting "1" in the LOCK bit in the software watchdog configuration register (SWDG_CFG) causes the watchdog counter to start up-counting.

The following figure shows the Software watchdog operation in RUN.

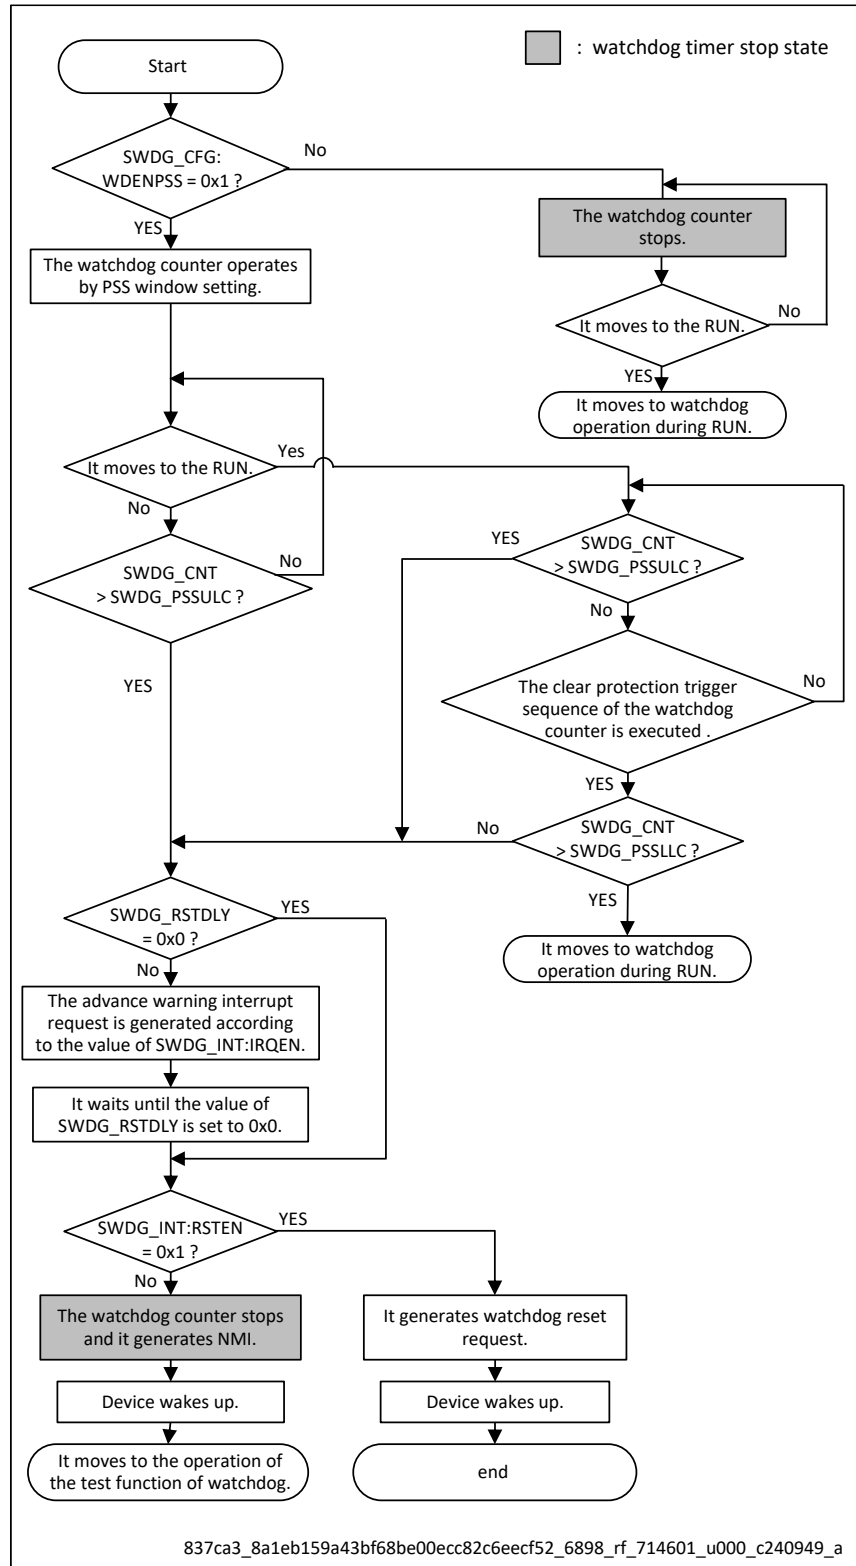

Figure 3-4 Software Watchdog Operation in RUN

1. The watchdog counter in RUN always operates.
2. When the device state transitions from RUN to PSS, the processing transitions to the operation of the watchdog in PSS. For details, see Figure 3-5.
3. During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Do this to clear the watchdog counter periodically.
4. If a runaway state of the software occurs and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI).
5. According to the value of the IRQEN bit in the Software watchdog interrupt configuration register (SWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Software watchdog reset delay counter register (SWDG_RSTDLY) are inserted.
6. After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Software watchdog interrupt configuration register (SWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3-6.

The following figure shows the Software watchdog operation in PSS.

Figure 3-5 Software Watchdog Operation in PSS

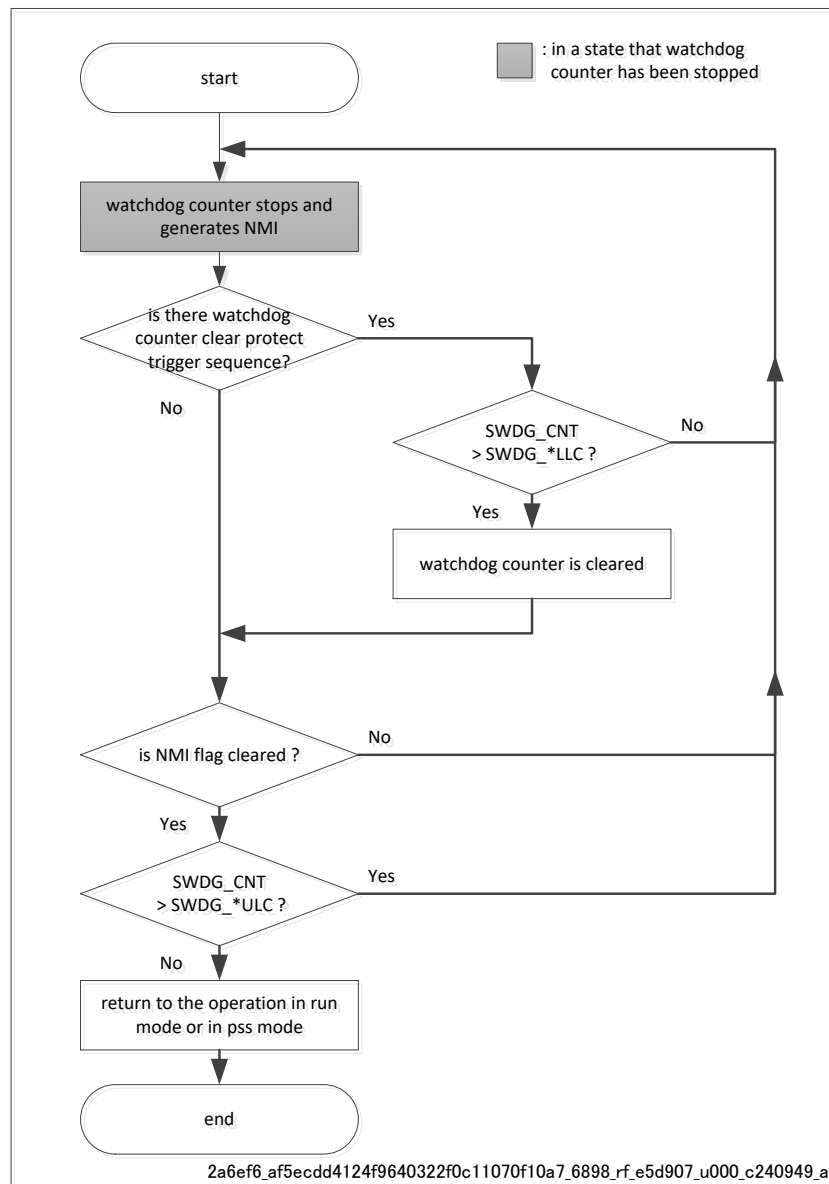

1. The watchdog counter in PSS operates or stops according to the value of the WDENPSS bit in the Software watchdog configuration register (SWDG_CFG).
2. When the device state transitions from PSS to RUN, the watchdog counter operation is started immediately. However, the PSS window setting continues to be used until the watchdog counter clear protection trigger sequence is executed.
3. During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Continuously clearing the watchdog counter needs to be done periodically.
4. If a runaway state of the software occurs and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI).
5. According to the value of the IRQEN bit in the Software watchdog interrupt configuration register (SWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Software watchdog reset delay counter register (SWDG_RSTDLY) are inserted.
6. After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Software watchdog interrupt configuration register (SWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3-6.

Note:

- *If the watchdog counter clear protection trigger sequence is executed during operation with the PSS window setting, this means that the device state has already returned from PSS to RUN.*

The following figure shows the operation of the test function of the Software watchdog.

Figure 3-6 Operation of Software Watchdog Test Function

1. The watchdog counter is in the stop state.
2. If the watchdog counter clear protection trigger sequence is executed in the stop state of the watchdog counter and the window lower limit value has already been reached at this time, the watchdog counter is cleared. (If this occurs outside the counter range, no special change occurs.)
3. When the NMIFLAG bit in the Software watchdog interrupt configuration register (SWDG_INT) is cleared, the watchdog interrupt request (NMI) is cleared.
4. When the watchdog counter has not reached the window upper limit value, processing returns to operation in RUN or PSS. When it has already reached the window upper limit value, no special change occurs.

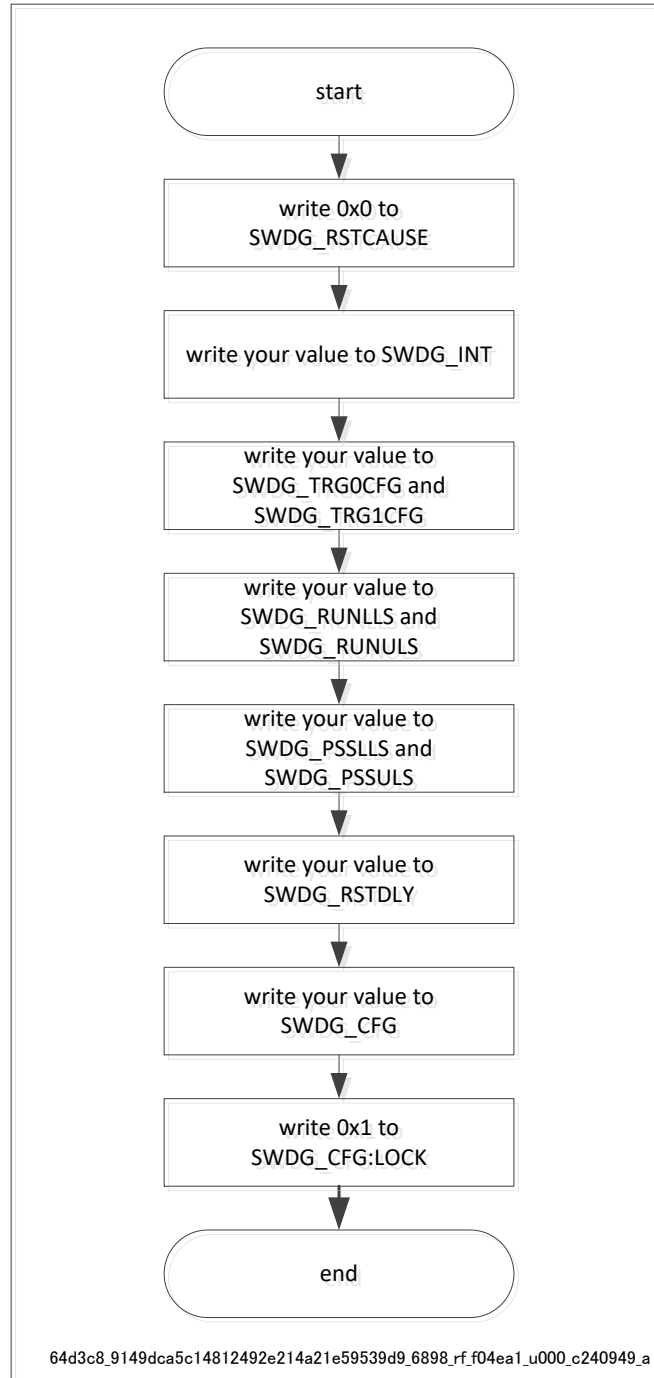

Note:

The notation * in Figure 3-6 means "RUN" or "PSS".

4. Setting Procedure Example

This section explains an example of a procedure for setting the Software watchdog timer.

Figure 4-1 Example of Software Watchdog Timer Register Setting Procedure

Note:

- In Figure 4-1, the setting order can be changed except for the step of setting the LOCK bit in the Software watchdog configuration register (SWDG_CFG) to "1".

5. Operation Examples

This section describes examples of operating the Software watchdog timer.

Figure 5-1 Example of Operating Software Watchdog Timer (When Operation in PSS Is Enabled)

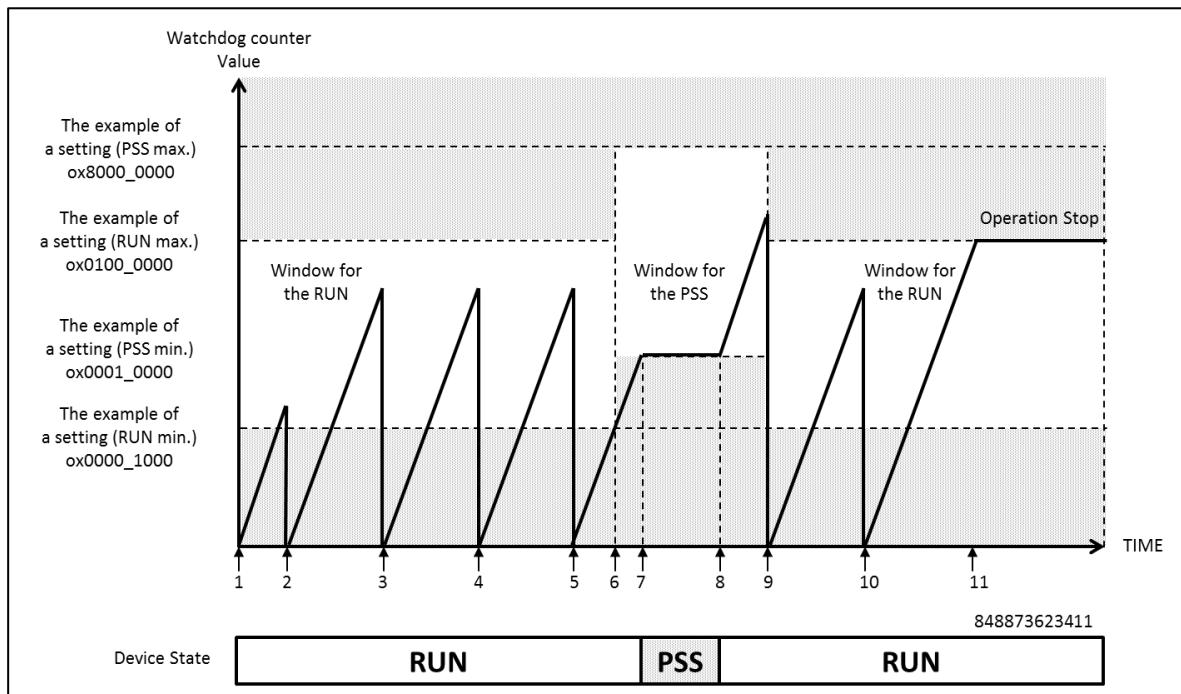

1. Before starting the software watchdog timer, the setting values of the registers are written.
2. The LOCK bit in the software watchdog configuration register (SWDG_CFG) is set to "1" to start the software watchdog timer. At this time, it starts up-counting from 0x00000000.
3. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
4. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
5. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
6. The device state transitions from RUN to PSS. At this time, switching to the PSS window setting occurs.
7. The device state returns from PSS to RUN. At this time, the switching to the RUN window setting does not occur immediately.
8. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared. At this time, the switching to the RUN window setting occurs.
9. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
10. When the watchdog counter reaches the window upper limit value, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Notes:

- The window setting is not immediately switched to the window setting for RUN when the device state is returned from PSS to RUN.
- Before the transition from RUN to PSS, be sure to clear the watchdog counter.

Figure 5-2 Example of Operating Software Watchdog Timer (When Operation in PSS Is Disabled)

1. Before starting the software watchdog timer, the setting values of the registers are written.
2. The LOCK bit in the software watchdog configuration register (SWDG_CFG) is set to "1" to start the software watchdog timer. At this time, it starts up-counting from 0x00000000.
3. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
4. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
5. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
6. Switching to the PSS window setting occurs.
7. The device state transitions from RUN to PSS. At this time, the Software watchdog timer stops operation.
8. The device state returns from PSS to RUN. At this time, the Software watchdog timer immediately starts operation. The switching to the RUN window setting does not occur immediately.
9. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared. At this time, the switching to the RUN window setting occurs.
10. The watchdog counter clear protection trigger sequence is executed, and the watchdog counter is cleared.
11. When the watchdog counter reaches the window upper limit value, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Notes:

- The window setting is not immediately switched to the window setting for RUN when the device state is returned from PSS to RUN.
- After the device state returned from PSS to RUN, the watchdog counter is cleared. At this time, the switching to the RUN window setting occurs.

- *Certainly set the same value in upper limit registers and lower limit registers.*
- *Set the same value following two lower limit registers.*
 - Software watchdog lower limit PSS setting register (SWDG_PSSLLS)
 - Software watchdog lower limit RUN setting register (SWDG_RUNLLS)
- *Set the same value following two upper limit registers*
 - Software watchdog upper limit PSS setting register (SWDG_PSSULS)
 - Software watchdog upper limit RUN setting register (SWDG_RUNULS)
- *The limitation is needed, when device state change from PSS to RUN. Because the window setting don't change immediately. When device state change from RUN to PSS, clear the watchdog counter.*

6. Register List

This section explains the registers of the Software watchdog timer.

Table 6-1 List of Software Watchdog Timer Registers

Abbreviated Register Name	Register Name	Reference
SWDG_PROT	Software watchdog protection register	6.1
SWDG_CNT	Software watchdog counter register	6.2
SWDG_RSTCAUSE	Software watchdog reset source register	6.3
SWDG_TRG0	Software watchdog trigger 0 register	6.4
SWDG_TRG1	Software watchdog trigger 1 register	6.5
SWDG_INT	Software watchdog interrupt configuration register	6.6
SWDG_INTCLR	Software watchdog interrupt clear register	6.7
SWDG_TRG0CFG	Software watchdog trigger 0 configuration register	6.8
SWDG_TRG1CFG	Software watchdog trigger 1 configuration register	6.9
SWDG_RUNLLS	Software watchdog lower limit RUN setting register	6.10
SWDG_RUNULS	Software watchdog upper limit RUN setting register	6.11
SWDG_PSSLLS	Software watchdog lower limit PSS setting register	6.12
SWDG_PSSULS	Software watchdog upper limit PSS setting register	6.13
SWDG_RSTDLY	Software watchdog reset delay counter register	6.14
SWDG_CFG	Software watchdog configuration register	6.15
SWDG_RUNLLC	Software watchdog lower limit RUN current register	6.16
SWDG_RUNULC	Software watchdog upper limit RUN current register	6.17
SWDG_PSSLLC	Software watchdog lower limit PSS current register	6.18
SWDG_PSSULC	Software watchdog upper limit PSS current register	6.19

Note:

- The notation *n* indicates the CPU number of a monitored (0). Since the software watchdog timer is assigned to each of the monitored CPUs, for each type of these registers, there are as many registers as there are CPUs.

Table 6-2 Register Memory Layout of Software Watchdog Timer

Offset	Register Name			
	+3	+2	+1	+0
0x0000_0000	SWDG_PROT 00000000_00000000_00000000_00000000			
0x0000_0004	-	-	-	-

0x0000_0058	SWDG_PSSULC 10000000_00000000_00000000_00000000			

Notes:

- "X" indicates an undefined value.

6.1. Software Watchdog Protection Register (SWDG_PROT)

This register is used to execute the watchdog register write protection sequence. Write the correct key (0xEDAC_CE55) to this register before performing write access to each register. (However, the Software watchdog trigger 0/1 register (SWDG_TRG0 and SWDG_TRG1) are excluded.) Writing the correct key releases the write protection lock for subsequent register access. Write access to each register enables write protection lock for the registers. (Read access to each register does not affect the lock.) For write access to this register, you must write 32-bit data.

Bit	31	0
Field	KEY[31:0]	
R/W Attribute	R, W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] KEY[31:0]: Protection Bits

KEY[31:0]	Description
During write operation	When 0xEDAC_CE55 is written: Protection lock for register write is released. When a value other than 0xEDAC_CE55 is written: Protection lock for register write is not released.
During read operation	When 0xFFFF_FFFF is read: Protection lock for register write has been released. When 0x0000_0000 is read: Protection lock for register write has been enabled.

Notes:

- An AHB transfer error response is generated when write access to this register is performed under any of the conditions below. (This error response invokes the CPU exception handler.)
 - A wrong key is written to this register.
 - Non-32-bit data is written to this register.
 - Data is written to this register twice in a row.
- For details on the watchdog register write protection sequence, see Figure 3-1.
- A protect key will be locked again by writing to the address where is in the same group area(SYSC1 Group), however protect key will not be locked by writing to no protect target register (SWDG_TRG0/1) in Software Watchdog.

6.2. Software Watchdog Counter Register (SWDG_CNT)

This register indicates the current up count value of the watchdog counter.

Bit	31	0
Field	WDGCNT[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGCNT[31:0]: Watchdog Counter Bits

WDGCNT[31:0]	Description
During write operation	Invalid
During read operation	Returns the current watchdog counter value. The watchdog counter value is sampled by using the bus clock.

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.3. Software Watchdog Reset Factor Register (SWDG_RSTCAUSE)

When performing write access to this register, follow the watchdog register write protection sequence. This register is the status register that indicates the factor of the watchdog reset request or watchdog interrupt request (NMI). This register is not initialized by reset. After a watchdog reset, the value is maintained. To check the factor of the watchdog reset request, read this register.

Bit	31						8
Field	Reserved						
R/W Attribute	R0, WX						
Protection Attribute	WPS						
Initial Value	00000000_00000000_00000000						

Bit	7	5	4	3	2	1	0
Field	Reserved		RST CAUSE4	RST CAUSE3	RST CAUSE2	RST CAUSE1	RST CAUSE0
R/W Attribute	R0, WX		R, W	R, W	R, W	R, W	R, W
Protection Attribute	WPS						
Initial Value	000		X	X	X	X	X

[bit31:5] Reserved: Reserved Bits

[bit4] RSTCAUSE4: Reset Factor Bit 4

If the watchdog counter clear protection trigger sequence is executed when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is "0", this bit is set to "1".

RSTCAUSE4	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

[bit3] RSTCAUSE3: Reset Factor Bit 3

If the watchdog counter clear protection trigger sequence is executed before the watchdog counter reaches the window lower limit value, this bit is set to "1".

RSTCAUSE3	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

[bit2] RSTCAUSE2: Reset Factor Bit 2

When the watchdog counter reaches the window upper limit value, this bit is set to "1".

RSTCAUSE2	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

When the prior warning interrupt request is used, RSTCAUSE2 cannot be cleared during the period from the occurrence of a prior warning interrupt until a watchdog reset or watchdog interrupt (NMI).

[bit1] RSTCAUSE1: Reset Factor Bit 1

When there is a violation of the watchdog counter clear protection trigger sequence, this bit is set to "1". For details, see Figure 3-2.

RSTCAUSE1	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

[bit0] RSTCAUSE0: Reset Factor Bit 0

If the value written in the Software watchdog trigger 0/1 register (SWDG_TRG0 or SWDG_TRG1) does not match a proper value, this bit is set to "1".

RSTCAUSE0	Description
During write operation	When "0" is written: This bit cleared When "1" is written: Invalid
During read operation	When "0" is read: Indicating no detection of a reset/NMI factor When "1" is read: Indicating detection of a reset/NMI factor

Notes:

- When using the Software watchdog timer, be sure to clear this register.
- The value in this register becomes valid when the watchdog reset request is generated.

6.4. Software Watchdog Trigger 0 Register (SWDG_TRG0)

When performing write access to this register, you do not need to follow the watchdog register write protection sequence. This register is used to execute the watchdog counter clear protection trigger sequence. Write the value defined in the Software watchdog trigger 0 configuration register (SWDG_TRG0CFG) to this register. When a value other than the one in the Software watchdog trigger 0 configuration register (SWDG_TRG0CFG) is written, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Bit	31							8
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	-							
Initial Value	00000000_00000000_00000000							

Bit	7	6	5	4	3	2	1	0
Field	WDGTRG0[7:0]							
R/W Attribute	R0, W							
Protection Attribute	-							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG0[7:0]: Watchdog Trigger 0 Bits

These bits are used to execute the watchdog counter clear protection trigger sequence to clear the watchdog counter.

WDGTRG0[7:0]	Description
During write operation	<p>When the SWDG_TRG0CFG value is written: 1 condition for executing the watchdog counter clear protection trigger sequence is met.</p> <p>When a value other than the SWDG_TRG0CFG value is written: A watchdog error is generated.</p>
During read operation	Reads 0b00000000.

Note:

- *Figure 3-2 shows the flow of the watchdog counter clear protection trigger sequence.*

6.5. Software Watchdog Trigger 1 Register (SWDG_TRG1)

When performing write access to this register, you do not need to follow the watchdog register write protection sequence. This register is used to execute the watchdog counter clear protection trigger sequence. Write the value defined in the Software watchdog trigger 1 configuration register (SWDG_TRG1CFG) to this register. When a value other than the one in the Software watchdog trigger 1 configuration register (SWDG_TRG1CFG) is written, the watchdog reset request or watchdog interrupt request (NMI) is generated.

Bit	31							8
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	-							
Initial Value	00000000_00000000_00000000							

Bit	7	6	5	4	3	2	1	0
Field	WDGTRG1[7:0]							
R/W Attribute	R0, W							
Protection Attribute	-							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG1[7:0]: Watchdog Trigger 1 Bits

These bits are used to execute the watchdog counter clear protection trigger sequence to clear the watchdog counter.

WDGTRG1[7:0]	Description
During write operation	When the SWDG_TRG1CFG value is written: 1 condition for executing the watchdog counter clear protection trigger sequence is met. When a value other than the SWDG_TRG1CFG value is written: A watchdog error is generated.
During read operation	Reads 0b00000000.

Note:

- *Figure 3-2 shows the flow of the watchdog counter clear protection trigger sequence.*

6.6. Software Watchdog Interrupt Configuration Register (SWDG_INT)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to make settings related to the watchdog reset request (NMI) and prior warning interrupt request. This register also includes interrupt status flags.

Bit	31	18	17	16
Field	Reserved		RSTEN	IRQEN
R/W Attribute	R0, WX		R/W	R/W
Protection Attribute	WPS			
Initial Value	000000_00000000		1	0

Bit	15	2	1	0
Field	Reserved		NMI FLAG	IRQ FLAG
R/W Attribute	R0, WX		R, WX	R, WX
Protection Attribute	WPS			
Initial Value	000000_00000000		0	0

[bit31:18] Reserved: Reserved Bits

[bit17] RSTEN: Reset/NMI Enable Bit

This bit is used to generate either the watchdog reset request or watchdog interrupt request (NMI) in response to a watchdog error. Prohibiting setting this bit to "0" except for the purpose of using it as a test function. (If this bit is set to "0" during application execution, security is compromised.) This bit is equipped with a majority circuit with 3 FFs as a measure against a bit invert caused by the effects of noise or another factor.

RSTEN	Description
During write operation	When "0" is written: The watchdog interrupt request (NMI) is generated. When "1" is written: The watchdog reset request is generated.
During read operation	Set value read

[bit16] IRQEN: Prior warning Interrupt Enable Bit

This bit is used to enable generation of the prior warning interrupt request.

IRQEN	Description
During write operation	When "0" is written: The prior warning interrupt request is not generated. When "1" is written: The prior warning interrupt request is generated.
During read operation	Set value read

[bit15:2] Reserved: Reserved Bits

[bit1] NMIFLAG: NMI Flag

This bit is set by a watchdog error when the RSTEN bit in the Software watchdog interrupt configuration register (SWDG_INT) is "0". When the RSTEN bit in the Software watchdog interrupt clear register (SWDG_INT) is "1", the watchdog reset request is generated. You can clear this bit by writing "1" to the NMICLR bit in the Software watchdog interrupt configuration register (SWDG_INTCLR).

NMIFLAG	Description
During write operation	Invalid
During read operation	When "0" is read: No detection of a watchdog error (NMI) is indicated. When "1" is read: Detection of a watchdog error (NMI) is indicated.

[bit0] IRQFLAG: IRQ Flag

This bit is set by a watchdog error. The prior warning interrupt is generated when the IRQEN bit in the Software watchdog interrupt clear register (SWDG_INT) is "1". You can clear this bit by writing "1" to the IRQCLR bit in the Software watchdog interrupt configuration register (SWDG_INTCLR).

IRQFLAG	Description
During write operation	Invalid
During read operation	When "0" is read: No detection of a watchdog error (IRQ) is indicated. When "1" is read: Detection of a watchdog error (IRQ) is indicated.

Notes:

- For details on the watchdog interrupt request (NMI), see "3 Explanation of Operation Generation of watchdog reset request or watchdog interrupt request (NMI)."
- For details on watchdog errors, see "7 Precautions for Using This Device Watchdog Error."

6.7. Software Watchdog Interrupt Clear Register (SWDG_INTCLR)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to clear the NMI flag and IRQ flag in the Software watchdog interrupt configuration register (SWDG_INT). You can write data to this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set.

Bit	31				16
Field	Reserved				
R/W Attribute	R0, WX				
Protection Attribute	WPS				
Initial Value	00000000_00000000				

Bit	15	4	3	2	1	0
Field	Reserved				NMI CLR	IRQ CLR
R/W Attribute	R0, WX				R0, W	R0, W
Protection Attribute	WPS					
Initial Value	000000_00000000				0	0

[bit31:2] Reserved: Reserved Bits

[bit1] NMICLR: NMI Clear Bit

This bit is used to clear the NMIFLAG bit in the Software watchdog interrupt configuration register (SWDG INT).

NMICLR	Description
During write operation	When "0" is written: Invalid When "1" is written: The NMI flag is cleared.
During read operation	"0" is read.

You must clear the NMI after waiting for watchdog counter clear (0x0000_0000). Check the watchdog counter value with SWDG_CNT.

[bit0] IRQCLR: Prior warning Interrupt Clear Bit

This bit is used to clear the IRQFLAG bit in the Software watchdog interrupt configuration register (SWDG_INT).

IRQCLR	Description
During write operation	When "0" is written: Invalid When "1" is written: The IRQ flag is cleared.
During read operation	"0" is read.

6.9. Software Watchdog Trigger 1 Configuration Register (SWDG_TRG1CFG)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to define a valid value to be written to the Software watchdog trigger 1 register (SWDG_TRG1) when the watchdog counter clear protection trigger sequence is performed.

Bit	31								8
Field	Reserved								
R/W Attribute	R0, WX								
Protection Attribute	WPS								
Initial Value	00000000_00000000_00000000								

Bit	7	6	5	4	3	2	1	0
Field	WDGTRG1CFG[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG1CFG[7:0]: Watchdog Trigger 1 Configuration Bits

These bits are used to define a value to be written to the Software watchdog trigger 1 register (SWDG_TRG1) for execution of the watchdog counter clear protection trigger sequence.

WDGTRG1CFG[7:0]	Description
During write operation	Set value written
During read operation	Set value read

6.10. Software Watchdog Lower Limit RUN Setting Register (SWDG_RUNLLS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window lower limit value for RUN is written to this register. However, this register value is different from the window lower limit value for RUN that is actually used. For details on how to reflect this register value in the window lower limit value for RUN actually used, see "6.16 Software Watchdog Lower Limit RUN Current Register (SWDG_RUNLLC)." You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set.

Bit	31	0
Field	WDGRUNLLS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGRUNLLS[31:0]: Window Lower Limit Value for RUN Set Bits

These bits are used to define the window lower limit value for RUN. The reading of these bits returns the set value regardless of the Software watchdog configuration register (SWDG_CFG) LOCK bit value.

WDGRUNLLS[31:0]	Description
During write operation	When "0" is written to all 32 bits: The window function is disabled. When any value except "0" is written: The window function is enabled.
During read operation	Set value read

Note:

- This register value is different from the window lower limit value that is actually used. The window lower limit value actually used is the value in the Software watchdog lower limit RUN current register (SWDG_RUNLLC).

6.11. Software Watchdog Upper Limit RUN Setting Register (SWDG_RUNULS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window upper limit value for RUN is written to this register. However, this register value is different from the window upper limit value for RUN that is actually used. For details on how to reflect this register value in the window upper limit value for RUN actually used, see "6.17 Software Watchdog Upper Limit RUN Current Register (SWDG_RUNULC)" You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set.

Bit	31	0
Field	WDGRUNULS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000001_00000000_00000000_00000000	

[bit31:0] WDGRUNULS[31:0]: Window Upper Limit Value for RUN Set Bits

These bits are used to define the window upper limit value for RUN. The reading of these bits returns the set value regardless of the Software watchdog configuration register (SWDG_CFG) LOCK bit value.

WDGRUNULS[31:0]	Description
During write operation	Set value written
During read operation	Set value read

Note:

- This register value is different from the window upper limit value that is actually used. The window upper limit value actually used is the value in the Software watchdog upper limit RUN current register (SWDG_RUNULC).

6.12. Software Watchdog Lower Limit PSS Setting Register (SWDG_PSSLLS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window lower limit value for PSS is written to this register. However, this register value is different from the window lower limit value for PSS that is actually used. For details on how to reflect this register value in the window lower limit value for PSS actually used, see "6.18 Software Watchdog Lower Limit PSS Current Register (SWDG_PSSLLC)." You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set.

Bit	31	0
Field	WDGPSSLLS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGPSSLLS[31:0]: Window Lower Limit Value for PSS Set Bits

These bits are used to define the window lower limit value for PSS. The reading of these bits returns the set value regardless of the Software watchdog configuration register (SWDG_CFG) LOCK bit value.

WDGPSSLLS[31:0]	Description
During write operation	When "0" is written to all 32 bits: The window function is disabled. When any value except "0" is written: The window function is enabled.
During read operation	Set value read

Note:

- This register value is different from the window lower limit value that is actually used. The window lower limit value actually used is the value in the Software watchdog lower limit PSS current register (SWDG_PSSLLC).

6.13. Software Watchdog Upper Limit PSS Setting Register (SWDG_PSSULS)

When performing write access to this register, follow the watchdog register write protection sequence. A setting value of the window upper limit value for PSS is written to this register. However, this register value is different from the window upper limit value for PSS that is actually used. For details on how to reflect this register value in the window upper limit value for PSS actually used, see "6.19 Software Watchdog Upper Limit PSS Current Register (SWDG_PSSULC)." You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set.

Bit	31	0
Field	WDGPSSULS[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	10000000_00000000_00000000_00000000	

[bit31:0] WDGPSSULS[31:0]: Window Upper Limit Value for PSS Set Bits

These bits are used to define the window upper limit value for PSS. The reading of these bits returns the set value regardless of the Software watchdog configuration register (SWDG_CFG) LOCK bit value.

WDGPSSULS[31:0]	Description
During write operation	Set value written
During read operation	Set value read

Note:

- *This register value is different from the window upper limit value that is actually used. The window upper limit value actually used is the value in the Software watchdog upper limit PSS current register(SWDG_PSSULC).*

6.14. Software Watchdog Reset Delay Counter Register (SWDG_RSTDLY)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to set the number of cycles for the delay time from the occurrence of a watchdog error to the watchdog reset request or watchdog interrupt request (NMI). The reference clock for the delay time is the source clock of the watchdog counter. When the IRQEN bit in the Software watchdog interrupt configuration register (SWDG_INT) is "1", this register indicates the number of cycles for the delay time from the prior warning interrupt request to the watchdog reset request or watchdog interrupt request (NMI).

Bit	bit31	bit16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

Bit	bit15	bit0
Field	WDGRSTDLY[15:0]	
R/W Attribute	R0, W	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

[bit31:16] Reserved: Reserved Bits

[bit15:0] WDGRSTDLY[15:0]: Reset/NMI Delay Counter Bits

These bits define the number of cycles for the delay time that is to be inserted before generation of the watchdog reset request or watchdog interrupt request (NMI). The reference clock for this delay time is the source clock of the watchdog counter.

WDGRSTDLY[15:0]	Description
During write operation	Set value written
During read operation	0x0000 is read.

6.15. Software Watchdog Configuration Register (SWDG_CFG)

When performing write access to this register, follow the watchdog register write protection sequence. This register is used to make the operation settings of the Software watchdog timer.

Bit	bit31	bit25	bit24
Field	Reserved		LOCK
R/W Attribute	R0, WX		R, W
Protection Attribute	WPS		
Initial Value	0000000		0

Bit	bit23	bit21	bit20	bit19	bit18	bit17	bit16
Field	Reserved			OBSSEL[4:0]			
R/W Attribute	R0, WX			R/W			
Protection Attribute	WPS						
Initial Value	000			00000			

Bit	bit15	bit10	bit9	bit8
Field	Reserved			CLKSEL[1:0]
R/W Attribute	R0, WX			R/W
Protection Attribute	WPS			
Initial Value	000000			00

Bit	bit7	bit4	bit3	bit2	bit1	bit0
Field	Reserved			ALLOWS TOP CLK	WDEN PSS	WDEN RUN
R/W Attribute	R0, WX			R/W	R/W	R/W
Protection Attribute	WPS					
Initial Value	00000			0	1	1

[bit31:25] Reserved: Reserved Bits

[bit24] LOCK: Lock Bit

You can write data to this bit only once. This register is used to prevent rewriting of the set values of various registers. When this bit is "0", you can rewrite the setting values of various registers. When this bit is set to "1" the watchdog counter is automatically cleared. This bit is equipped with a majority circuit with 3 FFs as a measure against a bit invert caused by the effects of noise or another factor.

LOCK	Description
During write operation	When "0" is written: Invalid When "1" is written: The set values of the registers are locked.
During read operation	When "0" is read: The lock for the register set values is disabled. When "1" is read: The lock for the register set values is enabled.

[bit23:21] Reserved: Reserved Bits

[bit20:16] OBSSEL[4:0]: Watchdog Counter Monitor Bit Output Selection Bits

These bits are used for selecting any 1 bit in the watchdog counter (32 bits) as the output of the watchdog counter monitor bit. (Support target of this function is different depends on product specification. For details, see "Output of the Watchdog Counter Monitor Bit for MCU Output Pin" in 3 Explanation of Operation.

OBSSEL[4:0]	Description
During write operation	When 0b00000 is written: Bit 0 is selected for the monitor output. When 0b00001 is written: Bit 1 is selected for the monitor output. When 0b00010 is written: Bit 2 is selected for the monitor output. . . . When 0b11111 is written: Bit 31 is selected for the monitor output.
During read operation	Set value read

Note:

- If products do not support "Output of watchdog counter monitor bit for MCU output pin", Any data written to these bits does not affect operation.

[bit15:10] Reserved: Reserved Bits

[bit9:8] CLKSEL[1:0]: Clock Selection Bits

These bits are used to select the source clock for the watchdog counter. When activated, the watchdog counter starts its operation as the high-speed CR clock. For details on clock switching, see "7 Precautions for Using This Device Switching of watchdog counter source clock."

CLKSEL[1:0]	Description
During write operation	When 0b00 is written: The high-speed CR clock is selected. When 0b01 is written: The low-speed CR clock is selected. When 0b10 is written: The sub clock is selected. When 0b11 is written: The main clock is selected.
During read operation	Set value read

[bit7:3] Reserved: Reserved Bits

[bit2] ALLOWSTOPCLK: Clock Stop for PSS Enable Bit

This bit is used to enable transition to PSS that involves the source clock stop of the watchdog counter. This bit is valid only when the WDENPSS bit in the Software watchdog configuration register (SWDG_CFG) is "1".

ALLOWSTOPCLK	Description
During write operation	When "0" is written: Watchdog clock stop in PSS is disabled. When "1" is written: Watchdog clock stop in PSS is enabled.
During read operation	Set value read

[bit1] WDENPSS: Watchdog Counter for PSS Enable Bit

This bit is used to enable the watchdog counter in PSS. This bit is enabled when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set to "1".

This bit is equipped with a majority circuit with 3 FFs as a measure against a bit invert caused by the effects of noise or another factor.

WDENPSS	Description
During write operation	When "0" is written: The watchdog counter in PSS is disabled. When "1" is written: The watchdog counter in PSS is enabled.
During read operation	Set value read

[bit0] WDENRUN: Watchdog Counter for RUN Enable Bit

This bit is used to enable the watchdog counter in RUN. This bit is enabled when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set to "1".

This bit is equipped with a majority circuit with 3 FFs as a measure against a bit invert caused by the effects of noise or another factor.

WDENRUN	Description
During write operation	When "0" is written: The watchdog counter in RUN is disabled. When "1" is written: The watchdog counter in RUN is enabled.
During read operation	Set value read

Note:

- When the ALLOWSTOPCLK bit in the Software watchdog configuration register (SWDG_CFG) is "1", transition to PSS that involves clock stop is enabled. However, in case of transition from RUN to PSS during reset delay counter operation, the reset delay counter is stopped until a return from PSS to RUN occurs.

6.16. Software Watchdog Lower Limit RUN Current Register (SWDG_RUNLLC)

This register is used to read the window lower limit value for RUN that is actually used. This register fetches the set value in the Software watchdog lower limit RUN setting register (SWDG_RUNLLS) when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. In this case, this register fetches the set value of the software watchdog lower limit RUN setting register (SWDG_RUNLLS) when the watchdog counter clear protection sequence is executed.

Bit	bit31	bit0
Field	WDGRUNLLC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGRUNLLC[31:0]: Window Lower Limit for RUN Current Bits

These bits are used to define the window lower limit value for RUN. The reading of these bits returns the initial value, until the Software watchdog configuration register (SWDG_CFG) LOCK bit is set.

WDGRUNLLC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.17. Software Watchdog Upper Limit RUN Current Register (SWDG_RUNULC)

This register is used to read the window upper limit value for RUN that is actually used. This register fetches the set value in the Software watchdog upper limit RUN setting register (SWDG_RUNULS) when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. In this case, this register fetches the set value of the software watchdog upper limit RUN setting register (SWDG_RUNULS) when the watchdog counter clear protection trigger sequence is executed.

Bit	bit31	bit0
Field	WDGRUNULC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000001_00000000_00000000_00000000	

[bit31:0] WDGRUNULC[31:0]: Window Upper Limit for RUN Current Bits

These bits are used to define the window upper limit value for RUN. The reading of these bits returns the initial value, until the Software watchdog configuration register (SWDG_CFG) LOCK bit is set.

WDGRUNULC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.18. Software Watchdog Lower Limit PSS Current Register (SWDG_PSSLLC)

This register is used to read the window lower limit value for PSS that is actually used. This register fetches the set value in the Software watchdog lower limit PSS setting register (SWDG_PSSLLS) when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. In this case, this register fetches the set value of the software watchdog lower limit PSS setting register (SWDG_PSSLLS) when the watchdog counter clear protection trigger sequence is executed.

Bit	bit31	bit0
Field	WDGPSSLLC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] WDGPSSLLC[31:0]: Window Lower Limit for PSS Current Bits

These bits are used to define the window lower limit value for PSS. The reading of these bits returns the initial value, until the Software watchdog configuration register (SWDG_CFG) LOCK bit is set.

WDGPSSLLC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- An AHB transfer error response is generated where there is write access to this register.

6.19. Software Watchdog Upper Limit PSS Current Register (SWDG_PSSULC)

This register is used to read the window upper limit value for PSS that is actually used. This register fetches the set value in the Software watchdog upper limit PSS setting register (SWDG_PSSULS) when the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. You can change the set value of this register even after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set. In this case, this register fetches the set value of the software watchdog upper limit PSS setting register (SWDG_PSSULS) when the watchdog counter clear protection trigger sequence is executed.

Bit	bit31	bit0
Field	WDGPSSULC[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	10000000_00000000_00000000_00000000	

[bit31:0] WDGPSSULC[31:0]: Window Upper Limit for PSS Current Bits

These bits are used to define the window upper limit value for PSS. The reading of these bits returns the initial value, until the Software watchdog configuration register (SWDG_CFG) LOCK bit is set.

WDGPSSULC[31:0]	Description
During write operation	Invalid
During read operation	Set value read

Note:

- Write access to this register generates an AHB transfer error response.

7. Precautions for Using This Device

This section describes precautions on the use of the Software watchdog timer.

Watchdog Window Setting

For the Software watchdog timer, you can make 2 types of window setting, the setting for RUN and setting for PSS. The user must make an appropriate window setting for each device state.

When the device transitions from PSS to RUN, the Software watchdog timer continues operation using the PSS window setting until the watchdog counter clear protection trigger sequence is executed. The watchdog counter clear protection trigger sequence switches the window setting to the RUN window setting. You can control the watchdog function in each device state with the WDENRUN bit and WDENPSS bit in the Software watchdog configuration register (SWDG_CFG).

Only PSS operation is not recommend at Software watchdog timer.

Because of Software watchdog timer can clear the counter under working the timer itself.

Software watchdog timer cannot clear the counter under CPU stopping.

Notes:

- When WDENPSS bit is "0", the watchdog timer perform the same operation. So certainly set the same value in upper limit registers and lower limit registers.
- Set the same value following two upper limit registers.
 - Software watchdog lower limit PSS setting register (SWDG_PSSLLS)
 - Software watchdog lower limit RUN setting register (SWDG_RUNLLS)
- Set the same value following two upper limit registers.
 - Software watchdog upper limit PSS setting register (SWDG_PSSULS)
 - Software watchdog upper limit RUN setting register (SWDG_RUNULS)

Switching of Watchdog Counter Source Clock

The system controller controls the switching of the watchdog counter source clock since the source clock control of the watchdog counter is a part of the system setting information (profile). To change the watchdog counter source clock, follow the sequence below.

1. Writing data to the RUN profile source clock enable register of the system controller (SYSC0_RUNCKSRER) enables oscillation of the new source clock of the watchdog. Then, writing 0xAB to the RUN profile update trigger register of the system controller (SYSC0_TRGRUNCNTR) executes RUN profile update.
2. Setting the CLKSEL bit in the Software watchdog configuration register (SWDG_CFG) sets the new source clock of the watchdog counter. Then, writing data to the following registers finalizes the window setting.
3. Software watchdog lower limit RUN setting register (SWDG_RUNLLS)
4. Software watchdog upper limit RUN setting register (SWDG_RUNULS)
5. Software watchdog lower limit PSS setting register (SWDG_PSSLLS)
6. Software watchdog upper limit PSS setting register (SWDG_PSSULS)
7. Setting the LOCK bit in the Software watchdog configuration register (SWDG_CFG) to "1" locks rewriting of the register set values.
8. Writing 0xAB to the RUN profile update trigger register of the system controller (SYSC0_TRGRUNCNTR) executes RUN profile update. At this point in time, the source clock of the watchdog counter is switched to the new source clock selected by the CLKSEL bit of the Software watchdog configuration register (SWDG_CFG).

Note:

- When the oscillation of the new source clock is stable, Step 1 is unnecessary.

Watchdog Error

A watchdog error is generated under the following conditions. This watchdog error generates the watchdog reset request/interrupt request (NMI).

1. An incorrect value is written to the Software watchdog trigger 0/1 register (SWDG_TRG0 or SWDG_TRG1).
2. The watchdog counter clear protection trigger sequence is violated.
3. The watchdog counter clear protection trigger sequence is not executed before the watchdog counter reaches the window upper limit value.
4. The watchdog counter clear protection trigger sequence is executed before the watchdog counter reaches the window lower limit value.
5. The watchdog counter clear protection trigger sequence is executed while the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is still "0".

Factors for Bus Error Responses (Data Abort)

A bus error response is generated in the following cases.

- Access (read or write) to an address where no register exists
- Violation of the watchdog register write protection sequence
- Write access to a register with the read-only attribute (indicated as R, WX)
- Write access to a register after the LOCK bit in the Software watchdog configuration register (SWDG_CFG) is set to "1"
- Write access with an incorrect value to the Software watchdog protection register (SWDG_PROT)
- Byte/Half-word write access to the Software watchdog protection register (SWDG_PROT)
- Write access to a register in non-privileged mode
 - (Except for the Software watchdog trigger 0/1 register (SWDG_TRG0 and SWDG_TRG1))

Watchdog Timer Operation in Standby State of Processor

The Software watchdog timer operates using the RUN window setting in the following case.

- Without a valid key being written to the PSS profile update enable register (SYSC0_PSSSEN.PSSEN0 and SYSC1_PSSSEN.PSSEN1), the processor transitions to the standby state by executing a wait for interrupt (WFI) instruction.

CHAPTER 16: TCRAM Interface

This chapter provides an overview of the interface between the Cortex-R5F BTCM port and SRAM, and describes their configuration, operation, and registers.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Examples
5. Registers

TCRAM-TXXPT03P01R01L06-E1-XX

1. Overview

This section describes the features of the TCRAM interface.

Features

The TCRAM interface has the following features.

- Connection between the Cortex-R5F BTCM port and SRAM (RAM size is Product specific).
- Wait control function

The Cortex-R5F BTCM port has a signal for waiting for data read (BxTCWAIT).

The TCRAM interface sets and controls the number of cycles of the wait signal (for data write, there is no wait control).
- Generation of a bus error response

The TCRAM interface generates an error when non-privilege access or unsupported access to the configuration register is attempted.

For details on unsupported access, see "Generation of a bus error response" in "3. Explanation of Operation."
- ECC error insertion function

The Cortex-R5F performs an ECC check.

The TCRAM interface can insert an error in data read from the TCRAM for the ECC function test performed by the Cortex-R5F.
- Direct write/read test function of the ECC area

A function to write an arbitrary value to the ECC area is implemented for test.

Also, a function that captures a read value before error correction and stores it to the register is implemented.
- RAM diagnosis and initialization function

Diagnosis and initialization are performed for the TCRAM. One or more methods from the following can be selected to perform diagnosis.

 - Unique (as unique data, address information (below), Upper 7 bits are ECC data.)

Address Information

$$((\text{address} \& 0x0000007F) \ll 32)$$

$$+ ((\text{address} \& 0x000000FF) \ll 24)$$

$$+ ((\text{address} \& 0x000000FF) \ll 16)$$

$$+ ((\text{address} \& 0x000000FF) \ll 8)$$

$$+ (\text{address} \& 0x000000FF)$$
 - Checker
 - March (performed in the order of all "0's" to all "1's")

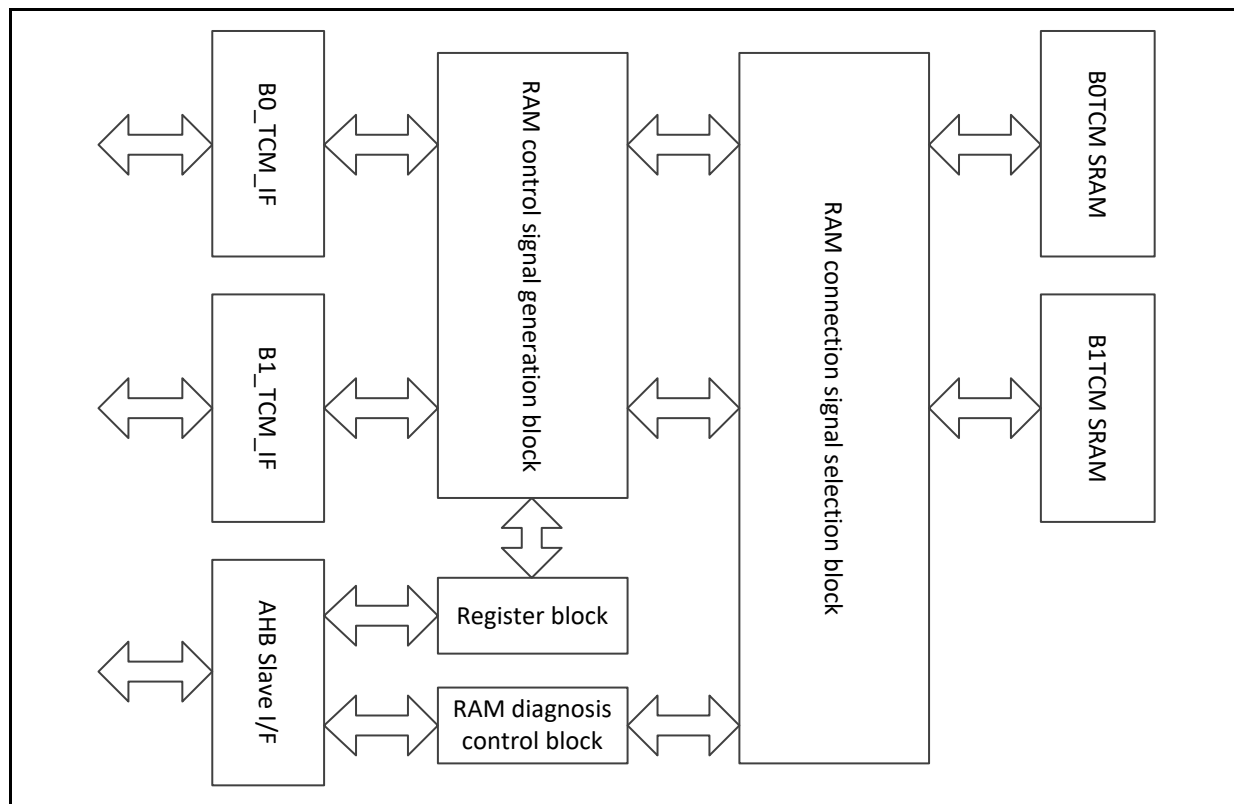

One of the following can be selected as initialization.

 - all "0" is written
 - all "1" is written

2. Configuration

Figure 2-1 is a block diagram of the TCRAM interface that uses B0TCM and B1TCM.

Figure 2-1 TCRAM Interface Block Diagram

B0_TCM_IF

Interface for the Cortex-R5F B0TCM port

B1_TCM_IF

Interface for the Cortex-R5F B1TCM port

AHB Slave I/F

AHB Slave interface, which is used as a bus for configuration

Register Block

Includes the registers of the TCRAM interface.

The registers are common to the B0TCM and B1TCM, and set values are reflected in both ports.

RAM Control Signal Generation Block

Generates control signals of the TCRAM from signals input at the Cortex-R5F BTCM port.

RAM Diagnosis Control Block

Controls diagnosis and initialization of the SRAM.

RAM Connection Signal Selection Block

Selects the BTCM port or RAM diagnosis control block as a path for connecting to the SRAM.

3. Explanation of Operation

This section describes the operation of the TCRAM interface.

Wait Control

The wait status can be configured by setting TRCFGn_TCMCFG0:DWAIT via the configuration bus when privilege access is allowed and the TRCFGn_TCMCFG0:LOCKSTATUS bit is "0".

The number of waits that can be set is from 0 to 3, and the default set value is the least number of waits (0 waits).

The asserted BxTCWAIT signal indicates the wait status.

The Cortex-R5F is kept waiting for acquisition of data read from the SRAM while the BxTCWAIT signal is asserted. There is no wait regarding write operation.

Generation of a Bus Error Response

The TCRAM interface returns an error response to the configuration bus under the following conditions.

- Non-privilege write access to a TCRAM interface register
- Write access to a TCRAM interface register that is not the TRCFGn_TCMUNLOCK register in the locked state
- Write access to the TRCFGn_TCMUNLOCK register with the unlock value or any value except the lock value
- Write access that is not 32-bit access to the TRCFGn_TCMUNLOCK register
- Write access to a reserved space
- Read or write access to a space that is not used as a register space
- Write access when all the write target bits are reserved or read-only bits

ECC Check

Since the following access to an uninitialized area of the TCRAM causes an ECC error, 32-bit initialization is necessary before using it.

- 8- or 16-bit write access
- Read access

The Cortex-R5F performs an ECC check for the TCRAM in units of 32 bits. For 32- or 64-bit write operation, add ECC to data and then write it to the TCRAM. For 8- or 16-bit write operation, perform read-modify-write access so that the correct ECC can be generated. An ECC check is also performed during read operation in read-modify-write access.

ECC Error Insertion

This interface has a function to insert an error into data that is read from the SRAM so that the 32-bit ECC function of the Cortex-R5F can be tested.

When the TRCFGn_TCMCFG0:LOCKSTATUS bit is "0", this function sets "1" in a bit in the configuration register that causes an ECC error in the RAM.

To generate an ECC error by data area destruction, set the TRCFGn_TCMCFG1:ERRBIT[31:0] bits, and to generate one by ECC area destruction, set the TRCFGn_TCMCFG0:ERRECC[6:0] bits.

For read from the TCRAM the read data is XOR-ed with TRCFGn_TCMCFG1:ERRBIT[31:0], and the ECC data is XOR-ed with TRCFGn_TCMCFG0:ERRECC[6:0].

Note:

- During normal operation, keep TRCFGn_TCMCFG1:ERRBIT[31:0] and TRCFGn_TCMCFG0:ERRECC[6:0] set to "0".

Direct Write/Read Function of the ECC Area

A direct write/read function of the ECC data storage area is implemented for the SRAM test.

By using this function, you can write arbitrary data into the ECC area of the SRAM, and read the data before ECC error correction and the ECC data.

This function is a testing function. To prevent incorrect setting during the execution of a user program, the direct access enable bit and direct write access enable bit are protected by their relevant lock bits.

In the locked state, write access to the relevant registers is ignored, while read access is not restricted.

Direct Read Function

A function that captures data before ECC error correction read from the TCRAM and its ECC data into a register

When the direct access enable bit is set (TRCFGn_ECCDEN:DEN = 1), reading the TCRAM has this function store the read data and ECC data in a register.

The direct access enable bit is set or cleared under the following conditions.

[Setting condition]

- When TRCFGn_TCMCFG0:LOCKSTATUS is "0", 0b10011110 is written in bit[23:16] in the TRCFGn_ECCDEN register (DEN, DENUNLOCK) in a state in which privilege access is possible.

[Clearing conditions]

- TRCFGn_TCMCFG0:LOCKSTATUS becomes "1".
- A value that is not 0b10011110 is written in bit[23:16] in the TRCFGn_ECCDEN register (DEN, DENUNLOCK) in a state in which privilege access is possible.

For 32-bit read operation, only 32 bits in the data register and their corresponding 32 bits in ECC data are updated, and the data register and ECC data bits for unread data are not updated.

Since registers are used commonly for the B0TCM and B1TCM ports, when read access via the B0TCM and B1TCM ports occurs at the same time, data on the B0TCM port side is stored in the register.

Direct Write Function

This function writes an arbitrary value set in a register to the ECC data area of the TCRAM instead of writing the ECC calculated from the written data.

When the direct write access enable bit is set (TRCFGn_ECCDW:DWEN = 1), and write operation is performed to the TCRAM, this function writes the value in the ECCDW_PARITY[13:0] bits in the TRCFGn_ECCDW register.

For 32-bit write access, only the ECC bits for the word to be written are updated and the ECC bits for the unwritten word are not updated.

The direct write access enable bit is cleared under the following conditions.

[Setting condition]

- When TRCFGn_ECCDEN:DEN is "1", 0b10110101 is written in bit[31:24] in the TRCFGn_ECCDW register (DWEN, DWENUNLOCK) in a state in which privilege access is possible.

[Clearing conditions]

- TRCFGn_ECCDEN:DEN becomes "0".
- A value that is not 0b10110101 is written in bit[31:24] in the TRCFGn_ECCDW register (DWEN, DWENUNLOCK) in a state in which privilege access is possible.

Note:

- Before using this function, set the stack pointer and make other settings in an area that is not the area subject to the direct access.

RAM Diagnosis and Initialization Function

RAM Diagnosis

Select RAM diagnosis items to perform for the TCRAM from the following. (Multiple items can be selected.)

- Unique (as unique data, address information (below), Upper 7 bits are ECC data.)
 - Address Information
 - ((address & 0x0000007F) << 32)
 - + ((address & 0x000000FF) << 24)
 - + ((address & 0x000000FF) << 16)
 - + ((address & 0x000000FF) << 8)
 - + (address & 0x000000FF)
- Checker
- March (performed in the order of all "0's" to all "1's")

The RAM diagnosis is performed only in the following sequence.

1. Unique
2. Checker
3. March

Diagnosis items to be performed are selected according to the setting of the TTYP[2:0] bits in the TEST diagnosis function register (TRCFGn_TTCR). (Unique and Checker are selected by default.)

The range for Diagnosis can be defined with TEST start address register (TRCFGn_TASAR) and TEST end address register (TRCFGn_TAEAR).

Diagnosis is initiated with the key code control by software.

The following shows the RAM diagnosis start procedure.

1. Wait until TRUN bit of TEST diagnosis function register (TRCFGn_TTCR) and IRUN bit of TEST initialization function register both become "0" by reading these bits.
2. Clear TRCFGn_TTCR:TCI and TRCFGn_TICR:ICI.
To clear TRCFGn_TTCR:TCI and TRCFGn_TICR:ICI, write "1" to the corresponding bit of TRCFGn_TSCR.
3. To the TEST key code control register (TRCFGn_TKCCR), write 0x02, 0x42, 0x82, 0xC2 in a row in this sequence to TEST keycode control register to start Diagnosis.
4. Wait until Diagnosis finishes (TRCFGn_TTCR:TCI=1).

Notes:

- When you use this function, all the data bits of the RAM contain "1" after the March diagnosis, or some values after diagnosis other than it.
- If data on the RAM is read before initialization or 32- or 64-bit write access, an ECC error occurs. Therefore, be sure to perform initialization or write access.
- Also, it is prohibited to access the RAM when it is under diagnosis.

RAM Initialization

For the TCRAM initialization operation, you can select either of the following by the specification of the ITPY bit in the TEST initialization function register (TRCFGn_TICR).

- Writing all "0's" (default)
- Writing all "1's"

To the ECC area, the value corresponding to the written value is written.

You can specify a range for performing RAM initialization with the TEST start address register (TRCFGn_TASAR) and TEST end address register (TRCFGn_TAEAR).

The following shows the RAM initialization start procedure.

1. Wait until TRUN bit of TEST diagnosis function register (TRCFGn_TTCR) and IRUN bit of TEST initialization function register both become "0" by reading these bits.
2. Clear TRCFGn_TTCR:TCI and TRCFGn_TICR:ICI.
To clear TRCFGn_TTCR:TCI and TRCFGn_TICR:ICI, write "1" to the corresponding bit of TRCFGn_TSCR.
3. To the TEST key code control register (TRCFGn_TKCCR), write 0x01, 0x41, 0x81, and 0xC1 in this sequence in a row to start initialization.
4. Wait until Diagnosis finishes (TRCFGn_TICR:ICI=1).

Note:

- It is prohibited to access the RAM when it is being initialized.

Forcibly Stopping RAM Diagnosis and Initialization

You can forcibly stop the execution of diagnosis and initialization of the TCRAM.

The following shows the procedure for the forcible stop.

1. During the diagnosis or initialization, to the TEST key code control register (TRCFGn_TKCCR), write 0x00, 0x40, 0x80, and 0xC0 in this sequence in a row.
2. Wait until TRCFGn_TTCR:TRUN becomes "0" for diagnosis, and wait until TRCFGn_TICR:IRUN is "0" for initialization.

Operation when a RAM Diagnosis Error Occurs

If an error occurs during RAM diagnosis, the contents of the diagnosis in which the error occurs and the address where it occurs are stored in the TRCFGn_TEAR0 to 2 registers.

When 4 or more errors occur, TRCFGn_TTCR:OVFLW is set to "1".

RAM Diagnosis Interrupt

You can generate an interrupt for RAM diagnosis and initialization.

Table 3-1 shows interrupt factors, generation flag bits, and enable bits.

Table 3-1 Correspondence between Interrupt Factors, Generation Flag Bits, and Enable Bits

Interrupt Factor	Generation Flag Bit	Enable Bit
Diagnosis end interrupt	TRCFGn_TTCR:TCI	TRCFGn_TTCR:TCIE
Diagnosis error interrupt	TRCFGn_TTCR:TEI	TRCFGn_TTCR:TEIE
Initialization end interrupt	TRCFGn_TICR:ICI	TRCFGn_TICR:ICIE

The TCRAM interface output 1 interrupt signal collectively indicates the above 3 types of interrupts.

You can check what type of interrupt has occurred by reading the TCI and TEI bits in TRCFGn_TTCR and the ICI bit in TRCFGn_TICR.

(By reading data at the offset address 0x0000_0040 in units of words, you can check it by 1-time read access.)

Generation of a RAM Diagnosis Pseudo Error

With this function, you can generate a pseudo error on purpose for debugging software.

The operation for generating a pseudo error is set as the following procedure.

1. Selecting an error type by setting the TEST pseudo error generation control register (TRCFGn_TFEER)
 - Set a diagnosis pattern that generates a pseudo error in TRCFGn_TFEER:ETYP[2:0].
 - Identify a diagnosis pattern that generates a pseudo error by writing "1" in TRCFGn_TFEER:FERR.
2. Starting RAM diagnosis (For the procedure see "Starting RAM diagnosis.")

4. Setting Procedure Examples

Figure 4-1 shows a procedure for register setting of the TCRAM interface, Figure 4-2 shows a procedure for direct read access, Figure 4-3 shows a procedure for direct write access, and Figure 4-4 shows a procedure for starting RAM diagnosis and initialization.

Figure 4-1 Register Setting Flow

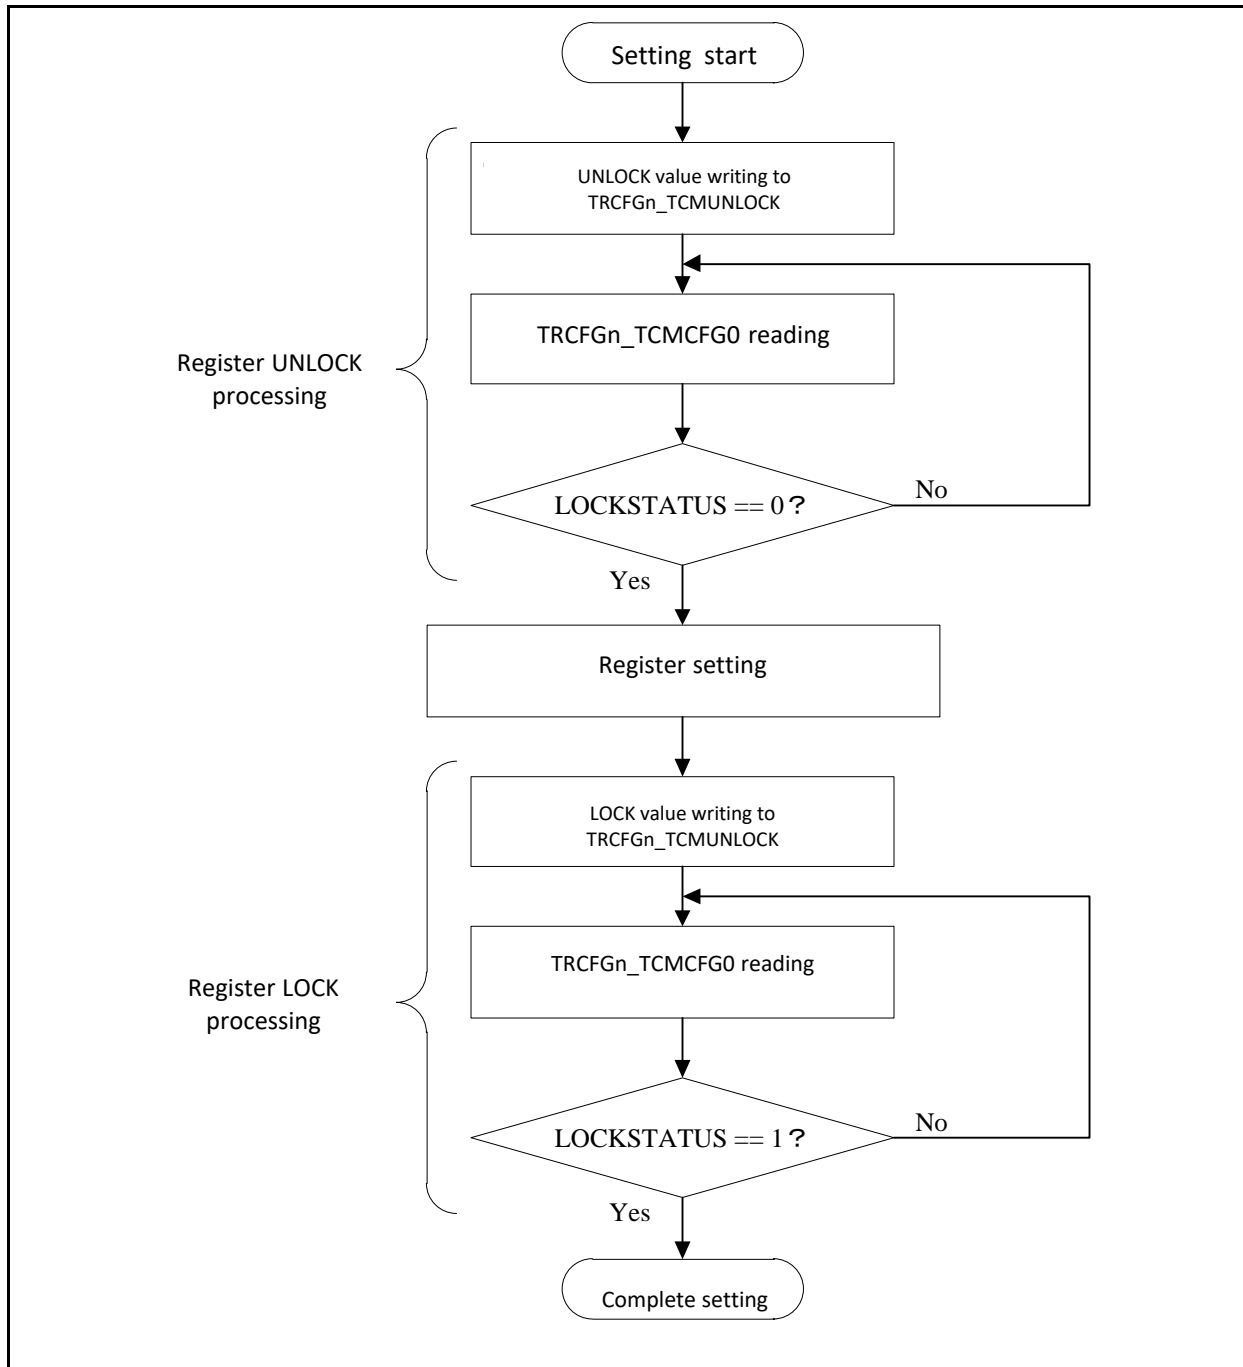

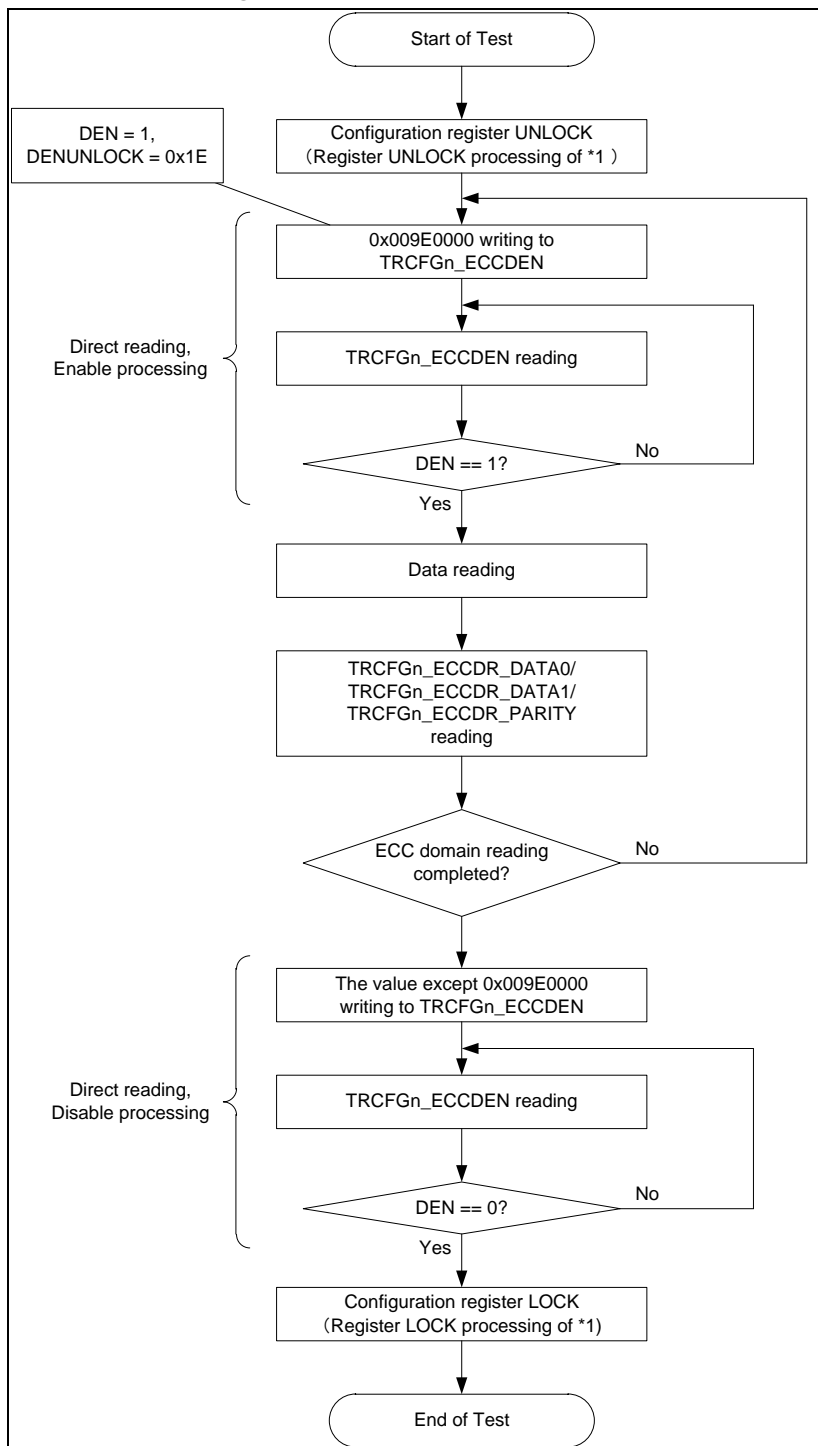

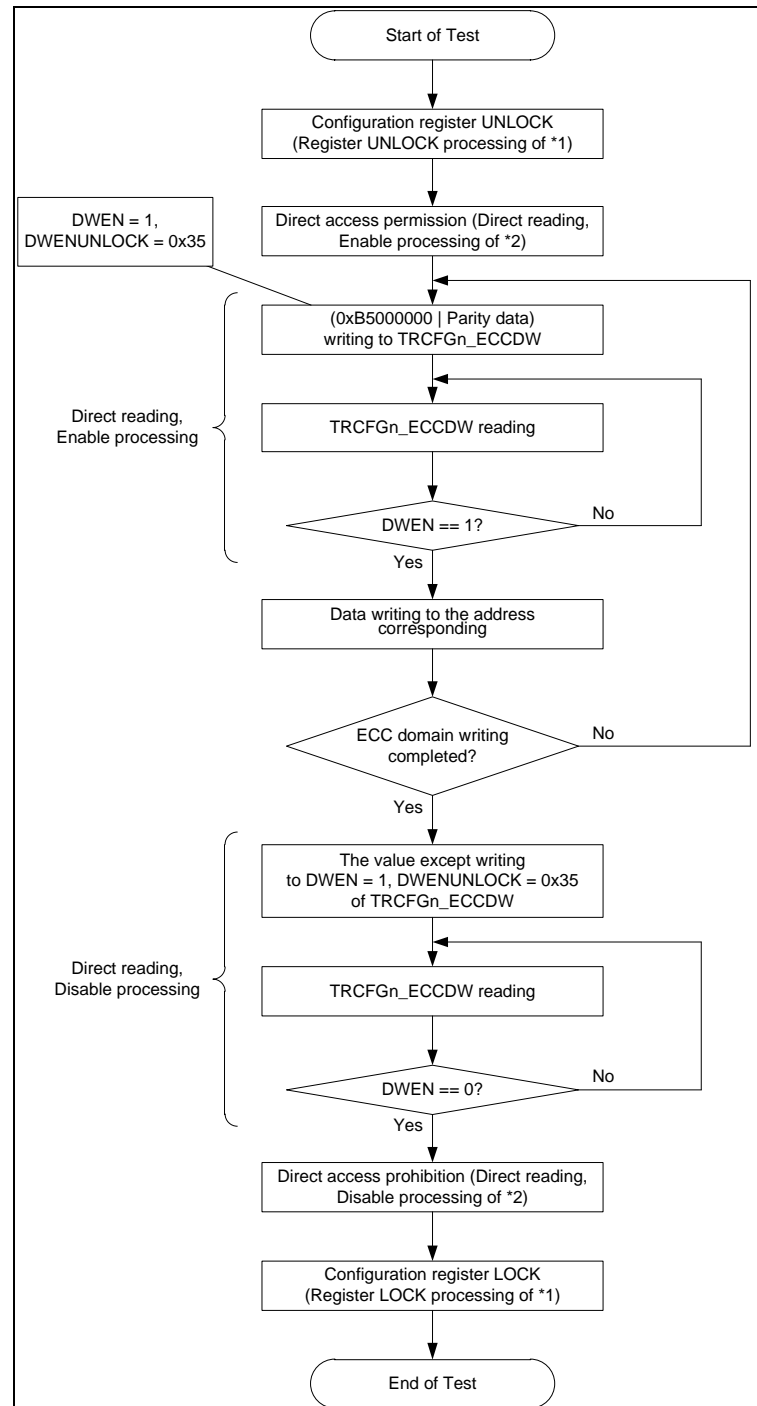

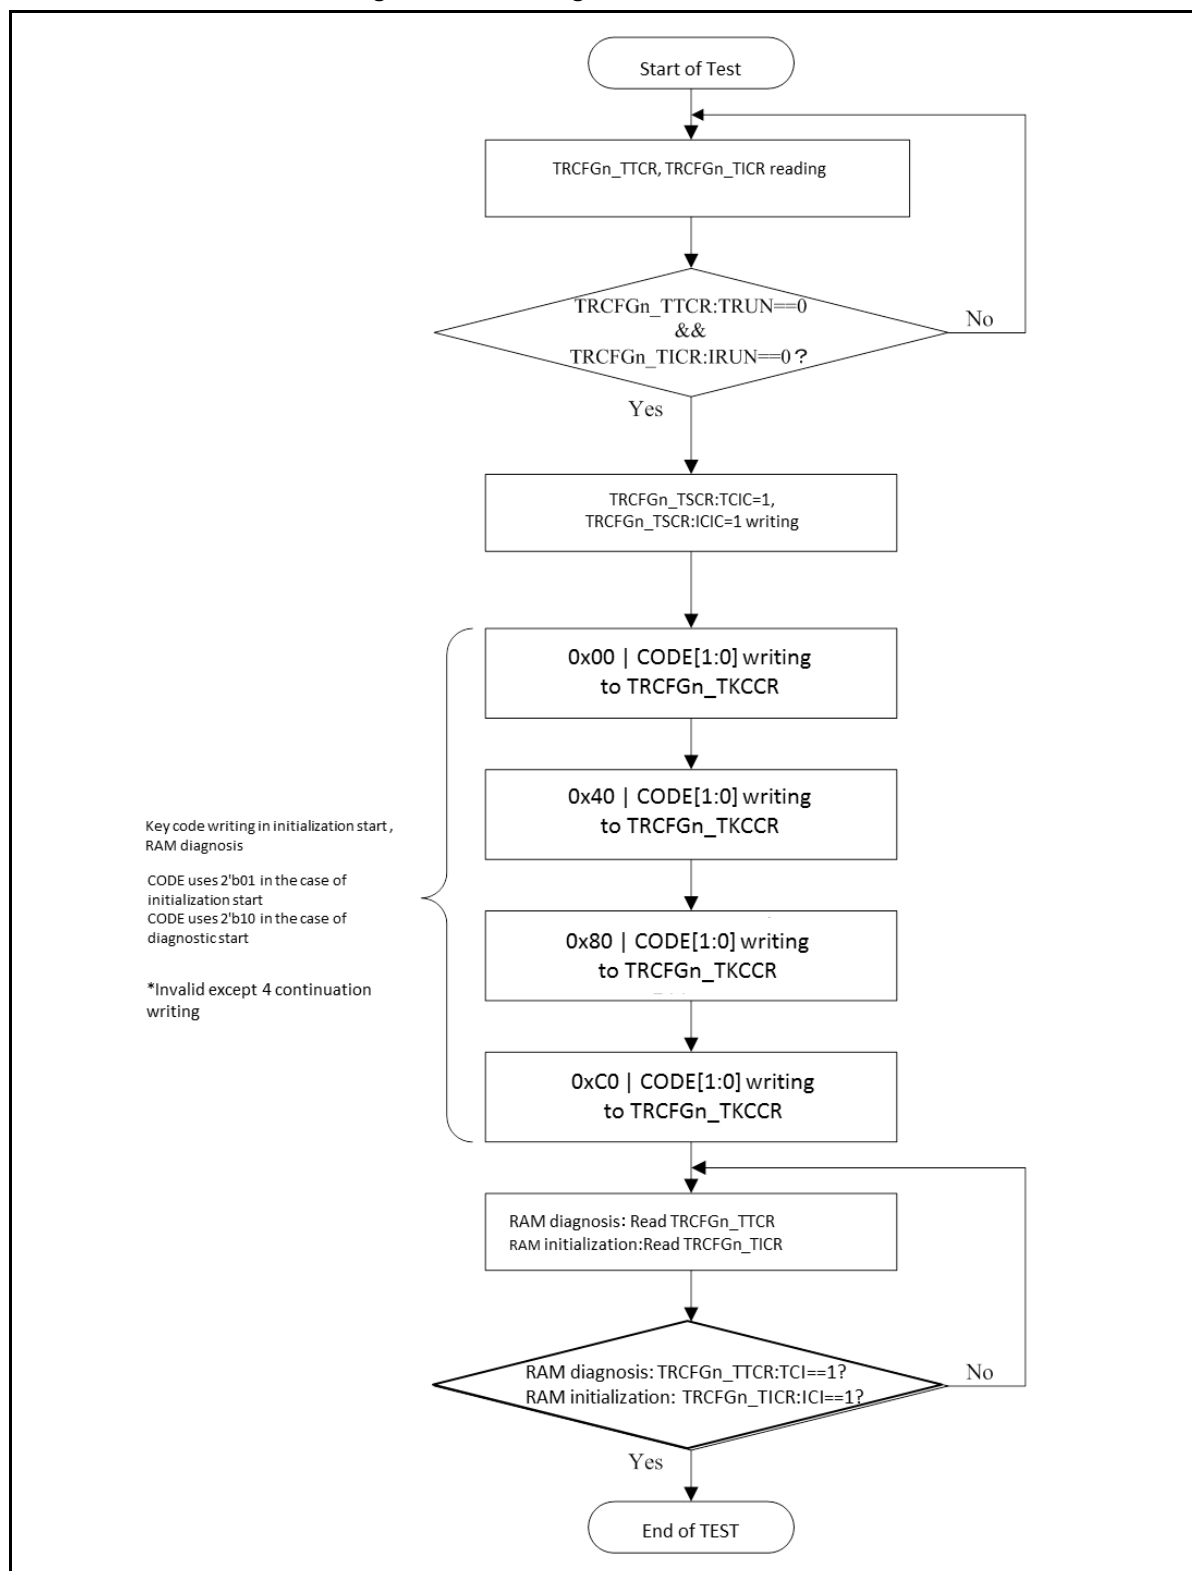

Figure 4-2 Direct Read Access Flow

*1 See Figure 4-1.

Figure 4-3 Direct Write Access Flow

*1 See Figure 4-1.

*2 See Figure 4-2.

Figure 4-4 RAM Diagnosis and Initialization Start Flow

5. Registers

This section provides a list of the TCRAM interface registers.

When you use the B1TCM port, register setting affects both B0TCM and B1TCM.

Table 5-1 List of TCRAM Interface Registers

Abbreviated Register Name	Register Name	Reference
TRCFGn_TCMCFG0	Configuration register 0	5.1
TRCFGn_TCMCFG1	Configuration register 1	5.2
TRCFGn_TCMUNLOCK	Unlock register	5.3
TRCFGn_ECCDEN	ECC direct access enable register	5.4
TRCFGn_ECCDR_PARITY	ECC direct read parity register	5.5
TRCFGn_ECCDR_DATA0	ECC direct read data register 0	5.6
TRCFGn_ECCDR_DATA1	ECC direct read data register 1	5.7
TRCFGn_ECCDW	ECC direct write register	5.8
TRCFGn_TEAR0	TEST error address register 0	5.9
TRCFGn_TEAR1	TEST error address register 1	5.10
TRCFGn_TEAR2	TEST error address register 2	5.11
TRCFGn_TAEAR	TEST end address register	5.12
TRCFGn_TASAR	TEST start address register	5.13
TRCFGn_TFECDR	TEST pseudo error generation control register	5.14
TRCFGn_TICR	TEST initialization function register	5.15
TRCFGn_TTCR	TEST diagnosis function register	5.16
TRCFGn_TSRCR	TEST soft reset generation control register	5.17
TRCFGn_TKCCR	TEST key code control register	5.18
TRCFGn_TSCR	TEST status clear register	5.19

The register memory layout of TCRAM is shown in Table 5-2.

Table 5-2 Register Memory Layout

Offset	Register Name/Initial Value
0x0000_0000	TRCFGn_TCMCFG0 00000000_00000000_00000001_00000000
0x0000_0004	TRCFGn_TCMCFG1 00000000_00000000_00000000_00000000
0x0000_0008	TRCFGn_TCMUNLOCK 00000000_00000000_00000000_00000000
0x0000_000C	Reserved 00000000_00000000_00000000_00000000
0x0000_0010	TRCFGn_ECCDEN 00000000_00000000_00000000_00000000
0x0000_0014	TRCFGn_ECCDR_PARITY 00000000_00000000_00000000_00000000
0x0000_0018	TRCFGn_ECCDR_DATA0 00000000_00000000_00000000_00000000
0x0000_001C	TRCFGn_ECCDR_DATA1 00000000_00000000_00000000_00000000
0x0000_0020	Reserved 00000000_00000000_00000000_00000000
0x0000_0024	TRCFGn_ECCDW 00000000_00000000_00000000_00000000
0x0000_0028	Reserved 00000000_00000000_00000000_00000000
0x0000_002C	Reserved 00000000_00000000_00000000_00000000
0x0000_0030	TRCFGn_TEAR0 00000000_00000000_00000000_00000000
0x0000_0034	TRCFGn_TEAR1 00000000_00000000_00000000_00000000
0x0000_0038	TRCFGn_TEAR2 00000000_00000000_00000000_00000000
0x0000_003C	TRCFGn_TAEAR 01111111_11111111
0x0000_003E	TRCFGn_TASAR 00000000_00000000
0x0000_0040	TRCFGn_TFECR 00000000
0x0000_0041	TRCFGn_TICR 00000000
0x0000_0042	TRCFGn_TTCR 00000000_00001100
0x0000_0044	TRCFGn_TSRCR 00000000

Offset	Register Name/Initial Value
0x0000_0045	TRCFGn_TSCR 00000000
0x0000_0046	Reserved 00000000
0x0000_0047	TRCFGn_TKCCR 00000000
0x0000_0048 to 0x0000_03FF	Reserved

Notes:

- The [bit25:24] bits in TRCFGn_TCMCFG0 may not operate with the above described default number of waits depending on the TCRAM interface clock frequency, the access time of the mounted SRAM, and other conditions.
- If necessary, change the number of waits to the least number of waits that allows operation.

5.1. TCRAM IF Configuration Register 0 (TRCFGn_TCMCFG0)

This register has 7 bits for ERRECC data for the BTCM port, 2 bits for setting the number of waits, and the LOCKSTATUS bit that indicates the locked state or unlocked state of the TCRAM IF configuration register.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	Reserved						DWAIT[1:0]	
R/W Attribute	R0,WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

Bit	bit 23	bit 22	bit 21	bit 20	bit 19	bit 18	bit 17	bit 16
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved							LOCKSTATUS
R/W Attribute	R0,WX							R,WX
Protection Attribute	WPS							
Initial Value	00000000							1

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	Reserved	ERRECC[6:0]						
R/W Attribute	R0,WX	R/W						
Protection Attribute	-	WPS						
Initial Value	0	0000000						

[bit31:26] Reserved: Reserved Bits

[bit25:24] DWAIT: Number of Data Wait Bits

DWAIT	Number of Data Wait Bits
During Write Operation	The number of read waits for the BTCM port (0 to 3) is set.
During Read Operation	The number of read waits for the BTCM port that has been set can be read.

[bit23:9] Reserved: Reserved Bits

[bit8] LOCKSTATUS: Lock Status Bit

LOCKSTATUS	Lock Status Bit
During Write Operation	No effect
During Read Operation	0: The TCRAM interface registers are in the unlocked state. 1: The TCRAM interface registers are in the locked state. (Initial value)

[bit7] Reserved: Reserved Bit
[bit6:0] ERRECC: ECC Data Error Insertion Bits

ERRECC	ECC Data Error Insertion Bits
During Write Operation	The data resulting from the XOR operation of these bits and ECC data read from the SRAM is input to the Cortex-R5F BTCM port. In the case of 64-bit read, data whose higher 7 bits and lower 7 bits are XOR-ed with these bits is input to the BTCM port.
During Read Operation	Set value read

5.2. TCRAM IF Configuration Register 1 (TRCFGn_TCMCFG1)

This register is used to insert an error in data read from the TCRAM for the purpose of testing the ECC function of the Cortex-R5F BTCM port.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 31	bit 0
Field	ERRBIT[31:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] ERRBIT: ECC Error insertion Bits

ERRBIT	ECC Error Insertion Bits
During Write Operation	<p>The data resulting from the XOR operation of these bits and data read from the SRAM is input to the Cortex-R5F BTCM port.</p> <p>In the case of 64-bit read, data whose higher word and lower word are XOR-ed with these bits is input to the BTCM port.</p>
During Read Operation	Set value read

5.3. TCRAM IF Unlock Register (TRCFGn_TCMUNLOCK)

This register locks or unlocks write access to the TCRAM interface registers.

Writing the correct unlock value (0xACC55ECC) to this register enables write access to the registers.

After setting registers, writing the correct lock value (0x5ECCB10C) to this register disables write access to the registers.

You must access this register in units of words, and can access it only with privilege access.

Bit	bit 31	bit 0
Field	UNLOCK[31:0]	
R/W Attribute	R0,W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] UNLOCK: Lock/Unlock Bits

UNLOCK	Lock/Unlock Bit
During Write Operation	<p>Locks and unlocks write accesses to the registers.</p> <p>0xACC55ECC: TRCFGn_TCMCFG0:LOCKSTATUS becomes "0" and write access to the TCRAM interface registers is enabled.</p> <p>0x5ECCB10C: TRCFGn_TCMCFG0:LOCKSTATUS becomes "1" and write access to the TCRAM interface registers is disabled.</p> <p>Other values: An error is generated.</p> <p>For details on the register setting procedure, see Figure 4-1.</p>
During Read Operation	"0" is always read.

5.4. TCRAM IF ECC Direct Access Enable Register (TRCFGn_ECCDEN)

This register enables/disables the direct access function for testing the TCRAM ECC area.

Also, it can set the unlock bits for the direct access enable/disable bit for preventing incorrect writing.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	bit 23	bit 22	bit 21	bit 20	bit 19	bit 18	bit 17	bit 16
Field	DEN	DENUNLOCK[6:0]						
R/W Attribute	R,W	R0,W						
Protection Attribute	WPS							
Initial Value	0	0000000						

Bit	bit 15	bit 0
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

[bit31:24] Reserved: Reserved Bits

[bit23] DEN: Direct Access Enable

DEN	Direct Access Enable Bit
During Write Operation	0: Disable direct access. 1: Enable direct access when this bit and the DENUNLOCK bits make up the value of 0b10011110. With a value other than the above, direct access is disabled. For the detailed setting procedure of these bits, see Figure 4-2.
During Read Operation	0: Direct access has not been enabled. 1: Direct access has been enabled.

[bit22:16] DENUNLOCK: Direct Access Enable Unlock

DENUNLOCK	Direct Access Enable Unlock Bits
During Write Operation	0b00111110: Enables direct access when the direct access enable bit (DEN) is set to "1" at the same time. When DEN is "0", direct access is disabled. A value other than 0b00111110: The direct access enable bit becomes "0".
During Read Operation	"0" is always read.

[bit15:0] Reserved: Reserved Bits

5.5. TCRAM IF ECC Direct Read Parity Register (TRCFGn_ECCDR_PARITY)

This register includes the ECCDR_PARITY bits, which display ECC data that is read when direct access is enabled.

The displayed ECC data is the value that is read by the last read access.

Bit	bit 31	bit 16
Field	Reserved	
R/W Attribute	R0,WX	
Protection Attribute	-	
Initial Value	00000000_00000000	

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved		ECCDR_PARITY[13:8]					
R/W Attribute	R0,WX		R,WX					
Protection Attribute			-					
Initial Value	00		000000					

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	ECCDR_PARITY[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit31:14] Reserved: Reserved Bits

[bit13:0] ECCDR_PARITY: Direct Read Parity Data

ECCDR_PARITY	Direct Read Parity Data Bits
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	Displays the ECC data that is last read while the TRCFGn_ECCDEN: DEN bit is set. When the ECC error insertion function is enabled (TRCFGn_TCMCFG0:ERRECC is not "0"), the ECC data modified with TRCFGn_TCMCFG0:ERRECC is captured. This register is updated at B0TCM read or B1TCM read.

5.6. TCRAM IF ECC Direct Read Data Register 0 (TRCFGn_ECCDR_DATA0)

This register displays data [31:0] that is read when direct access is enabled.

The displayed data is the value that is read by the last read access.

Bit	bit 31	bit 0
Field	ECCDR_DATA0[31:0]	
R/W Attribute	R,WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] ECCDR_DATA0: Direct Read Data 0

ECCDR_DATA0	Direct Read Data 0 Bits
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	Displays the data [31:0] that is last read while the TRCFGn_ECCDEN:DEN bit is set. When the ECC error insertion function is enabled (TRCFGn_TCMCFG1 is not "0"), the data [31:0] modified with TRCFGn_TCMCFG1 is captured. This register is updated at B0TCM read or B1TCM read.

5.7. TCRAM IF ECC Direct Read Data Register 1 (TRCFGn_ECCDR_DATA1)

This register displays data [63:32] that is read when direct access is enabled.

The displayed data is the value that is read by the last read access.

Bit	bit 31	bit 0
Field	ECCDR_DATA1[31:0]	
R/W Attribute	R,WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] ECCDR_DATA1: Direct Read Data 1

ECCDR_DATA1	Direct Read Data 1 Bits
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	Displays the data [63:32] that is last read while the TRCFGn_ECCDEN: DEN bit is set. When the ECC error insertion function is enabled (TRCFGn_TCMCFG1 is not "0"), the data [63:32] modified with TRCFGn_TCMCFG1 is captured. This register is updated at B0TCM read or B1TCM read.

5.8. TCRAM IF ECC Direct Write Register (TRCFGn_ECCDW)

This register has a direct write access enable bit, direct write access enable unlock bits, and direct write ECC data bits.

To enable the direct write access enable bit, you must write "1" in the DWEN bit and the unlock value in the DWENUNLOCK bits when TRCFGn_ECCDEN.DEN is "1".

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	DWEN	DWENUNLOCK[6:0]						
R/W Attribute	R,W	R0,W						
Protection Attribute	WPS							
Initial Value	0	0000000						

Bit	bit 23	bit 22	bit 21	bit 20	bit 19	bit 18	bit 17	bit 16
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	WPS							
Initial Value	00000000							

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved		ECCDW_PARITY[13:8]					
R/W Attribute	R0,WX		R/W					
Protection Attribute	WPS							
Initial Value	00		000000					

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	ECCDW_PARITY[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31] DWEN: Direct Write Access Enable

DWEN	Direct Write Access Enable Bit
During Write Operation	0: Disable direct write access. 1: Enable direct write access when this bit and the DWENUNLOCK bits make up the value of 0b10110101. With a value other than the above, direct write access is disabled. For the detailed setting procedure of these bits, see Figure 4-3.
During Read Operation	0: Direct write access has not been enabled. 1: Direct write access has been enabled.

[bit30:24] DWENUNLOCK: Direct Write Access Enable Unlock

DWEN UNLOCK	Direct Write Access Enable Unlock Bits
During Write Operation	0b0110101: Enable direct write access (DWEN = 1) when the direct access enable bit (DWEN) is set to "1" at the same time. When DWEN is "0", direct write access is disabled. A value other than 0b0110101: The direct write access enable bit is "0".
During Read Operation	"0" is read.

[bit23:14] Reserved: Reserved Bits**[bit13:0] ECCDW_PARITY: Direct Write Parity Data**

ECCDW_ PARITY	Direct Write Parity Data Bits
During Write Operation	Write the value you want to set in the ECC area of the SRAM. When the DWEN bit is "1", the value of these bits is written in the ECC area of the SRAM instead of the ECC data that is calculated by the BTCM. These bits are used for write access of both B0TCM and B1TCM.
During Read Operation	Reads the value set in these bits.

5.9. TCRAM IF TEST Error Address Register 0 (TRCFGn_TEAR0)

This register holds the address for when an error occurs during RAM diagnosis.

Also, this register holds the source flag indicating the diagnosis pattern that has caused this error.

Bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	TER[2:0]			Reserved				
R/W Attribute	R,WX			R0,WX				
Protection Attribute	-							
Initial Value	000			00000				

Bit	bit 23	bit 22	bit 21	bit 20	bit 19	bit 18	bit 17	bit 16
Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	-							
Initial Value	00000000							

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved	ERR_ADDR[14:8]						
R/W Attribute	R0,WX	R,WX						
Protection Attribute	-							
Initial Value	0	0000000						

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	ERR_ADDR[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit31:29]TER: Diagnosis Error Source identification

TER	Diagnosis Error Source Identification Bits
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	<p>Holds the diagnosis pattern when an error occurs during RAM diagnosis. ERR_ADDR[14:0] is effective only when any of these bits is set to "1".</p> <p>0b001: Error occurred in the march diagnosis 0b010: Error occurred in the checker diagnosis 0b100: Error occurred in the unique diagnosis 0b000: No error occurred</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to 0b000) these bits.</p>

[bit28:15] Reserved: Reserved Bits
[bit14:0] ERR_ADDR: Error Occurrence Address

ERR_ADDR	Error Occurrence Address Bit
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	Holds the address when an error occurs during RAM diagnosis. These bits indicate a valid value only when TER is not 0b000. Triggered by the specification of RAM diagnosis start, the hardware initializes these bits (clears them to 0b0000000_00000000).

Notes:

- When any of the TER bits becomes "1", even if an error occurs during another diagnosis item, the corresponding error source bit does not become "1".
- ERR_ADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {ERR_ADDR << 2} to the base address.

5.10. TCRAM IF TEST Error Address Register 1 (TRCFGn_TEAR1)

This register holds the address for when an error occurs during RAM diagnosis at an address that is different from the one held in TRCFGn_TEAR0.

Also, this register holds the source flag indicating the diagnosis pattern that has caused this error.

Bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	TER[2:0]			Reserved				
R/W Attribute	R,WX			R0,WX				
Protection Attribute	-

Field	Reserved							
R/W Attribute	R0,WX							
Protection Attribute	-							
Initial Value	00000000							

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved	ERR_ADDR[14:8]						
R/W Attribute	R0,WX	R,WX						
Protection Attribute	-							
Initial Value	0	0000000						

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	ERR_ADDR[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit31:29]TER: Diagnosis Error Source identification

TER	Diagnosis Error Source Identification Bits
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	<p>Holds the diagnosis pattern when an error occurs during RAM diagnosis. ERR_ADDR[14:0] is effective only when any of these bits is set to "1".</p> <p>0b001: Error occurred in the march diagnosis 0b010: Error occurred in the checker diagnosis 0b100: Error occurred in the unique diagnosis 0b000: No error occurred</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to 0b000) these bits.</p> <p>Note: When any of these bits becomes "1", even if an error occurs during another diagnosis item, the corresponding error source bit does not become "1".</p>

[bit28:15] Reserved: Reserved Bits

[bit14:0] ERR_ADDR: Error Occurrence Address

ERR_ADDR	Error Occurrence Address Bit
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	<p>Holds the address when an error occurs during RAM diagnosis. These bits are effective only when TER is not 0b000.</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to 0b00000000_00000000) these bits.</p>

Notes:

- When any of the TER bits becomes "1", even if an error occurs during another diagnosis item, the corresponding error source bit does not become "1".
- ERR_ADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {ERR_ADDR << 2} to the base address.

5.11. TCRAM IF TEST Error Address Register 2 (TRCFGn_TEAR2)

This register holds the address for when an error occurs during RAM diagnosis at an address that is different from the one held in TRCFGn_TEAR0 and TRCFGn_TEAR1.

Also, this register holds the source flag indicating the diagnosis pattern that has caused this error.

Bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	TER[2:0]			Reserved

R/W Attribute	R,WX							
Protection Attribute	-							
Initial Value	00000000							

[bit31:29]TER: Diagnosis Error Source identification

TER	Diagnosis Error Source Identification Bits
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	<p>Holds the diagnosis pattern when an error occurs during RAM diagnosis. ERR_ADDR[14:0] is effective only when any of these bits is set to "1".</p> <p>0b001: Error occurred in the march diagnosis 0b010: Error occurred in the checker diagnosis 0b100: Error occurred in the unique diagnosis 0b000: No error occurred</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to 0b000) these bits.</p> <p>Note: When any of these bits becomes "1", even if an error occurs during another diagnosis item, the corresponding error source bit does not become "1".</p>

[bit28:15] Reserved: Reserved Bits

[bit14:0] ERR_ADDR: Error Occurrence Address

ERR_ADDR	Error Occurrence Address Bit
During Write Operation	Writing data to these bits causes a bus error.
During Read Operation	<p>Holds the address when an error occurs during RAM diagnosis. These bits are effective only when TER is not 0b000.</p> <p>A RAM diagnosis start instruction triggers the hardware to initialize (clear to 0b0b0000000_00000000) these bits.</p>

Notes:

- When any of the TER bits becomes "1", even if an error occurs during another diagnosis item, the corresponding error source bit does not become "1".
- ERR_ADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {ERR_ADDR << 2} to the base address.

5.12. TCRAM IF TEST End Address Register (TRCFGn_TAEAR)

This register specifies the end address for performing RAM diagnosis or initialization.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved	EADDR[14:8]						
R/W Attribute	R0,WX	R/W						
Protection Attribute	WPS							
Initial Value	0	1111111						

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	EADDR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	11111111							

[bit15] Reserved: Reserved Bit

[bit14:0] EADDR: RAM Diagnosis End Address

EADDR	RAM Diagnosis End Address Bits
During Write Operation	You can set an address at which RAM diagnosis or initialization operation ends. A word address of the RAM is set.
During Read Operation	You can read the address at which specified RAM diagnosis or initialization operation ends.

Notes:

- EADDR is an offset in word units (RAM address).
- Obtain the absolute address by adding {EADDR << 2} to the base address.

5.13. TCRAM IF TEST Start Address Register (TRCFGn_TASAR)

This register specifies the start address for performing RAM diagnosis or initialization.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved	SADDR[14:8]						
R/W Attribute	R0,WX	R/W						
Protection Attribute	WPS							
Initial Value	0	0000000						

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	SADDR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit15] Reserved: Reserved Bit

[bit14:0] SADDR: RAM Diagnosis Start Address

SADDR	RAM Diagnosis Start Address Bits
During Write Operation	You can set an address at which RAM diagnosis or initialization operation starts. A word address of the RAM is set.
During Read Operation	You can read the address at which specified RAM diagnosis or initialization operation starts.

Notes:

- SADDR is an offset address in units of words (RAM address).
- To calculate the absolute address, add {SADDR << 2} to the base address.

5.14. TCRAM IF TEST Pseudo Error Generation Control Register (TRCFGn_TFECR)

This register specifies the RAM diagnosis operation in which a pseudo error is to be generated.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	Reserved				FERR	ETYP[2:0]		
R/W Attribute	R0,WX				R/W	R/W		
Protection Attribute	WPS							
Initial Value	0000				0	000		

[bit7:4] Reserved: Reserved Bits

[bit3]FERR: RAM Diagnosis Pseudo-Error Generation Enable

FERR	RAM Diagnosis Pseudo-Error Generation Enable Bit
During Write Operation	0: Disable generation of pseudo-errors. (Normal operation) 1: Enable generation of pseudo-errors. Erroneous data is deliberately written in accordance with the ETYP setting.
During Read Operation	The enable/disable setting for generation of pseudo-errors can be read.

[bit2:0] ETYP: Pseudo-Error Generation Processing Specification

ETYP	Pseudo-Error Generation Processing Specification Bits
During Write Operation	0bxx1: Generate pseudo-errors during march diagnosis. 0bx1x: Generate pseudo-errors during checker diagnosis. 0b1xx: Generate pseudo-errors during unique diagnosis. 0b000: Generate no pseudo error.
During Read Operation	This register can read the setting value for the diagnosis in which the pseudo-error is generated.

5.15. TCRAM IF TEST Initialization Function Register (TRCFGn_TICR)

This register specifies contents of RAM initialization, and holds the result and state of the initialization.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	Reserved				ICIE	ICI	ITYP	IRUN
R/W Attribute	R0,WX				R/W	R,WX	R/W	R,WX
Protection Attribute	WPS							
Initial Value	0000				0	0	0	0

[bit7:4] Reserved: Reserved Bits

[bit3] ICIE: RAM Initialization End Source Interrupt Enable

ICIE	RAM Initialization End Source Interrupt Enable Bit
During Write Operation	0: Disable interrupts triggered by RAM initialization end. 1: Enable interrupts triggered by RAM initialization end.
During Read Operation	You can read the setting for enabling or disabling the initialization end source interrupt.

[bit2] ICI: RAM Initialization Completion

ICI	RAM Initialization End Bit
During Write Operation	No effect
During Read Operation	0: Initialization has not been completed or has not been started. 1: RAM initialization has been completed. This bit is not set for forcible stop by the key code.

[bit1] ITYP: RAM Initialization Contents Specification

ITYP	RAM Initialization Contents Specification Bit
During Write Operation	0: Initialize with all "0's". 1: Initialize with all "1's".
During Read Operation	You can read the setting of the initialization contents specification.

[bit0] IRUN: RAM Initialization Operation Status

IRUN	RAM Initialization Operation Status Bit
During Write Operation	No effect
During Read Operation	0: Initialization is not in progress. 1: Initialization is in progress.

5.16. TCRAM IF TEST Diagnosis Function Register (TRCFGn_TTCR)

This register specifies the contents of RAM diagnosis, and holds the result and state of the diagnosis.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
Field	Reserved						TSTAT	OVFLW
R/W Attribute	R0,WX						R,WX	R,WX
Protection Attribute	WPS							
Initial Value	000000						0	0

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	TEIE	TEI	TCIE	TCI	TTYP		TRUN	
R/W Attribute	R/W	R,WX	R/W	R,WX	R/W		R,WX	
Protection Attribute	WPS							
Initial Value	0	0	0	0	110		0	

[bit15:10] Reserved: Reserved Bits

[bit9] TSTAT: RAM Diagnosis Error Detection

TSTAT	RAM Diagnosis Error Detection Bit
During Write Operation	No effect
During Read Operation	0: No error has been detected in RAM diagnosis. 1: An error has been detected in RAM diagnosis. A RAM diagnosis start instruction triggers the hardware to initialize (clear to "0") this bit.

[bit8] OVFLW: RAM Diagnosis Error Overflow

OVFLW	RAM Diagnosis Error Overflow Bit
During Write Operation	No effect
During Read Operation	0: RAM diagnosis errors have occurred at 3 addresses or less. 1: RAM diagnosis errors have occurred at 4 addresses or more. A RAM diagnosis start instruction triggers the hardware to initialize (clear to "0") this bit.

[bit7] TEIE: Enable Error Occurrence Interrupt during Diagnosis

TEIE	Diagnosis-Time Error Generation Interrupt Enable Bit
During Write Operation	0: Disable interrupts triggered by RAM diagnosis errors. 1: Enable interrupts triggered by RAM diagnosis errors. When TRCFGn_TTCR:TEI is "1", "H" is output to the interrupt signal.
During Read Operation	You can read the setting for enabling or disabling the error interrupts during diagnosis.

[bit6] TEI: Diagnosis-Time Error Generation

TEI	Diagnosis-Time Error Generation Bit
During Write Operation	No effect
During Read Operation	0: TRCFGn_TTCR:TSTAT = 0 when RAM diagnosis ends. 1: TRCFGn_TTCR:TSTAT = 1 when RAM diagnosis ends.

[bit5] TCIE: Diagnosis End Source Interrupt Enable

TCIE	Diagnosis End Source Interrupt Enable Bit
During Write Operation	0: Disable interrupts triggered by RAM diagnosis end. 1: Enable interrupts triggered by RAM diagnosis end. When TRCFGn_TTCR:TCI is "1", "H" is output to the interrupt signal.
During Read Operation	You can read the setting for enabling or disabling the diagnosis end source interrupt.

[bit4] TCI: Diagnosis End

TCI	Diagnosis End Bit
During Write Operation	No effect
During Read Operation	0: The diagnosis has not completed or has been stopped. 1: RAM diagnosis has been completed. This bit is not set for forcible stop by the key code.

[bit3:1] TTYP: RAM Diagnosis Contents Specification

TTYP	RAM Diagnosis Contents Specification Bits
During Write Operation	0bxx1: Perform march diagnosis. 0bxx0: Do not perform march diagnosis. 0bx1x: Perform checker diagnosis. 0bx0x: Do not perform checker diagnosis. 0b1xx: Perform unique diagnosis. 0b0xx: Do not perform unique diagnosis. RAM diagnoses are performed in the following order. Unique diagnosis (The address itself is used as the data.) Checker diagnosis March diagnosis (all "0" and then all "1")
During Read Operation	You can read the set value for the types to be executed in RAM diagnosis.

[bit0] TRUN: RAM Diagnosis Operation Status

TRUN	RAM Diagnosis Operation Status Bit
During Write Operation	No effect
During Read Operation	0: RAM diagnosis is not in progress. 1: RAM diagnosis is in progress.

Note:

- Be sure to make the setting for this register before starting RAM diagnosis.

5.17. TCRAM IF TEST Soft Reset Generation Control Register (TRCFGn_TSRCR)

This register resets the entire circuit related to RAM diagnosis except this register itself.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	SRST	Reserved						
R/W Attribute	R0,W	R0,WX						
Protection Attribute	WPS							
Initial Value	0	0000000						

[bit7] SRST: Software Reset

SRST	Software Reset Bit
During Write Operation	0: No effect 1: Reset all circuits that are related to RAM diagnosis except for this register.
During Read Operation	"0" is always read.

[bit6:0] Reserved: Reserved Bits

5.18. TCRAM IF TEST Key Code Control Register (TRCFGn_TKCCR)

This register is used to start or to forcibly stop RAM diagnosis or initialization.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	KEY[1:0]		Reserved				CODE[1:0]	
R/W Attribute	R0,W		R0,WX				R/W	
Protection Attribute	WPS							
Initial Value	00		0000				00	

[bit7:6] KEY: Key Code Control

KEY	Key Code Control Bits
During Write Operation	<p>These bits control the key code.</p> <p>The operation specified in the CODE bits is performed by writing in the order of 0b00, 0b01, 0b10, and 0b11.</p> <p>In addition, if you have accessed another RAMTEST (TRCFGn_TEAR0, TRCFGn_TEAR1, TRCFGn_TEAR2, TRCFGn_TAEAR, TRCFGn_TASAR, TRCFGn_TFECR, TRCFGn_TICR, TRCFGn_TTCR, TRCFGn_TSRCR, TRCFGn_TSCR) register or have performed an operation other than that described above (read operation or a series of write operations other than the above) during key code operation, start the operation over again.</p> <p>For the detailed setting procedure of these bits, see Figure 4-4.</p>
During Read Operation	"0" is always read.

[bit5:2] Reserved: Reserved Bits

[bit1:0] CODE: Operation Specification

CODE	Operation Specification Bits
During Write Operation	<p>0b00: Forcibly terminate</p> <p>0b01: Activate initialization</p> <p>0b10: Activate diagnosis</p> <p>0b11: Setting prohibited</p>
During Read Operation	The set value of operation specification can be read.

Notes:

- During KEY bits operation, set the same value in the CODE bits.
- Setting the value 0b11 to the CODE bits is prohibited

5.19. TCRAM IF TEST Status Clear Register (TRCFGn_TSCR)

This register is used to clear the RAM diagnosis and initialization status bits.

You can perform the write operation for this register only when privilege access is possible and TRCFGn_TCMCFG0:LOCKSTATUS is "0".

Bit	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Field	Reserved	TEIC	Reserved	TCIC	Reserved	ICIC	Reserved	
R/W Attribute	R0,WX	R0,W	R0,WX	R0,W	R0,WX	R0,W	R0,WX	
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	00	

[bit7] Reserved: Reserved Bit

[bit6] TEIC: Diagnosis-Time Error Generation Clear

TEIC	Diagnosis-Time Error Generation Clear Bit
During Write Operation	0: No effect 1: Clear the TRCFGn_TTCR:TEI bit.
During Read Operation	"0" is always read.

[bit5] Reserved: Reserved Bit

[bit4] TCIC: Diagnosis End Clear

TCIC	Diagnosis End Clear Bit
During Write Operation	0: No effect 1: Clear the TRCFGn_TTCR:TCI bit.
During Read Operation	"0" is always read.

[bit3] Reserved: Reserved Bit

[bit2] ICIC: RAM Initialization End Clear

ICIC	RAM Initialization End Clear Bit
During Write Operation	0: No effect 1: Clear the TRCFGn_TTCR:ICI bit.
During Read Operation	"0" is always read.

[bit1:0] Reserved: Reserved Bits

CHAPTER 17: TCFLASH

This chapter explains the functions and operations of TCFLASH.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Examples
5. Registers
6. Others
7. Support for Dual Port Flash Macro

TCFLASH-TXXPT03P01R02L07-E1-XX

1. Overview

This section explains the overview of TCFLASH.

Overview of TCFLASH

- TCFLASH is a flash memory to mainly store programs. If this LSI is in user mode, it is mapped to 2 regions, the TCM region and the AXI region. If accessed via the TCM region, TCFLASH is treated as an L1 memory on the ARM(R) architecture. Therefore, non-cacheable and low-latency access is possible. If TCFLASH is accessed via the AXI region, it is treated as an L2 memory in the context of ARM architecture.
- TCFLASH can be extended to up to 16 MB, logically. However, only 8 MB of it can be accessed via the TCM region. If it is accessed via the AXI region, 16 MB of the entire region can be accessed.
- Programming or erasing in TCFLASH is performed if a program sequence is sent when it is accessed via the AXI region. Programming or erasing in TCFLASH cannot be performed when it is accessed via the TCM region.
- Programming with access via the AXI region has the highest priority in TCFLASH. With the default setting, reading priority is toggled between access via the AXI region and access via the TCM region every 16 accesses.
- In TCFLASH, set priority to allow reading with access via the TCM region. However, reading has lower priority than programming.
- Data can be read from the CPU in units of 8 bits/16 bits/32 bits/64 bits.
- If ECC is enabled, programming from the CPU is possible only in 16/32-bit. If ECC is disabled, programming from the CPU is possible in 8-/16-/32-bit.
- Non-aligned read for the access size is supported. However, non-aligned programming for the access size is not supported. If non-aligned programming for the access size is detected, TCFLASH responds by issuing a bus error.
- Wait cycle count that is inserted during data access can be specified.
- Flash memory reads data with a width (product specification) times as wide as 64 bits. If there are consecutive addresses, 64-bit data can be used with a frequency (product specification) times as high as the flash clock frequency.
- The TCM has (product specification) buffers to reduce penalties for non-consecutive addresses resulting from branch instructions or the like.
- ECC is supported with the same calculation formula as that for the ARM Cortex(TM)-R5F core, realizing 1-bit error correction and 2-bit error detection.
- The ECC check for reading via the TCM region is performed with logic in the ARM Cortex-R5F core.
- ECC logic check can be performed by inserting an error. Error injection is valid for both reading via the TCM region and reading via the AXI region.
- Register setting values are protected using a protection key.
- Programming and erasing are possible only when access is in privileged mode.
- The flash security function is implemented. For details, see the security specifications.
- Bus error response is sent when access is to the reserved area or detect 1-bit ECC error via TCM region(*1).
 *1:Partially ECC supported. For more detail, See " CHAPTER17, 6. Others, 1-bit ECC error is detected".
- The flash security function enables the function for protection from programming and erasing in sector units.
- Parallel programmer provides the function for reading, programing, and erasing data in flash memory.
- ECC support for the AXI ports for FLASH 1-bit error correction and 2-bit error detection (SEC-DED).

- ECC support for the TCM ports for FLASH 1-bit error detection(*1) and 2-bit error detection (SED-DED) at default setting.

*1 For more detail, See "CHAPTER17, 6. Others, 1-bit ECC error is detected"

2. Configuration

This section explains the configuration within TCFLASH.

2.1. Block Diagrams

- There is 1 TCFLASH per 1 Cortex-R5F core.
- When Cortex-R5F core accesses via the TCM region, TCFLASH is handled as a read-only L1 memory. On the other hand, when Cortex-R5F core accesses via the AXI region, TCFLASH is handled as an L2 memory that can both write and read.

Figure 2-1 Position of TCFLASH

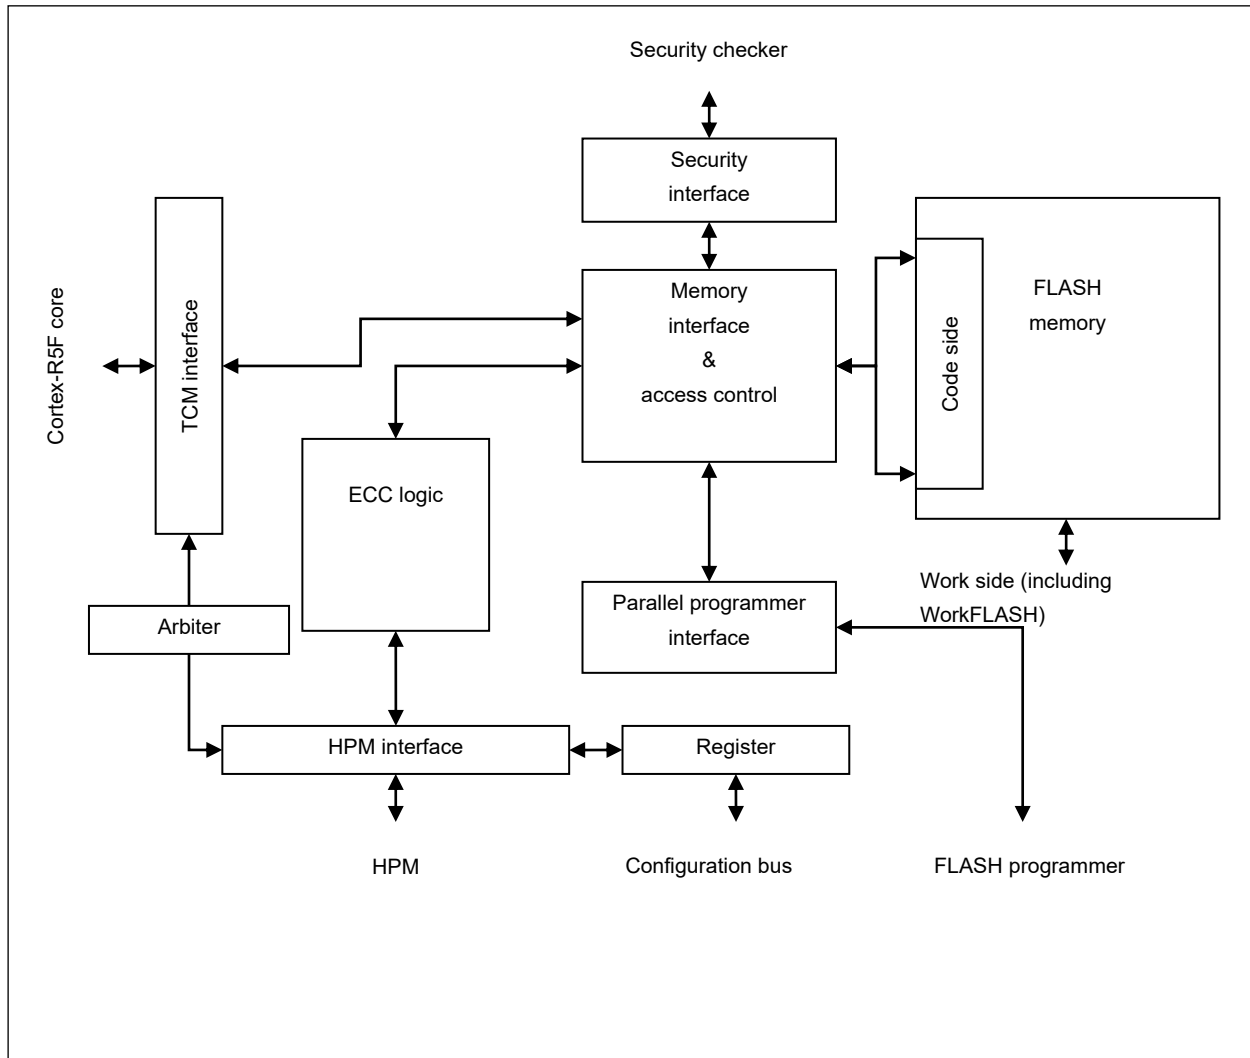

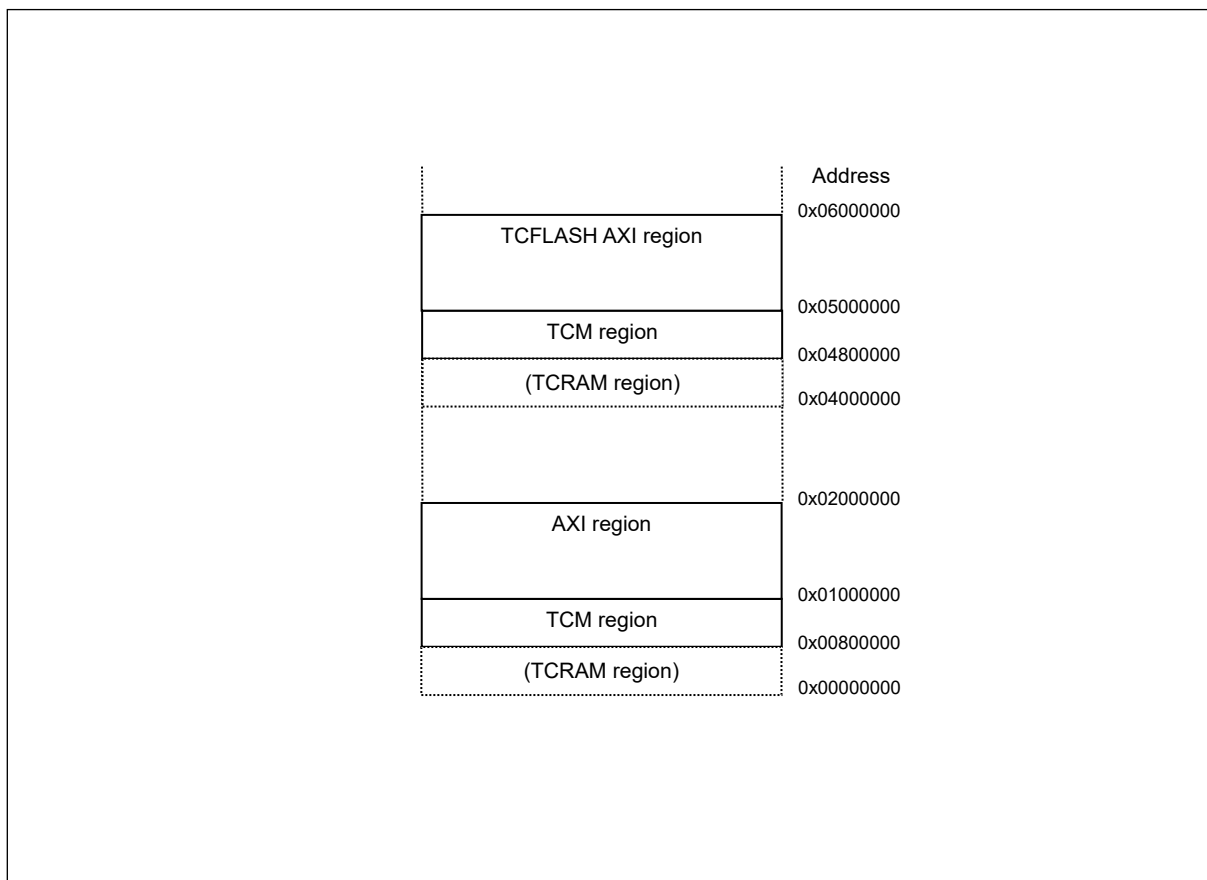

Figure 2-2 Configuration of TCFLASH

2.2. Address/Sector Map of TCFLASH

A TCFLASH exists for CPU core and is placed on the memory map by the program as shown in Figure 2-3.

Figure 2-3 Position of TCFLASH on the Memory Map

The size of the TCM region for each TCFLASH is 8 MB. The size of the AXI region is 16 MB. The sector placement for the respective region is shown in Figure 2-4 and Figure 2-5.

Figure 2-4 Address/Sector Map of TCFLASH

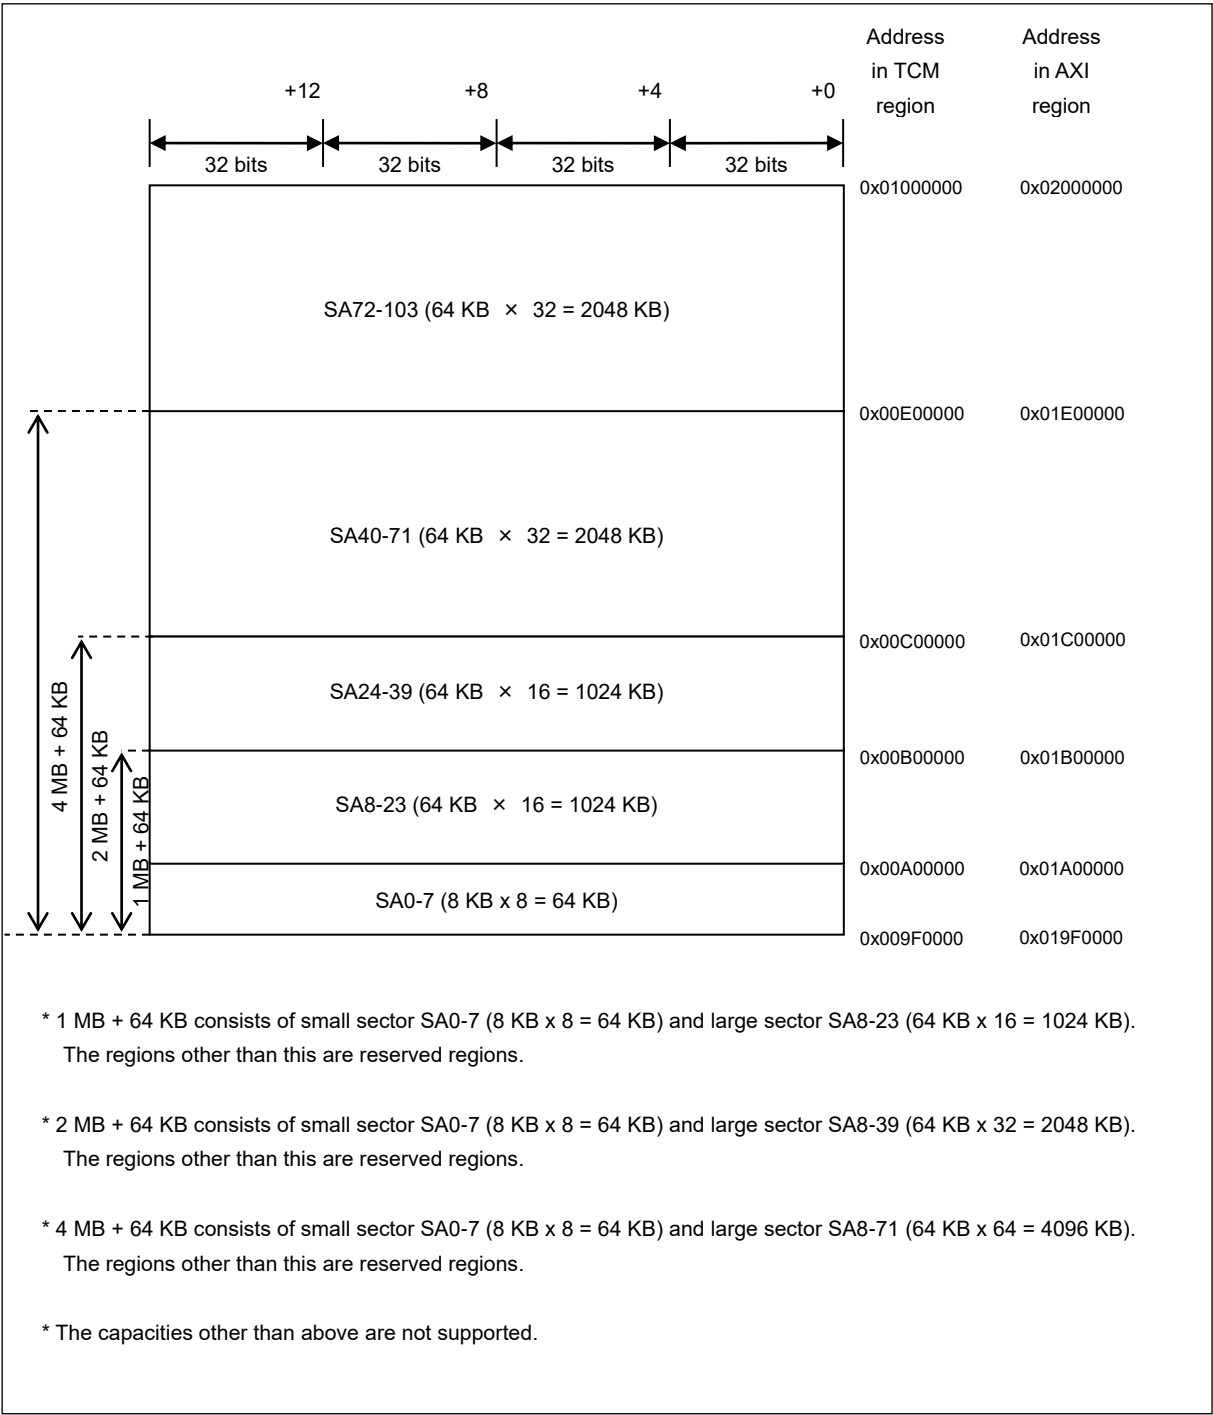

Figure 2-5 TCFLASH Address Map for Multiple Flash Memories

	Address Within TCM Region	Address With AXI Region		Address Within TCM Region	Address With AXI Region

3. Explanation of Operation

This section explains the operation of TCFLASH.

3.1. Operation Mode of TCFLASH

If this LSI is in user mode, the CPU or other bus master can access TCFLASH. A Cortex-R5F core can access TCFLASH that is connected to itself, via the TCM interface or via AXI. It can access TCFLASH that is connected to another Cortex-R5F core, via AXI Bus masters (non-Cortex-R5F core) such as DMAC can access TCFLASH via AXI.

In user mode, programming or erasing in TCFLASH via AXI interface can be performed. However, programming or erasing via the TCM interface cannot be performed. Programming and erasing are performed by executing a program access sequence to start an automatic algorithm. ECC is generated in programming by using the TCFLASH interface. (*1)

In the serial writer mode or the parallel writer mode, the Flash can be read/programmed/erased according to security setting.*1: Do not perform the read operation via the TCM interface if you have run the program access sequence via AXI. Otherwise, a bus error occurs and an undefined value is output.

3.2. Programming and Erasing

If this LSI is in user mode, programming and erasing in TCFLASH are performed by writing the programming access sequence in the flash memory via the AXI region.

- For the programming access sequence, see "3.5.1 Command Sequence." For the programming procedure, see "4.4 Programming Procedure." For macro erase in non-user mode, restriction of the erasing order exists. For details on the sequence, see the security specifications.
- Overwriting of the same data bit is prohibited. (Even overwriting of 1 -> 0, 0 -> 0, 1 -> 1 is also prohibited.)
- If ECC is enabled, only programming in 16-/32-bit is possible. If ECC is disabled, programming in 8-/16 -/32-bit is possible.
- After erase operation is completed, all the values of the flash memory cells in the target sectors are "1".

If this LSI is in parallel programmer mode or serial programmer mode, and if the flash security is turned on, programming or erasing in TCFLASH is restricted as described in the security specifications. To remove the restriction, you must set the flash security to "off". For the procedure for this setting, see CHAPTER: Security.

3.3. TCM Buffer

This section explains the TCM buffer which allows efficient access from the TCM.

When TCFLASH is accessed from the TCM, the TCM buffers allow the access time to be reduced. The previous flash memory read data and its address are stored in the TCM buffer. If data accessed later matches the address of TCM buffer, the data is read directly from TCM buffer. Compared to FLASH macro, access with high throughput and low latency is possible. (product specification) buffers are assembled.

A single buffer consists of the following.

- Buffer enable bit (TCFCFG_TCMBUF0 to 15 :BVALID)
- Buffered address (TCFCFG_TCMBUF0 to 15 :BUFADD[31:0])
- Buffered data (TCFCFG_TCMBUF0 to 15 :BUFDATA[127:0])
- Buffered parity (TCFCFG_TCMBUF0 to 15 :ECC_PARITY[15:0])

Only one region can be set. The following can be set:

- Enable/Disable setting (TCFCFG_BRAT :RGEN)
- Buffer number of region (TCFCFG_BRCFG :REGION_END_BUF[15:0]): 0 to 15 can be set.
- Range of bufferable sectors (TCFCFG_BRCFG :SSEC[7:0]/ESEC[7:0]): SA0 to SA71 can be set.
- Selection policy for words to be buffered (TCFCFG_BRAT :AM)

TCFCFG_TCMBUF	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Buffer enable	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID	BVALID
Buffered address	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]	BUFADD[31:0]
Buffered Data	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]	BUFDATA[127:0]
Buffered parity data	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]	ECCDR_PARITY[15:0]

3.4. Arbitration of TCM and AXI

If access via the AXI region conflicts with access via the TCM region, arbitration is performed as follows.

- If the WE bit in the TCFCFG_FCFGR register is "1", programming TCFLASH is enabled. In this case, programming via the AXI region has the highest priority for processing.
- The read operation via the AXI region has equal priority with that via the TCM region, both of which are processed accordingly. TCFLASH alternates the priority of the AXI region and the TCM region after each 16 read operations. For example, if the first 16 read operations via the AXI region are processed on a priority basis, the next 16 read operations via the TCM region are processed on a priority basis.
- In either case, priority does not shift during burst access.

3.5. Automatic Algorithms

Programming and erasing can be performed by sending the program access sequence to flash memory to start an automatic algorithm. The available commands in the automatic algorithm include reset, read, program, macro erase, and sector erase. For the sector erase command, it is possible to control the suspension and resumption of its execution.

3.5.1. Command Sequence

To start an automatic algorithm, perform operation to program given data to a given address once to six times consecutively, depending on the command type.

Table 3-1 Command Sequence List

Command	Program Count	1st cycle		2nd cycle		3rd cycle		4th cycle		5th cycle		6th cycle		7th cycle	
		Address	Data	Address	Data	Address	Data	Address	Data	Address	Data	Address	Data	Address	Data
Reset	1	CA0	0xF0	-	-	-	-	-	-	-	-	-	-	-	-
Read	1	RA	RD	-	-	-	-	-	-	-	-	-	-	-	-
Program	4	CA0	0xAA	CA1	0x55	CA0	0xA0	PA	PD	-	-	-	-	-	-
Program (64-bit)	5	CA0	0xAA	CA1	0x55	CA0	0xAC	PA	PD64_0	any	PD64_1	-	-	-	-
Macro Erase	6	CA0	0xAA	CA1	0x55	CA0	0x80	CA0	0xAA	CA1	0x55	CA0	0x10	-	-
Sector Erase	6	CA0	0xAA	CA1	0x55	CA0	0x80	CA0	0xAA	CA1	0x55	SA	0x30	-	-
Multiple Sectors Erase	6 + x	CA0	0xAA	CA1	0x55	CA0	0x80	CA0	0xAA	CA1	0x55	SA0	0xE0	SA1	0x30
Sector Erase Suspend	1	SA	0xB0	-	-	-	-	-	-	-	-	-	-	-	-
Sector Erase Resume	1	SA	0x30	-	-	-	-	-	-	-	-	-	-	-	-

Table 3-2 Address in the Command

Operation Mode	Code (Table 3-1)	Offset in AXI Region
User mode	CA0	0x?????AA8
	CA1	0x?????554

- Specify the values shown in Table 3-2 for "CA0" and "CA1" in Table 3-1.
- Specify the value of the lower 32 bits of 64-bit program data for "PD64_0" in Table 3-1. Specify the value of the upper 32 bits of 64-bit program data for "PD64_1".
- Except for the program data which is represented as "PD PD64_0 PD64_1" in the table, the upper 24 bits (bit31 to bit8) of data to be programmed to start an automatic algorithm are ignored.
- "?????" of Table 3-2 is an arbitrary value that specifies the address range used by the flash memory on which to execute the command. For the memory map, see "2.2 Address/Sector Map of TCFLASH."
- The address PA given upon the 4th write cycle is the address in which program data PD is written.
- The programming address PA for programming must be a value which is programming size aligned.
- The address SA given upon the 6th program cycle of the sector erase command and 1st cycle of sector erase suspend/resume command, and the address SA0, SA1 given upon 6th, 7th cycle of multi sector erase command indicates the address of the sector to be erased. SA is specified in the same format as PA.
- Flash memory is reset and transitions to read mode if an invalid address or data set is programmed as a command or if commands are programmed in the wrong order.
- The read operation from flash memory is possible even when the command sequence is being programmed. The automatic algorithm starts upon completion of the last cycle of the program sequence.
- Do not specify the sector address of which sector protection is enabled for any of CA0, CA1, SA, SA0, SA1, and PA.

- Do not change the setting of the sector protection register for TCFLASH (TCFCFG0_C*SWP) while writing the command sequence.
- Flash memory must not be read-accessed until the status register READ changes to "1" after the sector erase suspend command is issued.
- The 4 MB model has 2 FLASH macros(SA0 to 39 and SA40 to 71), and care should be taken regarding the following.
 - Macro erasure should be issued separately for 2 FLASH macros.
 - Multiple sector erasure cannot be executed over 2 FLASH macro (SA39 and SA40).

Parallel Programmer Mode

- Commands supported in parallel programmer mode differ from those in the command sequence stated above. For details on how to read, program, and erase in parallel programmer mode, see the Parallel Programmer Specifications.

3.6. Automatic Algorithm Execution Status

The hardware sequence flag which had been implemented so far is not included. The detailed status of flash memory during the execution of an automatic algorithm can be confirmed by reading the TCFCFG_FSTAT : TCFLASH status register to check the value of each bit. If flash memory is read during the execution of automatic algorithm, it causes a bus error response.

Table 3-3 Bit Assignment of TCFLASH Status Register

Bit No.	7	6	5	4	3	2	1	0
Flag Name	CERS	PGMS	ESPS	ERSEC	SERS	READ	HANG	RDY

The TCFCFG_FSTAT : TCFLASH status register consists of the following bits: CERS, PGMS, ESPS, ERSEC, SERS, READ, HANG, and RDY. Each bit indicates the following status:

Table 3-4 Values of Register TCFLASH Status Register

State		CERS	PGMS	ESPS	ERSEC	SERS	READ	HANG	RDY
Reset		0	0	0	0	0	0	0	0
Command		0	0	0	0	0	1	0	1
Program		0	1	0	0	0	0	0	0
Macro erase		1	0	0	0	0	0	0	0
Sector erase		0	0	0	0	1	0	0	0
Interruption of sector erasure	Sector read during erasure	0	0	1	1	1	1	0	1
	Non-target sector read during erasure	0	0	1	0	1	1	0	1
Hang up 1	Program	0	1	0	0	0	0	1	0
	Macro erase	1	0	0	0	0	0	1	0
	Sector erase	0	0	0	0	1	0	1	0

■ CERS (Chip ERase Status) bit

This bit indicates the macro erase status.

Any command can be received until macro erase is completed.

■ PGMS (ProGraM Status) bit

This bit indicates the programming status.

■ ESPS (Erase SusPend Status) bit

This bit indicates the sector erase suspend status.

Reading and programming are possible for sectors other than erase targets.

Reading and programming are not possible sectors that are erase targets.

Sector erase resume command resumes sector erase.

■ ERSEC (ERase Suspend SECTOR status) bit

This bit indicates the status in which a target sector read is being executed while sector erase is suspended.

At this time, the data read from flash memory is not the correct data.

■ SERS (Sector ERase Status) bit

This bit indicates the sector erase status.

During sector erase, sector erase suspend commands can be received.

■ READ (READ rdy) bit

This bit indicates the readable status of TCFLASH.

■ HANG (HANG up 1 status) bit

This bit indicates the Hang up 1 status.

Hang up 1 status indicates that 2 of the following events occurred.

1. When an attempt is made to overwrite with value 1 an address to which the value of 0 has been written
2. When programming, macro erase, and sector erase do not complete within the time limit

In the Hang up 1 status, the status can be recovered by writing command reset.

■ RDY (RDY) bit

This bit indicates the programmable/erasable status of TCFLASH/WorkFLASH.

When WorkFLASH is programmable/erasable, this bit becomes "0".

The TCFLASH status can be confirmed with READ and RDY bits.

1. READ=0, RDY=0: Reset (TCFLASH: Waiting for ready)
2. READ=0, RDY=1: Reading TCFLASH (TCFLASH: Waiting for ready)
3. READ=1, RDY=1: NOP (TCFLASH: Readable/programmable/erasable)
4. READ=1, RDY=0: WorkFLASH programming/erasing (TCFLASH: Readable only)

3.7. Inserting Wait Cycles

You can insert wait cycles when flash memory is accessed by setting the FAWC bit in the TCFCFG_FCFGR register.

If the system clock frequency is low, you can even set the FAWC bit to "0". The wait cycle count set for the FAWC bit is applied when flash memory is accessed for both reading and programming. The value set for the FAWC bit is valid until the setting is changed. The value of the FAWC bit is "3" after reset.

3.8. ECC Generation and Check

TCFLASH is capable of 1-bit error detection and correction and 2-bit error detection by adding the 8-bit error check code (ECC: Error Check Code) per 64 bits.

The ECC logic used in TCFLASH performs ECC generation during write-access and syndrome check during read-access in the same way as with 64-bit ECC in the ARM Cortex-R5F core.

During write-access, 8-bit ECC is generated for the 64-bit data, which is programmed along with the data. For the procedure for adding ECC to program data, see "4.4 Programming Procedure."

During read-access via the AXI space, a syndrome is calculated to determine any of "No error," "1-bit error," or "2-bit-or-more error." If the result is "2-bit-or-more error," error correction cannot be performed. If the content of flash memory is erased, an error is never detected. During read-access via the TCM space, TCFLASH does not detect or correct any errors. TCFLASH directly sends data and the ECC bit that are read from flash memory to the Cortex-R5F core. Error detection/correction for the data and ECC bit read via the TCM space is performed in the Cortex-R5F core.

The ECC movement in TCM port is based on ECC setting inside the CPU.

The contents described from 3.8.1 to 3.8.3 are the operations performed in TCFLASH when it is read-accessed via the AXI space.

To test the check function, the ECC logic has the function to insert an error into the data and ECC that are read from flash memory. Error injection is performed during read-access both via the TCM space and via the AXI space.

ECC is enabled/disabled by setting the ECCOFF bit in the TCFCFG_FECCCTRL register.

When programming, the 8-bit check bit CB[7:0] is generated from the 64-bit program data D[63:0] according to the calculation formulas given in Table 3-5 ECC Calculation Formulas. The generated check bit is XORed with 0xf3 and then programmed in flash memory.

		Data Bit

3.8.2. Calculating a Syndrome

When read-accessing, the 8-bit check bits CB[7:0] are calculated from the data D[63:0] which is read from flash memory in accordance with the calculation formulas given in Table 3-5. The calculated check bits are used together with the check bits EDOR[7:0] that are read from the flash memory to generate a syndrome S[7:0] in accordance with the calculation formulas given in Table 3-6.

Table 3-6 Syndrome Calculation Formulas

Bit	Calculation Formula
S[7]	$\sim (CB[7] \wedge EDOR[7])$
S[6]	$\sim (CB[6] \wedge EDOR[6])$
S[5]	$\sim (CB[5] \wedge EDOR[5])$
S[4]	$\sim (CB[4] \wedge EDOR[4])$
S[3]	$(CB[3] \wedge EDOR[3])$
S[2]	$(CB[2] \wedge EDOR[2])$
S[1]	$\sim (CB[1] \wedge EDOR[1])$
S[0]	$\sim (CB[0] \wedge EDOR[0])$

3.8.3. Detecting Errors

Based on the value of the calculated syndrome $S[7:0]$, a decision is made: "no error detected," "1-bit error detected," "2-bit error detected," and "error of 3 bits or greater detected." Table 3-7 shows the relationship between syndrome values and decision results. The meanings of symbols used in the table are as follows:

- "+" : No error is detected.
- "C[n] ($0 \leq n \leq 7$)" : 1-bit error is detected. The value of the check bit $CB[n]$ is erroneous.
- "[m] ($0 \leq m \leq 63$)" : 1-bit error is detected. The value of the data bit $D[m]$ is erroneous.
- "T" : 2-bit error is detected. It cannot be corrected.
- "M" : 3-bit-or-more error is detected. It cannot be corrected.

The 1-bit errors can be detected and corrected in all cases. The 2-bit errors can be detected in all cases, but cannot be corrected. As indicated in Table 3-7, errors of 3 bits or greater may be detected in some cases. However, they cannot be detected in all cases. Errors of 3 bits or greater cannot be corrected, either.

Table 3-7 Meanings of Syndrome Values

		Syndrome[7:4]															
		0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Syndrome[3:0]	0	+	C4	C5	T	C6	T	T	62	C7	T	T	46	T	M	M	T
	1	C0	T	T	14	T	M	M	T	T	M	M	T	M	T	T	30

	F	T	M	M	T	32	T	T	M	48	T	T	M	T	M	M	T

3.9. Interrupt

TCFLASH can generate an interrupt request in the following case.

- When a 1-bit error (correctable) is detected with the ECC logic
The SECINT bit in the TCFCFG_FSECIR register is "1". In this case, if the SECIE bit of the same register is "1", TCFLASH generates an interrupt request.

3.10. Bus Error Response

TCFLASH generates a bus error response in the following cases.

- When an uncorrectable error is detected. (A 2-bit-or-more error is detected with the ECC check.)
- When a program or erase operation in the non-privileged state is attempted
- When a program or erase operation is attempted while the WE bit in the TCFCFG_FCFGR register is "0"
- When programming is attempted from the TCM region
- When 8-bit programming is attempted while ECC is enabled
- When programming an address that is not boundary aligned with the program size is attempted
- When read-access is attempted via the TCM/AXI interface during execution of the automatic algorithm
- When access is attempted to the reserved area in the TCM space, reserved area in the AXI space, or reserved area in the register space
- When a change of setting is attempted by programming registers in the non-privileged state
- When programming of the 2nd and subsequent cycle in the TCFCFG_FECCCTRL register is attempted
- When a change of settings is attempted in a manner deviating from the unlock sequence. Specifically, the following cases are applicable.
 - When 2 consecutive write-accesses are attempted for the TCFCFG_FCPROTKEY
 - When programming of the wrong protection key is attempted for the TCFCFG_FCPROTKEY
 - When write-access of the protected register is attempted by a bus master other than the one that unlocked programming of that protected register
- When write-access to the read-only register is attempted
- When programing/erasing is attempted for the sectors protected with security
- When software reset is issued for Flash of which program is not enabled
- When TCM buffer register (TCFCFG_TCMBUF) is programmed in a way that does not meet the following conditions:
 - TCFLASH TCM Buffer Region Attribute Register:TCFCFG_BRAT:AM=10
 - 32/64-bit access

4. Setting Procedure Examples

This section explains the TCFLASH setting procedures.

4.1. Setting Wait Cycle Count

If the operating frequency of the system is higher than the maximum operating frequency of the flash memory, it is necessary to insert wait cycles when accessing the flash memory, by setting an appropriate value in FAWC[1:0] in the TCFCFG_FCFGR register.

You can calculate the value to set for FAWC[1:0] according to the following formula.

$$\text{FAWC}[1:0] = \text{CEILING} (\text{System operating frequency} / \text{Maximum operating frequency of flash memory}) - 1$$

CEILING() in the above formula represents a function that rounds up the decimal part of the argument to make it an integer.

The maximum operating frequency of flash memory built in this LSI is (product specification) MHz. Therefore, if the system operating frequency is (product specification) MHz, for example, the setting value for FAWC[1:0] should be "01" as calculated using the above formula.

4.2. Reading Flash Memory State/Transition to Reset State

Program the read/reset command sequence in flash memory. If execution of the automatic algorithm terminates abnormally (due to a timeout, for example), the state of flash memory can be initialized. Because the state of flash memory is read/reset immediately after this LSI is reset, you do not need to program the read/reset command sequence in flash memory.

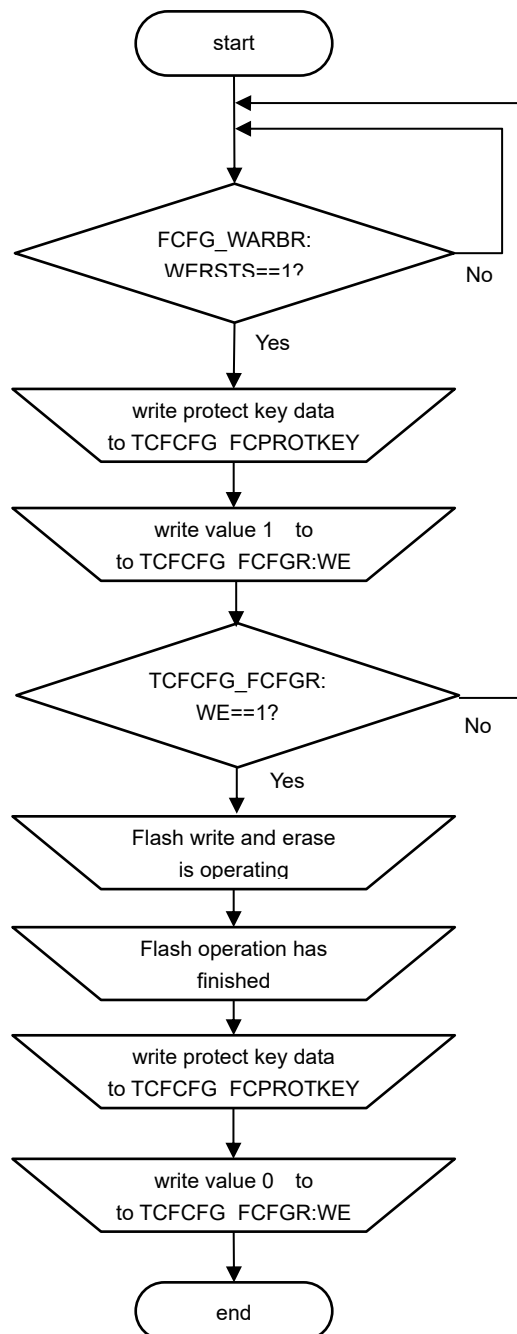

Successful program or erase operation by flash memory is not affected by programming of the read/reset command sequence. In addition, a suspended sector erase cannot be canceled by programming the read/reset command sequence.

4.3. Enable Programming

To program/erase data in TCFLASH, program the enable bit of TCFLASH has to be set. In addition, TCFLASH and WorkFLASH cannot be programmed/erased at the same time. Therefore, the flash interface (TCFLASH, WorkFLASH) includes the arbitration function.

To program from TCFLASH, the program enable bit has to be enabled using the following procedure.

Figure 4-1 Procedure to Set Flash Memory Program Enable Bit

Write enable setting can be done using program enable release (FCFG_WARBR:WERINT) interrupt, instead of the monitoring program enable release status (FCFG_WARBR:WERSTS) bit.

To confirm the completion of Flash program/erase, check that the Programming/erasing ready bit (TCFCFG_FSTAT:RDY) has become "1".

When programming/erasing is not required, to allow programming/erasing to Flash using WorkFLASH interface or SHE, set program enable (TCFCFG_FCFGR:WE) bit to "0".

When program enable is requested simultaneously, programming is enabled in accordance with the priority below:

1. SHE
2. WorkFLASH
3. TCFLASH

4.4. Programming Procedure

To program data in flash memory, write the program command sequence to flash memory. The destination address must be aligned with the data size to be programmed.

Overwriting of the same data bit is prohibited. (Even overwriting 1 -> 0, 0 -> 0, 1 -> 1 is prohibited as well.)

The cell value of flash memory cannot be changed from "0" to "1" by programming. Therefore, if "1" is written in the cell in which "0" has already been written, flash memory is indicated as being in the hung up state.

During execution of program operation, all the command sequences additionally written in flash memory are ignored.

If a bus error response is received while the command sequence is being written, issue software reset by writing "1" bit to the SWFRST bit to initialize the macro (for flash memory to be ready to accept a new command rather than erasing the macro).

If this LSI is reset during execution of program operation or flash memory is reset because "1" is written to the SWFRST bit in the TCFCFG_FCFGR register, contents of the cell programmed after reset cannot be assured.

When ECC is disabled and programming is performed in 8-/16-/32-bit, the data is directly written in the address specified in flash memory. When ECC is enabled, follow the procedure below to program in 16-/32-bit.

Flash security function blocks the programming of data in protected sectors. For details, see the security specifications.

- When ECC is enabled and programming is performed in 32-bit (64-bit program command is used.) (See Table 3-1.)

1st time: Command sequence for 64-bit program

- 1-1: Address = CA0, Data = 0xAA
- 1-2: Address=CA1, Data = 0x55
- 1-3: Address=CA0, Data = 0xAC
- 1-4: Address=PA(Lower:0**), Data = PD64_0([31:0])
- 1-5: Address=PA(Lower:1**), Data = PD64_1([63:32])

- When ECC is enabled and program is performed in 32-bit (Program command is used.) (See Table 3-1.)

1st time: Command sequence for 32-bit program

- 1-1: Address=CA0, Data = 0xAA
- 1-2: Address=CA1, Data = 0x55
- 1-3: Address=CA0, Data = 0xA0
- 1-4: Address=PA(Lower:0**), Data = PD32_0([31:0])

2nd time: Command sequence for 32-bit program

- 2-1: Address=CA0, Data = 0xAA
- 2-2: Address=CA1, Data = 0x55

2-3: Address=CA0, Data = 0xA0

2-4: Address=PA (Lower:1**), Data = PD32_1([63:32])

- When ECC is enabled and program is performed in 16-bit (Program command is used.) (See Table 3-1.)

1st time: Command sequence for 16-bit program

1-1: Address=CA0, Data = 0xAA

1-2: Address=CA1, Data = 0x55

1-3: Address=CA0, Data = 0xA0

1-4: Address=PA (Lower:00*), Data = PD16_0([15:0])

2nd time: Command sequence for 16-bit program

2-1: Address=CA0, Data = 0xAA

2-2: Address=CA1, Data = 0x55

2-3: Address=CA0, Data = 0xA0

2-4: Address=PA (Lower:01*), Data = PD16_1([31:16])

3rd time: Command sequence for 16-bit program

3-1: Address=CA0, Data = 0xAA

3-2: Address=CA1, Data = 0x55

3-3: Address=CA0, Data = 0xA0

3-4: Address=PA (Lower:10*), Data = PD16_2([47:32])

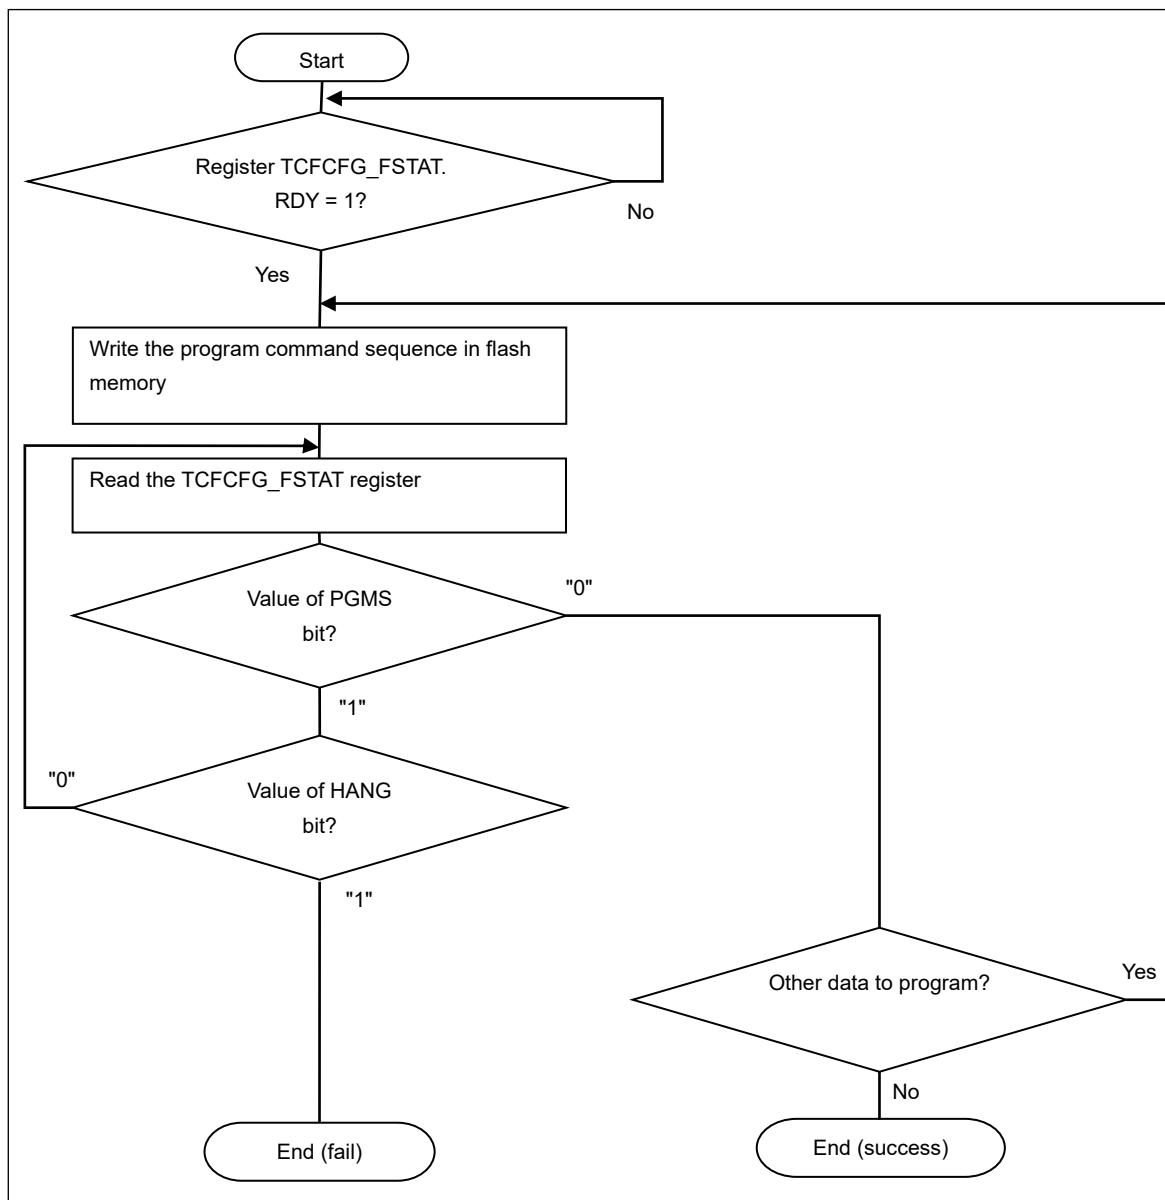

4th time: Command sequence for 16-bit program

4-1: Address=CA0, Data = 0xAA

4-2: Address=CA1, Data = 0x55

4-3: Address=CA0, Data = 0xA0

4-4: Address=PA (Lower:11*), Data = PD16_3([63:48])

Figure 4-2 Programming Procedure

The time it takes for HANG to become "1" is not equal to the Flash max writing time defined in datasheet. For example, when max writing time is defined as 400us in datasheet, it does not indicate HANG is set 400us after writing the data. HANG is designed so that the time for it to set is relatively longer than the max writing time defined in the datasheet. Hence, do not design the program that expects HANG=1 after the max writing time defined in datasheet (the same thing applies to sector erasing).

4.5. Macro Erasure Procedure

Write the macro erase command sequence in flash memory. If the last cycle of programming completes in a total of 6 cycles of programming that comprise the sequence, flash memory starts the macro erase operation. After the macro erase operation completes, the values of all the memory cells in the targeted flash memory are "1".

Since 4 MB model has 2 FLASH macros, macro erasure has to be performed for each FLASH macro.

During execution of the macro erase operation, the write operation of any command sequence is ignored in flash memory.

If this LSI is reset during execution of the macro erasure operation or flash memory is reset because "1" is written to the SWFRST bit in the TCFCFG_FCFGR register, the contents of the flash memory after reset cannot be assured.

The execution status of macro erasure can be confirmed with the value of the CERS bit. In addition, the timing limit excess for macro erasure can be checked with the value of HANG bit.

If there is at least 1 sector protected with flash security function, macro erasure cannot be performed. For details, see the security specifications.

The time it takes for HANG to become "1" is not equal to the Flash macro max erasing time defined in datasheet. For example, when max macro erasing time is defined as 5000ms in datasheet, it does not indicate HANG is set 5000ms after the initiation of the macro erase operation. HANG is designed so that the time for it to set is relatively longer than the max macro erasing time defined in the datasheet. Hence, do not design the program that expects HANG=1 after the max macro erasing time defined in datasheet .

4.6. Procedure for Sector Erase

You can erase data in units of sectors by writing the sector erase command sequence in the flash memory. The sector to which the address specified in the command sequence belongs is to be erased.

The command sequence for multiple sectors erasure can erase multiple sectors. However, in the case of 4 MB model, multiple sectors cannot be erased for 2 FLASH macros (SA39 and SA40) together.

After erase operation completes, all the values of the flash memory cells in the target sectors are "1".

The execution status of sector erasure can be confirmed with the value of the SERS bit of the status register. In addition, the timing limit excess for sector erasure can be checked with the value of HANG bit.

Figure 4-3 and Figure 4-4 show a sector erase flow example.

The flash security function does not allow erasure of protected sectors. For details, see the security specifications.

The time it takes for HANG to become "1" is not equal to the Flash sector max erasing time defined in datasheet. For example, when max sector erasing time is defined as 900ms in datasheet, it does not indicate HANG is set 900ms after the initiation of the sector erase operation. HANG is designed so that the time for it to set is relatively longer than the max sector erasing time defined in the datasheet. Hence, do not design the program that expects HANG=1 after the max sector erasing time defined in datasheet .

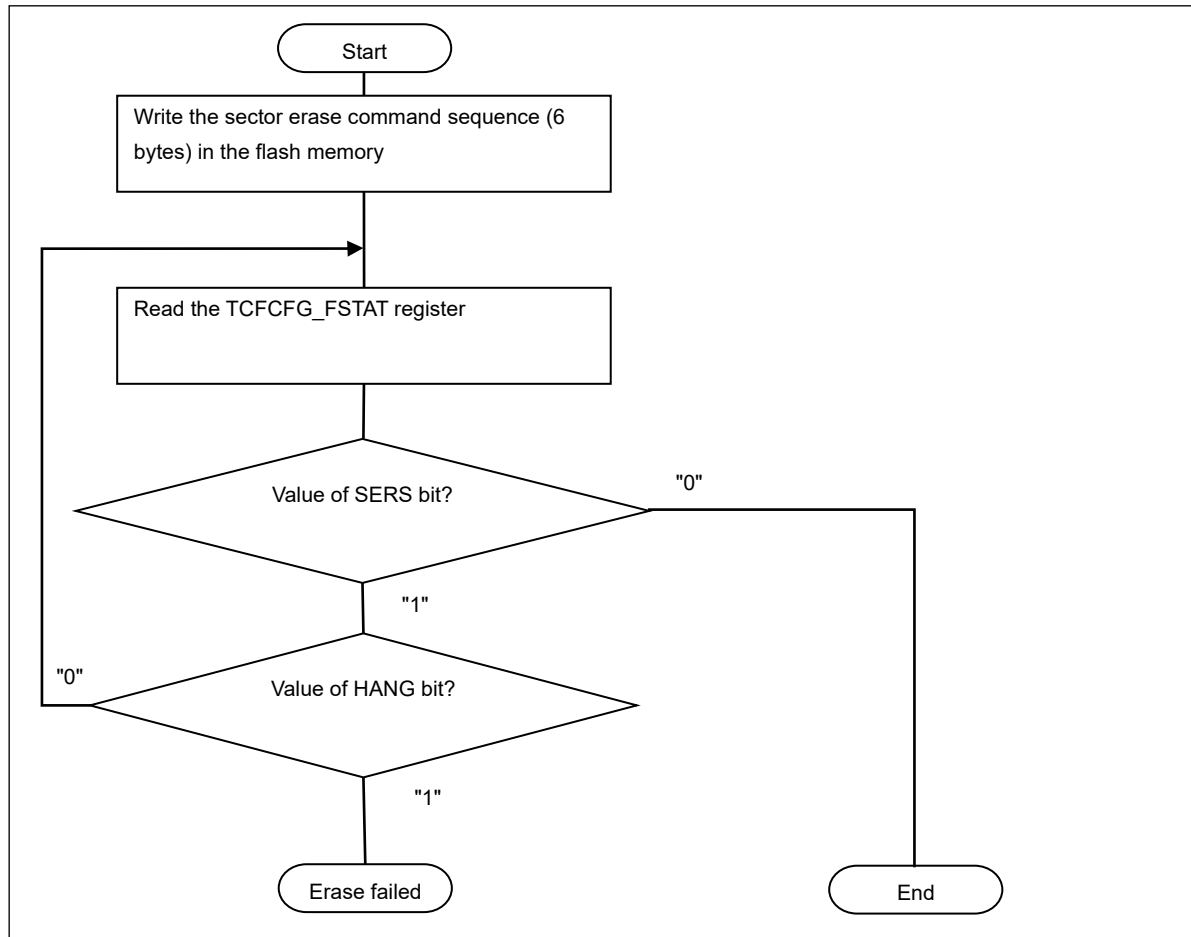

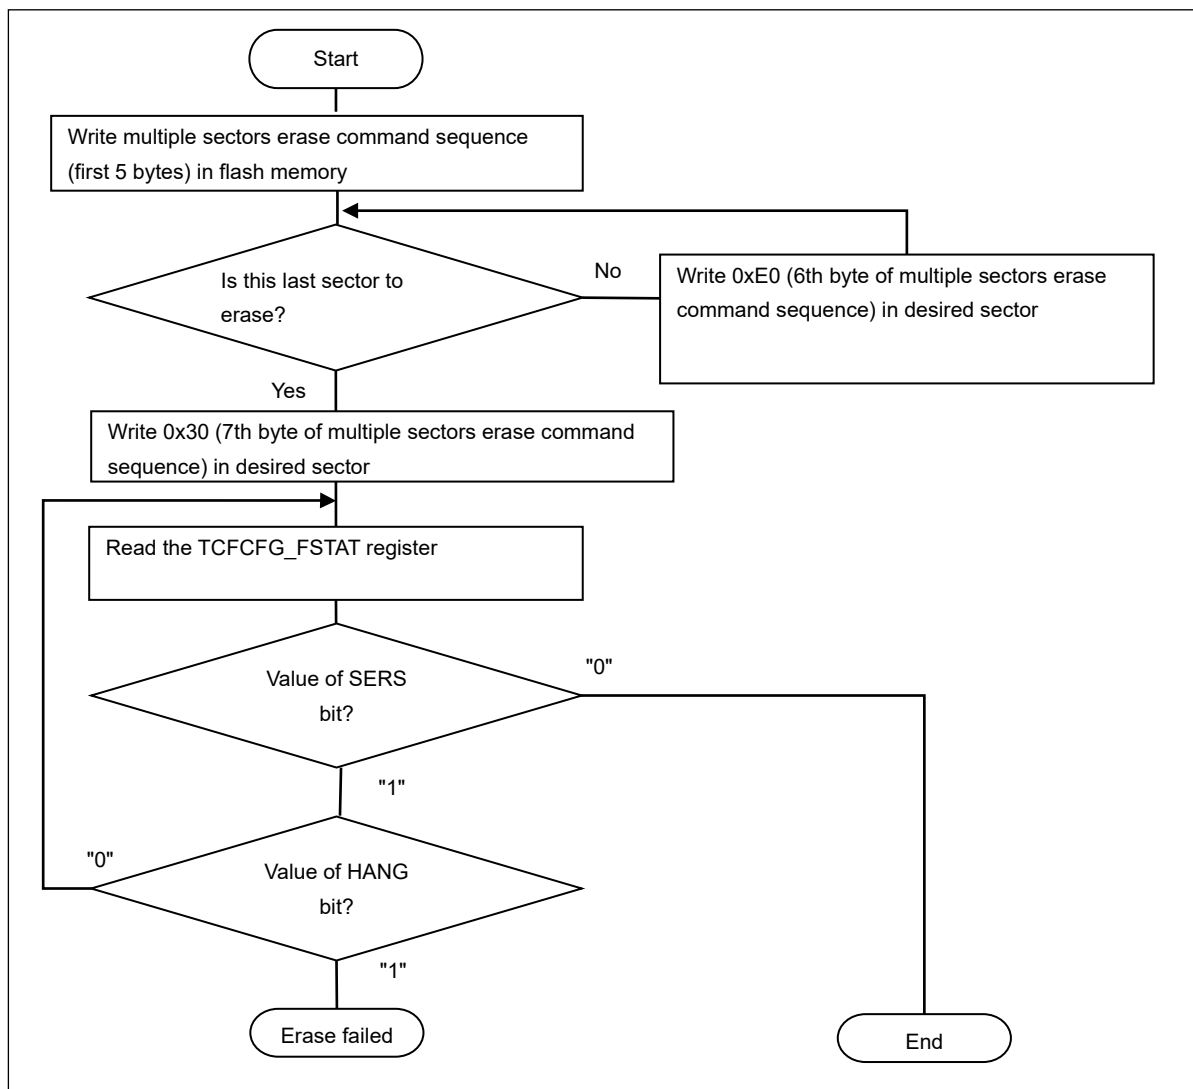

Figure 4-3 Flow Example When a Single Sector is Erased

Figure 4-4 Flow Example When Multiple Sectors are Erased

4.6.1. Sector Erase Suspend

Write the sector erase suspend command sequence in the flash memory that performs the sector erase operation that you want to suspend. At this time, specify the address that belongs to the target sector for which sector erase is to be suspended.

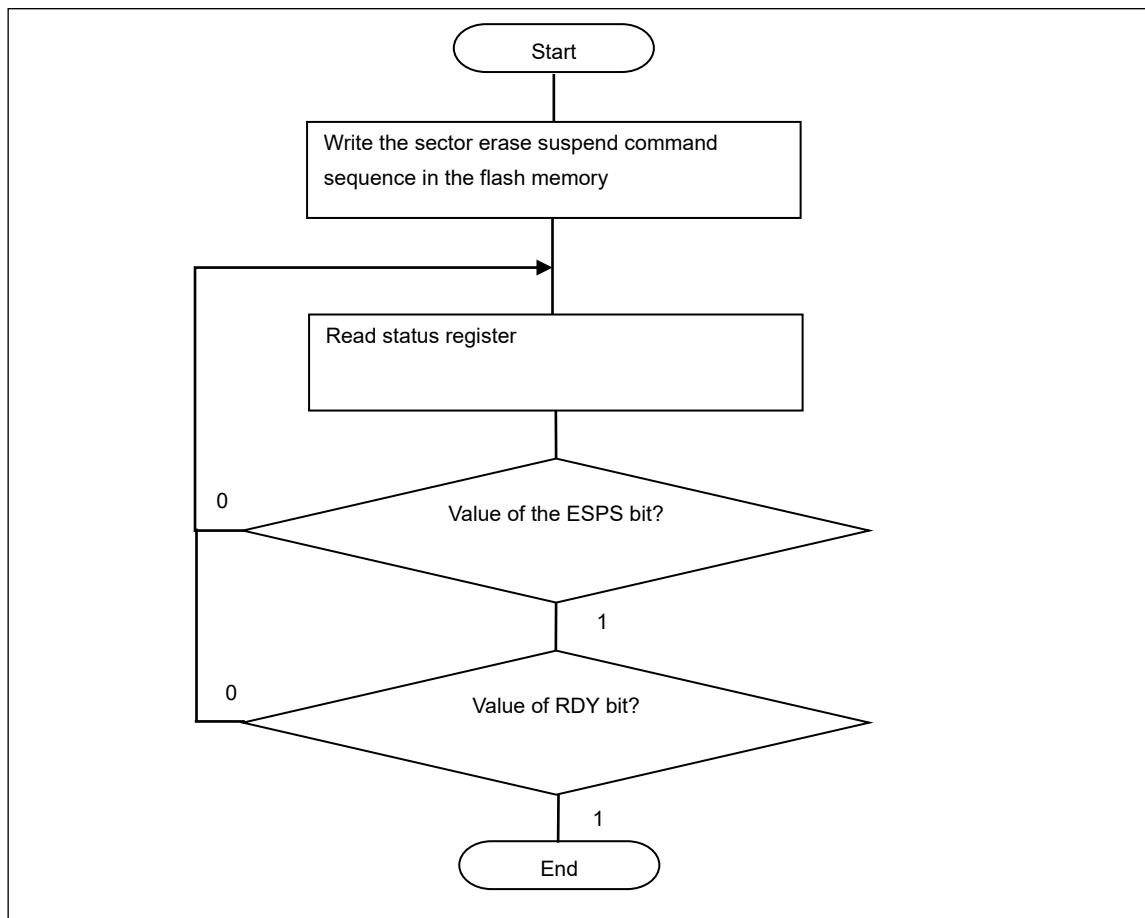

The sector erase suspend command sequence is valid only when flash memory is in the sector erase state. The sector erase suspend command sequence is ignored by the flash memory if the programming or macro erase operation is being performed or the flash memory is already in the sector erase suspend state.

Sector erase suspension can be confirmed by the TCFCFG_FSTAT:ESPS bit and TCFCFG_FSTAT:RDY bit both being "1". Therefore, before suspending sector erase to program/read data to TCFLASH, it is necessary to confirm the value for these bits.

Do not write a command sequence other than the read/reset or sector erase resume command in the flash memory in the sector erase suspend state.

Figure 4-5 shows a flow example of sector erase suspend.

Figure 4-5 Flow of Sector Erase Suspend Process (Example)

4.6.2. Sector Erase Resume

Write the sector erase resume command sequence in the flash memory that performs sector erase operation that you want to resume. At this time, specify the address that belongs to the target sector for which sector erase is suspended.

The sector erase resume command sequence is ignored by the flash memory if the sector erase is not suspended.

5. Registers

This section explains the registers in TCFLASH.

Register List

The register areas in TCFLASH are located in the peripheral functions area, each of which has a size of 1 KB.

Table 5-1 Register Areas in TCFLASH

Unit No.	Offset	Remarks
0	0x000	TCFLASH that is connected to the Cortex-R5F core #0
1	0x400	TCFLASH that is connected to the Cortex-R5F core #1. (*1)
2	0x800	TCFLASH that is connected to the Cortex-R5F core #2. (*2)
3	0xC00	TCFLASH that is connected to the Cortex-R5F core #3. (*3)

(*1) Reserved area for models in which Cortex-R5F core#1 is not assembled.

(*2) Reserved area for models in which Cortex-R5F core#2 is not assembled.

(*3) Reserved area for models in which Cortex-R5F core#3 is not assembled.

Table 5-2 shows the location of registers in the register area.

Table 5-2 Register Map

Abbreviated Register Name	Description	Reference
TCFCFG_FCPROTKEY	TCFLASH configuration protection key register	5.1
TCFCFG_FCGR	TCFLASH configuration register	5.2
TCFCFG_FECCCTRL	TCFLASH ECC control register	5.3
TCFCFG_FDATEIR	TCFLASH data bit error injection register	5.4
TCFCFG_FECCEIR	TCFLASH ECC bit error injection register	5.5
TCFCFG_FICTRL	TCFLASH interrupt control register	5.6
TCFCFG_FSTAT	TCFLASH status register	5.7
TCFCFG_FSECIR	TCFLASH SEC interrupt register	5.8
TCFCFG_FECCEAR	TCFLASH ECC error address register	5.9
TCFCFG_FUCEDIR	TCFLASH uncorrectable error detection interrupt register	5.10
TCFCFG_FUCEAR	TCFLASH uncorrectable error address register	5.11
TCFCFG_BRCFG	TCM buffer region configuration register	5.12
TCFCFG_BRAT	TCM buffer region attribute register	5.13
TCFCFG_TCMBUF0 to 15	TCM Buffer0 to Buffer15 256-bit register	5.14

Table 5-3 Register Map

Offset	Abbreviated Register Name	Description
0x000	TCFCFG_FCPROTKEY 00000000_00000000_00000000_00000000	TCFLASH configuration protection key register
0x004	-	Reserved area
0x008	TCFCFG_FCFGR 00000000_00000000_00000000_00000011	TCFLASH configuration register
0x00C	-	Reserved area
0x010	TCFCFG_FECCTRL 00000000_00000000_00000000_00000000	TCFLASH ECC control register
0x014	-	Reserved area
0x018	-	Reserved area (moved for 64-bit migration)
0x01C	TCFCFG_FECCEIR 00000000_00000000_00000000_00000000	TCFLASH ECC bit error injection register
0x020	TCFCFG_FICTRL 00000000_00000000_00000000_00000000	TCFLASH interrupt control register
0x024	-	Reserved area
0x028	TCFCFG_FDATEIR (lower32) 00000000_00000000_00000000_00000000	TCFLASH data bit error injection register Lower 32 bits
0x02c	TCFCFG_FDATEIR (upper32) 00000000_00000000_00000000_00000000	TCFLASH data bit error injection register Upper 32 bits
0x030 to 0x34	-	Reserved area
0x038	TCFCFG_FSTAT 00000000_00000000_00000000_00000000	TCFLASH status register
0x03C to 0x4C	-	Reserved area
0x050	TCFCFG_FSECIR 00000000_00000000_00000000_00000000	TCFLASH SEC interrupt register
0x054	TCFCFG_FECCEAR 00000000_00000000_00000000_00000000	TCFLASH ECC error address register
0x058 to 0x07C	-	Reserved area
0x080	TCFCFG_FUCEDIR 00000000_00000000_00000000_00000000	TCFLASH uncorrectable error detection interrupt register
0x084	TCFCFG_FUCEAR 00000000_00000000_00000000_00000000	TCFLASH uncorrectable error address register
0x088 to 0x08C	-	Reserved area
0x090	TCFCFG_BRCFG 00000000_00010000_00000000_11111111	TCM buffer region configuration register
0x094	-	Reserved area
0x098	TCFCFG_BRAT 00000000_00000000_00000000_00000001	TCM buffer region attribute register
0x09C to 0x0FC	-	Reserved area

Offset	Abbreviated Register Name	Description
0x100 to 0x11C	TCFCFG_TCMBUF0	TCM Buffer0 to Buffer15 256-bit register
0x120 to 0x13C	TCFCFG_TCMBUF1	
0x140 to 0x15C	TCFCFG_TCMBUF2	
0x160 to 0x17C	TCFCFG_TCMBUF3	
0x180 to 0x19C	TCFCFG_TCMBUF4	
0x1A0 to 0x1BC	TCFCFG_TCMBUF5	
0x1C0 to 0x1DC	TCFCFG_TCMBUF6	
0x1E0 to 0x1FC	TCFCFG_TCMBUF7	
0x200 to 0x21C	TCFCFG_TCMBUF8	
0x220 to 0x23C	TCFCFG_TCMBUF9	
0x240 to 0x25C	TCFCFG_TCMBUF10	
0x260 to 0x27C	TCFCFG_TCMBUF11	
0x280 to 0x29C	TCFCFG_TCMBUF12	
0x2A0 to 0x2BC	TCFCFG_TCMBUF13	
0x2C0 to 0x2DC	TCFCFG_TCMBUF14	
0x2E0 to 0x2FC	TCFCFG_TCMBUF15	
	128-bit ALL0	
The following registers are those listed in the security specifications. These are noted here because the memory area is in the TCFLASH area, and actual read and program are performed through TCFLASH. For details, see the security specifications.		
0x3C0	TCFCFG0_SECSTAT	Security State Register
0x3C4	TCFCFG0_SER	Security Enable Register
0x3C8	TCFCFG0_SSR	Security Scope Register
0x3CC	TCFCFG0_CEER	Chip Erase Enable Register
0x3D0	TCFCFG0_SOER	Security Overwrite Enable Register
0x3D4	TCFCFG0_SWPOER	Sector Write Permission Overwrite Enable Register
0x3D8	TCFCFG0_WSWP	Work Flash Sector Write Permissions
0x3DC	TCFCFG0_C0SWP	Code Flash Sector Write Permissions (Small Sectors)
0x3E0	TCFCFG0_C1SWP	Code Flash Sector Write Permissions (Large Sectors)
0x3E4	TCFCFG0_C2SWP	
0x3E8	TCFCFG0_C3SWP	

5.1. TCFLASH Configuration Protection Key Register: TCFCFG_FCPROTKEY (TCFLASH Configuration Protection Key Register)

TCFLASH configuration protection key register (TCFCFG_FCPROTKEY) is used to protect the registers listed below from unintended writing.

TCFLASH configuration register (TCFCFG_FCFGR)

TCFLASH ECC control register (TCFCFG_FECCCTRL)

TCFLASH data bit error injection register (TCFCFG_FDATEIR)

TCFLASH ECC bit error injection register (TCFCFG_FECCEIR)

TCFLASH TCM buffer region configuration register (TCFCFG_BRCFG)

TCFLASH TCM buffer region attribute register(TCFCFG_BRAT)

TCFLASH TCM buffer register (TCFCFG_TCMBUF0 to 15)

Before programming these registers, you must write the correct value for the TCFLASH configuration protection key (0xCF61F1A5) to the TCFLASH configuration protection key register in the same unit to unlock programming to these registers.

Programming to the above registers is locked again by programming to the addresses in the TCFLASH internal register area.

If the value of the configuration protection key is wrong or an invalid procedure is used to program the above registers, such that programming is attempted in these registers without unlocking programming, TCFLASH generates a bus error response. For access with a CPU, a data abort exception is generated due to the bus error response.

Be sure to program in 32-bit to the TCFLASH configuration protection key register.

bit	31	0
Field	FCPROTKEY[31:0]	
R/W Attribute	R, W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] FCPROTKEY[31:0]: Configuration Protection Key

By writing a correct configuration protection key value (0xCF61F1A5) to the register, programming for the following is unlocked to set a new value: TCFLASH configuration register (TCFCFG_FCFGR), TCFLASH ECC control register (TCFCFG_FECCCTRL), TCFLASH data bit error insertion register (TCFCFG_FDATEIR), TCFLASH ECC bit error insertion register (TCFCFG_FECCEIR), TCFLASH TCM buffer region configuration register (TCFCFG_BRCFG), TCFLASH TCM buffer region attribute register (TCFCFG_BRAT), and TCFLASH TCM buffer register (TCFCFG_TCMBUF0 to 15).

When programming to these registers is unlocked, 0xFFFFFFFF is output from this register. When programming to these registers is locked, 0x00000000 is output from this register.

5.2. TCFLASH Configuration Register: TCFCFG_FCFGR (TCFLASH Configuration Register)

TCFLASH configuration register has the following functions:

- Resets flash memory
- Determines whether access via the TCM port or that via the AXI has higher priority.
- Enables programming of flash memory
- Specifies the wait cycle count when flash memory is accessed

This register setting can be changed only when the correct configuration protection key value is written to the TCFLASH configuration protection key register and programming to this register is unlocked.

bit	31										8									
Field	Reserved																			
R/W Attribute	R0, WX																			
Protection Attribute	WPS																			
Initial Value	00000000_00000000_00000000																			

bit	7			6		5		4		3		2		1		0	
Field	Reserved		SWFRST		TCMPR		WE		Reserved		Reserved		FAWC[1:0]				
R/W Attribute	R0, WX		R0, W		R/W		R,W		R0, WX		R0, WX		R/W				
Protection Attribute	WPS																
Initial Value	0		0		0		0		00		00		11				

[bit31:7] Reserved: Reserved Bits

[bit 6] SWFRST: Software Reset

SWFRST	Description
0	There is no effect on operation.
1	Flash memory is reset.

When the WorkFLASH interface or SHE obtains program enable, writing "1" in this bit does not reset flash memory. When no program is enabled, writing "1" in this bit causes a bus error.

If "1" is written in this bit at the same time that program enable is obtained, flash memory reset is not issued. It causes a bus error response. To issue a reset to flash memory, it is necessary to obtain program enable before writing "1" in this bit. For the flow for obtaining for program enable, see 4.3 Enable Programming.

[bit5] TCMPR: TCM Priority Enable

Determine whether read access via TCM or read access via AXI has higher priority.

(AXI write access has the highest priority)

TCMPR	Description
0	Toggle the priority between the AXI access and TCM access every 16 accesses.
1	Give priority to the TCM access.

[bit4] WE: Program Enable

It sets enable/disable programming to/erasing of flash memory. If programming of the command sequence to flash memory is detected while this bit is "0", TCFLASH generates a bus error response.

Perform the program/erase operation in FLASH by starting the automatic algorithm after setting the program enable bit at WE. After the program/erase operation in FLASH completes, set the program disable bit.

When the WorkFLASH interface or SHE obtains program enable, program enable can not be set. In this case, writing "1" cannot be reflected, and the read value becomes "0". For the configuration method for program enable, see 4.3 Enable Programming.

WE	Description
0	Programming command sequence is prohibited.
1	Programming command sequence is permitted.

[bit3:2] Reserved: Reserved Bits

[bit1:0] FAWC[1:0]: Flash Wait Control

These bits set the wait cycle count when flash memory is accessed. Set the appropriate value according to the operating frequency of the flash memory and flash memory access time.

FAWC[1:0]	Description
00	Do not insert wait cycle.
01	Insert 1 wait cycle.
10	Insert 2 wait cycles.
11	Insert 3 wait cycles.

Note:

- Avoid TCFlash access via AXI bus while changing Flash wait configuration (FAWC[1:0]) 0 -> X (X=1,2,3)

5.3. TCFLASH ECC Control Register: TCFCFG_FECCCTRL (TCFLASH ECC Control Register)

This register is used to control the operation of the ECC logic. This register setting can be changed only when the correct configuration protection key value is written to the TCFLASH configuration protection key register and programming to this register is unlocked. You can change the setting value of this register only once. If a 2nd and subsequent write access is attempted to this register, TCFLASH generates a bus error response.

bit	31	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							ECCOFF
R/W Attribute	R0, WX							R/W
Protection Attribute	WPS							
Initial Value	0000000							0

[bit31:1] Reserved: Reserved Bits

[bit 0] ECCOFF: ECC Off

This bit enables or disables operation of the ECC logic for AXI accesses. ECC generation and check for TCM accesses are controlled by the settings in the Cortex-R5F core.

ECCOFF	Description
0	Perform ECC generation and check for AXI accesses.
1	Do not perform ECC generation and check for AXI accesses.

This register allows enabling interrupt request generation for each factor and clearing interrupt factors.

This register is not supported.

Always write "0" to RDYIE and HANGIE bit.

bit	7	6	5	4	3	2	1	0
Field	Reserved						HANGIE	RDYIE
R/W Attribute	R0, WX						R/W0	R/W0
Protection Attribute	WP							
Initial Value	000000						0	0

[bit31:10] Reserved: Reserved Bits

[bit 9] HANGIC: Hang Interrupt Clear

HANGIC	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the HANGINT bit in the TCFCFG_FSTAT register.

Note:

- *Do not use this function.*

[bit 8] RDYIC: Ready Interrupt Clear

RDYIC	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the RDYINT bit in the TCFCFG_FSTAT register.

Note:

- *Do not use this function.*

[bit7:2] Reserved: Reserved Bits

[bit 1] HANGIE: Hang Interrupt Enable

HANGIE	Description
0	Disable the generation of hang interrupt requests.
1	Enable the generation of hang interrupt requests.

Note:

- *Do not use this function.*

[bit 0] RDYIE: Programming/Erasing Ready Interrupt Enable

RDYIE	Description
0	Disable the generation of programming/erasing ready interrupt requests.
1	Enable the generation of programming/erasing ready interrupt requests.

Note:

- *Do not use this function.*

5.5. TCFLASH Data Bit Error Injection Register: TCFCFG_FDATEIR (TCFLASH Data Bit Error Injection Register)

The TCFLASH data bit error injection register is used to test operation of the ECC logic by injecting an error to the data bit read from the flash memory.

This register setting can be changed only when the correct configuration protection key value is written to the TCFLASH configuration protection key register and programming to this register is unlocked.

bit	63	0
Field	FDATEIR[63:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000_00000000_00000000_00000000_00000000_00000000	

[bit63:0] FDATEIR[63:0]: Data Bit Error Injection Point

The exclusive OR of the value in this field and the value of the data bits that are read from the flash memory is sent to the ECC inspection logic.

FDATEIR[i] (63≥i≥0)	Description
0	The bits at the same position as that of the data that is read from the flash memory are sent to the ECC inspection logic as they are.
1	The bits at the same position as that of the data that is read from the Flash memory are sent to the ECC inspection logic after being inverted.

5.6. TCFLASH ECC Bit Error Insertion Register: TCFCFG_FECCEIR (TCFLASH ECC Bit Error Injection Register)

The TCFLASH ECC bit error injection register is used to test operation of the ECC logic by injecting an error into the ECC bit from the flash memory.

This register setting can be changed only when the correct configuration protection key value is written to the TCFLASH configuration protection key register and programming to this register is unlocked.

bit	31	30	29	28	27	26	25	24
Field	Reserved						LMASK[1:0]	
R/W Attribute	R0, WX						R/W	
Protection Attribute	WPS							
Initial Value	000000						00	

bit	23	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	FECCEIR[7:0]							
R/W Attribute	R/W							
Protection Attribute	WPS							
Initial Value	00000000							

[bit31:26] Reserved: Reserved Bits

[bit25:24] LMASK[1:0]: Error Injection Lane Mask

These bits specify whether to insert an error in the data read from the flash memory.

LMASK[i] (1 ≤ i ≤ 0)	Description
0	Insert an error between bit(64*(i+1)-1) and bit(64*i) of the data read from the flash memory, as specified by the TCFCFG_FDATEIR register. Similarly, insert an error between bit(8*(i+1)-1) and bit(8*i) of the ECC data read from the flash memory, as specified by the TCFCFG_FECCEIR register.
1	Do not insert an error between bit (64*(i+1)-1) and (64*i) of the data read from the flash memory. Also, do not insert an error between bit (8*(i+1)-1) and bit (8*i) of the ECC data read from the flash memory.

LMASK[0] decides whether an error inserted in data ending with 0x0 to 7 and ECC data should be masked. LMASK[1] decides whether an error inserted in data ending with 0x8 to F and ECC data should be masked.

[bit23:8] Reserved: Reserved Bits

[bit7:0] FECCEIR[7:0]: ECC Bit Error Injection Point

The exclusive OR of the value in this field and the value of the ECC bits that are read from the flash memory is sent to the ECC inspection logic.

FECCEIR[i] (7≥i≥0)	Description
0	Directly send the bits with the same position as the ECC data being read from the flash memory, to the ECC inspection logic.
1	Send the bits with the same position as the ECC data being read from the flash memory, to the ECC inspection logic after inverting their values.

[bit 7] CERS: Chip ERase Status

This bit shows the TCFLASH macro erase status.

CERS	Description
0	TCFLASH does not perform macro erase.
1	TCFLASH performs macro erase.

[bit 6] PGMS: ProGraM Status

This bit shows the TCFLASH programming status.

PGMS	Description
0	No programming to TCFLASH.
1	Programming to TCFLASH.

[bit 5] ESPS: Erase SusPend Status

This bit shows the TCFLASH sector erase suspend status.

ESPS	Description
0	TCFLASH does not suspend sector erase.
1	TCFLASH received sector erase suspend command.

This bit indicates the receipt of the sector erase suspend command. Therefore, the suspension of sector erase can be confirmed with the TCFCFG_FSTAT:ESPS bit becoming "1" and the TCFCFG_FSTAT:RDY bit becoming "1". Therefore, before suspending sector erase to program/read data to TCFLASH, it is necessary to confirm the value for these bits.

[bit 4] ERSEC: ERase Suspend SEctor status

This bit indicates the target sector read execution status while TCFLASH sector erase is suspended.

ERSEC	Description
0	There is no target sector read while TCFLASH sector erase is suspended.
1	There is target sector read while TCFLASH sector erase is suspended.

[bit 3] SERS: Sector ERase Status

This bit indicates the TCFLASH sector erase status.

SERS	Description
0	TCFLASH does not perform sector erase.
1	TCFLASH performs sector erase.

[bit 2] READ: Reading ready

This bit indicates whether TCFLASH is in the reading ready state. TCFLASH can start new read command execution in the reading ready state.

READ	Description
0	Unable to enter read command to TCFLASH
1	Able to enter read command to TCFLASH

Note:

- Initial value depends on the boot configuration.

[bit 1] HANG: Hang up

This bit indicates whether the flash memory is in hang up 1 state. The flash memory changes to hang up 1 state in the following cases.

- When write access with "1" is attempted to a cell with the value of "0"
- When execution of the automatic algorithm has not completed within the given time

HANG	Description
0	The flash memory is not in hang up 1 state.
1	The flash memory is in hang up 1 state.

[bit 0] RDY: Programming/erasing Ready

This bit indicates whether the flash memory is in the programming/erasing ready state. The flash memory can start command execution in the programming/erasing ready state.

RDY	Description
0	Indicate that the flash memory is performing program or erase operation using the automatic algorithm.
1	Indicate that the flash memory completes program or erase operation using the automatic algorithm and is ready to start the next command.

You can confirm whether TCFLASH is in the programming/erasing ready state with the RDY bit. The reading ready state can be checked with the READ bit.

Note:

- Initial value depends on the boot configuration.

5.8. TCFLASH SEC Interrupt Register: TCFCFG_FSECIR (TCFLASH SEC Interrupt Register)

This register holds status flags, enable bits, and clear bits concerning 1-bit error correction interrupt.

bit	31	30	29	28	27	26	25	24
Field	SYN							
R/W Attribute	R, WX							
Protection Attribute	WP							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved							SECINT
R/W Attribute	R0, WX							R, WX
Protection Attribute	WP							
Initial Value	00000000							0

bit	15	14	13	12	11	10	9	8
Field	Reserved							SECIC
R/W Attribute	R0, WX							R0, W
Protection Attribute	WP							
Initial Value	00000000							0

bit	7	6	5	4	3	2	1	0
Field	Reserved							SECIE
R/W Attribute	R0, WX							R/W
Protection Attribute	WP							
Initial Value	00000000							0

[bit31:24] SYN: Syndrome

This bit holds syndrome when a 1-bit error is detected. If a 1-bit error is detected in both the upper 64 bits and lower 64 bits when 128-bit read access is performed, syndrome for the error detected in the lower 64 bits is stored. Use the value of bit3 in the TCFCFG_FECCEAR register to determine whether the syndrome stored in this field is detected in the upper 64-bits or lower 64 bits.

[bit23:17] Reserved: Reserved Bits

[bit 16] SECINT: 1-Bit Error Correction Interrupt

This bit indicates whether there is a 1-bit error correction interrupt request. A 1-bit error correction interrupt request is generated if a 1-bit error is detected with the ECC inspection during reading, and is corrected. Flash ECC is generated and detected for every 64bits. Note that if a read operation with the size of is 32-bit wide or less is performed, and an ECC error exists in other byte lanes than the read address, this bit is still set. This is a read-only bit. This bit is cleared by writing "1" to the SECIC bit in the same register.

SECINT	Description
0	No 1-bit error correction interrupt request is generated.
1	A 1-bit error correction interrupt request is generated.

[bit15:9] Reserved: Reserved Bits

[bit 8] SECIC: 1-Bit Error Correction Interrupt Clear

SECIC	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the SECINT bit in the same register.

[bit7:1] Reserved: Reserved Bits

[bit 0] SECIE: 1-bit Error Correction Interrupt Enable

SECIE	Description
0	Disable generation of 1-bit error correction interrupt request.
1	Enable generation of 1-bit error correction interrupt request.

5.9. TCFLASH ECC Error Address Register: TCFCFG_FECCEAR (TCFLASH ECC Error Address Register)

This register retains the address at which a 1-bit error is detected during reading. If a 1-bit error is detected multiple times, the register retains the address of the error detected last.

This register is read-only. Programming to this register returns a bus error.

bit	31	0
Field	FECCEAR[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] FECCEAR[31:0]: Error Address

These bits hold an address (word address) at which a 1-bit error is detected in the ECC check when read accessed. If an error is detected multiple times, they retain the address of the error detected last. Flash ECC is generated and detected for every 64bits. Note that if a read operation with the size of is 32-bit wide or less is performed, and an ECC error exists in other byte lanes than the read address, the address of the read operation is retained in this register.

If a 1-bit error is detected in both the upper 64 bits and lower 64 bits when 128-bit read access is performed, the address of the lower 64 bits is stored.

5.10. TCFLASH Uncorrectable Error Detection Interrupt Register: TCFCFG_FUCEDIR (TCFLASH Un-Correctable Error Detection Interrupt Register)

This register holds status flags and clear bits concerning the uncorrectable error detection interrupt.

bit	31	30	29	28	27	26	25	24
Field	SYN							
R/W Attribute	R, WX							
Protection Attribute	WP							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved							UCEDINT
R/W Attribute	R0, WX							R, WX
Protection Attribute	WP							
Initial Value	00000000							0

bit	15	14	13	12	11	10	9	8
Field	Reserved							UCEDIC
R/W Attribute	R0, WX							R0, W
Protection Attribute	WP							
Initial Value	00000000							0

bit	7	6	5	4	3	2	1	0
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	WP							
Initial Value	00000000							

[bit31:24] SYN: Syndrome

This bit holds syndrome when a 2-bit error is detected. If an uncorrectable error is detected in both the upper 64 bits and lower 64 bits when 128-bit read access is performed, syndrome for the error detected in the lower 64 bits is stored. Use the value of bit3 in the TCFCFG_FUCEAR register to determine whether the stored syndrome is for an error that occurred in the upper 64 bits or an error that occurred in the lower 64 bits.

[bit23:17]: Reserved Bits

[bit16] UCEDINT: Uncorrectable Error Detection Interrupt

This bit indicates whether an uncorrectable error detection interrupt request exists. An uncorrectable error detection interrupt request is generated if an uncorrectable error is detected in the ECC check at read access. This bit is read-only. The value written in this bit has no meaning. This bit is cleared by writing "1" to the UCEDIC bit in this register.

UCEDINT	Description
0	Indicate that an uncorrectable error detection interrupt request is not generated.
1	Indicate that an uncorrectable error detection interrupt request is generated.

[bit15:9] Reserved: Reserved Bits

[bit8] UCEDIC: Uncorrectable Error Detection Interrupt Clear

UCEDIC	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the UCEDINT bit in this register.

"0" is always read from this bit.

[bit7:0] Reserved: Reserved Bits

5.11. TCFLASH Uncorrectable Error Address Register: TCFCFG_FUCEAR (TCFLASH Un-Correctable Error Address Register)

This register holds an address (word address) at which an uncorrectable error is detected when read accessed. If multiple uncorrectable errors are detected, it holds the address at which the error is detected last. If an uncorrectable error is detected in both the upper 64 bits and lower 64 bits when 128-bit read access is performed, the address of the lower 64 bits is stored.

This register is read-only. Programming to this register returns a bus error.

bit	31	0
Field	UCEA[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit 31:0] UCEA[31:0]: Uncorrectable Error Address

These bits indicate the address at which an uncorrectable error is detected in the ECC check at read access. If multiple errors are detected, they hold the address at which the error is detected last.

5.12. TCFLASH TCM Buffer Region Configuration Register: TCFCFG_BRCFG (TCFLASH Buffer Region Configuration Register)

This register configures the range of the TCM buffer region. When the content of this register is changed, it is necessary to intentionally clear the entire TCM buffer region.

bit	31	16
Field	REGION_END_BUF[15:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00010000	

bit	15	8
Field	SSEC[7:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000	

bit	7	5	0
Field	ESEC[7:0]		
R/W Attribute	R/W		
Protection Attribute	WPS		
Initial Value	11111111		

[bit31:16] REGION_END_BUF[15:0]: TCM Buffer Word Number of Region End

These bits set the TCM buffer word number of this region end. The first of this region end is set to "0". If REGION_END_BUF is set to "8", it uses up to TCFCFG_TCMBUF0 to TCFCFG_TCMBUF7.

[bit15:8] SSEC[7:0]: Starting Bufferable Sector Number

These bits set the starting sector number that can be buffered by this TCM buffer region. This sector is included in the bufferable sectors. (Big and small sectors shall not be differentiated, but shall be set using numbers.) Set $SSEC \leq ESEC$.

[bit7:0] ESEC[7:0]: Ending Bufferable Sector Number

These bits set the ending sector number that can be buffered by this TCM buffer region. This sector is included in the bufferable sectors. (Big and small sectors shall not be differentiated, but shall be set using numbers.) When a sector number larger than the number mounted is set, the largest mounted sector number is used. Set $SSEC \leq ESEC$.

5.13. TCFLASH TCM Buffer Region Attribute Register: TCFCFG_BRAT (TCFLASH Buffer Region Attribution Register)

This register configures the attributes of the TCM buffer region. When the content of this register is changed, it is necessary to intentionally clear the TCM buffer region in the region.

bit	31	24
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000	

bit	23	16
Field	Reserved	VCLR
R/W Attribute	R0, WX	R0, W
Protection Attribute	WPS	
Initial Value	00000000	0

bit	15	9	8
Field	Reserved		AM[1:0]
R/W Attribute	R0, WX		R/W
Protection Attribute	WPS		
Initial Value	000000		00

bit	7	0
Field	Reserved	RGEN
R/W Attribute	R0, WX	R/W
Protection Attribute	WPS	
Initial Value	00000000	1

[bit31:17] Reserved: Reserved Bits

[bit 16] VCLR: TCM Buffer Region Intentional Clear

VCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit performs the following operations. Instruct to clear the entire relevant TCM buffer region. All the buffers become invalid and the buffer pointer returns to its beginning.

[bit15:10] Reserved: Reserved Bits

[bit 9:8] AM[1:0]: Buffer Policy for TCM Buffer Region

AM[1:0]	Description
00	Buffer all the data that enters the access wait state. Although this consumes a considerable amount of buffers, if a short loop occurs frequently, TCM throughput can be expected to be higher than FLASH macro theoretical throughput.
01	Buffer the first 2 pieces of data in the non-consecutive address. This is targeting the TCM throughput that is close to FLASH macro theoretical throughput.
10	Lock the buffer region. The buffer contents can be accessed only by directly writing to the buffer register and are not changed by any other means. In the TCM buffer region, in which this lock mode is set, TCFCFG_BRCFG:SSEC[7:0] and TCFCFG_BRCFG:ESEC[7:0] have no meaning. Intentional care for coherency is required.
11	Reserved

[bit7:1] Reserved: Reserved Bits

[bit 0] RGEN: TCM Buffer Region Enable

RGEN	Description
0	The relevant buffer region does not function.
1	The relevant buffer region functions.

5.14. TCFLASH TCM Buffer Register: TCFCFG_TCMBUF0 to 15 (TCFLASH Buffer0 to 15)

This register reads/writes the TCM buffer itself. It is a 256-bit register. There are 16 registers. Programming/erasing FLASH clears the TCM buffer register. Use 32-/64-bit access for programming of the TCM buffer register only when TCFCFG_BRAT:AM = 10. Other programming causes a bus error response. Program when TCFCFG_BRAT:RGEN = 0 (TCM buffer is disabled).

When TCFCFG_BRAT:AM = 00/01, the data buffered with TCM can be read. When TCFCFG_BRAT:AM = 10 (Lock mode), a user can intentionally set the TCM buffer content.

bit	127	0
Field	BUFDATA[127:0]	
R/W Attribute	R,W	
Protection Attribute	WPS	
Initial Value	ALL0	

bit	239	161	160	159	152	151	132	131	128
Field	Reserved		BVALID	Reserved		BUFADDH[23:4]		BUFADDL[3:0]	
R/W Attribute	R0, WX		R,W	R0, WX		R,W		R0, WX	
Protection Attribute	WPS					WPS			
Initial Value	ALL0					0x800000			

bit	255	240
Field	ECC_PARITY[15:0]	
R/W Attribute	R,W	
Protection Attribute	WPS	
Initial Value	ALL0	

[bit127:0] BUFDATA[127:0]: Data Value of TCM Buffer

These bits are data to be buffered. If TCFCFG_BRAT:AM is in lock mode, these bits do not function unless they are intentionally set. It is necessary to rewrite when TCM is not read. In addition, do not set the same address to multiple buffers.

Do not program if not in lock mode.

[bit131:128] BUFADDL[3:0]: Buffer Address Lower Bit

These are the lower 4 bits that are implicitly 0 bits because the buffer address is 128-bit data.

[bit151:132] BUFADDH[23:4]: Buffer Address Upper Bit

These are the upper 20 bits of the buffer address. These bits indicate the address that uses buffering. To use in lock mode, do not set the same address to multiple buffers.

Note:

- See the following table for the initial value of BUFADDH[23:4] and BUFADDL[3:0].

TCFLASH memory size	Initial value of BUFADDH[23:4] and BUFADDL[3:0]
1MB	0x900000
2MB	0x800000
4MB	0x800000

[bit159:152] Reserved: Reserved Bits

[bit160] BVALID: Buffer Valid

This bit indicates that the buffer address and data are valid.

[bit239:161] Reserved: Reserved Bits

If 32-bit programming is performed in [bit 223:192], it causes a bus error response.

[bit255:240] ECC_PARITY: Parity Value of TCM Buffer

This is the parity value of buffered data. To use in lock mode, this must be set by using software for the calculation.

6. Others

This section explains precautions on the use of TCFLASH.

Handling of Values Read from Reserved Bits

"0" is read from the reserved bits that exist in registers in TCFLASH. However, do not allow the values read from the reserved bits to have meanings when programming, from the standpoint of software compatibility with the future products.

Reset during Execution of Program or Erase Operation

If this LSI is reset during execution of the program operation, the contents of the target address are shown as undefined. If it is reset during execution of the sector erase operation, the contents of the target sector are shown as undefined. In these cases, following steps should be done.

1. erase the sector.
2. re-program the sector

Instruction Fetch from Flash Memory

During execution of the program or erase operation, you cannot read data from TCFLASH. Therefore, you must copy the required data or program from TCFLASH to RAM before starting the program or erase operation so that you do not need to read them while the operation is being executed.

Wait for Reset Completion from Software

Flash memory is reset by writing "1" to the SWFRST bit in the TCFCFG_FCFGR register. If the flash memory is reset, be sure to wait for reset completion by monitoring the RDY bit in the TCFCFG_FSTAT register in the unit that executes reset before accessing the memory.

To generate software reset, the program enable (TCFCFG_FCFGR:WE) bit must be "1". Software reset cannot be generated without program enable. If software reset cannot be generated, it causes a bus error response.

Suspend Command

After the suspend command is issued, do not read flash memory until the RDY bit in the status register becomes "1".

When 1-bit ECC error is detected

When the CPU accesses the TCFLASH via TCM and detected 1-bit ECC error with the default setting, it tries to re-write the 1-bit-error-corrected data to the same address by the hardware. But TCFlash cannot be written. So it results to the data abort.

Note:

TCFLASH Status Register Bits

Since some status information of flash memory is common to Code side (TCFLASH) and Work side (WorkFLASH) in Dual Port FLASH macro,

TCFLASH status register bits listed below are affected by WorkFLASH operation in addition to TCFLASH operation:

- TCFCFG_FSTAT.ESPS*
- TCFCFG_FSTAT.ERSEC*
- TCFCFG_FSTAT.RDY*
- TCFCFG_FSTAT.HANG*
- TCFCFG_FSTAT.RDYINT*
- TCFCFG_FSTAT.HANGINT*

Use these bits only when program/erase is performed in TCFLASH.

7. Support for Dual Port Flash Macro

This section explains restrictions when using a dual port flash macro as a flash macro.

Difference from the Case where Single Port Flash Macro is Used

- TCFLASH uses ports on the code side of the dual port flash.
- Since the programming/erasing circuit is shared with the Work side, some operation at the Work side affects the Code side.

Software control that keeps the foregoing in mind is necessary.

Whether the Code Side and Work Side of a Dual Port Macro can be Executed at the Same Time

	Code:Read/NOP Work:Read/NOP	Code:Read/NOP Work:PGM/ERS	Code:PGM/ERS Work:Read/NOP	Code:PGM/ERS Work:PGM/ERS
Operation enabled/disabled	OK	OK	OK	NG

Access of Dual Port to Code and Work Sides

The flash destinations that each interface accesses are described.

7. Secure Hardware Extension (SHE) Support
8. Dual Port FLASH Macro Support

WORKFLASH-TXXPT03P01R01L07-E1-XX

1. Overview

This section provides an overview of WorkFLASH.

WorkFLASH is rewritable, non-volatile data memory with a built-in MCU.

Some features of WorkFLASH are listed below.

- Enables reading in units of 8/16/32/64 bits.
- Provides an ECC (SEC/DED) function. (64bit ECC)
- Enables switching between the enabled and disabled states of the ECC function through a register setting.
- Enables switching between ECC-enabled access and ECC-disabled access by using two mirror areas.
- Enables writing in units of 64 bits when ECC is enabled. In any attempt to write with a width of less than 64 bits when ECC is enabled, WorkFLASH reads the corresponding 64-bit data first and then replaces the bit portion to be written. After that, it creates 64-bit data, writes the data to be written, and writes the ECC generated from the 64 bits.
- Enables writing in units of 8/16/32/64 bits when ECC is disabled.

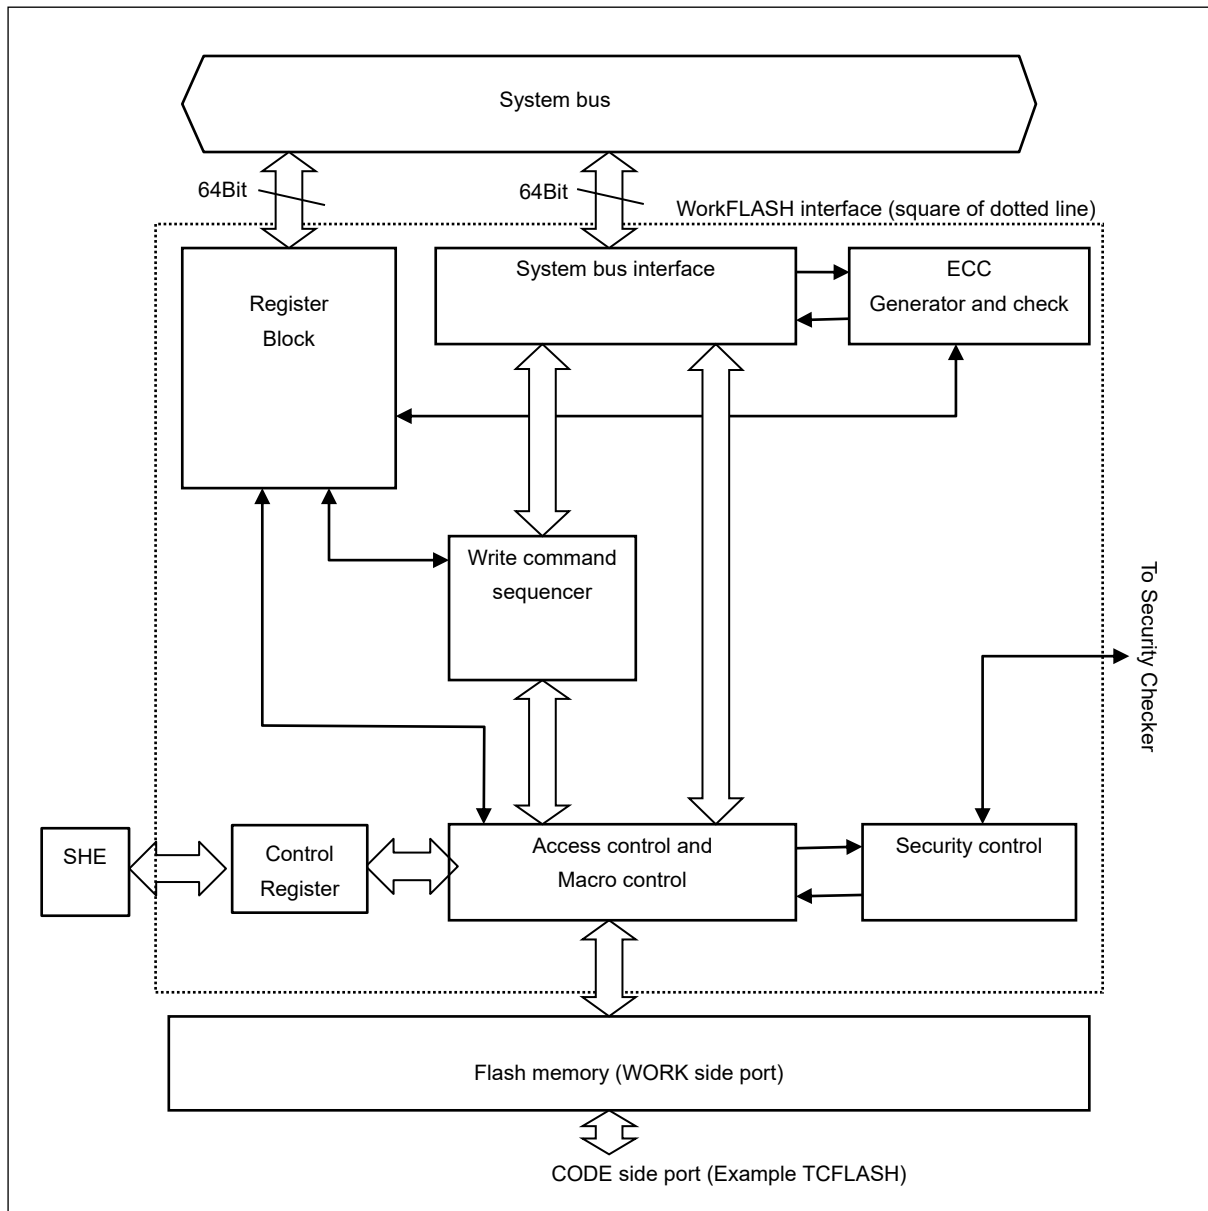

- Equipped with an ECC check circuit test function with error injection.
- Enables writing from not only a CPU but also the DMAC.
- Enables writing from an unprivileged mode.
- Equipped with a control register setting protection function using a key code.
- Equipped with a Flash security function for data protection.
- Equipped with a bus error response function for access to reserved areas.
- Enables interrupt generation with writing/erasing completed.
- The Flash security function has a function to protect against writing and erasing in units of sectors. CPU can execute instructions on WorkFLASH in writing or erasing TCFLASH.

2. Configuration

This section explains the configuration within WorkFLASH.

2.1. Block Diagrams

Figure 2-1 Block Diagram of WorkFLASH

2.2. Address/Sector Maps in User Mode

This section explains WorkFLASH address/sector maps in user mode.

In the products in this series, 48 KB/112 KB/240 KB WorkFLASH is mounted depending on the model. (In this model, (product specification) KB WorkFLASH is mounted.)

WorkFLASH has the addresses placed on the memory map in a 4-MB area between 0x0E000000 and 0x0E3FFFFF. As shown in Figure 2-2, this area is further divided into four mirror areas.

Mirror area 1 is an area provided for access to WorkFLASH via ECC logic.

When WorkFLASH is read via mirror area 1 with ECC enabled for the unit to be read, an ECC check is performed. If the check detects a 1-bit error, the error is corrected. If it detects an error of 2 or more bits, a bus error response is made. However, in cases where ECC is disabled, the ECC check, error detection, and correction are not performed. In these cases, even if there is an error, no action such as error correction and bus error response is taken for it. When writing to WorkFLASH via mirror area 1 with ECC enabled for the unit to be written, an ECC is generated and written. WorkFLASH can generate an ECC for only 64-bit data, so for any attempt to write 8/16/32 bits via mirror area 1 with ECC enabled, WorkFLASH reads the corresponding 64-bit data and then replaces the relevant 8/16/32-bit data to create new 64-bit data. Based on this, an ECC is generated and written at the same time.

Mirror area 2 is entirely a reserved area. For this reason, WorkFLASH makes a bus error response for any attempt to read and write or erase data in mirror area 2.

Mirror area 3 is an area provided for access to WorkFLASH by bypassing ECC logic. If WorkFLASH is read via mirror area 3, the ECC check and error detection are not performed. Therefore, even if an error occurs, there is neither the 1-bit error correction nor the bus error response associated with the detection of an error of 2 or more bits. If writing is performed via mirror area 3, no ECC is generated and written regardless of whether ECC is enabled or disabled.

Mirror area 4 is a read-only area that is set up for reading with Normal memory attribute access. If writing is attempted, WorkFLASH makes a bus error response.

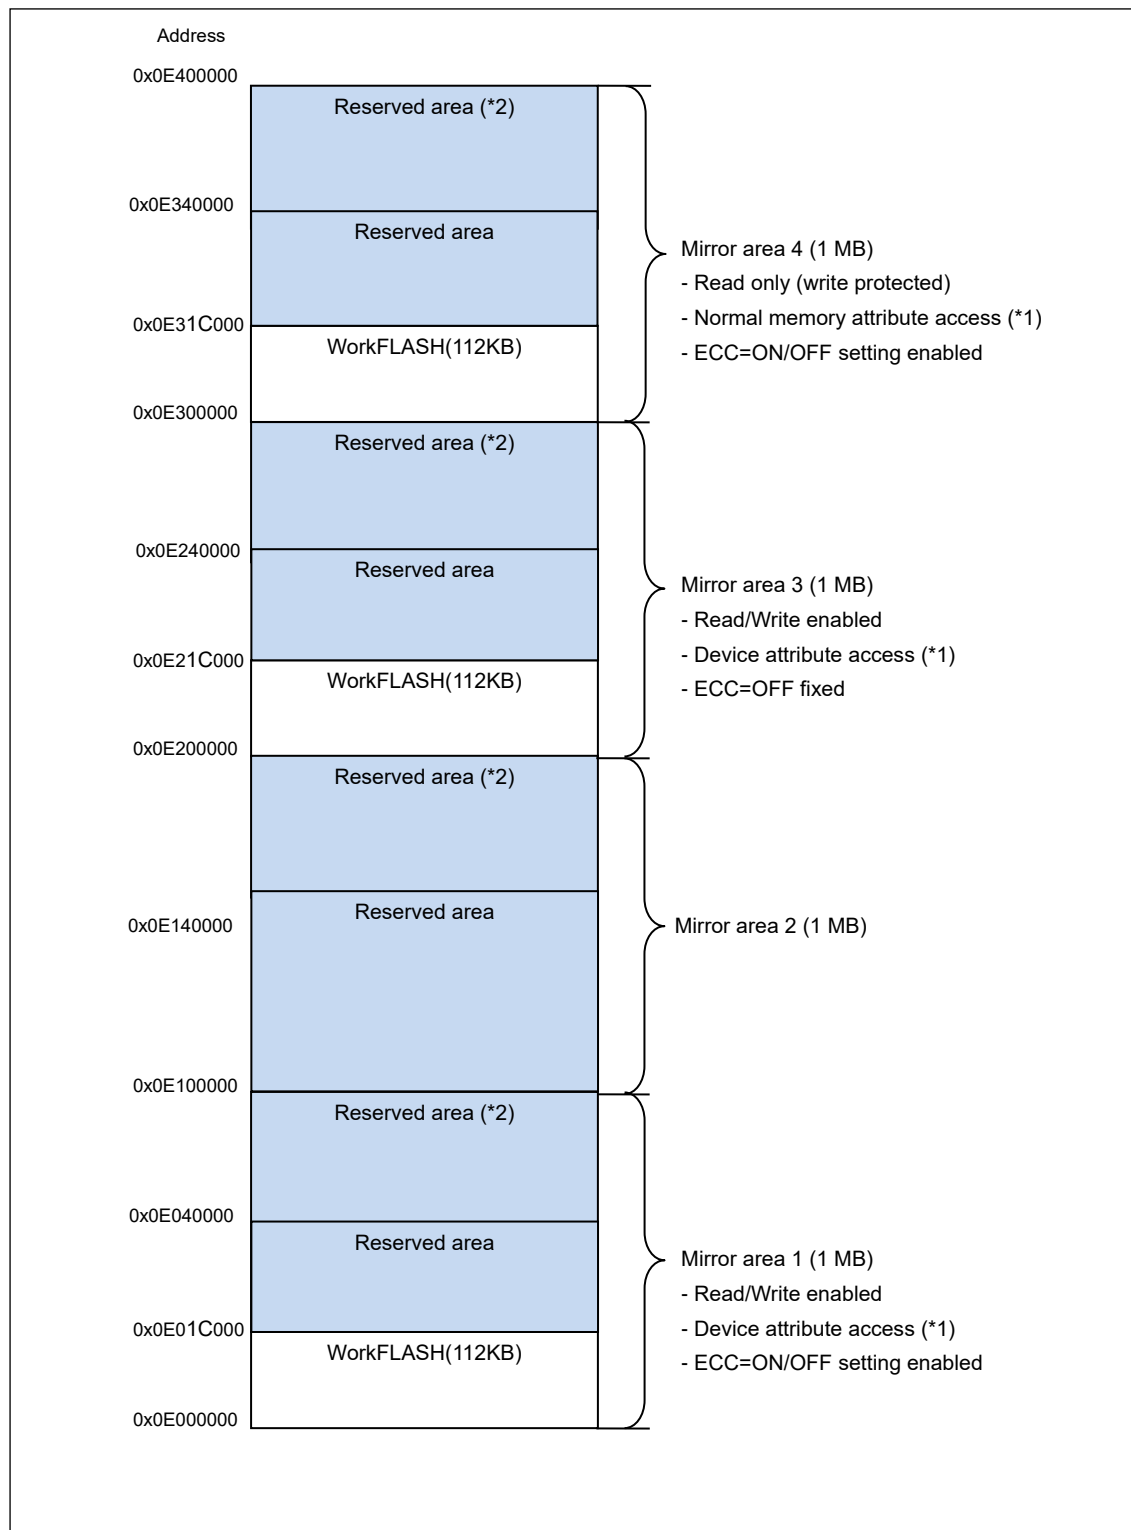

For reading and writing, the access attributes for each mirror area must be set in the MPU. See Figure 2-2.

A single WorkFLASH has an area of 48 KB (or 112 KB or 240 KB depending on the assembly). The 48-KB area consists of 6 small sectors (or 14 or 30 sectors depending on the assembly), and the size of each small sector is 8 KB. These sectors are placed as shown in Figure 2-3. Their places in an overall address map are shown in Figure 2-2.

The following table shows the purpose for each area.

Area Number	Read Operation	Write Operation
Mirror area 1	Normal read	Write the value with ECC calculated
Mirror area 2	Reserved area (access prohibited)	Reserved area (access prohibited)
Mirror area 3	Normal read	Write the value without ECC
Mirror area 4	Normal memory attribute read	Access prohibited

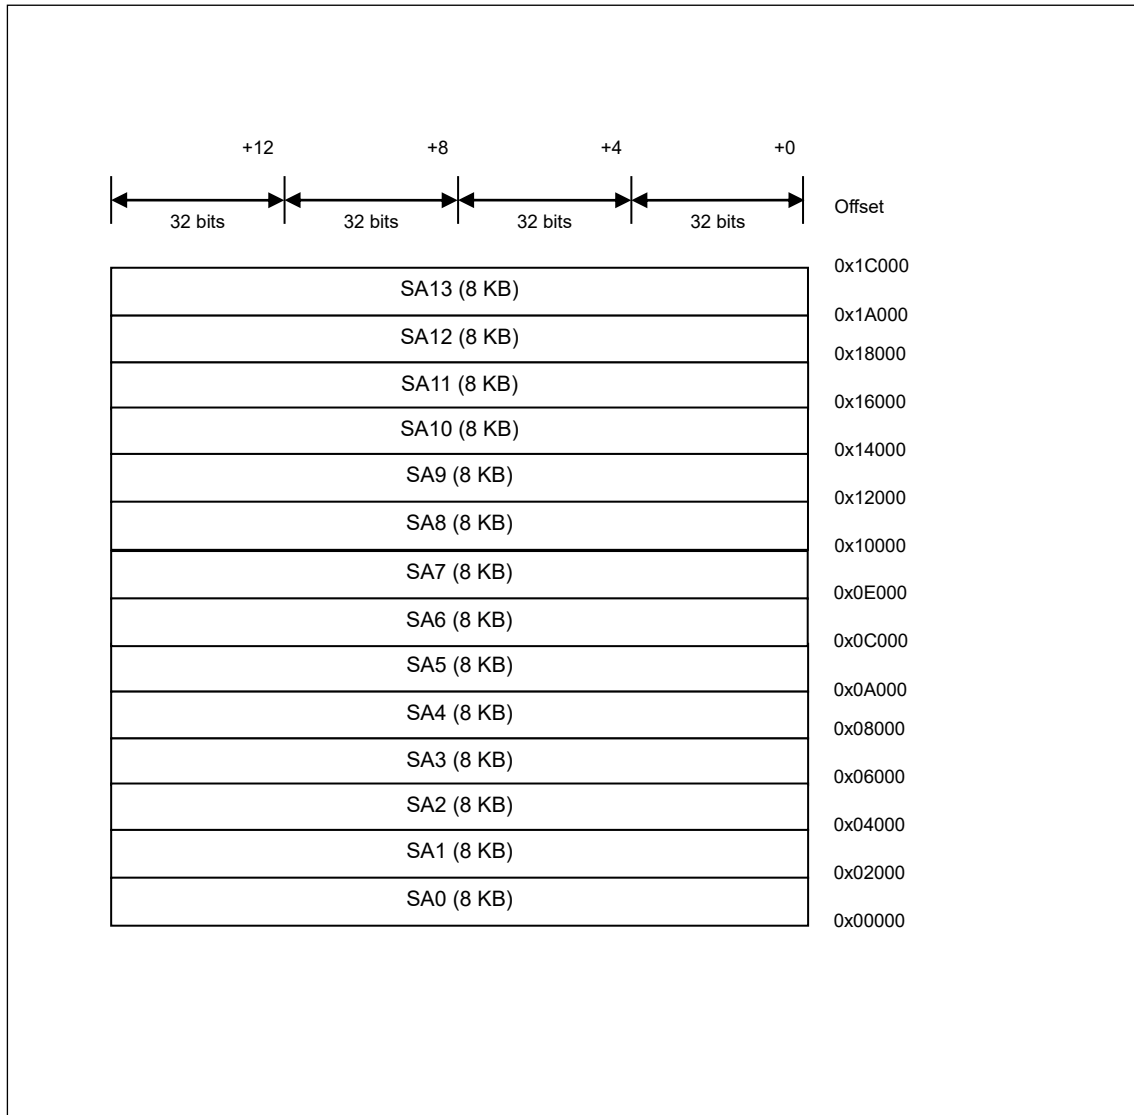

* In order to perform read and write operation as shown above, the access attribute has to be configured for each mirror area by MPU.

Figure 2-2 Address Map of WorkFLASH in User Mode

(*1) Access attributes for each mirror area must be set in the MPU.

(*2) Accessing this region results in a bus error, but the reserved area access bit (WFCFG_BERR:RESA) is not set.

Figure 2-3 Sector Configuration of WorkFLASH in User Mode

3. Explanation of Operation

This section explains the operation of WorkFLASH.

3.1. Read

Reading from WorkFLASH can be done with a size of 8 bits/16 bits/32 bits/64 bits.

However, if reading is attempted while the command sequencer is operating, WorkFLASH makes a bus error response.

If reading is attempted from an existing reserved area inside mirror areas 1 to 4, WorkFLASH makes a bus error response. Thus, any attempt by software to read a reserved area causes a data abort to occur.

If the ECCOFF bit in the WFCFG_ECR register is "0", an ECC check is performed during reading via mirror area 1 or 4. If the check finds a 1-bit error, the error is corrected, and the reading itself ends normally. The detection of the 1-bit error can be posted with an interrupt. If the check detects a 2-bit error, WorkFLASH makes a bus error response.

No ECC check is performed for reading via mirror area 3. The value of the ECCOFF bit in this WFCFG_ECR register in such cases has no significance.

3.2. Write and Erase

When data is written to an address that is not in a reserved area of mirror area 1 or mirror area 3, the WorkFLASH hardware automatically sends the programming access sequence of the write command to Flash memory.

Overwriting of the same data bit is prohibited. (Even overwriting of 1 -> 0, 0 -> 0, or 1 -> 1 is also prohibited.)

After erase operation is completed, all the values of the flash memory cells in the target sectors are "1". The Flash security function does not allow writing and erasing of protected sectors. For details, see the security specifications. If any of these sectors is written to or erased, a bus error response is made.

If the ECCOFF bit in the WFCFG_ECR register is "0", WorkFLASH generates and writes an ECC for 64-bit writing via mirror area 1. In any attempt to write with a width of less than 64 bits, WorkFLASH reads the corresponding 64-bit data first and then replaces the bit portion to be written. After that, it creates 64-bit data, write the data to be written, and writes the ECC generated from the 64 bits.

WFCFG_WSR :ST[1:0]	00	01	01	10	00
Mirror area 1 (ECCOFF=0) 8/16/32-bit Write	IDLE	64-bit data Read	Write command being issued	Write command completion wait	IDLE
Mirror area 1 (ECCOFF=0) 64-bit Write	IDLE	-	Write command being issued	Write command completion wait	IDLE

If the ECCOFF bit in the WFCFG_ECR register is "1", writing is performed without reading and replacement of data, even when attempting to write in 8/16/32/64 bits to mirror area 1. An ECC is not generated and written.

For mirror area 3, writing with a size of 8/16/32/64 bits is possible. However, in writing via mirror area 3, no ECC is generated and written.

WFCFG_WSR :ST[1:0]	00	01	10	00
Mirror area 1 (ECCOFF=1) 8/16/32/64-bit Write	IDLE	Write command being issued	Write command completion wait	IDLE
Mirror area 3 8/16/32/64-bit Write	IDLE	Write command being issued	Write command completion wait	IDLE

Normally, for writing with an ECC and with a size of 32 bits or less, first write the 64-bit part by using mirror area 3. After that, write the last bit portion together with the ECC, by writing in mirror area 1. For the writing procedure, see "4.3 Writing Procedure."

Example: Writing [15:0] in area 3 -> Writing [31:16] in area 3 -> Writing [63:32] in area 1

An erase operation is executed with the ERS[7:0] bits in the WFCFG_SEQCM register specifying the sector to erase, and the OPC[2:0] bits specifying the erase operation.

The suspend and resume operations for sector erase are also specified in the OPC[2:0] bits to suspend and resume sector erase.

The command sequencer can handle one write operation at a time. If another write request is received during execution of the write command sequence, a bus error response is made. While the write command sequence is not being executed, the value of the ST[1:0] bits in the WFCFG_WSR register is "00".

If a hang up is detected when the command sequencer is operating during writing or sector erase, the command sequencer automatically performs a reset for the FLASH macro to restore operation. Furthermore, the OPC[1:0] bits can also execute the read/reset command.

3.3. Transfer of Write Data with DMA

WorkFLASH enables writing by DMA transfer.

When the DMAEN bit in the WFCFG_WCR register is "1", a DMA transfer request is generated each time that the write command sequencer becomes idle (the ST[1:0] bit of the WFCFG_WSR register is "00").

The command sequencer can use DMA transfer in block mode. However, for DMA transfer of data to the command sequencer, use block mode DMA transfer with a block size of 64 bits.

Notes:

- *If DMA transfer stops because of an error, follow the processing flow below.*
 1. *The detection of an error in WorkFLASH cancels a DMA transfer, but a WorkFLASH DMA transfer request is asserted again.*
(Any write data that is written immediately before the error is detected is not guaranteed after the error is detected.)
 2. *A WorkFLASH interrupt request is asserted.*
 3. *From the CPU, write DMAEN="0" (DMA transfer release) in the WFCFG_WCR register.*
 4. *After step 3, WorkFLASH DMA transfer requests are disabled (initialized state).*
(To perform a DMA transfer after step 4, set and perform it from the beginning.)

3.4. Inserting a Wait Cycle

Since WorkFLASH and TCFLASH use the same Dual Port Flash memory, the FAWC bit setting in the TCFCFG_FCFGR register can insert a wait cycle at the Flash memory access time. (See "4.1 Setting Wait Cycle Count" and "5.2 TCFLASH Configuration Register: TCFCFG_FCFGR" in the TCFLASH specifications.)

3.5.2. Syndrome Calculation

During reading, the 8-bit check bits CB[7:0] are calculated from the data [63:0] read from Flash memory, according to the calculation formulas shown in Table 3-1. The calculated check bits are used together with the check bits EDOR[7:0] read from Flash memory to generate a syndrome S[7:0] according to the calculation formulas shown in Table 3-2.

Table 3-2 Syndrome Calculation Formulas

Bit	Calculation Formula
S[7]	$\sim (CB[7] \wedge EDOR[7])$
S[6]	$\sim (CB[6] \wedge EDOR[6])$
S[5]	$\sim (CB[5] \wedge EDOR[5])$
S[4]	$\sim (CB[4] \wedge EDOR[4])$
S[3]	$(CB[3] \wedge EDOR[3])$
S[2]	$(CB[2] \wedge EDOR[2])$
S[1]	$\sim (CB[1] \wedge EDOR[1])$
S[0]	$\sim (CB[0] \wedge EDOR[0])$

3.5.3. Error Detection

Based on the calculated value of syndrome $S[7:0]$, the following decision is made: "no error detected," "1-bit error detected," "2-bit error detected," or "error of 3 or more bits detected." Table 3-3 shows the relationship between syndrome values and decision results. The meanings of symbols used in the table are as follows.

- "+" : No error is detected.
- "C[n] ($0 \leq n \leq 7$)" : A 1-bit error is detected. The value of the check bit CB[n] is erroneous.
- "[m] ($0 \leq m \leq 63$)" : A 1-bit error is detected. The value of the data bit D[m] is erroneous.
- "T" : A 2-bit error is detected. It cannot be corrected.
- "M" : An error of 3 or more bits is detected. It cannot be corrected.

The 1-bit errors can be detected in all cases, and they can be corrected. The 2-bit errors can be detected in all cases, but they cannot be corrected. The errors of 3 or more bits may be detected in some cases, as shown in Table 3-3. However, they cannot be detected in all cases. Note that errors of 3 or more bits also cannot be corrected.

Table 3-3 Meanings of Syndrome Values

		Syndrome[7:4]															
		0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

	C	T	23	13	T	M	T	T	M	M	T	T	M	T	7	29	T
	D	M	T	T	M	T	39	61	T	T	55	45	T	M	T	T	M
	E	16	T	T	M	T	M	M	T	T	M	M	T	0	T	T	M
	F	T	M	M	T	32	T	T	M	48	T	T	M	T	M	M	T

3.6. Interrupts

WorkFLASH can generate interrupt requests in cases such as the following.

- When one write or erase operation is completed and the next one can begin
An interrupt request is generated in WorkFLASH when the RDYINT bit in the WFCFG_SR register is "1" and the RDYIE bit in the WFCFG_ICR register is "1".
- When the hang up state is detected
The hang up state resulting from a timeout detected while the command sequencer is operating causes the HANGINT bit in the WFCFG_SR register to change to "1". If the HANGIE bit in the WFCFG_ICR register is "1" at this time, an error interrupt request is generated in WorkFLASH.
- When the ECC logic detects a 1-bit error (correctable)
An interrupt request is generated in WorkFLASH when the SECINT bit in the WFCFG_SECIR register is "1" and the SECIE bit in the WFCFG_SECIR register is "1".
- When write enable can be obtained
The WERSTS bit in the FCFG_WARBR register is set to "1" when write enable is released and can be obtained from TCFLASH, WorkFLASH or SHE. A write enable release interrupt request is generated at this time.

3.7. Bus Error Response

WorkFLASH responds returns bus error responses to invalid bus accesses. The cause of bus errors can be checked with the bus error response status register (WFCFG_BERR). The causes of bus errors are the following.

Error Factor	WFCFG_BERR	
	bit	Field
- Setting the sector number that does not exist, and performing the sector erase.	11	ERSIGN
- Writing to a read-only register.	10	RORW
- Writing to the mirror area 4 (refer next table for detail condition when NWTM flag is set).	9	NWTM
- Command sequencer writes to WorkFLASH or perform a command from WFCFG_SEQCM register (after this action, write operations/commands are ignored) unless the command sequencer is idle. - Performing the sector erase suspend command or read/reset command while Flash is in the sector erase suspend state. - Performing write or read operation to the sector to be erased while Flash is in the sector erase suspend state. - Performing the sector erase suspend command while Flash is in the normal state. - Reading WorkFLASH while the command sequencer is operating.	8	ACCIGN
- Performing write operation to WFCFG_ECR more than once. - Attempting to write to a protected register by performing an invalid register write unlock sequence. The invalid sequences are described specifically below. - Writing to WFCFG_CPR two times in a row - Writing a wrong key value to WFCFG_CPR - Writing to following protected registers in the locked state. - WFCFG_CR - WFCFG_ECR - WFCFG_DBEIR - WFCFG_EEIR	7	ECRWL
- Writing to the registers other than below with unprivileged mode. - WFCFG_WCR - WFCFG_SEQCM - WFCFG_EMENR - WFCFG_ARBCLR - WFCFG_BERRCLR - FCFG_WARBR	6	UNACC
- Accessing the reserved area of WorkFLASH (reserved area in Flash and registers, refer next table for detail condition when RESA flag is set in access to WorkFLASH memory map)	5	RESA
- Setting the sector number that is protected to ERS bit of WFCFG_SEQCM. - Setting the number of last two sectors dedicated to SHE to WFCFG_SEQCM.	4	RWE
- Accessing Flash or registers with the prohibited data width.	2	SIZE
- Performing write or erase operation to the mirror area 1 or mirror area 3 while WE bit of WFCFG_CR is "0". - Performing read/reset command while WE bit of WFCFG_CR is "0". - Performing software reset while WE bit of WFCFG_CR is "0".	1	CRWE
- ECC detects an uncorrectable bit error (bit error of more than one bit).	0	DED

Following table shows occurrence of bus error response in access to each mirror area addresses, with relevant field state in WFCFG_BERR (RESA bit and NWTM bit).

Area		Address	Write access			Read access		
			Bus error response	RESA bit	NWTM bit	Bus error response	RESA bit	NWTM bit
Mirror area 4	Reserved	0x0E3F_FFFF ~ 0x0E34_0000	Yes	Not set	Not set	Yes	Not set	Not set
		0x0E33_FFFF ~ 0x0E32_0000	Yes	Set	Not set	Yes	Set	Not set
		0x0E31_FFFF ~ 0x0E31_C000	Yes	Not set	Set	Yes	Set	Not set
	SA0-13	0x0E31_BFFF ~ 0x0E30_0000	Yes	Not set	Set	No	Not set	Not set
Mirror area 3	Reserved	0x0E2F_FFFF ~ 0x0E24_0000	Yes	Not set	Not set	Yes	Not set	Not set
		0x0E23_FFFF ~ 0x0E22_0000	Yes	Set	Not set	Yes	Set	Not set
		0x0E21_FFFF ~ 0x0E21_C000	Yes	Set	Not set	Yes	Set	Not set
	SA0-13	0x0E21_BFFF ~ 0x0E20_0000	No	Not set	Not set	No	Not set	Not set
Mirror area 2	Reserved	0x0E1F_FFFF ~ 0x0E14_0000	Yes	Not set	Not set	Yes	Not set	Not set
		0x0E13_FFFF ~ 0x0E12_0000	Yes	Set	Not set	Yes	Set	Not set
		0x0E11_FFFF ~ 0x0E11_C000	Yes	Set	Not set	Yes	Set	Not set
	SA0-13	0x0E11_BFFF ~ 0x0E10_0000	Yes	Set	Not set	Yes	Set	Not set
Mirror area 1	Reserved	0x0E0F_FFFF ~ 0x0E04_0000	Yes	Not set	Not set	Yes	Not set	Not set
		0x0E03_FFFF ~ 0x0E02_0000	Yes	Set	Not set	Yes	Set	Not set
		0x0E01_FFFF ~ 0x0E01_C000	Yes	Set	Not set	Yes	Set	Not set
	SA0-13	0x0E01_BFFF ~ 0x0E00_0000	No	Not set	Not set	No	Not set	Not set

3.8. WorkFLASH Access Restrictions

To prevent the data and programs in WorkFLASH from being read by third parties, operations on WorkFLASH are restricted. (For details, see the security specifications.)

4. Setting Procedure

This section explains the WorkFLASH setting procedures.

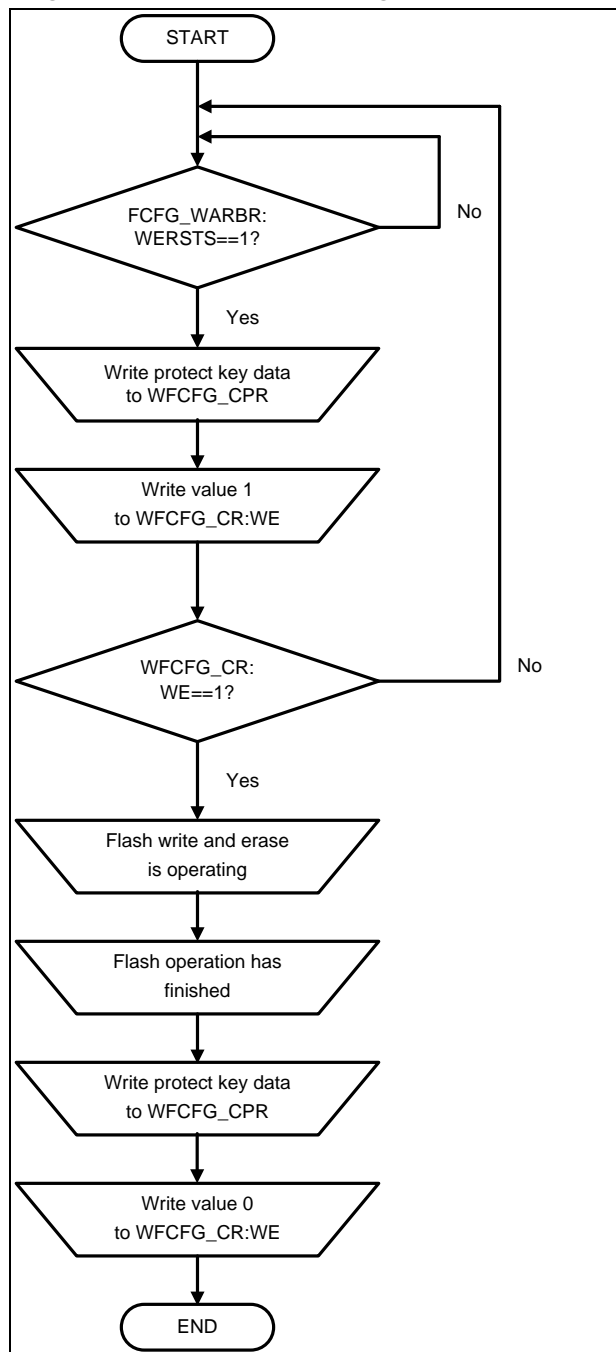

4.1. Setting the Number of Wait Cycles

Since WorkFLASH and TCFLASH use the same Dual Port Flash memory, the FAWC bit setting in the TCFCFG_FCFGR register can insert a wait cycle at the Flash memory access time. For details on how to set it, see "4.1 Setting Wait Cycle Count" in the TCFLASH specifications.

4.2. Enabling Writing

To write data to WorkFLASH or erase its data, the write enable bit of WorkFLASH has to be set. Also, TCFLASH and WorkFLASH as well as SHE in the products cannot be simultaneously written and erased. Therefore, an arbitration function is included for the write enable of Flash interfaces (TCFLASH, WorkFLASH, SHE).

To write from WorkFLASH, write enable must be set through the following procedure.

Figure 4-1 Procedure for Setting Flash Write Enable

You can set write enable by using a write enable release (FCFG_WARBR:WERINT) interrupt instead of monitoring the write enable release status (FCFG_WARBR:WERSTS) bit.

To confirm the completion of Flash program/erase, check that the Programming/erasing ready bit (WFCFG_SR:RDY) has become "1".

If writing and erasing are not required, set the write enable (WFCFG_CR:WE) bit to "0" to allow writing to Flash and erasing of Flash through the TCFLASH interface or SHE.

If write enable is obtained simultaneously, writing is enabled in accordance with the priority below:

1. SHE
2. WorkFLASH
3. TCFLASH

4.3. Writing Procedure

This section provides a procedure for data writing with an ECC attached. To execute writing with an ECC attached in the procedure shown in the figure below, the ECCOFF bit in the WFCFG_ECR register must be "0" (default value). In any attempt to write with a width of less than 64 bits, WorkFLASH reads the corresponding 64-bit data first and then replaces the bit portion to be written. After that, it creates 64-bit data, write the data to be written, and writes the ECC generated from the 64 bits.

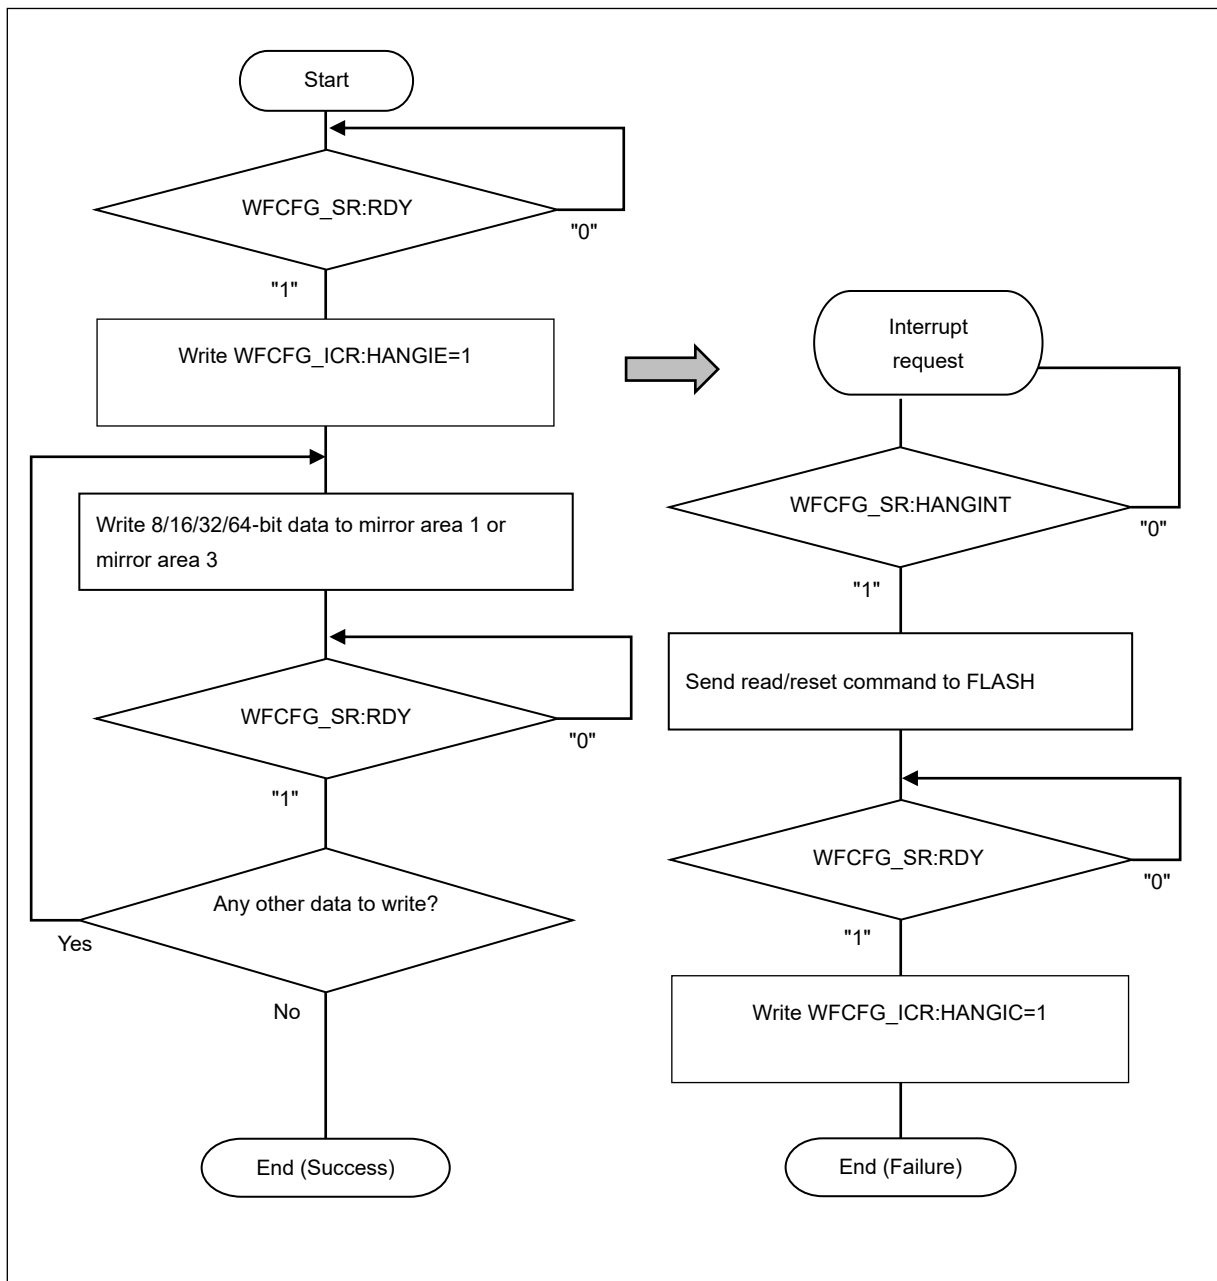

To write only data without attaching an ECC, write the data via mirror area 3 instead of mirror area 1. In the writing via mirror area 3, the data is written but ECC data is not written.

Normally, for writing with an ECC and with a size of 32 bits or less, first write the 64-bit part without the ECC by using mirror area 3. After that, write the last bit portion together with the ECC by writing in mirror area 1. The following shows access for writing with 8/16/32/64 bits when ECC is enabled. Furthermore, the WFCFG_SR register is polled to wait for the completion of writing, as shown in Figure 4-2. Another method of detecting the completion is to use an RDY interrupt.

The Flash security function does not allow writing of protected sectors. For details, see the security specifications.

1. Writing with 64 bits when ECC is enabled
 - 1st time: Address=PA[mirror area 1], Data=PD64[63:0]
2. Writing with 32 bits when ECC is enabled
 - 1st time: Address=PA[mirror area 3], Data=PD32_0[31:0]
 - 2nd time: Address=PA[mirror area 1], Data=PD32_1[63:32]
3. Writing with 16 bits when ECC is enabled
 - 1st time: Address=PA[mirror area 3], Data=PD16_0[15:0]
 - 2nd time: Address=PA[mirror area 3], Data=PD16_1[31:16]
 - 3rd time: Address=PA[mirror area 3], Data=PD16_2[47:32]
 - 4th time: Address=PA[mirror area 1], Data=PD16_3[63:48]
4. Writing with 8 bits when ECC is enabled
 - 1st time: Address=PA[mirror area 3], Data=PD8_0[7:0]
 - 2nd time: Address=PA[mirror area 3], Data=PD8_1[15:8]
 - 3rd time: Address=PA[mirror area 3], Data=PD8_2[23:16]
 - 4th time: Address=PA[mirror area 3], Data=PD8_3[31:24]
 - 5th time: Address=PA[mirror area 3], Data=PD8_4[39:32]
 - 6th time: Address=PA[mirror area 3], Data=PD8_5[47:40]
 - 7th time: Address=PA[mirror area 3], Data=PD8_6[55:48]
 - 8th time: Address=PA[mirror area 1], Data=PD8_7[63:56]

Figure 4-2 Writing Procedure

The time it takes for HANGINT to become “1” is not equal to the Flash max writing time defined in datasheet. For example, when max writing time is defined as 400us in datasheet, it does not indicate HANGINT is set 400us after writing the data. HANGINT is designed so that the time for it to set is relatively longer than the max writing time defined in the datasheet. Hence, do not design the program that expects HANGINT=1 after the max writing time defined in datasheet (the same thing applies to sector erase).

If a write operation fails with HANGINT=1, perform re-writing after erasing the corresponding sector.

4.4. Sector Erasing Procedure

Writing the necessary information in the WFCFG_SEQCM register makes it possible to erase in units of sectors.

The command sequencer starts the sector erase operation on the specified sector as a result of the following. The sector number of the sector to erase has been set in the ERS[7:0] bits, and data with the OPC[2:0] bits set to 0b010 (code representing erase) has been written to the WFCFG_SEQCM register.

The sector erase can be suspended. During the sector erase, the command sequencer starts the sector erase suspend operation on the sector being erased when data with the OPC[2:0] bits set to 0b011 (code representing erase suspend) is written to the WFCFG_SEQCM register.

You can verify the suspension of the sector erase by checking whether the WFCFG_SR:ESPS bit is "1" and the WFCFG_SR:RDY bit is "1". Therefore, before suspending sector erase to write data to WorkFLASH or read its data, verification of the values of these bits is necessary.

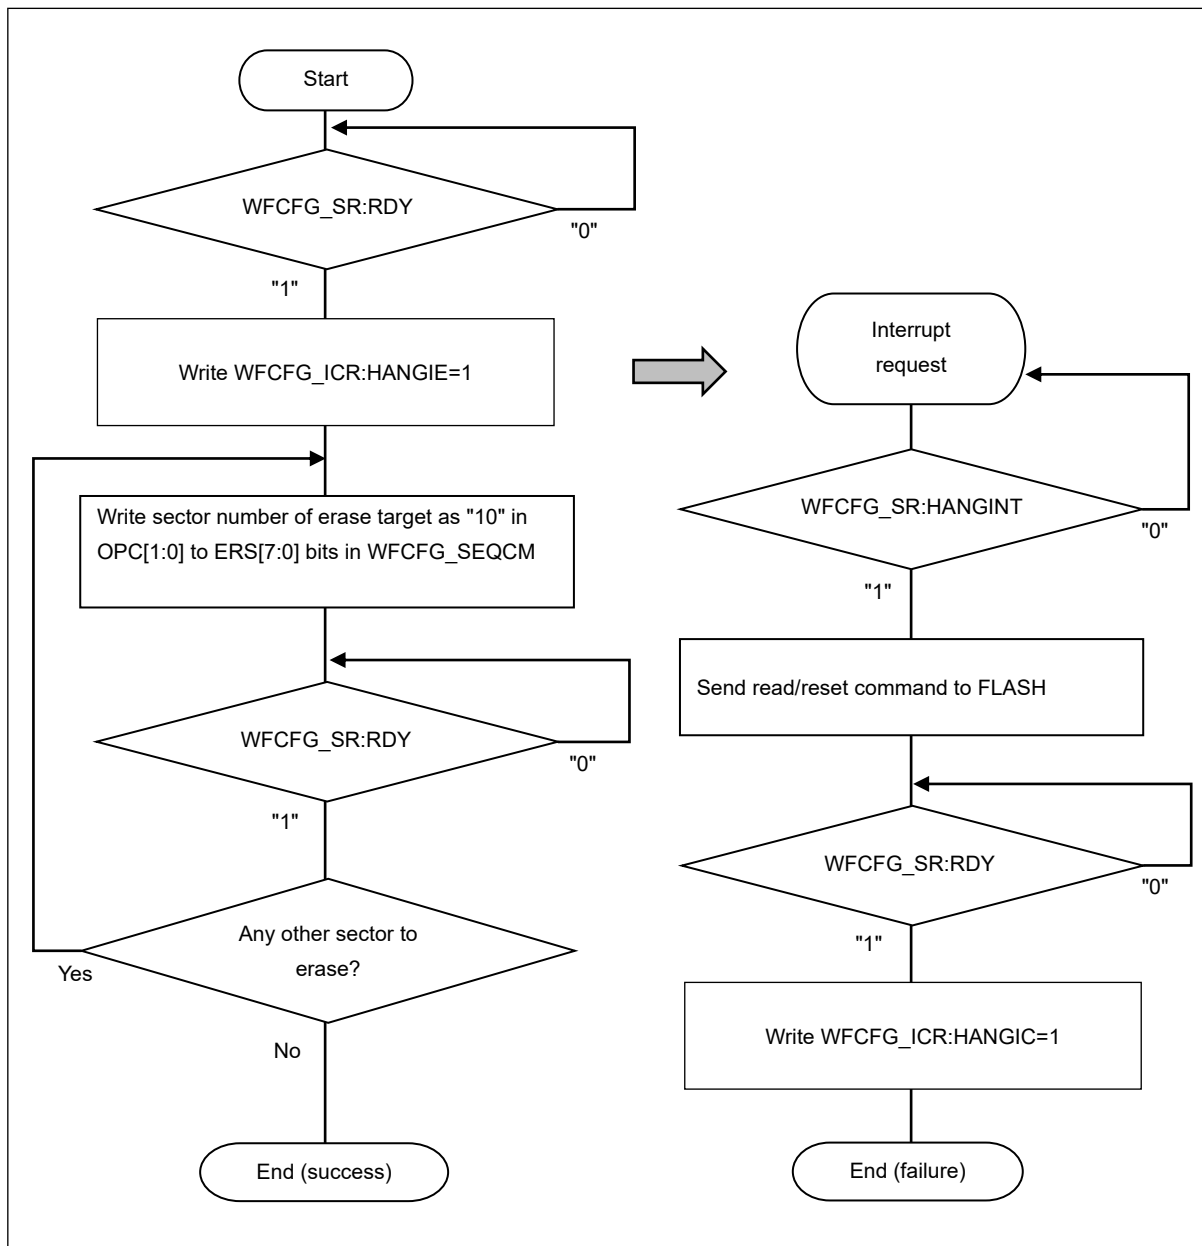

To resume sector erase, the command sequencer starts the sector erase resume operation on the sector of the suspended erase when data that includes 0b010 (code representing erase) is written to the WFCFG_SEQCM register.

You can verify the completion of the sector erase operation by checking whether the value of the RDY bit in WFCFG_SR is "1". You can check the sector erase execution status with the SERS bit and ESPS bit in WFCFG_SR.

You can verify a sector erase timeout with the value of the HANGINT bit in WFCFG_SR.

When sector erase is suspended, sectors other than the sector to be erased can be read and written. The sector to be erased can be neither read nor written.

The Flash security function does not allow erasing of protected sectors. For details, see CHAPTER: Security.

Figure 4-3 Flow of Erasing a Sector

The time it takes for HANGINT to become "1" is not equal to the Flash max sector erase time defined in datasheet. For example, when max sector erase time is defined as 900ms in datasheet, it does not indicate HANGINT is set 900ms after the initiation of sector erase operation. HANGINT is designed so that the time for it to set is relatively longer than the max sector erase time defined in the datasheet. Hence, do not design the program that expects HANGINT=1 after the max sector erase time defined in datasheet.

5. Registers

This section explains the registers in WorkFLASH.

Register List

The register areas of WorkFLASH are in the peripheral function area, and they have a size of 1 KB.

Table 5-1 shows the placement of registers in the register areas.

Table 5-1 Register Map

Abbreviated Register Name	Description	Reference
WFCFG_CPR	WorkFLASH configuration protection key register	5.1
WFCFG_CR	WorkFLASH configuration register	5.2
WFCFG_ECR	WorkFLASH ECC control register	5.3
WFCFG_WCR	WorkFLASH write command sequencer configuration register	5.4
WFCFG_WSR	WorkFLASH write command sequencer status register	5.5
WFCFG_DBEIR	WorkFLASH data bit error injection register	5.6
WFCFG_EEIR	WorkFLASH ECC bit error injection register	5.7
WFCFG_ICR	WorkFLASH interrupt control register	5.8
WFCFG_SR	WorkFLASH status register	5.9
WFCFG_SECIR	WorkFLASH SEC interrupt register	5.10
WFCFG_EEAR	WorkFLASH ECC error address register	5.11
WFCFG_EMENR	WorkFLASH extra mode enable register	5.12
WFCFG_SEQCM	WorkFLASH sequencer command register	5.13
WFCFG_ARBERR	WorkFLASH arbitration error register	5.14
WFCFG_ARBCLR	WorkFLASH arbitration error clear register	5.15
WFCFG_BERR	WorkFLASH bus error response status register	5.16
WFCFG_BERRCLR	WorkFLASH bus error response status clear register	5.17
WFCFG_UCESR	WorkFLASH uncorrectable error status register	5.18
WFCFG_UCEAR	WorkFLASH uncorrectable error address register	5.19
FCFG_WARBR	FLASH write arbitration register	5.20

Table 5-2 Register Memory Map

Offset	Abbreviated Register Name	Description
0x000	WFCFG_CPR 00000000_00000000_00000000_00000000	WorkFLASH configuration protection key register
0x004	-	Reserved area
0x008	WFCFG_CR 00000000_00000000_00000000_00001001	WorkFLASH configuration register
0x00C	WFCFG_ECR 00000000_00000000_00000000_00000000	WorkFLASH ECC control register
0x010	WFCFG_WCR 00000000_00000000_00000001_00000000	WorkFLASH command sequencer configuration register
0x014	WFCFG_WSR 00000000_00000000_00000000_00000000	WorkFLASH command sequencer status register
0x018	-	Reserved area (moved for 64-bit migration)
0x01C	WFCFG_EEIR 00000000_00000000_00000000_00000000	WorkFLASH ECC bit error injection register
0x020	-	Reserved area
0x024	WFCFG_ICR 00000000_00000000_00000000_00000000	WorkFLASH interrupt control register
0x028	WFCFG_SR 00000000_00000000_00000000_00000001	WorkFLASH status register
0x02C	WFCFG_SECIR 00000000_00000000_00000000_00000000	WorkFLASH SEC interrupt register
0x030	WFCFG_EEAR 00000000_00000000_00000000_00000000	WorkFLASH ECC error address register
0x034	-	Reserved area
0x038	WFCFG_EMENR 00000000_00000000_00000000_00000000	WorkFLASH extra mode enable register
0x03C to 0x04C	-	Reserved area
0x050	-	Reserved area
0x054	WFCFG_SEQCM 00000000_11111111_00000000_00000000	WorkFLASH sequencer command mode register
0x058	WFCFG_ARBERR 00000000_00000000_00000000_00000000	WorkFLASH arbitration error register
0x05c	WFCFG_ARBCLR 00000000_00000000_00000000_00000000	WorkFLASH arbitration error clear register
0x060	WFCFG_BERR 00000000_00000000_00000000_00000000	WorkFLASH bus error response status register
0x064	WFCFG_BERRCLR 00000000_00000000_00000000_00000000	WorkFLASH bus error response status clear register
0x068	FCFG_WARBR 00000001_00000000_00000000_00000000	FLASH write arbitration register
0x06C	WFCFG_UCESR 00000000_00000000_00000000_00000000	WorkFLASH uncorrectable error status register

Offset	Abbreviated Register Name	Description
0x070	WFCFG_UCEAR 00000000_00000000_00000000_00000000	WorkFLASH uncorrectable error address register
0x074	-	Reserved area
0x078	WFCFG_DBEIR (lower32) 00000000_00000000_00000000_00000000	WorkFLASH data bit error injection register, lower 32 bits
0x07c	WFCFG_DBEIR (upper32) 00000000_00000000_00000000_00000000	WorkFLASH data bit error injection register, upper 32 bits
0x080 to 0x3FC	-	Reserved area

5.1. WorkFLASH Configuration Protection Key Register: WFCFG_CPR

The WorkFLASH configuration protection key register (WFCFG_CPR) is used to protect the following registers from unintended writing:

- WorkFLASH configuration register (WFCFG_CR)
- WorkFLASH ECC control register (WFCFG_ECR)
- WorkFLASH data bit error injection register (WFCFG_DBEIR)
- WorkFLASH ECC bit error injection register (WFCFG_EEIR)

Before writing to these registers, write the correct configuration protection key value (0xCF6DF1A5) to the WorkFLASH configuration protection key register of the same unit to set the unlock state. When unlocked, writing (setting change) is enabled.

After being unlocked, writing to the above registers is done. Then, it is locked again.

For any attempted writing to the above registers using an invalid procedure, WorkFLASH makes a bus error response. For example, suppose the configuration protection key value is incorrect, or an attempt is made to write to the above registers without unlocking writing. For access with a CPU, a data abort exception is generated because of the bus error response.

Be sure to write 32 bits to the WorkFLASH configuration protection key register.

bit	31	0
Field	CPR[31:0]	
R/W Attribute	R, W	
Protection Attribute	WP	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] CPR[31:0]: Configuration Protection Key

Writing to the following protected registers is unlocked when the correct configuration protection key value (0xCF6DF1A5) is written to this register so that new values can be set:

- WorkFLASH configuration register (WFCFG_CR)
- WorkFLASH ECC control register (WFCFG_ECR)
- WorkFLASH data bit error injection register (WFCFG_DBEIR)
- WorkFLASH ECC bit error injection register (WFCFG_EEIR)

When writing to these registers is unlocked, 0xFFFFFFFF is read from this register. When writing to these registers is locked, 0x00000000 is read from this register.

5.2. WorkFLASH Configuration Register: WFCFG_CR

The WorkFLASH configuration register has the following functions for controlling the Flash memory in WorkFLASH:

- Enabling writing to the Flash memory
- Resetting the Flash memory

The setting of this register can be changed only when the correct configuration protection key value is written to the WorkFLASH configuration protection key register and writing to this register is unlocked.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	WPS							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved							SWFRST
R/W Attribute	R0, WX							R0, W
Protection Attribute	WPS							
Initial Value	00000000							0

bit	15	14	13	12	11	10	9	8
Field	Reserved							WE
R/W Attribute	R0, WX							R, W
Protection Attribute	WPS							
Initial Value	00000000							0

bit	7	6	5	4	3	2	1	0
Field	Reserved						Reserved	Reserved
R/W Attribute	R0, WX						R1, WX	R0, WX
Protection Attribute	WPS							
Initial Value	000000						1	0

[bit31:17] Reserved: Reserved Bits

[bit16] SWFRST: Software Reset

SWFRST	Description
0	There is no effect on operation.
1	Reset the Flash memory and the command sequencer.

When the TCFLASH interface or SHE has obtained write enable, even writing "1" to this bit cannot reset the Flash memory. When write enable has not been obtained, writing "1" to this bit causes a bus error.

If "1" is written to this bit at the same time as write enable is obtained, no reset is issued to the Flash memory. It causes a bus error response. To issue a reset to the Flash memory, write enable must be obtained before the writing of "1" in this bit. For the flow of obtaining write enable, see "4.2 Enabling Writing."

[bit15:9] Reserved: Reserved Bits

[bit8] WE: Write Enable

This bit enables/disables Flash memory writing/erasing. The detection of any writing or erasing of the Flash memory when this bit is "0" causes a bus error response by WorkFLASH.

If another Flash interface has obtained write enable, write enable cannot be set here. In this case, even the writing of "1" would not be reflected, and the read value would be "0". For details on how to set write enable, see 4.2 Enabling Writing.

WE	Description
0	Disable writing and erasing.
1	Enable writing and erasing.

[bit7:0] Reserved: Reserved Bits

This register is used to control the operation of the ECC logic. The setting of this register can be changed only when the correct configuration protection key value is written to the WorkFLASH configuration protection key register and writing to this register is unlocked. You can write this register only once. For any second or subsequent writing to this register, WorkFLASH makes a bus error response (ECRWL).

bit	31	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved							ECCOFF
R/W Attribute	R0, WX							R/W
Protection Attribute	WPS							
Initial Value	00000000							0

This bit enables or disables ECC generation and check by access via mirror area 1 or 4. If ECC generation and check are disabled, no ECC is generated and no ECC check is performed even during access via mirror area 1 or 4.

ECCOFF	Description
0	Generate an ECC and perform an ECC check by access via mirror area 1 or 4 .
1	Neither generate an ECC nor perform an ECC check by access via mirror area 1 or 4.

5.4. WorkFLASH Write Command Sequencer Configuration Register: WFCFG_WCR

This register can set whether to operate the write command sequencer and write using DMA transfer.

bit	31	16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	-	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved							Reserved
R/W Attribute	R0, WX							R/W1
Protection Attribute	-							
Initial Value	00000000							1

bit	7	6	5	4	3	2	1	0
Field	Reserved							DMAEN
R/W Attribute	R0, WX							R/W
Protection Attribute	-							
Initial Value	00000000							0

[bit31:1] Reserved: Reserved Bits

[bit0] DMAEN: DMA Enable

When this bit is "1" and the ST[1:0] bits in the WorkFLASH write command sequencer status register is "00", WorkFLASH generates a DMA transfer request and makes a request to the DMAC for the data to be written next.

DMAEN	Description
0	Do not generate a DMA transfer request.
1	Generate a DMA transfer request.

5.5. WorkFLASH Write Command Sequencer Status Register: WFCFG_WSR

Reading this register can provide information on the status of the write command sequencer.

This register is read-only. Writing to this register returns a bus error response (RORW).

bit	31	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000	

bit	7	6	5	4	3	2	1	0
Field	Reserved						ST[1:0]	
R/W Attribute	R0, WX						R, WX	
Protection Attribute	-							
Initial Value	000000						00	

[bit31:2] Reserved: Reserved Bits

[bit1:0] ST[1:0]: Write Command sequencer Status

These bits represent the status of the write command sequencer. Do not access Flash memory when the write command sequencer is in a state other than the idle state.

ST[1:0]	Description
0b00	Indicates that the write command sequencer is in the idle state.
0b01	Indicates that the write command sequencer is sending a command sequence to Flash memory.
0b10	Indicates that the write command sequencer is waiting for the completion of a Flash memory operation.
0b11	Reserved. This state never occurs.

5.6. WorkFLASH Data Bit Error Injection Register: WFCFG_DBEIR

This register is used to perform an ECC logic operation test by injecting errors into the data bits read from Flash memory.

The setting of this register can be changed only when the correct configuration protection key value is written to the WorkFLASH configuration protection key register and writing to this register is unlocked.

bit	63	0
Field	DBEIR[63:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000_00000000_00000000_00000000_00000000_00000000	

[bit63:0] DBEIR[63:0]: Data Bit Error Injection Location

These bits send a calculated value to the ECC check logic. The value is the exclusive OR of the value in this register and the value of the data bits read from Flash memory. (This is a 64-bit register.)

DBEIR[i] (63≥i≥0)	Description
0	Send the bits at the same location as the data read from Flash memory, to the ECC check logic as they are.
1	Invert the bits at the same location as the data read from Flash memory, before sending them to the ECC check logic.

5.7. WorkFLASH ECC Bit Error Injection Register: WFCFG_EEIR

This register is used to perform an ECC logic operation test (dummy normal test) by injecting errors into the ECC bits read from Flash memory.

The setting of this register can be changed only when the correct configuration protection key value is written to the WorkFLASH configuration protection key register and writing to this register is unlocked.

bit	31	8
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WPS	
Initial Value	00000000_00000000_00000000	
bit	7	6 5 4 3 2 1 0
Field	EEIR[7:0]	
R/W Attribute	R/W	
Protection Attribute	WPS	
Initial Value	00000000	

[bit31:8] Reserved: Reserved Bits

[bit7:0] EEIR[7:0]: ECC Bit Error Injection Location

These bits send a calculated value to the ECC check logic. The value is the exclusive OR of the value in this register and the value of the ECC data read from Flash memory.

EEIR[i] (7 ≥ i ≥ 0)	Description
0	Send the EEIR bits at the same location as the ECC data read from Flash memory, to the ECC check logic as they are.
1	Invert the EEIR bits at the same location as the ECC data read from Flash memory, before sending them to the ECC check logic.

5.8. WorkFLASH Interrupt Control Register: WFCFG_ICR

This register can enable interrupt request generation for each factor and clear an interrupt factor.

bit	31	16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	WP	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved						HANGIC	RDYIC
R/W Attribute	R0, WX						R0, W	R0, W
Protection Attribute	WP							
Initial Value	000000						0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved						HANGIE	RDYIE
R/W Attribute	R0, WX						R/W	R/W
Protection Attribute	WP							
Initial Value	000000						0	0

[bit31:10] Reserved: Reserved Bits

[bit9] HANGIC: Hang Interrupt Clear

HANGIC	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the HANGINT bit in the WFCFG_SR register.

[bit8] RDYIC: Ready Interrupt Clear

RDYIC	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the RDYINT bit in the WFCFG_SR register.

[bit7:2] Reserved: Reserved Bits

[bit1] HANGIE: Hang Interrupt Enable

HANGIE	Description
0	Disable generation of hang interrupt requests.
1	Enable generation of hang interrupt requests.

[bit0] RDYIE: Ready Interrupt Enable

RDYIE	Description
0	Disable generation of ready interrupt requests.
1	Enable generation of ready interrupt requests.

5.9. WorkFLASH Status Register: WFCFG_SR

This register is a read-only register that retains the state of Flash memory and individual interrupt factors. Writing to this register returns a bus error response (RORW).

bit	31	16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	-	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved		WERINT	Reserved	Reserved	Reserved	HANGINT	RDYINT
R/W Attribute	R0, WX		R, WX	R0, WX	R0, WX	R0, WX	R, WX	R, WX
Protection Attribute	-		-	-	-	-	-	-
Initial Value	000		0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved	ESPS	Reserved	SERS	Reserved	Reserved	Reserved	RDY
R/W Attribute	R0, WX	R, WX	R0, WX	R, WX	R0, WX	R0, WX	R, WX	R, WX
Protection Attribute	-	-	-	-	-	-	-	-
Initial Value	00	0	0	0	0	0	0	1

[bit31:13] Reserved: Reserved Bits

[bit12] WERINT: Write Enable Release Interrupt

This register is a mirror of WERINT in "5.20 FLASH Write Arbitration Register: FCFG_WARBR". For details, see the description of the WERINT bit in "5.20 FLASH Write Arbitration Register: FCFG_WARBR"

WERINT	Description
0	No new write enable can be obtained.
1	This indicates that write enable can be obtained.

[bit11:10] Reserved: Reserved Bits

[bit9] HANGINT: Hang Up Interrupt

This bit indicates that a hang up interrupt request was generated because a transition of Flash memory to the hang up 1 state was detected. This bit is cleared when "1" is written to the HANGIC bit in the WFCFG_ICR register.

HANGINT	Description
0	No hang up interrupt request has been generated.
1	A hang up interrupt request has been generated.

[bit8] RDYINT: Ready Interrupt

This bit indicates that a ready interrupt request was generated because a transition of Flash memory to the ready state was detected. This bit is cleared when "1" is written to the RDYIC bit in the WFCFG_ICR register.

RDYINT	Description
0	No ready interrupt request has been generated.
1	A ready interrupt request has been generated.

[bit7:6] Reserved: Reserved Bits

[bit5] ESPS: Erase SusPend Status

This bit represents the WorkFLASH sector erase suspend status.

ESPS	Description
0	WorkFLASH has not suspended sector erase.
1	WorkFLASH received the sector erase suspend command.

This bit indicates the receipt of the sector erase suspend command. Therefore, you can verify the suspension of the sector erase by checking whether the WFCFG_SR:ESPS bit is "1" and the WFCFG_SR:RDY bit is "1". Therefore, before suspending sector erase to write data to WorkFLASH or read its data, verification of the values of these bits is necessary.

[bit4] Reserved: Reserved Bit

[bit3] SERS: Sector ERase Status

This bit represents the WorkFLASH sector erase status. When the write enable bit (WFCFG_CR:WE) is "0" (disabled), "0" is read from this bit.

SERS	Description
0	WorkFLASH is not erasing a sector.
1	WorkFLASH is erasing a sector.

[bit2:1] Reserved: Reserved Bits

[bit0] RDY: Ready

This bit indicates whether Flash memory is in the ready state. In the ready state, Flash memory can start the execution of a new operation.

RDY	Description
0	Flash memory is operating. In this state, it can receive only the read/reset command.
1	Flash memory can start the execution of the next command.

If Flash memory writing or erasing has failed (when WFCFG_SR:HANGINT="1"), RDY remains "0". Therefore, to perform new read, write, and erase operations after such a writing or erasing failure, it is necessary to send the read/reset command to Flash memory and verify that the RDY bit is set to "1".

5.10. WorkFLASH SEC Interrupt Register: WFCFG_SECIR

This register contains the status flags, enable bits, and clear bits related to 1-bit error correction interrupts.

bit	31	30	29	28	27	26	25	24
Field	SYN							
R/W Attribute	R, WX							
Protection Attribute	WP							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	Reserved							SECINT
R/W Attribute	R0, WX							R, WX
Protection Attribute	WP							
Initial Value	00000000							0

bit	15	14	13	12	11	10	9	8
Field	Reserved							SECIC
R/W Attribute	R0, WX							R0, W
Protection Attribute	WP							
Initial Value	00000000							0

bit	7	6	5	4	3	2	1	0
Field	Reserved							SECIE
R/W Attribute	R0, WX							R/W
Protection Attribute	WP							
Initial Value	00000000							0

[bit31:24] SYN: Syndrome

These bits store the syndrome from the detection of a 1-bit error.

[bit23:17]: Reserved Bits

[bit16] SECINT: 1-Bit Error Correction Interrupt

This bit indicates whether there is a 1-bit error correction interrupt request. If the ECC check during reading has detected and corrected a 1-bit error, a 1-bit error correction interrupt request is generated. Flash ECC is generated and detected for every 64bits. Note that if a read operation with the size of is 32-bit wide or less is performed, and an ECC error exists in other byte lanes than the read address, this bit is still set. This bit is read-only. Writing to this bit has no meaning. This bit is cleared when "1" is written to the SECIC bit in the same register.

SECINT	Description
0	A 1-bit error correction interrupt request has not been generated.
1	A 1-bit error correction interrupt request has been generated.

[bit15:9] Reserved: Reserved Bits

[bit8] SECIC: 1-Bit Error Correction Interrupt Clear

SECIC	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the SECINT bit in the same register.

[bit7:1] Reserved: Reserved Bits

[bit0] SECIE: 1-Bit Error Correction Interrupt Enable

SECIE	Description
0	Disable generation of 1-bit error correction interrupt requests.
1	Enable generation of 1-bit error correction interrupt requests

5.11. WorkFLASH ECC Error Address Register: WFCFG_EEAR

This register retains the address at which a 1-bit error was detected during reading. If the 1-bit error was detected multiple times, the register retains the address at which the error was last detected.

This register is read-only. Writing to this register returns a bus error response (RORW).

bit	31	0
Field	EEAR[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] EEAR[31:0]: Error Address

These bits have the address at which a 1-bit error was detected by the ECC check during reading. If the error was detected multiple times, they retain the address at which the error was last detected. Flash ECC is generated and detected for every 64bits. Note that if a read operation with the size of is 32-bit wide or less is performed, and an ECC error exists in other byte lanes than the read address, the address of the read operation is retained in this register.

5.12. WorkFLASH Extra Mode Enable Register: WFCFG_EMENR

This register can set an extra mode.

bit	31	16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	-	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved							AEE
R/W Attribute	R0, WX							R/W
Protection Attribute	-							
Initial Value	00000000							0

bit	7	6	5	4	3	2	1	0
Field	Reserved							Reserved
R/W Attribute	R0, WX							R/W0
Protection Attribute	-							
Initial Value	00000000							0

[bit31:9] Reserved: Reserved Bits

[bit8] AEE: Read Arbitration Error Enable

AEE	Description
0	Disable read arbitration errors. In this mode, the execution of reading has to wait until the WFIF is selected for arbitration. If the higher-priority SHEIF side occupies the bus for a long time, there is a long wait for execution. In the worst case, this causes a watchdog timer reset.
1	In this mode, reading is completed without being blocked by arbitration, but it may be completed with an arbitration error. This bit can be disabled only if all buses are stopped and idle.

[bit7:0] Reserved: Reserved Bits

5.13. WorkFLASH Sequencer Command Register: WFCFG_SEQCM

This register is used to specify the execution of the read/reset command or the sector erase command for the command sequencer. If the execution of the command is completed with "1" set in the RDY bit in the WFCFG_SR register, this register is cleared.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	-							
Initial Value	00000000							

bit	23	22	21	20	19	18	17	16
Field	ERS[7:0]							
R/W Attribute	R, W							
Protection Attribute	-							
Initial Value	11111111							

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	-							
Initial Value	00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved						OPC[1:0]	
R/W Attribute	R0, WX						R, W	
Protection Attribute	-							
Initial Value	000000						00	

[bit31:24] Reserved: Reserved Bits

[bit23:16] ERS[7:0]: Sector Erase Instruction

ERS[7:0]	Description
Initial Value (All "1")	This status has no selected sector. Disable sector erase.
Sector number exceeding number of implemented sectors	The number can be set, but there is a bus error response (ERSIGN) if the OPC bit specifies erase execution.
Sector number of implemented sector	Erase the specified sector. If SHE is supported, the last two sectors cannot be erased. Any attempt to set the last two sectors causes a bus error response (RWE). The sectors targeted for sector protection cannot be erased. Any attempt to set them causes a bus error response (RWE).

ERS[7:0] is reset to the initial value when the command specified by OPC[2:0] is complete. However, this reset does not occur if no operation is selected.

These bits are cleared with the completion of the sector erase suspend command, but the value of ERS[7:0] is ignored when resuming the sector erase with the sector erase command. Therefore, ERS[7:0] do not have to be reconfigured for resuming the sector erase.

The Flash security function does not allow erasing of protected sectors. For details, see the security specifications.

[bit15:2] Reserved: Reserved Bits

[bit1:0] OPC[1:0]: Command

OPC[1:0]	Description
2b00	No operation
2b01	Execute the read/reset command.
2b10	Execute the sector erase command. ERS[7:0] specifies the sector erase target. If sector erase has been suspended, the sector erase resume command is executed. When the sector erase resume command is executed, ERS[7:0] is ignored.
2b11	Execute the sector erase suspend command. When the sector erase suspend command is executed, ERS[7:0] is ignored.

OPC[1:0] is reset to the initial value when the command specified by OPC[1:0] is complete.

While WE bit of WFCFG_CR is "0", writing OPC other than "00" causes bus error.

This register shows that a read request has been received while the SHE side was receiving an arbitration selection. This register is read-only. Writing to this register returns a bus error response (RORW).

bit	31	16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	-	
Initial Value	00000000_00000000	

	bit	15	14	13	12	11	10	9	8
Field

		00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved							ARBERR
R/W Attribute	R0, WX							R, WX
Protection Attribute	-							
Initial Value	0000000							0

[bit31:1] Reserved: Reserved bits

[bit0] ARBERR: Read Arbitration Error

ARBERR	Description
0	No read arbitration error has occurred.
1	A read arbitration error has occurred. The read data that is returned when a read error occurs is all "1". This bit can be cleared by the writing of "1" to WFCFG_ARBCLR:ARBCLR.

5.15. WorkFLASH Arbitration Error Clear Register: WFCFG_ARBCLR

This register gives instructions to clear the ARBERR field in the arbitration error register (WFCFG_ARBERR).

bit	31	16
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	-	
Initial Value	00000000_00000000	

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0, WX							
Protection Attribute	-							
Initial Value	00000000							

bit	7	6	5	4	3	2	1	0
Field	Reserved							ARBCLR
R/W Attribute	R0, WX							R0,W
Protection Attribute	-							
Initial Value	0000000							0

[bit0] ARBCLR: Read Arbitration Error Clear

ARBCLR	Description
0	No effect
1	Clear the ARBERR flag in WFCFG_ARBERR.

5.16. WorkFLASH Bus Error Response Status Register: WFCFG_BERR

This register is a read-only register that retains the flags representing the factors of the bus error responses by WorkFLASH. Each flag can be cleared by the writing of "1" to the corresponding bit in the WFCFG_BERRCLR register.

This register is read-only. Writing to this register returns a bus error response (RORW).

bit	31															16															
Field	Reserved																														
R/W Attribute	R0, WX

Initial Value	0		0		0		0		0		0		0		0	

[bit31:12] Reserved: Reserved Bits

[bit11] ERSIGN: ERS Writing Violation

ERSIGN	Description
0	No ERS writing violation has been detected.
1	This indicates that an ERS writing violation has been detected, followed by a bus error response, in the following case: - When writing to ERS[7:0] bits of WFCFG_SEQCM the number of a sector that is not equipped in the device, and attempting to perform the sector erase.

[bit10] RORW: Write Access to a Read-Only Register

RORW	Description
0	Write access to a read-only register has not been detected.
1	This indicates that a bus error response was made because write access to a read-only register was detected.

[bit9] NWTM: Writing to Mirror Area 4

NWTM	Description
0	Writing to mirror area 4 has not been detected.
1	This indicates that a bus error response was made because writing to mirror area 4 was detected. However, in case the reserved area is written, RESA bit is set instead of this bit.

[bit8] ACCIGN: Command Overrun

ACCIGN	Description
0	No command overrun has been detected.
1	<p>This indicates that a new command was written to Flash memory during execution of the preceding command, and the subsequent command was ignored. At this time, WorkFLASH made a bus error response to the bus master that wrote the subsequent command.</p> <p>This value is also set by attempts to execute the following commands when sector erase is suspended:</p> <ul style="list-style-type: none"> • Execution of a command other than the sector erase resume command when Flash is in the sector erase suspend state • Execution of a write/read command for a sector where sector erase is suspended

[bit7] ECRWL: Protection Sequence Violation

ECRWL	Description
0	Writing to the protected register in violation of the protection sequence has not been detected.
1	<p>WorkFLASH has detected a violation of the protection sequence and made a bus error response, in the following cases:</p> <ul style="list-style-type: none"> • Writing twice in a row to the protection key register WFCFG_CPR • Incorrect key value written to the protection key register • Attempt to write to a protected register in the locked state • Attempt to write to the ECCOFF bit in the WFCFG_ECR register a second or subsequent time

[bit6] UNACC: Unprivileged Writing

UNACC	Description
0	No unprivileged writing has been detected.
1	This indicates that a bus error response was made because writing to a register area in the unprivileged state was detected.

[bit5] RESA: Reserved Area Access

RESA	Description
0	Access to a reserved area has not been detected.
1	This indicates that a bus error response was made because access to a reserved area in Flash memory or the register area was detected.

[bit4] RWE: Write protected sector access error

RWE	Description
0	<ul style="list-style-type: none"> - Access to a protected sector has not been detected. - No ERS writing violation has been detected.
1	<ul style="list-style-type: none"> - This indicates that a bus error response was made because access to a protected sector was detected. - A sector assigned to SHE has been written to the ERS[7:0] bits in WFCFG_SEQCM.

[bit3] Reserved Bit

[bit2] SIZE: Access Size Violation

SIZE	Description
0	Access with an unsupported size has not been detected.
1	This indicates that access with an invalid size to Flash memory or a register has been detected, followed by a bus error response.

[bit1] CRWE: Writing Prohibition Violation

CRWE	Description
0	No writing prohibition violation has been detected.
1	<p>This indicates one of the following.</p> <ul style="list-style-type: none"> - A bus error response was made because of an attempt to write to Flash memory (mirror area 1 or mirror area 3) when the WE bit in the WFCFG_CR register was "0". However, in case the reserved area is written, RESA bit is set instead of this bit. - A bus error response was made because of an attempt to execute software reset (WFCFG_CR:SWFRST) when the WE bit in the WFCFG_CR register was "0".

[bit0] DED: Uncorrectable Error Detection

DED	Description
0	No uncorrectable error has been detected.
1	This indicates that an uncorrectable error was detected by the ECC check during reading, followed by a bus error response. Flash ECC is generated and detected for every 64bits. Note that if a read operation with the size of is 32-bit wide or less is performed, and an ECC error exists in other byte lanes than the read address, this bit is still set.

5.17. WorkFLASH Bus Error Response Status Clear Register: WFCFG_BERRCLR

This register can clear each flag representing the factor of the bus error response by WorkFLASH. To clear the flag, write "1" to the bit corresponding to the flag bit in the WFCFG_BERR register.

bit	31															16														
Field	Reserved

[bit31:12] Reserved: Reserved Bits

[bit11] ERSIGNCLR: ERSIGN Clear

ERSIGNCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the ERSIGN bit in the WFCFG_BERR register.

[bit10] RORWCLR: RORW Clear

RORWCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the RORW bit in the WFCFG_BERR register.

[bit9] NWTMCLR: NWTM Clear

NWTMCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the NWTM bit in the WFCFG_BERR register.

[bit8] ACCIGNCLR: ACCIGN Clear

ACCIGNCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the ACCIGN bit in the WFCFG_BERR register.

[bit7] ECRWLCLR: ECRWL Clear

ECRWLCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the ECRWL bit in the WFCFG_BERR register.

[bit6] UNACCLR: UNACC Clear

UNACCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the UNACC bit in the WFCFG_BERR register.

[bit5] RESACLR: RESA Clear

RESACLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the RESA bit in the WFCFG_BERR register.

[bit4] RWECLR: RWE Clear

RWECLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the RWE bit in the WFCFG_BERR register.

[bit3] Reserved Bit
[bit2] SIZECLR: SIZE Clear

SIZECLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the SIZE bit in the WFCFG_BERR register.

[bit1] CRWECLR: CRWE Clear

CRWECLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the CRWE bit in the WFCFG_BERR register.

[bit0] DEDCLR: DED Clear

DEDCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the DED bit in the WFCFG_BERR register.

5.18. WorkFLASH Uncorrectable Error Status Register: WFCFG_UCESR

This register contains fields representing information about uncorrectable error detection interrupts.

This register is read-only. Writing to this register returns a bus error response (RORW).

bit	31	30	29	28	27	26	25	24
Field	SYN							
R/W Attribute	R, WX							
Protection Attribute	-							
Initial Value	00000000							

bit	23	0
Field	Reserved	
R/W Attribute	R0, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000	

[bit31:24] SYN: Syndrome

These bits store the syndrome from the detection of a 2-bit error.

[bit23:0] Reserved: Reserved Bits

5.19. WorkFLASH Uncorrectable Error Address Register: WFCFG_UCEAR

This register retains the address at which an uncorrectable error was detected during reading. If the uncorrectable error was detected multiple times, the register retains the address at which the error was last detected.

This register is read-only. Writing to this register returns a bus error response (RORW).

bit	31	0
Field	UCEA[31:0]	
R/W Attribute	R, WX	
Protection Attribute	-	
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] UCEA[31:0]: Uncorrectable Error Address

These bits have the address at which an uncorrectable error was detected by the ECC check during reading. If the error was detected multiple times, they retain the address at which the error was last detected.

5.20. FLASH Write Arbitration Register: FCFG_WARBR

This register performs arbitration of write enable in order to write and erase Flash memory.

bit	31	25	24
Field	Reserved		WERSTS
Initial Value	R0, WX		R, WX
Protection Attribute	-		-
Initial Value	0000000		1

bit	23	17	16
Field	Reserved		WERINT
Initial Value	R0, WX		R, WX
Protection Attribute	-		-
Initial Value	0000000		0

bit	15	9	8
Field	Reserved		WERINTCLR
Initial Value	R0, WX		R0, W
Protection Attribute	-		-
Initial Value	0000000		0

bit	7	1	0
Field	Reserved		WERINTE
Initial Value	R0, WX		R/W
Protection Attribute	-		-
Initial Value	0000000		0

[bit31:25] Reserved: Reserved Bits

[bit24] WERSTS: Write Enable Release Status

WERSTS	Description
0	Since one of the Flash units has obtained write enable, a new write enable cannot be set. At this time, write enable is not set for TCFLASH or WorkFLASH, so even the writing of "1" to the write enable bit of WorkFLASH or SHE would not be reflected.
1	Write enable for Flash can be set.

[bit23:17] Reserved: Reserved Bits

[bit16] WERINT: Write Enable Release Interrupt

WERINT	Description
0	No new write enable can be obtained.
1	This indicates that write enable can be obtained.

This bit can be set only when WERINTE="1".

This register has the mirror described in "5.9. WorkFLASH Status Register: WFCFG_SR." Both have the same values.

[bit15:9] Reserved: Reserved Bits

[bit8] WERINTCLR: Write Enable Release Interrupt Clear

WERINTCLR	Description
0	Writing "0" to this bit has no meaning.
1	Writing "1" to this bit clears the WERINT bit in this register.

[bit7:1] Reserved: Reserved Bits

[bit0] WERINTE: Write Enable Release Interrupt

WERINTE	Description
0	Disable generation of write enable release interrupt requests.
1	Enable generation of write enable release interrupt requests.

6. Other

This section provides notes on using WorkFLASH.

Reset during Execution of Writing or Erasing

If the products is reset during execution of writing, the contents of the address targeted for writing are shown as undefined. Alternatively, if it is reset partway through a sector erase, the contents of the sector targeted for erasing are shown as undefined. In such cases, after the completion of the reset, retry suspended writing or erasing.

Reading from Flash Memory

Data cannot be read from WorkFLASH while writing or erasing of WorkFLASH is being executed. For this reason, copy the required data and programs from WorkFLASH to RAM before starting the write or erase operation, so that they do not need to be read partway through writing or erasing.

Waiting for the Completion of a Reset from Software

Flash memory is reset by the writing of "1" to the SWFRST bit in the WFCFG_CR register. After performing a reset on a unit, monitor the RDY bit in the WFCFG_SR register of the unit, and wait for the completion of the reset before accessing it.

To generate a software reset, the write enable (WFCFG_CR:WE) bit must be "1". A software reset cannot be generated in a state without writing enabled. A bus error response is made when a software reset could not be generated.

WorkFLASH Status Register Bits

Since some status information of flash memory is common to Code side (TCFLASH) and Work side (WorkFLASH) in Dual Port FLASH macro, WorkFLASH status register bits listed below are affected by TCFLASH operation in addition to WorkFLASH operation:

- WFCFG_SR.ESPS

Use this bit only when program/erase is performed in WorkFLASH.

MPU Attribute/Write Access Type

The MPU attribute is supported the below table when each master writes to the Work Flash.

	CPU		DMA	DAP
	Normal	Device		
Dword	Support	Non-support	Support	Non-support
Word	Non-support	Support	Support	Support
Hword	Non-support	Support	Support	Support
Byte	Non-support	Support	Support	Support

7. Secure Hardware Extension (SHE) Support

This section describes the functions and restrictions relating to SHE support by WorkFLASH.

Overview

S6J3200 series containing 48 KB/112 KB/240 KB WorkFLASH have in total 6/14/30 sectors allocated for general use cases and two additional sectors which are not part of memory map but internally used only by SHE IP. The following two buses provided by WorkFLASH include SHE IP support:

- WorkFLASH interface (WFIF)
- SHE interface (SHEIF)

Hardware barrier

A hardware barrier is provided to prevent access from the WFIF to SHEIF sectors. A similar hardware barrier is provided to also prevent access from the SHEIF to WFIF sectors.

All attempts from the WFIF to access the sectors protected by the hardware barrier cause a bus error response and set the RESA bit in the WFCFG_BERR register.

Separation of Register sets

The WFIF and SHEIF settings and status registers have been implemented independently. The configuration registers for the WFIF can be set only in access from the WFIF side. Only the WFIF status registers are updated in access from the WFIF. SHEIF cannot be accessed from the user side.

Arbitration of FLASH Macro Access

An arbitration circuit is implemented so that the WFIF and SHEIF can access and share FLASH macros. The arbitration circuit uses a fixed preferred scheme for each transfer. The SHEIF has higher priority than the WFIF.

Example: Even for a FLASH macro performing an AHB read with a burst length of 16, arbitration is performed on each and every transfer in the burst. This means that the read burst access can be interrupted by SHEIF access.

All FLASH macro accesses including command sequencer operations (write, sector erase, and read reset) behave similarly and independently of the arbitration state, excluding the exception of command execution operation time.

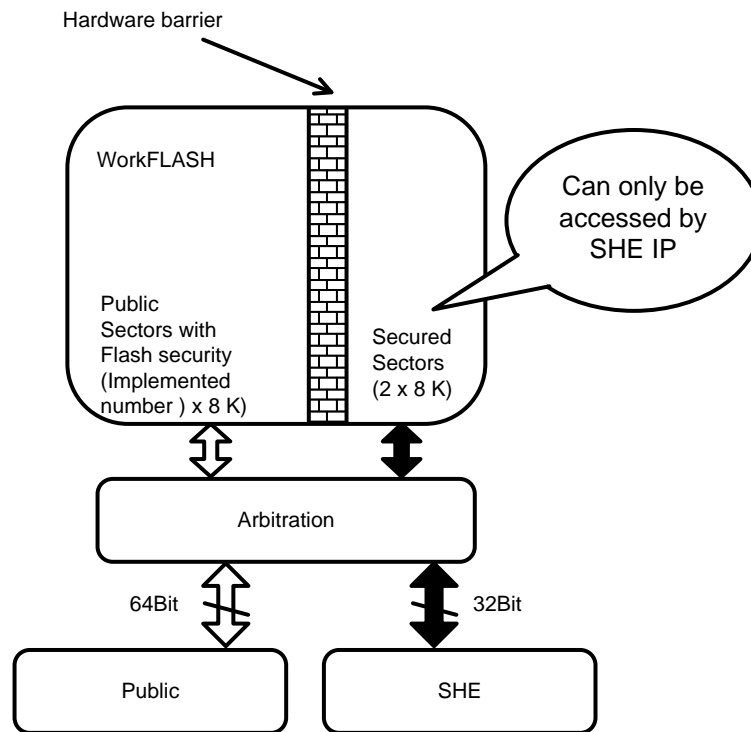

Example: If the WFIF has valid write access, but the SHEIF has the current access right, the WFIF access is accepted, but its execution has to wait until the end of the SHEIF access.

Once the command sequencer starts execution of a command, arbitration is maintained until the end of the WFIF command. The behavior of read access by the WFIF varies depending on the arbitration setting and status.

- When WFCFG_EMENR:AEE=0
 - Read access stops until an arbitration selection is made and read data is returned from the FLASH macro.
- When WFCFG_EMENR:AEE=1
 - If the WFIF is selected for arbitration, read data is returned from the FLASH macro.
 - If the SHEIF is selected for arbitration, the WFCFG_ARBERR:ARBERR flag is set to 1, the arbitration error is indicated, and the returned read data is all "1". Such non-blocking read access helps prevent (prolonged) stoppages of the bus while the SHEIF operation of write or sector erase is under execution. After the ARBERR flag in WFCFG_ARBERR:ARBERR is set to "1" or after

multiple read accesses, an application must check whether normal data has been read. This means, when an access from SHEIF is made it is impossible to execute instruction codes on WorkFLASH.

Figure 7-1 Hardware Barrier Separating the WFIF and SHEIF Data Paths

8. Dual Port FLASH Macro Support

This section describes restrictions when using a Dual Port FLASH macro as a FLASH macro.

Differences from the Case of Using a Single Port FLASH Macro

- WorkFLASH uses the port on the Work side of Dual Port FLASH.
- Since the writing and erasing circuit is shared with the Code side, partial operation on the Code side affects the Work side.

Software control that takes the foregoing into consideration is necessary.

Availability of concurrent Dual Port Operation on the Code and Work Sides

	Code:Read/NOP Work:Read/NOP	Code:Read/NOP Work:PGM/ERS	Code:PGM/ERS Work:Read/NOP	Code:PGM/ERS Work:PGM/ERS
Operation available	OK	OK	OK	NG

Access to Dual Port on the Code and Work Sides

The Flash areas accessed by each interface are described below.

Interface	TCFLASH	WorkFLASH	SHE
Accessed Area	Code	Work	Work

CHAPTER 19: BootROM Hardware Interface

This chapter explains the BootROM hardware interface.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Example
5. Registers
6. Others

BOOTROMHW-TXXPT03P01R01L05-E1-XX

1. Overview

This section provides an overview of the BootROM hardware interface.

The BootROM hardware interface is the interface between CPU and BootROM. The BootROM hardware interface sets the setting registers for the user-defined exception handler. The interface has 2 exception vector register sets. When one of the sets is in use, the setting of the other one can be changed.

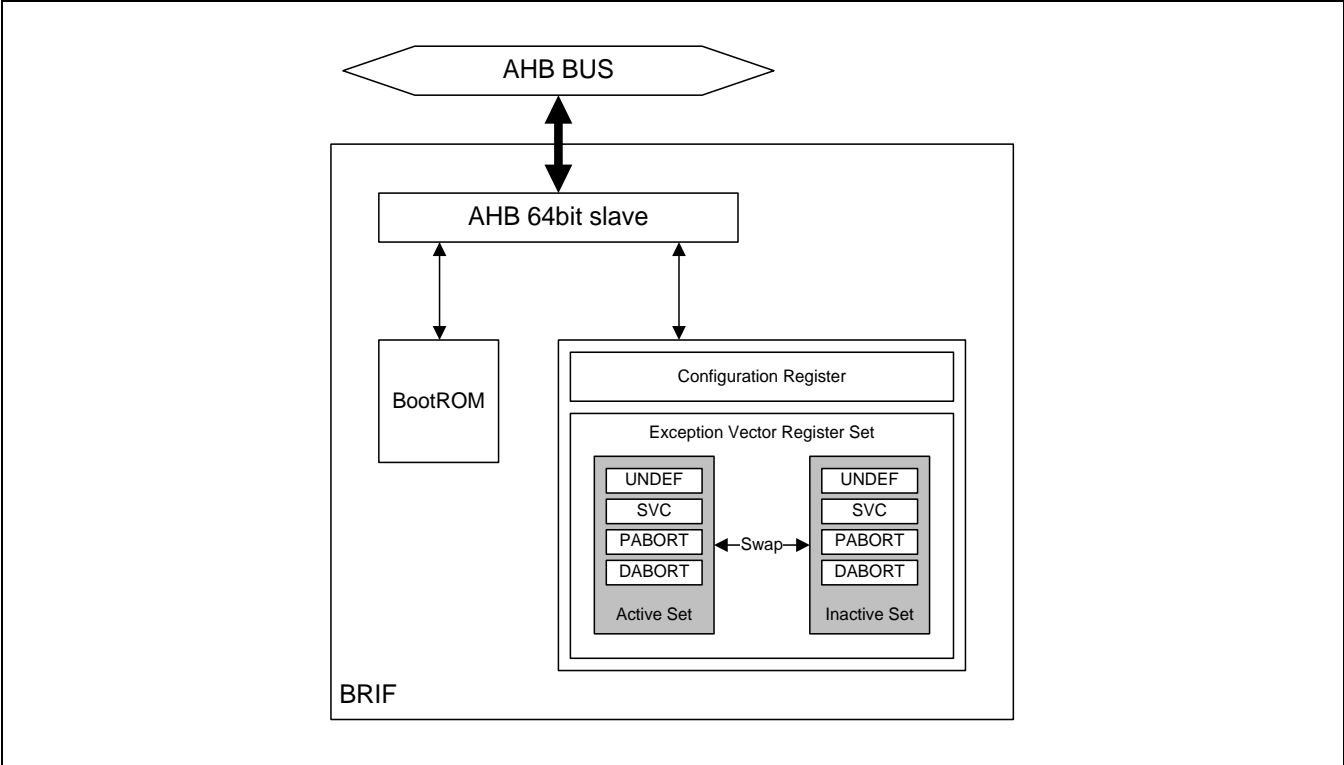

Notes:

- *In this chapter, the BootROM hardware interface is sometimes referred to by its abbreviation BRIF (BootRom hardware InterFace).*
- *Among the abbreviated register names of the BootROM hardware interface, "EXCFG" in "EXCFG_****" indicates exception vector configuration (EXception vector ConFiGuration).*

2. Configuration

This section explains a block diagram of the BootROM hardware interface.

Figure 2-1 BootROM Hardware Interface Block Diagram

3. Explanation of Operation

This section explains the operation of the BootROM hardware interface.

Sequence Protection by the Lock Release Register

The BootROM hardware interface provides the sequence protection function made available by the lock release register (EXCFG_UNLOCK). To update the exception vector configuration, the lock release value must be written in EXCFG_UNLOCK in advance to release locking. Write the lock value after update of the exception vector configuration to lock it again.

ARM Cortex-R5 Exception Vector Processing

ARM Cortex-R5 processes exceptions in the following steps:

1. Exception occurs.
2. The control jumps to the execution code of the corresponding entry of the fixed exception vector table of BootROM.
3. The load instruction at the exception entry loads the value of each exception vector register of PC.
4. The control jumps to the starting address of the exception handler, and the exception handler is executed.

The exception entry for the BootROM vector table is fixed. However, in order to make the jump destination changeable, the starting address of the ARM Cortex-R5 exception handler (inline literal) is stored in registers. These registers are mapped to addresses lower than BootROM, and are referred to by the BootROM exception entry when an exception occurs. This arrangement allows the exception vectors to be dynamically defined.

In order to allow all exception vector registers to be redefined by a single access, there are two register sets: active and inactive sets. These two sets are mapped to addresses lower than BootROM. The address to which the active set is mapped is at an active position that the BootROM exception entry refers to at the time of exception occurrence. The address to which the inactive set is mapped is at an inactive position, in which the values can be changed. Writing "1" to the exception vector register set swap bit of the setting register (EXCFG_CNFG:SWAP) swaps the contents of the active and inactive sets. This action changes the settings of the active set.

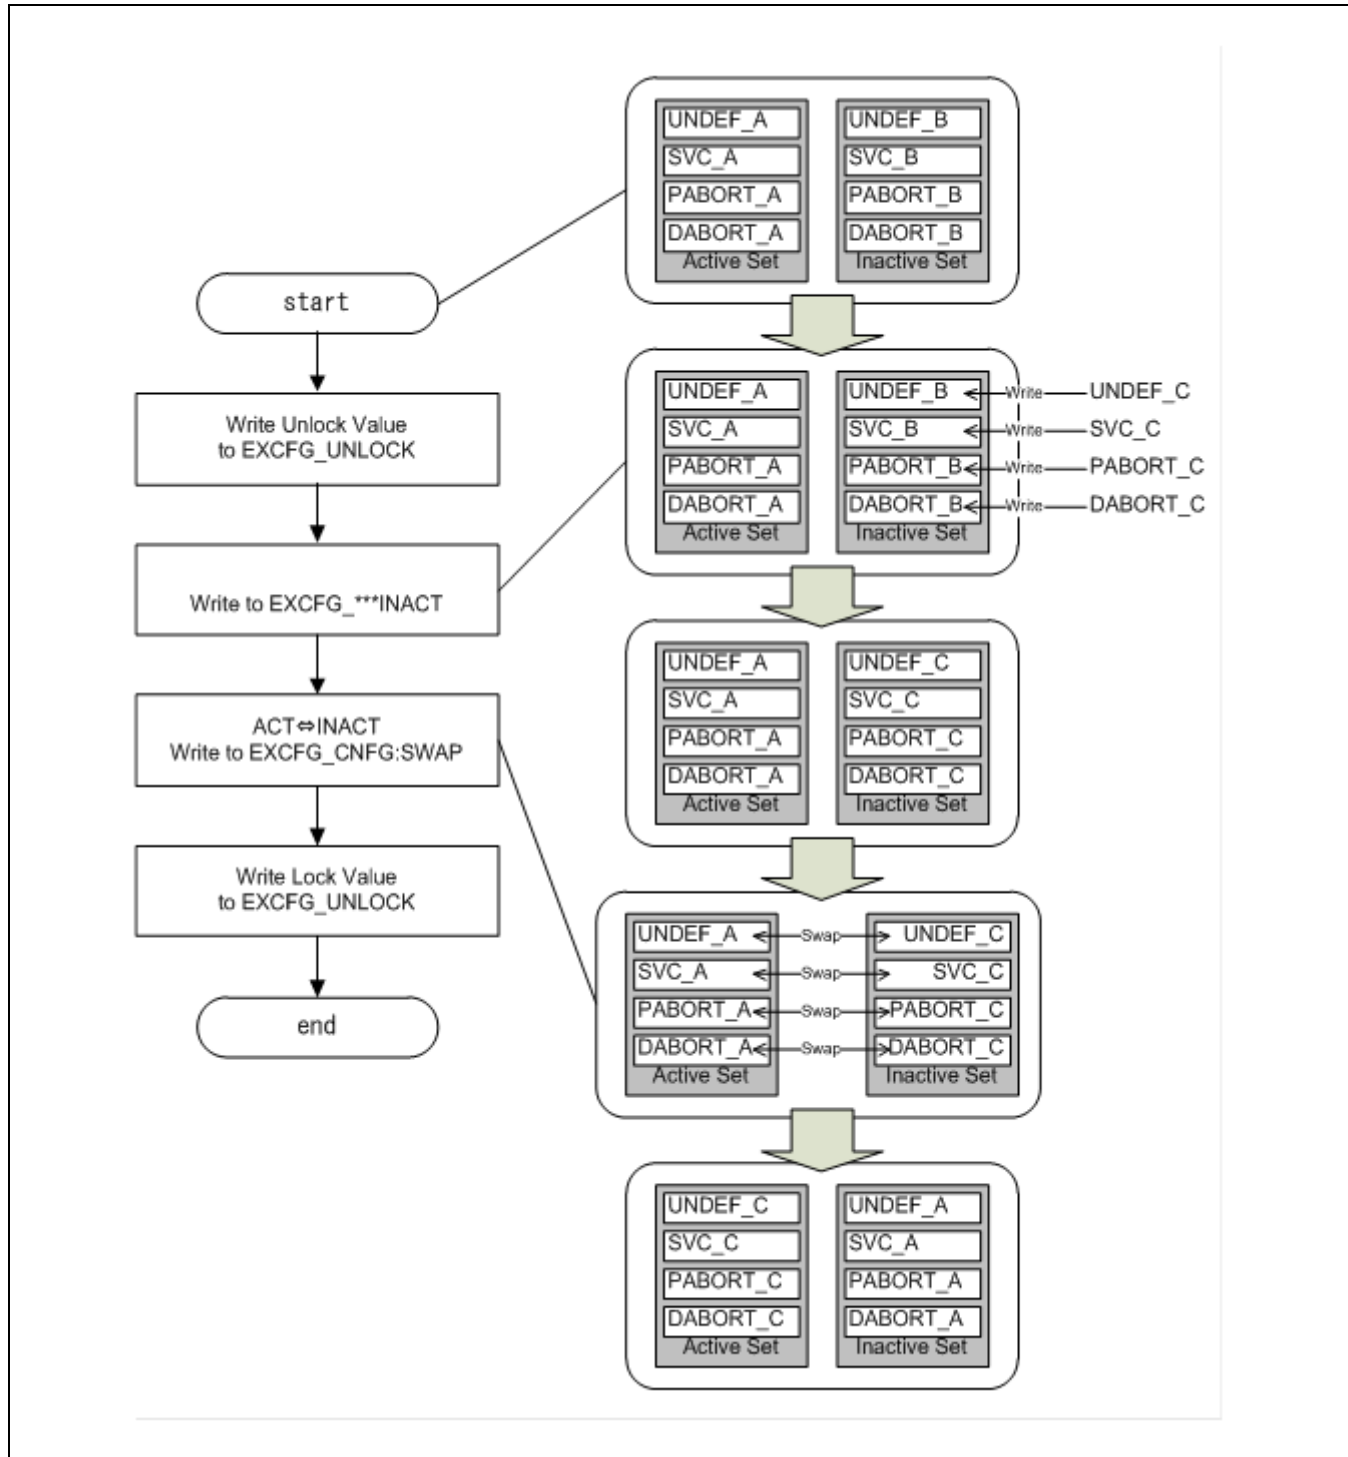

Note:

- *It takes about 30 to 40 clocks of the clock supplied to this block (CLK_HPM) after writing "1" to EXCFG_CNFG:SWAP until the exception handler is enabled with the completion of swap. It is unpredictable which handler will be executed during the swapping period.*

4. Setting Procedure Example

This section explains a setting procedure example of BootROM hardware interface.

Figure 4-1 Setting Flow of BootROM Hardware Interface

5. Registers

This section explains the registers used by the BootROM hardware interface.

The base address of the registers BootROM hardware interface is 0xFFFE_FC00. The base address of ROM is 0xFFFF_0000.

Table 5-1 List of BootROM Hardware Interface Registers

Abbreviated Register Name	Register Name	Reference
EXCFG_UNLOCK	EXCFG lock release register	5.1
EXCFG_CNFG	EXCFG setting register	5.2
EXCFG_UNDEFINACT	EXCFG inactive set - undefined instruction vector register	5.3
EXCFG_SVCINACT	EXCFG inactive set - supervisor call vector register	5.4
EXCFG_PABORTINACT	EXCFG inactive set - prefetch abort vector register	5.5
EXCFG_DABORTINACT	EXCFG inactive set - data abort vector register	5.6
EXCFG_UNDEFACT	EXCFG active set - undefined instruction vector register	5.7
EXCFG_SVCACT	EXCFG active set - supervisor call vector register	5.8
EXCFG_PABORTACT	EXCFG active set - prefetch abort vector register	5.9
EXCFG_DABORTACT	EXCFG active set - data abort vector register	5.10

Table 5-2 Register Memory Layout of BootROM Hardware Interface

Offset	+7	+6	+5	+4	+3	+2	+1	+0

* BootROM is mapped to an area starting from 0xFFFF0000.

5.1. EXCFG Lock Release Register (EXCFG_UNLOCK)

This register controls the write lock of the registers of the BootROM hardware interface.

Bit	31	0
Field	UNLOCK	
R/W	R0,W	
Attribute		
Protection	WP	
Attribute		
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] UNLOCK: Lock Release Bits of BootROM Hardware Interface

These bits control the write lock of the setting registers of the BootROM hardware interface. All registers except EXCFG_UNLOCK are subject to sequence protection by this register.

UNLOCK	Description
0xACC5B007	Unlock value (which enables writing)
0xB007ECF6	Lock value (which disables writing)
Other than above	Setting prohibited (bus error returned)

Note:

- The value of all 32 bits of this register is needed to determine the lock status. Therefore, writing to this register must be made with 32-bit access. 8-bit, 16-bit, or 64-bit access is not allowed.

5.2. EXCFG Setting Register (EXCFG_CNFG)

This register indicates the lock status of the BootROM hardware interface. This register also swaps the contents of the active and inactive sets of the exception vector registers.

Bit	31	16
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	WPS	
Attribute		
Initial Value	00000000_00000000	

Bit	15	14	13	12	11	10	9	8
Field	Reserved							SWAP
R/W	R0,WX							R0,W
Attribute								
Protection	WPS							
Attribute								
Initial Value	0000000							0

Bit	7	6	5	4	3	2	1	0
Field	Reserved							LST
R/W	R0,WX							R,WX
Attribute								
Protection	WPS							
Attribute								
Initial Value	0000000							1

[bit31:9] Reserved: Reserved Bits

[bit8] SWAP: Exception Vector Register Swap Bit

Writing "1" to this bit swaps the contents of the active and inactive sets of the exception vector registers.

Bit	Description
0	Invalid (no effect on operation)
1	Swap execution

[bit7:1] Reserved: Reserved Bits

[bit0] LST: BootROM Hardware Interface Lock Status Bit

This bit indicates the lock status of the BootROM hardware interface.

Bit	Description
0	Unlocked state
1	Locked state

Note:

- It takes about 30 to 40 clocks of the clock supplied to this block (CLK_HPM) after writing "1" to EXCFG_CNFG:SWAP until the exception handler is enabled with the completion of swap. It is unpredictable which handler will be executed during the swapping period.

5.3. EXCFG Inactive Set - Undefined Instruction Vector Register (EXCFG_UNDEFINACT)

This register is included in the inactive set of the exception vector registers, and stores the starting address of the exception handler for the undefined instruction exception.

Bit	31	0
Field	UNDEFVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00100100	

[bit31:0] UNDEFVEC: Undefined Instruction Vector Bits

These bits set the starting address of the exception handler for the undefined instruction exception.

Note:

- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_UNDEFACT.

5.4. EXCFG Inactive Set - Supervisor Call Vector Register (EXCFG_SVCINACT)

This register is included in the inactive set of the exception vector registers, and stores the starting address of the exception handler for the supervisor call exception.

Bit	31	0
Field	SVCVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00101000	

[bit31:0] SVCVEC: Supervisor Call Vector Bits

These bits set the starting address of the exception handler for the supervisor call exception.

Note:

- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_SVCACT.

5.5. EXCFG Inactive Set - Prefetch Abort Vector Register (EXCFG_PABORTINACT)

This register is included in the inactive set of the exception vector registers, and stores the starting address of the exception handler for the prefetch abort exception.

Bit	31	0
Field	PABORTVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00101100	

[bit31:0] PABORTVEC: Prefetch Abort Vector Bits

These bits set the starting address of the exception handler for the prefetch abort exception.

Note:

- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_PABORTACT.

5.6. EXCFG Inactive Set - Data Abort Vector Register (EXCFG_DABORTINACT)

This register is included in the inactive set of the exception vector registers, and stores the starting address of the exception handler for the data abort exception.

Bit	31	0
Field	DABORTVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00110000	

[bit31:0] DABORTVEC: Data Abort Vector Bits

These bits set the starting address of the exception handler for the data abort exception.

Note:

- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_DABORTACT.

5.7. EXCFG Active Set - Undefined Instruction Vector Register (EXCFG_UNDEFACT)

This register is included in the active set of the exception vector registers, and stores the starting address of the exception handler for the undefined instruction exception.

Bit	31	0
Field	UNDEFVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00100100	

[bit31:0] UNDEFVEC: Undefined Instruction Vector Bits

These bits store the starting address of the exception handler for the undefined instruction exception.

Notes:

- Writing to this register is prohibited. Normal operation is not guaranteed when doing so. To set this register, set the value in the inactive set, and then execute swapping. For details on the setting procedure, see 3 Explanation of Operation and 4 Setting Procedure Example.
- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_UNDEFINACT.

5.8. EXCFG Active Set - Supervisor Call Vector Register (EXCFG_SVCACT)

This register is included in the active set of the exception vector registers, and stores the starting address of the exception handler for the supervisor call exception.

Bit	31	0
Field	SVCVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00101000	

[bit31:0] SVCVEC: Supervisor Call Vector Bits

These bits store the starting address of the exception handler for the supervisor call exception.

Notes:

- Writing to this register is prohibited. Normal operation is not guaranteed when doing so. To set this register, set the value in the inactive set, and then execute swapping. For details on the setting procedure, see 3 Explanation of Operation and 4 Setting Procedure Example.
- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_SVCINACT.

5.9. EXCFG Active Set - Prefetch Abort Vector Register (EXCFG_PABORTACT)

This register is included in the active set of the exception vector registers, and stores the starting address of the exception handler for the prefetch abort exception.

Bit	31	0
Field	PABORTVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00101100	

[bit31:0] PABORTVEC: Prefetch Abort Vector Bits

These bits store the starting address of the exception handler for the prefetch abort exception.

Notes:

- Writing to this register is prohibited. Normal operation is not guaranteed when doing so. To set this register, set the value in the inactive set, and then execute swapping. For details on the setting procedure, see 3 Explanation of Operation and 4 Setting Procedure Example.
- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_PABORTINACT.

5.10. EXCFG Active Set - Data Abort Vector Register (EXCFG_DABORTACT)

This register is included in the active set of the exception vector registers, and stores the starting address of the exception handler for the data abort exception.

Bit	31	0
Field	DABORTVEC	
R/W	R,W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	11111111_11111111_00000000_00110000	

[bit31:0] DABORTVEC: Data Abort Vector Bits

These bits store the starting address of the exception handler for the data abort exception.

Notes:

- Writing to this register is prohibited. Normal operation is not guaranteed when doing so. To set this register, set the value in the inactive set, and then execute swapping. For details on the setting procedure, see 3 Explanation of Operation and 4 Setting Procedure Example.
- Writing "1" to EXCFG_CNFG:SWAP swaps the value of this register and the value of EXCFG_DABORTINACT.

6. Others

This section explains precautions on the use of the BootROM hardware interface.

Register access or ROM access of the BootROM hardware interface returns a bus error in the following cases:

- Sequence protection violation by EXCFG_UNLOCK
 - Attempt at writing in EXCFG_UNLOCK a value other than lock release or locking
 - Privilege protection violation
 - Read or write attempt in which access is made only to a register undefined area
 - Write attempt in which access is made only to bits of WX attribute (including register undefined area)
 - Attempt at writing in ROM
-
- Attempt at reading from a read protected area of ROM

CHAPTER 20: BootROM Software Interface

This chapter explains the BootROM Software Interface.

1. Overview
2. BootROM Markers
3. BootROM Operation
4. Notes

BOOTROMSW-TXXPT03P01R01L05-E1-XX

1. Overview

The BootROM software is built-in firmware that is executed after reset and before execution of user applications.

The BootROM software chiefly performs mode judgment, security setting, and hardware watchdog timer setting.

It also reads a Secure Boot configuration from the marker and issues a Secure Boot processing request to the SHE.

This section explains the functions of the BootROM software and a configuration based on the marker in the flash memory.

BootROM Functions

The following lists the functions of the BootROM software.

1. Makes a setting for enabling the VIC port and floating-point operations.
2. Judges the operating mode based on the MODE register and MD pin, and branches to a processing handler according to the mode.
3. Makes a setting for security based on the TCFCFG0_SECSTAT.SECEN bit and the Debug Authentication Record (DDR) value.
4. Configures the Secure Boot processing according to the Boot Description Record (BDR) value, and issues a Secure Boot processing request to the SHE.
5. Waits for debugger connection based on the value of BDR_DWEM of the Boot Description Record (BDR).
6. Makes a setting for the hardware watchdog timer according to the Watchdog Description Record (WDR) value.
7. Judges the start address of a user application according to the values of BDR_ABVM and BDR_ABVEM of the Boot Description Record (BDR).
8. The exception vector table of the core is fixed at 0xFFFF0000. Therefore, the BootROM software references the interrupt controller, which is user-configurable, and the BootROM hardware interface to branch to an exception handler.
9. Issues a hard reset if an exception occurs before the user exception handler is set.

2. BootROM Markers

This section explains the BootROM markers.

2.1 Overview of BootROM Markers

2.2 Register Lists

2.3 Security Record (SR)

2.4 Debugger Key Enable Marker (DDR_DSM)

2.5 Debugger Security Key Marker 0 (DDR_DSKM0)

2.6 Debugger Security Key Marker 1 (DDR_DSKM1)

2.7 Debugger Security Key Marker 2 (DDR_DSKM2)

2.8 Debugger Security Key Marker 3 (DDR_DSKM3)

2.9 SHE Secure Boot Mode Marker (BDR_SBMM)

2.10 SHE Secure Boot Size Marker (BDR_SBSM)

2.11 Debugger Connection Wait Enable Marker (BDR_DWEM)

2.12 Alternative Boot Vector Marker (BDR_ABVM)

2.13 Alternative Boot Vector Enable Marker (BDR_ABVEM)

2.14 Hardware Watchdog Interrupt Configuration Marker (WDR_INTM)

2.15 Hardware Watchdog Trigger 0 Configuration Marker (WDR_TRG0CFGM)

2.16 Hardware Watchdog Trigger 1 Configuration Marker (WDR_TRG1CFGM)

2.17 Hardware Watchdog Lower Limit RUN Setting Marker (WDR_RUNLLM)

2.18 Hardware Watchdog Upper Limit RUN Setting Marker (WDR_RUNULM)

2.19 Hardware Watchdog Lower Limit PSS Setting Marker (WDR_PSSLLM)

2.20 Hardware Watchdog Upper Limit PSS Setting Marker (WDR_PSSULM)

2.21 Hardware Watchdog Reset Delay Counter Marker (WDR_RSTDLYM)

2.22 Hardware Watchdog Configuration Marker (WDR_CFGM)

2.23 Hardware Watchdog Configuration Enable Marker (WDR_CEM)

2.1. Overview of BootROM Markers

This section provides an overview of the BootROM markers.

Overview

BootROM markers are registers in the TCFLASH. Unlike ordinary registers, the values of BootROM markers do not directly control hardware functions. The BootROM software reads BootROM markers and controls hardware functions.

Types of BootROM Markers

There are the following 4 types of BootROM markers.

1. Security Record (SR)
Markers used for configuring security setting
2. Debugger Authentication Record (DDR)
Markers used for making debugger connection setting
3. Boot Description Record (BDR)
Markers used for making startup setting
4. Watchdog Description Record (WDR)
Markers used for making hardware watchdog timer setting

2.2. Register Lists

This section explains the lists of the BootROM marker registers.

The BootROM marker registers comprise the following 4 register groups.

- Security Record (SR) register group
- Debugger Authentication Record (DDR) register group
- Boot Description Record (BDR) register group
- Watchdog Description Record (WDR) register group

List of the BootROM Marker Registers (SR Registers)

Table 2-1 List of the BootROM Marker Registers (SR Registers)

Abbreviated Register Name	Register Name	Reference
MK_SER	Security Enable Marker	2.3
MK_SSR	Security Scope Marker	2.3
MK_CEER	Chip Erase Enable Marker	2.3
MK_SOER	Security Overwrite Enable Marker	2.3
MK_SWPOER	Sector Write Permission Overwrite Enable Marker	2.3
MK_WSWPR	Work Flash Sector Write Permissions Marker	2.3
MK_C0SWPR	Code Flash 0 Sector Write Permissions of the small sectors Marker	2.3
MK_C1SWPR	Code Flash 0 Sector Write Permissions of the large sectors Marker	2.3
MK_C2SWPR	Code Flash 1 Sector Write Permissions of the large sectors Marker	2.3
MK_C3SWPR	Code Flash 2 Sector Write Permissions of the large sectors Marker	2.3

List of the BootROM Marker Registers (DDR Registers)

Table 2-2 List of the BootROM Marker Registers (DDR Registers)

Abbreviated Register Name	Register Name	Reference
DDR_DSM	Debugger Key Enable Marker	2.4
DDR_DSKM0	Debugger Security Key Marker 0	2.5
DDR_DSKM1	Debugger Security Key Marker 1	2.6
DDR_DSKM2	Debugger Security Key Marker 2	2.7
DDR_DSKM3	Debugger Security Key Marker 3	2.8

List of the BootROM Marker Registers (BDR Registers)

Table 2-3 List of the BootROM Marker Registers (BDR Registers)

Abbreviated Register Name	Register Name	Reference
BDR_SBMM	SHE Secure Boot Mode Marker	2.9
BDR_SBSM	SHE Secure Boot Size Marker	2.10
BDR_DWEM	Debugger Connection Wait Enable Marker	2.11
BDR_ABVM	Alternative Boot Vector Marker	2.12
BDR_ABVEM	Alternative Boot Vector Enable Marker	2.13

List of the BootROM Marker Registers (WDR Registers)

Table 2-4 List of the BootROM Marker Registers (WDR Registers)

Abbreviated Register Name	Register Name	Reference
WDR_INTM	Hardware Watchdog Interrupt Configuration Marker	2.14
WDR_TRG0CFGM	Hardware Watchdog Trigger 0 Configuration Marker	2.15
WDR_TRG1CFGM	Hardware Watchdog Trigger 1 Configuration Marker	2.16
WDR_RUNLLM	Hardware Watchdog Lower Limit RUN Setting Marker	2.17
WDR_RUNULM	Hardware Watchdog Upper Limit RUN Setting Marker	2.18
WDR_PSSLLM	Hardware Watchdog Lower Limit PSS Setting Marker	2.19
WDR_PSSULM	Hardware Watchdog Upper Limit PSS Setting Marker	2.20
WDR_RSTDLYM	Hardware Watchdog Reset Delay Counter Marker	2.21
WDR_CFGM	Hardware Watchdog Configuration Marker	2.22
WDR_CEM	Hardware Watchdog Configuration Enable Marker	2.23

Memory Layout of the BootROM Markers

The BootROM markers are located in the beginning area of sector 0 (SA0) of the TCFLASH flash memory.

Table 2-5 BootROM Marker Area

BootROM Markers	TCM Area	AXI Area
SR	+ 0x009F_0000	+ 0x019F_0000
DDR	+ 0x009F_0080	+ 0x019F_0080

2.3. Security Record (SR)

This section explains the Security Record, which is used for configuring the security setting.

Security Record (SR)

For details of the Security Record, see "3.3. Security Marker Definition" in the chapter on Security.

2.4. Debugger Key Enable Marker (DDR_DSM)

This marker is used to enable the debugger connection key.

Bit	31	0
Field	DSEM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] DSEM: Debugger Key Enable Marker

These bits are used to enable the debugger security key. The following are the setting values.

bit31:0	Description
0x59F71234	Debugger key enabled
Other than above	Debugger connection disabled (initial value)

If debugger key is enabled with these bits, a 128-bit authentication key (DDR_DSKM0 to 3 registers) can be used to open a debugger connection in case the device is in the security enabled state.

If security is disabled with the MK_SER register, an SR register, a 128-bit authentication key is not required when a debugger is connected.

MK_SER	DDR_DSEM	Description
Security disabled	Debugger key disabled	The debugger can be connected without a key.
Security disabled	Debugger key enabled	The debugger can be connected without a key.
Security enabled	Debugger key disabled	Either an application based authentication scheme has to be used or a debugger cannot be connected.
Security enabled	Debugger key enabled	A 128-bit authentication key can be used to open the debugger connection.

2.5. Debugger Security Key Marker 0 (DDR_DSKM0)

This marker is used to set an authentication key for debugger connection.

Bit	31	0
Field	DSKM [127:96]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] DSKM (bit127:96): Debugger Security Key Marker (bit127:96)

These bits are a 128-bit authentication key for debugger connection when debugger connection is enabled by Debugger Key Enable Marker (DSEM [31:0] bits of the DDR_DSM register). These bits are bit127:96 of the key.

A trivial key DSKM[127:0] equal to all-0 or all-1 cannot be used to authenticate the debugger connection.

2.6. Debugger Security Key Marker 1 (DDR_DSKM1)

This marker is used to set an authentication key for debugger connection.

Bit	31	0
Field	DSKM [95:64]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] DSKM (bit95:64): Debugger Security Key Marker (bit95:64)

These bits are a 128-bit authentication key for debugger connection when debugger connection is enabled by Debugger Key Enable Marker (DSEM [31:0] bits of the DDR_DSM register). These bits are bit95:64 of the key.

A trivial key DSKM[127:0] equal to all-0 or all-1 cannot be used to authenticate the debugger connection.

2.7. Debugger Security Key Marker 2 (DDR_DSKM2)

This marker is used to set an authentication key for debugger connection.

Bit	31	0
Field	DSKM [63:32]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] DSKM (bit63:32): Debugger Security Key Marker (bit63:32)

These bits are a 128-bit authentication key for debugger connection when debugger connection is enabled by Debugger Key Enable Marker (DSEM [31:0] bits of the DDR_DSM register). These bits are bit63:32 of the key.

A trivial key DSKM[127:0] equal to all-0 or all-1 cannot be used to authenticate the debugger connection.

2.8. Debugger Security Key Marker 3 (DDR_DSKM3)

This marker is used to set an authentication key for debugger connection.

Bit	31	0
Field	DSKM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] DSKM (bit31:0): Debugger Security Key Marker (bit31:0)

These bits are a 128-bit authentication key for debugger connection when debugger connection is enabled by Debugger Key Enable Marker (DSEM [31:0] bits of the DDR_DSM register). These bits are bit31:0 of the key.

A trivial key DSKM[127:0] equal to all-0 or all-1 cannot be used to authenticate the debugger connection.

2.9. SHE Secure Boot Mode Marker (BDR_SBMM)

This marker is used to set a mode of Secure Boot.

Bit	31	0
Field	SBMM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] SBMM: SHE Secure Boot Mode Marker

These bits select a mode of Secure Boot.

bit31:0	Description
0x00000000	"Measuring during application" mode is selected. There is a possibility that the BootROM starts a user application before the SecureBoot processing completes.
Other than above	"Measuring before application" mode is selected. BootROM waits for the SecureBoot processing to complete, and then starts a user application.

2.10. SHE Secure Boot Size Marker (BDR_SBSM)

This marker is used to make the SHE channel master setting.

Bit	31	0
Field	SBSM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] SBSM: SHE Secure Boot Size Marker

These bits are used to set the size of the area for the program to be tested with the SHE in bytes.

The value of the size in bytes specified in these bits is used also as data for calculation of the CMAC algorithm.

Specify the size with an alignment of 128 bits.

The start address of the area for the program to be tested with SHE is determined based on the values of the BDR_ABVM register and BDR_ABVEM register.

If the BDR_ABVEM register is set to 0x292D3A7B, the value of the BDR_ABVM register is the start address.

If the BDR_ABVEM register is set to a value other than 0x292D3A7B, 0x00A00000 is the start address.

2.11. Debugger Connection Wait Enable Marker (BDR_DWEM)

This marker is used to set waiting for debugger connection after clearing a hard reset.

Bit	31	0
Field	DWEM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] DWEM: Debugger Connection Wait Enable Marker

These bits are used to specify whether to enable wait for debugger connection after clearing a hard reset.

bit31:0	Description
0x292D3A7B	Wait for debugger connection after clearing a hard reset is not enabled. – Debugger connection is not awaited and control is immediately handed over to a user program.
Other than above	Wait for debugger connection after clearing a hard reset is enabled (initial value).

If wait for debugger connection is enabled, control is not handed over from the BootROM software to a user program until the processing of "Debugger connection wait" in "3. BootROM Operation" is complete.

2.12. Alternative Boot Vector Marker (BDR_ABVM)

This marker is used to set the start address of a user program.

Bit	31	0
Field	ABVM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] ABVM: Alternative Boot Vector Marker

These bits are used to set the start address of a user program.

If the Alternative Boot Vector Enable Marker (BDR_ABVEM) is used to enable the setting of the start address of a user program, the start address set in these bits is valid. If the Alternative Boot Vector Enable Marker (BDR_ABVEM) is not used and the setting of the start address of a user program is not enabled, the start address of the user program is 0x00A00000 (fixed address).

2.13. Alternative Boot Vector Enable Marker (BDR_ABVEM)

This marker is used to enable the setting of the start address of a user program.

Bit	31	0
Field	ABVEM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] ABVEM: Alternative Boot Vector Enable Marker

These bits are used to enable the setting of the start address of a user program.

bit31:0	Description
0x292D3A7B	The setting of the start address of a user program is enabled. <ul style="list-style-type: none"> The start address of a user program is the value set in the Alternative Boot Vector Marker (BDR_ABVM).
Other than above	The setting of the start address of a user program is not enabled (initial value). <ul style="list-style-type: none"> The start address of a user program is 0x00A00000 (fixed address).

2.14. Hardware Watchdog Interrupt Configuration Marker (WDR_INTM)

This marker is used to set the hardware watchdog interrupt configuration register (HWDG_INT).

Bit	31	24
Field	Reserved	
R/W Attribute	R1/W1	
Protection Attribute	-	
Initial Value	11111111	

Bit	23	22	21	20	19	18	17	16
Field	Reserved						RSTENM	IRQENM
R/W Attribute	R1/W1						R/W	R/W
Protection Attribute	-							
Initial Value	111111						1	1

Bit	15	0
Field	Reserved	
R/W Attribute	R1/W1	
Protection Attribute	-	
Initial Value	11111111_11111111	

[bit31:18] Reserved: Reserved Bits

[bit17] RSTENM: Reset Enable Marker

This bit is a marker that controls output when a watchdog error occurs.

Bit	Description
0	Generate an NMI when a watchdog error occurs.
1	Generate a reset when a watchdog error occurs (initial value).

[bit16] IRQENM: Prior Warning Interrupt Enable Marker

This bit is a marker that enables a prior warning interrupt.

Bit	Description
0	Do not enable a prior warning interrupt.
1	Enable a prior warning interrupt (initial value).

For the prior warning interrupt, see "CHAPTER HARDWARE WATCHDOG TIMER."

[bit15:0] Reserved: Reserved Bits

2.15. Hardware Watchdog Trigger 0 Configuration Marker (WDR_TRG0CFGM)

This marker is used to set the hardware watchdog trigger 0 configuration register (HWDG_TRG0CFG).

Bit	31	8
Field	Reserved	
R/W Attribute	R1/W1	
Protection	-	
Attribute		
Initial Value	11111111_11111111_11111111	

Bit	7	0
Field	WDGTRG0CFGM [7:0]	
R/W Attribute	R/W	
Protection	-	
Attribute		
Initial Value	11111111	

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG0CFGM: Watchdog Trigger 0 Configuration Marker

These bits are a marker that is used to set a value to be written to the hardware watchdog trigger 0 register (HWDG_TRG0) for execution of the watchdog counter clear protection trigger sequence.

For the watchdog counter clear protection trigger sequence, see "CHAPTER HARDWARE WATCHDOG TIMER."

2.16. Hardware Watchdog Trigger 1 Configuration Marker (WDR_TRG1CFGM)

This marker is used to set the hardware watchdog trigger 1 configuration register (HWDG_TRG1CFG).

Bit	31	8
Field	Reserved	
R/W Attribute	R1/W1	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111	

bit	7	0
Field	WDGTRG1CFGM [7:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111	

[bit31:8] Reserved: Reserved Bits

[bit7:0] WDGTRG1CFGM: Watchdog Trigger 1 Configuration Marker

These bits are a marker that is used to set a value to be written to the hardware watchdog trigger 1 register (HWDG_TRG1) for execution of the watchdog counter clear protection trigger sequence.

For the watchdog counter clear protection trigger sequence, see "CHAPTER HARDWARE WATCHDOG TIMER."

2.17. Hardware Watchdog Lower Limit RUN Setting Marker (WDR_RUNLLM)

This marker is used to set the hardware watchdog lower limit RUN setting register (HWDG_RUNLLS).

Bit	31	0
Field	WDGRUNLLM [31:0]	
R/W Attribute	R/W	
Protection	-	
Attribute		
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] WDGRUNLLM: Window Lower Limit for RUN Setting Marker

These bits are a marker that is used to set the window lower limit value for RUN.

For the window of RUN, see "CHAPTER HARDWARE WATCHDOG TIMER."

2.18. Hardware Watchdog Upper Limit RUN Setting Marker (WDR_RUNULM)

This marker is used to set the hardware watchdog upper limit RUN setting register (HWDG_RUNULS).

Bit	31	0
Field	WDGRUNULM [31:0]	
R/W Attribute	R/W	
Protection	-	
Attribute		
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] WDGRUNULM: Window Upper Limit for RUN Setting Marker

These bits are a marker that is used to set the window upper limit value for RUN.

For the window of RUN, see "CHAPTER HARDWARE WATCHDOG TIMER."

2.19. Hardware Watchdog Lower Limit PSS Setting Marker (WDR_PSSLLM)

This marker is used to set the hardware watchdog lower limit PSS setting register (HWDG_PSSLLS).

Bit	31	0
Field	WDGPSSLLM [31:0]	
R/W Attribute	R/W	
Protection	-	
Attribute		
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] WDGPSSLLM: Window Lower Limit for PSS Setting Marker

These bits are a marker that is used to set the window lower limit value for PSS.

For the window of PSS, see "CHAPTER HARDWARE WATCHDOG TIMER."

2.20. Hardware Watchdog Upper Limit PSS Setting Marker (WDR_PSSULM)

This marker is used to set the hardware watchdog upper PSS setting register (HWDG_PSSULS).

Bit	31	0
Field	WDGPSSULM [31:0]	
R/W Attribute	R/W	
Protection	-	
Attribute		
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] WDGPSSULM: Window Upper Limit for PSS Setting Marker

These bits are a marker that is used to set the window upper limit value for PSS.

For the window of PSS, see "CHAPTER HARDWARE WATCHDOG TIMER."

2.21. Hardware Watchdog Reset Delay Counter Marker (WDR_RSTDLYM)

This marker is used to set the hardware watchdog reset delay counter register (HWDG_RSTDLY).

Bit	31	16
Field	Reserved	
R/W Attribute	R1/W1	
Protection	-	
Attribute		
Initial Value	11111111_11111111	

Bit	15	0
Field	WDGRSTDLYM [15:0]	
R/W Attribute	R/W	
Protection	-	
Attribute		
Initial Value	11111111_11111111	

[bit31:16] Reserved: Reserved Bits

[bit15:0] WDGRSTDLYM: Reset/NMI Delay Counter Marker

These bits are used to set the number of cycles for the delay time that is to be inserted before generation of the watchdog reset request or watchdog interrupt request (NMI).

For the number of cycles for the delay time, see "CHAPTER HARDWARE WATCHDOG TIMER."

2.22. Hardware Watchdog Configuration Marker (WDR_CFGM)

This marker is used to set the hardware watchdog configuration register (HWDG_CFG).

Bit	31	24
Field	Reserved	
R/W Attribute	R1/W1	
Protection Attribute	-	
Initial Value	11111111	

Bit	23	22	21	20	19	18	17	16
Field	Reserved				OBSSELM [4:0]			
R/W Attribute	R1/W1				R/W			
Protection Attribute	-							
Initial Value	111				11111			

Bit	15	14	13	12	11	10	9	8
Field	Reserved						CLKSELM	
R/W Attribute	R1/W1						R/W	
Protection Attribute	-							
Initial Value	111111						11	

Bit	7	6	5	4	3	2	1	0
Field	Reserved							
R/W Attribute	R1/W1							
Protection Attribute	-							
Initial Value	11111111							

[bit31:21] Reserved: Reserved Bits

[bit20:16] OBSSELM: Watchdog Counter Monitor Bit Output Selection Marker

These bits are used to select any 1 bit in the watchdog counter (32 bits) as the output of the watchdog counter monitor bit.

bit20:16	Description
00000	Bit 0 is selected as the output of the watchdog counter monitor bit.
00001	Bit 1 is selected as the output of the watchdog counter monitor bit.
00010	Bit 2 is selected as the output of the watchdog counter monitor bit.
...	...
11111	Bit 31 is selected as the output of the watchdog counter monitor bit (initial value).

[bit15:10] Reserved: Reserved Bits

[bit9:8] CLKSELM: Clock Selection Marker

These bits are used to select a source clock of the watchdog counter.

bit9:8	Description
*0	High-speed CR clock selected
*1	Low-speed CR clock selected (initial value)

* means "don't care" (the value is ignored).

[bit7:0] Reserved: Reserved Bits

2.23. Hardware Watchdog Configuration Enable Marker (WDR_CEM)

This marker is used to enable various marker settings of the hardware watchdog (WDR).

Bit	31	0
Field	CEM [31:0]	
R/W Attribute	R/W	
Protection Attribute	-	
Initial Value	11111111_11111111_11111111_11111111	

[bit31:0] CEM: Configuration Enable Marker

These bits are used to enable various markers of the hardware watchdog (WDR).

bit31:0	Description
0x292D3A7B	The hardware watchdog is started based on the settings defined with the WDR.
Other than above	The hardware watchdog is started not based on the settings defined with the WDR (initial value). – The hardware watchdog operates based on the default settings.

3. BootROM Operation

This section explains the operation of the BootROM.

Starting the Device

After any type of reset, the BootROM software is performed first.

If the BootROM software selects user mode with an external pin, a user application is started.

The following shows a process flow of the BootROM software in user mode.

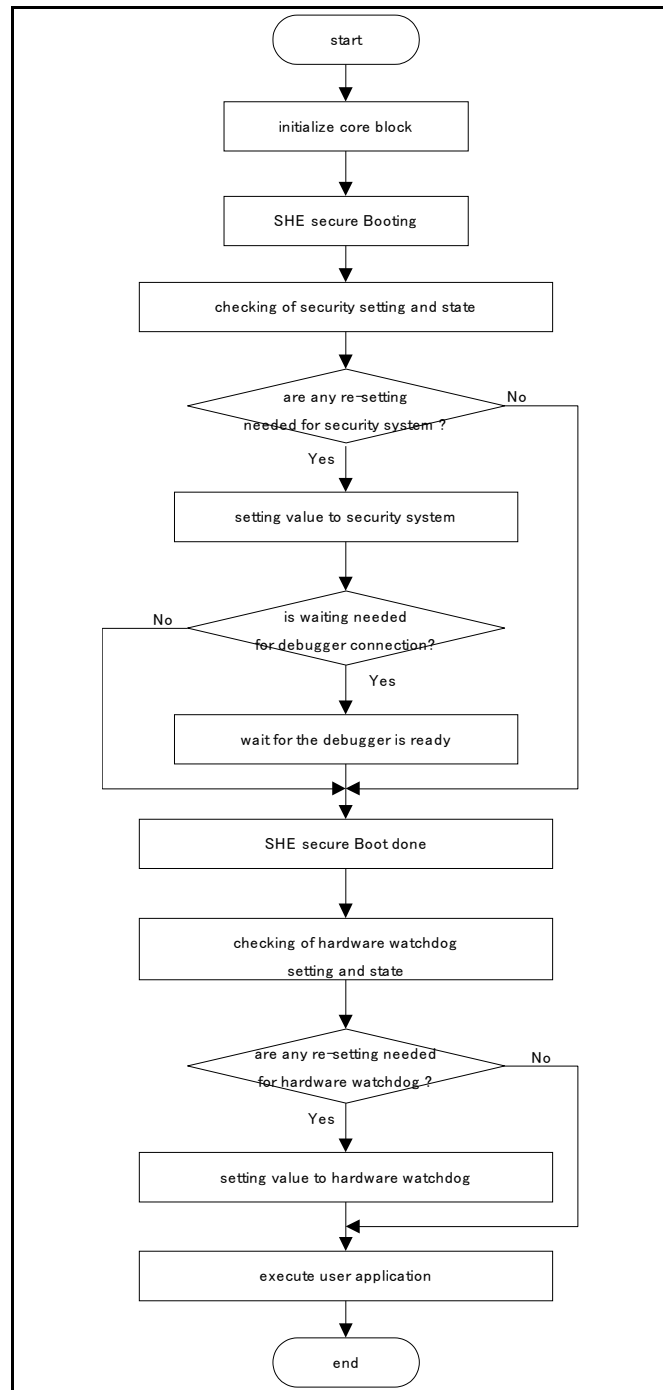

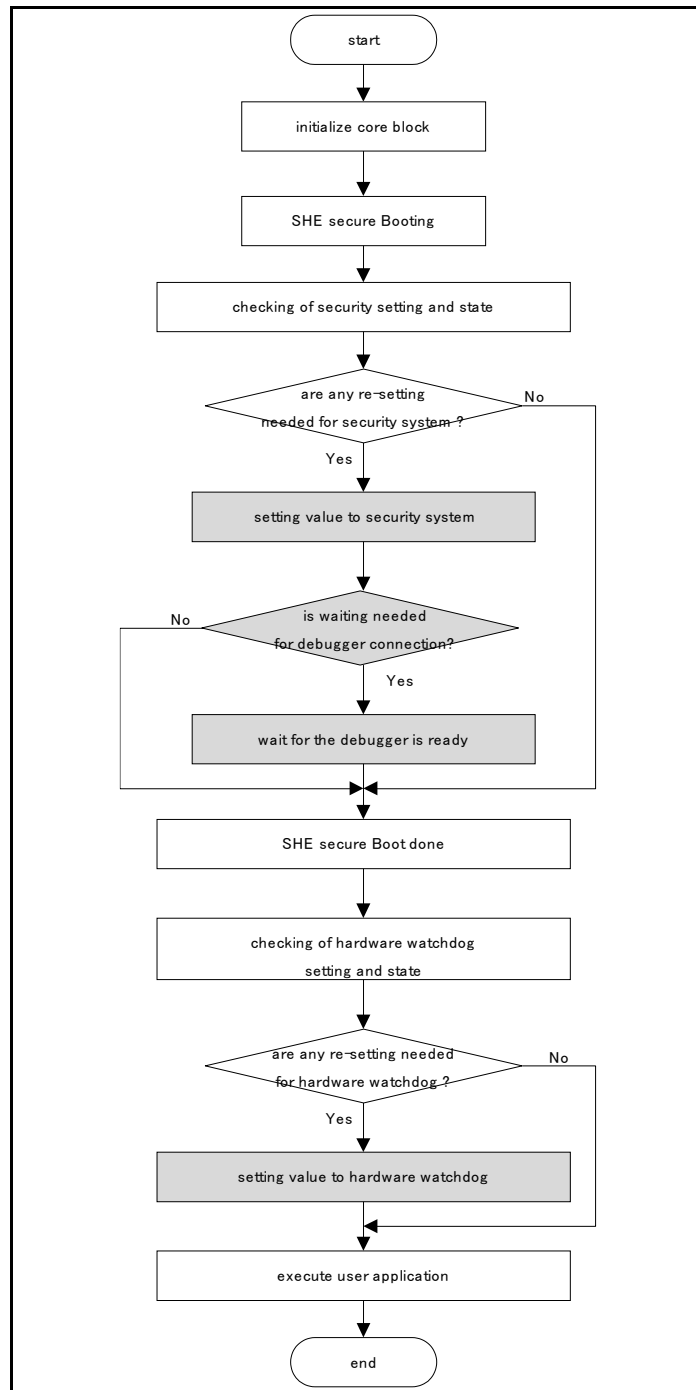

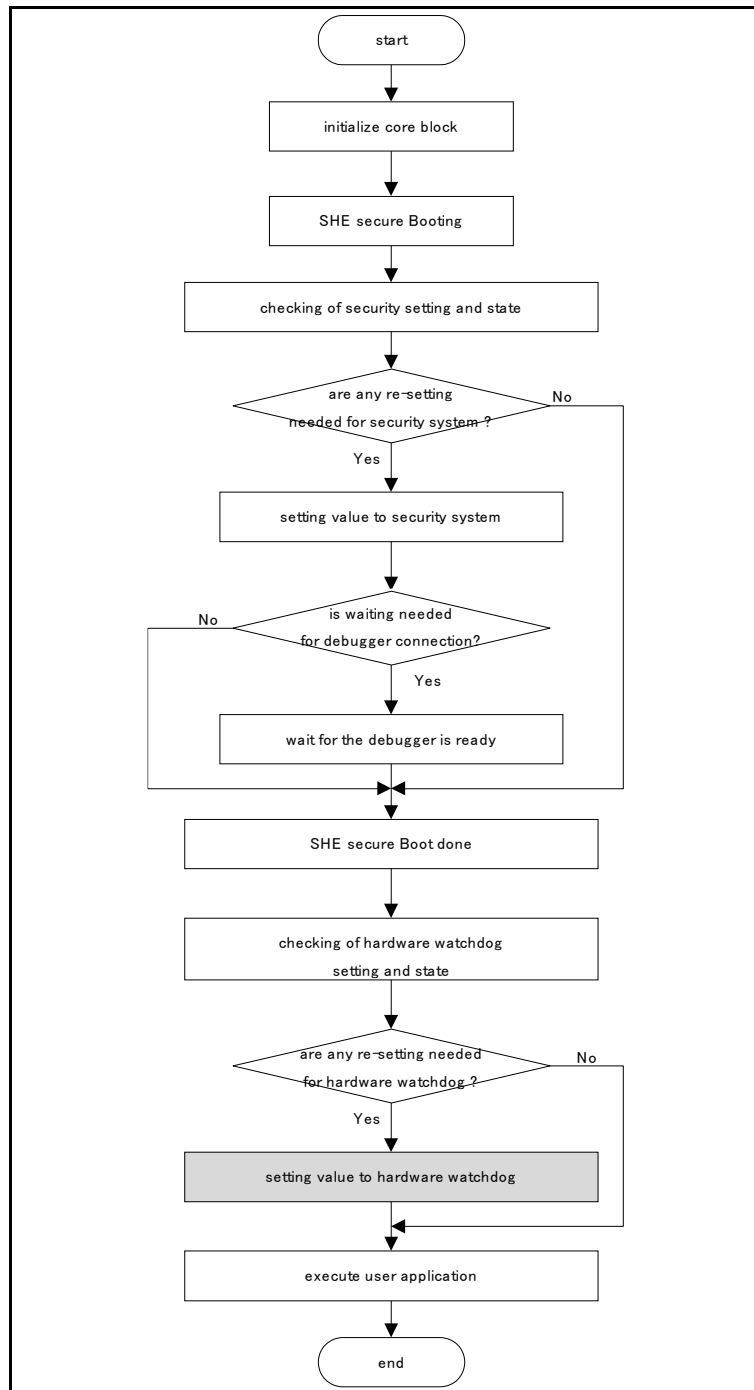

Figure 3-1 User Mode Process Flow (Hard Reset)

Figure 3-2 User Mode Process Flow (Soft Reset)

For a soft reset, security setting, debugger connection wait, and hardware watchdog setting are not performed.

Figure 3-3 User Mode Process Flow (Standby Reset PD2)

For standby reset PD2, hardware watchdog setting is not performed.

Core Initial Setting

During the core initial setting, the following settings are made.

- Initialization of the general-purpose registers
- VIC port enable setting
- FPU enable setting
- The settings of the stack pointers for the following modes, which are used by the BootROM software
 1. System mode
 2. ABORT
 3. Undefined instruction exception

Table 3-1 BootROM Software CPU Initial Settings

Function	BootROM Software Processing
System control	VIC port enable setting Access right setting of the coprocessor for the FPU
MPU control	Not set
Cache control	Not set
TCM control	Not set
System performance	Cycle Counter is used for debugger connection wait (it is initialized after being used).
FPU control	FPU enable setting
Debugging reset	Not set

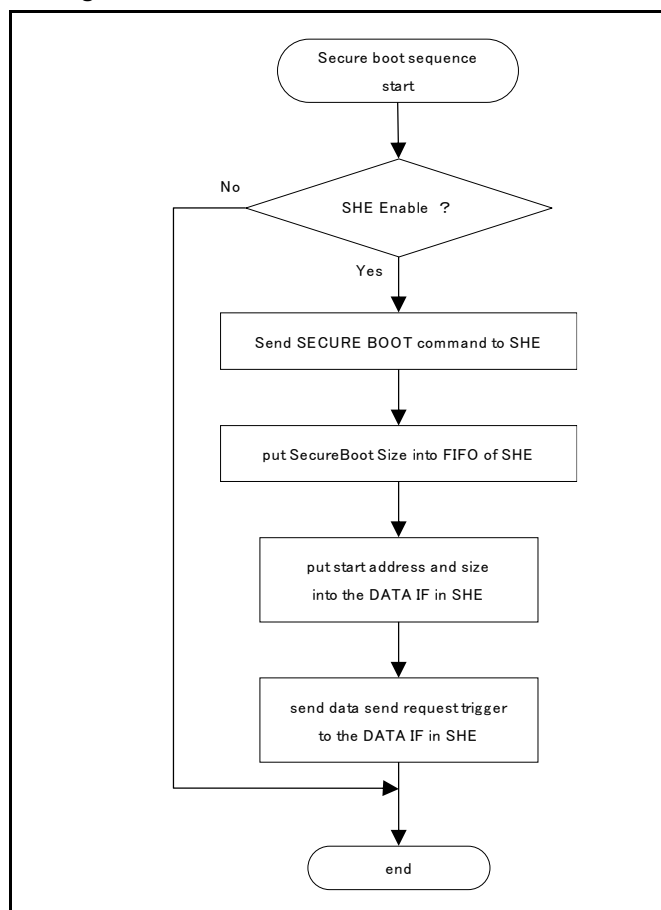

Notes:

- For Cortex-R5 setting that is not made by the BootROM software, a user application shall make the setting as required.
- For Cortex-R5 registers, see the material provided by ARM, "Cortex™-R5 Revision: r1p2 Technical Reference Manual (ARM DDI 0460D)."

SHE Secure Boot Processing

Processing for SHE Secure Boot configuration is performed according to the values of BDR_SBSM, BDR_ABVM, and BDR_ABVEM of the Boot Description Record (BDR). The BootROM program issues a Secure Boot processing request. If the SHE is disabled, the Secure Boot processing is not performed.

Figure 3-4 SHE Secure Boot Process Flow

The BootROM program issues the Secure Boot command to request the SHE to perform Secure Boot processing. Also, it sets the Secure Boot size value read from BDR_SBSM in the input FIFO of the SHE for CMAC algorithm operation.

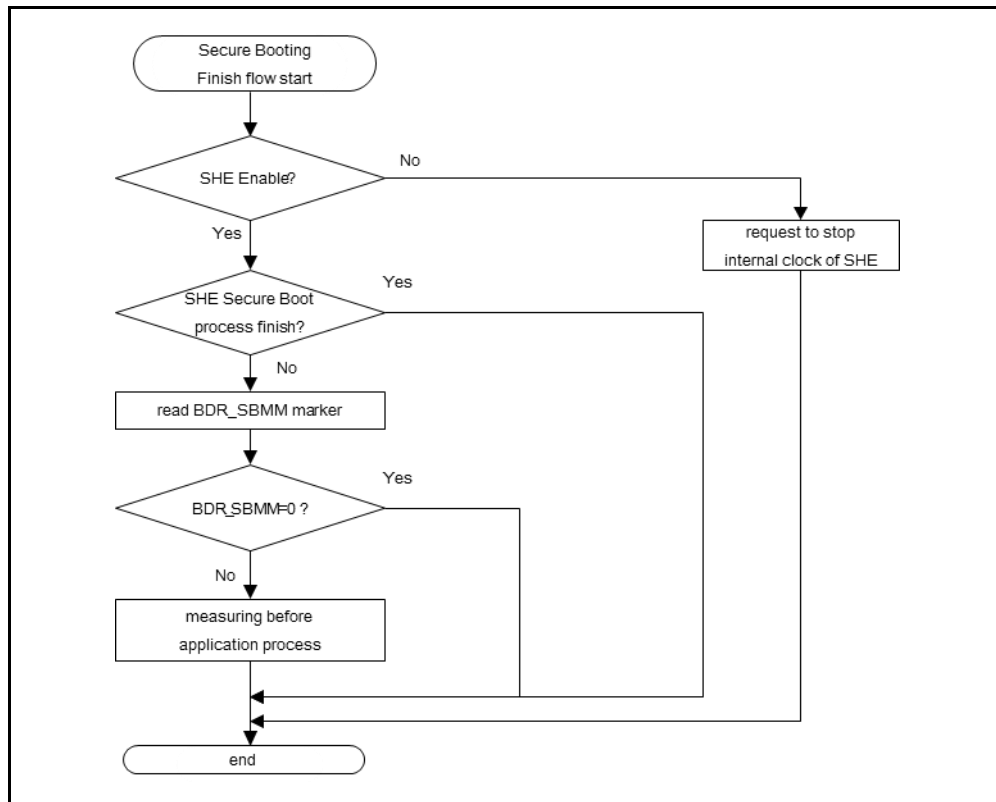

In the DATA IF register of the SHE, the BootROM program sets the Secure Boot Start address determined based on the values of BDR_ABVM and BDR_ABVEM and the Secure Boot size value read from BDR_SBSM. Then, it issues a data transfer request trigger, thus starting the testing of the program area specified by the Secure Boot Start address and Secure Boot size.

When BDR_ABVEM enables the setting of an alternative boot vector, the Secure Boot Start address is the value of BDR_ABVM. Otherwise, the Secure Boot Start address is 0x00A00000.

SHE Secure Boot Finish Processing

Whether the Secure Boot Processing started by the SHE Secure Boot processing has been completed is checked.

Figure 3-5 SHE Secure Boot Finish Process Flow

Read the Status register to check if the processing has been completed. If it is complete, then the SHE Secure Boot Finish processing is completed. If it has not been completed, the BootROM program performs the following processing according to the value of BDR_SBMM.

- When BDR_SBMM is 0x00000000 ("Measuring during application" mode is selected)
The BootROM program completes the SHE Secure Boot Finish processing without waiting for the completion of the SHE Secure Boot processing.
- BDR_SBMM is not 0x00000000 ("Measuring before application" is selected.)
The BootROM program completes the SHE Secure Boot Finish processing after waiting until the SHE Secure Boot processing is completed.

The BootROM program reads the Status register of the SHE. If the read value of the Status register indicates that the SHE is disabled, the BootROM program sets a request for stopping the SHE internal CLK, and then completes the SHE Secure Boot Finish processing.

Security Setting

As to the security setting, access limit setting of the flash memory, the enabling of the use of the debugger, and the security key setting are performed.

The security setting is made according to the value of the TCFCFG0_SECSTAT.SECEN bit.

The following is the condition for enabling the use of the debugger.

The value of the Debugger Key Enable Marker (DDR_DSM) is 0x59F71234.

When the reset factor is a soft reset, since the security setting is not initialized, the security setting is not made.

For access restriction by security setting, see "CHAPTER SECURITY."

Debugger Connection Wait

When debugger connection wait is enabled by the Debugger Connection Wait Enable Marker (BDR_DWEM) setting, the debugger connection wait processing is performed.

This processing enables debugging from the first instruction of an application.

The following shows details of the processing.

1. *Debugger Connection Wait Enable Marker (BDR_DWEM) is checked.*
2. *If the debugger connection wait is not enabled, the next BootROM software processing is performed without debugger connection wait being performed.*
3. *Whether the debugger is connected is checked.*
4. *If the debugger is not connected for a period of 19,200 high-speed CR clock cycles, the connection wait is canceled and the next BootROM software processing is performed.*
5. *If the debugger is connected, whether the debugger setting is completed is checked.*
6. *If there is no notification of setting completion from the debugger, the wait state is canceled after 8,388,608 (2 to 23rd power) high-speed CR clock cycles.*

Hardware Watchdog Setting

The setting of the hardware watchdog is made according to the value of the Watchdog Description Record (WDR).

If the reset factor is a soft reset or standby reset (PD2), the setting of the hardware watchdog is not made.

The lock bit of the hardware watchdog is set with the initial values being maintained and the hardware watchdog is set in the operating state if the following conditions are met: The reset factor is neither soft reset nor standby reset (PD2) and the value of the Hardware Watchdog Configuration Enable Marker (WDR_CEM) is not 0x292D3A7B.

The value of Watchdog Description Record (WDR) and the lock bit are set in the hardware watchdog and the hardware watchdog is set in the operating state if the following conditions are met: The reset factor is neither soft reset nor standby reset (PD2) and the value of the Hardware Watchdog Configuration Enable Marker (WDR_CEM) is 0x292D3A7B.

Executing a User Application

The BootROM software jumps to the user application in its last processing.

If the Alternative Boot Vector Enable Marker (BDR_ABVEM) is enabled, it jumps to the value of the Alternative Boot Vector Marker (BDR_ABVM).

If the Alternative Boot Vector Enable Marker is not enabled, the software jumps to the fixed address of 0x00A00000.

Before jumping to the user application, the BootROM software clears the stack area and general-purpose registers R0 to R12 it has used.

Exception Vector Table

In the BootROM, there is a core exception vector table.

In the exception vector table, processing for branching to exception handlers is stored.

An exception handler address is specified by a register of the interrupt controller or BootROM hardware interface, and the BootROM software jumps to the value of the register.

The following table includes the registers that are referenced by the BootROM software when exceptions occur.

Table 3-2 Reference Registers When Exceptions Occur

Exception	Reference Register
Undefined instruction Exception	EXCFG_UNDEFACT
SVC	EXCFG_SVCACT
Instruction abort	EXCFG_PABORTACT
Data abort	EXCFG_DABORTACT
NMI(FIQ)	IRC_NMIVASBR

4. Notes

This section provides notes regarding the BootROM.

RAM Area Used by the BootROM Software

For the execution of the BootROM software, the TCRAM area (address range of 0x00000000 to 0x000000CF) is used.

Since the area used by the BootROM software is initialized to 0 at the end of the BootROM software processing, its contents are changed from those before the reset.

Interrupt Setting

The BootROM software does not set the I bit and F bit of the core internal register CPSR.

(The default value is 1, which means "Disable.")

Before using IRQ or FIQ, a user application shall set the I and F bits to 0.

ARM Core Setting

1. R0-R12 are cleared to 0.
2. Bit24(VE) of System Control Register (SCTLR) is set to 1.
3. Bit23:22(CP11) and bit21:20(CP10) of Coprocessor Access Control Register (CPACR) are set to 0b11 (Privileged and User mode access).
4. Bit30(EN) of Floating-Point Exception Register (FPEXC) is set to 1.

CHAPTER 21: Exclusive Access Memory (EAM)

This chapter provides an overview of the exclusive access memory (EAM) and describes its configuration, operation, and memory area.

1. Overview
2. Configuration
3. Explanation of Operation
4. Operation Examples
5. Memory Area

EAM-TXXPT03P01R01L05-E1-XX

1. Overview

This section describes the features of the exclusive access memory (EAM) block.

If a conflicting access occurs, Cortex™-R5F can exclusively access the memory area of this block by using the AXI exclusive command for the memory area.

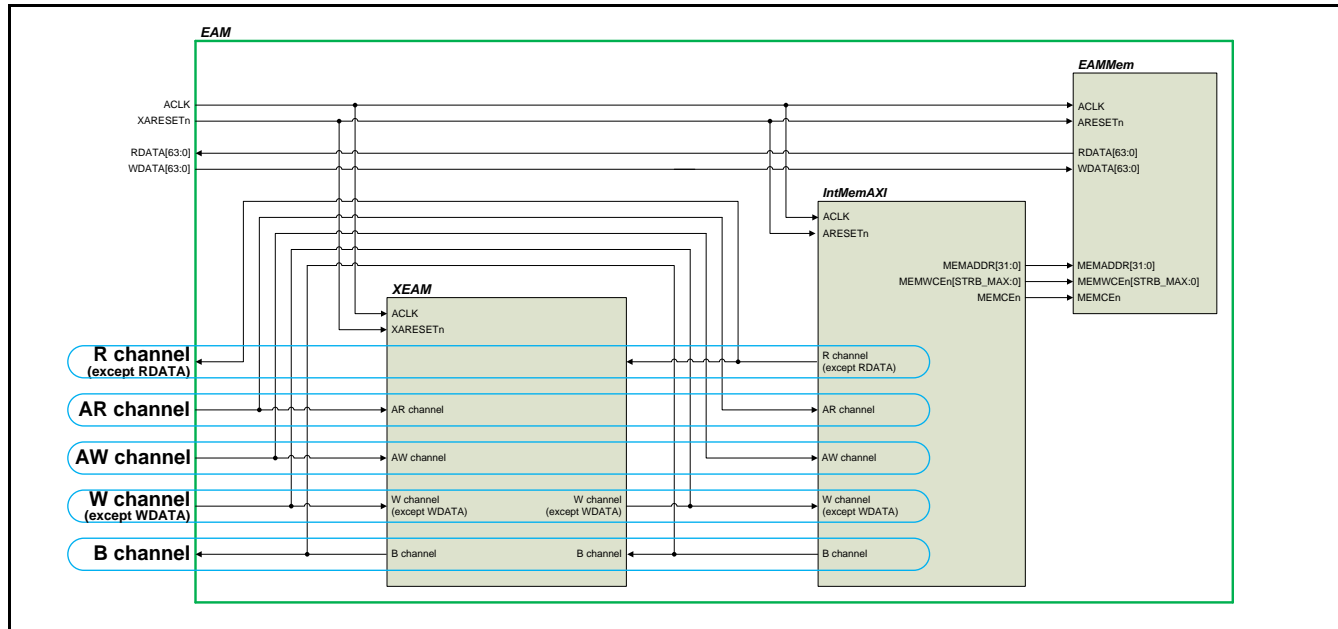

Features

- This block is located as a slave on the HPM, and this memory area can be accessed exclusively from Cortex-R5F.
- This block has 48 bytes of memory area that can be accessed exclusively.
- Exclusion processing by this block is positioned as the global monitor. (The local monitor is located on Cortex-R5F.) For details on the local monitor and the global monitor, see the ARM® Architecture Reference Manual ARM®v7-A and ARM®v7-R edition (ARM DDI 0406B).
- Up to 4 ID and address range sets can be monitored for exclusive access.
- The write data width is 64 bits.
- The read data width is 64 bits.
- The ID width is 8 bits.

2. Configuration

This section shows the configuration of the exclusive access memory (EAM).

Figure 2-1 Block Diagram of Exclusive Access Memory (EAM)

■ XEAM

Exclusive access processing is performed.

Up to 4 ID and address range sets can be monitored simultaneously.

■ IntMemAXI

Conversion from the AXI interface to the memory interface is performed.

■ EAMMem

This block has a capacity of 48 bytes as a memory area, and reads and writes data using the memory interface.

3. Explanation of Operation

This section describes the operation for each instruction.

The letter "x" in LDRx, STRx, LDREXx, STREXx, and so on in the commands described below represents the size of the command: "D" = Doubleword, "" = Word, "H" = Halfword, and "B" = Byte. (There is not suffix of "x" in the Word case.)

3.1. General Aspects of Transfer

This section outlines the operation for normal instructions (such as STRx and LDRx) and exclusive instructions (such as STREXx and LDREXx).

- This block is located as a slave on the HPM, and receives and processes an exclusive access (in addition to normal access) from a master.
- The memory area in this block has a capacity of 48 bytes. This memory area supports exclusive access. Normal read (LDRx), normal write (STRx), exclusive load (LDREXx), and exclusive store (STREXx) can be performed.
- IntMemAXI in this block has no address buffer mounted. Therefore, it has no WID and processes both normal write (STRx) and exclusive store instruction (STREXx) without interleaving. It processes address and data pairs only one by one. So, consider a transfer method for a master.
- This block does not support AxCACHE and AxPROT.

3.2. Normal Access

This section describes the operation for normal instructions (such as STRx and LDRx).

Read Instruction (LDRx)

- This instruction reads the relevant address in EAMMem according to a read instruction (LDRx) from a master.

Write Instruction (STRx)

- This instruction writes to the relevant address in EAMMem according to a write instruction (STRx) from a master.

3.3. Exclusive Access

This section outlines the operation for exclusive instructions (such as STREXx and LDREXx).

- Up to 4 ID (except for WID) and address sets are monitored simultaneously for the exclusive load instruction (LDREXx) and exclusive store instruction (STREXx) from a master.
- Whether access is exclusive or normal is determined by ARLOCK[1:0] (Read) or AWLOCK[1:0] (Write). The access is handled as exclusive load when ARLOCK[1:0] is "0b01" and as exclusive store when AWLOCK[1:0] is "0b01". In cases other than these, it is handled as normal read (LDRx) or write (STRx).

3.3.1. Exclusive Load Instruction (LDREXx)

This section describes the operation for the exclusive load instruction (LDREXx).

This section uses the following rules in transfer example tables:

The transfer example tables are described in ascending order of time.

However, transfers that have "+" in the Simultaneous Reception column are received simultaneously.

ADD (Address) A, B, C, and D are addresses whose address ranges do not overlap in any part. ADD (Address) A and ADD (Address) @A and the like are addresses whose address ranges overlap in some part.

- When an exclusive load instruction (LDREXx) is received, 1 address is monitored for 1 ID.
- Exclusive load instruction (LDREXx) monitoring is performed on 4 sets of different IDs and addresses. (A register that holds an ID and address as a set is hereafter referred to as a monitoring register.)
- If an exclusive load instruction (LDREXx) is determined as exclusive access NG with the following conditions, the response (RRESP[1:0]) to the master is set to OKAY ("0b00"). Otherwise, it is determined as exclusive access OK and EXOKAY ("0b01") is sent.
 1. If normal write (STRx) and an exclusive load instruction (LDREXx) are received simultaneously and they have the same address or their address ranges overlap in some part, the exclusive load instruction (LDREXx) is determined as exclusive access NG. (At this time, normal write (STRx) is written normally and the information of the exclusive load instruction (LDREXx) that is determined as exclusive access NG is not held by a monitoring register.)
 2. If an exclusive store instruction (STREXx) and an exclusive load instruction (LDREXx) are received simultaneously and they have the same address or their address ranges overlap in some part, the exclusive load instruction (LDREXx) is determined as exclusive access NG. (At this time, the exclusive store instruction (STREXx) is processed normally and the information of the exclusive load instruction (LDREXx) that is determined as exclusive access NG is not held by a monitoring register.)
 3. If an exclusive load instruction (LDREXx) is sent from a master by a method other than single burst (ARLENS[3:0]="0b0000" and ARBURSTS[1:0]="0b01"), it is determined as exclusive access NG.
 4. If monitoring registers already hold 4 exclusive load instructions (LDREXx) when an exclusive load instruction (LDREXx) is received, the ID of the received exclusive load instruction (LDREXx) does not match the values in the monitoring registers, and address ranges do not overlap in any part, the instruction is determined as exclusive access NG. (At this time, the information of the exclusive load instruction (LDREXx) that is determined as exclusive access NG is not held by a monitoring register.)

The following table provides an example of operation when normal write (STRx) and an exclusive load instruction (LDREXx) are received simultaneously and they have the same address, as described in 1. above.

Table 3-1 When Normal Write (STRx) and Exclusive Load Instruction (LDREXx) Are Received Simultaneously and They Have the Same Address

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
+	STRx	1	A	OKAY								
+	LDREXx	0	A	OKAY								
	LDREXx	3	B	EXOKAY	3	B						
+	STRx	0	C	OKAY	3	B						
+	LDREXx	2	C	OKAY	3	B						

The following tables provide examples of operation when an exclusive store instruction (STREXx) and an exclusive load instruction (LDREXx) are received simultaneously, as described in 2. above.

Table 3-2 When Exclusive Store Instruction (STREXx) and Exclusive Load Instruction (LDREXx) Are Received Simultaneously and They Have the Same Address

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
+	STREXx	0	B	OKAY	0	A						
+	LDREXx	1	B	OKAY	0	A						
	STREXx	0	A	EXOKAY								

Table 3-3 When Exclusive Store Instruction (STREXx) and Exclusive Load Instruction (LDREXx) Are Received Simultaneously and They Have Different Addresses

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
+	STREXx	0	B	OKAY	0	A						
+	LDREXx	1	A	EXOKAY	1	A						
	STREXx	1	A	EXOKAY								

Table 3-4 When Exclusive Store Instruction (STREXx) and Exclusive Load Instruction (LDREXx) Are Received Simultaneously and They Have Different Addresses

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
+	STREXx	0	A	EXOKAY								
+	LDREXx	1	B	EXOKAY	1	B						
	STREXx	1	B	EXOKAY								

The following tables provide examples of operations when address ranges do not overlap in any part and when address ranges overlap in some part, as described in 4. above.

Table 3-5 When Exclusive Load Instruction (LDREXx) Whose Address Range (of ID Different from IDs Held by Monitoring Registers) Does Not Overlap in Any Part Is Received

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	LDREXx	4	E	OKAY	0	A	1	B	2	C	3	D

Table 3-6 When Exclusive Load Instruction (LDREXx) Whose Address Range (of the Same ID as ID Held by Monitoring Register) Overlaps in Some Part Is Received

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	LDREXx	3	@A	EXOKAY			1	B	2	C	3	@A

3.3.2. Exclusive Store Instruction (STREXx)

This section describes the operation for the exclusive store instruction (STREXx).

This section uses the following rules in transfer example tables:

The transfer example tables are described in ascending order of time.

However, transfers that have "+" in the Simultaneous Reception column are received simultaneously.

ADD (Address) A, B, C, and D are addresses whose address ranges do not overlap in any part. ADD (Address) A and ADD (Address) @A and the like are addresses whose address ranges overlap in some part.

- If an exclusive store instruction (STREXx) is determined as exclusive access OK, a write command is sent to IntMemAXI without particularly processing the write command.
- If an exclusive store instruction (STREXx) is under the following conditions, it is determined as exclusive access NG, write strobe is dropped to IntMemAXI (0x00), and a write command that does not update data is sent. The response (BRESP[1:0]) to the master is set to OKAY ("0b00"). If the instruction is not under the following conditions, it is determined as exclusive access OK and EXOKAY ("0b01") is sent.
 1. If an exclusive store instruction (STREXx) that is different from exclusive load instructions (LDREXx) held by monitoring registers is received, it is determined as exclusive access NG. (This includes a case where normal write (STRx) cleared an internally held exclusive load instruction (LDREXx).)
 2. If an exclusive store instruction (STREXx) is sent from a master by means other than single burst (AWLENS[3:0]="0b0000" and AWBURSTS[1:0]="0b01"), it is determined as exclusive access NG.

The following tables provide examples of operation that is described in 1. above.

Table 3-7 When Exclusive Store Instruction (STREXx) Different from Contents of Monitoring Registers Is Received

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	STREXx	0	E	OKAY	0	A	1	B	2	C	3	D

Table 3-8 When Normal Write (STRx) Cleared Monitoring Register

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	STRx	0	A	OKAY			1	B				
	STREXx	0	A	OKAY			1	B				

4. Operation Examples

This section describes the operation of this block for exclusive access from a master.

This section uses the following rules in transfer example tables:

The transfer example tables are described in ascending order of time.

However, transfers that have "+" in the Simultaneous Reception column are received simultaneously.

ADD (Address) A, B, C, and D are addresses whose address ranges do not overlap in any part. ADD (Address) A and ADD (Address) @A and the like are addresses whose address ranges overlap in some part.

The following tables provide examples of the operation of this block when exclusive access is received from a master.

Table 4-1 When Exclusive Load Instructions (LDREXx) Have Different IDs and Address Ranges

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	STREXx	0	A	EXOKAY			1	B	2	C	3	D
	STREXx	1	B	EXOKAY					2	C	3	D
	STREXx	2	C	EXOKAY							3	D
	STREXx	3	D	EXOKAY								

Table 4-2 When Exclusive Load Instructions (LDREXx) Have Different IDs and the Same Address Range

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	A	EXOKAY	1	A						
	LDREXx	2	A	EXOKAY	2	A						
	LDREXx	3	A	EXOKAY	3	A						
	STREXx	0	A	OKAY	3	A						
	STREXx	1	A	OKAY	3	A						
	STREXx	2	A	OKAY	3	A						
	STREXx	3	A	EXOKAY								

Table 4-3 When Exclusive Store Instructions (STREXx) That Have Different IDs for the Same Address Range Arrive

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	STREXx	1	A	OKAY	0	A						
	LDREXx	1	A	EXOKAY	1	A						
	STREXx	2	A	OKAY	1	A						
	LDREXx	2	A	EXOKAY	2	A						
	STREXx	3	A	OKAY	2	A						
	LDREXx	3	A	EXOKAY	3	A						
	STREXx	0	A	OKAY	3	A						

Row 2: If STREXx is determined as exclusive access NG, the monitoring register holds values as they are.

Row 3: If LDREXx has the same address range, the current ID is overwritten with the ID of LDREXx.

Table 4-4 When ID and Address Range of Exclusive Load Instruction (LDREXx) Do Not Match Those of Exclusive Store Instruction (STREXx)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	STREXx	0	D	OKAY			1	B	2	C	3	D
	STREXx	1	C	OKAY					2	C	3	D
	STREXx	2	B	OKAY							3	D
	STREXx	3	A	OKAY								

Table 4-5 When Order of Exclusive Load Instructions (LDREXx) Is Different from That of Exclusive Store Instructions (STREXx)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	STREXx	3	D	EXOKAY	0	A	1	B	2	C		
	STREXx	2	C	EXOKAY	0	A	1	B				
	STREXx	1	B	EXOKAY	0	A						
	STREXx	0	A	EXOKAY								

Table 4-6 When 5 Exclusive Load Instructions (LDREXx) Are Received

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	LDREXx	0	E	EXOKAY	0	E	1	B	2	C	3	D
	STREXx	0	A	OKAY			1	B	2	C	3	D
	STREXx	1	B	EXOKAY					2	C	3	D
	STREXx	2	C	EXOKAY							3	D
	STREXx	3	D	EXOKAY								
	STREXx	0	E	OKAY								

Row 5: The values are overwritten by LDREXx that has the same ID and a different address range.

Row 6: The response is OKAY because a monitoring register is overwritten (in row 5).

Table 4-7 When 5 Exclusive Load Instructions (LDREXx) Are Received

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	LDREXx	1	B	EXOKAY	0	A	1	B				
	LDREXx	2	C	EXOKAY	0	A	1	B	2	C		
	LDREXx	3	D	EXOKAY	0	A	1	B	2	C	3	D
	LDREXx	4	E	OKAY	0	A	1	B	2	C	3	D
	STREXx	0	A	EXOKAY			1	B	2	C	3	D
	STREXx	1	B	EXOKAY					2	C	3	D
	STREXx	2	C	EXOKAY							3	D
	STREXx	3	D	EXOKAY								
	STREXx	4	E	OKAY								

Row 5: The monitoring registers are not overwritten because the ID is different from the 4 IDs that are held. LDREXx=OKAY

Table 4-8 When Exclusive Store Instruction (STREXx) Arrives before Exclusive Load Instruction (LDREXx)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	STREXx	0	A	OKAY								
	LDREXx	0	A	EXOKAY	0	A						

Row 1: The response is OKAY because STREXx is received when there are no monitoring targets in the monitoring registers.

Table 4-9 When There Is Normal Write (STRx) That Has the Same Address between Exclusive Load Instruction (LDREXx) and Exclusive Store Instruction (STREXx) (When Normal Write Is Received, Monitoring Registers Are Cleared)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	0	A	EXOKAY	0	A						
	STRx	0	A	OKAY								
	STREXx	0	A	OKAY								
	LDREXx	0	B	EXOKAY	0	B						
	STRx	1	B	OKAY								
	STREXx	0	B	OKAY								

Row 2: Normal write (STRx) to the same ID and address as those of the exclusive load instruction (LDREXx)

Row 6: Normal write (STRx) to a different ID but from the same address as that of the exclusive load instruction (LDREXx)

Table 4-10 When Exclusive Load Instruction (LDREXx) and Exclusive Store Instruction (STREXx) Arrive Simultaneously (If It Arrives Simultaneously with STREXx, STREXx Takes Precedence)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	1	A	EXOKAY	1	A						
+	LDREXx	2	A	OKAY	1	A						
+	STREXx	0	A	OKAY	1	A						

Row 3: The response is STREXx=OKAY and monitoring registers are not cleared because the ID does not match the ID in the monitoring register.

Row 2: The response is LDREXx=OKAY and monitoring registers are not updated because the address matches the address of STREXx received simultaneously.

Table 4-11 When Exclusive Load Instruction (LDREXx) and Exclusive Store Instruction (STREXx) Arrive Simultaneously (If It Arrives Simultaneously with STREXx, STREXx Takes Precedence)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	1	A	EXOKAY	1	A						
+	LDREXx	2	B	EXOKAY	2	B						
+	STREXx	1	A	EXOKAY								

Row 3: The response is STREXx=EXOKAY and monitoring registers are cleared because both the ID and address match those in the monitoring register.

Row 2: The address does not match the address of STREXx received simultaneously. Therefore, it is held as a new monitoring target in the monitoring register.

Table 4-12 When Exclusive Load Instruction (LDREXx) and Exclusive Store Instruction (STREXx) Arrive Simultaneously (If It Arrives Simultaneously with STREXx, STREXx Takes Precedence)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	1	A	EXOKAY	1	A						
+	LDREXx	1	B	EXOKAY	1	B						
+	STREXx	0	A	OKAY	1	A						

Row 3: The response is STREXx=OKAY and monitoring registers are not cleared because the ID does not match the ID in the monitoring register.

Row 2: The monitoring register is updated because the address does not match the address of STREXx received simultaneously and the ID is the same as the ID in the monitoring register.

Table 4-13 When Exclusive Load Instruction (LDREXx) and Exclusive Store Instruction (STREXx) Arrive Simultaneously (If It Arrives Simultaneously with STREXx, STREXx Takes Precedence)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
+	LDREXx	1	A	EXOKAY	1	A						
+	STREXx	0	B	OKAY								

Row 2: The response is STREXx=OKAY because there is no monitoring target in monitoring registers (no LDREXx is received before STREXx).

Row 1: The address does not match the address of STREXx received simultaneously. Therefore, it is held as a new monitoring target in the monitoring register.

Table 4-14 When Exclusive Load Instruction (LDREXx) Is Received Simultaneously with Normal Write (STRx) and They Have the Same Address (If It Is Received Simultaneously with Normal Write to the Same Address Range, OKAY Is Returned to LDREXx)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
+	LDREXx	0	A	OKAY								
+	STRx	1	A	OKAY								

Row 2: The response is OKAY because the transfer type is normal write (STRx).

Row 1: The response is LDREXx=OKAY because the address is the same as that of normal Write (STRx).

Table 4-15 When Exclusive Load Instruction (LDREXx) Is Received Simultaneously with Normal Write (STRx) and They Have the Same Address (If It Is Received Simultaneously with Normal Write to the Same Address Range, OKAY Is Returned to LDREXx)

Simultaneous Reception	Transfer Type	Ax ID	ADD	Response	Monitoring Register 1		Monitoring Register 2		Monitoring Register 3		Monitoring Register 4	
					ID	ADD	ID	ADD	ID	ADD	ID	ADD
	LDREXx	1	B	EXOKAY	1	B						
+	LDREXx	0	B	OKAY

CHAPTER 22: Interrupt Controller

This chapter explains the interrupt controller.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Examples
5. Registers
6. Others

IRC-TXXPT03P01R01L08-E1-XX

1. Overview

This section provides an overview of the interrupt controller.

The interrupt controller supports 512 channels for normal interrupts (IRQs) and 32 channels for non-maskable interrupts (NMIs). All IRQs are processed so that they issue a single interrupt request (nIRQ) to the CPU. All NMIs are processed so that they issue a single fast interrupt request (nFIQ) to the CPU.

The interrupt controller has the following functions.

- Controls the issue of interrupts (nIRQ and nFIQ) to the CPU.
- Supports 512 IRQ channels for nIRQ generation.
- Supports 32 NMI channels for nFIQ generation.
- Default interrupt priority levels. (Those channels with the lower channel numbers take precedence.)
- Internally synchronizes asynchronous interrupts.
- IRQ priority level control which allows 32-level settings.
- Controls IRQ priority level masking.
- NMI priority level control which allows 16-level settings. (Note that only NMI0 is fixed to level 0.)
- Supports vectored interrupt for both IRQ and NMI.
- A 32-bit vector address per interrupt channel.
- Generates a software interrupt for both IRQ and NMI.
- Supports privileged mode for access restriction.

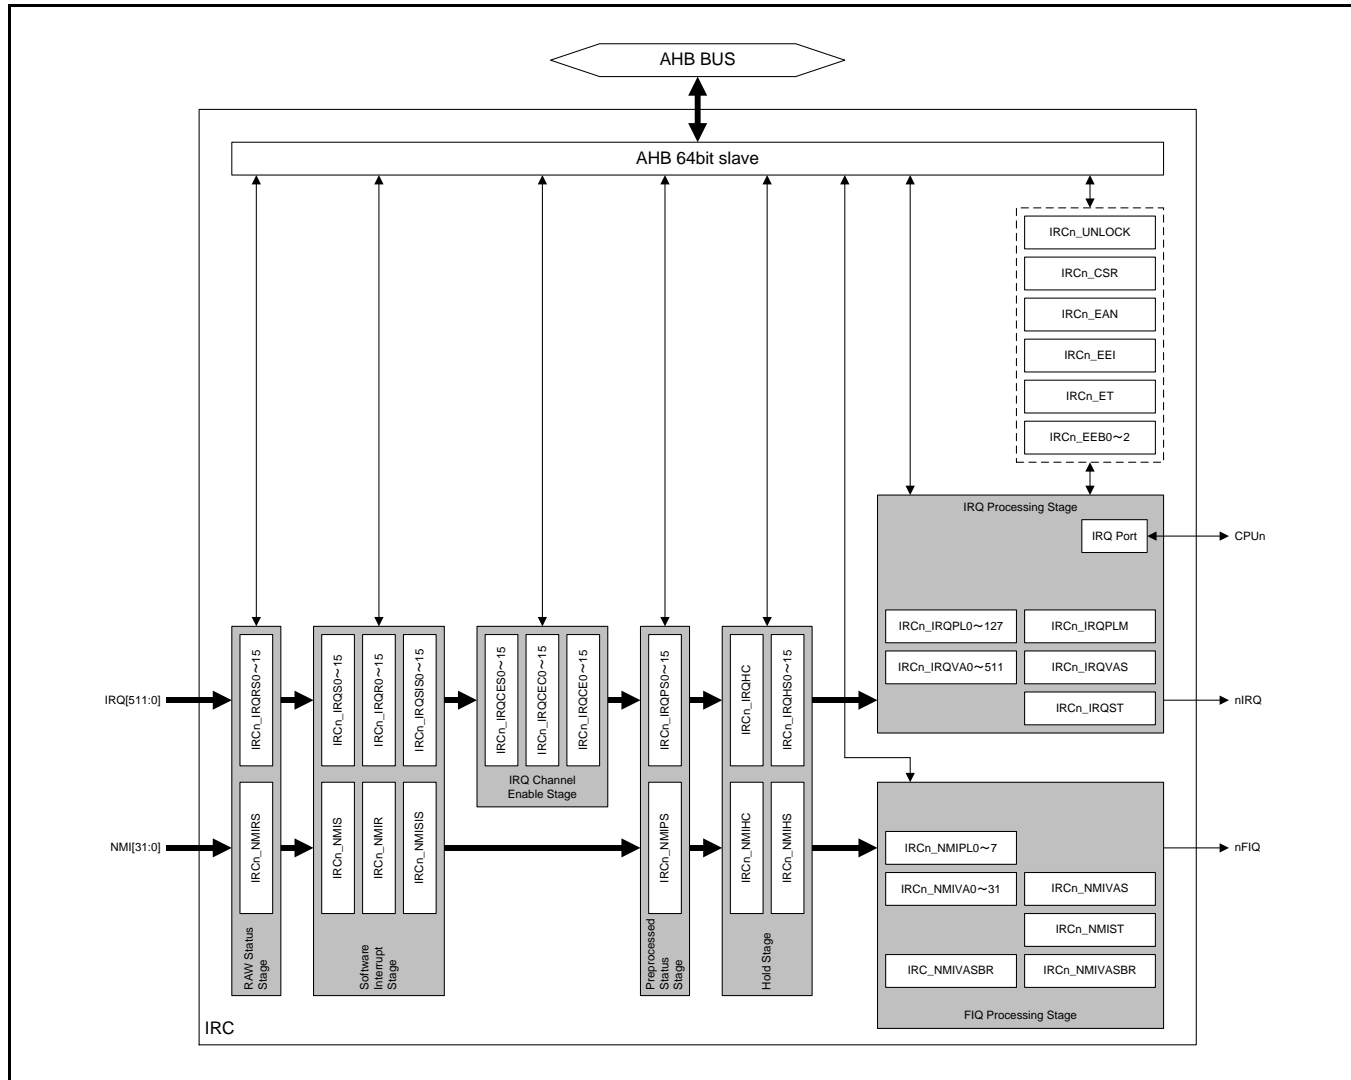

Notes:

- In this chapter, you may see the abbreviated notation, *IRC*, which stands for *InterRupt Controller*. You may also see the notations *ISR* and *VIC*, which stand for *Interrupt Service Routine* and *Vectored Interrupt Controller*, respectively.
- Regarding the abbreviations used for the registers of the interrupt controller, the "n" in "IRCn_****" corresponds to the CPU number, "m" in "IRCn_**m" to the NMI channel number (0 to 31), and "r" in "IRCn_***r" to the IRQ channel number (0 to 511).
- For details on the interrupt factor assignment to each NMI/IRQ channel, see product specification.

2. Configuration

This section explains the block diagram of the interrupt controller.

Figure 2-1 Block Diagram of Interrupt Controller

3. Explanation of Operation

This section explains the operation of the interrupt controller.

Interrupt Controller Stages

RAW Status Stage

For each IRQ/NMI channel, the interrupt controller posts notification of the RAW status. The RAW status is the interrupt status existing immediately after an input to the interrupt controller. In this status, the interrupt controller does not execute any processing. For both IRQ and NMI, notification of the status is obtained by reading the RAW status register (IRCn_IRQRS0 to IRCn_IRQRS15, IRCn_NMIRS).

Software Interrupt Stage

The interrupt controller can generate a software interrupt for each IRQ/NMI channel. By writing "1" to a bit in the IRQ software interrupt set register (IRCn_IRQS0 to IRCn_IRQS15), a software interrupt is set for the corresponding IRQ channel. By writing "1" to a bit of the IRQ software interrupt reset register (IRCn_IRQR0 to IRCn_IRQR15), the software interrupt for the corresponding IRQ channel is reset. The IRQ software interrupt status is obtained by reading the IRQ software interrupt status register (IRCn_IRQSIS0 to IRCn_IRQSIS15).

Similarly, for NMI, the interrupt controller has the NMI software interrupt set register (IRCn_NMIS), NMI software interrupt reset register (IRCn_NMIR), and NMI software interrupt status register (IRCn_NMISIS). The operation is same as for IRQ.

Although the interrupt controller supports 512 channels for IRQ and 32 channels for NMI, not every channel is assigned an interrupt factor. Therefore some channels are unused. These unused channels can be used for software interrupts. You can use software interrupts to test the ISRs for hardware interrupts.

IRQ Channel Enable Stage

For each IRQ channel, the interrupt controller can set either enable or disable. It cannot disable NMI channels. By writing "1" to a bit in the IRQ channel enable set register (IRCn_IRQCES0 to IRCn_IRQCES15), the corresponding IRQ channel is enabled. By writing "1" to a bit of the IRQ channel enable clear register (IRCn_IRQCEC0 to IRCn_IRQCEC15), the enabled status of the corresponding IRQ channel is cleared. The IRQ channel enable status is obtained by reading the IRQ channel enable setting register (IRCn_IRQCE0 to IRCn_IRQCE15). The interrupt controller can also be set either enable or disable by writing directly to the registers from IRCn_IRQCE0 to IRCn_IRQCE15.

Preprocessed Status Stage

The interrupt controller posts notification of the preprocessed interrupt status. In this case, preprocessing means the processing which is executed in the software interrupt stage and the IRQ channel enable stage. For both IRQ and NMI, the status is obtained by reading the preprocessed interrupt status register (IRCn_IRQPS0 to IRCn_IRQPS15, IRCn_NMIPS).

Hold Stage

For each IRQ/NMI channel, the interrupt controller holds the interrupt hold status. When the IRQ is applied to the CPU, the corresponding bit in the IRQ hold status register (IRCn_IRQHS0 to IRCn_IRQHS15) becomes "1". When the NMI is applied to the CPU and the CPU which has accepted the nFIQ reads IRC_NMIVASBR, the corresponding bit in the NMI hold status register (IRCn_NMIHS) becomes "1". After ISR ends, the corresponding hold status bit must be cleared. By writing, to the hold

clear register (IRChn_IRQHC, IRChn_NMIHC), the number of the channel for which the hold status is to be cleared, the corresponding hold status bit is cleared.

IRQ Processing Stage

IRQs are processed according to their software priority which is set in the IRQ priority level register (IRChn_IRQPL0 to IRChn_IRQPL127) and their hardware priority, and the channel having the highest priority level is applied. There are 32 software priority levels that can be set. If 2 requests have the same software priority level, that with the higher hardware priority level takes precedence. Hardware priority is fixed and that channel having the lower channel number has the higher priority level.

For IRQ, the interrupt controller has an interrupt mask function provided through the IRQ priority level mask register (IRChn_IRQPLM). If an IRQ channel has a software priority level (which is set in registers IRChn_IRQPL0 to IRChn_IRQPL127) that is higher than the value set in IRChn_IRQPLM, the channel is masked.

FIQ Processing Stage

NMIs are processed according to their software priority which is set in the NMI priority level register (IRChn_NMIPL0 to IRChn_NMIPL7) and their hardware priority, and the channel having the highest priority level is applied. There are 16 software priority levels that can be set. If 2 requests have the same software priority level, that with the higher hardware priority level takes precedence. Hardware priority is fixed and that channel having the lower channel number has the higher priority level. The software priority level of NMI0 is fixed to "0". Since NMI0 has the highest hardware priority level, it always has the highest priority.

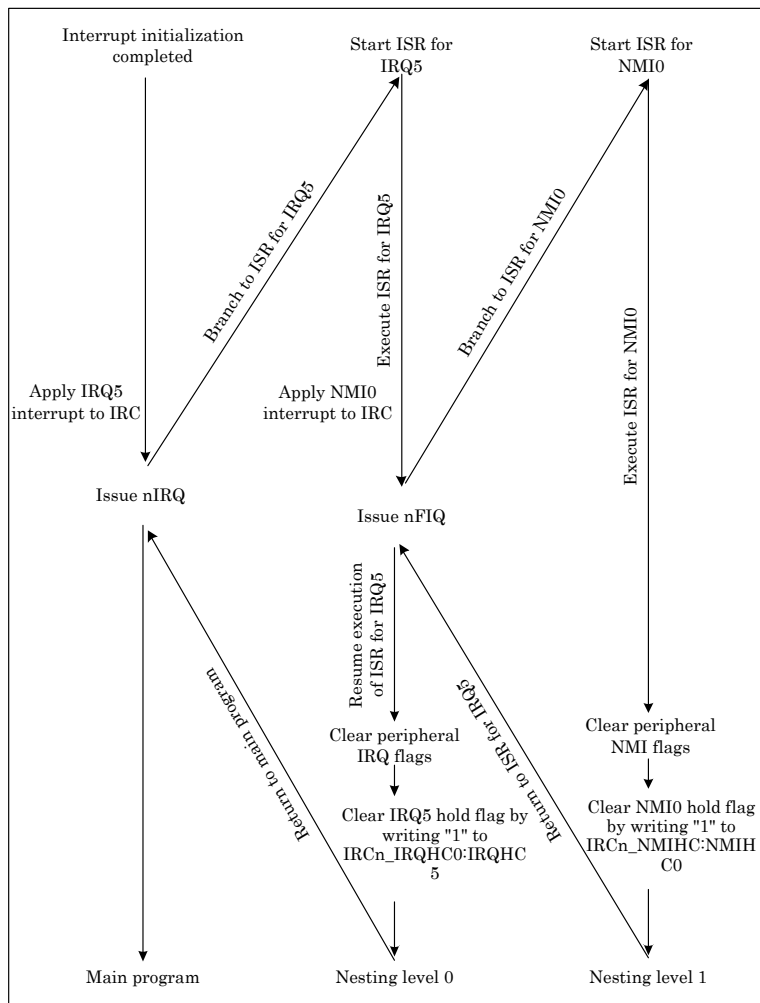

Nesting IRQ and NMI

The ARM® Cortex™-R5 register set does not automatically process nested interrupts. This processing should be provided within the ISR by applications. If this is not provided in the ISR, the first active IRQ is executed, but next IRQ will not be accepted and ISR will not be executed until the active ISR ends. This is also true for NMIs. However, since the interrupt controller uses nIRQ for IRQs and nFIQ for NMIs, and since NMIs have a higher hardware priority than that of IRQs, NMIs can interrupt IRQs.

For details on the save/restore of interrupts, see also the Cortex™-R5 Revision:r1p2 Technical Reference Manual (ARM DDI 0460D).

Interrupt Operation When Particular Software is Not Used for Nested Processing

Figure 3-1 ISR Processing Flow When NMI Generation Causes Nested IRQ

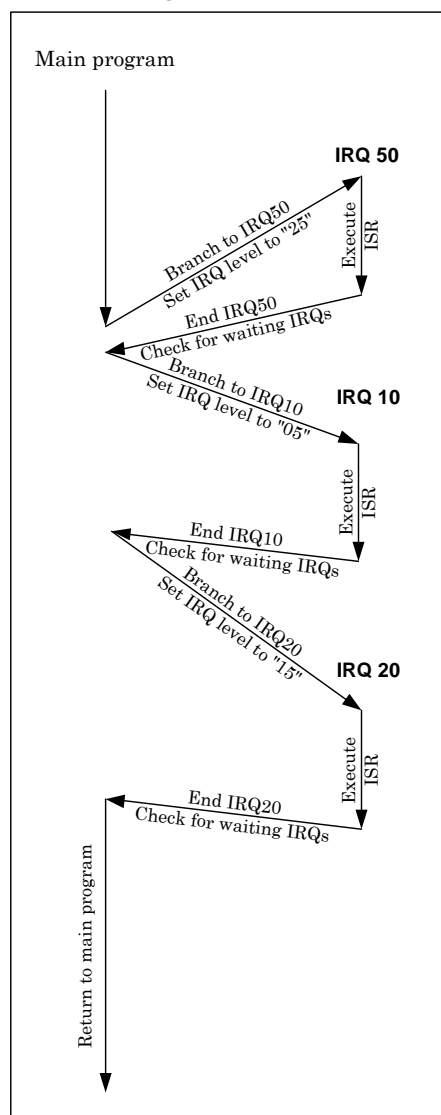

The following paragraphs explain the example shown in Figure 3-1.

When IRQ5 occurred, the interrupt controller issues nIRQ to the CPU. The interrupt controller sets the hold bit corresponding to IRQ5. The CPU holds the current program execution and saves CPU's current execution status. It then reads the vector address of IRQ5 and starts executing IRQ5's ISR. If NMI0 occurs during the previous process, the controller issues nFIQ to the CPU. Since NMIs have a higher priority than IRQs, the CPU stops executing the ISR for IRQ5 and saves CPU's current execution status. It then reads the vector address of NMI0. At this point, interrupt controller sets the hold flag corresponding to NMI0. Then starts executing NMI0's ISR. Before the ISR for NMI0 ends, the ISR clears the peripheral interrupt cause of NMI0. Then also clears NMI0's hold bit. After the ISR for NMI0 ends, the CPU resumes the ISR for IRQ5. Before the ISR for IRQ5 ends, the ISR clears the peripheral interrupt cause of IRQ5. Then also clears IRQ5's hold bit. After the ISR for IRQ5 ends, the CPU returns to the main program.

If the interrupt that is applied here is a software interrupt caused by a write operation to a register from IRCn_IRQS0 to IRCn_IRQS15 or IRCn_NMIS, the ISR needs to reset the software interrupt. This must be done by writing to a register between IRCn_IRQR0 and IRCn_IRQR15 or IRCn_NMIR, rather than by clearing the peripheral interrupt.

Figure 3-2 ISR Processing Flow When There Is No Nested IRQ

The following paragraph explains the example shown in Figure 3-2.

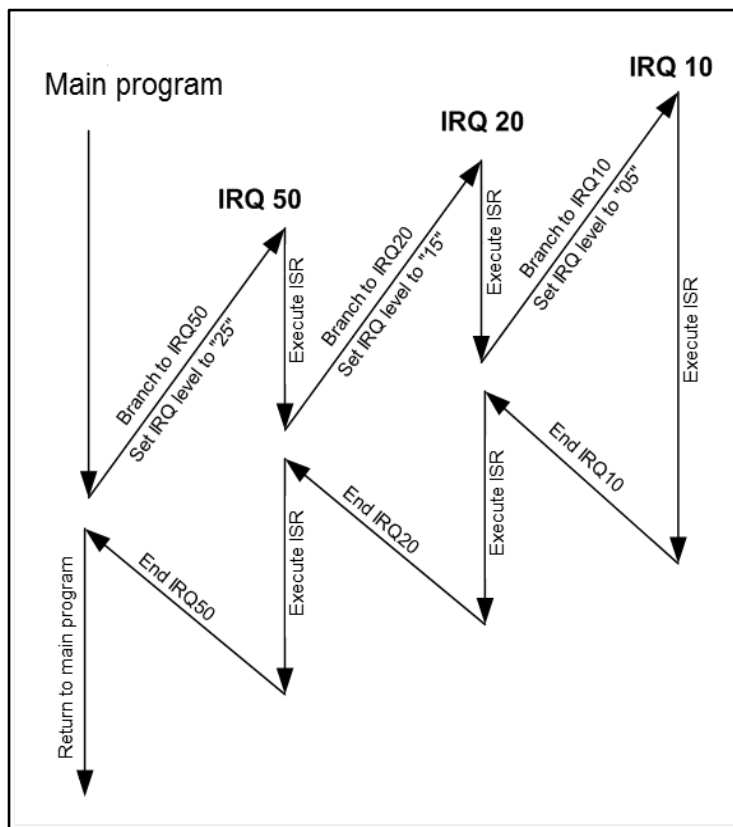

The priority levels of IRQ10, 20, and 50 used in this example are assumed to be "5", "15", and "25", respectively.

First, IRQ50 occurs. Since there are no waiting IRQs, IRQ50 is executed. At this point, "25" can be read from IRCn_IRQST:IRQPS. During the execution of the ISR for IRQ50, IRQ20 occurs. IRQ20 will wait

because ISR for IRQ50 has not ended. Then similarly, IRQ10 occurs. As IRQ20, IRQ10 waits until the ISR for IRQ50 ends. When the ISR for IRQ50 ends, IRQ10 and 20 enter the wait state. Since the priority level of IRQ10 is higher than that of IRQ20, which occurred earlier than IRQ10, the ISR for IRQ10 is executed next. At this point, "5" can be read from `IRCN_IRQST:IRQPS`. After the ISR for IRQ10 ends, the ISR for IRQ20 is executed. At this point, "15" can be read from `IRCN_IRQST:IRQPS`. After the ISR for IRQ20 ends, there are no other waiting IRQs. Therefore, the CPU returns to the main program.

Interrupt Operation When Particular Software Is Used for Nested Processing

Figure 3-3 ISR Processing Flow When There Are Nested IRQs

The following paragraphs explain the example shown in Figure 3-3.

As in the case of Figure 3-2, the priority levels of IRQ10, 20, and 50, used in this example, are assumed to be "5", "15", and "25", respectively.

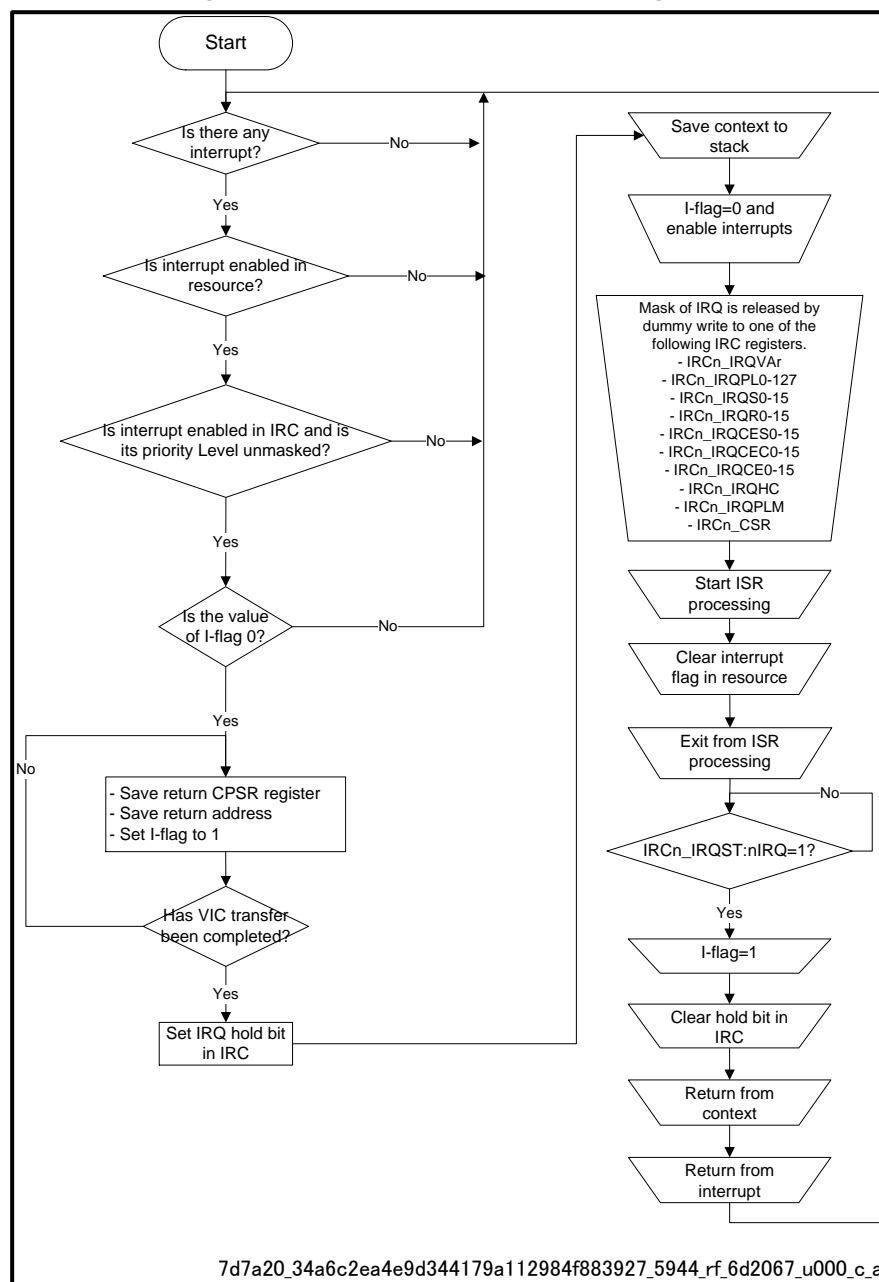

First, IRQ50 occurs. Since there are no waiting IRQs, IRQ50 is executed. At this point, "25" can be read from `IRCN_IRQST:IRQPS`. During the execution of the ISR for IRQ50, IRQ20 occurs. The ISR for IRQ50 is stopped and the ISR for IRQ20 is executed. At this point, "15" can be read from `IRCN_IRQST:IRQPS`. Then, similarly, IRQ10 occurs and the ISR for IRQ20 is stopped. At this point, "5" can be read from `IRCN_IRQST:IRQPS`. The ISR for IRQ10 is executed. After the ISR for IRQ10 ends, the ISR for IRQ20 will resume. After the ISR for IRQ20 ends, the ISR for IRQ50 will resume. After the ISR for IRQ50 ends, there are no other waiting IRQs. Therefore the CPU returns to the main program.

Example of Software Used to Process Nested IRQ/NMI

IRQ Processing

Since the ARM architecture does not support nested nIRQ interrupts, applications should be used to handle any nested processing. The ISR should internally save the values of 2 registers (LR_irq and SPSR_irq) and registers which values will be changed by ISR process in the system stack and then allow interrupts again. Then, if a new IRQ occurs and it has a higher priority level than that of the ISR that is being executed, it can interrupt the ISR. When the ISR ends, the saved values of the 2 registers (LR_irq and SPSR_irq) and registers which values will be changed by ISR process should be restored from the system stack.

Figure 3-4 Nest Supported IRQ Processing Flow

Below is an example of nest supported ISR in assembler code.

```

IRQxx_Handler:
SUB          lr, lr, #4
SRSFD        SP!,#0x1f          ; Save LR_irq and SPS_irq to the system stack.
CPS          #0x1f              ; Switch to system mode.
PUSH         {r0-r3, r12}       ; Save the remaining registers to the system stack.
AND          r1, sp, #4         ; Confirm that the stack is aligned to 8 bytes.
SUB          sp, sp, r1
PUSH         {r1, lr}
CPSIE        i                  ; Enable the interrupt.

...
; ISR code that may be interrupted by other interrupts having a higher priority.
; End of ISR
CPSID        i                  ; Disable interrupt.
POP          {r1, lr}           ; Restore LR_sys and return the system stack to its previous
                                state.

ADD          sp, sp, r1
POP          {r0-r3, r12}       ; Restore the saved registers.
RFEFD        SP!                ; Return from system mode.

```

Notes:

- *If you use nested IRQs or NMIs (or both), you should calculate the additional system stack size needed according to the depth of the nesting level being used.*
- *All registers which values will be changed by ISR process must be saved to system stack.*

NMI Processing

Fast interrupts are set as NMIs. The NMI flag is placed in the interrupt source module. This differs from IRQs in that there is no enable bit in the resource or interrupt controller.

The NMI entry is processed as follows:

1. The NMI interrupt flag is set by hardware or software and issued to the interrupt controller.
2. The interrupt controller evaluates the priority level. In a case when more than one NMI occurs, the NMI with the highest priority level is selected. Then the NMI is issued to the CPU.
3. The CPSR is copied to SPSR_fiq, and the return address is set in r14_fiq. Then, in the CPSR, the mode is set in fiq, and I-flag and F-flag are set (this disables the acceptance of new NMIs). This processing is all executed by the hardware.
4. Processor reads the register in interrupt controller which stores the vector address of selected NMI. This read access sets the hold bit for the corresponding NMI. This read operation is executed by the BootROM code (instruction in the FIQ entry).
5. Transit to the vector address that was read from the register in the interrupt controller. Then corresponding ISR is executed.
6. If nested NMIs support is required, the F-flag must be cleared by software. Process 7 must be done before this operation.
7. Before the F-flag is cleared, the context should be saved to the stack by software.
8. After the F-flag is cleared, another NMI having a higher priority level can interrupt the current NMI by nest.

If nested NMI support is required, operation 6 to 8 must be executed to save the context to stack. This could be expressed by below example. This is only an example. You may be able to use other assembler instructions.

- Execute SRS (save the return state). This instruction saves r14_fiq and SPSR_fiq to the stack (the address is selected through r13_fiq). r13_fiq is also updated as appropriate.
- Execute STM (save multiple registers). This instruction saves the defined number of registers (r0 to r14) to the stack that is defined in r13_fiq.
- Update r13_fiq as appropriate (cannot be used with STM).
- Clear the F-flag (enable nested NMIs).

The F-flag is set at every NMI accepted by CPU. Therefore, above save operation will not be stopped by other NMIs unless F-flag is cleared.

The steps for ending the NMI interrupt are as follows:

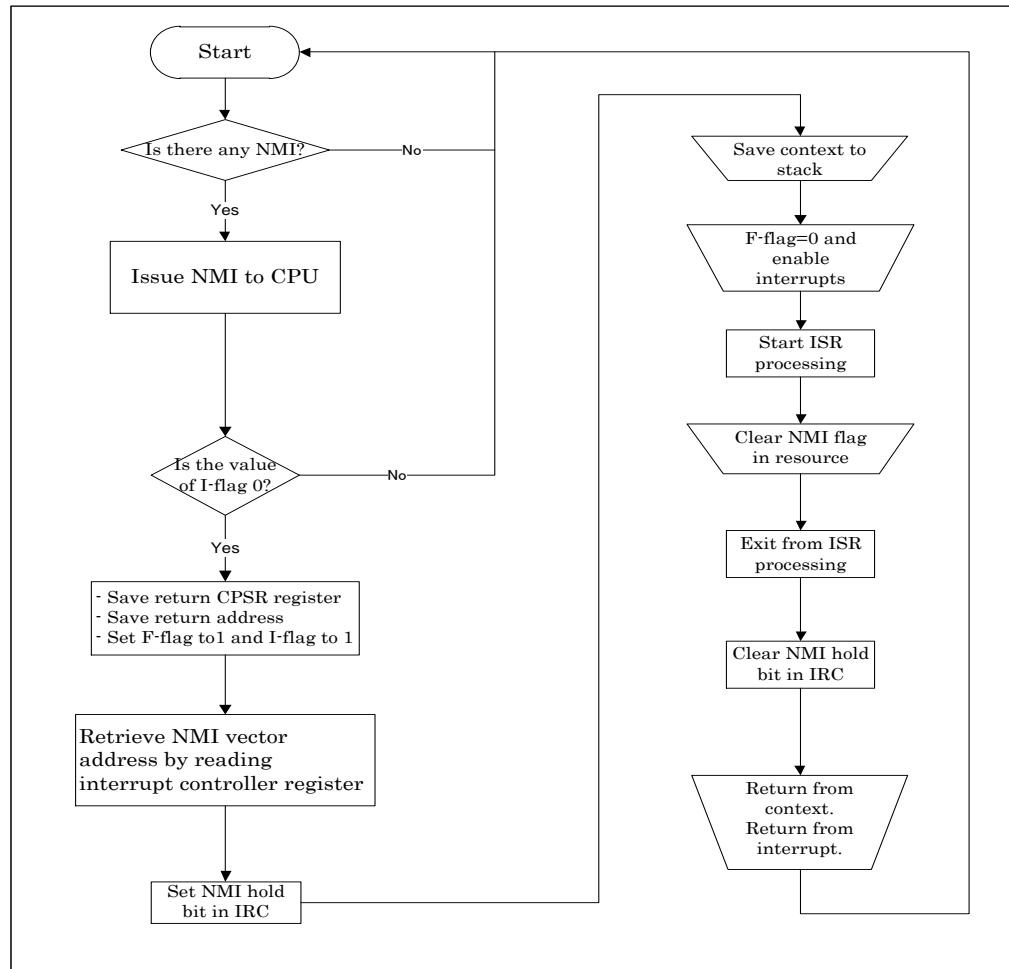

1. The NMI flag which caused the NMI interrupt must be cleared by software during the execution of the ISR. This should be completed as early as possible in the ISR to prevent the interrupt controller from accepting the same NMI flag.
2. The hold bit in the interrupt controller should be cleared during the execution of the ISR by writing the NMI number to an appropriate register (IRCn_NMIHC) in the interrupt controller. This should also be executed by the software.
3. After the above processing ends, the saved context including PC and CPSR in stack is restored in order to return from the interrupt. This operation must be done by software. When the CPSR is restored, the state of the register immediately before the generation of NMI is restored. Restoration is also applied to an enable status of an interrupt.

If nested NMI support is required, the software must execute the following processing to restore the saved context and to return from the interrupt. Several instructions must not be used to restore and returning from the interrupt. If executed, transition to a new NMI process may happen while restore and returning from the interrupt.

Execute LDM (end the exception handling). This instruction restores the saved user register as well as the CPSR and PC from the stack. r13_fiq is updated as appropriate. Required context to be restored must be restored by this one instruction only.

NMI processing flow is shown in Figure 3-5.

Figure 3-5 Nest Supported NMI Processing Flow

ECC Support and Test

The interrupt controller is equipped with SRAM which has an ECC protection function. Assume that a 1-bit error (correctable) occurs in the ECC. The `IRCN_EEI:EEIS` bit is set and the IRQ is generated for both `IRCN_IRQVAr` register reading and reading from the IRQ processing stage. If an error of 2 or more bits (uncorrectable) occurs, the `IRCN_EEI:EENS` bit is set and the NMI is generated at `IRCN_IRQVAr` register reading. Upon reading from the IRQ processing stage, transition is made to the ISR indicated by `IRCN_IRQEEVA`. Therefore, make sure that a valid ISR address is set for `IRCN_IRQEEVA`.

ECC Test Function

The interrupt controller has a function for generating pseudo ECC errors by corrupting the data read from SRAM. Using this function, you can check the operation of the ECC error handler while developing applications. By setting the ECC error bit registers (`IRCN_EEB0` to `IRCN_EEB2`), you can invert the data read from SRAM by using the bitwise operation. This test function is enabled/disabled using the ECC test register (`IRCN_ET`).

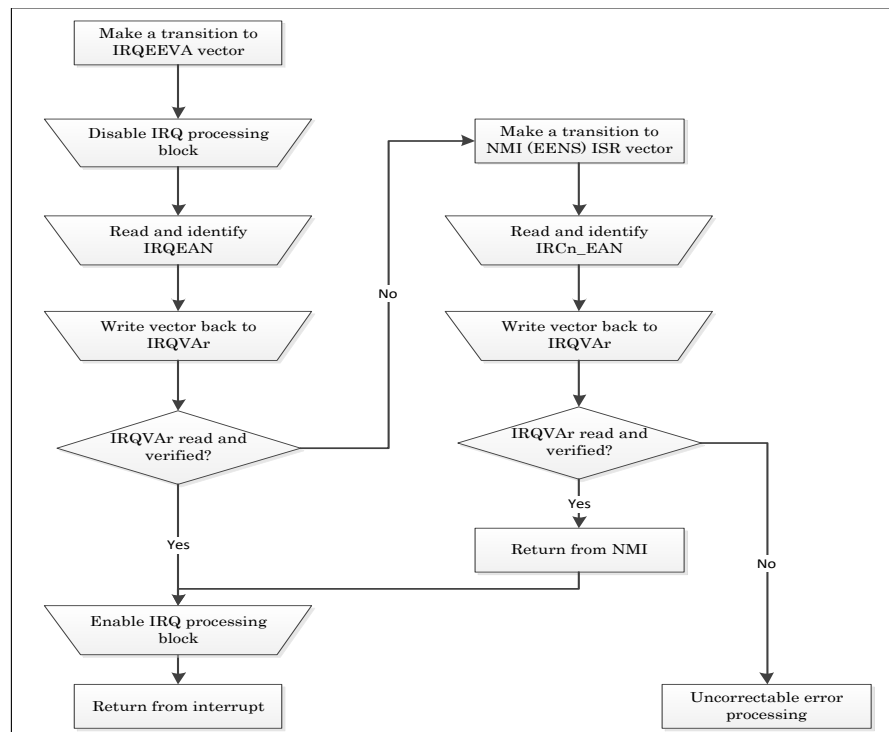

About IRCn_IRQEEVA

In the IRQ processing stage, if an SRAM 2-bit ECC error is detected, a transition is made to the ISR configured in `IRCN_IRQEEVA`. This behavior always occurs upon the occurrence of an error. So, `IRCN_IRQEEVA` must be properly set.

When a transition is made to this ISR, the IRQ hold bit for the erroneous `IRCN_IRQVAr` channel number is not generated. Moreover, this `IRCN_IRQEEVA` interrupt has no hold bit. Therefore, the interrupt factor need not be cleared within this ISR.

The ISR of `IRCN_IRQEEVA` needs to perform processing for correcting SRAM errors, using the following procedure.

Figure 3-6 SRAM 2BitECC Error Correction Flow by IRQEEVA

In this ISR, a software reset can be issued without any error correction, by rewriting to `IRCN_IRQVAR`.

How to Control Multiple Interrupts

The IRC controls the interrupt priority at a timing different from the CPU timing. So, if interrupt enable or disable is performed or if an interrupt level is changed, the software and hardware need to be synchronized according to a given procedure.

Procedure for Initializing and Setting the Interrupt Function

When initializing all interrupts for the first time, initialize and set the interrupts in the following order.

1. Setting peripheral function interrupts
2. Clear CPU I-FLAG
3. Setting the `IRCN_CSR:IRQEN` bit

Temporarily Enabling/Disabling Interrupts Using `IRCN_CSR:IRQEN` with Interrupts Enabled

Before rewriting `IRCN_CSR:IRQEN`, verify that the `IRCN_IRQST:nIRQ` bit is 1. The following shows an example.

```
while(IRCN_IRQST:nIRQ==0) ; // if 0, repeat reading
IRCN_CSR:IRQEN=0; // safe for changing enable bit
```

Changing an Interrupt Level Using `IRCN_IRQPLM` and `IRCN_IRQPLx` with Interrupts Enabled

Before rewriting `IRCN_IRQPLM` and `IRCN_IRQPLx`, verify that the `IRCN_IRQST:nIRQ` bit is 1. The following shows an example.

```
while(IRCN_IRQST:nIRQ==0) ; // if 0, repeat reading
IRCN_IRQPLM=0x2; // safe for changing interrupt level
```

Hold Clear Procedure Using `IRCN_IRQHC` with Interrupts Enabled

Assume that writing to `IRCN_IRQHC` is to be performed after the I-FLAG clear instruction is executed within the interrupt handler. Before rewriting `IRCN_IRQHC`, verify that the `IRCN_IRQST:nIRQ` bit is 1. The following shows an example.

```
while(IRCN_IRQST:nIRQ==0) ; // if 0, repeat reading
IRCN_IRQHC=0x80; // safe for changing interrupt level
```

Processing at the Head of the IRQ Interrupt Handler

Until interrupt acceptance is enabled with the I-FLAG clear instruction in the interrupt processing handler, directly write the desired values to each of the `IRCN_CSR:IRQEN`, `IRCN_IRQPLM`, and `IRCN_IRQHC` registers, rather than using the procedure described above. Moreover, even if these register values do not need to be changed, write dummy values in one of the IRC registers listed below.

- `IRCN_IRQVAR`
- `IRCN_IRQPL0-127`
- `IRCN_IRQS0-15`
- `IRCN_IRQR0-15`

- IRCn_IRQCES0-15
- IRCn_IRQCEC0-15
- IRCn_IRQCE0-15
- IRCn_IRQHC
- IRCn_IRQPLM
- IRCn_CSR

Notes:

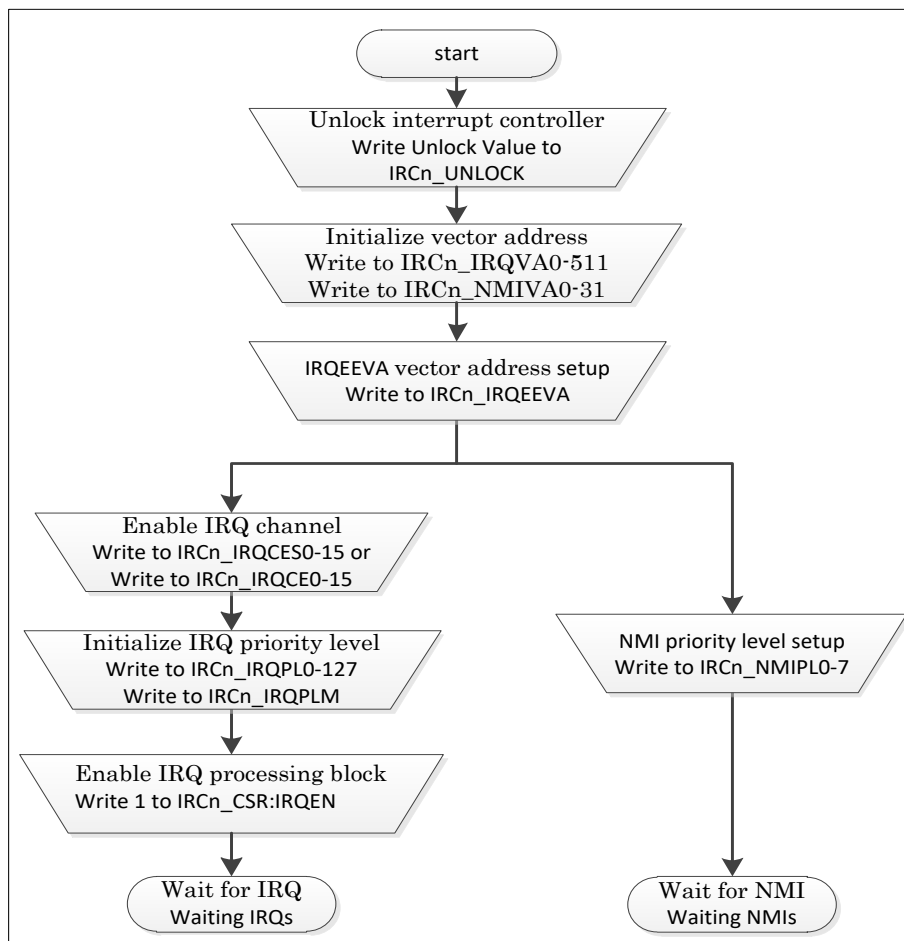

- *If dummy values are not written to any of the registers within the IRC, the generation of a new IRQ interrupt is suppressed until writing is complete. After writing to any of the registers within the IRC, the acceptance of a new IRQ interrupt is resumed.*
- *If the condition for returning a bus error is written during writing, interrupt acceptance is not released.*

4. Setting Procedure Examples

This section provides examples of the setting procedure for the interrupt controller.

Initial Setting

Figure 4-1 Interrupt Controller Initial Setting Flow

5. Registers

This section explains the registers that are used by the interrupt controller.

Table 5-1 Interrupt Controller Registers

Abbreviated Register Name	Register Name	Reference
IRCN_NMIVAS	IRC NMI vector address status register	5.1
IRCN_NMIST	IRC NMI status register	5.2

Register Memory Layout of Interrupt Controller (HSEL2)

Offset	+7	+6	+5	+4	+3	+2	+1	+0
0x00000000 0x000003F0	Reserved				Reserved			
0x000003F8	IRCN_NMIVASBR 00000000_00000000_00000000_00000000				Reserved			

* In the ERRCFG area, 1 KB should be allocated separately for each CPU.

Register Memory Layout of Interrupt Controller (HSEL3)

Offset	+7	+6	+5	+4	+3	+2	+1	+0
0x00000000 0x000003F0	Reserved				Reserved			
0x000003F8	IRC_NMIVASBR 00000000_00000000_00000000_00000000				Reserved			

* In the ERRCFG area, 1 KB should be allocated and shared by all CPUs.

5.1. IRC NMI Vector Address Status Register (IRCn_NMIVAS)

This register indicates the vector address status of the NMI that the CPU accepted most recently.

Bit	31	0
Field	NMIVAS	
R/W	R,WX	
Attribute		
Protection	RP	
Attribute		
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] NMIVAS: NMI Vector Address Status Bits

These bits indicate the vector address status of the NMI that the CPU accepted most recently.

Note:

- By reading the IRC_NMIVASBR by the CPU which accepted the nFIQ, the interrupt controller will determine that the interrupt has been accepted and then update the register.

5.2. IRC NMI Status Register (IRCn_NMIST)

This register indicates the priority level and channel number status of the NMI that the CPU accepted most recently.

Bit	31	16
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000	

Bit	15	14	13	12	11	10	9	8
Field	Reserved				NMIPS			
R/W	R0,WX				R,WX			
Attribute								
Protection	-				-			
Attribute								
Initial Value	0000				1111			

Bit	7	6	5	4	3	2	1	0
Field	Reserved		NMISN					
R/W	R0,WX		R,WX					
Attribute								
Protection	-		-					
Attribute								
Initial Value	00		100000					

[bit31:12] Reserved: Reserved Bits

[bit11:8] NMIPS: NMI Priority Status Bits

These bits indicate the priority status (0 to 15) of the NMI that the CPU accepted most recently.

[bit7:6] Reserved: Reserved Bits

[bit5:0] NMISN: NMI Channel Number Bits

These bits indicate the channel number status (0 to 31) of the NMI that the CPU accepted most recently. The initial value indicates that no interrupt has been accepted; bit5 will never be "1" unless it is in the initial state.

Note:

- By reading the IRC_NMIVASBR by the CPU to which the nFIQ is applied, the interrupt controller will determine that the interrupt has been accepted and then update the register.

5.3. IRC IRQ Vector Address Status Register (IRCN_IRQVAS)

This register indicates the vector address status of the IRQ that the CPU accepted most recently.

Bit	31	0
Field	IRQVAS	
R/W	R,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] IRQVAS: IRQ Vector Address Status Bits

These bits indicate the vector address status of the IRQ that the CPU accepted most recently.

Notes:

- By receiving acknowledgment of the VIC port from the CPU which accepted the nIRQ, the interrupt controller will determine that the interrupt has been accepted and then update the register.
- If a 2-bit ECC error is detected in the IRQ processing block and a branch is made to the IRQEEVA handler, the value of the erroneous IRQ is read as an IRQVAS value.

5.4. IRC IRQ Status Register (IRCN_IRQST)

This register indicates the priority level and channel number status of the IRQ that the CPU accepted most recently. This register also indicates the suppress status of newly accepted interrupts.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							nIRQ
R/W	R0,WX							R,WX
Attribute								
Protection	-							-
Attribute								
Initial Value	0000000							1

Bit	23	22	21	20	19	18	17	16
Field	Reserved				IRQPS			
R/W	R0,WX				R,WX			
Attribute								
Protection	-				-			
Attribute								
Initial Value	000				11111			

Bit	15	14	13	12	11	10	9	8
Field	Reserved						IRQSN[9:8]	
R/W	R0,WX						R,WX	
Attribute								
Protection	-						-	
Attribute								
Initial Value	000000						10	

Bit	7	6	5	4	3	2	1	0
Field	IRQSN[7:0]							
R/W	R,WX							
Attribute								
Protection	-							
Attribute								
Initial Value	00000000							

[bit31:25] Reserved: Reserved Bits

[bit24] nIRQ: IRQ Interrupt Status Bit

If 0 is read from this bit, the IRC is either generating the IRQ for the CPU or IRQ generation to CPU is stopped by IRC. Once this bit is read, the IRC will not accept any subsequent interrupts. Moreover, if data is written to any one of the IRC registers listed below, the stopped interrupt acceptance is released.

- IRCn_IRQVAr
- IRCn_IRQPL0-127
- IRCn_IRQS0-15
- IRCn_IRQR0-15
- IRCn_IRQCES0-15
- IRCn_IRQCEC0-15
- IRCn_IRQCE0-15
- IRCn_IRQHC
- IRCn_IRQPLM
- IRCn_CSR

Note:

- *If the condition for returning a bus error is written during writing, no interrupt acceptance is released.*

[bit23:21] Reserved: Reserved Bits

[bit20:16] IRQPS: IRQ Priority Status Bits

These bits indicate the priority status (0 to 31) of the IRQ that the CPU accepted most recently.

[bit15:10] Reserved: Reserved Bits

[bit9:0] IRQSN: IRQ Channel Number Bits

These bits indicate the channel number status (0 to 511) of the IRQ that the CPU accepted most recently. The initial value means that no interrupt has been accepted; bit9 will never be "1" unless it is in the initial state.

Notes:

- *By receiving the acknowledgment of VIC port from the CPU to which the nIRQ is applied, the interrupt controller will determine that the interrupt has been accepted and will then update the register.*
- *If a 2-bit ECC error is detected in the IRQ processing block and a branch is made to the IRQEEVA handler, the value of the erroneous IRQ is read as the IRQSN and IRQPS register values.*

5.5. IRC NMI Vector Address Register (IRCn_NMIVAm)

This register indicates the 32-bit vector address of individual NMI channels. Before the corresponding NMI peripheral is enabled, the vector address should be initialized by software. The same type of register is installed for each NMI channel. The "m" in the abbreviated register name corresponds to the NMI channel number, m (0 to 31).

Bit	31	8
Field	NMIVA[31:8]	
R/W	R/W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	XXXXXXXX_XXXXXXXX_XXXXXXXX	

Bit	7	6	5	4	3	2	1	0
Field	NMIVA[7:2]						NMIVA[1:0]	
R/W	R/W						R0,WX	
Attribute								
Protection	WPS						-	
Attribute								
Initial Value	XXXXXX						00	

[bit31:0] NMIVA: NMI Vector Address Bits

These bits set the vector address of NMIm.

Notes:

- Since all vector addresses are 32 bits long, the lowest 2 bits are fixed to 0b00.
- The bit configurations of registers IRCn_NMIVA0 to IRCn_NMIVA31 are all the same.

5.6. IRC IRQ Vector Address Register (IRCN_IRQVA_r)

This register indicates the 32-bit vector address of individual IRQ channels. Before the corresponding IRQ channel is enabled, the vector address should be initialized by software. The same type of register is installed for each IRQ channel. The "r" in the abbreviated register name corresponds to the IRQ channel number, r (0 to 511). This register is on SRAM of the interrupt controller.

Bit	31																													8
Field	IRQVA[31:8]																													
R/W	R/W																													
Attribute																														
Protection	WPS																													
Attribute																														
Initial Value	XXXXXXXX_XXXXXXXX_XXXXXXXX																													

Bit	7	6	5	4	3	2	1	0
Field	IRQVA[7:2]						IRQVA[1:0]	
R/W	R/W						R0,WX	
Attribute								
Protection	WPS						-	
Attribute								
Initial Value	XXXXXX						00	

[bit31:0] IRQVA: IRQ Vector Address Bits

These bits set the vector address of IRQ_r.

Notes:

- Before this register is read, the vector address should be initialized. For initialization, use either 32-bit or 64-bit access.
- Since all vector addresses are 32 bits long, the lowest 2 bits are fixed to 0b00.
- The bit configurations of registers IRC_n_IRQVA₀ to IRC_n_IRQVA₅₁₁ are all the same.
- This register consists of SRAM having the ECC protection function. If an ECC Error occurs, overwrite the register with the correct values.

5.7. IRC NMI Priority Level Register (IRCN_NMIPL0)

This register indicates the priority level of NMI0. It also sets the priority level (0 to 15) of each of channels NMI1 to NMI3. For each channel, a different value can be set. The smaller the setting value, the higher the priority. The initial value for channels other than channel 0 is "15", which indicates the lowest level. For channel 0 only, the value is fixed to "0", which is the highest level.

Bit	31	30	29	28	27	26	25	24
Field	Reserved				NMIPL3			
R/W	R0,WX				R/W			
Attribute								
Protection	-				WPS			
Attribute								
Initial Value	0000				1111			

Bit	23	22	21	20	19	18	17	16
Field	Reserved				NMIPL2			
R/W	R0,WX				R/W			
Attribute								
Protection	-				WPS			
Attribute								
Initial Value	0000				1111			

Bit	15	14	13	12	11	10	9	8
Field	Reserved				NMIPL1			
R/W	R0,WX				R/W			
Attribute								
Protection	-				WPS			
Attribute								
Initial Value	0000				1111			

Bit	7	6	5	4	3	2	1	0
Field	Reserved				NMIPL0			
R/W	R0,WX				R0,WX			
Attribute								
Protection	-				-			
Attribute								
Initial Value	0000				0000			

[bit31:28] Reserved: Reserved Bits

[bit27:24] NMIPL3: NMI3 Priority Level Bits

These bits set the priority level of NMI3.

[bit23:20] Reserved: Reserved Bits

[bit19:16] NMIPL2: NMI2 Priority Level Bits

These bits set the priority level of NMI2.

[bit15:12] Reserved: Reserved Bits

[bit11:8] NMIPL1: NMI1 Priority Level Bits

These bits set the priority level of NMI1.

[bit7:4] Reserved: Reserved Bits

[bit3:0] NMIPL0: NMI0 Priority Level Bits

These bits indicate the priority level of NMI0. The priority level of NMI0 is fixed to "0".

5.8. IRC NMI Priority Level Register (IRCn_NMIPL1 to IRCn_NMIPL7)

These registers set the priority level (0 to 15) of each NMI channel. For each channel, a different value can be set. The smaller the setting value, the higher the priority. The initial value is "15", which is the lowest level. The 7 registers are of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 4 channels are assigned, so that 32 channels are supported by the 8 registers including IRCn_NMIPL0.

Bit	31	30	29	28	27	26	25	24
Field	Reserved				NMIPL7			
R/W	R0,WX				R/W			
Attribute								
Protection	-				WPS			
Attribute								
Initial Value	0000				1111			

Bit	23	22	21	20	19	18	17	16
Field	Reserved				NMIPL6			
R/W	R0,WX				R/W			
Attribute								
Protection	-				WPS			
Attribute								
Initial Value	0000				1111			

Bit	15	14	13	12	11	10	9	8

Attribute								
Protection	-				WPS			
Attribute								
Initial Value	0000				1111			

[bit31:28] Reserved: Reserved Bits

[bit27:24] NMIPL7: NMI7 Priority Level Bits

These bits set the priority level of NMI7.

[bit23:20] Reserved: Reserved Bits**[bit19:16] NMIPL6: NMI6 Priority Level Bits**

These bits set the priority level of NMI6.

[bit15:12] Reserved: Reserved Bits**[bit11:8] NMIPL5: NMI5 Priority Level Bits**

These bits set the priority level of NMI5.

[bit7:4] Reserved: Reserved Bits**[bit3:0] NMIPL4: NMI4 Priority Level Bits**

These bits set the priority level of NMI4.

Notes:

- The register bit configuration described in this section is for `IRCN_NMIPL1`, which is representative of those registers that are all the same. The bit configurations of registers `IRCN_NMIPL1` to `IRCN_NMIPL7` are all the same. The description of `IRCN_NMIPL0` is separated from others because NMI0 is handled differently from other channels.
- NMI4 to NMI7 are assigned to `IRCN_NMIPL1`, and the subsequent channels are assigned in the same way until NMI28 to NMI31 are assigned to `IRCN_NMIPL7`.
- The "m" in bit field name `NMIPLm` corresponds to the NMI channel number, m (0 to 31).

5.9. IRC IRQ Priority Level Register (IRCn_IRQPL0 to IRCn_IRQPL127)

These registers set the priority level (0 to 31) of each IRQ channel. For each channel, a different value can be set. The smaller the setting value, the higher the priority. The initial value is "31", which is the lowest level. The 128 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 4 channels are assigned, so that 512 channels are supported by the 128 registers.

Bit	31	30	29	28	27	26	25	24
Field	Reserved				IRQPL3			
R/W	R0,WX				R/W			
Attribute								
Protection	-				WPS

Bit	7	6	5	4	3	2	1	0
Field	Reserved				IRQPL0			
R/W	R0,WX				R/W			
Attribute								
Protection	-				WPS			
Attribute								
Initial Value	000				11111			

[bit31:29] Reserved: Reserved Bits

[bit28:24] IRQPL3: IRQ3 Priority Level Bits

These bits set the priority level of IRQ3.

[bit23:21] Reserved: Reserved Bits**[bit20:16] IRQPL2: IRQ2 Priority Level Bits**

These bits set the priority level of IRQ2.

[bit15:13] Reserved: Reserved Bits**[bit12:8] IRQPL1: IRQ1 Priority Level Bits**

These bits set the priority level of IRQ1.

[bit7:5] Reserved: Reserved Bits**[bit4:0] IRQPL0: IRQ0 Priority Level Bits**

These bits set the priority level of IRQ0.

Notes:

- *The register bit configuration described in this section is for `IRCN_IRQPL0`, which is representative of those registers that are all the same. The bit configurations of registers `IRCN_IRQPL0` to `IRCN_IRQPL127` are all the same.*
- *`IRQ0` to `IRQ3` are assigned to `IRCN_IRQPL0`, and the subsequent channels are assigned in the same way until `IRQ508` to `IRQ511` are assigned to `IRCN_IRQPL127`.*
- *In case of writing to this register, please perform it in any of the following states (= IRC is stopping).*
 - Until writing the target register from reading that `nIRQ` bit of `IRCN_IRQST` register is "1". Please refer to the description of `nIRQ` bit for the target register.
 - The state that `IRQEN` bit of `IRCN_CSR` register is "0" (immediately after reset, etc).

5.10. IRC NMI Software Interrupt Set Register (IRCN_NMIS)

This register sets a software interrupt for individual NMI channels. For each channel, 1 bit is assigned, and the bit location corresponds to the NMI channel number, m (0 to 31).

Bit	31	30	29	28	27	26	25	24

[bit31] to [bit0] NMISISm: NMI_m Software Interrupt Status Bits

These bits indicate the software interrupt status of the corresponding NMI_m.

Bit	Description
0	Software interrupt is not set.
1	Software interrupt is set.

5.13. IRC IRQ Software Interrupt Set Register (IRCN_IRQS0 to IRCN_IRQS15)

These registers set a software interrupt for individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQS31	IRQS30	IRQS29	IRQS28	IRQS27	IRQS26	IRQS25	IRQS24

[bit31] to [bit0] IRQSr: IRQr Software Interrupt Set Bits

These bits set a software interrupt for the corresponding IRQr.

Bit	Description
0	Invalid (no effect on operation)
1	Set a software interrupt for the corresponding IRQr.

Notes:

- The register bit configuration described in this section is for `IRCN_IRQS0`, which is representative of those registers that are all the same. The bit configurations of registers `IRCN_IRQS0` to `IRCN_IRQS15` are all the same.
- `IRQ0` to `IRQ31` are assigned to `IRCN_IRQS0`, and the subsequent channels are assigned in the same way until `IRQ480` to `IRQ511` are assigned to `IRCN_IRQS15`.
- The "r" in bit field name `IRQSr` corresponds to the IRQ channel number, r (0 to 511).

5.14. IRC IRQ Software Interrupt Reset Register (IRCN_IRQR0 to IRCN_IRQR15)

These registers reset a software interrupt for individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24

[bit31] to [bit0] IRQRr: IRQr Software Interrupt Reset Bits

These bits reset a software interrupt for the corresponding IRQr.

Bit	Description
0	Invalid (no effect on operation)
1	Reset a software interrupt for the corresponding IRQr.

Notes:

- The register bit configuration described in this section is for IRCN_IRQR0, which is representative of those registers that are all the same. The bit configurations of registers IRCN_IRQR0 to IRCN_IRQR15 are all the same.
- IRQ0 to IRQ31 are assigned to IRCN_IRQR0, and the subsequent channels are assigned in the same way until IRQ480 to IRQ511 are assigned to IRCN_IRQR15.
- The "r" in bit field name IRQRr corresponds to the IRQ channel number, r (0 to 511).

5.15. IRC IRQ Software Interrupt Status Register (IRCN_IRQSI0 to IRCn_IRQSI15)

These registers indicate the software interrupt status of the individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQSI31	IRQSI30	IRQSI29	IRQSI28	IRQSI27	IRQSI26	IRQSI25	IRQSI24
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	IRQSI23	IRQSI22	IRQSI21	IRQSI20	IRQSI19	IRQSI18	IRQSI17	IRQSI16
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX

[bit31] to [bit0] IRQSIr: IRQr Software Interrupt Status Bits

These bits indicate the software interrupt status of the corresponding IRQr.

Bit	Description
0	Software interrupt is not set.
1	Software interrupt is set.

Notes:

- *The register bit configuration described in this section is for `IRCN_IRQSIS0`, which is representative of those registers that are all the same. The bit configurations of registers `IRCN_IRQSIS0` to `IRCN_IRQSIS15` are all the same.*
- *`IRQ0` to `IRQ31` are assigned to `IRCN_IRQSIS0`, and the subsequent channels are assigned in the same way until `IRQ480` to `IRQ511` are assigned to `IRCN_IRQSIS15`.*
- *The "r" in bit field name `IRQSISr` corresponds to the IRQ channel number, r (0 to 511).*

5.16. IRC IRQ Channel Enable Set Register (IRCN_IRQCES0 to IRCn_IRQCES15)

These registers set enable for individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQCES31	IRQCES30	IRQCES29	IRQCES28	IRQCES27	IRQCES26	IRQCES25	IRQCES24

Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] IRQCESr: IRQr Channel Enable Set Bits

These bits set channel enable for the corresponding IRQr.

Bit	Description
0	Invalid (no effect on operation)
1	Set channel enable for IRQr.

Notes:

- The register bit configuration described in this section is for IRCn_IRQCES0, which is representative of those registers that are all the same. The bit configurations of registers IRCn_IRQCES0 to IRCn_IRQCES15 are all the same.
- IRQ0 to IRQ31 are assigned to IRCn_IRQCES0, and the subsequent channels are assigned in the same way until IRQ480 to IRQ511 are assigned to IRCn_IRQCES15.
- The "r" in bit field name IRQCESr corresponds to the IRQ channel number, r (0 to 511).

5.17. IRC IRQ Channel Enable Clear Register (IRCN_IRQCEC0 to IRCn_IRQCEC15)

These registers clear enable for individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQCEC31	IRQCEC30	IRQCEC29	IRQCEC28	IRQCEC27	IRQCEC26	IRQCEC25	IRQCEC24

Field	IRQCEC7	IRQCEC6	IRQCEC5	IRQCEC4	IRQCEC3	IRQCEC2	IRQCEC1	IRQCEC0
R/W Attribute	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W
Protection Attribute	WPS	WPS	WPS	WPS	WPS	WPS	WPS	WPS
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] IRQCECr: IRQr Channel Enable Clear Bits

These bits clear channel enable for the corresponding IRQr.

Bit	Description
0	Invalid (no effect on operation)
1	Clear channel enable for IRQr.

Notes:

- The register bit configuration described in this section is for IRCn_IRQCEC0, which is representative of those registers that are all the same. The bit configurations of registers IRCn_IRQCEC0 to IRCn_IRQCEC15 are all the same.
- IRQ0 to IRQ31 are assigned to IRCn_IRQCEC0, and the subsequent channels are assigned in the same way until IRQ480 to IRQ511 are assigned to IRCn_IRQCEC15.
- The "r" in bit field name IRQCECr corresponds to the IRQ channel number, r (0 to 511).

5.18. IRC IRQ Channel Enable Setting Register (IRCN_IRQCE0 to IRCN_IRQCE15)

These registers set enable of individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQCE31	IRQCE30	IRQCE29	IRQCE28	IRQCE27	IRQCE26	IRQCE25	IRQCE24
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS	WPS	WPS	WPS	WPS	WPS	WPS	WPS
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	IRQCE23	IRQCE22	IRQCE21	IRQCE20	IRQCE19	IRQCE18	IRQCE17	IRQCE16
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS	WPS	WPS	WPS	WPS	WPS	WPS	WPS
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	IRQCE15	IRQCE14	IRQCE13	IRQCE12	IRQCE11	IRQCE10	IRQCE9	IRQCE8
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS	WPS	WPS	WPS	WPS	WPS	WPS	WPS
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	IRQCE7	IRQCE6	IRQCE5	IRQCE4	IRQCE3	IRQCE2	IRQCE1	IRQCE0
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS	WPS	WPS	WPS	WPS	WPS	WPS	WPS
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] IRQCEr: IRQr Channel Enable Setting Bits

These bits set channel enable for the corresponding IRQr.

Bit	Description
0	Clear channel enable for IRQr.
1	Set channel enable for IRQr.

Notes:

- The register bit configuration described in this section is for IRCN_IRQCE0, which is representative of those registers that are all the same. The bit configurations of registers IRCN_IRQCE0 to IRCN_IRQCE15 are all the same.
- IRQ0 to IRQ31 are assigned to IRCN_IRQCE0, and the subsequent channels are assigned in the same way until IRQ480 to IRQ511 are assigned to IRCN_IRQCE15.
- The "r" in bit field name IRQCEr corresponds to the IRQ channel number, r (0 to 511).

5.19. IRC NMI Hold Clear Register (IRCn_NMIHC)

This register clears the hold bit for the ISR for the current NMI. The NMI channel number for which the hold bit is to be cleared is written.

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	Reserved			NMIHCN				
R/W	R0,WX			R0,W				
Attribute								
Protection	-			WP				
Attribute								
Initial Value	000			00000				

[bit31:5] Reserved: Reserved Bits

[bit4:0] NMIHCN: Hold Clear NMI Channel Number Bits

These bits set the channel number corresponding to the ISR for the NMI.

5.20. IRC NMI Hold Status Register (IRCn_NMIHS)

This register indicates the hold status of the individual NMI channels. For each channel, 1 bit is assigned, and the bit location corresponds to the NMI channel number, m (0 to 31).

Bit	31	30	29	28	27	26	25	24
Field	NMIHS31	NMIHS30	NMIHS29	NMIHS28	NMIHS27	NMIHS26	NMIHS25	NMIHS24
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	NMIHS23	NMIHS22	NMIHS21	NMIHS20	NMIHS19	NMIHS18	NMIHS17	NMIHS16
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	NMIHS15	NMIHS14	NMIHS13	NMIHS12	NMIHS11	NMIHS10	NMIHS9	NMIHS8
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	NMIHS7	NMIHS6	NMIHS5	NMIHS4	NMIHS3	NMIHS2	NMIHS1	NMIHS0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] NMIHSm: NMIm Hold Status Bits

These bits indicate the hold status for NMIm.

Bit	Description
0	The interrupt for NMIm is not applied to the CPU.
1	The interrupt for NMIm is being applied to the CPU.

5.21. IRC IRQ Hold Clear Register (IRCn_IRQHC)

This register clears the hold bit for the ISR for the current IRQ. The IRQ channel number for which the hold bit is to be cleared is written.

Bit	31	16
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000	

Bit	15	14	13	12	11	10	9	8
Field	Reserved							IRQHCN[8]
R/W	R0,WX							R0,W
Attribute								
Protection	-							WP
Attribute								
Initial Value	0000000							0

Bit	7	6	5	4	3	2	1	0
Field	IRQHCN[7:0]							
R/W	R0,W							
Attribute								
Protection	WP							
Attribute								
Initial Value	00000000							

[bit31:9] Reserved: Reserved Bits

[bit8:0] IRQHCN: Bits for IRQ Channel Number for which Hold is to be Cleared.

These bits set the channel number corresponding to the ISR for the IRQ.

Notes:

- *This register is forbidden to be cleared by byte access write. Access size must be larger than half size.*
Bus error will occur if write operation in byte size is done.
- *In case of writing to this register, please perform it in any of the following states (= IRC is stopping).*
 - *Until writing the target register from reading that nIRQ bit of IRCn_IRQST register is "1". Please refer to the description of nIRQ bit for the target register.*
 - *The state that IRQEN bit of IRCn_CSR register is "0" (immediately after reset, etc).*

5.22. IRC IRQ Hold Status Register (IRCN_IRQHS0 to IRCn_IRQHS15)

These registers indicate the hold status of individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels can be supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQHS31	IRQHS30	IRQHS29	IRQHS28	IRQHS27	IRQHS26	IRQHS25	IRQHS24
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	IRQHS23	IRQHS22	IRQHS21	IRQHS20	IRQHS19	IRQHS18	IRQHS17	IRQHS16
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	IRQHS15	IRQHS14	IRQHS13	IRQHS12	IRQHS11	IRQHS10	IRQHS9	IRQHS8
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	IRQHS7	IRQHS6	IRQHS5	IRQHS4	IRQHS3	IRQHS2	IRQHS1	IRQHS0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] IRQHSr: IRQr Hold Status Bits

These bits indicate the hold status of IRQr.

Bit	Description
0	The interrupt for IRQr is not applied to the CPU.
1	The interrupt for IRQr is being applied to the CPU.

Notes:

- *The register bit configuration described in this section is for `IRCN_IRQHS0`, which is representative of those registers that are all the same. The bit configurations of registers `IRCN_IRQHS0` to `IRCN_IRQHS15` are all the same.*
- *`IRQ0` to `IRQ31` are assigned to `IRCN_IRQHS0`, and the subsequent channels are assigned in the same way until `IRQ480` to `IRQ511` are assigned to `IRCN_IRQHS15`.*
- *The "r" in bit field name `IRQHSr` corresponds to the IRQ channel number, r (0 to 511).*

5.23. IRC IRQ Priority Level Mask Register (IRCn_IRQPLM)

This register sets the interrupt mask based on the priority level. The IRQ channel whose priority level is equal to or higher than the value set in this register is masked. The initial value for this register is 32. That is, no priority levels are masked in the initial state.

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	Reserved		IRQPLM					
R/W	R0,WX		R/W					
Attribute								
Protection	-		WPS					
Attribute								
Initial Value	00		100000					

[bit31:6] Reserved: Reserved Bits

[bit5:0] IRQPLM: IRQ Priority Level Mask Bits

These bits set the priority level mask value.

Note:

- In case of writing to this register, please perform it in any of the following states (= IRC is stopping).
 - Until writing the target register from reading that nIRQ bit of IRCn_IRQST register is "1". Please refer to the description of nIRQ bit for the target register.
 - The state that IRQEN bit of IRCn_CSR register is "0" (immediately after reset, etc).

5.24. IRC Control/Status Register (IRCn_CSR)

This register sets enable/disable of the IRQ processing block of the interrupt controller. It also indicates the lock status of the interrupt controller.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W	R0,WX							
Attribute								
Protection	-							
Attribute								
Initial Value	00000000							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							LST
R/W	R0,WX							R,WX
Attribute								
Protection	-							-
Attribute								
Initial Value	00000000							1

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W	R0,WX							
Attribute								
Protection	-							
Attribute								
Initial Value	00000000							

Bit	7	6	5	4	3	2	1	0
Field	Reserved							IRQEN
R/W	R0,WX							R/W
Attribute								
Protection	-							WPS
Attribute								
Initial Value	00000000							0

[bit31:17] Reserved: Reserved Bits

[bit16] LST: Interrupt Controller Lock Status

This bit indicates the lock status of the interrupt controller.

Bit	Description
0	Unlocked state
1	Locked state

[bit15:1] Reserved: Reserved Bits

[bit0] IRQEN: IRQ Processing Block Enable/Disable Setting Bit

This bit sets enable/disable of the IRQ processing block of the interrupt controller. If the IRQ processing block is disabled, the interrupt controller does not accept a new IRQ. The accepted interrupt is provided to the CPU.

Bit	Description
0	IRQ processing block is disabled.
1	IRQ processing block is enabled.

Note:

- In case of writing to this register, please perform it in any of the following states (= IRC is stopping).
 - Until writing the target register from reading that nIRQ bit of IRCn_IRQST register is "1". Please refer to the description of nIRQ bit for the target register.
 - The state that IRQEN bit of IRCn_CSR register is "0" (immediately after reset, etc).

5.25. IRC NMI RAW Status Register (IRCn_NMIRS)

This register indicates the RAW status of individual NMI channels. For each channel, 1 bit is assigned, and the bit location corresponds to the NMI channel number, m (0 to 31).

Bit	31	30	29	28	27	26	25	24
Field	NMIRS31	NMIRS30	NMIRS29	NMIRS28	NMIRS27	NMIRS26	NMIRS25	NMIRS24
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	NMIRS23	NMIRS22	NMIRS21	NMIRS20	NMIRS19	NMIRS18	NMIRS17	NMIRS16
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	NMIRS15	NMIRS14	NMIRS13	NMIRS12	NMIRS11	NMIRS10	NMIRS9	NMIRS8
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	NMIRS7	NMIRS6	NMIRS5	NMIRS4	NMIRS3	NMIRS2	NMIRS1	NMIRS0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] NMIRSm: RAW Status Bits for NMIm

These bits indicate the RAW status of NMIm.

Bit	Description
0	Interrupt is not set.
1	Interrupt is set.

5.26. IRC NMI Preprocessed Status Register (IRCn_NMIPS)

This register indicates the preprocessed status of individual NMI channels. For each channel, 1 bit is assigned, and the bit location corresponds to the NMI channel number, m (0 to 31).

Bit	31	30	29	28	27	26	25	24
Field	NMIPS31	NMIPS30	NMIPS29	NMIPS28	NMIPS27	NMIPS26	NMIPS25	NMIPS24
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	NMIPS23	NMIPS22	NMIPS21	NMIPS20	NMIPS19	NMIPS18	NMIPS17	NMIPS16
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	NMIPS15	NMIPS14	NMIPS13	NMIPS12	NMIPS11	NMIPS10	NMIPS9	NMIPS8
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	NMIPS7	NMIPS6	NMIPS5	NMIPS4	NMIPS3	NMIPS2	NMIPS1	NMIPS0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] NMIPSm: Preprocessed Status Bits for NMI_m

These bits indicate the preprocessed status of NMI_m.

Bit	Description
0	Interrupt is not set.
1	Interrupt is set.

5.27. IRC IRQ RAW Status Register (IRCn_IRQRS0 to IRCn_IRQRS15)

These registers indicate the RAW status of individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQRS31	IRQRS30	IRQRS29	IRQRS28	IRQRS27	IRQRS26	IRQRS25	IRQRS24
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	IRQRS23	IRQRS22	IRQRS21	IRQRS20	IRQRS19	IRQRS18	IRQRS17	IRQRS16
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	IRQRS15	IRQRS14	IRQRS13	IRQRS12	IRQRS11	IRQRS10	IRQRS9	IRQRS8
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	IRQRS7	IRQRS6	IRQRS5	IRQRS4	IRQRS3	IRQRS2	IRQRS1	IRQRS0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] IRQRSr: IRQr RAW Status Bits

These bits indicate the RAW status of IRQr.

Bit	Description
0	Interrupt is not set.
1	Interrupt is set.

Notes:

- *The register bit configuration described in this section is for `IRCN_IRQRS0`, which is representative of those registers that are all the same. The bit configurations of registers `IRCN_IRQRS0` to `IRCN_IRQRS15` are all the same.*
- *`IRQ0` to `IRQ31` are assigned to `IRCN_IRQRS0`, and the subsequent channels are assigned in the same way until `IRQ480` to `IRQ511` are assigned to `IRCN_IRQRS15`.*
- *The "r" in bit field name `IRQRSr` corresponds to the IRQ channel number, r (0 to 511).*

5.28. IRC IRQ Preprocessed Status Register (IRCN_IRQPS0 to IRCN_IRQPS15)

These registers indicate the preprocessed status of individual IRQ channels. For each channel, 1 bit is assigned. The 16 registers are all of the same type, and each is identified by the number at the end of the abbreviated register name. For each register, 32 channels are assigned, so that 512 channels are supported by the 16 registers.

Bit	31	30	29	28	27	26	25	24
Field	IRQPS31	IRQPS30	IRQPS29	IRQPS28	IRQPS27	IRQPS26	IRQPS25	IRQPS24
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	IRQPS23	IRQPS22	IRQPS21	IRQPS20	IRQPS19	IRQPS18	IRQPS17	IRQPS16
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	IRQPS15	IRQPS14	IRQPS13	IRQPS12	IRQPS11	IRQPS10	IRQPS9	IRQPS8
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	IRQPS7	IRQPS6	IRQPS5	IRQPS4	IRQPS3	IRQPS2	IRQPS1	IRQPS0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31] to [bit0] IRQPSr: IRQr Preprocessed Status Bits

These bits indicate the preprocessed status of IRQr.

Bit	Description
0	Interrupt is not set.
1	Interrupt is set.

Notes:

- The register bit configuration described in this section is for `IRCN_IRQPS0`, which is representative of those registers that are all the same. The bit configurations of registers `IRCN_IRQPS0` to `IRCN_IRQPS15` are all the same.
- `IRQ0` to `IRQ31` are assigned to `IRCN_IRQPS0`, and the subsequent channels are assigned in the same way until `IRQ480` to `IRQ511` are assigned to `IRCN_IRQPS15`.
- The "r" in bit field name `IRQPSr` corresponds to the `IRQ` channel number, *r* (0 to 511).

5.29. IRC Unlock Register (IRCn_UNLOCK)

This register controls write lock for the interrupt controller to each register.

Bit	31	0
Field	UNLOCK	
R/W	R0,W	
Attribute		
Protection	WP	
Attribute		
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] UNLOCK: Interrupt Controller Unlock Bits

These bits control write lock for the interrupt controller to the setting registers.

The target registers for sequence protection by this register are those other than IRCn_NMIHC, IRCn_IRQHC, IRCn_NMIR, and IRCn_IRQR0 to IRCn_IRQR15.

UNLOCK	Description
0x17ACC911	Unlock value (which enables writing)
0x17B10C11	Lock value (which disables writing)
Other than above	Setting prohibited (bus error returned)

Note:

- The values of all 32 bits of this register are needed to determine the lock status. Therefore, writing to this register must be done with 32-bit access. Neither 8-bit nor 16-bit access is allowed.

5.30. IRC ECC Error Interrupt Register (IRCn_EEI)

This register indicates the ECC error interrupt status. It also clears the interrupt. There are 2 types of ECC error interrupt: NMI and IRQ.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							EEIS
R/W	R0,WX							R,WX
Attribute								
Protection	-							-
Attribute								
Initial Value	0000000							0

Bit	23	22	21	20	19	18	17	16
Field	Reserved							EEIC
R/W	R0,WX							R0,W
Attribute								
Protection	-							WPS
Attribute								
Initial Value	0000000							0

Bit	15	14	13	12	11	10	9	8
Field	Reserved							EENS
R/W	R0,WX							R,WX
Attribute								
Protection	-							-
Attribute								
Initial Value	0000000							0

Bit	7	6	5	4	3	2	1	0
Field	Reserved							EENC
R/W	R0,WX							R0,W
Attribute								
Protection	-							WPS
Attribute								
Initial Value	0000000							0

[bit31:25] Reserved: Reserved Bits

[bit24] EEIS: ECC Error IRQ Status Bit

This bit indicates the status of the ECC error IRQ. When data is read from SRAM installed in the interrupt controller, this bit becomes "1" if a single-bit ECC error occurs.

Bit	Description
0	Single bit ECC error has not occurred.
1	Single bit ECC error has occurred.

[bit23:17] Reserved: Reserved Bits

[bit16] EEIC: ECC Error IRQ Clear Bit

This bit clears the ECC error IRQ.

Bit	Description
0	Invalid (no effect on operation)
1	Clear the ECC error IRQ (EEIS).

[bit15:9] Reserved: Reserved Bits

[bit8] EENS: ECC Error NMI Status Bit

This bit indicates the status of the ECC error NMI. When data is read from SRAM installed in the interrupt controller through the IRCn_IRQVAR register, this bit becomes "1" if a double-bit ECC error occurs.

Bit	Description
0	Double bit ECC error has not occurred.
1	Double bit ECC error has occurred.

Note:

- This flag is not set in accessing the IRQ register in the IRQ processing stage.

[bit7:1] Reserved: Reserved Bits

[bit0] EENC: ECC Error NMI Clear Bit

This bit clears the ECC error NMI.

Bit	Description
0	Invalid (no effect on operation)
1	Clear ECC error NMI (EENS).

Note:

- EENS must be cleared only after the IRQ vector address is reinitialized.

When a single-bit or double-bit ECC error occurs, this register indicates the SRAM address of the error.

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	EAN							
R/W	R,WX							
Attribute								
Protection	-							
Attribute								
Initial Value	00000000							

- If a single-bit error occurs after a double-bit error, SRAM address will not be updated while `IRCN_EEI:EENS=1`.
- If a single-bit or double-bit error occurs continuously, this register indicates the address of the last error.

5.32. IRC ECC Test Register (IRCn_ET)

This register sets enable/disable of the test mode for the ECC protection function of SRAM installed in the interrupt controller.

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	Reserved							ET
R/W	R0,WX							R/W
Attribute								
Protection	-							WPS
Attribute								
Initial Value	0000000							0

[bit31:1] Reserved: Reserved Bits

[bit0] ET: ECC Test Enable/Disable Setting Bit

This bit sets enable/disable of the ECC test mode.

Bit	Description
0	ECC test mode is disabled.
1	ECC test mode is enabled.

5.33. IRC ECC Error Bit Register (IRCn_EEB0 to IRCn_EEB1)

These registers are used in ECC test mode. In the data read from SRAM, you can spuriously corrupt any of the bits in the data area.

Bit	31	8
Field	EEB[29:6]	
R/W	R/W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	EEB[5:0]						Reserved	
R/W	R/W						R0,WX	
Attribute								
Protection	WPS						-	
Attribute								
Initial Value	000000						00	

[bit31:2] EEB: ECC Error Occurrence Bits

These bits are used to invert the data read from SRAM using the bitwise operation. If IRCn_ET:ET is "1", [29:0] of the data read from SRAM is XORed with EEB, and the result is handled as the read data. This means that the bits corresponding to those to which "1" is written within EEB are inverted. As a result, the SRAM data is spuriously corrupted and used for the test for the ECC protection function.

[bit1:0] Reserved: Reserved Bits

Note:

- The register bit configuration described in this section is for IRCn_EEB0, which is representative of those registers that are all the same. The bit configuration of register IRCn_EEB1 is the same. IRCn_EEB1:EEB corresponds to the bits [66:37] of the data read from SRAM.

5.34. IRC ECC Error Bit Register (IRCN_EEB2)

This register is used in ECC test mode. In the data read from SRAM, you can spuriously corrupt any of the bits in the ECC parity area.

Bit	31	16
Field	Reserved	
R/W Attribute	R0,WX	
Protection	-	
Attribute		
Initial Value	00000000_00000000	

Bit	15	14	13	12	11	10	9	8
Field	Reserved	EEBO						
R/W Attribute	R0,WX	R/W						
Protection	-	WPS						
Attribute								
Initial Value	0	00000000						

Bit	7	6	5	4	3	2	1	0
Field	Reserved	EEBE						
R/W Attribute	R0,WX	R/W						
Protection	-	WPS						
Attribute								
Initial Value	0	00000000						

[bit31:15] Reserved: Reserved Bits

[bit14:8] EEBO: ECC Error Occurrence Bits

These bits are used to invert the data read from SRAM using the bitwise operation. If IRCn_ET:ET is "1", [73:67] of the data read from SRAM is XORed with EEBO, and the result is handled as the read data. This means the bits corresponding to those to which "1" is written within EEBO are inverted. As a result, the SRAM data is spuriously corrupted and used for the test for the ECC protection function.

[bit7] Reserved: Reserved Bit

[bit6:0] EEBE: ECC Error Occurrence Bits

These bits are used to invert the data read from SRAM using the bitwise operation. If IRCn_ET:ET is "1", [36:30] of the data read from SRAM is XORed with EEBE, and the result is handled as the read data. This means that the bits corresponding to those to which "1" is written within EEBE are inverted. As a result, the SRAM data is spuriously corrupted and used for the test for the ECC protection function.

5.35. IRC NMI Vector Address Status Register (IRCn_NMIVASBR)

This register indicates the vector address status of the NMI that was applied to the CPU most recently.

Bit	31	0
Field	NMIVAS	
R/W	R,WX	
Attribute		
Protection	RP	
Attribute		
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] NMIVAS: NMI Vector Address Status Bits

These bits indicate the vector address status of the NMI that was applied to the CPU most recently.

5.36. IRC NMI Vector Address Status Mirror Register (IRC_NMIVASBR)

This register is a mirror register of IRCn_NMIVASBR, and is dedicated to BootROM. The CPU can read this register and branch to the ISR for the NMI.

Bit	31	0
Field	NMIVAS	
R/W	R,WX	
Attribute		
Protection	RP	
Attribute		
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] NMIVAS: NMI Vector Address Status Bits

These bits indicate the vector address status of the NMI that was applied to the CPU most recently.

Notes:

- This register is dedicated to BootROM and is used as follows:
 1. An NMI occurs.
 2. The execution code jumps to the corresponding entry in the fixed exception vector table of BootROM.
 3. The load instruction at the exception entry point loads the value stored in IRC_NMIVASBR.
 4. The code jumps to the vector address of the accepted NMI and executes the ISR for the NMI.
- Each CPU reads the same address from the register where the stored address is mapped to that which is common to all CPUs.
- When a read operation is executed by CPU_n, the register for IRC_n is read. AHB masters other than CPUs cannot read this register.

5.37. IRC ECC Error Vector Address Register (IRCn_IRQEEVA)

This register is used to perform correct error handling when SRAM holding the IRQ vector is read by the IRQ processing block and a 2-bit ECC error is detected.

Bit	31	8
Field	IRQVA[31:8]	
R/W	R/W	
Attribute		
Protection	WPS	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	IRQVA[7:2]						IRQVA[1:0]	
R/W	R/W						R0,WX	
Attribute								
Protection	WPS						-	
Attribute								
Initial Value	000000						00	

[bit31:0] IRQVA: IRQ Vector Address Bits

These bits set the address of the error handler when SRAM holding the IRQ vector is read by the IRQ processing block and a 2-bit ECC error is detected.

Notes:

- Since all vector addresses are 32 bits long, the lowest 2 bits are fixed to "00".
- If a 2-bit ECC error occurs in vector SRAM during IRQ processing, transition is made to this vector address, rather than to the interrupt vector of the IRQ that has occurred. A transition to this vector cannot be changed. Therefore, the vector address must be set to this register to enable correct error handling.
- Set a value in this register before enabling the IRQ processing block.

6. Others

This section lists precautions to be observed when using the interrupt controller.

- Software interrupts must be cleared by ISR.
- If 2 interrupts of the same priority level are asserted at the same time, that with the smaller channel number takes precedence. If an interrupt occurs, followed by another of the same priority level, the latter interrupt will be masked until the service routine for the former is completed.
- All vector addresses should be set during the initialization process.
- For the interrupt controller to work properly, the peripheral interrupt must be cleared before the corresponding hold bit in the interrupt controller is cleared.
- In the case of a software interrupt, the software interrupt setting bit in the interrupt controller must be cleared before the corresponding hold bit in the interrupt controller is cleared.
- If a double-bit ECC error in SRAM is detected by reading IRCn_IRQVAr by CPU, a correct vector address must be written again in the relevant IRCn_IRQVAr register with the corresponding NMI handler. Then, the error bit must be cleared by writing to IRCn_EEI:EENC.
- If a double-bit ECC error in SRAM is detected by reading IRCn_IRQVAr by IRQ processing unit, correct vector address must be rewritten to IRCn_IRQVAr register corresponded to IRQEEVA handler.

The conditions under which a bus error is returned for register access in the interrupt controller are shown below:

- Sequence protection violation by IRCn_UNLOCK
- Writing values other than the lock value and unlock value to IRCn_UNLOCK
- Privilege protection violation
- Read or write attempt in which access is made only to an undefined register area
- Read or write attempt in which access is made only to reserved bits
- Write attempt in which access is made only to bits having the WX write attribute (including the undefined register area)
- When write by byte access is performed to IRCn_IRQHC register

CHAPTER 23: Time Protection

This chapter explains time protection.

1. Overview
2. Configuration
3. Explanation of Operation
4. Setting Procedure Examples
5. Registers
6. Others

TPU-T00PT03P01R01L04-E1-XX

1. Overview

This section provides an overview of time protection.

Modern operating systems (especially those with time-based triggers) need to manage various time-based operations of tasks. For example, tasks involve the following types of time:

- Overall maximum execution time
- Time limit from start to end
- Maximum tolerated period during which certain-level interrupts are prohibited
- Maximum tolerated period during which all interrupts are prohibited
- Minimum rate of restart

To satisfy the requirements, each CPU is equipped with a time protection unit to provide hardware-based support.

The time protection unit provides the following features:

- 8 timers of the same type are provided, each of which is denoted by the timer number "m". (m = 0 to 7)
These timers are used for the execution time, the lock period, the arrival time interval, and the protection of the time limit.
- 24-bit up-counter, for which normal mode or overflow mode can be selected
- Generation of NMI interrupts
- Setting of end counts and preload values
- Preload function that loads the preload value in the overflow mode
- Free-run function that restarts the timer automatically
- Clock division enabled by a global prescaler (division ratio: 1/1 to 1/64)
This function divides the system clock into the frequency required as the input to each timer-specific prescaler.
- Clock division by each timer-specific prescaler (division ratio: 1/1, 1/2, 1/4, or 1/16)
Dividing the output clock from the global prescaler into the clock used by the timer
- Reading the current count value
- Control of start, stop, and restart of each timer
- Notification of each timer status (stopped or operating)
- Equipped with a slave interface of AHB 64 bits for register access
- Support of the debug mode for stalling timers

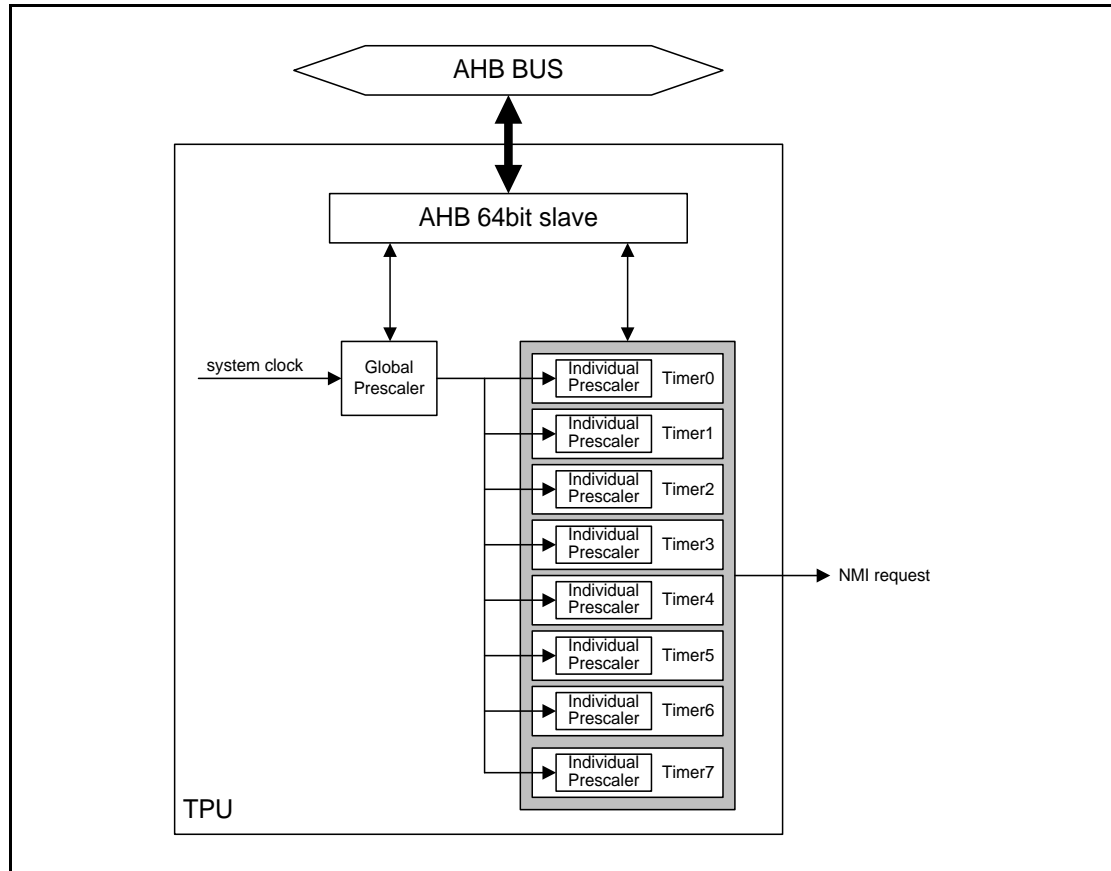

Notes:

- This chapter sometimes refers to the time protection unit by its abbreviation TPU (Time Protection Unit).
- "m" in the abbreviated register name of "TPU0_**m" or "TPU0_***.**m" indicates the timer number.
- In this chapter, interrupt indicates the NMI interrupt.

2. Configuration

This section explains a block diagram of the time protection unit.

Figure 2-1 Block Diagram of Time Protection Unit

3. Explanation of Operation

This section explains the operation of the time protection unit.

Sequence Protection by the Lock Release Register

The time protection unit provides the sequence protection feature using a lock release register (TPU0_UNLOCK). The lock must be released by writing the lock release value in TPU0_UNLOCK before the timer setting can be updated. Writing the locking value after making a timer setting sets the locked state again.

Timer Operation Mode

Normal Mode

The condition for generating an interrupt request in the normal mode is "the current timer count value \geq end count value". The current timer count value being counted up is compared with the end-count/preload-value setting bits (TPU0_TCN0m:ECPL) in timer control register 0. If the current count value is equal to or larger than the end-count value, an interrupt request occurs and the corresponding bit (TPU0_TIR:IRm) in the timer interrupt request register becomes "1". If an interrupt request occurs and the corresponding bit (TPU0_TIE:IEm) in the timer interrupt enable register is enabled, an interrupt for CPU0 is generated.

To start the timer operation, write "1" in the operation start bit (TPU0_TCN0m:START) in timer control register 0. The timer is reset and the counting starts from 0x000000. During timer operation, the corresponding bit (TPU0_TST:STm) in the timer status register keeps the value "1".

The timer automatically stops when an interrupt request occurs.

To stop the timer operation arbitrarily, write "1" in the operation stop bit (TPU0_TCN0m:STOP) in timer control register 0. TPU0_TST:STm becomes "0" when the timer stops. The current timer count value of the stopped timer is stalled.

To restart the timer, write "1" in the operation restart bit (TPU0_TCN0m:CONT) in timer control register 0. The current timer count value that has been stalled at the time of timer stop is used as the starting point of the counting. TPU0_TST:STm keeps the value "1" during timer operation.

Overflow Mode

The condition for generating an interrupt request in the overflow mode is timer overflow. If a count up occurs when the current timer count value is 0xFFFFF, an interrupt request occurs and TPU0_TIR:IRm becomes "1". If an interrupt request occurs and TPU0_TIE:IEm is enabled, an interrupt to CPU0 is generated.

Start, stop, and restart of the operation are the same as those in normal mode.

Debug Mode

All timers stop when "1" is written in the debug mode enable/disable bit (TPU0_CFG:DBGE) in the configuration register and the CPU enters the debug state. The current timer count values of the stopped timers are stalled. The timers start operation as soon as the above condition is no longer true.

For the definition of the debug state, see 12.8 of Cortex™-R5 Revision:r1p2 Technical Reference Manual (ARM DDI 0460D).

Preload Function

This function sets the counting start value in the overflow mode to any specified value, instead of setting it to the normal "0". This function is enabled by writing "1" in the preload function enable/disable setting bit (TPU0_TCN1m:PL) in timer control register 1. Any counting start value being set is called a preload value. The preload value is set by TPU0_TCN0m:ECPL.

This function cannot be used in the normal mode.

Free-Run Function

This function automatically restarts the timer, instead of stopping it, when an interrupt request occurs.

This function is enabled by writing "1" in the free-run function enable/disable setting bit (TPU0_TCN1m:FRT) in timer control register 1.

This function can be used in both normal and overflow modes.

The count starting value at restart is the same as in normal operation: 0x000000 for the normal mode, and 0x000000 or the preload value in the overflow mode.

Because the timer restarts as soon as an interrupt request occurs, the condition TPU0_TST:STm = 1 continues. When the condition for interrupt request generation is satisfied, TPU0_TIR:IRm becomes "1". The value stays at "1" if the previous interrupt request is not cleared.

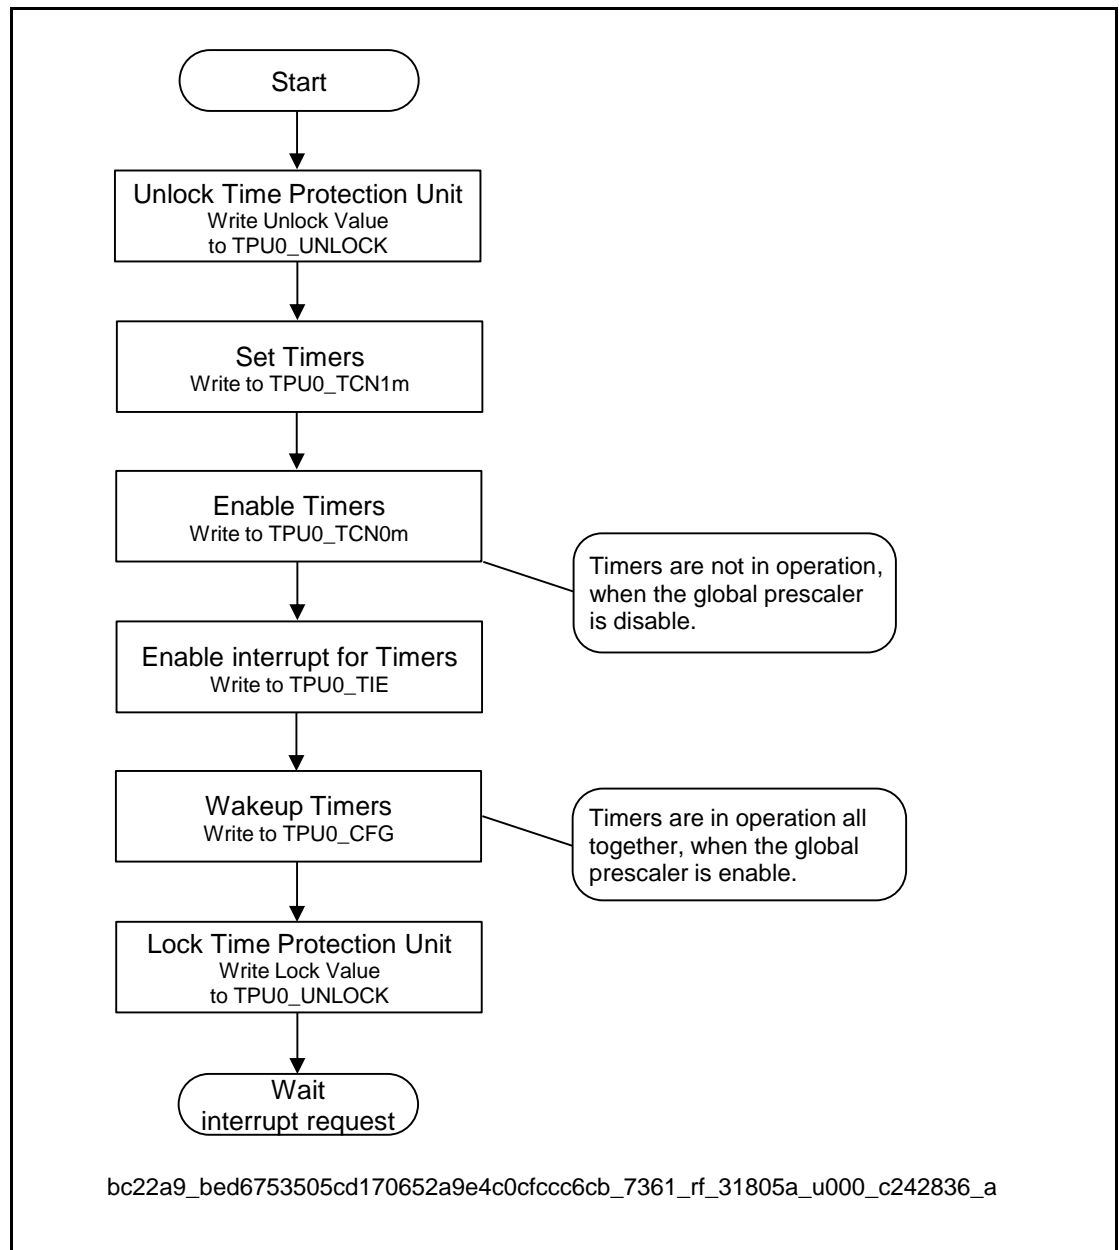

4. Setting Procedure Examples

This section explains provides setting procedure examples of the time protection unit.

When Multiple Timers are Simultaneously Started from the Initial State

When multiple timers are simultaneously started from the initial state, the enable setting of the global prescaler is used as the trigger. Configure TPU0_TCN1m and TPU0_TCN0m of the target timers to the operational status before enabling the global prescaler. At this time the timers are not still operational because the counters are not supplied with the clock. Enabling the global prescaler simultaneously starts the timers that have previously been configured with the operation start setting.

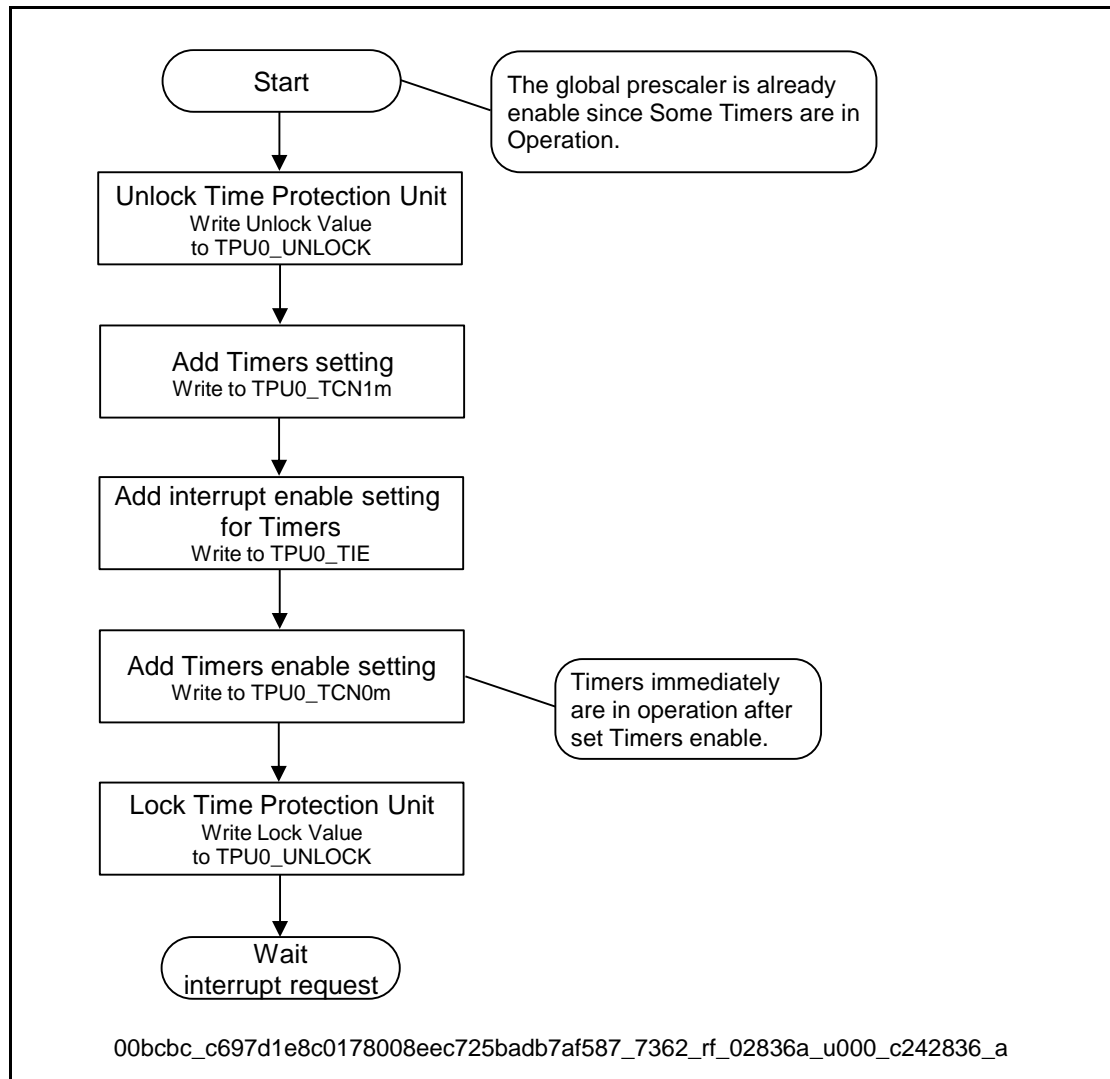

Figure 4-1 Time Protection Unit Setting Flow (When Multiple Timers are Simultaneously Started From the Initial State)

Starting an Additional Timer while Some Timers are in Operation

When starting an additional timer while some timers are in operation, the setting action for starting the additional timer directly triggers the start of the timer because the global prescaler is already in operation providing timer clocks to timers.

Figure 4-2 Time Protection Unit Setting Flow (Starting an Additional Timer While Some Timers are in Operation)

Note:

- Because the timer is started when the global prescaler is already in operation, the state of the global prescaler varies depending on the timing of the setting action for the timer start. For this reason, the actual time required before generation of an interrupt may have a margin of error. For example, suppose that the global prescaler has been started with a division ratio of 1/12. Also, suppose that it takes a period of 2 system clock cycles between the setting action for the timer start and the detection of the first clock edge of the global clock. In this case, there will be a time difference of 10 system clock cycles. The maximum time difference depends on the division ratio of the global prescaler.

5. Registers

This section explains the registers used by the time protection unit.

Table 5-1 Register List of Time Protection Unit

Abbreviated Register Name	Register Name	Reference
TPU0_UNLOCK	TPU lock release register	5.1
TPU0_LST	TPU lock status register	5.2
TPU0_CFG	TPU configuration register	5.3
TPU0_TIR	TPU timer interrupt request register	5.4
TPU0_TST	TPU timer status register	5.5
TPU0_TIE	TPU timer interrupt enable register	5.6
TPU0_TCN0m	TPU timer m control register 0	5.7
TPU0_TCN1m	TPU timer m control register 1	5.8
TPU0_TCCm	TPU timer m current count register	5.9

Table 5-2 Register Memory Layout of Time Protection Unit

Offset	+7	+6	+5	+4	+3	+2	+1	+0
0x00000000	TPU0_LST 00000000_00000000_00000000_00000001				TPU0_UNLOCK 00000000_00000000_00000000_00000000			
0x00000008	TPU0_TIR 00000000_00000000_00000000_00000000				TPU0_CFG 00000000_00000000_00000000_00000000			
0x00000010	TPU0_TIE 00000000_00000000_00000000_00000000				TPU0_TST 00000000_00000000_00000000_00000000			
0x00000018	Reserved				Reserved			
0x00000020 0x00000028	Reserved				Reserved

0x00000038	TPU0_TCN03 00000000_00000000_00000000_00000000				TPU0_TCN02 00000000_00000000_00000000_00000000			
0x00000040	TPU0_TCN05 00000000_00000000_00000000_00000000				TPU0_TCN04 00000000_00000000_00000000_00000000			
0x00000048	TPU0_TCN07 00000000_00000000_00000000_00000000				TPU0_TCN06 00000000_00000000_00000000_00000000			
0x00000050	TPU0_TCN11 00000000_00000000_00000000_00000000				TPU0_TCN10 00000000_00000000_00000000_00000000			
0x00000058	TPU0_TCN13 00000000_00000000_00000000_00000000				TPU0_TCN12 00000000_00000000_00000000_00000000			
0x00000060	TPU0_TCN15 00000000_00000000_00000000_00000000				TPU0_TCN14 00000000_00000000_00000000_00000000			
0x00000068	TPU0_TCN17 00000000_00000000_00000000_00000000				TPU0_TCN16 00000000_00000000_00000000_00000000			
0x00000070	TPU0_TCC1 00000000_00000000_00000000_00000000				TPU0_TCC0 00000000_00000000_00000000_00000000			
0x00000078	TPU0_TCC3 00000000_00000000_00000000_00000000				TPU0_TCC2 00000000_00000000_00000000_00000000			
0x00000080	TPU0_TCC5 00000000_00000000_00000000_00000000				TPU0_TCC4 00000000_00000000_00000000_00000000			
0x00000088	TPU0_TCC7 00000000_00000000_00000000_00000000				TPU0_TCC6 00000000_00000000_00000000_00000000			
0x00000090 0x0000003F8	Reserved				Reserved			

5.1. TPU Lock Release Register (TPU0_UNLOCK)

This register controls the write lock of the registers of the time protection unit.

Bit	31	0
Field	UNLOCK	
R/W	R0,W	
Attribute		
Protection	WP	
Attribute		
Initial Value	00000000_00000000_00000000_00000000	

[bit31:0] UNLOCK: Lock Release Bits of the Time Protection Unit

These bits control the write lock of the configuration registers of the time protection unit.

TPU0_CFG and TPU0_TCN10 to TPU0_TCN17 are subject to sequence protection by this register.

UNLOCK	Description
0xACC5A110	Unlock value (which enables writing)
0xB10CACC5	Lock value (which disables writing)
Other than above	Setting prohibited (bus error returned)

Note:

- The value of all 32 bits of this register is needed to determine the lock status. Therefore, writing to this register must be made with 32-bit or 64-bit access. 8-bit or 16-bit access is not allowed.

This register indicates the lock status of the time protection unit.

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	Reserved							LST
R/W	R0,WX							R,WX
Attribute								
Protection	-							
Attribute								
Initial Value	0000000							1

This bit indicates the lock status of the time protection unit.

Bit	Description
0	Unlocked state
1	Locked state

5.3. TPU Configuration Register (TPU0_CFG)

This register makes the setting of the global prescaler and enables/disables interrupts for the time protection unit. This register also makes the setting of enable/disable of the debug mode.

Bit	31	30	29	28	27	26	25	24
Field	Reserved							DBGE
R/W	R0,WX							R/W
Attribute								
Protection	WPS							
Attribute								
Initial Value	0000000							0

Bit	23	22	21	20	19	18	17	16						
Field	GLBPSE	Reserved	GLBPS

[bit31:25] Reserved: Reserved Bits

[bit24] DBGE: Debug Mode Enable/Disable Setting Bit

This bit sets enable/disable of the debug mode.

Bit	Description
0	Disable debug mode.
1	Enable debug mode.

[bit23] GLBPSE: Global Prescaler Enable/Disable Setting Bit

This bit sets enable/disable of the global prescaler. If this bit is set to disable, the global prescaler counter stops after the next increment pulse. All timers also stop as a result.

Bit	Description
0	Disable global prescaler.
1	Enable global prescaler.

[bit22] Reserved: Reserved Bit
[bit21:16] GLBPS: Global Prescaler Division Setting Bit

This bit sets the division ratio of the global prescaler. The input system clock is divided according to the configured division ratio, generating a clock of a lower frequency. A divided clock is provided to each timer.

Bit							Description
0	0	0	0	0	0	0	1/1
0	0	0	0	0	0	1	1/2
0	0	0	0	0	1	0	1/3
		-					-
		-					-
		-					-
1	1	1	1	1	1	1	1/64

[bit15:1] Reserved: Reserved Bits
[bit0] INTE: Time Protection Unit Interrupt Enable/Disable Setting Bit

This bit makes the enable/disable setting of interrupts of the time protection unit. The enable setting allows generation of interrupts to CPU0. The disable setting prohibits generation of interrupts to CPU0.

Bit	Description
0	Disable interrupts of the time protection unit.
1	Enable interrupts of the time protection unit.

Notes:

- For details of the debug mode, see "3.Explanation of Operation."
- Interrupts to CPU0 is generated when `TPU0_CFG:INTE= 1` and `TPU0_TIR:IRm= 1` and `TPU0_TIE:IEm= 1`.
- It is prohibition that carries out timer starting by `TPU0_CFG:GLBPS= 0b000000` and `TPU0_TCN1m:PS= 0b00`.

5.4. TPU Timer Interrupt Request Register (TPU0_TIR)

This register indicates the interrupt request status of each timer. Each timer is assigned with 1 bit, and the bit position indicates the timer number "m".

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	IR7	IR6	IR5	IR4	IR3	IR2	IR1	IR0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute								
Protection	-	-	-	-	-	-	-	-
Attribute

[bit31:8] Reserved: Reserved Bits

[bit7] IR7: Timer 7 Interrupt Request Bit
[bit6] IR6: Timer 6 Interrupt Request Bit
[bit5] IR5: Timer 5 Interrupt Request Bit
[bit4] IR4: Timer 4 Interrupt Request Bit
[bit3] IR3: Timer 3 Interrupt Request Bit
[bit2] IR2: Timer 2 Interrupt Request Bit
[bit1] IR1: Timer 1 Interrupt Request Bit
[bit0] IR0: Timer 0 Interrupt Request Bit

These bits indicate the interrupt request status of individual timers. Indication is made for each timer about whether the interrupt request flag is on or there is a retained interrupt request.

Bit	Description
0	An interrupt request does not exist for timer m.
1	An interrupt request exists for timer m.

Note:

- An interrupt to CPU0 is generated when TPU0_CFG:INTE= 1 and TPU0_TIR:IRm= 1 and TPU0_TIE:IEm= 1.

5.5. TPU Timer Status Register (TPU0_TST)

This register indicates the operation status of each timer. Each timer is assigned 1 bit, and the bit position indicates the timer number "m".

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	-	
Attribute		
Initial Value	00000000_00000000_00000000	

Bit	7	6	5	4	3	2	1	0
Field	ST7	ST6	ST5	ST4	ST3	ST2	ST1	ST0
R/W	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Attribute

Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31:8] Reserved: Reserved Bits

[bit7] ST7: Timer 7 Status Bit

[bit6] ST6: Timer 6 Status Bit

[bit5] ST5: Timer 5 Status Bit

[bit4] ST4: Timer 4 Status Bit

[bit3] ST3: Timer 3 Status Bit

[bit2] ST2: Timer 2 Status Bit

[bit1] ST1: Timer 1 Status Bit

[bit0] ST0: Timer 0 Status Bit

These bits indicate the operation status of individual timers. Their indications show whether individual timers are operating or stopped.

Bit	Description
0	Timer m is stopped.
1	Timer m is operating.

5.6. TPU Timer Interrupt Enable Register (TPU0_TIE)

This register sets enable/disable of interrupt of individual timers. Each timer is assigned 1 bit, and the bit position indicates the timer number "m".

Bit	31	8
Field	Reserved	
R/W	R0,WX	
Attribute		
Protection	WP	
Attribute		
Initial Value	00000000_00000000_00000000

Field	IE7	IE6	IE5	IE4	IE3	IE2	IE1	IE0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Attribute								
Protection	WP							
Attribute								
Initial Value	0	0	0	0	0	0	0	0

[bit31:8] Reserved: Reserved Bits

- [bit7] IE7: Timer 7 Interrupt Enable/Disable Setting Bit**
- [bit6] IE6: Timer 6 Interrupt Enable/Disable Setting Bit**
- [bit5] IE5: Timer 5 Interrupt Enable/Disable Setting Bit**
- [bit4] IE4: Timer 4 Interrupt Enable/Disable Setting Bit**
- [bit3] IE3: Timer 3 Interrupt Enable/Disable Setting Bit**
- [bit2] IE2: Timer 2 Interrupt Enable/Disable Setting Bit**
- [bit1] IE1: Timer 1 Interrupt Enable/Disable Setting Bit**
- [bit0] IE0: Timer 0 Interrupt Enable/Disable Setting Bit**

These bits set enable/disable of interrupts of individual timers. If these bits are enabled, interrupt requests of corresponding timers generate interrupts to CPU0. If these bits are disabled, interrupt requests of corresponding timers do not generate interrupts to CPU0.

Bit	Description
0	Disable interrupt of timer m.
1	Enable interrupt of timer m.

Note:

- An interrupt to CPU0 is generated when TPU0_CFG:INTE= 1 and TPU0_TIR:IRm= 1 and TPU0_TIE:IEm= 1.

5.7. TPU Timer m Control Register 0 (TPU0_TCn0m)

This register controls operation of individual timers. This register controls start, stop, and restart of timers, and controls timer interrupts. This register also sets the end counts and the preload values of timers. Registers of the same type are provided for individual timers, and "m" in the abbreviated register name indicates the timer number m (0 to 7).

Bit	31	30	29	28	27	26	25	24
Field	START	STOP	CONT	IES	IEC	IRC	Reserved

[bit31] START: Timer Operation Start Bit

Writing "1" in this bit resets the timer and starts its operation.

Bit	Description
0	Invalid (no effect on operation)
1	Start timer operation.

[bit30] STOP: Timer Operation Stop Bit

Writing "1" in this bit stops the timer operation. It does not reset the timer.

Bit	Description
0	Invalid (no effect on operation)
1	Stop timer operation.

[bit29] CONT: Timer Operation Restart Bit

Writing "1" in this bit restarts the timer from the previously stalled state.

Bit	Description
0	Invalid (no effect on operation)
1	Restart timer operation.

[bit28] IES: Timer Interrupt Enable Set Bit

Writing "1" in this bit sets the corresponding bit in the timer interrupt enable register. "1" is written in TPU0_TIE:IEm.

Bit	Description
0	Invalid (no effect on operation)
1	Enable timer interrupt.

[bit27] IEC: Timer Interrupt Enable Clear Bit

Writing "1" in this bit clears the corresponding bit in the timer interrupt enable register. "0" is written in TPU0_TIE:IEm.

Bit	Description
0	Invalid (no effect on operation)
1	Disable timer interrupt.

[bit26] IRC: Timer Interrupt Request Clear Bit

Writing "1" in this bit clears the corresponding bit in the timer interrupt request enable register. TPU0_TIR:IRm is cleared to "0".

Bit	Description
0	Invalid (no effect on operation)
1	Clear timer interrupt flag.

[bit25:24] Reserved: Reserved Bits

[bit23:0] ECPL: End Count / Preload Value Setting Bit

The value of these bits is used as the end count in the normal operation mode, and as the preload value when the operation mode is overflow mode and the preload function is enabled.

Notes:

- When multiple bits among START, STOP, and CONT are set to "1" simultaneously, the priority order is START > CONT > STOP.
- For details on timer operation modes, end counts, and preload values, see "3.Explanation of Operation."
- TPU0_TCN00 to TPU0_TCN07 share the same register bit configuration.

5.8. TPU Timer m Control Register 1 (TPU0_TCN1m)

This register controls operation of individual timers. This register configures the timer operation mode and individual prescalers. Registers of the same type are provided for individual timers, and "m" in the abbreviated register name indicates the timer number m (0 to 7).

Bit	31															8
Field	Reserved															
R/W	R0,WX															
Attribute																
Protection	WPS															
Attribute																
Initial Value	00000000_00000000_00000000

Attribute										
Initial Value	000			0	0	0	00			

[bit31:5] Reserved: Reserved Bits

[bit4] PL: Preload Function Enable/Disable Setting Bit

This bit sets enable/disable of the preload function. The preload function is effective only when the timer operation mode is the overflow mode.

Bit	Description
0	Disable preload function.
1	Enable preload function.

[bit3] FRT: Free-Run Function Enable/Disable Setting Bit

This bit sets enable/disable of the free-run function.

Bit	Description
0	Disable free-run function.
1	Enable free-run function.

[bit2] TMOD: Timer Operation Mode Setting Bit

This bit sets the operation mode of the timer.

Bit	Description
0	Normal mode
1	Overflow mode

[bit1:0] PS: Individual Prescaler Division Setting Bit

This bit sets the division ratio of the individual prescaler. An individual prescaler takes the output clock of the global prescaler, and divides it according to the configured division ratio to generate a clock of a timer-specific frequency.

Bits		Description
0	0	Divided by 1
0	1	Divided by 2
1	0	Divided by 4
1	1	Divided by 16

Notes:

- For details on timer operation modes, the preload function, and the free-run function, see "3.Explanation of Operation."
- TPU0_TCN10 to TPU0_TCN17 share the same register bit configuration.
- It is prohibition that carries out timer starting by TPU0_CFG:GLBPS= 0b000000 and TPU0_TCN1m:PS= 0b00.

6. Others

This section explains the notes when using the time protection unit.

An access to the register of the time protection unit returns a bus error in the following conditions:

- Sequence protection violation against TPU0_UNLOCK
- Writing in TPU0_UNLOCK a value other than that of lock release or locking.
- Privilege protection error
- Read or write attempt in which access is made only to a register undefined area
- Write attempt in which access is made only to bits of WX attribute (including register undefined area)

CHAPTER 24: Security

This chapter explains the functions and operations of the security feature in this product.

1. Overview
2. Security Scope and Access Restriction by the Security
3. Using and Configuring the Security
4. Registers

In this chapter, there is a place with two specifications, "SWP_NORMAL_type" and "SWP_LITE_type". Basically please refer to "SWP_NORMAL_type" specification, but when SWP_LITE_type is used, please refer to "SWP_LITE_type" specification and see the Product's HWM.

SECURITY-TXXPT03P01R01L10-E1-XX

1. Overview

This section shows brief overview of security features in this product.

This product has security features which forbid unauthorized access to Flash contents and unauthorized use of debugger.

This chapter describes security features supported in this product and procedure to configure it.

2. Security Scope and Access Restriction by the Security

This section explains restriction by the security.

2.1. Security Scope

This section explains scopes of the security.

Security Scope

This product has following "security scope" to protect the device from unauthorized access.

Flash Protection

Protect contents of Flash from external access.

Protect the device from unauthorized debugger access in USERMODE.

Device Protection

Protect contents of Flash from external access.

Protect the device from unauthorized debugger access in USERMODE.

Protect the device from unauthorized code execution in non-USERMODE.

Besides Flash protection it also:

- Prevents read-out of register contents
- Prevents read-out of RAM contents.

Notes:

- *As shown in 2.2 Access Restriction by the Security, It is not restricted to execute a full chip erase (Macro erase) in the parts without SHE*
- *Even with SHE activated parts macro erase of WorkFlash (except SHE sectors) and macro erase of Code Flash can be done (using Serial Loader or JTAG equipment). The two sectors reserved for SHE operation are not erased.*

Refer to datasheet of product.

If being written with "MK_CEER = Selectable", below is spec.

The ability to execute "chip erase" function depends on the permission set by the marker MK_CEER.

The possibility of doing chip erase can be removed, when the user intends to forbid the usage of other parties software on his system. However this removes any possibility for a recovery of a device when not implementing an unlock mechanism or forgetting the key for a device unlock. To protect the software IP only from being disassembled, debugged or copied – the normal security is enough and chip erase functionality should stay enabled.

Other spec is below.

The ability to execute "chip erase" always exists. The marker MK_CEER does not have any functionality.

Debugger Security

Debugger connection has to be authenticated to protect the device from unauthorized access. When the device boots in USERMODE, the debugger connection is not initialized by default. Debugger connection to secured device has to be configured by user software.

Two options exist for the authentication process:

1. Flash Marker and 128 bit Flash Key based method
2. Application based authentication (by access to security state controller registers)

2.2. Access Restriction by the Security

This section tabulates access restriction in each operation mode and security scope.

Access Restriction in USERMODE

Operation	USERMODE Security=Disabled	USERMODE Security= Flash Protection	USERMODE Security= Device Protection
TCFlash Macro Erase	Enabled *1	Enabled *1	Enabled *1
TCFlash Sector Erase	Enabled *1	Enabled *1	Enabled *1
WorkFlash Sector Erase	Enabled *1	Enabled *1	Enabled *1
Programming	Enabled *1	Enabled *1	Enabled *1
Reading	Enabled	Enabled	Enabled
Debugger connection	Enabled	Enabled *2	Enabled *2

*1: TCFCFG0_xxxx registers has to be configured by user software.

*2: Debugger connection has to be authorized and initialized by 128-bit passcode or by the user software.

Access Restriction in Non-USERMODE

Operation	Non-USERMODE Security=Disabled	Non-USERMODE Security= Flash Protection Chip Erase Enabled = Enabled	Non-USERMODE Security= Flash Protection Chip Erase Enabled = Disabled	Non-USERMODE Security= Device Protection Chip Erase Enabled = Enabled	Non-USERMODE Security= Device Protection Chip Erase Enabled = Disabled
TCFlash Macro Erase	Enabled	Restricted *1	Disabled	Restricted *2	Disabled
TCFlash Sector Erase	Enabled	Disabled			
WorkFlash Sector Erase	Enabled	Restricted *1			
Programming	Enabled	Restricted *1			
Reading	Enabled	Disabled			
Use of Serial Programmer	Enabled	Restricted *1			
Use of Parallel Programmer	Enabled	Restricted *1			
Debugger connection	Enabled	Enabled *3	Enabled*4		

*1: It has to follow the steps shown in Erase Order Restriction in Non-USERMODE to Devices with Flash Protection or Device Protection.

*2: Only a certain sequence of erase operations (full-chip erase) can be triggered by the writer equipment (Serial or JTAG).

*3: Access to Flash is restricted (only full-chip erase is possible).

*4: Access to Flash is restricted (Nothing can be done to Flash).

3. Using and Configuring the Security

This section explains how to configure the security.

The security settings of the device are stored in a region named Security Marker. After any RSTX_PD2H, the device automatically loads the security settings written in Security Marker and applies the settings to the Security State Registers. To apply the security settings, the Security Marker area has to be programmed according to the definition written in this section.

Each of the security control marker in the Flash has its 1:1 copy in its according security register.

During the runtime of the application, the Security State Registers could be accessed. It could modify the registers state until the overwrite feature gets disabled. That gives the application the chance to temporary change the security setting without reprogramming the Flash. That feature can be used to unlock security after a successful authentication. It can be used for gaining debugger access or for other maintenance tasks.

3.1. Set Security Setting

This section describes how to set security settings.

To enable the security setting, you need to program Security Marker as shown in this section.

Device without Protection

Program Security Marker to following:

MK_SER : Security = Disabled

MK_SSR : Scope = (don't care)

Device with Flash Protection

Program Security Marker to following:

MK_SER : Security = Enabled

MK_SSR : Scope = Flash Protection

Device with Device Protection

Program Security Marker to following:

MK_SER : Security = Enabled

MK_SSR : Scope = Device Protection

Examples

Address	Security Off (erased)	Flash Protection	Device Protection
0x019F0000 (MK_SER)	0xFFFFFFFF	0x00000001	0x00000001
0x019F0004	0xFFFFFFFF	0xFFFFFFFF	0xFFFFFFFF
0x019F0008 (MK_SSR)	0xFFFFFFFF	0xFFFFFFFF	0x00000001
0x019F000C	0xFFFFFFFF	0xFFFFFFFF	0xFFFFFFFF

3.2. Erasing Security Setting

This section describes how to erase security settings and make possible to reprogram the device.

To erase the security setting and make possible to reprogram the device, you need to reprogram Security Marker as shown in this section.

Device with Flash Protection

In USERMODE

Program following configuration to the security marker

MK_SER : Security = Disabled

By Using Write Equipment

Erase and programming can be possible by the steps shown in Erase Order Restriction in Non-USERMODE to Devices with Flash Protection or Device Protection.

To disable security, program following configuration to the security marker

1. Execute chip erase.
2. MK_SER : Security = Disabled

Device with Device Protection

In USERMODE

Program following configuration to the security marker

MK_SER : Security = Disabled

By Using Write Equipment

Execute "full chip erase" from writer equipments. Then flash contents are erased by the steps shown in Erase Order Restriction in Non-USERMODE to Devices with Flash Protection or Device Protection.

Following configuration will be automatically written to the security marker by the full chip erase operation.

MK_SER : Security = Disabled

Erase Order Restriction in Non-USERMODE to Devices with Flash Protection or Device Protection

For the devices with Flash Protection or Device Protection, erase and programming is possible only by following steps.

[W]→[T2]→[T1]→[T0]→[P]
 or [W]→[T1]→[T2]→[T0]→[P]
 or [T2]→[W]→[T1]→[T0]→[P]
 or [T2]→[T1]→[W]→[T0]→[P]
 or [T1]→[W]→[T2]→[T0]→[P]
 or [T1]→[T2]→[W]→[T0]→[P]

- [W] WorkFlash sector erase to all sectors : from the top sector to the bottom sector. (i.e.: ... → sector #5 → sector #4 → sector #3 → sector #2 → sector #1 → sector #0)
- [T2] TCFlash#2 macro erase
- [T1] TCFlash#1 macro erase
- [T0] TCFlash#0 macro erase
- [P] Program any data to TCFlash and WorkFlash.

Notes:

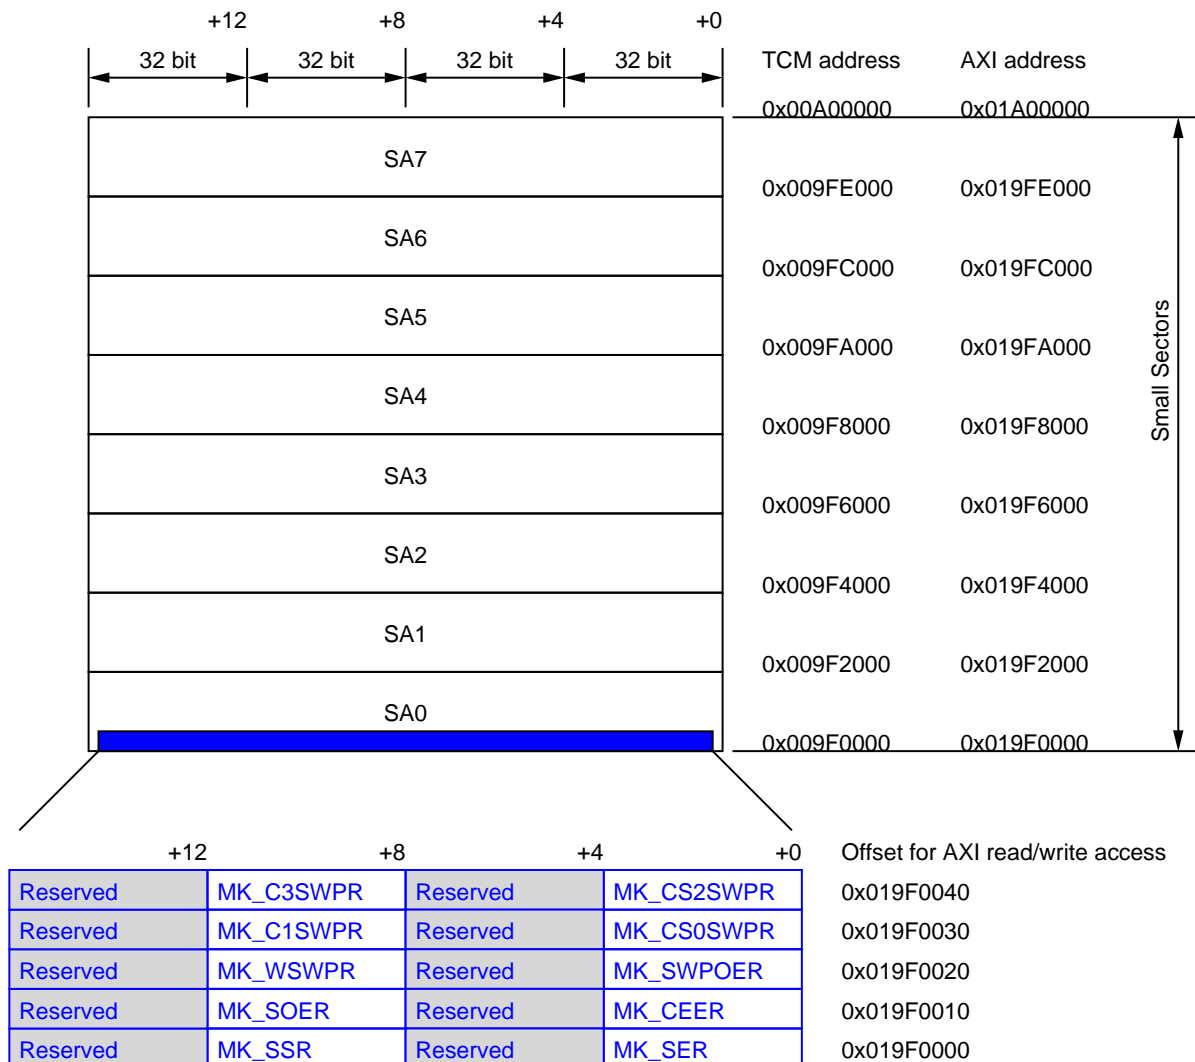

- *If there is a reset between the steps, you have to restart the steps from the first step.*
- *To disable security, program following configuration to the security marker in the last step.*
{MK_SER : Security = Disabled}

3.3. Security Marker Definition

This section describes details of the Flash Marker which is used to configure the security setting.

The security configuration is stored in the Flash Marker which is located to head of the SA0 area in small sector area of TCMFlash#0.

This section describes details of each marker definition.

The security markers are transferred after each RSTX_PD2H into the appropriate registers containing the security state of the device. This process is called "Security Fetch".

No errors will succeed in loading the marker values from Flash to registers.

Single bit errors get corrected and will succeed in loading the marker values from Flash to registers.

Fatal errors will not succeed in loading the marker values from Flash to registers. The according security register will keep its previous initial value.

To check detail of the integrity of ECC of the above marker section, it is recommended, to read the markers by the application. The normal ECC error detection by the TCFLASH interface can be utilized for that.

3.3.1. Security Enable Marker (MK_SER)

This section describes the function of the Security Enable Marker.

Offset	0x0000
Size	4 bytes
Name	SER[31:0]

[bit31:0] SER: Security Enable

The value is used to enable the security feature.

Value	Description
0x00000001	The security is enabled. This value should be used as lock code.
0xFFFFFFFF	The security is disabled (unlock value).
Other	Any other value enables the security, but should not be used.

The marker value is automatically copied to TCFCFG0_SER after each RSTX_PD2H.

Note:

- Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and security will be enabled.

3.3.2. Security Scope Marker (MK_SSR)

This section describes the function of the Security Scope Marker.

Offset	0x0008
Size	4 bytes
Name	SSR[31:0]

[bit31:0] SSR: Security Scope

The value is used to select security scope of the device.

Value	Description
0xFFFFFFFF	<p>The security scope is set to Flash protection.</p> <p>Flash access is only possible in USERMODE by the application.</p> <p>The Debug interface is disabled in USERMODE to protect from external access to the Flash (it could be enabled by unlocking after authentication).</p> <p>Debug interface can be used in non-USERMODE, while Flash access is disabled.</p>
Other	<p>The security scope is set to Device protection.</p> <p>It includes no accessibility to Flash, RAM and registers.</p> <p>The Debug interface is disabled all modes (it could be enabled by unlocking after authentication).</p>

The marker value is automatically copied to TCFCFG0_SSR after each RSTX_PD2H.

Note:

- Single ECC errors are corrected. When double ECC errors are detected, the scope will be set Device protection.

3.3.3. Chip Erase Enable (MK_CEER)

The functionality of Chip Erase Enable is described in this section.

Offset	0x0010
Size	4 bytes
Name	CEER[31:0]

Refer to datasheet of product.

If being written with "MK_CEER = Selectable", below is spec.

[bit31:0] CEER: Chip Erase Enable

The value controls the ability to execute the "chip erase" function.

Value	Description
0xFFFFFFFF	The MCU will support the "chip erase" command. As an effect a secured device can be unlocked by erasing all its internal secret content, except SHE.
Other	The MCU has disabled the "chip erase" command. Without knowing authentication scheme, the device cannot be erased anymore (independent from its operation mode).

The marker value is automatically copied to TCFCFG0_CEER after each RSTX_PD2H.

Other spec is below.

The marker value does not have any effect to both USERMODE / non-USERMODE operations.

Chip erase operation can be done regardless of this value. A secured device can be unlocked by erasing all its internal secret content, except SHE.

3.3.4. Security Overwrite Enable Marker (MK_SOER)

This section describes the function of the Security Overwrite Enable Marker.

Offset	0x0018
Size	4 bytes
Name	SOER[31:0]

The marker value is automatically copied to TCFCFG0_SOER after each RSTX_PD2H.

[bit31:0] SOER: Security Overwrite Enable

Value	Description
0xFFFFFFFF	The security settings in the registers (SER, SSR, CEER and SOER) can be overwritten.
Other	Any other value disables the write access to the security settings registers including TCFCFG0_SER, TCFCFG0_SSR, TCFCFG0_CEER and TCFCFG0_SOER.

Notes:

- Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the security settings cannot be overwritten.
- The marker value does not have any effect to non-USERMODE operations.

3.3.5. Sector Write Permission Overwrite Enable Marker (MK_SWPOER)

This section describes the function of the Sector Write Permission Overwrite Enable Marker.

Offset	0x0020
Size	4 bytes
Name	SOER[31:0]

The marker value is automatically copied to TCFCFG0_SWPOER after each RSTX_PD2H.

[bit31:0] SWPOER: Sector Write Permission Overwrite Enable

Value	Description
0xFFFFFFFF	The sector write permissions can be overwritten.
Other	Any other value disables the write access to the sector write permission registers including TCFCFG0_SWPOER, TCFCFG0_WSWP, TCFCFG0_C0SWP, TCFCFG0_C1SWP, TCFCFG0_C2SWP and TCFCFG0_C3SWP.

Notes:

- The marker value does not have any effect to non-USERMODE operations.
- In non-USERMODE, any program or sector erase operation cannot be done regardless this marker value when the security is enabled. Only chance is to execute a "full chip erase" command.
- Single ECC errors are corrected. When double ECC errors are detected the sector write permissions cannot be overwritten.

3.3.6. Work Flash Sector Write Permissions (MK_WSWPR)

This section describes the function of the WSWP Default Value Setting from Flash.

Offset	0x0028
Size	4 bytes
Name	WSWP[31:0]

The marker value is automatically copied to TCFCFG0_WSWP after each RSTX_PD2H.

For details please refer to the description of the TCFCFG0_WSWP register.

Notes:

- The marker value does not have any effect to non-USERMODE operations.
- In non-USERMODE, any program or sector erase operation cannot be done regardless this marker value when the security is enabled. Only chance is to execute a "full chip erase" command.
- Single ECC errors are corrected. When double ECC errors are detected, the sector write permissions are not set.

3.3.7. Code Flash Sector Write Permissions, Small Sectors (MK_C0SWPR)

This section describes the function of the C0SWP Default Value Setting from Flash.

Offset	0x0030
Size	4 bytes
Name	C0SWP[31:0]

The marker value is automatically copied to TCFCFG0_C0SWP after each RSTX_PD2H.

For details please refer to the description of the TCFCFG0_C0SWP register.

Notes:

- The marker value does not have any effect to non-USERMODE operations.
- In non-USERMODE, any program or sector erase operation cannot be done regardless this marker value when the security is enabled. Only chance is to execute a “full chip erase” command.
- Single ECC errors are corrected. When double ECC errors are detected, the sector write permissions are not set.

3.3.8. Code Flash Sector Write Permissions, Large Sectors (MK_C1SWPR)

This section describes the function of the C1SWP Default Value Setting from Flash.

Offset	0x0038
Size	4 bytes
Name	C1SWP[31:0]

The marker value is automatically copied to TCFCFG0_C1SWP after each RSTX_PD2H.

For details please refer to the description of the TCFCFG0_C1SWP register.

Notes:

- The marker value does not have any effect to non-USERMODE operations.
- In non-USERMODE, any program or sector erase operation cannot be done regardless this marker value when the security is enabled.
- Single ECC errors are corrected. When double ECC errors are detected the sector write permissions are not set.

3.3.9. Code Flash Sector Write Permissions, Large Sectors (MK_C2SWPR)

This section describes the function of the C2SWP Default Value Setting from Flash.

Offset	0x0040
Size	4 bytes
Name	C2SWP[31:0]

The marker value is automatically copied to TCFCFG0_C2SWP after each RSTX_PD2H.

For details please refer to the description of the TCFCFG0_C2SWP register.

Notes:

- The marker value does not have any effect to non-USERMODE operations.
- In non-USERMODE, any program or sector erase operation cannot be done regardless this marker value when the security is enabled. Only chance is to execute a “full chip erase” command.
- Single ECC errors are corrected. When double ECC errors are detected the sector write permissions are not set.

3.3.10. Code Flash Sector Write Permissions, Large Sectors (MK_C3SWPR)

This section describes the function of the C3SWP Default Value Setting from Flash.

Offset	0x0048
Size	4 bytes
Name	C3SWP[31:0]

The marker value is automatically copied to TCFCFG0_C3SWP after each RSTX_PD2H.

For details please refer to the description of the TCFCFG0_C3SWP register.

Notes:

- The marker value does not have any effect to non-USERMODE operations.
- In non-USERMODE, any program or sector erase operation cannot be done regardless this marker value when the security is enabled. Only chance is to execute a “full chip erase” command.
- Single ECC errors are corrected. When double ECC errors are detected the sector write permissions are not set.

3.4. Gain access in USERMODE

This section describes how to gain access of Flash and debugger in USERMODE.

3.4.1. Gaining program / erase permission to Flash Sectors

After each RSTX_PD2H the default permissions are loaded for each sector from its according Flash values. Sector permissions are grouped for its Flash regions as follows:

- TCFCFG0_WSWP: Work Flash 0
- TCFCFG0_C0SWP: Code Flash 0, small sectors
- TCFCFG0_C1SWP: Code Flash 0, large sectors (devices up to 2 MB Flash)
- TCFCFG0_C2SWP: Code Flash 1, large sectors (only on devices with 4 MB+ Flash)
- TCFCFG0_C3SWP: Code Flash 2, large sectors (only on devices with 6 MB+ Flash)

Each of the bits in the above registers control write permissions (erase and program) of single Flash sectors. Lower bits reflect the permission of the lower sector number. Higher bits reflect the setting of the higher sector number. Depending on the Flash size equipped with the device only such sector write permission registers or bits have an effect, for which the according Flash sector exists.

The sector permission registers are defining accessibility of Flash during USERMODE.

- "1" – Enable erase and program permission
- "0" – Disable erase and program permission

The settings do not have any effect in non-USERMODE. Writing sectors in non-USERMODE is permitted regardless of the configuration of the sector permissions.

In non-USERMODE Flash access can only be forbidden by the activation of security.

When sector write permissions should be frozen right from the beginning, set MK_SWPOER to DISABLED. Note that this is only valid for USERMODE. In non-USERMODE by using Flash programming equipment the Flash could be still erased (in case of non-secured device).

If the control of the sector write permissions should be possible by the application software, MK_SWPOER must be set to ENABLED.

After changing the sector write permissions by the application, any further change can be disabled by writing TCFCFG0_SWPOER = DISABLED. Sector write permissions and TCFCFG0_SWPOER itself is locked until the next RSTX_PD2H. This is useful to restrict updating sectors only during boot loader operation for functional safety reasons.

When keeping TCFCFG0_SWPOER = ENABLED, continuous change of sector write permissions is possible.

To enable macro erase in USERMODE, all sector write permissions need to be set.

Consequently, if any sector write permission of the TCFLASH is disabled, the macro erase command for the particular TCFLASH macro cannot be executed. That means the ability of macro erase is controlled on a per Flash macro basis. If other physically separated Flash macro does not have any own restricted sectors, its macro erase could be executed.

Logically the macro erase permissions would evaluate from sector erase permissions as follows:

```
TCFLASH0_macro_erase_permission = (TCFCFG0_C0SWP[7:0] == 0xFF) &&
                                     (TCFCFG0_C1SWP == 0xFFFF_FFFF);
TCFLASH1_macro_erase_permission = (TCFCFG0_C2SWP == 0xFFFF_FFFF);
TCFLASH2_macro_erase_permission = (TCFCFG0_C3SWP == 0xFFFF_FFFF);
```

The macro erase command is not supported by the WORKFLASH.

■ SWP_LITE_type

Following procedure is required to ensure the operation of Sector Write Permissions.

When programing to TCFLASH, all of following Sector Write Permissions register bits must be set to “1” to permit the TCFLASH programing.

- Code Flash 0 Sector Write Permissions of the Small Sectors (TCFCFG0_C0SWP)
- Code Flash 0 Sector Write Permissions of the Large Sectors (TCFCFG0_C1SWP)
- Code Flash 1 Sector Write Permissions of the Large Sectors (TCFCFG0_C2SWP)
- Code Flash 2 Sector Write Permissions of the Large Sectors (TCFCFG0_C3SWP)

After programing, set the original values of Sector Write Permissions again to protect the TCFLASH data.

■ SWP_NORMAL_type

No additional procedure is required.

■ end_of_type_listing

3.4.2. Gaining Debugger Access

Device with Protection (Flash Protection or Device Protection)

To gain the debugger access, do one of the followings:

- Set TCFCFG0_SER to "security disabled" value from the software. The authentication method can be freely chosen by the application.
- Enter 128-bit password from the debugger. Refer "CHAPTER : BOOTROM SOFTWARE INTERFACE" for more details.

Device without Protection

Debugger access is given by default.

4. Registers

After each RSTX_PD2H, the security information fetched from Code Flash #0 is stored in registers. The security state registers can be read and written by the application, to change the security state. That is needed to implement several unlocking mechanisms by the application software, i.e. to temporary allow a debugger access after sending a user defined unlock key.

Table 4-1 Security Register List

Abbreviated Register Name	Register Name	Reference
TCFCFG0_SECSTAT	Security Status Register	4.1
TCFCFG0_SER	Security Enable Register	4.2
TCFCFG0_SSR	Security Scope Register	4.3
TCFCFG0_CEER	Chip Erase Enable Register	4.4
TCFCFG0_SOER	Security Overwrite Enable Register	4.5

Table 4-2 Sector Write Permissions Register List

Abbreviated Register Name	Register Name	Reference
TCFCFG0_SWPOER	Sector Write Permission Overwrite Enable Register	4.6
TCFCFG0_WSWP	Work Flash Sector Write Permissions	4.7
TCFCFG0_C0SWP	Code Flash 0 Sector Write Permissions (small sectors)	4.8
TCFCFG0_C1SWP	Code Flash 0 Sector Write Permissions (large sectors)	4.9
TCFCFG0_C2SWP	Code Flash 1 Sector Write Permissions (large sectors)	4.10
TCFCFG0_C3SWP	Code Flash 2 Sector Write Permissions (large sectors)	4.11

Note:

- 64-bit access is not supported to the registers.

Table4-3 shows the register address map.

Table 4-3 Operation Security Register Map

Offset	Register Name/Initial Value
0x0000_0000	TCFCFG0_SECSTAT 00000000_00000000_0000000*_XX1**1**

[bit31:16] Reserved: Reserved bits

These bits are not used. Writing has no effect.

[bit15:9] Reserved: Reserved bits

These bits are not used. Writing has no effect.

[bit8] UMV: Specification of the unlock marker value

Bit	Description
0	The device supports the non-trivial unlock marker value 0x692E3A7B.
1	The device supports the trivial unlock marker value 0xFFFFFFFF.

The register bit UMV indicates what value has to be written to the markers for the purpose of unlocking or to configure the less secure option. It has effect on the interpretation of MK_SER, MK_SSR, MK_CEER, MK_SOER and MK_SWPOER.

"1" is always read.

UMV is a read-only bit. Any write attempt will cause a bus error.

[bit7:6] Reserved: Reserved bits

These bits are not used. Any write attempt will cause a bus error.

[bit5] SFDONE: Security fetch done register

Bit	Description
0	The security fetch is ongoing.
1	The security fetch is finished.

The register bit SFDONE indicates the progress of the evaluation of the security fetch of the security state controller.

SFDONE is a read-only bit. Any write attempt will cause a bus error.

[bit4] SWPOE: Sector write permission overwrite enable register

Bit	Description
0	Sector write permissions are fixed.
1	Sector write permissions can be overwritten by the application.

The register bit SWPOE indicates the ability to overwrite the sector write permissions.

The sector write permissions are initialized from Flash memory after RSTX_PD2H (security fetch).

SWPOE is a read-only bit. Any write attempt will cause a bus error.

[bit3] SECOE: Security overwrite enable register

Bit	Description
0	The security state information (SER, SSR, CEER, SOER) is fixed.
1	The security state information (SER, SSR, CEER, SOER) can be overwritten by the application.

The register bit SECOE indicates the ability to overwrite the security state by the application in user mode.

Other modes that user mode do not allow the overwriting of the security state. The reason is, that unlocking can be done only by the application (using some authentication scheme).

The security state is initialized from Flash markers and read after RSTX_PD2H (security fetch).

SECOE is a read-only bit. Any write attempt will cause a bus error.

[bit2] CEEN: Chip erase enable register

Bit	Description
0	A full erasure of the chip (TCFLASH and WORKFLASH) is not permitted.
1	A full erasure of the chip (TCFLASH and WORKFLASH) is always permitted, regardless of the security enable or the state of the sector write permissions.

The register bit CEEN indicates the permission to erase the full device.

Dedicated memory of the SHE module cannot be erased, regardless of that setting.

CEEN is a read-only bit. Any write attempt will cause a bus error.

Refer to datasheet of product.

If being written with "MK_CEER != Selectable", below is spec.

In this product CEEN is always '1' (fixed, because MK_CEER marker is not supported).

[bit1] SECSC: Security scope register

Bit	Description
0	The security scope is Flash protection. - During non-user mode Flash memory cannot be accessed. - At user mode the debug interface cannot be used.
1	The security scope is device protection. - During non-user mode Flash, RAM and registers cannot be accessed. - The debug interface cannot be used at any mode.

The register bit SECSC indicates the scope of the security. The value of that register is only relevant when security is enabled (SECEN=1).

SECSC is a read-only bit. Any write attempt will cause a bus error.

[bit0] SECEN: Security enable register

Bit	Description
0	The security is disabled.
1	The security is enabled.

The register bit SECEN indicates the general security enabled state.

SECEN is a read-only bit. Any write attempt will cause a bus error.

4.2. Security Enable Register (TCFCFG0_SER)

This section describes the function of the Security Enable Register.

BIT_OFFSET	31	30	29	28	27	26	25	24

INITIAL_VALUE	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

[bit31:0] SER: Security enable register

SER	Description
0x00000001	The security is enabled. This value should be used as lock code.
0xFFFFFFFF	The security is disabled (unlock value).
Other	Any other value enables the security, but should not be used.

After RSTX_PD2H the Security Enable Marker (MK_SER) is transferred from Flash into the Security Enable Register (TCFCFG0_SER).

TCFCFG0_SER can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error. TCFCFG0_SER is typically used, to gain debug access of a secured device after a successful authentication. The authentication method should be implemented in the application before setting the MK_SER to "secured".

The register is written to 0xFFFFFFFF to gain debugger access in USERMODE in application. As alternative, authentication by hardware using 128 bit key can be used (see DDR_DSM, BOOTROM

SOFTWARE INTERFACE). The key is stored in Flash and does not require software for the authentication.

Note:

- *Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and security will be enabled.*

4.3. Security Scope Register (TCFCFG0_SSR)

This section describes the function of the Security Scope Register.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	SSR[31:24]							
ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
PROT_TYPE	WP

ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
PROT_TYPE	WP							
INITIAL_VALUE	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

[bit31:0] SSR: Security scope register

SSR	Description
0xFFFFFFFF	The security scope is Flash protection. Debugger connection can be used in non-USERMODE without the possibility of having Flash access. At USERMODE the debugger interface is disabled.
Other	The security scope is Device protection. It includes no accessibility to Flash, RAM and registers from outside the device at non-USERMODE.

After RSTX_PD2H the Security Scope Marker (MK_SSR) is transferred from Flash into the Security Scope Register (TCFCFG0_SSR).

TCFCFG0_SSR can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error. Writing this register has no effect on the execution of the application.

Note:

- *Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the scope will be set to the more safe state of Device protection.*

4.4. Chip Erase Enable Register (TCFCFG0_CEER)

This section describes the function of the Chip Erase Enable Register.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	CEER[31:24]							
ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
PROT_TYPE	WP							
INITIAL_VALUE	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

[bit31:0] CEER: Chip erase enable register

Refer to datasheet of product.

If being written with "MK_CEER = Selectable", below is spec.

Full-chip erase can be forbidden using this marker.

CEER	Description
0xFFFFFFFF	The chip erase of a secured device is enabled.
Other	Any other value disables the chip erase in non-USERMODE.

Without enabling the security by TCFCFG0_SER, the Chip Erase Enable Register has no meaning.

Other spec is below.

Disabling chip erase is not possible by this product. Writing to that register has no effect.

Bit	Description
Any	No effect

After each RSTX_PD2H the Chip Erase Enable Marker (MK_CEER) is transferred from Flash into the Chip Erase Enable Register (TCFCFG0_CEER).

TCFCFG0_CEER can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error.

Refer to datasheet of product.

If being written with "MK_CEER = Selectable", below is spec.

The chip erase can be triggered by JTAG equipment, writing the chip erase sequence to the general purpose registers of the security checker or transferring the chip erase sequence through serial interface when using Serial Loader equipment. It erases all sectors of the WORKFLASH and TCFLASH. Sectors used for SHE are not erased.

Notes:

- *A secured device without an unlock mechanism implemented by the application and without the ability to erase the full device cannot be updated or tested anymore. Not programming the unlock marker value to MK_CEER should be used with absolute care!*
- *Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the chip erase will be disabled.*

4.5. Security Overwrite Enable Register (TCFCFG0_SOER)

This section describes the function of the Security Overwrite Enable Register.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	SOER[31:24]							
ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

[bit31:0] SOER: Security overwrite enable register

SOER	Description
0xFFFFFFFF	The security settings can be overwritten.
Other	Any other value disables the write access to the security settings registers including TCFCFG0_SER, TCFCFG0_SSR, TCFCFG0_CEER and TCFCFG0_SOER.

After each RSTX_PD2H the Security Overwrite Enable Marker (MK_SOER) is transferred from Flash into the Security Overwrite Enable Register (TCFCFG0_SOER).

TCFCFG0_SOER can be written by the application, when TCFCFG0_SOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error. TCFCFG0_SOER is used to implement a self-lock mechanism by intention. The application could disable the write access to the security registers in the main branch of the application for functional safety reasons, whenever it seems a

protected sequence is not sufficient. It cannot be enabled again, except after execution of a RSTX_PD2H.

Byte and half word access to TCFCFG0_SOER cannot be allowed, because a partial modification would lock immediately the write access. The attempt will be rejected with a bus error response.

Note:

- *Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the security settings cannot be overwritten.*

4.6. Sector Write Permission Overwrite Enable Register (TCFCFG0_SWPOER)

This section describes the function of the Sector Write Permission Overwrite Enable Register.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	SWPOER[31:24]							
ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

[bit31:0] SWPOER: Sector write permission overwrite enable register

SWPOER	Description
0xFFFFFFFF	Write to *SWP* registers is enabled. The sector write permissions and this register can be overwritten.
Other	Write to *SWP* registers is disabled. Any other value disables the write access to the sector write permission registers including TCFCFG0_SWPOER, TCFCFG0_WSWP, TCFCFG0_C0SWP, TCFCFG0_C1SWP, TCFCFG0_C2SWP and TCFCFG0_C3SWP.

After each RSTX_PD2H the Sector Write Permission Overwrite Enable Marker (MK_SWPOER) is transferred from Flash into the Sector Write Permission Overwrite Enable Register (TCFCFG0_SWPOER).

TCFCFG0_SWPOER can be written by the application, when TCFCFG0_SWPOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error. TCFCFG0_SWPOER is used to implement a self-lock mechanism by intention. The application could disable the write access to the

sector write permission registers in the main branch of the application for functional safety reasons, whenever it seems a protected sequence is not sufficient. Once TCFCFG0_SWPOER was set to "disabled", it cannot be set to "enabled" again, except after execution of a RSTX_PD2H.

Byte and half word access to TCFCFG0_SWPOER cannot be allowed, because a partial modification would lock immediately the write access. The attempt will be rejected with a bus error response.

Note:

- *Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the sector write permissions cannot be overwritten.*

4.7. Work Flash Sector Write Permissions Register (TCFCFG0_WSWP)

This section describes the function of the Work Flash Sector Write Permission Register.

BIT_OFFSET	31	30	29	28	27	26	25	24
BIT_NAME	Reserved							
ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
PROT_TYPE	WP							
INITIAL_VALUE	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

BIT_OFFSET	23	22	21	20	19	18	17	16
BIT_NAME	Reserved							
ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
PROT_TYPE	WP							
INITIAL_VALUE	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

BIT_OFFSET	15	14	13	12	11	10	9	8

BIT_OFFSET	7	6	5	4	3	2	1	0
BIT_NAME	WSWP7	WSWP6	WSWP5	WSWP4	WSWP3	WSWP2	WSWP1	WSWP0
ACCESS_TYPE	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
PROT_TYPE	WP							
INITIAL_VALUE	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

After each RSTX_PD2H the Work Flash Sector Write Permissions (WSWP) are transferred from Flash into the Work Flash Sector Write Permissions Register (TCFCFG0_WSWP).

TCFCFG0_WSWP can be written by the application, when TCFCFG0_SWPOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error and the permission set is fixed.

Notes:

- Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the sector write permissions are not set.
- Sector write permissions do not protect Flash sectors in non-USERMODE.
- If any of sector permission is set to disabled, macro erase is disabled.

Bit [0] WSWP0: Work Flash Sector Write Permission SA0

Value	Description
0	Work Flash SA0 cannot be programmed or erased.
1	Work Flash SA0 program or erase is permitted.

Bit [1] WSWP1: Work Flash Sector Write Permission SA1

Value	Description
0	Work Flash SA1 cannot be programmed or erased.
1	Work Flash SA1 program or erase is permitted.

Bit [2] WSWP2: Work Flash Sector Write Permission SA2

Value	Description
0	Work Flash SA2 cannot be programmed or erased.
1	Work Flash SA2 program or erase is permitted.

Bit [3] WSWP3: Work Flash Sector Write Permission SA3

Value	Description
0	Work Flash SA3 cannot be programmed or erased.
1	Work Flash SA3 program or erase is permitted.

Bit [4] WSWP4: Work Flash Sector Write Permission SA4

Value	Description
0	Work Flash SA4 cannot be programmed or erased.
1	Work Flash SA4 program or erase is permitted.

Bit [5] WSWP5: Work Flash Sector Write Permission SA5

Value	Description
0	Work Flash SA5 cannot be programmed or erased.
1	Work Flash SA5 program or erase is permitted.

Bit [6] WSWP6: Work Flash Sector Write Permission SA6

Value	Description
0	Work Flash SA6 cannot be programmed or erased.
1	Work Flash SA6 program or erase is permitted.

Bit [7] WSWP7: Work Flash Sector Write Permission SA7

Value	Description
0	Work Flash SA7 cannot be programmed or erased.
1	Work Flash SA7 program or erase is permitted.

Bit [8] WSWP8: Work Flash Sector Write Permission SA8

Value	Description
0	Work Flash SA8 cannot be programmed or erased.
1	Work Flash SA8 program or erase is permitted.

Bit [9] WSWP9: Work Flash Sector Write Permission SA9

Value	Description
0	Work Flash SA9 cannot be programmed or erased.
1	Work Flash SA9 program or erase is permitted.

Bit [10] WSWP10: Work Flash Sector Write Permission SA10

Value	Description
0	Work Flash SA10 cannot be programmed or erased.
1	Work Flash SA10 program or erase is permitted.

Bit [11] WSWP11: Work Flash Sector Write Permission SA11

Value	Description
0	Work Flash SA11 cannot be programmed or erased.
1	Work Flash SA11 program or erase is permitted.

Bit [12] WSWP12: Work Flash Sector Write Permission SA12

Value	Description
0	Work Flash SA12 cannot be programmed or erased.
1	Work Flash SA12 program or erase is permitted.

Bit [13] WSWP13: Work Flash Sector Write Permission SA13

Value	Description
0	Work Flash SA13 cannot be programmed or erased.
1	Work Flash SA13 program or erase is permitted.

Bit [31:14] Reserved

4.8. Code Flash 0 Sector Write Permissions of the Small Sectors Register (TCFCFG0_C0SWP)

This section describes the function of the Code Flash Sector Write Permission Register of the small sectors.

BIT_OFFSET	31	30	29	28	27	26	25	24

After each RSTX_PD2H the Code Flash Sector Write Permissions of the small sectors (C0SWP) are transferred from Flash into the Code Flash Sector Write Permissions Register of the small sectors (TCFCFG0_C0SWP).

TCFCFG0_C0SWP can be written by the application, when TCFCFG0_SWPOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error and the permission set is fixed.

Notes:

- Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the sector write permissions are not set.
- Sector write permissions are ignored in non-USERMODE.
- If any of sector permission is set to disabled, macro erase is disabled.

Bit [0] C0SWP0: Code Flash Sector Write Permission SA0

Value	Description
0	Code Flash SA0 cannot be programmed or erased.
1	Code Flash SA0 program or erase is permitted.

Bit [1] C0SWP1: Code Flash Sector Write Permission SA1

Value	Description
0	Code Flash SA1 cannot be programmed or erased.
1	Code Flash SA1 program or erase is permitted.

Bit [2] C0SWP2: Code Flash Sector Write Permission SA2

Value	Description
0	Code Flash SA2 cannot be programmed or erased.
1	Code Flash SA2 program or erase is permitted.

Bit [3] C0SWP3: Code Flash Sector Write Permission SA3

Value	Description
0	Code Flash SA3 cannot be programmed or erased.
1	Code Flash SA3 program or erase is permitted.

Bit [4] C0SWP4: Code Flash Sector Write Permission SA4

Value	Description
0	Code Flash SA4 cannot be programmed or erased.
1	Code Flash SA4 program or erase is permitted.

Bit [5] C0SWP5: Code Flash Sector Write Permission SA5

Value	Description
0	Code Flash SA5 cannot be programmed or erased.
1	Code Flash SA5 program or erase is permitted.

Bit [6] C0SWP6: Code Flash Sector Write Permission SA6

Value	Description
0	Code Flash SA6 cannot be programmed or erased.
1	Code Flash SA6 program or erase is permitted.

Bit [7] C0SWP7: Code Flash Sector Write Permission SA7

Value	Description
0	Code Flash SA7 cannot be programmed or erased.
1	Code Flash SA7 program or erase is permitted.

4.9. Code Flash 0 Sector Write Permissions of the Large Sectors Register (TCFCFG0_C1SWP)

This section describes the function of the Code Flash 0 Sector Write Permission Register of the large sectors.

After each RSTX_PD2H the Code Flash Sector Write Permissions of the large sectors (C1SWP) are transferred from Flash into the Code Flash Sector Write Permissions Register of the large sectors (TCFCFG0_C1SWP).

TCFCFG0_C1SWP can be written by the application, when TCFCFG0_SWPOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error and the permission set is fixed.

Notes:

- Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the sector write permissions are not set.
- Sector write permissions are ignored in non-USERMODE.
- If any of sector permission is set to disabled, macro erase is disabled.

Bit [0] C1SWP8: Code Flash 0 Sector Write Permission SA8

Value	Description
0	Code Flash SA8 cannot be programmed or erased.
1	Code Flash SA8 program or erase is permitted.

Bit [1] C1SWP9: Code Flash 0 Sector Write Permission SA9

Value	Description
0	Code Flash SA9 cannot be programmed or erased.
1	Code Flash SA9 program or erase is permitted.

Bit [2] C1SWP10: Code Flash 0 Sector Write Permission SA10

Value	Description
0	Code Flash SA10 cannot be programmed or erased.
1	Code Flash SA10 program or erase is permitted.

Bit [3] C1SWP11: Code Flash 0 Sector Write Permission SA11

Value	Description
0	Code Flash SA11 cannot be programmed or erased.
1	Code Flash SA11 program or erase is permitted.

Bit [4] C1SWP12: Code Flash 0 Sector Write Permission SA12

Value	Description
0	Code Flash SA12 cannot be programmed or erased.
1	Code Flash SA12 program or erase is permitted.

Bit [5] C1SWP13: Code Flash 0 Sector Write Permission SA13

Value	Description
0	Code Flash SA13 cannot be programmed or erased.
1	Code Flash SA13 program or erase is permitted.

Bit [6] C1SWP14: Code Flash 0 Sector Write Permission SA14

Value	Description
0	Code Flash SA14 cannot be programmed or erased.
1	Code Flash SA14 program or erase is permitted.

Bit [7] C1SWP15: Code Flash 0 Sector Write Permission SA15

Value	Description
0	Code Flash SA15 cannot be programmed or erased.
1	Code Flash SA15 program or erase is permitted.

Bit [8] C1SWP16: Code Flash 0 Sector Write Permission SA16

Value	Description
0	Code Flash SA16 cannot be programmed or erased.
1	Code Flash SA16 program or erase is permitted.

Bit [9] C1SWP17: Code Flash 0 Sector Write Permission SA17

Value	Description
0	Code Flash SA17 cannot be programmed or erased.
1	Code Flash SA17 program or erase is permitted.

Bit [10] C1SWP18: Code Flash 0 Sector Write Permission SA18

Value	Description
0	Code Flash SA18 cannot be programmed or erased.
1	Code Flash SA18 program or erase is permitted.

Bit [11] C1SWP19: Code Flash 0 Sector Write Permission SA19

Value	Description
0	Code Flash SA19 cannot be programmed or erased.
1	Code Flash SA19 program or erase is permitted.

Bit [12] C1SWP20: Code Flash 0 Sector Write Permission SA20

Value	Description
0	Code Flash SA20 cannot be programmed or erased.
1	Code Flash SA20 program or erase is permitted.

Bit [13] C1SWP21: Code Flash 0 Sector Write Permission SA21

Value	Description
0	Code Flash SA21 cannot be programmed or erased.
1	Code Flash SA21 program or erase is permitted.

Bit [14] C1SWP22: Code Flash 0 Sector Write Permission SA22

Value	Description
0	Code Flash SA22 cannot be programmed or erased.
1	Code Flash SA22 program or erase is permitted.

Bit [15] C1SWP23: Code Flash 0 Sector Write Permission SA23

Value	Description
0	Code Flash SA23 cannot be programmed or erased.
1	Code Flash SA23 program or erase is permitted.

Bit [16] C1SWP24: Code Flash 0 Sector Write Permission SA24

Value	Description
0	Code Flash SA24 cannot be programmed or erased.
1	Code Flash SA24 program or erase is permitted.

Bit [17] C1SWP25: Code Flash 0 Sector Write Permission SA25

Value	Description
0	Code Flash SA25 cannot be programmed or erased.
1	Code Flash SA25 program or erase is permitted.

Bit [18] C1SWP26: Code Flash 0 Sector Write Permission SA26

Value	Description
0	Code Flash SA26 cannot be programmed or erased.
1	Code Flash SA26 program or erase is permitted.

Bit [19] C1SWP27: Code Flash 0 Sector Write Permission SA27

Value	Description
0	Code Flash SA27 cannot be programmed or erased.
1	Code Flash SA27 program or erase is permitted.

Bit [20] C1SWP28: Code Flash 0 Sector Write Permission SA28

Value	Description
0	Code Flash SA28 cannot be programmed or erased.
1	Code Flash SA28 program or erase is permitted.

Bit [21] C1SWP29: Code Flash 0 Sector Write Permission SA29

Value	Description
0	Code Flash SA29 cannot be programmed or erased.
1	Code Flash SA29 program or erase is permitted.

Bit [22] C1SWP30: Code Flash 0 Sector Write Permission SA30

Value	Description
0	Code Flash SA30 cannot be programmed or erased.
1	Code Flash SA30 program or erase is permitted.

Bit [23] C1SWP31: Code Flash 0 Sector Write Permission SA31

Value	Description
0	Code Flash SA31 cannot be programmed or erased.
1	Code Flash SA31 program or erase is permitted.

Bit [24] C1SWP32: Code Flash 0 Sector Write Permission SA32

Value	Description
0	Code Flash SA32 cannot be programmed or erased.
1	Code Flash SA32 program or erase is permitted.

Bit [25] C1SWP33: Code Flash 0 Sector Write Permission SA33

Value	Description
0	Code Flash SA33 cannot be programmed or erased.
1	Code Flash SA33 program or erase is permitted.

Bit [26] C1SWP34: Code Flash 0 Sector Write Permission SA34

Value	Description
0	Code Flash SA34 cannot be programmed or erased.
1	Code Flash SA34 program or erase is permitted.

Bit [27] C1SWP35: Code Flash 0 Sector Write Permission SA35

Value	Description
0	Code Flash SA35 cannot be programmed or erased.
1	Code Flash SA35 program or erase is permitted.

Bit [28] C1SWP36: Code Flash 0 Sector Write Permission SA36

Value	Description
0	Code Flash SA36 cannot be programmed or erased.
1	Code Flash SA36 program or erase is permitted.

Bit [29] C1SWP37: Code Flash 0 Sector Write Permission SA37

Value	Description
0	Code Flash SA37 cannot be programmed or erased.
1	Code Flash SA37 program or erase is permitted.

Bit [30] C1SWP38: Code Flash 0 Sector Write Permission SA38

Value	Description
0	Code Flash SA38 cannot be programmed or erased.
1	Code Flash SA38 program or erase is permitted.

Bit [31] C1SWP39: Code Flash 0 Sector Write Permission SA39

Value	Description
0	Code Flash SA39 cannot be programmed or erased.
1	Code Flash SA39 program or erase is permitted.

4.10. Code Flash 1 Sector Write Permissions of the Large Sectors Register (TCFCFG0_C2SWP)

After each RSTX_PD2H the Code Flash 1 Sector Write Permissions of the large sectors (C2SWP) are transferred from Flash into the Code Flash 1 Sector Write Permissions Register of the large sectors (TCFCFG0_C2SWP).

TCFCFG0_C2SWP can be written by the application, when TCFCFG0_SWPOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error and the permission set is fixed.

Notes:

- Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the sector write permissions are not set.
- Sector write permissions are ignored in non-USERMODE.
- If any of sector permission is set to disabled, macro erase is disabled.

Bit [0] C2SWP8: Code Flash 1 Sector Write Permission SA8

Value	Description
0	Code Flash SA8 cannot be programmed or erased.
1	Code Flash SA8 program or erase is permitted.

Bit [1] C2SWP9: Code Flash 1 Sector Write Permission SA9

Value	Description
0	Code Flash SA9 cannot be programmed or erased.
1	Code Flash SA9 program or erase is permitted.

Bit [2] C2SWP10: Code Flash 1 Sector Write Permission SA10

Value	Description
0	Code Flash SA10 cannot be programmed or erased.
1	Code Flash SA10 program or erase is permitted.

Bit [3] C2SWP11: Code Flash 1 Sector Write Permission SA11

Value	Description
0	Code Flash SA11 cannot be programmed or erased.
1	Code Flash SA11 program or erase is permitted.

Bit [4] C2SWP12: Code Flash 1 Sector Write Permission SA12

Value	Description
0	Code Flash SA12 cannot be programmed or erased.
1	Code Flash SA12 program or erase is permitted.

Bit [5] C2SWP13: Code Flash 1 Sector Write Permission SA13

Value	Description
0	Code Flash SA13 cannot be programmed or erased.
1	Code Flash SA13 program or erase is permitted.

Bit [6] C2SWP14: Code Flash 1 Sector Write Permission SA14

Value	Description
0	Code Flash SA14 cannot be programmed or erased.
1	Code Flash SA14 program or erase is permitted.

Bit [7] C2SWP15: Code Flash 1 Sector Write Permission SA15

Value	Description
0	Code Flash SA15 cannot be programmed or erased.
1	Code Flash SA15 program or erase is permitted.

Bit [8] C2SWP16: Code Flash 1 Sector Write Permission SA16

Value	Description
0	Code Flash SA16 cannot be programmed or erased.
1	Code Flash SA16 program or erase is permitted.

Bit [9] C2SWP17: Code Flash 1 Sector Write Permission SA17

Value	Description
0	Code Flash SA17 cannot be programmed or erased.
1	Code Flash SA17 program or erase is permitted.

Bit [10] C2SWP18: Code Flash 1 Sector Write Permission SA18

Value	Description
0	Code Flash SA18 cannot be programmed or erased.
1	Code Flash SA18 program or erase is permitted.

Bit [11] C2SWP19: Code Flash 1 Sector Write Permission SA19

Value	Description
0	Code Flash SA19 cannot be programmed or erased.
1	Code Flash SA19 program or erase is permitted.

Bit [12] C2SWP20: Code Flash 1 Sector Write Permission SA20

Value	Description
0	Code Flash SA20 cannot be programmed or erased.
1	Code Flash SA20 program or erase is permitted.

Bit [13] C2SWP21: Code Flash 1 Sector Write Permission SA21

Value	Description
0	Code Flash SA21 cannot be programmed or erased.
1	Code Flash SA21 program or erase is permitted.

Bit [14] C2SWP22: Code Flash 1 Sector Write Permission SA22

Value	Description
0	Code Flash SA22 cannot be programmed or erased.
1	Code Flash SA22 program or erase is permitted.

Bit [15] C2SWP23: Code Flash 1 Sector Write Permission SA23

Value	Description
0	Code Flash SA23 cannot be programmed or erased.
1	Code Flash SA23 program or erase is permitted.

Bit [16] C2SWP24: Code Flash 1 Sector Write Permission SA24

Value	Description
0	Code Flash SA24 cannot be programmed or erased.
1	Code Flash SA24 program or erase is permitted.

Bit [17] C2SWP25: Code Flash 1 Sector Write Permission SA25

Value	Description
0	Code Flash SA25 cannot be programmed or erased.
1	Code Flash SA25 program or erase is permitted.

Bit [18] C2SWP26: Code Flash 1 Sector Write Permission SA26

Value	Description
0	Code Flash SA26 cannot be programmed or erased.
1	Code Flash SA26 program or erase is permitted.

Bit [19] C2SWP27: Code Flash 1 Sector Write Permission SA27

Value	Description
0	Code Flash SA27 cannot be programmed or erased.
1	Code Flash SA27 program or erase is permitted.

Bit [20] C2SWP28: Code Flash 1 Sector Write Permission SA28

Value	Description
0	Code Flash SA28 cannot be programmed or erased.
1	Code Flash SA28 program or erase is permitted.

After each RSTX_PD2H the Code Flash 2 Sector Write Permissions of the large sectors (C3SWP) are transferred from Flash into the Code Flash 2 Sector Write Permissions Register of the large sectors (TCFCFG0_C3SWP).

TCFCFG0_C3SWP can be written by the application, when TCFCFG0_SWPOER indicates that overwrite is enabled. Otherwise the write access will cause a bus error and the permission set is fixed.

Notes:

- Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the sector write permissions are not set.
- Sector write permissions are ignored in non-USERMODE.
- If any of sector permission is set to disabled, macro erase is disabled.

Bit [0] C3SWP8: Code Flash 2 Sector Write Permission SA8

Value	Description
0	Code Flash SA8 cannot be programmed or erased.
1	Code Flash SA8 program or erase is permitted.

Bit [1] C3SWP9: Code Flash 2 Sector Write Permission SA9

Value	Description

Bit [29] C3SWP37: Code Flash 2 Sector Write Permission SA37

Value	Description
0	Code Flash SA37 cannot be programmed or erased.
1	Code Flash SA37 program or erase is permitted.

Bit [30] C3SWP38: Code Flash 2 Sector Write Permission SA38

Value	Description
0	Code Flash SA38 cannot be programmed or erased.
1	Code Flash SA38 program or erase is permitted.

Bit [31] C3SWP39: Code Flash 2 Sector Write Permission SA39

Value	Description
0	Code Flash SA39 cannot be programmed or erased.
1	Code Flash SA39 program or erase is permitted.

CHAPTER 25: Memory Protection Unit for AXI of SHE

This chapter explains the functions and operations of the Memory Protection Unit for AMBA AXI protocol bus (MPU AXI).

1. Overview
2. Configuration and Block Diagram
3. Operation of the MPU AXI
4. Registers
5. Notes on Using MPU AXI

MPUAXI-TXXPT03P01R01L06-E1-XX

1. Overview

This section describes the features of the MPU AXI.

■ Features of the MPU AXI

The MPU AXI module monitors the accesses from AXI masters and checks each access against an authorized set of access permissions. Access permissions ('permission attributes' here onwards) are defined by 'access permissions' bits. These bits are explained in Section 'MPU access permissions'. MPU AXI provides eight regions and one background region. Each region has corresponding access permission bits that defines the permission attributes for that particular region. Any unauthorized access to memory space is flagged using Non-Maskable Interrupt. MPU AXI also collects information about the unauthorized bus access and stores it in its internal registers.

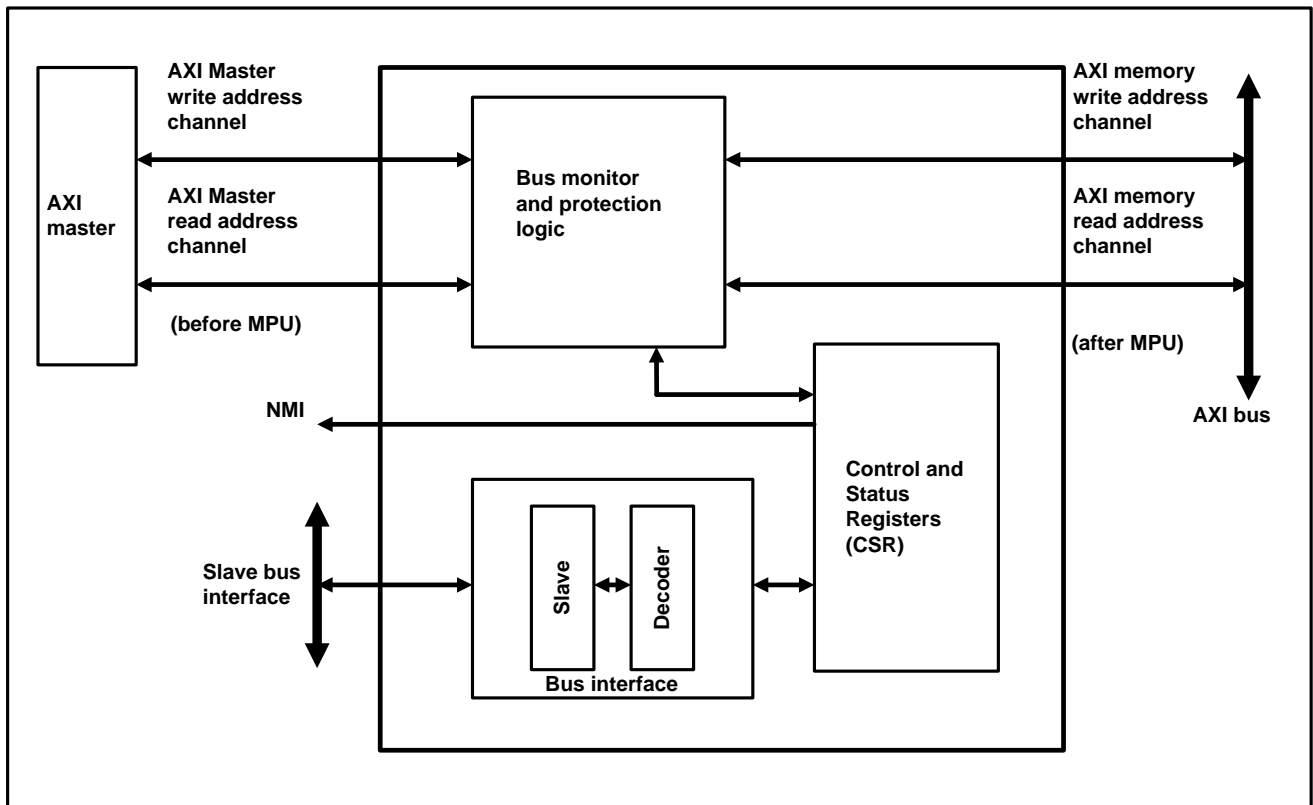

- Each of the eight regions in MPU AXI is specified using corresponding start address and end address
- Background region covers entire 4 GB address space
- On unauthorized access MPU AXI generates an NMI to the CPU
- MPU AXI collects information about the AXI master bus access that caused unauthorized access
- Supports 8-bit, 16-bit, and 32-bit bus accesses for configuration of registers in MPU AXI
- Supports lock, unlock feature for protection of registers from illegal write accesses
- Modification of registers in MPU AXI is only allowed in privileged mode
- Optionally supports privileged mode overwrite feature that allows overwrite of privilege attribute of memory side AXI interface

2. Configuration and Block Diagram

This section shows a block diagram of MPU AXI.

■ Block Diagram of MPU AXI

Figure 2-2-1 Block Diagram of MPU AXI

■ Bus Interface

The bus masters can access the MPU AXI module through its slave bus interface.

■ Bus Monitor and Protection Logic

This logic monitors the transaction on AXI master interfaces. It finds out the region/s where the current transfer belongs to and then applies permissions based on the region match. It signals any permission violation to CSR logic that in turn generates NMI interrupt. All transactions on AXI master interfaces (including the transfer that caused permission violation) are blocked until NMI is cleared.

■ Control and Status Registers

The operation of MPU AXI can be controlled and monitored through its Control and Status Registers (CSR)

3. Operation of the MPU AXI

This section describes the operation of MPU AXI.

MPU AXI provides start address and end address for each of the eight regions. MPU AXI regions are defined with granularity of 128 bytes.

Start address specifies the first address of the region and is specified by registers MPUXSHE_SADDR1 to MPUXSHE_SADDR8 for region 1 to region 8 respectively. Since the region granularity is 128 bytes least significant 7 bits of start addresses will read 0.

End addresses are specified by registers MPUXSHE_EADDR1 to MPUXSHE_EADDR8 for region 1 to region 8 respectively. Least significant 7 bits of End Address Registers are read-only bits and will always read "1". This ensures the granularity of 128 bytes.

■ AXI Burst Monitoring

Bus monitor and protection logic monitors AXI master 'write address channel' signals and 'read address channel' signals ('AXI master interfaces' here onwards). The transactions on AXI master interfaces are manipulated (if required) before they are passed on to AXI memory 'write address channel' signals and 'read address channel' signals ('AXI memory interfaces' here onwards).

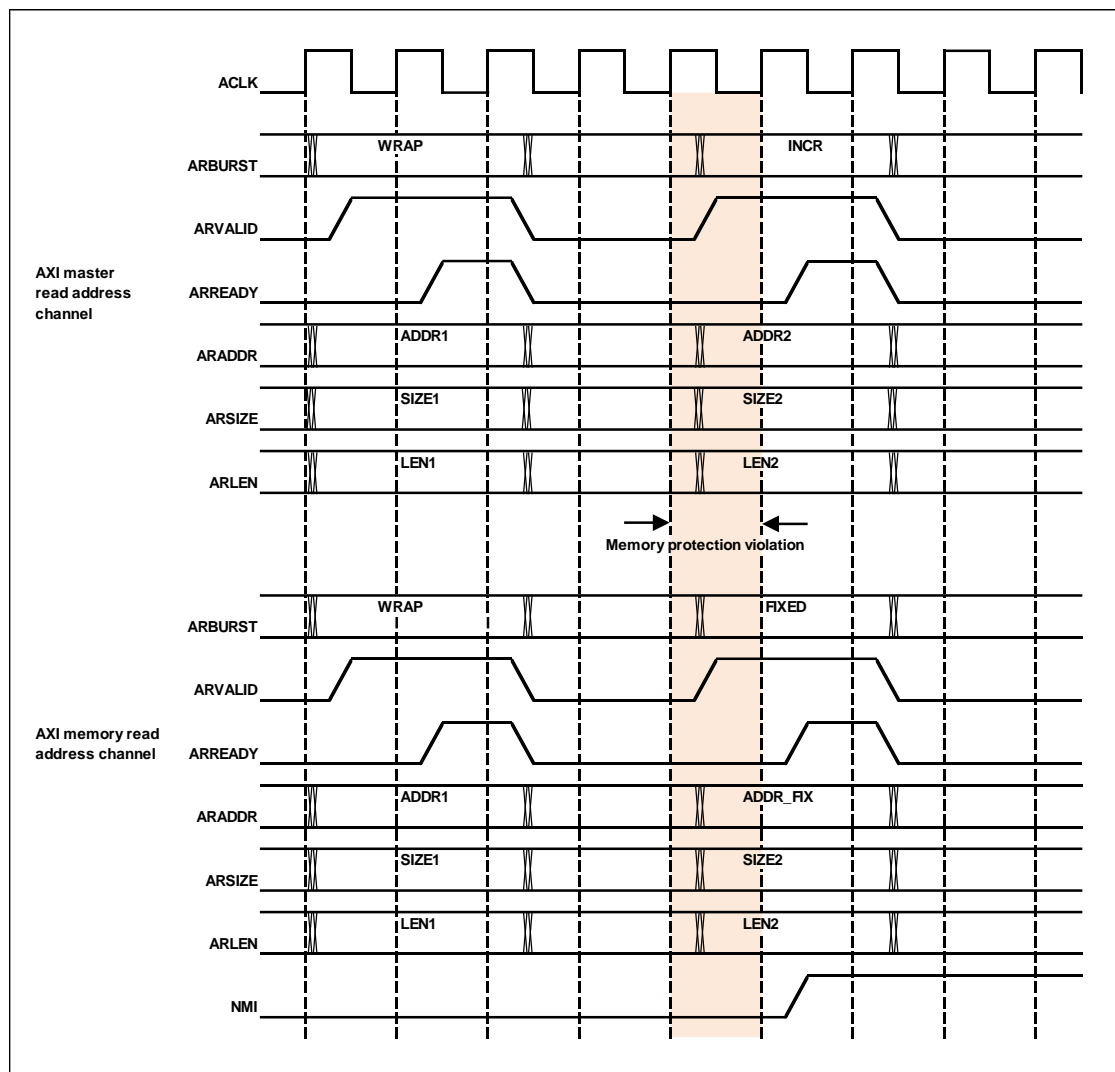

AXI protocol supports following features

- Separate address or control and data phases
- Burst based transaction where only start address is issued
- Separate write and read address/control channels
- Separate write and read data channels

AXI master begins each burst by driving transaction control information and address of the first byte in the transaction. As the burst transaction progresses, AXI slave calculates the addresses of subsequent transfers in the burst. The AWLEN (write address channel signal), ARLEN (read address channel signal) specifies the number of data transfers for a burst transaction. Each burst can be of 1 to 16 transfers long. The AWSIZE, ARSIZE signals specifies the maximum number of data transfers in terms of bytes in each data transfer within a burst. The AXI protocol defines FIXED, incrementing and wrapping burst types.

As the addresses are defined in separate channels than data channels MPU AXI monitors and controls only address channels of AXI. If memory protection violation is detected entire burst transaction is manipulated to FIXED address burst with address of predefined value.

Figure 3-3-1 shows timings for read address channel signals. First burst is of WRAP type for which no memory protection violation was detected. Second burst is of INCR type for which memory protection violation was detected and hence MPU AXI manipulates the ARBURST to FIXED type and ARADDR to predefined value (shown as ADDR_FIX).

Figure 3-3-1 MPU AXI Example Timings

MPU AXI uses burst start address (AWADDR, ARADDR signals), burst type (AWBURST, ARBURST signals), burst length (AWLEN, ARLEN signals), and burst size (AWSIZE, ARSIZE signals) from AXI burst transaction to calculate the lowest address and the highest address of the burst and then both the addresses are used to find the region match.

For FIXED type of burst:

Lowest address = Highest address = Burst start address

For INCR type of burst:

Lowest address = Burst start address

Highest address = Burst start address + (num_bytes x num_transfers) – 1

where, num_bytes is number of bytes in each transfer of burst and

num_transfers is number of transfers in the burst

For WRAP type of burst:

Lowest address = Wrap boundary

$$\text{Highest address} = \text{Wrap boundary} + (\text{num_bytes} \times \text{num_transfers}) - 1$$

■ MPU Access Permissions

Region control registers in MPU AXI, MPUXSHE_CTRL1 to MPUXSHE_CTRL8 are used to control the access permission for region 1 to region 8 respectively. Also MPUXSHE_CTRL0 is used to control the access permission for background region.

Table 3-1 Access Permissions

AP Bits	Access in Privileged Mode	Access in Non- Privileged Mode	Comment
0b000 (default)	No access	No access	All bus accesses are blocked and hence would generate memory protection violation.
0b001	read, write	No access	Reads and writes are permitted in privileged mode only. Any access in non- privileged mode would generate memory protection violation.
0b010	read, write	read only	Reads and writes are permitted in privileged mode. Only reads are permitted in non-privileged mode. Writes in non- privileged mode would generate memory protection violation.
0b011	read, write	read, write	All bus transfers are permitted. No memory protection violation is generated in this mode.
0b100	No access	No access	All bus accesses are blocked and hence generate memory protection violation.
0b101	read only	No access	Reads are permitted in privileged mode only. Writes in privileged mode and any access in non-privileged mode would generate memory protection violation.
0b110	read only	read only	Reads are permitted in privileged as well as non-privileged mode. Any write access would generate memory protection violation.
0b111	read, write	read, write	All bus transfers are permitted. No memory protection violation is generated in this mode.

■ MPU Priority Decision

MPU AXI provides start address and end address for each region. Start address specifies the first address of the region and end address specifies the last address of the region. It is allowed in MPU AXI that the region may overlap each other. Hence it is also possible that an AXI transaction address may match with multiple regions.

For AXI protocol transaction following scenarios are possible.

1. Lowest address and highest address might fall in the same region.
2. Lowest address might match in one region, but highest address might match in some other region.
3. Scenario mentioned in point 1 here, happens for multiple regions due to region overlapping.
4. Scenario mentioned in point 2 here, happens for multiple regions due to region overlapping.

Figure 3-3-2 Example Region Overlapping

MPU AXI finds region match signals based on lowest address of AXI burst transaction and also separate region match signals based on highest address. Due to overlapping of regions it is possible lowest address and/or highest address may match with multiple regions.

MPU AXI supports upto eight regions. Each region is identified as region 1, region 2, region 3, and so on upto region 8. Region 8 is given highest priority, region 7 has second highest priority, and so on with region 1 as the second lowest priority region. Background region is the lowest priority region.

Whenever the AXI transaction lowest address matches with multiple regions the permissions corresponding to the highest priority (among all matching region) region is applied. Similarly, if AXI transaction highest address matches with multiple regions the permissions corresponding to highest priority (among all matching region) region is applied.

It is possible that lowest address and highest address may match with different highest priority regions. In this case the more restrictive permission is applied. Table 3-2 shows access permissions with corresponding restriction index for privileged mode access. Restriction index 1 has the most restrictive access and access permissions with restriction index 3 has the least restrictive access. This table is applied when privileged mode attribute of current transaction is of type privileged mode.

Similarly, Table 3-3 shows access permissions with corresponding restriction index for non- privileged mode access. This table is applied when privileged mode attribute of current transaction is of type non-privileged mode.

Table 3-2 Restrictive Access Permission Matrix for Privileged Mode Access

AP Bits	Access in Privileged Mode	Restriction Index
0b000, 0b100	No access	1
0b101, 0b110	read only	2
0b001, 0b010, 0b011, 0b111	read, write	3

Table 3-3 Restrictive Access Permission Matrix for Non-Privileged Mode Access

AP Bits	Access in Non-Privileged Mode	Restriction Index
0b000, 0b001, 0b100, 0b101	No access	1
0b010, 0b110	read only	2
0b011, 0b111	read, write	3

■ Bus Monitor and Protection Logic

All transactions on the AXI master interfaces are monitored and checked for permitted access.

- Bus monitor and protection logic within MPU AXI compares the lowest address and highest address of current transaction with start addresses and end addresses of each region to find region match where the current transaction matches to among the eight defined regions
- As explained in Section MPU priority decision the AXI transaction address may match with multiple regions. The permission attributes of highest priority region are checked against the attributes of currently applied transaction from AXI master
- If the attributes of currently applied transaction are within permitted attributes, current transaction is passed on to the AXI memory interfaces
- If the attributes are not within permitted attributes current transaction is blocked. The Non Maskable Interrupt (MPUXSHE_CTRL0:NMI) flag is set. If the memory protection violation is detected on write address channel, the address and control information is stored in MPUXSHE_WERRA and MPUXSHE_WERRC registers respectively. If the memory protection violation is detected on read address channel, the address and control information is stored in MPUXSHE_RERRA and MPUXSHE_RERRC registers respectively. It is possible that memory protection violation is detected simultaneously on both the channels
- All further transaction are blocked until the MPUXSHE_CTRL0:NMI flag is cleared by software. Further monitoring of AXI master interfaces is also stalled until the MPUXSHE_CTRL0:NMI flag is cleared

When a transfer is blocked, MPU AXI does the following actions:

- Current transaction on AXI master is manipulated to FIXED address burst
- The transaction address is changed to predefined address. Check device specific datasheet for details of predefined address

■ Privileged Mode Overwrite Feature

Optionally MPU AXI supports privileged mode overwrite feature.

When this mode is enabled privileged mode attribute on the AXI memory interfaces are set by register bit setting MPUXSHE_CTRL0:PROT.

Note:

- *Bus monitor and protection logic for detecting memory protection violation uses privilege mode attribute on AXI master interfaces and not MPUXSHE_CTRL0:PROT bit setting even when privileged mode overwrite feature is enabled.*

4. Registers

This section describes the registers of MPU AXI.

The MPU AXI module contains various registers to configure its operation, to monitor its status and to read the information it has collected from the AXI master interfaces at the time of the memory protection violation.

The MPU AXI module is allocated 1 KB of MCU address space for mapping the Configuration and Status Registers (i.e. CSRs). The address area allocated to MPU AXI and the Control and Status Registers in MPU AXI are explained in this section.

The suffix 'n' in the register name indicates that the register is an instance 'n' of the module.

■ Registers of MPU AXI

The following registers are available for MPU AXI:

- MPU AXI Control Register (MPUXSHE_CTRL0)
- MPU AXI NMI Enable Register (MPUXSHE_NMIEN)
- MPU AXI Write Error Control Register (MPUXSHE_WERRC)
- MPU AXI Write Error Address Register (MPUXSHE_WERRA)
- MPU AXI Read Error Control Register (MPUXSHE_RERRC)
- MPU AXI Read Error Address Register (MPUXSHE_RERRA)
- MPU AXI Region Control Registers (MPUXSHE_CTRL1~8)
- MPU AXI Start Address Registers (MPUXSHE_SADDR1~8)
- MPU AXI End Address Registers (MPUXSHE_EADDR1~8)
- MPU AXI Unlock Register (MPUXSHE_UNLOCK)
- MPU AXI Module ID Register (MPUXSHE_MID)

4.1. MPU AXI Control Register (MPUXSHE_CTRL0)

MPU AXI Control Register can be used by the software to configure the MPU AXI. This register provides a bit to enable the MPU AXI monitoring and protection function. It also provides permission attributes for background region. It also provides controls for enabling or disabling of privileged mode overwrite feature. Lastly it provides MPU AXI lock status and controls the status for Non-Maskable Interrupt.

■ MPUXSHE_CTRL0

bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	AP[2]	AP[1]	AP[0]
R/W Attribute	R0	R0	R0	R0	R0	R/W	R/W	R/W
Protection Attribute	-	-	-	-	-	WPS	WPS	WPS
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	MPUENC	MPUEN
R/W Attribute	R0	R0	R0	R0	R0	R0	R/W	R
Protection Attribute	-	-	-	-	-	-	WPS	-
Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved	Reserved	Reserved	PROT	POEN	Reserved	Reserved	LST
R/W Attribute	R0	R0	R0	R/W	R/W	R0	R0	R
Protection Attribute	-	-	-	WPS	WPS	-	-	-
Initial Value	0	0	0	0	0	0	0	1

bit	7	6	5	4	3	2	1	0
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	NMICL	NMI
R/W Attribute	R0	R0	R0	R0	R0	R0	R0,W	R
Protection Attribute	-	-	-	-	-	-	WPS	-
Initial Value	0	0	0	0	0	0	0	0

Bit Position	Bit Field Name	Bit Description
[31:27]	Reserved	-
[26:24]	AP	Access Permissions for Background Region These bits are used to control access permissions for background region. For detailed description of these bits refer to Table 'Access Permissions'.
[23:18]	Reserved	-
[17]	MPUENC	MPU AXI Enable Control "0": MPU AXI monitoring and protection function is disabled "1": MPU AXI monitoring and protection function is enabled Read returns status of MPUENC bit. The region enable status to be effective takes some delay with reference to write on MPUENC bit. The actual enable status can be read through MPUXSHE_CTRL0:MPUEN bit.
[16]	MPUEN	MPU AXI Enable Status "0": MPU AXI monitoring and protection function is disabled. All accesses on AXI master write or read address channel interfaces are passed on to AXI memory write or read address channel interfaces without any protection "1": MPU AXI monitoring and protection function is enabled
[15:13]	Reserved	-
[12]	PROT	Privilege Attribute When privileged mode overwrite feature is available and also MPUXSHE_CTRL0:POEN = "1", privilege mode attribute on AXI memory interfaces are controlled by this bit. "0": Non-privilege mode "1": Privilege mode
[11]	POEN	Privileged Mode Overwrite Feature Enable "0": Privileged mode overwrite feature is disabled "1": Privileged mode overwrite feature is enabled Note: For availability of privileged mode overwrite feature, refer to device specific datasheet.
[10:9]	Reserved	-
[8]	LST	MPU Lock Status "0": MPU AXI is unlocked, registers in MPU AXI can be written "1": MPU AXI is locked, no registers (other than MPUXSHE_UNLOCK register) in MPU AXI can be written
[7:2]	Reserved	-
[1]	NMICL	NMI Interrupt Clear "0": No effect "1": Clears the NMI interrupt flag Read returns "0".

Bit Position	Bit Field Name	Bit Description
[0]	NMI	NMI Interrupt Flag This bit indicates that the memory protection violation is detected for an AXI transaction.

Note:

- The register bits `MPUXSHE_CTRL0:AP`, `MPUXSHE_CTRL0:MPUSTOPEN`, `MPUXSHE_CTRL0:POEN` and `MPUXSHE_CTRL0:PROT` in `MPUXSHE_CTRL0` register can only be written when MPU is disabled (`MPUXSHE_CTRL0:MPUEN = "0"`). This also implies that when `MPUXSHE_CTRL0:MPUEN = "1"`:
 - 32-bit or 16-bit access to this register is not allowed
 - 8-bit access is required to disable the MPU
 - 8-bit access is required to clear the NMI interrupt flag

4.2. MPU AXI NMI Enable Register (MPUXSHE_NMIEN)

MPU AXI NMI Enable Register can be used by software to reset NMI enable bit. Default value of NMI enable bit is "1". This bit can be reset by software only once after reset operation.

■ MPUXSHE_NMIEN

bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0	R0	R0	R0	R0	R0	R0	R0
Protection Attribute	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16

Bit Position	Bit Field Name	Bit Description
[31:8]	Reserved	-
[7:1]	Reserved	-
[0]	NMIEN	<p>NMI Interrupt Enable</p> <p>This bit decides whether the NMI interrupt flag is routed to NMI interrupt signal or not.</p> <p>"0": NMI interrupt flag does not trigger NMI interrupt signal "1": NMI interrupt flag triggers NMI interrupt signal</p> <p>The value of this bit can be changed only once after reset.</p>

4.3. MPU AXI Write Error Control Register (MPUXSHE_WERRC)

This is a read-only register that provides the software the control information of AXI transaction on AXI master write address channel interface for which memory protection violation was detected. Software can read this register to get privileged mode, burst length, burst size, and burst type information of AXI transaction.

■ MPUXSHE_WERRC

bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved

Initial Value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved	Reserved	Reserved	Reserved	Reserved	AP[2]	AP[1]	AP[0]
R/W Attribute	R0	R0	R0	R0	R0	R/W	R/W	R/W
Protection	-	-	-	-	-	WP	WP	WP
Attribute	-	-	-	-	-	WP	WP	WP
Initial Value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	MPUENC	MPUEN
R/W Attribute	R0	R0	R0	R0	R0	R0	R/W	R
Protection	-	-	-	-	-	-	WPS	-
Attribute	-	-	-	-	-	-	WPS	-
Initial Value	0	0	0	0	0	0	0	0

Bit Position	Bit Field Name	Bit Description
[31:16]	Reserved	-
[15:11]	Reserved	-
[10:8]	AP	Access Permissions These bits are used to control access permissions for region 1.
[7:2]	Reserved	-

Bit Position	Bit Field Name	Bit Description
[1]	MPUENC	Enable Control bit "0": Memory protection for region 1 is disabled "1": Memory protection for region 1 is enabled Read returns status of MPUENC bit. The region enable status to be effective takes some delay with reference to write on MPUENC bit. The actual enable status can be read through MPUXSHE_CTRL1:MPUEN bit.
[0]	MPUEN	Enable Status "0": Memory protection for region 1 is disabled "1": Memory protection for region 1 is enabled This is a read-only bit, writing to this bit does not have any effect.

Notes:

- Access permission bits (i.e. MPUXSHE_CTRL1~8:AP) can only be written when corresponding region is disabled (MPUXSHE_CTRL1~8:MPUEN = "0") or MPU is disabled (MPUXSHE_CTRL0:MPUEN = "0").
- This also implies that when MPUXSHE_CTRL0:MPUEN = "1" and MPUXSHE_CTRL1~8:MPUEN = "1":
 - 32-bit or 16-bit access to this register is not allowed
 - 8-bit access is required to disable the MPU region

4.8. MPU AXI Start Address Registers (MPUXSHE_SADDR1~8)

Each region in MPU AXI can be set by specifying start address and end address for that particular region. MPUXSHE_SADDR1~8 registers are used to specify start address for eight regions. Start address indicates the first address for that region. MPUXSHE_SADDR1 Start Address Register for Region 1 is explained below.

■ MPUXSHE_SADDR1

Protection Attribute	WPS	WPS	WPS	WPS	WPS	WPS	WPS	WPS
Initial Value	0	0	0	0	0	0	0	0

Bit Position	Bit Field Name	Bit Description
[31:0]	SADDR	Start Address Start address for region 1

Note:

- MPUXSHE_SADDR1~8 registers can only be written when corresponding region is disabled (MPUXSHE_CTRL1~8:MPUEN = "0") or MPU is disabled (MPUXSHE_CTRL0:MPUEN = "0").

4.9. MPU AXI End Address Registers (MPUXSHE_EADDR1~8)

Each region in MPU AXI can be set by specifying start address and end address for that particular region. MPUXSHE_EADDR1~8 registers are used to specify end addresses for eight regions. End Address indicates the last address for that region. MPUXSHE_EADDR1 End Address Register for Region 1 is explained below.

Protection Attribute	WP	WP	WP	WP	WP	WP	WP	WP
Initial Value	0	0	0	0	0	0	0	0

Bit Position	Bit Field Name	Bit Description
[31:0]	UNLOCK	<p>MPU AXI Unlock</p> <p>The MPU AXI Unlock Register protects the MPU AXI module from being modified accidentally by software. The MPU AXI registers cannot be written until this register has been written with a specific unlock value. The correct value for unlocking can be written only in privileged mode. Reading this register always returns a zero. To lock the MPU AXI again software must write another value specific to lock. Write access to MPU AXI registers without unlocking or writing a value other than the lock or unlock values to this register causes a protection error.</p> <p>Notes:</p>

4.11. MPU AXI Module ID Register (MPUXSHE_MID)

This is a read-only register with a unique module identification number which identifies the version of the MPU AXI module used in the MCU.

■ MPUXSHE_MID

bit	31	30	29	28	27	26	25	24
Field	MID[31]	MID[30]	MID[29]	MID[28]	MID[27]	MID[26]	MID[25]	MID[24]
R/W Attribute	R	R	R	R	R	R	R	R
Protection Attribute	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	MID[23]	MID[22]	MID[21]	MID[20]	MID[19]	MID[18]	MID[17]	MID[16]
R/W Attribute	R	R	R	R	R	R	R	R
Protection Attribute	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	1	1	0	1

bit	15	14	13	12	11	10	9	8
Field	MID[15]	MID[14]	MID[13]	MID[12]	MID[11]	MID[10]	MID[9]	MID[8]
R/W Attribute	R	R	R	R	R	R	R	R
Protection Attribute	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	1	0

bit	7	6	5	4	3	2	1	0
Field	MID[7]	MID[6]	MID[5]	MID[4]	MID[3]	MID[2]	MID[1]	MID[0]
R/W Attribute	R	R	R	R	R	R	R	R
Protection Attribute	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0

Bit Position	Bit Field Name	Bit Description
[31:0]	MID	Module ID Always return a meaningless constant.

5. Notes on Using MPU AXI

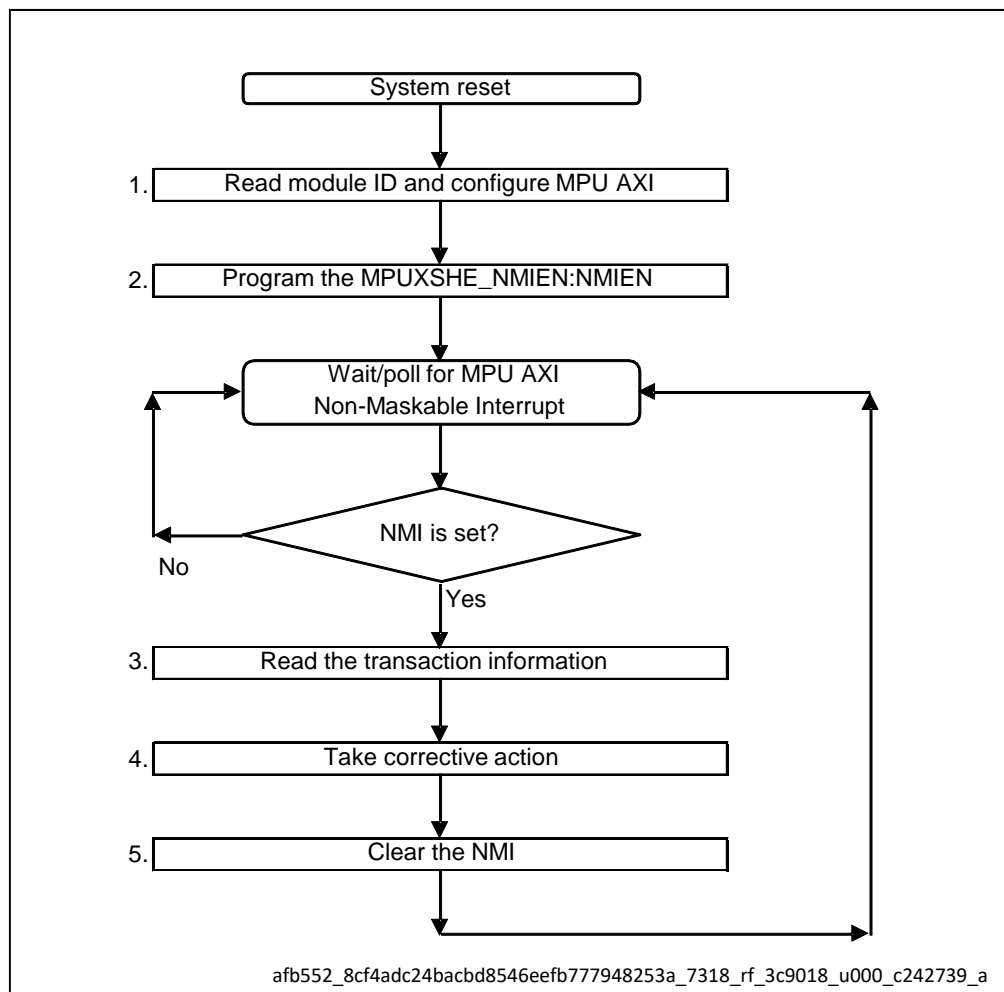

This section is the 'programmer's guide', which lists the usage notes for programming the MPU AXI module. It is recommended to read these guidelines before programming the MPU AXI module.

■ General Usage Notes

- Reserved bits return undefined values. The software programs shall be independent of the values read from the reserved register bits
- The MPU AXI supports storage of information of first memory protection violation on the bus. Therefore, once an NMI interrupt flag is set, the further monitoring of AXI master interface is stalled until MPUXSHE_CTRL0:NMI bit is cleared. This implies that any protection violation occurring on the bus while the MPUXSHE_CTRL0:NMI is set are simply ignored by MPU AXI. Software developers must therefore try to keep the ISR size small, so that the NMI interrupt of MPU AXI does not remain unattended for long

■ Steps in Programming the MPU AXI Module

Figure 5-1 Programmer's Flowchart

1. After the system reset, the software detects the module ID number of MPU AXI, by reading the MPUXSHE_MID register. This helps it in identifying the attributes and capabilities supported by the MPU AXI module. Then the software configures MPU AXI by setting appropriate registers.
2. By default, MPU AXI propagates the MPUXSHE_CTRL0:NMI flag to the CPU through the Interrupt Controller. If polling mode is desired, the software can reset the MPUXSHE_NMIEN:NMIEN bit to "0".

Note:

- *The MPUXSHE_NMIEN:NMIEN can be written only once after reset. Subsequent write accesses to this bit have no visible impact on the state of this bit.*

3. When the NMI is triggered or is in polling mode, if the software detects during its polling cycle that the MPUXSHE_CTRL0:NMI status flag is set, the CPU is invoked. This would read the status information collected and stored by MPU AXI in its CSR.
4. The software diagnoses the information about the transaction for which memory protection violation was detected and initiates a corrective action (if any).
5. Once the software has processed the information from the status registers, it shall clear the MPUXSHE_CTRL0:NMI flag by writing a "1" to the MPUXSHE_CTRL0:NMICL bit. Clearing MPUXSHE_CTRL0:NMI flag ensures that the MPU AXI starts monitoring the AXI master interfaces again for checking memory protection violation.

Note:

- *Software may clear the NMI flag before taking corrective action, hence steps 4 and 5 can be interchanged.*

CHAPTER 26: Secure Hardware Extension (SHE)

This chapter explains the function and operation of the SHE module.

1. Overview
2. Block Diagram of the SHE Module
3. Secure Hardware Extension RegistersOperation of the Secure Hardware Extension
4. Operation of the Secure Hardware Extension

SHE-TXXPT03P01R01L11-E1-XX

1. Overview

This section describes the features and the block diagram of the Secure Hardware Extension (SHE) module.

Features of SHE

The Secure Hardware Extension (SHE) module is an on-chip peripheral of the microcontroller that provides cryptographic functions and secure key storage. This chapter describes the hardware part of the SPANSION SHE implementation which, together with the software driver, fulfills the 'SHE Functional Specification v1.1, rev 439' [1] as well as Errata and amendments to this specification.

Features of the SHE Module Are:

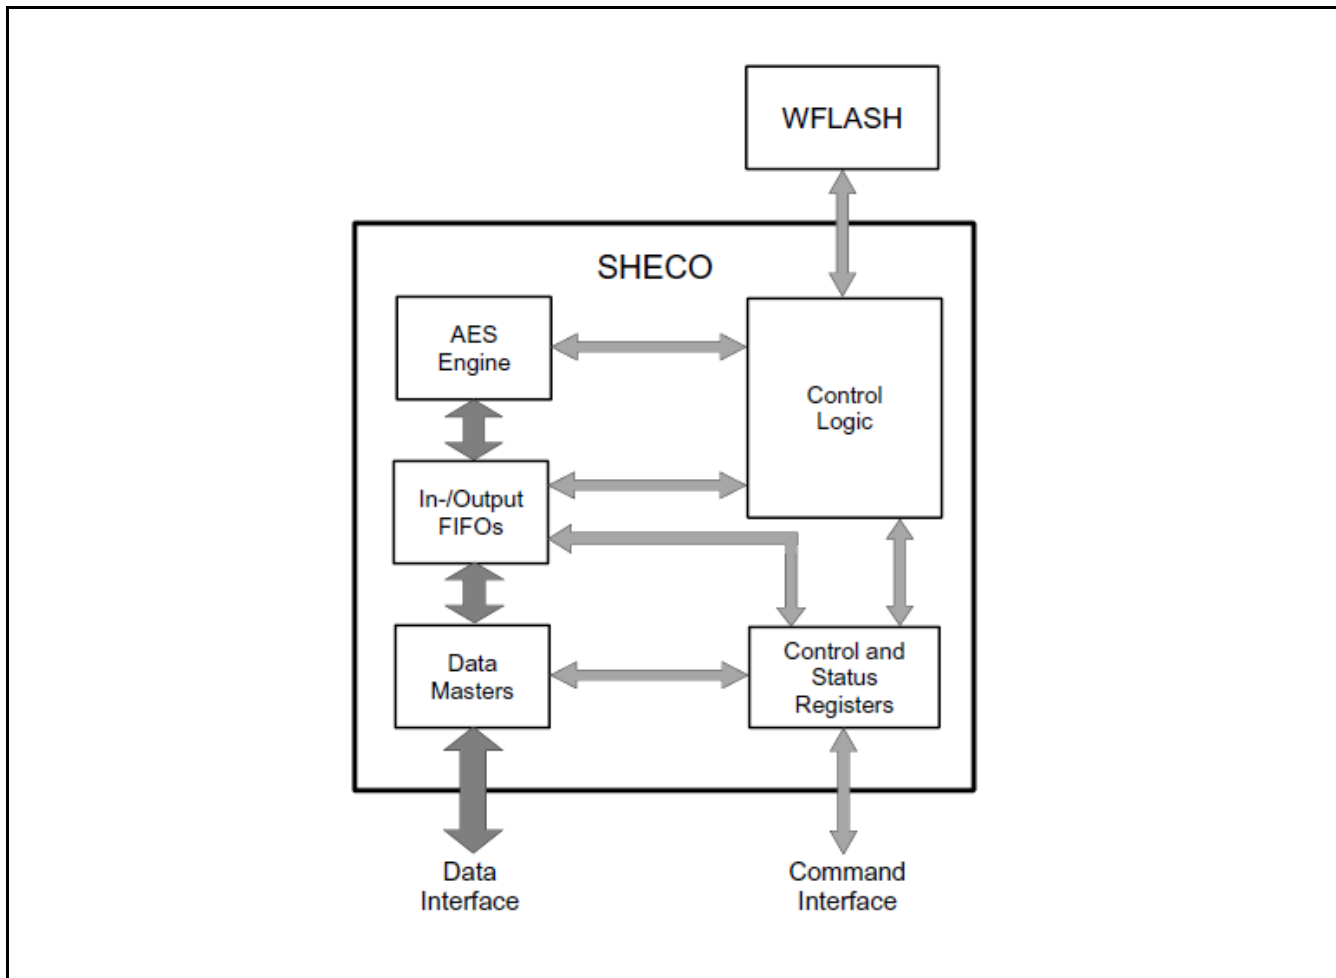

- It implements all commands defined by the Functional Specification of SHE (Chapter 7), such as
 - It provides AES-128 encryption and decryption operations [2] in Electronic Cipher Book (ECB) and Cipher-Block Chaining (CBC) modes [3]
 - It supports the generation of the cipher-based message authentication code (CMAC) [4]
 - It implements the Miyaguchi-Preneel compression function (see [5] Algorithm 9.43).
- Note:**
 - *The Miyaguchi-Preneel compression function is not directly accessible by the user and will only be used internally if required during command processing*
 - It provides a random number generation function
- SHE supports secure booting (See SHE Functional Specification, Chapter 10) by ensuring:
 - Measurement before application start-up
 - Measurement during application start-up
 - Secure boot mode, start address and length of the boot loader are configurable by the user
- Secure key storage implemented in the WFLASH (Work Flash, refer to chapter WORKFLASH for more information). In this implementation:
 - Two small sectors are exclusively accessible from SHE and are not available for the user software (public side)
 - There is a round robin arbitration of accesses from SHE and the CPU
- It has a unique random and read-only SECRET_KEY inserted during production, which is only accessible inside the SHE module
- SHE has a unique read-only Identification item (UID), which is inserted during production
- It has a Command Interface for accessing configuration and status registers. This can also be used for data transfer to and from internal First-in/First-out (FIFOs)
- It has a data interface for direct access to microcontroller memory locations. This interface is:
 - Implemented as a master interface
 - Independent of read and write transfers
 - Configured by the software
- It implements FIFO-based data transfer for:
 - Command parameters
 - Data to be processed. Only 128-bit data blocks can be processed by SHE, hence all padding has to be done by the application
 - Results
- The internal SHE clock implements clock gating in order to reduce power consumption
- It features external debugger notification in order to recognize if debugging facilities of the MCU are activated

Note:

Bus-error occurs when register is accessed at SHE-OFF parts.

2. Block Diagram of the SHE Module

Figure 2-1 Block Diagram of the SHE Module

3. Secure Hardware Extension Registers

This section lists and describes all the SHE registers.

Registers of the SHE Module

The following registers are available for the SHE module:

Configuration Registers for Command Interface

- SHE Command Register (SHE_CMD)
- SHE Command Cancel Register (SHE_CMDCANCEL)
- SHE Clock Control Register (SHE_CLKCTRL)

Status Registers for Command Interface

- SHE Status Register (SHE_STATUS)
- SHE Error Code Register (SHE_ERC)
- SHE Clock Status Register (SHE_CLKSTAT)
- SHE Module ID Register (SHE_MID)

Interrupt Registers for Command Interface

- Interrupt Request Register (SHE_IRQ)
- Interrupt Request Enable Register (SHE_IRQEN)
- Interrupt Request Clear Register (SHE_IRQCLR)

Configuration Registers for Data Interface

- Input Channel Master Start Address Register (SHE_IMSTADDR)
- Output Channel Master Start Address Register (SHE_OMSTADDR)
- Input Channel Master Data Transfer Counter (SHE_IMSTCNT)
- Output Channel Master Data Transfer Counter (SHE_OMSTCNT)
- Input Channel Master Start Trigger (SHE_IMSTSTART)
- Output Channel Master Start Trigger (SHE_OMSTSTART)
- Input FIFO Configuration Register (SHE_IFIFOCFG)
- Output FIFO Configuration Register (SHE_OFIFOCFG)
- Input FIFO Compare Value Register (SHE_COMPARE0 to 1)

Status Registers for Data Interface

- Compare Register Access Status Register (SHE_COMPACC)
- Data Master Status Register (SHE_MSTSTATUS)
- Input Channel Master Error Response Address Register (SHE_IMSTERRADDR)
- Output Channel Master Error Response Address Register (SHE_OMSTERRADDR)
- FIFO Status Register (SHE_FIFOSTATUS)
- FIFO Load Register (SHE_FIFOLOAD)
- Input FIFO Data Counter Register (SHE_DATACNT0 to 1)

Data Transfer Registers

- Input FIFO Write Data Register (SHE_IFIFOWRDATA0 to 31)
- Output FIFO Read Data Register (SHE_OFIFORDDATA0 to 31)

Notes:

- Initial value of SHE_CMD depends on the boot configuration.

- *Initial value of SHE_STATUS depends on the boot configuration.*
- *Initial value of SHE_IRQ depends on the boot configuration.*

3.1. Configuration Registers for the Command Interface

3.1.1. SHE Command Register (SHE_CMD)

The SHE command register is used to initiate the execution of sequential commands, i.e. all commands defined in Chapter 7 of the SHE Functional Specification except for CMD_CANCEL and CMD_GET_STATUS.

Writing valid command opcode to this register starts command execution. Writing invalid command opcode generates an ERC_GENERAL_ERROR error code in the error register bit field SHE_ERC:CMDMAIN.

The busy flag (SHE_STATUS:BUSY) is set and the done flag (SHE_STATUS:DONE) is cleared by the hardware with a write access to the SHE_CMD register. Moreover, the error code register SHE_ERC:CMDMAIN is set to ERC_INVALID to indicate that error code is not yet available.

A new sequential command can only be started if the previous one has finished. Hence the register is locked for write accesses while command execution is ongoing, i.e. SHE_STATUS:BUSY is "1". Any write access will trigger a bus error response. Moreover, the command register SHE_CMD is also locked during the execution of the command CMD_CANCEL, i.e. while SHE_STATUS:BUSY is high. Refer to Section 2.2.1 for more information about using this register.

Table 3-2 SHE Command Register (SHE_CMD) Bits

Bit Position	Bit Field Name	Bit Description
[31:8]	Reserved	-
[7:0]	CMD	<p>Command Opcode register</p> <p>Listed below are possible opcode values with the related commands. Other values are reserved and will generate an ERC_GENERAL_ERROR error code in the SHE_ERC:CMDMAIN error register.</p> <p>0x01: CMD_ENCRYPT_ECB 0x02: CMD_ENCRYPT_CBC 0x03: CMD_DECRYPT_ECB 0x04: CMD_DECRYPT_CBC 0x05: CMD_GENERATE_MAC 0x06: CMD_VERIFY_MAC 0x07: CMD_LOAD_KEY 0x08: CMD_LOAD_PLAIN_KEY 0x09: CMD_EXPORT_RAM_KEY 0x0A: CMD_INIT_RNG 0x0B: CMD_EXTEND_SEED 0x0C: CMD_RND 0x0D: CMD_SECURE_BOOT 0x0E: CMD_BOOT_FAILURE 0x0F: CMD_BOOT_OK 0x11: CMD_GET_ID 0x13: CMD_DEBUG 0x41: CMD_ENC_ECB_ESHE (ESHE only) 0x42: CMD_ENC_CBC_ESHE (ESHE only) 0x43: CMD_DEC_ECB_ESHE (ESHE only) 0x44: CMD_DEC_CBC_ESHE (ESHE only) 0x45: CMD_GENERATE_MAC_ESHE (ESHE only) 0x46: CMD_VERIFY_MAC_ESHE (ESHE only) 0x47: CMD_LOAD_KEY_ESHE (ESHE only)</p> <p>Notes:</p> <p>1) The concurrent command CMD_CANCEL is started using its own register (SHE_CMDCANCEL).</p> <p>2) The concurrent command CMD_GET_STATUS simply reads the SHE status register (SHE_STATUS).</p>

Notes:

- Initial value depends on the boot configuration.
- In the case of the other values except above ones, it is not in the normal status. Please take appropriate measures for the system characteristic.

3.1.2. SHE Command Cancel Register (SHE_CMDCANCEL)

This is a dedicated register that initiates the CMD_CANCEL command concurrently with another ongoing command.

The busy flag (SHE_STATUS:BUSY) is set and done flag (SHE_STATUS:DONE) is cleared by the hardware upon write access to the SHE_CMDCANCEL register. Moreover, the error code for the CMD_CANCEL command (SHE_ERR:CANCELMAIN) is set to ERC_INVALID.

Note:

- The SHE command register (SHE_CMD) is locked while the CMD_CANCEL command is being processed.

Table 3-3 SHE Command Cancel Register (SHE_CMDCANCEL) Bits

Bit Position	Bit Field Name	Bit Description
[31:8]	Reserved	-
[7:1]	Reserved	-
[0]	CANCELREQ	<p>Cancel Request bit</p> <p>Any ongoing command execution inside SHE can be canceled by writing this bit to "1". It remains "1" while the cancel request is being processed and will be cleared by the SHE control logic afterwards.</p>

3.1.3. SHE Clock Control Register (SHE_CLKCTRL)

This register is used for enabling/disabling the clock. The software can disable the internal clock of the SHE module in order to reduce power consumption.

Note:

- Only the SHE_CLKCTRL and SHE_CLKSTAT registers are accessible if the internal SHE clock is disabled. Accessing other SHE registers will generate a bus error response. Refer to Section “Clock gating for SHE” for more details.

Bit	31	30	29	28	27	26	25	24

Table 3-4 SHE Clock Control Register (SHE_CLKCTRL) Bits

Bit Position	Bit Field Name	Bit Description
[31:24]	Reserved	-
[23:17]	Reserved	-
[16]	DISREQ	<p>Clock Disable Request bit</p> <p>Writing this bit to "1" triggers a clock disable request to the SHE control logic. DISREQ is automatically cleared when the SHE clock is disabled (i.e. SHE_CLKSTAT:CLKOFF = "1").</p> <p>The internal SHE clock can only be disabled if SHE is in idle mode, i.e. if the clock disable request is written during ongoing command execution, then the clock won't be disabled until SHE becomes idle.</p> <p>This bit can only be written to "1". Writing "0" is ignored.</p> <p>Writing "1" while the SHE clock is disabled is ignored and the DISREQ bit remains "0".</p>
[15:8]	Reserved	-
[7:1]	Reserved	-
[0]	ENREQ	<p>Clock Enable Request bit</p> <p>Writing this bit to "1" triggers a clock enable request to the SHE control logic. ENREQ is automatically cleared when the SHE clock is enabled (i.e. SHE_CLKSTAT:CLKOFF = "0").</p> <p>This bit can only be written to "1". Writing "0" is ignored.</p> <p>Writing "1" while the SHE clock is enabled is ignored and the ENREQ bit remains "0".</p>

3.2. Status Registers for the Command Interface

3.2.1. SHE Status Register (SHE_STATUS)

A status register provides the state of SHE. It contains eight status bits, which are defined in the SHE Functional Specification (Chapter 6) along with additional status bits required for more detailed information.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	FATALERR
R/W Attribute	R0,WX	R1,WX	R1,WX	R1,WX	R0,WX	R0,WX	R0,WX	R,WX
Protection Attribute	-							
Initial Value	0	1	1	1	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	Reserved	Reserved	Reserved	Reserved	FLASHDED	FLASHSEC	RAMDED	RAMSEC
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	INITDONE	DONE
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	INTDEBUGGER	EXTDEBUGGER	RNDINIT	BOOTOK	BOOTFINISHED	BOOTINIT	SECUREBOOT	BUSY
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Table 3-5 SHE Status Register (SHE_STATUS) Bits

Bit Position	Bit Field Name	Bit Description
[31]	Reserved	-
[30:28]	Reserved	-
[27:25]	Reserved	-
[24]	FATALERR	<p>Fatal Error flag</p> <p>This flag is set in the event of an unrecoverable error inside the SHE module. It is cleared by a reset only.</p> <p>If an unrecoverable error is detected, SHE immediately stops its current operation, moves to a safe state and becomes unresponsive. A reset is required before SHE can be used again.</p> <p>Note: The update of the error code register SHE_ERC may take up to 100 clock cycles after the rise of the FATALERR flag, depending on the severity of the error.</p>
[23:20]	Reserved	-
[19]	FLASHDED	<p>Flash Double Bit ECC Error flag</p> <p>This flag indicates that a double bit Error Correction Code (ECC) error occurred in SHE's flash memory (dedicated part of WFLASH). The flag is set on the first occurrence of the error and can only be cleared by a reset.</p>
[18]	FLASHSEC	<p>Flash Single Bit ECC Warning flag</p> <p>This flag indicates that a single bit ECC error occurred in SHE's flash memory (i.e. a dedicated part of WFLASH) and has been corrected. The flag is set on the first occurrence of the error and can only be cleared by a reset.</p>
[17]	RAMDED	<p>RAM Double Bit ECC Error flag</p> <p>This flag indicates that a double bit ECC error occurred in SHE's internal RAM. The flag is set on the first occurrence of the error and can only be cleared by a reset.</p>
[16]	RAMSEC	<p>RAM Single Bit ECC Warning flag</p> <p>This flag indicates that a single bit ECC error in SHE's internal RAM occurred and has been corrected. The flag is set on the first occurrence of the error and can only be cleared by a reset.</p>
[15:10]	Reserved	-
[9]	INITDONE	<p>SHE Initialization status flag</p> <p>This flag indicates that the initialization phase of SHE is finished.</p>
[8]	DONE	<p>Done status flag</p> <p>This flag indicates that command processing inside SHE is finished and an appropriate error code is present in the error code register SHE_ERC. It is cleared immediately upon a 32-bit read access to SHE_ERC.</p>
[7]	INTDEBUGGER	<p>Internal Debugger status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set if the internal debugging mechanisms of SHE are activated. It is cleared by the reset only.</p>

Bit Position	Bit Field Name	Bit Description
[6]	EXTDEBUGGER	<p>External Debugger status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set if an external debugger is connected to the MCU, i.e. it reflects the input to activate the debugger.</p> <p>It is cleared by the reset only.</p> <p>Note: External debugger detection is active even if the SHE clock is switched off. More precisely, if an external debugger is attached while SHE is in power saving mode, then this will be detected and the EXTDEBUGGER bit set after the SHE clock has been enabled.</p>
[5]	RNDINIT	<p>Random Seed Initialization status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set if the random number generator has been initialized.</p> <p>It is cleared after successful authentication during the CMD_DEBUG command.</p>
[4]	BOOTOK	<p>Boot OK status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set if secure booting (CMD_SECURE_BOOT command) has succeeded. If the CMD_BOOT_FAILURE command is called, then the bit is erased.</p> <p>The Boot OK status flag is also cleared if some parts of the MCU enter power saving mode (refer to the Section titled 'Power saving functionality' for more information).</p>
[3]	BOOTFINISHED	<p>Boot Finished status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set when secure booting has been completed by calling either the CMD_BOOT_FAILURE or CMD_BOOT_OK commands (in the SHE_CMD register), or if the CMD_SECURE_BOOT command failed while verifying BOOT_MAC.</p>
[2]	BOOTINIT	<p>Boot Initialization status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set if secure booting has been personalized during the boot sequence.</p>
[1]	SECUREBOOT	<p>Secure Boot Activated status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set if secure booting is activated.</p>

Bit Position	Bit Field Name	Bit Description
[0]	BUSY	<p>Busy status flag</p> <p>Defined in the SHE Functional Specification (Chapter 6). See the 'References' section of this chapter.</p> <p>This bit is set whenever SHE is processing a command.</p> <p>The BUSY status flag is set immediately upon the start of a new command, i.e. write access to the command register (SHE_CMD) while BUSY is "0" or write access to the command cancel register SHE_CMDCANCEL.</p> <p>The BUSY status flag is cleared immediately upon a 32-bit read access to the error code register (SHE_ERC) while the SHE_STATUS:DONE flag is "1".</p>

Notes:

- *Initial value depends on the boot configuration.*
- *In the case of the other values except above ones, it is not in the normal status. Please take appropriate measures for the system characteristic.*

3.2.2. SHE Error Code Register (SHE_ERC)

The SHE module outputs error code after the execution of a command in the SHE_ERC register. This register is divided into two parts: error codes for regular/sequential commands (all SHE commands except for CMD_CANCEL and CMD_GET_STATUS) and error codes for CMD_CANCEL.

The CMD_CANCEL command requires a dedicated error code register because it can be executed concurrently with other commands and also returns an error code. The currently executed command will return ERC_CANCELED to inform the software about its cancellation.

Table 3-6 lists only several often used codes, Refer to chapter 5.1.2 for the complete list of the error codes.

Bit	31	30	29	28	27	26	25	24
Field	CANCELEX TD[7]	CANCELEX TD[6]	CANCELEX TD[5]	CANCELEX TD[4]	CANCELEX TD[3]	CANCELEX TD[2]	CANCELEX TD[1]	CANCELEX TD[0]
R/W Attribute	R,WX	R,WX	R0,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection	-							
Attribute

Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Table 3-6 SHE Error Code Register (SHE_ERC) Bits

Bit Position	Bit Field Name	Bit Description
[31:24]	CANCELEXTD	<p>Extended Command CMD_CANCEL Execution Error Code</p> <p>These bits contain the extended error code to the error code stored in the eight CANCELMAIN bits and is only valid if the value of the CANCELMAIN bits is equal to ERC_GENERAL_ERROR. It can be used to retrieve additional information about errors that have occurred during the processing of CMD_CANCEL.</p> <p>0x00: ERC_INVALID CMD_CANCEL processing ongoing; error code not yet available</p>
[23:16]	CANCELMAIN	<p>Command CMD_CANCEL Execution Error Code</p> <p>These bits contain the dedicated error code for the CMD_CANCEL command. The default value is ERC_CANCEL_IDLE and is written after a reset and after the start of a new command (i.e. a write access to the SHE_CMD register while SHE is idle). The value changes to ERC_INVALID immediately after a cancel request (i.e. a write access to SHE_CMDCANCEL) and will be updated with the correct error code when CMD_CANCEL has finished processing.</p> <p>0x00: ERC_INVALID CMD_CANCEL processing ongoing; error code not yet available 0x01: ERC_NO_ERROR CMD_CANCEL processing has completed without error 0x0D: ERC_GENERAL_ERROR A general error occurred during CMD_CANCEL processing 0x10: ERC_CANCEL_IDLE (Default value) No CMD_CANCEL processing is ongoing</p>
[15:8]	CMDEXTD	<p>Extended SHE Command Execution Error Code</p> <p>These bits contain the extended error code to the error code already stored in the eight CMDMAIN bits. The extended error code is only valid if the value of CMDMAIN is not equal to ERC_INVALID or ERC_NO_ERROR. It can be used to retrieve additional information about errors that have occurred.</p> <p>0x00: ERC_INVALID The command is ongoing and the error code is not available, or the command has successfully finished (depending on value of CMDMAIN) 0x80: ERC_EXCESS_INPUT_DATA The input FIFO was not empty at the moment when the compare match event occurred</p>

Bit Position	Bit Field Name	Bit Description
[7:0]	CMDMAIN	<p>SHE Command Execution Error Code</p> <p>These bits contains the error codes which can be returned for the execution of all SHE commands with the exception of CMD_CANCEL and CMD_GET_STATUS. Two error code values are added and will be handled by the SHE software driver. Other values are reserved.</p> <p>The ERC_BUSY error code (not listed below) must be generated by the software driver if it receives an error response while writing to the locked command register (SHE_CMD).</p> <p>Upon the start of a new command, the error code is reset to ERC_INVALID until after the command has executed, when it is then changed to an appropriate value, e.g. it will be set to ERC_CANCELED if CMD_CANCEL was issued during command execution.</p> <p>Possible error code values, defined in the SHE Functional Specification (Chapter 8) are summarized below:</p> <p>0x00: ERC_INVALID The current command is still ongoing and error code is not available (Default value)</p> <p>0x01: ERC_NO_ERROR No error has occurred and the command will be executed</p> <p>0x02: ERC_SEQUENCE_ERROR Sequence of commands or subcommands is out of order</p> <p>0x03: ERC_KEY_NOT_AVAILABLE A key is locked due to either a failed boot measurement or an active debugger</p> <p>0x04: ERC_KEY_INVALID A function is called to perform an operation with a key that is not permitted for the given operation</p> <p>0x05: ERC_KEY_EMPTY The application attempts to use a key not yet initialized</p> <p>0x06: ERC_NO_SECURE_BOOT Returned by the CMD_SECURE_BOOT command when the conditions for a secure boot process have not been met and the process has to be canceled. It is also returned if a function changing the boot status is called without secure booting or after the secure boot process has finished</p> <p>0x07: ERC_KEY_WRITE_PROTECTED A key update is attempted on a memory slot that has been write protected or when an attempt to active the debugger is started when a key is write-protected</p> <p>0x08: ERC_KEY_UPDATE_ERROR A key update did not succeed due to errors in verifying the messages</p> <p>0x09: ERC_RNG_SEED Returned by the CMD_RND and CMD_DEBUG commands if the seed has not been initialized</p> <p>0x0A: ERC_NO_DEBUGGING Internal debugging is not possible because authentication with the challenge response protocol has not succeeded</p> <p>0x0C: ERC_MEMORY_FAILURE See Chapter 8 in the SHE Functional Specification</p> <p>0x0D: ERC_GENERAL_ERROR See Chapter 8 in the SHE Functional Specification</p> <p>0x0E: ERC_CANCELED Command execution has been canceled</p>

3.2.3. SHE Clock Status Register (SHE_CLKSTAT)

This register provides information about whether the SHE module clock is enabled or disabled in order to reduce power consumption.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	-

Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Table 3-8 SHE Module ID Register (SHE_MID) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	MID	<p>Module ID register</p> <p>This register identifies the particular version of the hardware used in the device.</p> <p>Note: Refer to the device specific datasheet for more details about the module identification number.</p>

3.3. Interrupt Registers for Command Interface

3.3.1. Interrupt Request Register (SHE_IRQ)

This register contains active interrupt requests, each of which is associated with a specific event. The lower half-word represents regular interrupts, i.e. events which are expected during command execution. All these interrupts are combined and propagated to the interrupt controller on a single shared interrupt line. The upper half-word represents error interrupts. These interrupts are also combined, resulting in a shared error interrupt line.

All interrupts can be enabled and cleared independently of each other using the SHE_IRQEN and SHE_IRQCLR registers respectively. Refer to Section “Interrupt request generation” for more information on interrupt generation/processing.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved

Initial Value	0	0	0	0	0	0	0	0

Table 3-9 Interrupt Request Register (SHE_IRQ) Bits

Bit Position	Bit Field Name	Bit Description
[31:24]	Reserved	-
[23]	FATALERR	<p>Fatal Error Interrupt flag</p> <p>This bit is set in the event of an unrecoverable error inside the SHE module (on the rising edge of SHE_STATUS:FATALERR).</p> <p>The Fatal Error Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:FATALERR bit).</p>
[22]	IFIFOLOCKERR	<p>Write To Locked Input FIFO Interrupt flag</p> <p>This bit is set if a write access to the locked input FIFO is performed either by the input channel master or through the command interface.</p> <p>The Write To Locked Input FIFO Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:IFIFOLOCKERR bit).</p>
[21]	OMSTIFSELERR	<p>Output Data Channel Interface Selection Error Interrupt flag</p> <p>This bit is set if a data transfer start for the output data channel master is requested (i.e. write access to the SHE_OMSTSTART register while in idle state) and the output FIFO interface selection is configured to 'Command Interface'.</p> <p>The Output Data Channel Interface Selection Error Interrupt flag can only be cleared by the software (refer to the SHE_IRQCLR:OMSTIFSELERR bit).</p>
[20]	IMSTIFSELERR	<p>Input Data Channel Interface Selection Error Interrupt flag</p> <p>This bit is set if a data transfer start for the input data channel master is requested (i.e. write access to the SHE_IMSTSTART register while in idle state) and the input FIFO interface selection is configured to 'Command Interface'.</p> <p>The Input Data Channel Interface Selection Error Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:IMSTIFSELERR bit).</p>
[19]	OMSTERR	<p>Output Channel Master Error Interrupt flag</p> <p>This bit is set if the output channel master receives an error response on the AXI bus (on the rising edge of SHE_MSTSTATUS:OMSTERR).</p> <p>The Output Channel Master Error Interrupt flag can only be cleared by the software (refer to the SHE_IRQCLR:OMSTERR bit).</p>
[18]	IMSTERR	<p>Input Channel Master Error Interrupt flag</p> <p>This bit is set if the input channel master receives an error response on the AXI bus (on the rising edge of SHE_MSTSTATUS:IMSTERR).</p> <p>The Input Channel Master Error Interrupt flag can only be cleared by the software (refer SHE_IRQCLR:IMSTERR bit).</p>
[17]	OFIFORDERR	<p>Read From Empty Output FIFO Error Interrupt flag</p> <p>This bit is set if a read access to the empty output First-in First-out (FIFO) is performed over the Command Interface.</p> <p>The Read From Empty Output FIFO Error Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:OFIFORDERR bit).</p>
[16]	IFIFOWRERR	<p>Write To Full Input FIFO Error Interrupt flag</p> <p>This bit is set if a write access to the full input FIFO is performed over the Command Interface.</p> <p>The Write To Full Input FIFO Error Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:IFIFOWRERR bit).</p>

Bit Position	Bit Field Name	Bit Description
[15:8]	Reserved	-
[7:6]	Reserved	-
[5]	OFIFORDTH	Output FIFO Above Threshold Interrupt flag This bit is set if the amount of data words stored in the output FIFO becomes greater than the configured read threshold value (on the rising edge of SHE_FIFOSTATUS:OFIFORDTH). The Output FIFO Above Threshold Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:OFIFORDTH bit).
[4]	IFIFOWRTH	Input FIFO Below Threshold Interrupt flag This bit is set if the amount of data words stored in the input FIFO is less than the configured write threshold value (on the rising edge of SHE_FIFOSTATUS:IFIFOWRTH). The Input FIFO Below Threshold Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:IFIFOWRTH bit).
[3]	OMSTIDLE	Output Channel Master Idle Interrupt flag This bit is set if the output channel master moves to the idle state (on the rising edge of SHE_MSTSTATUS:OMSTIDLE). The Output Channel Master Idle Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:OMSTIDLE bit).
[2]	IMSTIDLE	Input Channel Master Idle Interrupt flag This bit is set if the input channel master moves to the idle state (on the rising edge of SHE_MSTSTATUS:IMSTIDLE). The Input Channel Master Idle Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:IMSTIDLE bit).
[1]	DONE	Command Execution Done Interrupt flag This bit is set if SHE internal processing has finished (on the rising edge of SHE_STATUS:DONE). The Command Execution Done Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:DONE bit).
[0]	COMPAREMATCH	Compare Match Interrupt flag This bit is set if the required amount of data has been transferred through the input FIFO (on the rising edge of SHE_FIFOSTATUS:COMPAREMATCH). The Compare Match Interrupt flag can only be cleared by software (refer to the SHE_IRQCLR:COMPAREMATCH bit).

Note:

- Initial value depends on the boot configuration.

3.3.2. Interrupt Request Enable Register (SHE_IRQEN)

This register enables the signaling of interrupts stored in SHE_IRQ to the host CPU. Refer to Section “Interrupt request generation” for more information on interrupt generation/processing.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX

Table 3-10 Interrupt Request Enable Register (SHE_IRQEN) Bits

Bit Position	Bit Field Name	Bit Description
[31:24]	Reserved	-
[23]	FATALERR	Fatal Error Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:FATALERR will be propagated to the interrupt controller.
[22]	IFIFOLOCKERR	Write To Locked Input FIFO Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:IFIFOLOCKERR will be propagated to the interrupt controller.
[21]	OMSTIFSELERR	Output Data Channel Interface Selection Error Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:OMSTIFSELERR will be propagated to the interrupt controller.
[20]	IMSTIFSELERR	Input Data Channel Interface Selection Error Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:IMSTIFSELERR will be propagated to the interrupt controller.

Bit Position	Bit Field Name	Bit Description
[19]	OMSTERR	Output Data Channel Master Error Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:OMSTERR will be propagated to the interrupt controller.
[18]	IMSTERR	Input Data Channel Master Error Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:IMSTERR will be propagated to the interrupt controller.
[17]	OFIFORDERR	Read From Empty Output FIFO Error Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:OFIFORDERR will be propagated to the interrupt controller.
[16]	IFIFOWRERR	Write To Full Input FIFO Error Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:IFIFOWRERR will be propagated to the interrupt controller.
[15:8]	Reserved	-
[7:6]	Reserved	-
[5]	OFIFORDTH	Output FIFO Above Threshold Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:OFIFORDTH will be propagated to the interrupt controller.
[4]	IFIFOWRTH	Input FIFO Below Threshold Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:IFIFOWRTH will be propagated to the interrupt controller.
[3]	OMSTIDLE	Output Data Channel Master Idle Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:OMSTIDLE will be propagated to the interrupt controller.
[2]	IMSTIDLE	Input Data Channel Master Idle Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:IMSTIDLE will be propagated to the interrupt controller.
[1]	DONE	Command Execution Done Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:DONE will be propagated to the interrupt controller.
[0]	COMPAREMATCH	Compare Match Interrupt Enable bit If set to "1", the interrupt request stored in SHE_IRQ:COMPAREMATCH will be propagated to the interrupt controller.

3.3.3. Interrupt Request Clear Register (SHE_IRQCLR)

This register clears interrupt requests stored in SHE_IRQ. Refer to Section “Interrupt request generation” for more information on interrupt generation/processing.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved

Table 3-11 Interrupt Request Clear Register (SHE_IRQCLR) Bits

Bit Position	Bit Field Name	Bit Description
[31:24]	Reserved	-
[23]	FATALERR	Fatal Error Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:FATALERR.
[22]	IFIFOLOCKERR	Write To Locked Input FIFO Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:IFIFOLOCKERR.
[21]	OMSTIFSELERR	Output Data Channel Interface Selection Error Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:OMSTIFSELERR.
[20]	IMSTIFSELERR	Input Data Channel Interface Selection Error Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:IMSTIFSELERR.
[19]	OMSTERR	Output Data Channel Master Error Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:OMSTERR.
[18]	IMSTERR	Input Data Channel Master Error Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:IMSTERR.
[17]	OFIFORDERR	Read From Empty Output FIFO Error Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:OFIFORDERR.
[16]	IFIFOWRERR	Write To Full Input FIFO Error Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:IFIFOWRERR.
[15:8]	Reserved	-
[7:6]	Reserved	-
[5]	OFIFORDTH	Output FIFO Above Threshold Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:OFIFORDTH.
[4]	IFIFOWRTH	Input FIFO Below Threshold Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:IFIFOWRTH.
[3]	OMSTIDLE	Output Data Channel Master Idle Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:OMSTIDLE.
[2]	IMSTIDLE	Input Data Channel Master Idle Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:IMSTIDLE.
[1]	DONE	Command Execution Done Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:DONE.
[0]	COMPAREMATCH	Compare Match Interrupt Clear bit Writing this bit to "1" clears the interrupt request stored in SHE_IRQ:COMPAREMATCH.

3.4. Configuration Registers for the Data Interface

3.4.1. Input Channel Master Start Address Register (SHE_IMSTADDR)

This register contains the memory start address for data transfer by the data interface input channel master. The address stored has to be aligned to the 64-bit boundary.

Moreover, the start address should be aligned to the 128-byte boundary if the transfer is supposed to cross the 4KB address boundary. Otherwise at least one short burst transfer (on reaching the 4KB boundary) will be performed. This limitation comes from the AXI protocol which cannot perform bursts over the 4KB address boundary.

This register must be configured by the user prior to the transfer. After the transfer has started the register is locked for writing. Write access to the locked register produces a bus error response. The lock is released if the required amount of data has been transferred (i.e. SHE_IMSTCNT is zero) or if the data transfer has been canceled.

Bit	31	30	29	28	27	26	25	24
Field	IMSTADDR[31]	IMSTADDR[30]	IMSTADDR[29]	IMSTADDR[28]	IMSTADDR[27]	IMSTADDR[26]	IMSTADDR[25]	IMSTADDR[24]

Bit Position	Bit Field Name	Bit Description
[31:0]	IMSTADDR	Input Channel Master Start Address

3.4.2. Output Channel Master Start Address Register (SHE_OMSTADDR)

This register contains the memory start address for data transfer by the data interface output channel master. The address stored has to be aligned to the 64-bit boundary.

Moreover, the start address should be aligned to the 128-byte boundary if the transfer is supposed to cross the 4KB address boundary. Otherwise at least one short burst transfer (on reaching the 4KB boundary) will be performed. This limitation comes from the AXI protocol, which cannot perform bursts over the 4KB address boundary.

This register has to be configured by the user prior to the transfer. After the transfer has started the register is locked for writing. Write access to the locked register produces a bus error response. The lock is released if the required amount of data has been transferred (i.e. SHE_OMSTCNT is zero) or if the data transfer has been canceled.

[31:0]	OMSTADDR	Output Channel Master Start Address

3.4.3. Input Channel Master Data Transfer Counter (SHE_IMSTCNT)

This register defines the number of 64-bit double words to be transferred by the input channel master.

It has to be configured by the user prior to starting the transfer. After the transfer has started the register is locked for write accesses and will be updated by the hardware to represent the amount of remaining data transfers. Write access to the locked register produces a bus error response. The lock is released if the required amount of data has been transferred (i.e. SHE_IMSTCNT is zero) or if the data transfer has been canceled.

3.4.4. Output Channel Master Data Transfer Counter (SHE_OMSTCNT)

This register defines the number of 64-bit double words to be transferred by the output channel master.

This register has to be configured by the user prior to starting the transfer. After the transfer has started the register is locked for write accesses and will be updated by the hardware to represent the amount of remaining data transfers. Writing access to the locked register produces a bus error response. The lock is released if the required amount of data has been transferred (SHE_OMSTCNT is zero) or if the data transfer has been canceled.

[23:17]	Reserved	-
[16]	IFSEL	<p>Interface Selection bit</p> <p>1: Output FIFO can be read through the Command Interface</p> <p>0: Output FIFO can be read through the Data Interface</p> <p>If the data transfer has to be performed by the output data channel master, this bit must be configured (to "0") prior to starting the transfer. After the transfer starts, this bit is locked for writing and any attempt to write to this bit produces a bus error response. The lock is released if the required amount of data has been transferred (SHE_OMSTCNT is zero) or if the data transfer has been canceled</p>
[15:8]	Reserved	-
[7:6]	Reserved	-
[5:0]	RDTHRESHOLD	<p>Programmable Read Threshold Of Output FIFO</p> <p>The programmable read threshold of the output FIFO (in terms of 32-bit words) can be used for interrupt-based software design.</p> <p>If the amount of stored 32-bit data words (the amount is defined by the SHE_FIFOLoad:OFIFOLoad bits) is greater than the value of RDTHRESHOLD, the OFIFORDTH bit in the SHE_FIFOSTATUS register is set. Moreover, an interrupt request (SHE_IRQ:OFIFORDTH) is set on the rising edge of SHE_FIFOSTATUS:OFIFORDTH.</p> <p>The capacity of the output FIFO is equal to 1,536 bits, i.e. 32 bits wide and 48 words deep.</p> <p>The threshold value is not verified by SHE for its feasibility. This means that if the programmed threshold value exceeds the capacity of the FIFO (i.e. RDTHRESHOLD > 47), the SHE_FIFOSTATUS:OFIFORDTH status bit will never be set.</p> <p>Note: This bit field should be written using 8- or 16-bit accesses in case of pending data transfer by the input data channel master (SHE_MSTSTATUS:OMSTLOCK == "1"). Otherwise there will be a bus error response because the IFSEL bit is locked for writing.</p>

3.4.9. Input FIFO Compare Value Register (SHE_COMPARE0 to 1)

This register contains the amount of data (all parameters and the actual data used for processing) required for a single SHE API command represented in terms of 32-bit data words.

SHE_COMPARE is used by the hardware to recognize that the required amount of data for a single SHE command has been transferred through the input FIFO. For this purpose the value of the compare register SHE_COMPARE is continuously compared with the value of the data counter register SHE_DATACNT. When the data counter reaches the value of the compare register, the status bit SHE_FIFOSTATUS:COMPAREMATCH and an interrupt request bit SHE_IRQ:COMPAREMATCH are immediately set. This transition of the COMPAREMATCH bit is referenced to as a compare match event.

SHE_COMPARE is reset by the hardware to the maximal value ($2^{59} - 1$) every time the opcode for a new SHE command is written to the SHE_CMD register.

In most cases the SHE_COMPARE register is configured by the control logic of SHE according to selected command and/or parameter values and cannot be changed during command execution. But for CBC commands, the software can adjust the value of SHE_COMPARE during the command execution, i. e. if the total amount of data is not known before the command start. Since the SHE_COMPARE register is 59 bits wide and accessed using a 32-bit interface, it cannot be written through an atomic operation and a faulty compare match event can occur. Hence the software has to use the following approach, when adjusting it: To increase the compare value, the software can write the most significant 32 bits first and then adjust the least significant 32 bits. To decrease the compare value, the software can write the least significant 32 bits first and then adjust the most significant 32 bits.

Note:

- *The software is only allowed to change the value of the SHE_COMPARE register if a CBC command is performed. **Before trying to modify the SHE_COMPARE register the software should verify that write access is enabled by checking the value of the SHE_COMPACC:CPUEN bit.** Otherwise a bus error response is generated.*

Table 3-23 Data Master Status Register (SHE_MSTSTATUS) Bits

Bit Position	Bit Field Name	Bit Description
[31:27]	Reserved	-
[26:25]	OMSTERRRESP	<p>Output Data Channel Master Error Response Code</p> <p>These bits contain the error response code of the AXI protocol.</p> <p>'00': OKAY (Normal access okay)</p> <p>A normal access has been successful. This code can also indicate an exclusive access failure</p> <p>'01': EXOKAY (Exclusive access okay)</p> <p>Either the read or write portion of an exclusive access has been successful</p> <p>'10': SLVERR (Slave error)</p> <p>Access has reached the slave successfully but the slave returns an error condition to the originating master</p> <p>Typically, a decode error is generated by an interconnect component to indicate that there is no slave at the transaction address</p> <p>The register is updated in the event of an AXI bus error response on the output data channel.</p>
[24]	OMSTERR	<p>Output Data Channel Master Error Response flag</p> <p>This bit is set in the event of an AXI bus error response on the output data channel.</p> <p>It is cleared on the rising edge of the DONE flag (SHE_STATUS:DONE).</p> <p>The rising edge of the OMSTERR error flag sets the SHE_IRQ:OMSTERR interrupt flag.</p>
[23:18]	Reserved	-
[17]	OMSTLOCK	<p>Output Data Channel Master Lock Enabled flag</p> <p>If this bit is high, the output master channel configuration registers (SHE_OFIFOCFG:IFSEL, SHE_OMSTADDR and SHE_OMSTCNT) are locked for writing.</p> <p>The Output Data Channel Master Lock Enabled flag is set at the start of a data transfer.</p> <p>And it is cleared after the required amount of data has been transferred (i.e. SHE_OMSTCNT is zero), or if the data transfer was canceled and the current burst finished.</p>
[16]	OMSTIDLE	<p>Output Data Channel Master Idle flag</p> <p>This bit is high if no data transfer is ongoing. It is cleared at the start of a new data transfer.</p> <p>The Output Data Channel Master Idle flag is set when data transfer has completed, i.e. the Output Channel Master Data Transfer Counter (SHE_OMSTCNT) is zero and all the data has been transferred to the requested memory location, or if data transfer has been canceled and the current burst finished.</p> <p>The rising edge of the OMSTIDLE flag sets SHE_IRQ:OMSTIDLE interrupt flag.</p>
[15:11]	Reserved	-

Bit Position	Bit Field Name	Bit Description
[10:9]	IMSTERRRESP	<p>Input Data Channel Master Error Response Code</p> <p>These bits contain the error response code of the AXI protocol.</p> <p>'00': OKAY (Normal access okay)</p> <p>Normal access has been successful. This value can also indicate an exclusive access failure</p> <p>'01': EXOKAY (Exclusive access okay)</p> <p>Either the read or write portion of an exclusive access has been successful</p> <p>'10': SLVERR (Slave error)</p> <p>Slave error is used when the access has successfully reached the slave but the slave returns an error condition to the originating master</p> <p>Typically, a decode error is generated by an interconnect component to indicate that there is no slave at the transaction address</p> <p>The register is updated in the event of an AXI bus error response on the input data channel.</p>
[8]	IMSTERR	<p>Input Data Channel Master Error Response flag</p> <p>This bit is set in the event of an AXI bus error response on the input data channel.</p> <p>It is cleared on the rising edge of the DONE flag (SHE_STATUS:DONE).</p> <p>The rising edge of IMSTERR error flag sets the SHE_IRQ:IMSTERR interrupt flag.</p>
[7:2]	Reserved	-
[1]	IMSTLOCK	<p>Input Data Channel Master Lock Enabled flag</p> <p>If this bit is high, the input master channel configuration registers (SHE_IFIFOCFG:IFSEL, SHE_IMSTADDR and SHE_IMSCNT) are locked for writing.</p> <p>It is set at the start of a data transfer.</p> <p>The Input Data Channel Master Lock Enabled flag is cleared after the required amount of data has been transferred (i.e. SHE_IMSCNT is zero), or if the data transfer was canceled and current burst has been finished.</p>
[0]	IMSTIDLE	<p>Input Data Channel Master Idle flag</p> <p>This bit is high if no data transfer is ongoing.</p> <p>It is cleared at the start of a new data transfer.</p> <p>The Input Data Channel Master Idle flag is set when the data transfer to the input FIFO has completed, i.e. the Input Channel Master Data Transfer Counter (SHE_IMSCNT) is zero, or if the data transfer has been canceled and the current burst finished.</p> <p>The rising edge of the IMSTIDLE flag sets the SHE_IRQ:IMSTIDLE interrupt flag.</p>

3.5.3. Input Channel Master Error Response Address Register (SHE_IMSTERRADDR)

This register is updated in case of an AXI bus error response on the input data channel and contains the address of the slave which issued the error response. The register content is valid until the next error response occurs.

In a read transaction, the AXI slave can give different responses for different transfers within a burst. Hence the SHE_IMSTERRADDR register stores the precise address.

Table 3-24 Input Channel Master Error Response Address Register (SHE_IMSTERRADDR) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	IMSTERRADDR	Input Data Channel Error Response Address

3.5.4. Output Channel Master Error Response Address Register (SHE_OMSTERRADDR)

This register is updated in the event of the AXI bus error response on the output data channel and contains the address of the slave which issued the error response. The register content is valid until the next error response occurs.

For a write transaction, there is just one response given for the entire burst and not for each data transfer within the burst. Hence the SHE_OMSTERRADDR register stores the imprecise address (i.e. the start address of the burst).

[7:6]	Reserved	-
[5:0]	IFIFOFREE	The amount of data which can be written into the input FIFO is defined in terms of 32-bit data words

3.5.7. Input FIFO Data Counter Register (SHE_DATACNT0 to 1)

This register represents the amount of 32-bit data words transferred through the input FIFO.

SHE_DATACNT is used by the hardware to recognize that the required amount of data for a single SHE command has been transferred through the input FIFO. For this purpose the value of the compare register SHE_COMPARE is continuously compared with the value of the data counter register SHE_DATACNT. When the data counter reaches the value of the compare register, the status bit SHE_FIFOSTATUS:COMPAREMATCH and an interrupt request bit SHE_IRQ:COMPAREMATCH are immediately set. This transition of the COMPAREMATCH bit is referenced to as a compare match event.

SHE_DATACNT is reset by the hardware to zero every time the opcode for the new SHE command is written to the SHE_CMD register.

Table 3-29 Input FIFO Data Counter Register 1 (SHE_DATACNT1) Bits

Bit Position	Bit Field Name	Bit Description
[31:27]	Reserved	-
[26:0]	DATACNT	Most significant bits of the data counter register The amount of data which has been transferred through the input FIFO is defined in terms of 32-bit data words.

3.6. Data Transfer Registers

3.6.1. Input FIFO Write Data Register (SHE_IFIFOWRDATA0 to 31)

The input FIFO write data registers are used to write data to the input FIFO through the command interface. A write access to any SHE_IFIFOWRDATA0 to 31 register is directly mapped to the write port of the input FIFO.

For this reason effectively there is only one register which is replicated thirty-two times in the register map. This is done in order to increase performance of data transfers to the input FIFO by allowing burst transfers over the AHB bus (command interface of SHE). In other words, if several data words have to be transferred into the input FIFO of SHE through the command interface, this should be performed using burst transfer feature of the AHB bus, which is more efficient than several single transfers.

Only 32-bit accesses are allowed to these registers. 64-bit accesses are split into two 32-bit accesses. 8-bit or 16-bit accesses to these register trigger an error response.

The software should check the load status of the FIFO before writing to it. In case the FIFO is full, an error interrupt flag (SHE_IRQ:IFIFOWRERR) is set and the data is lost. Similarly, an error interrupt flag (SHE_IRQ:IFIFOLOCKERR) is set and the data is lost if a write access to the locked input FIFO is performed. An error response on the command interface (AHB bus) is generated in case of a write access to this register if the data interface is selected through the SHE_IFIFOCFG:IFSEL bit.

Table 3-30 Input FIFO Write Data Register 0 (SHE_IFIFOWRDATA0) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	IFIFOWRDATA	A 32-bit register for accessing the write port of the input FIFO over the Command Interface

3.6.2. Output FIFO Read Data Register (SHE_OFIFORDDATA0 to 31)

The output FIFO read data registers are used to read data from the output FIFO through the command interface. A read access to any SHE_OFIFORDDATA0 to 31 register is directly mapped to the read port of the output FIFO.

For this reason effectively there is only one register which is replicated thirty-two times in the register map. This is done in order to increase performance of data transfers from the output FIFO by allowing burst transfers over the AHB bus (command interface of SHE). In other words, if several data words have to be transferred from the output FIFO of SHE through the command interface, this should be performed using the burst transfer feature of the AHB bus, which is more efficient than several single transfers.

Only 32-bit accesses are allowed to these registers. 64-bit accesses are split in two 32-bit accesses. 8-bit or 16-bit accesses to these register trigger an error response.

The software should check the load state of the FIFO before reading from it. In case the FIFO is empty, an error interrupt flag (SHE_IRQ:OFIFORDERR) is set and default data is read. An error response is generated in case of read access to this register if data interface is selected through SHE_OFIFOCFG:IFSEL bit.

4. Operation of the Secure Hardware Extension

This chapter describes the operation of the SHE module in detail.

4.1. Operation of the Command Interface

Command interface of SHE is mainly used for accessing configuration and status registers of SHE . Additionally it can also be used for the transfer of parameters and data that are used to process commands defined in the SHE Functional Specification.

Feature List

Features of the command interface are:

- Provides configuration and status registers for SHE
- 32-bit Advanced High-Performance Bus (AHB) slave interface
- Command register locked during command execution
- There is a dedicated register for starting the CMD_CANCEL
- FIFO based transfer of parameters, processing data and results of command execution
- Support for interrupt-based software design
- Access protection through Peripheral Protection Unit (PPU) and master ID filter

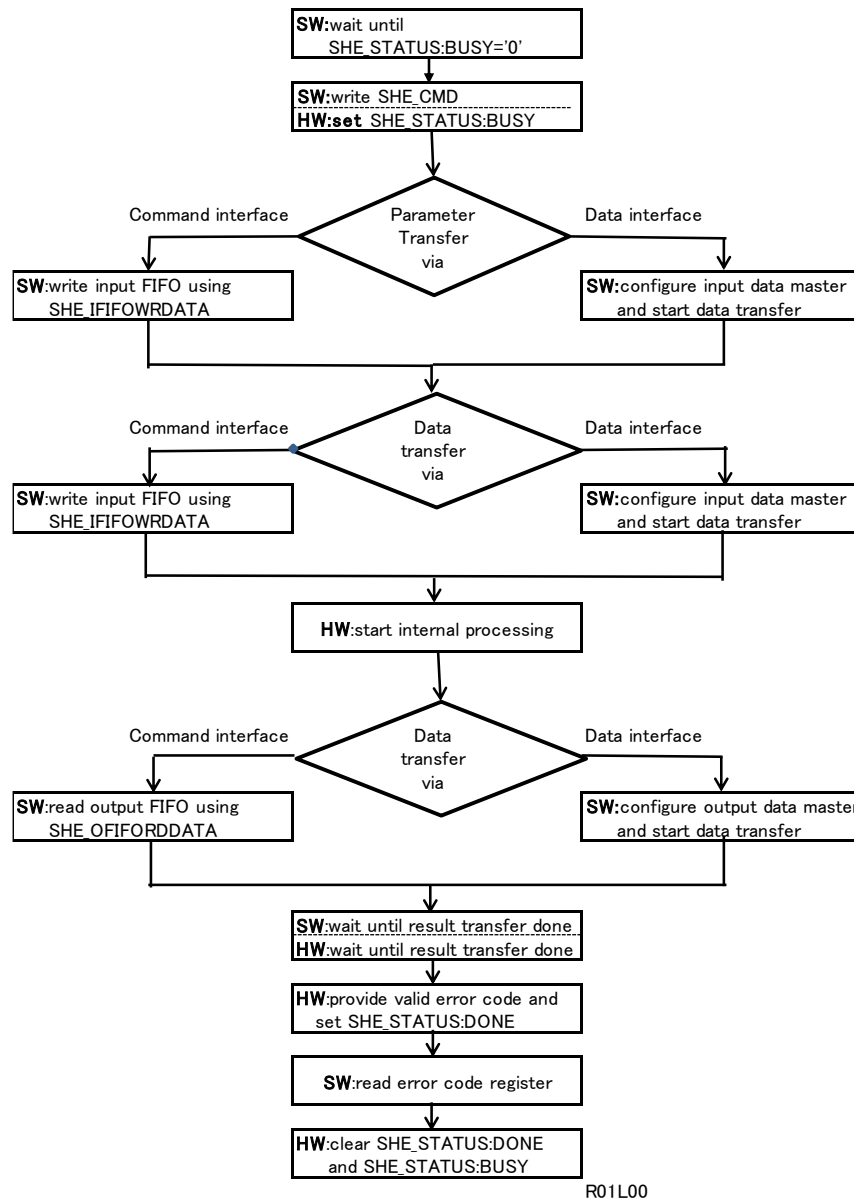

Command Execution

The following section describes the execution of SHE API commands inside the SHE module. All commands are defined in the SHE Functional Specification (Chapter 7) and can be separated into two groups: sequential and concurrent. As the name implies, sequential commands can only be executed sequentially, i.e. one command must finish before the next one starts. Concurrent commands can be executed in parallel to other commands, i.e. they can be started at an arbitrary point in time.

Sequential Command Execution

The processing of a sequential SHE command is presented in Figure 2-1 and is described in the following.

Figure 4-1 Flow Chart for the Execution of a Sequential SHE Command

A sequential SHE command can only be started if SHE is in idle mode, i.e. the BUSY bit in the SHE status register (SHE_STATUS) is low. In order to start the execution of the required SHE command, the user has to write the command opcode into the command register (see Section 3.1.1 SHE Command Register (SHE_CMD) description). The commands are defined in the SHE Functional Specification (Chapter 7) and listed in Table 4-1 below.

Note:

- The concurrent commands *CMD_CANCEL* and *CMD_GET_STATUS* are not present in the overview table. *CMD_CANCEL* has its own command register (*SHE_CMDCANCEL*). *CMD_GET_STATUS* just performs a read access to the status register of SHE (*SHE_STATUS*) and therefore doesn't need to write an opcode to the command register.

Table 4-1 Sequential SHE Commands Started Through the SHE_CMD Register

CMD_ENCRYPT_ECB
CMD_ENCRYPT_CBC
CMD_DECRYPT_ECB
CMD_DECRYPT_CBC
CMD_GENERATE_MAC
CMD_VERIFY_MAC
CMD_LOAD_KEY
CMD_LOAD_PLAIN_KEY
CMD_EXPORT_RAM_KEY
CMD_INIT_RNG
CMD_EXTEND_SEED
CMD_RND
CMD_SECURE_BOOT
CMD_BOOT_FAILURE
CMD_BOOT_OK
CMD_GET_ID
CMD_DEBUG

Refer to the description of the SHE Command Register (SHE_CMD) register for the opcode values.

As already mentioned, writing command opcode to the SHE_CMD register starts command execution. The busy flag (SHE_STATUS:BUSY) is set and the command register lock is enabled thereupon. A locked command register disables write access to it and protects it from being overwritten by accident or by malicious software. This lock is kept enabled until the complete processing has finished, i.e. as long as the busy flag (SHE_STATUS:BUSY) is high. While the command register is locked only read accesses are allowed. Any write access will trigger a bus error response.

After starting the command execution, the user has to provide the parameters and data which are required for the processing using the input FIFO of SHE. The input FIFO can be written either through the command interface (see Section 2.6.1 - SHE_IFIFOWRDATA register) or through the SHE data interface. Data transfer through the data interface is done using the input data master, which is capable of performing autonomous memory accesses.

The decision concerning which interface to use should be based on the amount of parameters and data which are required for processing. If only a few data transfers are required, it is more reasonable to use the SHE command interface because of the overhead due to the configuration of the input data master. If SHE is utilized for the processing of bigger data streams, e.g. CBC or Media Access Control (MAC) commands, the data interface input data master should be taken and configured accordingly. Refer to the description of the data interface for more information.

Under normal circumstances both FIFOs are empty after command execution. But there are some error scenarios that may lead to inconsistent FIFO states (e.g. more data than required was fed to the input FIFO). Hence, in order to avoid incorrect behavior from SHE or faulty computation results if some data is still present in the FIFOs, both FIFOs are cleared at the start a new command.

SHE expects the delivery of parameters and data for processing in a pre-defined order. This order as well as the order in which results are generated is shown in Table 3-2. The following commands are not presented in the table since they neither require any parameters or data for processing nor generate results:

- CMD_INIT_RNG
- CMD_BOOT_FAILURE
- CMD_BOOT_OK
- CMD_CANCEL
- CMD_GET_STATUS

In Table 3-2 "Sequential order for parameter and result transfer", please note the reversed parameter and result order for the CMD_DEBUG command: the CHALLENGE value is first provided by SHE and the AUTHORIZATION value is expected afterwards.

Each parameter has to be provided in one or several 64-bit large data blocks. Therefore, parameters with lengths less than 64 bits have to be padded with leading zeros and those wider than 64 bits have to be split into 64-bit large data blocks. The least significant part of the parameter must be transferred first. The same approach is also valid for SHE command results: small results are padded and large results are split.

Table 4-2 Sequential Order for Parameter and Result Transfer

Command	Parameter			Return Value		
	Seq. No.	Name	Size [Bits]	Seq. No.	Name	Size [Bits]
CMD_ENC_ECB	1	KEY_ID PLAINTEXT	64	1	CIPHERTEXT	128
	2		128

					N/A	N/A
CMD_EXPORT_RAM_KEY		N/A	N/A	1	M1	128
				2	M2	256
				3	M3	128
				4	M4	256
				5	M5	128
CMD_EXTEND_SEED	1	ENTROPY	128		N/A	N/A
CMD_RND		N/A	N/A	1	RND	128
CMD_SECURE_BOOT ²	1	SIZE DATA	64		N/A	N/A
	2		n ³ x 128			
CMD_GET_ID	1	CHALLENGE	128	1	ID ⁴ SREG	120 + 8
				2	MAC	128
CMD_DEBUG	1	AUTHORIZATION	128	1	CHALLENGE	128

¹ : $n = \text{ceil}^5 (\text{MESSAGE_LENGTH} / 128)$

² : CMD_SECURE_BOOT is always started by the Boot ROM of the host MCU and is not directly available for the user

³ : $n = \text{ceil}^5 (\text{SIZE} / 16)$

⁴ : Vertical bar ('|') symbol represents concatenation of two values. Left value is kept in most significant, right value in least significant bits.

⁵ : $\text{ceil}(x) = \min\{n \in \mathbb{Z}_1 \mid n \geq x\}, \mathbb{Z}_1 = \{1, 2, 3, \dots\}$

The processed results from SHE are written to the output FIFO in the order given in Table 4-2 above and can be read by the user either through the SHE command interface - see the Output FIFO Read Data Register (SHE_OFIFORDDATA0 to 31) - or data interface using the output data master. Similar to the input data master, the output data master should be used if many data transfers are required.

Once the complete result data has been read from the output FIFO, the SHE control logic writes valid error code to the error code register (SHE_ERC:CMDMAIN) and indicates the end of processing by setting the DONE status flag in the status register (SHE_STATUS). For the commands which require no parameters or do not generate results, as well as for the CMD_DEBUG command, the error code register (SHE_ERC:CMDMAIN) is updated and the SHE_STATUS:DONE flag is set once internal processing has completed.

Command execution is finished only when the software reads the error code register using a 32-bit data access. The SHE_STATUS:BUSY and SHE_STATUS:DONE flags are cleared thereupon.

Figure 4-2 illustrates the timing flow for the execution of a sequential SHE command. The command is started at moment T1 by a write access to the SHE_CMD register. Internal processing is finished at moment T2 and the error code register is read at moment T3. A new command can be started at any time after T3, for example at moment T4.

Figure 4-2 Timing Diagram for Execution of a Sequential SHE Command

Special Case Handling for CBC Operations

The majority of SHE commands have a fixed number of parameters, and the amount of data used for processing is also fixed. Hence SHE control logic knows the required amount of information which has to be transferred through the input FIFO. This value is stored in a special compare register - see Input

FIFO Compare Value Register (SHE_COMPARE0 to 1) for more details - which is configured through the SHE control logic upon the start of a command.

For two CBC commands, CMD_ENC_CBC and CMD_DEC_CBC, the amount of data used for processing is not always known before command execution (i.e. a priori). Hence command execution is started using the default value of SHE_COMPARE. Once the required amount of data is known, the software has to update the value of the SHE_COMPARE register. For example if SHE is used for a CBC command on a 1024-bit data stream, the total amount of data is 1,216 bits (64 bits for the key ID, 128 bits for initialization vector and 1,024 bits for the data itself). And since SHE_COMPARE represents data in terms of 32-bit data words, it has to be set by the software to 38 (1216 divided by 32).

Finally, the software has two possibilities of finishing an ongoing CBC command: adjusting the value of the SHE_COMPARE register; or issuing the CMD_CANCEL command. If CMD_CANCEL is used, the software has to make sure that the required amount of data has been processed in SHE and the results transferred from the SHE output FIFO.

Note:

- *The software is only allowed to change the value of SHE_COMPARE if a CBC command is performed. Otherwise a bus error response is generated.*

Concurrent Command Execution

CMD_GET_STATUS

The current status of SHE is provided in SHE_STATUS register which is always kept up to date by the SHE control logic. Since this register is directly accessible by the software, no special handling of the CMD_GET_STATUS command is required by SHE.

CMD_CANCEL

As already stated, execution of the CMD_CANCEL command is not started using the regular SHE command register but instead with a dedicated command cancel register (SHE_CMDCANCEL). To cancel an ongoing command the user has to set the SHE_CMDCANCEL:CANCELREQ bit to "1". Once this is detected by the SHE control logic, the internal processing of the CMD_CANCEL command starts. This is indicated by the change of error code in the error code register SHE_ERC for the sequential command (SHE_ERC:CMDMAIN) and command cancel (SHE_ERC:CANCELMAIN) to ERC_INVALID. Furthermore, similar to the processing of a sequential command, the busy flag (SHE_STATUS:BUSY) is kept high and the done flag (SHE_STATUS:DONE) is kept low during the processing of the CMD_CANCEL command. Additionally, the command register SHE_CMD is locked for writing while CMD_CANCEL is being processed, i.e. while SHE_STATUS:BUSY is high.

Once the internal processing is finished, the SHE control logic updates SHE_ERC and sets the SHE_STATUS:DONE flag. The error code for the canceled sequential command (SHE_ERC:CMDMAIN) is set to ERC_CANCELED and the error code for the command cancel (SHE_ERC:CANCELMAIN) is set to a valid value defined by the SHE Functional Specification. The user application has to read the error code register using 32-bit data access in order to complete command execution. The SHE_STATUS:BUSY and SHE_STATUS:DONE flags are then cleared.

Figure 4-3 Execution of CMD_CANCEL Command illustrates the timing flow for the execution of the CMD_CANCEL command.

Figure 4-3 Execution of CMD_CANCEL Command

The cancel request for the command which was started at moment T1 is detected at moment T2. Internal processing of CMD_CANCEL is finished at moment T3 and the error code register is read at moment T4. A new command can be started at any time after T4, for example at moment T5.

Figure 4-4 illustrates the timing flow for the execution of a CMD_CANCEL command issued after the end of the internal data processing in SHE, i.e. when the valid error code (SHE_ERC:CMDMAIN) is available and the done flag (SHE_STATUS:DONE) is high.

Figure 4-4 Execution of CMD_CANCEL Command Issued after the Previous Command Has Completed

The internal processing of the sequential command, which was started at moment T1, is completed at moment T2. The cancel request is issued at moment T3. Both error codes (SHE_ERC:CMDMAIN and SHE_ERC:CANCELMAIN) are reset and the done flag (SHE_STATUS:DONE) is then cleared by the hardware. Internal processing of CMD_CANCEL is completed at moment T4 and the error code register is read at moment T5.

The CMD_CANCEL command can also be issued when no command is being executed. The appropriate timing diagram is shown in Figure 4-5. The cancel request is issued at moment T1. Both error codes, SHE_ERC:CMDMAIN and SHE_ERC:CANCELMAIN, are reset, the SHE_STATUS:BUSY flag is set and the SHE_STATUS:DONE flag is kept low by the hardware. Internal processing of CMD_CANCEL is completed at moment T2.

Note:

- Only the error code for CMD_CANCEL (SHE_ERC:CANCELMAIN) is updated. The error code register for the sequential command (SHE_ERC:CMDMAIN) keeps its value (ERC_INVALID).

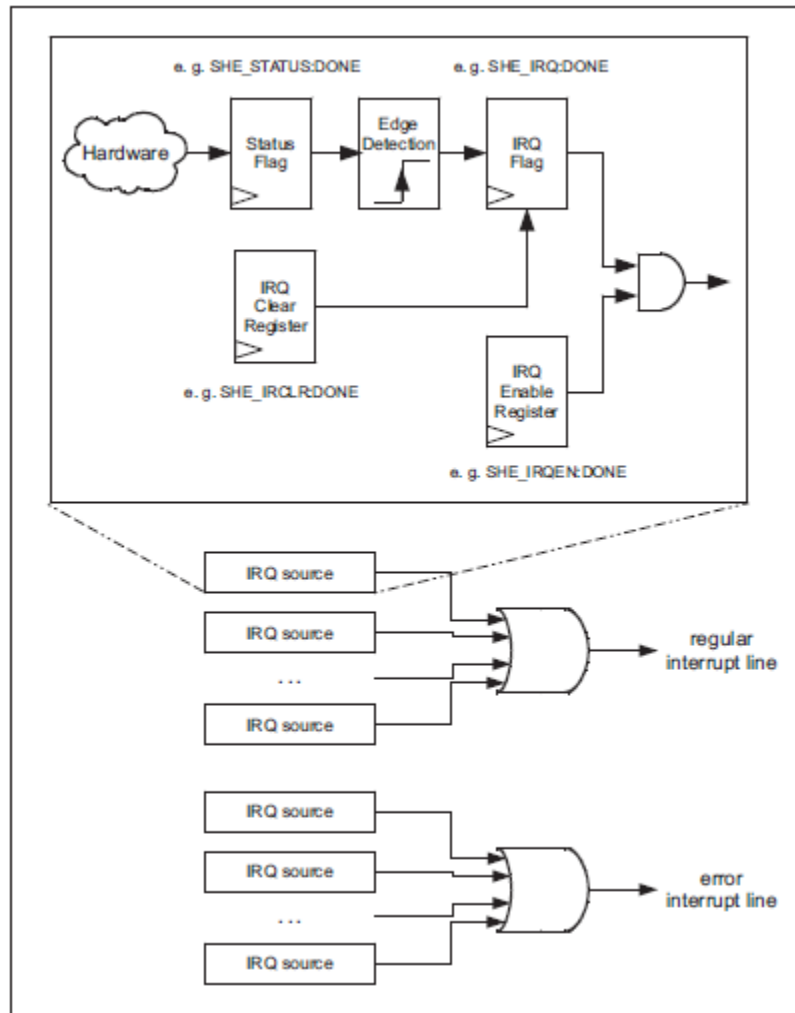

Figure 4-5 Execution of CMD_CANCEL Command When No Command Execution Is Ongoing.

Interrupt Request Generation

In order to support interrupt-based application design, SHE provides two separate interrupt request lines to signal changes to its internal state. The first interrupt line is used for regular interrupts and is triggered by regular events that are expected during command processing. For example, the rising of the done status flag (SHE_STATUS:DONE) triggers the regular interrupt request. The second interrupt line is used to signal extraordinary events, i.e. errors.

Both interrupts are shared interrupts, i.e. each interrupt line has several interrupt sources. To distinguish between interrupt sources the user has to perform a read access to the SHE Interrupt Request register SHE_IRQ. This register represents all interrupts available in SHE and is divided into two parts: regular and error interrupts. All interrupts can be enabled and cleared independently of each other using the SHE_IRQEN and SHE_IRQCLR registers respectively. The architecture of the interrupt circuitry used in SHE is shown in Figure 4-6 In general it consists of the following parts:

- Status flags that represent the actual state and which change accordingly with it. For example, the DONE flag in the SHE_STATUS register.
- Edge detection logic. The rising edge of the status flag sets the interrupt request flag.
- Interrupt request flags representing pending interrupt request. Each flag is set by the rising edge of the corresponding status flag and remains high until it is cleared by the software, e.g. the DONE flag in SHE_IRQ register.
- IRQ enable bits. If written to "1", the corresponding interrupt request stored in the SHE_IRQ register is propagated to the appropriate interrupt line. For example, the SHE_IRQEN:DONE bit enables the generation of a SHE interrupt for the SHE_STATUS:DONE bit.
- The interrupt request flag should be cleared by the software during the execution of its interrupt service routine. This is achieved by writing "1" to the appropriate bit in the interrupt request clear register, i.e. SHE_IRQCLR:DONE.

Figure 4-6 Block Diagram of SHE Interrupt Generation Circuitry**Note:**

- All IRQ source circuits are identical to the one shown in detail.

As already mentioned, several interrupt sources are combined and the resulting shared interrupt lines (one for regular and one for error interrupts) are then connected to the interrupt controller.

4.1.1. Power Saving Functionality

Clock Gating for SHE

The power consumption of SHE can be reduced by disabling its internal clock. Enabling/disabling the SHE clock can be performed using the SHE_CLKCTRL register. The current status of the clock is given by the SHE_CLKSTAT register. The procedure for clock gating is presented in Figure 4-7.

Figure 4-7 SHE Clock Disabling/Enabling

In order to disable the SHE clock the user has to set the SHE_CLKCTRL:DISREQ bit to "1" (T1). Please note that access to the SHE_CLKCTRL register can occur at an arbitrary point in time, but the SHE clock can only be disabled if SHE is in an idle state (i.e. SHE_STATUS:BUSY is "0"). Hence the pending clock disable request is kept high until SHE moves to the idle state and performs the internal operations required for clock gating. The CLKOFF bit in the SHE_CLKSTAT register is then set (T2). The pending disable request SHE_CLKCTRL:DISREQ is automatically cleared by the SHE hardware, and the SHE clock is disabled on the next cycle of the input clock (T3).

The clock is enabled by writing "1" to the SHE_CLKCTRL:ENREQ bit (T4). SHE_CLKCTRL:ENREQ and SHE_CLKSTAT:CLKOFF are cleared after which the internal clock is enabled (T5).

External debugger detection is active even if the SHE clock is switched off. More precisely, the external debugger will be detected if it is attached during SHE power-saving mode, and the SHE_STATUS:EXTDEBUGGER bit will be set after the SHE clock has been enabled.

Note:

- Only the SHE_CLKCTRL and SHE_CLKSTAT registers are accessible if the internal SHE clock is disabled. Accessing other SHE registers will generate a bus error response.

System Wide Clock/Power Gating

The status register bit SHE_STATUS:BOOTOK is automatically cleared whenever the CPU or a memory of the MCU enters power saving mode. This means for a TRAVEO™ T1G series device, SHE is notified if any clock is gated for at least one of the following modules (the appropriate clock name is given in parentheses):

- Cortex-R5 CPU (CLK_CPU)
- TCFLASH (CLK_FLCK, CLK_MEMC)

- WFLASH (CLK_FLCK, CLK_MEMC)
- System RAM (CLK_HPM)
- TCRAM (CLK_CPU, CLK_MEMC)

Note:

- *Only falling edges of the clock/power enable signals for the modules listed above are taken into account. Thus the SHE_STATUS:BOOTOK bit will be cleared only when the clock/power is disabled.*

4.1.2. Command Interface Access Issues

A master ID filter is also implemented. This means that only two specified masters, the CPU and debugger, are allowed to access the SHE command interface.

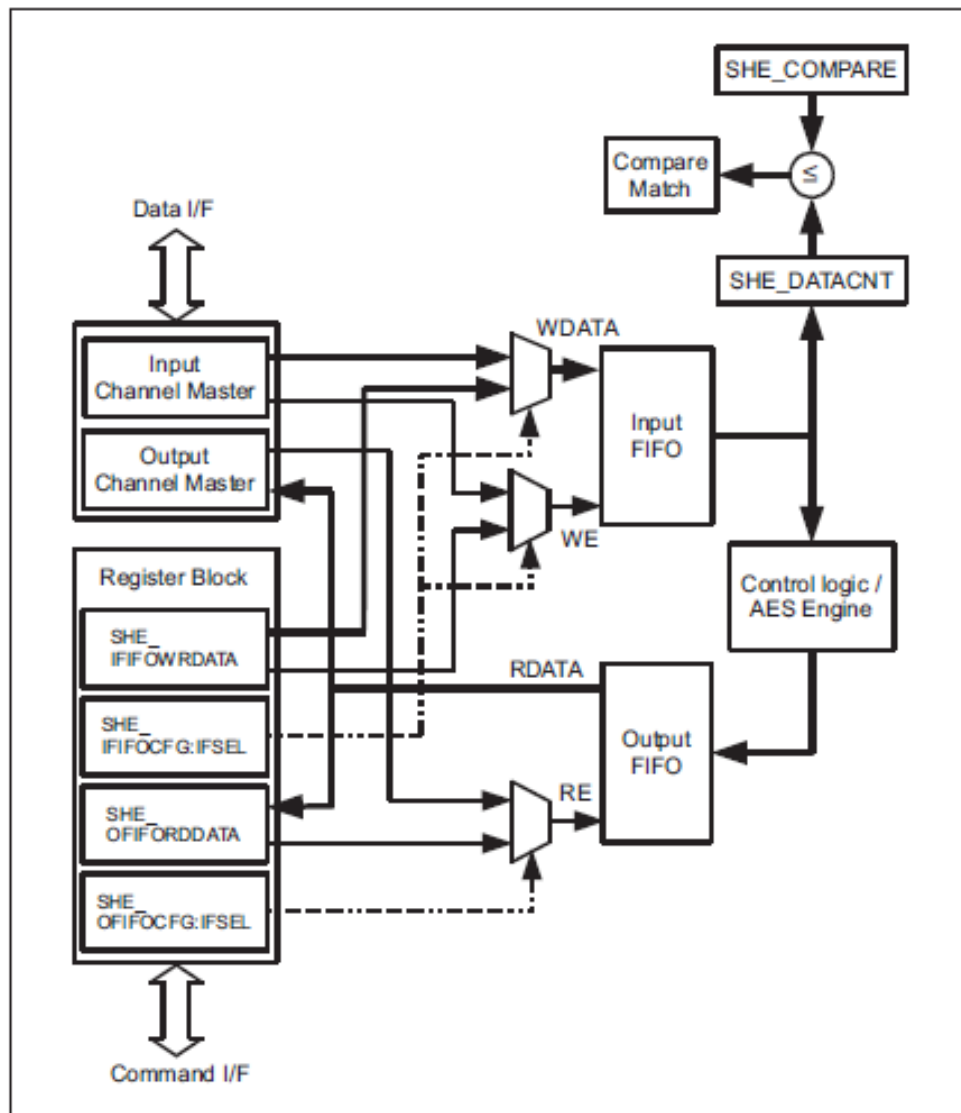

Since the command interface can also be utilized for the transfer of parameters and data used for processing, special registers exist for accessing the write port of the input FIFO (refer to the Input FIFO Write Data Register (SHE_IFIFOWRDATA0 to 31) description) and read port of the output FIFO (refer to the Output FIFO Read Data Register (SHE_OFIFORDDATA0 to 31) description). An error interrupt flag is set (refer to the Interrupt Request Register (SHE_IRQ) and bits IFIFOWRERR and OFIFORDERR) if write access to a full input FIFO or read access to an empty output FIFO is performed over the command interface. Moreover, an error response on the AHB bus is generated in the event of a write access to SHE_IFIFOWRDATA if the input FIFO is locked (see Section n "Input FIFO"). Hence the state of the FIFOs has to be checked before performing the accesses.

4.2. Operation of the Data Interface

All data required for the execution of a single SHE API command as well as results of commands can be transferred over the SHE data interface. This interface is controlled by two data master modules which transfer data to/from the attached FIFOs. The data flow diagram is shown in Figure 4-8.

By default the data transfer is done over the command interface, but alternatively the data can also be transferred over the data interface using data masters. Refer to SHE_IFIFOCFG:IFSEL, SHE_OFIFOCFG:IFSEL, SHE_IFIFOWRDATA and SHE_OFIFORDDATA register descriptions.

Figure 4-8 SHE Data Flow Diagram

Feature List

The features of the data interface are:

- A 64-bit AXI master interface
- Input and output channels for independent read and write data transfers
- Only incremental bursts to 64-bit aligned addresses are supported
- Direct memory access capability, which covers the complete address range of the MCU (32-bit)
- Configuration settings lock during transfer
- FIFOs for synchronization and data transfer between several parties with different data-path widths
- Support for interrupt-based software design

Operation of Data Master modules

The input and output channel masters are responsible for performing data transfers to and from SHE. They can perform independent read and write transfers between different memory locations of the MCU and SHE. In order to increase data transfer performance, both masters always try to perform burst transfers of the maximal possible length.

Both data masters have the same set of configuration registers:

- Start address in memory where the master has to read data from or store to. Refer to the Input Channel Master Start Address Register (SHE_IMSTADDR) and Output Channel Master Start Address Register (SHE_OMSTADDR) descriptions. The address has to be 64-bit aligned. The start address should also be aligned to the 128-byte boundary if the transfer is supposed to cross the 4KB address boundary. Otherwise at least one short burst transfer (on reaching the 4KB boundary) will be performed.
- The total number of transfers required for a single command. Refer to the Input Channel Master Data Transfer Counter (SHE_IMSTCNT) and the Output Channel Master Data Transfer Counter (SHE_OMSTCNT) register descriptions. This value, which has to be preloaded by software, is the number of 64-bit double words that have to be transferred. This value is decremented with every transfer and represents the amount of remaining data transfers.
- Data transfer start trigger. Refer to Input Channel Master Start Trigger (SHE_IMSTSTART) and Output Channel Master Start Trigger (SHE_OMSTSTART) registers. The transfer can only be started if the master idle flag (IMSTIDLE or OMSTIDLE in the SHE_MSTSTATUS register) is high. Trying to start the transfer while the master idle flag is low has no effect. Once started the transfer proceeds as long as the number of remaining transfers (SHE_*MSTCNT) is greater than zero.

The configuration settings can be written before or after the start of the command (write access to the SHE_CMD register). The data transfer itself (through the SHE_*MSTSTART register) should only be started after the start of the command. Otherwise the data which may have already been transferred into the input FIFO will be discarded because the FIFO is flushed upon the start of the command.

Note:

- If the start of a new data transfer is requested (i.e. a write access to the SHE_*MSTSTART register) and the interface setting for the appropriate FIFO is 'Command Interface' - refer to either the Input FIFO Configuration Register (SHE_IFIFOCFG) or Output FIFO Configuration Register (SHE_OFIFOCFG) - which is in fact an error condition, the value of the SHE_*MSTSTART register remains zero but the SHE_IRQ:*MSTIFSELERR error interrupt flag is set instead and the transfer is not started.

To prevent the manipulation of settings, the appropriate configuration registers are automatically locked after starting a data transfer. An enabled lock is signaled through the IMSTLOCK or OMSTLOCK bit in the SHE_MSTSTATUS register. Writing access to locked registers produces a bus error response. The lock is released either if the required amount of data has been transferred (SHE_*MSTCNT is zero) or if the data transfer was canceled in case of an error or CMD_CANCEL. The complete overview of lockable registers is given in Table 3-3 .

Table 4-3 Lockable Registers List

	Input Channel Master	Output Channel Master
Lock bit	SHE_MSTSTATUS:IMST-LOCK	SHE_MSTSTATUS:OMSTLOCK
Locked Registers	SHE_IFIFOCFG:IFSEL SHE_IMSTADDR SHE_IMSTCNT	SHE_OFIFOCFG:IFSEL SHE_OMSTADDR SHE_OMSTCNT

As already mentioned in Section "Sequential command execution", the decision concerning which interface should be selected for data transfer depends on the amount of data. The software may use only one, both or even no data masters. Also a combination of command interface and data interface is possible; the parameters can be transferred through the command interface and the subsequent data required for processing can be transferred by the input channel master. The results can also be read through the command interface or by the output channel master.

Behavior in the Event of a CMD_CANCEL Command

Both data masters feature special stop request input signals, which are controlled by the SHE control logic and can be set in order to cancel an ongoing data transfer. These signals will be asserted in the event of the pending CMD_CANCEL command.

If the stop request is detected by a data master, it completes any ongoing burst but cancels all subsequent ones. The ongoing burst is completed as follows: the input channel master reads the remaining data from the AXI bus but discards it and doesn't write it into input FIFO. The output channel master stops reading the output FIFO and writes the default data to the bus (0x0...0), but AXI byte strobes are disabled.

Note:

- *The transfer counter (SHE_*MSTCNT) only counts regular transfers, i.e. the counter value is not changed if the data transfer has been canceled and "dummy" transfers are performed.*

After finishing the current burst, the master moves to an idle state and asserts the appropriate master idle flag (SHE_MSTSTATUS:*MSTIDLE). No new data bursts will be started until a new command is issued. The transfer counter (SHE_*MSTCNT) value is kept, allowing the software to determine the amount of data transferred.

Error Handling

Two kinds of errors can occur during the operation of the data masters:

1. Write access from the input channel master to the locked input FIFO.

The input FIFO is locked when the required amount of data has been transferred (see Section 3.3 "Operation of the FIFO unit"). However, misconfiguration may cause the input channel master to execute write accesses to the input FIFO. In this case an error interrupt flag (SHE_IRQ:IFIFOLOCKERR) is set to notify the software of this error.

Upon error detection, the input data master behaves in the same way as if it were processing a stop request (see 'Behavior in the event of a CMD_CANCEL command'), i.e. an ongoing burst is completed without transferring the data to the input FIFO and all subsequent bursts are canceled. The output data master is not affected in this case and continues its operation.

2. Bus error response.

An AXI slave can generate an error response in the event of an error during data transfer. Since SHE cannot resolve bus errors, the software should be informed about it. This will be done by setting the status flags (SHE_MSTSTATUS:IMSTERR, SHE_MSTSTATUS:OMSTERR) and appropriate error interrupt flags - SHE_IRQ:IMSTERR for the input channel master and SHE_IRQ:OMSTERR for the output channel master. Besides the interrupt, the AXI response code (IMSTERRRESP and OMSTERRRESP in SHE_MSTSTATUS) and the error address (SHE_IMSTERRADDR and SHE_OMSTERRADDR) are stored.

According to the AXI protocol definition for a read transaction, the slave can give different responses for different transfers within a burst. Hence, on receiving an error response the input channel master behaves in the same way as if it were processing a stop request (see 'Behavior in the event of a CMD_CANCEL command'), i.e. an ongoing burst is completed without transferring the data to the input FIFO, and all subsequent bursts are canceled.

According to the AXI protocol definition for a write transaction, there is just one response given for the entire burst and not for each data transfer within the burst. Hence, on receiving an error response the output channel master does not have to complete any ongoing burst and just cancels any outstanding transfers.

Error responses on both data channels are also signaled to the SHE control logic, which will cancel the current command execution and return an error code thereupon.

System integration issues

Memory Protection

For safety reasons both masters have a Memory Protection Unit (MPU) in order to protect the memory areas of the MCU. For details on MPU configuration, refer to Chapter: Memory Protection Unit for the AXI of SHE.

Instruction Flash Addressing

Instruction flash (TCFLASH) is separated in two parts (beginning at start address): small sectors and large sectors. Independent on the start position it is possible for the input channel master of SHE to address the complete memory area, e. g. for a validation of complete TCFLASH. By default the input channel master jumps from the last address of small sectors to the first address of large sectors. Furthermore an address wrap around occurs if input channel master reaches end of large sectors. In this case read accesses continue at the start address of small sectors. This feature together with the

previous one allow complete TCFLASH addressing independently from the starting location (128bit aligned).

Note:

- *The approach described above only applies if a valid address in the TCFLASH (not a reserved area) is given in the SHE_IMSTADDR register. This means if SHE_IMSTADDR points to a reserved area of the TCFLASH, no special action is performed and the usual Error Handling is done.*

Notes on the Operation of the Data masters

The data interface implements the AXI protocol using a 32-bit address and 64-bit data buses. Input and output data transfers can be carried out simultaneously by performing up to 16-beat long incremental bursts. This means up to $16 \times 64 = 1,024$ bits of data can be transferred in one burst. In order to simplify the design, no unaligned accesses are allowed, i.e. all addresses have to be aligned to the 64-bit boundary.

The number of transfers in a single burst is determined by the value of the total transfer counter (see Section 2.4.3 - SHE_IMSTCNT and Section 2.4.4 - SHE_OMSTCNT). While this value is greater than or equal to 16, the master issues bursts with a maximum length of 16. Once the number of remaining transfers becomes less than 16, this value will be taken to perform the last burst.

Due to the limitation of the AXI protocol, which cannot perform bursts over the 4KB address boundary, the master has to reduce the size of the burst if it is about to cross the 4KB boundary. All consecutive bursts will be performed using the approach described in the previous paragraph.

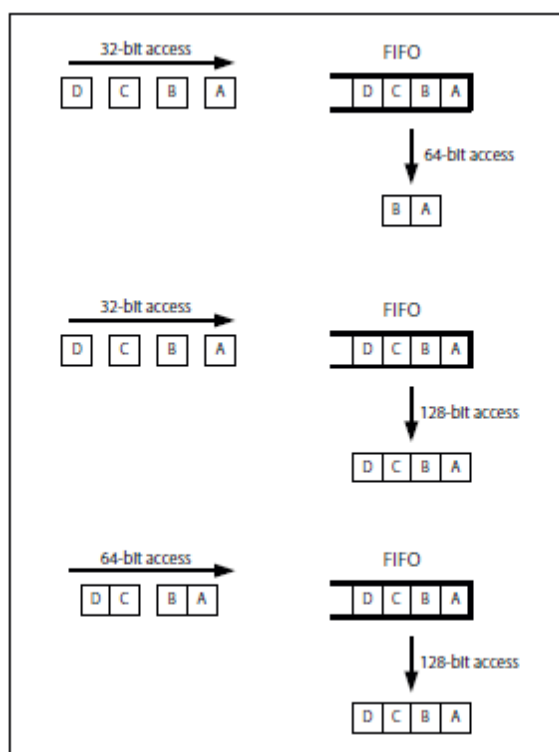

FIFO load information is also taken into account in order to maximize the efficiency of the data transfer. Incoming data transfers are only started if enough free space is available in the input FIFO. Outgoing data transfers are only started if the output FIFO contains enough data for a complete burst.

The data master performs no manipulation on the transferred data; it is ensured that the data which is delivered to the internal AES engine has the same content and order as it was provided by the user in the source memory location.

4.3. Operation of the FIFO Unit

All data transfers to and from the SHE module are done over two FIFO memories. Additionally they are used for synchronisation between several parties with different data-path widths. For example, the data can be written to the input FIFO via the command interface using 32-bit accesses or via the data interface using 64-bit accesses. The same is also valid for the output FIFO, which can be read either by a 32-bit or 64-bit access. Hence, to ensure the correct synchronisation and data order, the least significant part of the data has to be transferred first. More precisely, if the transfer of a data item has to be split into several transfers, the order shown in Figure 4-9 must be kept.

Figure 4-9 FIFO Data Ordering

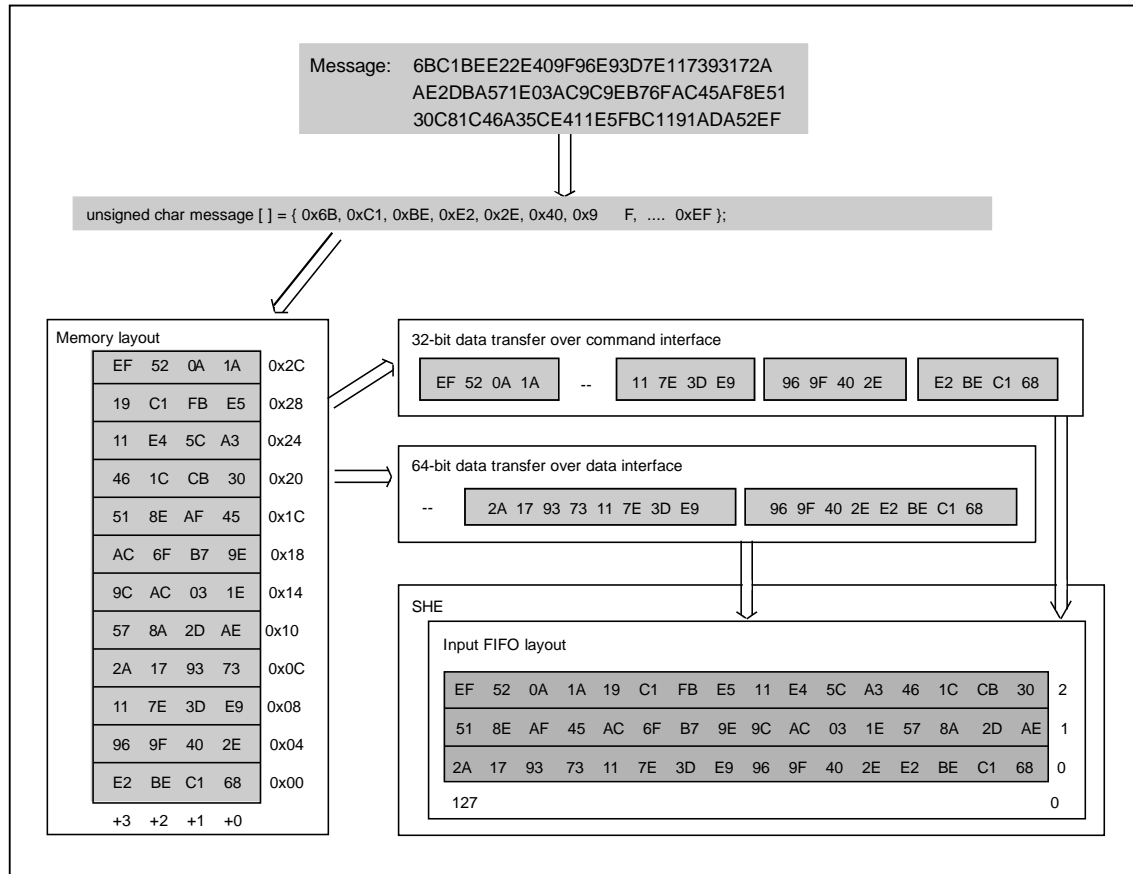

With reference to Figure 4-9:

1. If a 64-bit double word has to be written/read using two 32-bit accesses, the least significant word, i.e. bits[31:0], has to be transferred first followed by the most significant word, i.e. bits [63:32].
2. If a 128-bit quad word has to be written/read using four 32-bit accesses, the least significant word, i.e. bits[31:0], has to be transferred first followed by bits[63:32] and bits[95:64]. The most significant word, i.e. bits[127:96], is transferred last.
3. If a 128-bit quad word has to be written/read using two 64-bit accesses, the least significant double word, i.e. bits[63:0], has to be transferred first followed by the most significant double word, i.e. bits[127:64].

Data ordering for the Command Parameters

Command parameters given in Table 3-2 must be transferred according to one of the following ways depending on the parameter width:

1. 64-bit wide parameters must be represented in the native little endian byte order of TRAVEO™ T1G host system and, as described in the Section 3.1, the least significant part of the parameter has to be transferred first. For example if the KEY_ID parameter is 4 (0x0000000000000004) and it will be transferred to SHE using two 32-bit accesses, the data for the first access will be 0x00000004 and for the second will be 0x00000000.
2. Parameters wider than 64-bits must be represented in the big endian ordering of bytes and the most significant byte (MSB) must be transferred first. Please refer to the Figure 4-10 for an example showing data transfer of a 384-bit large message. Since cryptographic messages are usually stored using byte arrays, the MSB of the message will be stored in the memory at the offset zero resulting in the memory layout given in the example. For the processing in SHE the message can be transferred either through the command interface (using SHE_IFIFOWRDATA registers) or through the data interface (using input data master). The resulting layout of the input FIFO of SHE represents the message with byte-wise swapped 128-bits data blocks. This swapping is then compensated by the SHE hardware during the internal processing. Note that the results of the SHE processing which are wider than 64 bits are also represented in the big endian ordering of bytes and are available in the output FIFO of SHE in the byte swapped way.

Figure 4-10 FIFO Data Ordering for Parameters Wider than 64 Bits**Input FIFO**

The input FIFO of SHE is used for the transfer of parameters and data required for SHE command execution. It can be written automatically through the input data master or manually by the user through the command interface - refer to the Input FIFO Write Data Register (SHE_IFIFOWRDATA0 to 31) description. The input FIFO has a capacity of 1,536 bits, which is sufficient to store one and a half bursts from the input data master. The size of free space in the input FIFO can be determined by reading the SHE_FIFOLoad:IFIFOFREE status register.

The input FIFO provides a programmable write threshold setting - refer to the Input FIFO Configuration Register (SHE_IFIFOCFG) description. If the amount of stored data words is less than the stored value, a status flag (SHE_FIFOSTATUS:IFIFOWRTH) and an interrupt flag (SHE_IRQ:IFIFOWRTH) are set.

SHE has to be able to recognize that the amount of data required for the execution of a SHE API function has been transferred through the input FIFO. For this purpose two specific registers are introduced: SHE_COMPARE and SHE_DATAcnt. The former contains the required amount of data and the latter contains the amount of data actually transferred. According to the SHE specification, the largest possible data stream size for a function is 2^{64} bits. And since both registers represent data amounts in terms of 32-bit words, their size is specified to 59 bits.

SHE_DATAcnt is an up-counter and is automatically reset to zero every time the opcode for a new SHE API function is written to the SHE_CMD register. Every read access to the input FIFO increases the value of the counter. When the counter reaches the value of the SHE_COMPARE register, the

status bit `SHE_FIFOSTATUS:COMPAREMATCH` and an interrupt request bit `SHE_IRQ:COMPAREMATCH` are immediately set. This transition of the `COMPAREMATCH` bit is referenced to as a compare match event.

`SHE_COMPARE` is reset by the hardware to the maximal value ($2^{59} - 1$) every time the opcode for a new SHE command is written to the `SHE_CMD` register. This approach avoids an immediate compare match event in case of low reset values (including zero value). In most cases the `SHE_COMPARE` register is configured through the SHE control logic according to selected command and/or parameter values and cannot be changed during command execution. The only exception to this rule is two SHE commands `CMD_ENC_CBC` and `CMD_DEC_CBC`. In this case the amount of processing data is not always known (i.e. a priori) and command execution is started using the default value of `SHE_COMPARE`. Once the required amount of data is known, the software updates the `SHE_COMPARE` register.

According to the functional specification of SHE, some commands require notification in case the amount of delivered data exceeds that required. This notification will be stored in the error code register and can be read by the software. But since the error code has to be read by software before a new command can be written, there is a time window from reading the error code to writing the new command where new data could enter the input FIFO without being recognized by the software (error code already read). In order to avoid this situation, the write port of the input FIFO has to be locked at the time when all input data have been transferred until the next command is written. This means the lock is enabled immediately after the compare match event and disabled upon writing new opcode to the `SHE_CMD` register. If any write access to the locked input FIFO is performed by the input data master or through the command interface, an error interrupt flag (`SHE_IRQ:IFIFOLOCKERR`) is set.

Output FIFO

The output FIFO of SHE is used to transfer the results of SHE commands. It can be read automatically by the output data master or manually by the user through the command interface - refer to the Output FIFO Read Data Register (`SHE_OFIFORDDATA0` to `31`) description. The capacity of the output FIFO is equal to 1,536 bits, which is sufficient to store one and a half bursts for the output data master. The load status of the output FIFO can be determined by reading the `SHE_FIFOSTATUS:OFIFOLOAD` status bit.

The output FIFO provides the programmable read threshold setting (see `SHE_OFIFOCFG:RDTHRESHOLD` bit description). If the amount of stored data words is greater than the stored value, a status flag (`SHE_FIFOLOAD:OFIFORDTH`) and an interrupt flag (`SHE_IRQ:OFIFORDTH`) are set.

To avoid an inconsistent state in case of excess data contained in FIFOs, they are both cleared automatically at the beginning of the command. More precisely, the FIFOs are cleared by a writing access to the command register `SHE_CMD` while SHE is not busy.

5. Notes on Using SHE

This section lists some issues which has to be taken care of when using the SHE module. Programmers should read these guidelines before programming the SHE module.

5.1. General Notes on Using SHE

SHE is connected to the same reset and the same clock signals as the CPU and the WFLASH. The only difference is that the clock of SHE cannot be switched off in the system controller and is always enabled. However SHE allows local clock gating (refer to 3.1.1 Power saving functionality).

Note:

- *Since secure key storage is implemented in WFLASH, the WFLASH clock must be enabled when SHE functionality is required.*

5.1.1. Notes on Using SHE Commands

CMD_SECURE_BOOT

Secure boot process is automatically started after every reset. Secure boot settings i.e. secure boot mode, start address and size of the protected memory are stored in the BDR area of the TCFLASH. The Boot ROM code reads these settings and afterwards evaluates them and configures the input data master of SHE and starts execution of the CMD_SECURE_BOOT.

Note that the user application is started only after the execution of CMD_SECURE_BOOT inside SHE has begun. Hence from the point of view of user application some SHE registers do not have their reset values as defined in this document. Depending on secure boot settings following registers can be effected:

- SHE_CMD
- SHE_STATUS
- SHE_ERC
- SHE_IMSTADDR
- SHE_IMSTCNT
- SHE_IMSTSTART
- SHE_IFIFOCFG
- SHE_COMPARE0 to 1
- SHE_MSTSTATUS
- SHE_FIFOSTATUS
- SHE_FIFOLoad
- SHE_DATACNT0 to 1

Depending on secure boot mode, the secure boot process may not have finished when entering the application. The application software or SHE driver shall consider that SHE might still be busy and should either wait for its completion or cancel the process.

Autonomous Bootstrap Configuration of the Secure Boot Process

If the secure booting has been personalized during the same boot process, the following is valid for the BOOT_MAC memory slot:

- None of the flags are set
- The counter is equal to 1

Memory Used for Secure Boot

Though all of the memories of MCU can be used for the secure boot process, it is recommended to use only the instruction flash (TCFLASH), since write access to it is monitored by SHE. This means a write access to instruction flash during the secure boot leads to the secure boot failure.

Secure Boot Settings

Secure boot start address should be aligned to 64-bit boundary (lower 3 bits are "0"). Otherwise it will be automatically aligned by the Boot ROM code during the evaluation of the secure boot settings. Note that only the start address which is used for setting up the input data master of the SHE is modified, not the address in BDR which is the entry address to the application. The amount of data which is

transferred to SHE for the CMD_SECURE_BOOT is always a multiple of 128-bits. If the secure bit size parameter stored in BDR is not a multiple of 128-bits, following applies 'data size of input data master configuration' = $\text{ceil}(\text{'size from BDR'} / 16) * 2$. The amount of valid data is still given by the secure boot size parameter in the BDR.

If secure boot start address and/or secure boot size are modified by the Boot ROM, the secure boot process may try to access non-initialized memory regions before or after the authenticated area. If such access causes bus error, secure boot process will fail.

If secure boot start address and/or secure boot size are modified by Boot ROM during successful personalization (self-learning of BOOT_MAC) and the secure boot settings in the BDR are not changed by the user anymore, same adjustment applies to secure boot process during next reset cycles and successful secure boot is possible.

Furthermore this automated adjustment of the secure boot settings must be kept in mind if the BOOT_MAC is calculated offline and loaded into SHE using CMD_LOAD_KEY. Otherwise the BOOT_MAC calculated by SHE may not be equal to the reference BOOT_MAC and the secure boot will fail.

CMD_LOAD_KEY

The initial (empty) value of the non-volatile slots is: 0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF.

Special care has to be taken if the memory update command fails, i.e. the error code register

SHE_ERC:CMDMAIN contains an error code other than ERC_NO_ERROR. In such a case the user should check whether the old or the new version of the key is valid before repeating the update. If an error occurs before or during the physical write operation to the memory, the old value is still valid. If an error occurs after the physical write operation to the memory, the new value is valid.

SHE stores keys in a redundant way which is intended to cover aging and transient errors. Occurrence of such errors in the memory slot during the write by CMD_LOAD_KEY cause the command to fail despite redundancy and the NVM state is not changed. However in some rare cases such errors are accepted by CMD_LOAD_KEY and the memory slot is updated. In that case the command CMD_LOAD_KEY will succeed (SHE_ERC:CMDMAIN contains ERC_NO_ERROR), but the user will be notified by the warning code (other than ERC_INVALID) in the extended error code register (SHE_ERC:CMDEXTD) and can react by repeating the memory update procedure.

5.1.2. SHE Used Error Codes/Used Cancel Codes

Table 5-1 SHE Used Error Codes

Cancel Error	Command Error	Main Error	Description
0x0010	0x0001	ERC_NO_ERROR	Command was normally completed.
See Table 5-2	0x000E	ERC_CANCELED	The current command was aborted by SHE_CMDCANCEL.CANCELREQ.
0x0010	0x010D	ERC_GENERAL_ERROR	AES engine could not be stopped after a preceding error.
0x0010	0x020D	ERC_GENERAL_ERROR	Internal register access invoked a bus error.
0x0010	0x4D06	ERC_NO_SECURE_BOOT	TCFLASH was written during Secure Boot.
0x0010	0x4506	ERC_NO_SECURE_BOOT	Secure boot is disabled by the empty secure boot key.
0x0010	0x2f03	ERC_KEY_NOT_AVAILABLE	While a boot protected key was used, the BOOTOK flag was cleared, e.g. by clock switching.
0x0010	0x3003	ERC_KEY_NOT_AVAILABLE	While a debugger protected key was used, the EXTDEBUGGER flag was set due to the connecting debugger.
0x0010	0x390D	ERC_GENERAL_ERROR	The requested command is not available in the current state or mode.
0x0010	0x370D	ERC_GENERAL_ERROR	The AXI channel master stopped host-to- SHE transfer due to a bus error.
0x0010	0x360D	ERC_GENERAL_ERROR	The AXI channel master stopped SHE-to- host transfer due to a bus error.
0x0010	0x1904	ERC_KEY_INVALID	Invalid SHE slot number command argument.
0x0010	0x1004	ERC_KEY_INVALID	The RAM key to be exported was loaded as a plain key.
0x0010	0x1E09	ERC_RNG_SEED	The command requires initialized RNG but CMD_INIT_RNG was not executed before or was discarded by CMD_DEBUG.
0x0010	0x3A0D	ERC_GENERAL_ERROR	Illegal device test mode request in SHE operation mode.
0x0010	0x1C04	ERC_KEY_INVALID	Key update protocol violated by an invalid key ID or an authentication ID.
0x0010	0x2708	ERC_KEY_UPDATE_ERROR	Key update violated by unmatched UID.
0x0010	0x1B08	ERC_KEY_UPDATE_ERROR	Key update violated by unmatched M3.
0x0010	0x1308	ERC_KEY_UPDATE_ERROR	Key update protocol violated by a wildcard UID despite the wildcard being disabled for the slot.
0x0010	0x4E0D	ERC_GENERAL_ERROR	CMD_INIT_RNG failed due to missing TRNG calibration data.
0x0010	0x030D	ERC_GENERAL_ERROR	Command disabled or command code unknown.
0x0010	0x190A	ERC_NO_DEBUGGING	CMD_DEBUG failed due to invalid authentication.
0x0010	0x1107	ERC_KEY_WRITE_PROTECTED	CMD_DEBUG failed due to at least one write protected or invalid SHE slot.
0x0010	0x170D	ERC_GENERAL_ERROR	At any command end there are still unprocessed data in the input FIFO if an extra argument was falsely provided to SHE.

Cancel Error	Command Error	Main Error	Description
0x0010	0x3C0D	ERC_GENERAL_ERROR	This is a special asynchronous error code which may occur independently of the normal command end if the ECC double bit error in the SHE RAM does not allow further SHE operations. If it occurs, the lower byte of SHE_STATUS is not updated but SHE_STATUS:FATAL is set. SHE is halted.
0x0010	0x400D	ERC_GENERAL_ERROR	MCU device mode was changed on-the-fly during the current SHE operation mode. SHE is halted.
0x0010	0x420D	ERC_GENERAL_ERROR	Illegal combination of device mode signals and SHE mode signals. SHE is halted.
0x0010	0x3D0D	ERC_GENERAL_ERROR	Invalid NVM state found during SHE start- up. SHE is halted.
0x0010	0x3B0D	ERC_GENERAL_ERROR	Despite SHE being disabled due to the NVM state and device mode, the device mode changes again. SHE remains stopped.
0x0010	0x410D	ERC_GENERAL_ERROR	The device mode changes again despite SHE being in test mode. SHE remains stopped.
0x0010	0x430D	ERC_GENERAL_ERROR	NVM is blank. Fabrication is not complete. SHE is halted.
0x0010	0x3E0D	ERC_GENERAL_ERROR	The device mode changes despite SHE being in operation. SHE is halted.
0x0010	0x340C	ERC_MEMORY_FAILURE	Internal NVM address is out of range. NVM operation skipped.
0x0010	0x310C	ERC_MEMORY_FAILURE	Reading NVM showed there was insufficient redundancy to rely in data
0x0010	0x4A0D	ERC_GENERAL_ERROR	Slot ID is out of range. Internal error which should never occur.
0x0010	0x350D	ERC_GENERAL_ERROR	An active NVM slot revision was not completely loaded. This error should never occur.
0x0010	0x330C	ERC_MEMORY_FAILURE	Failed read verification of a word just written to the NVM.
0x0010	0x0B03	ERC_KEY_NOT_AVAILABLE	A boot protected key is used even though secure boot had failed (BOOTOK == 0).
0x0010	0x1A08	ERC_KEY_UPDATE_ERROR	Key update protocol violated by invalid key counter.
0x0010	0x0F03	ERC_KEY_NOT_AVAILABLE	A debugger protected key is used despite external debugger being connected.
0x0010	0x1204	ERC_KEY_INVALID	The key usage for encryption/decryption or MAC calculation/verification does not match the slot flag.
0x0010	0x1806	ERC_NO_SECURE_BOOT	Invalid sequence of secure boot commands CMD_SECURE_BOOT, CMD_BOOT_OK and CMD_BOOT_FAILURE.
0x0010	0x1F0C	ERC_MEMORY_FAILURE	A bus error occurred when accessing the NVM private bus.
0x0010	0x210D	ERC_GENERAL_ERROR	A double bit error occurred when reading the NVM.
0x0010	0x230C	ERC_MEMORY_FAILURE	The HANGINT error occurred when erasing a sector of the NVM.
0x0010	0x540C	ERC_MEMORY_FAILURE	SHE could not lock Flash by setting WE bit.
0x0010	0x5501	ERC_MEMORY_FAILURE	SHE may not have properly released Flash IF by clearing WE bit.

Cancel Error	Command Error	Main Error	Description
0x0010	0x080C	ERC_MEMORY_FAILURE	The NVM Master was either not idle before reading the NVM or does not get ready after sequencer operation (sector erase, blank check)
0x0010	0x200C	ERC_MEMORY_FAILURE	Flash interface reported that a word could not be written correctly.
0x0010	0x090C	ERC_MEMORY_FAILURE	The NVM Master was not idle before writing to the NVM.
0x0010	0x500C	ERC_MEMORY_FAILURE	The sector swap during the NVM update failed. The old values are still active but redundancy is reduced.
0x0010	0x0C0C	ERC_MEMORY_FAILURE	A required slot is not available due to an NVM error during start-up.
0x0010	0x0D0C	ERC_MEMORY_FAILURE	A RAM buffered NVM slot is corrupted by a double bit error.
0x0010	0x0E05	ERC_KEY_EMPTY	A slot needed for authentication, encryption, decryption MAC generation or verification is empty.
0x0010	0x1107	ERC_KEY_WRITE_PROTECTED	A slot to be updated is write protected.
0x0010	0x4F0C	ERC_MEMORY_FAILURE	The slot update failed and the slot still shows the old value but with reduced redundancy.
0x0010	0x510C	ERC_MEMORY_FAILURE	The slot update failed due to multiple defects and no longer contains any valid key.
0x0010	0x4F01	ERC_NO_ERROR	The slot update was incomplete. The slot contains the new value but the redundancy of the control marker has been reduced.
0x0010	0x140D	ERC_GENERAL_ERROR	TRNG returned an autocorrelation error.
0x0010	0x250D	ERC_GENERAL_ERROR	TRNG returned a CRNGT error.
0x0010	0x260D	ERC_GENERAL_ERROR	The TRNG returned a “Lost Sample” error.
0x0010	0x160D	ERC_GENERAL_ERROR	TRNG did not return RND on time.
0x0010	0x240D	ERC_GENERAL_ERROR	TRNG returned a “Von Neumann” error.

Table 5-2 SHE Used Cancel Codes

Cancel Error	Command Error	Main Error	Description
0x0010	See Table 4-1	See Table 4-1	Command was not cancelled.
0x0000	n.a.	n.a.	Cancellation requested but not yet processed.
0x0001	0x000E	ERC_CANCELED	Cancelled without any error.
0x010D	0x000E	ERC_CANCELED	AES engine could not be stopped during cancellation.
0x020D	0x000E	ERC_CANCELED	Internal register access invoked a bus error during cancellation.

6. Enhanced Secure Hardware Extension

This section describes Enhanced Secure Hardware Extension (ESHE) module which is an extension of the SHE. ESHE is fully compliant with Functional Specification of SHE[1] and provides some additional functionality which is described below.

6.1. Additional Generate Purpose Keys

ESHE has ten additional non-volatile memory slots KEY_11 through KEY_20 which means that ESHE provides in total twenty general-purpose keys KEY_<n> (where n is a number 1...20). The additional keys comply to KEY_<n> requirements from Functional Specification of SHE and can be used for bulk data processing through functions described in section [5.3].

Additional keys KEY_11 to KEY_20 are addressable by a four-bit address as shown in the Table 6-1.

Table 6-1 KEY_<n> (n = 11..20) Addressing

Key Name	Address (hexadecimal)
– KEY_11	– 0x4
– KEY_12	– 0x5
– KEY_13	– 0x6
– KEY_14	– 0x7
– KEY_15	– 0x8
– KEY_16	– 0x9
– KEY_17	– 0xA
– KEY_18	– 0xB
– KEY_19	– 0xC
– KEY_20	– 0xD

Note:

- since keys KEY_11 to KEY_20 have the same addresses as the already existing keys KEY_1 to KEY_10 the differentiation which key is used it based on the command being executed. KEY_1 to KEY_10 can only be used together with commands specified by Functional Specification of SHE whereas KEY_11 to KEY_20 can only be used together with the new ESHE commands described in section [5.3].

6.2. Additional Verify Only Flag

An additional key usage flag "VERIFY_ONLY" is implemented for KEY_<n> memory slots (where n is a number 1...20) and can be used for key usage restriction. If this flag is set to "1", the memory slot can only be used for the CMD_VERIFY_MAC command. Trying to use such key for en-/ decryption operations as well as for MAC generation will result in an error code ERC_KEY_INVALID. Otherwise, if the verify only flag is set to "0", the memory slot can be used either for en-/decryption operation or for MAC generation/verification operation depending on the value of the key usage flag as specified in the Functional Specification of SHE.

Following table summarizes the key usage according to values of VERIFY_ONLY and KEY_USAGE flags.

Table 6-2 The key usage according to values of VERIFY_ONLY and KEY_USAGE flags

VERIFY_ONLY Flag	KEY_USAGE	Key Usage
0	0	Encryption or decryption
0	1	MAC generation or verification
1	don't care	MAC verification

The memory update protocol for a KEY_<n> slot equipped with the VERIFY_ONLY flag is modified with respect to computing of the M2 message.

- The FID flag vector is extended by the VERIFY_ONLY flag

$$F_{ID}' = \text{WRITE_PROTECTION} | \text{BOOT_PROTECTION} | \text{DEBUGGER_PROTECTION} | \text{KEY_USAGE} | \text{WILDCARD} | \text{VERIFY_ONLY}$$

- The size of the pattern to fill the first block with "0" bits padding data is reduced by one bit

$$M_2 = \text{ENC}_{\text{CBC}, K1, IV=0}(C_{ID}' | F_{ID}' | "0...0"_{94} | K_{ID}')$$

6.3. Additional User-accessible Functions

ESHE provides seven additional user-accessible commands which can be used in combination with the general-purpose keys KEY_11 to KEY_20. These commands are derived from the commands applicable to KEY_<n> memory slots as defined by SHE Functional Specification and are marked with “_ESHE” suffix. The functionality of the ESHE commands is the same as of the appropriate SHE commands with the difference that ESHE commands are applicable only to KEY_11 to KEY_20. All new ESHE commands are listed in the Table 6-3 together with the opcode value which is required to start the execution through the SHE_CMD register.

Table 6-3 ESHE Commands

	SHE_CMD opcode
CMD_ENC_ECB_ESHE	– 0x41
CMD_ENC_CBC_ESHE	– 0x42
CMD_DEC_ECB_ESHE	– 0x43
CMD_DEC_CBC_ESHE	– 0x44
CMD_GENERATE_MAC_ESHE	– 0x45
CMD_VERIFY_MAC_ESHE	– 0x46
CMD_LOAD_KEY_ESHE	– 0x47

The order in which parameters and data for processing are expected as well as the order in which results are generated is shown in Table 6-4.

Table 6-4 Parameter Order for ESHE Commands

Command	Parameter			Return Value		
	Seq. No	Name	Size [Bits]	Seq. No	Name	Size [Bits]
CMD_ENC_ECB_ESHE	1	KEY ID ¹	64	1	CIPHERTEXT	128
	2	PLAINTEXT	128			
CMD_ENC_CBC_ESHE	1	KEY ID1	64	1	CIPHERTEXT	n x 128
	2	IV	128			
	3	PLAINTEXT	n x 128			
CMD_DEC_ECB_ESHE	1	KEY ID1	64	1	PLAINTEXT	128
	2	CIPHERTEXT	128			
CMD_DEC_CBC_ESHE	1	KEY ID1	64	1	PLAINTEXT	n x 128
	2	IV	128			
	3	CIPHERTEXT	n x 128			
CMD_GENERATE_MAC_ESHE	1	KEY ID1	64	1	MAC	128
	2	MESSAGE LENGTH	64			
	3	MESSAGE	n2 x 128			

Command	Parameter			Return Value		
	Seq. No	Name	Size [Bits]	Seq. No	Name	Size [Bits]
CMD_VERIFY_MAC_ESHE	1	KEY ID1	64	1	VERIFICATION STATUS	64
	2	MESSAGE LENGTH	64			
	3	MAC LENGTH	64			
	4	MAC	128			
	5	MESSAGE	n2 x 128			
CMD_LOAD_KEY_ESHE	1	M1	128	1 2	M4 M5	256 128
	2	M2	256			
	3	M3	128			

¹ : valid values: 0x04, ..., 0xD, which corresponds to KEY_11, ..., KEY_20

² : $n = \text{ceil}^3 (\text{MESSAGE_LENGTH} / 128)$

³ : $\text{ceil}(x) = \min\{n \in \mathbb{Z}_1 \mid n \geq x\}, \mathbb{Z}_1 = \{1, 2, 3, \dots\}$

6.3.1. CMD_LOAD_KEY_ESHE

Secure key update for additional general-purpose keys KEY_11 to KEY_20 is done through the command CMD_LOAD_KEY_ESHE. The memory update protocol is derived from the one described in chapter 9 of Functional Specification of SHE[1]. The differences are described below.

Key update message M1 is generated according to chapter 9.1 of Functional Specification of SHE and is a concatenation of the UID, the ID of the memory slot to be updated and ID of the key used for the authentication. However the ID and AuthID are evaluated according to Table 6-5.

Table 6-5 Parameter Order for ESHE Commands

Key to update	Authentication	ID values to be used for CMD_LOAD_KEY_ESHE			
		KEY_ID	ID	KEY_AuthID	AuthID
KEY_<n>	KEY_<n>	KEY_<n>	0x4..0xD	same as KEYID	same as ID
KEY_<n>	MASTER_ECU_KE	KEY_<n>	0x4..0xD	MASTER_ECU_K	0x1
RAM_KEY	KEY_<n>	RAM_KEY	0xE	KEY_<n>	0x4..0xD

Note: n = 11..20

Key update and verification messages M2 - M5 are generated according to chapters 9.1 and 9.2 of Functional Specification of SHE. However the constants which are used for generation of intermediate keys K1 - k4 are modified by adding 0x00800000 00000000 00000000 00000000 which is done to prevent cross loading of keys between the memory slots reserved for KEY_1 through KEY_10 and the memory slots reserved for KEY_11 through KEY_20.

The complete message generation scheme for command CMD_LOAD_KEY_ESHE is shown below.

```

KEY_UPDATE_ENC_C* = KEY_UPDATE_ENC_C + 0x00800000 00000000 00000000 00000000
KEY_UPDATE_MAC_C* = KEY_UPDATE_MAC_C + 0x00800000 00000000 00000000 00000000
FID' =
WRITE_PROTECTION|BOOT_PROTECTION|DEBUGGER_PROTECTION|KEY_USAGE|WILDCARD|VERIFY_ONLY

```

```

K1 = KDF(KAuthID, KEY_UPDATE_ENC_C*)
K2 = KDF(KAuthID, KEY_UPDATE_MAC_C*)
M1 = UID|ID|AuthID
M2 = ENCCBC,K1,IV=0(CID'|FID'|"0...0"94|KID')
M3 = CMACK2(M1|M2)

```

```

K3 = KDF(KID, KEY_UPDATE_ENC_C*)
K4 = KDF(KID, KEY_UPDATE_MAC_C*)
M4 = UID|ID|AuthID|ENCECB,K3(CID)
M5 = CMACK4(M4)

```

CHAPTER 27: DMA Controller

This chapter explains DMA Controller.

1. Overview
2. Configuration
3. Operational Description
4. Registers
5. Additional Information

DMA-TXXPT03P01R01L08-E1-XX

1. Overview

The DMA Controller (DMAC) implements Direct Memory Access (DMA) with little CPU intervention. DMAC is performing complex data transfers through 'N' DMA channels. This section describes the features and the block diagram of DMA Controller.

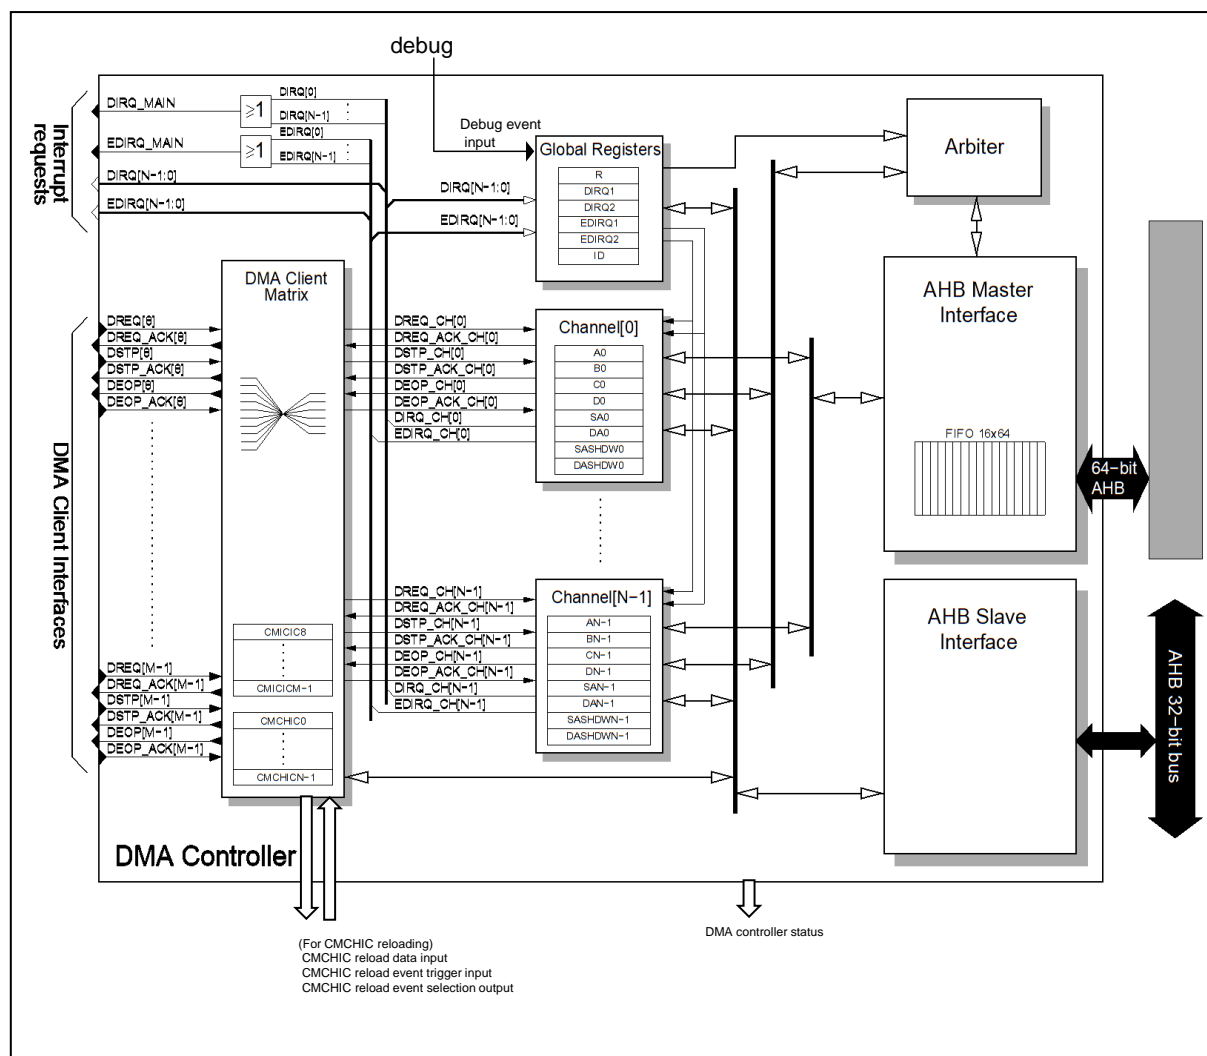

The following items are the features related to data transfer by the DMA Controller:

- Data can be transferred independently over multiple channels
- A high number of MCU internal and MCU DMA clients can be assigned to the available DMA channels
- Flexible priority between DMA channels (fixed, dynamic, or round-robin)
- DMA transfer request sources
 - Hardware request (internal clients)
 - Software request (register write)
- Transfer modes
 - Block transfer and burst transfer
 - Addressing: full 32-bit (incrementing, decrementing, or fixed)
 - Data types: 8-, 16-, 32-, or 64-bit wide data

2. Configuration

This section shows the block diagram.

Figure 2-1 Block Diagram

DREQ : DMA Request

DREQ_ACK : DMA Request Acknowledge

DSTP : DMA Stop Request

DSTP_ACK : DMA Stop Request Acknowledge

DEOP : DMA End of Processing

DEOP_ACK : DMA End of Processing Acknowledge

DIRQ : Completion Interrupt

EDIRQ : Error Interrupt

'i' represents instance number of DMAC. i = 0

'n' represents channel number. $n = 0, 1, 2, \dots, 15$

'N' represents number of DMAC channels per DMAC instance. $N = 16$ in this product.

'm' represents client number. $m = 8, 9, \dots$, (product specification)

'M' represents number of client I/F. $M =$ (product specification) in this product.

Note:

- Please refer "CHAPTER:PLATFORM OVERVIEW" for the maximum numbers.

3. Operational Description

This section describes the operation of the DMA controller.

Features of DMA Controller

- DMA Client Matrix, routing 'M' DMA clients to 'N' DMA channels
- DMA trigger
 - Hardware request (internal clients)
 - Software request
- Two transfer modes
 - Block transfer
 - Burst transfer
- 8-, 16-, 32-, or 64-bit wide data transfers
- Master transactions can be done in user or privileged mode
- Writing the configuration registers can only be done in privileged mode and 8-, 16-, or 32-bit wide. Illegal accesses result in an error response
- Reading the configuration registers can be done in user or privileged mode
- Incrementing, decrementing, or fixed addressing independent for source and destination
- Independent source and destination access protection
- Central interrupt flag register for completion and error interrupts
- Stop status per channel for analysis by ISRs or debugging
- Shadow registers for source and destination address
- Configurable debug event behavior (continue, halt, or stop)
- Three channel arbitration schemes
 - Fixed priority
 - Dynamic priority
 - Round-robin
- Client matrix reloading (CMCHIC reloading)

Global Functions of the DMA Controller

DMAC Enabling or Halting

After reset the DMA Controller is disabled. DMAC is enabled by setting DMA Enable (DMAi_R:DE) to "1". If DMA Enable is set to "1" the individual DMA Channel Enable (DMAi_An:EB) settings become effective. Setting DMA Enable to "0" disables the complete DMAC. Setting DMA Enable to "0" while there is a not completed transfer running on a DMA channel, the running transfer is stopped when its current block of data was transferred, and an error interrupt is issued. In case it is the last block of data of this DMA transfer a completion interrupt is issued. DMA channels which have a DMA transfer pending, but are not currently served are disabled and an error interrupt is issued. DMA channels which are enabled but have not started a DMA transfer (channel was enabled and there was not a transfer request yet) are simply disabled without issuing an error interrupt.

The DMA Controller can be halted completely (all DMA channels) by writing a single bit, DMA Halt (DMAi_R:DH). When this bit is set to "1", all DMA channels are requested to halt and not perform DMA transfers until this bit is cleared. After DMA Halt is cleared the halted DMA transfers continue at the point they were halted. If DMA Halt is set to "1" while a transfer is running, halting takes place once the current block of data of the running transfer is transferred. Depending on the clock ratio of the DMAC/source clock domain and DMAC/destination clock domain a considerable time can elapse between the time when the halt request was set and when the DMAC is actually halted.

Global disable and halt request condition of the DMAC is indicated by DMA Stop/Halt Request Flag (DMAi_R:DSHR). DMA Stop/Halt Request Flag is "0" if none of the below disable or halt request conditions is true:

- DMAi_R:DE bit is set to "0"
 - DMAi_R:DH bit is set to "1"
 - DMAi_R:DBE = 1, DMAi_R:DB[1:0] = 0b10 (stop on debug event), and a 'debug event' is pending
 - DMAi_R:DBE = 1, DMAi_R:DB[1:0] = 0b01 (halt on debug event), and a 'debug event' is pending
- If any of the above conditions is true, DMA Stop/Halt Request Flag is "1" indicating that DMA transfers of all channels are requested to halt or stop.

The condition that all channels are halted or have come to a stop after a global halt or stop request is indicated by DMA Stop/Halt Status Flag (DMAi_R:DSHS). DMA Stop/Halt Status Flag is "0" if one or more channels are not yet stopped or halted and "1" if all channels are stopped or halted.

DMAC Debug Behavior

The DMA Controller can be configured to react in a predefined way on a 'debug event' (e.g. debugger break point). The feature to react on a 'debug event' can be enabled with bit Debug Enable (DMAi_R:DBE). If enabled the DMACs behavior depend on the setting of Debug Behavior (DMAi_R:DB[1:0]). This feature is disabled after reset.

The behavior can be configured to stop all transfers (DMAi_R:DB[1:0] = 0b10), or to halt all transfers (DMAi_R:DB[1:0] = 0b01), or just to continue operation independent of debug events (DMAi_R:DB[1:0] = 0b00). Initial value is to continue operation independent of debug events.

3.1. DMA Channels

This section describes behavior of the DMA channel.

Modes of Operation

The DMA channels can operate in two modes:

- Block transfer mode
- Burst transfer mode

The mode must be set with bits Mode Select (DMAi_Bn:MS[1:0]). After reset, the channel is set to block transfer mode.

Block Transfer Mode

In block transfer mode the DMA client will request the transfers of a specified number of blocks of data. The number of blocks to be transferred is specified with Transfer Count (DMAi_An:TC[15:0]). Each block of data is transferred in one arbitration phase of the DMA arbiter. For each block to transfer a DMA transfer request, either a hardware request or software request is needed. The DMA client or the software continues to give requests until the DMAC has transferred the specified number of blocks and thus the DMA transfer is completed. The DMA transfer will be successfully completed if all blocks of data were transferred without error or unsuccessfully completed if an error condition occurred.

After each transferred block of data the DMA arbiter does another arbitration and proceed with the next requesting channel with the highest priority. The arbitration depends on the selected arbitration scheme.

DMA Transfer Requests

1. Hardware request

For a channel hardware request Input Select (DMAi_An:IS) need to be set to '01'. The DMA client which is routed through the DMA Client Matrix to the channel will give the trigger by asserting DREQ. Refer 3.2 for the function and configuration of the DMA Client Matrix.

2. Software request

For a software request Input Select need to be set to '00' and Software Trigger (DMAi_An:ST) must be set to "1". Software Trigger shall be set to "1" if the channel is ready to receive a software trigger, which is indicated with Software Trigger Ready (DMAi_Bn:SR) and no error condition is pending (DMAi_Bn:SS[2:0] is '000' or '101'). If Software Trigger is tried to set to "1" while Software Trigger Ready is "0", it is ignored. Software Trigger is automatically cleared by hardware once the trigger is accepted or an error condition occurs. The error conditions can be:

- DMA channel is disabled right after setting Software Trigger
- A debug event occurred and DMAC is configured to stop all transfers on a debug event
- The master interface receives an error response and the CPU sets the Software Trigger before receiving an error interrupt caused by the AHB error

Block of Data

A block of data is determined by the setting of Block Count (DMAi_An:BC[3:0]) and Transfer Width (DMAi_Bn:TW[1:0]). The DMA Controller will make DMAi_An:BC + 1 data transfers from source address range starting at Source Address (DMAi_SAn:SA) to destination address range starting at Destination Address (DMAi_DAn:DA). If DMAi_An:BC is set to "0" a single data transfer from Source Address (DMAi_SAn:SA) to Destination Address (DMAi_DAn:DA) will be done. The settings of Block Count (DMAi_An:BC[3:0]), Beat Limit (DMAi_An:BL[1:0]), Alternate (DMAi_An:AL), and Transfer Width (DMAi_Bn:TW[1:0]) define how the AHB master interface issues the DMAi_An:BC + 1 data transfers. The following table shows all possible combinations between DMAi_An:BC, DMAi_An:BL, and

DMAi_An:AL. Only these three influence the sequence of AHB transfers, whereas DMAi_Bn:TW only affects the data size which will be transported.

Table 3-1 Block Count/Beat Limit/Alternate Combinations

Block Count	Beat Limit	Alternate	Resulting Sequence of AHB Transfers
0	SINGLE	0	1x SINGLE RD + 1x SINGLE WR
1	SINGLE	0	2x SINGLE RD + 2x SINGLE WR
2	SINGLE	0	3x SINGLE RD + 3x SINGLE WR
3	SINGLE	0	4x SINGLE RD + 4x SINGLE WR
4	SINGLE	0	5x SINGLE RD + 5x SINGLE WR
5	SINGLE	0	6x SINGLE RD + 6x SINGLE WR
6	SINGLE	0	7x SINGLE RD + 7x SINGLE WR
7	SINGLE	0	8x SINGLE RD + 8x SINGLE WR
8	SINGLE	0	9x SINGLE RD + 9x SINGLE WR
9	SINGLE	0	10x SINGLE RD + 10x SINGLE WR
10	SINGLE	0	11x SINGLE RD + 11x SINGLE WR
11	SINGLE	0	12x SINGLE RD + 12x SINGLE WR
12	SINGLE	0	13x SINGLE RD + 13x SINGLE WR

0	INCR16	1	1x SINGLE RD + 1x SINGLE WR
1	INCR16	1	2x (1x SINGLE RD + 1x SINGLE WR)
2	INCR16	1	3x (1x SINGLE RD + 1x SINGLE WR)
3	INCR16	1	1x (1x 4_BEAT RD + 1x 4_BEAT WR)
4	INCR16	1	1x (1x 4_BEAT RD + 1x 4_BEAT WR) + 1x SINGLE RD + 1x SINGLE WR
5	INCR16	1	1x (1x 4_BEAT RD + 1x 4_BEAT WR) + 2x (1x SINGLE RD + 1x SINGLE WR)
6	INCR16	1	1x (1x 4_BEAT RD + 1x 4_BEAT WR) + 3x (1x SINGLE RD + 1x SINGLE WR)
7	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR)

Block Count	Beat Limit	Alternate	Resulting Sequence of AHB Transfers
8	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR) + 1x SINGLE RD + 1x SINGLE WR
9	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR) + 2x (1x SINGLE RD + 1x SINGLE WR)
10	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR) + 3x (1x SINGLE RD + 1x SINGLE WR)
11	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR) + 1x (1x 4_BEAT RD + 1x 4_BEAT WR)
12	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR) + 1x (1x 4_BEAT RD + 1x 4_BEAT WR) + 1x SINGLE RD + 1x SINGLE WR
13	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR) + 1x (1x 4_BEAT RD + 1x 4_BEAT WR) + 2x (1x SINGLE RD + 1x SINGLE WR)
14	INCR16	1	1x (1x 8_BEAT RD + 1x 8_BEAT WR) + 1x (1x 4_BEAT RD + 1x 4_BEAT WR) + 3x (1x SINGLE RD + 1x SINGLE WR)
15	INCR16	1	1x 16_BEAT RD + 1x 16_BEAT WR

Note:

- *n_BEAT RD can be a 'n' beat incremental burst (INCRn) or it can be 'n' times a single (SINGLE) data transfer. n_BEAT RD will be 'n' times a SINGLE transfer if one or more of the following conditions is met:*
 - Fixed Source Address (DMAi_Dn:FS) is set to "1"
 - Decrement Source Address (DMAi_Dn:DES) is set to "1"
 - The 1 KB AHB address boundary will be crossed by the read block transfer
- *n_BEAT WR can be a 'n' beat incremental burst (INCRn) or it can be 'n' times a single (SINGLE) data transfer. n_BEAT WR will be 'n' times a SINGLE transfer if one or more of the following conditions is met:*
 - Fixed Destination Address (DMAi_Dn:FD) is set to "1"
 - Decrement Destination Address (DMAi_Dn:DED) is set to "1"
 - The 1 KB AHB address boundary will be crossed by the write block transfer.

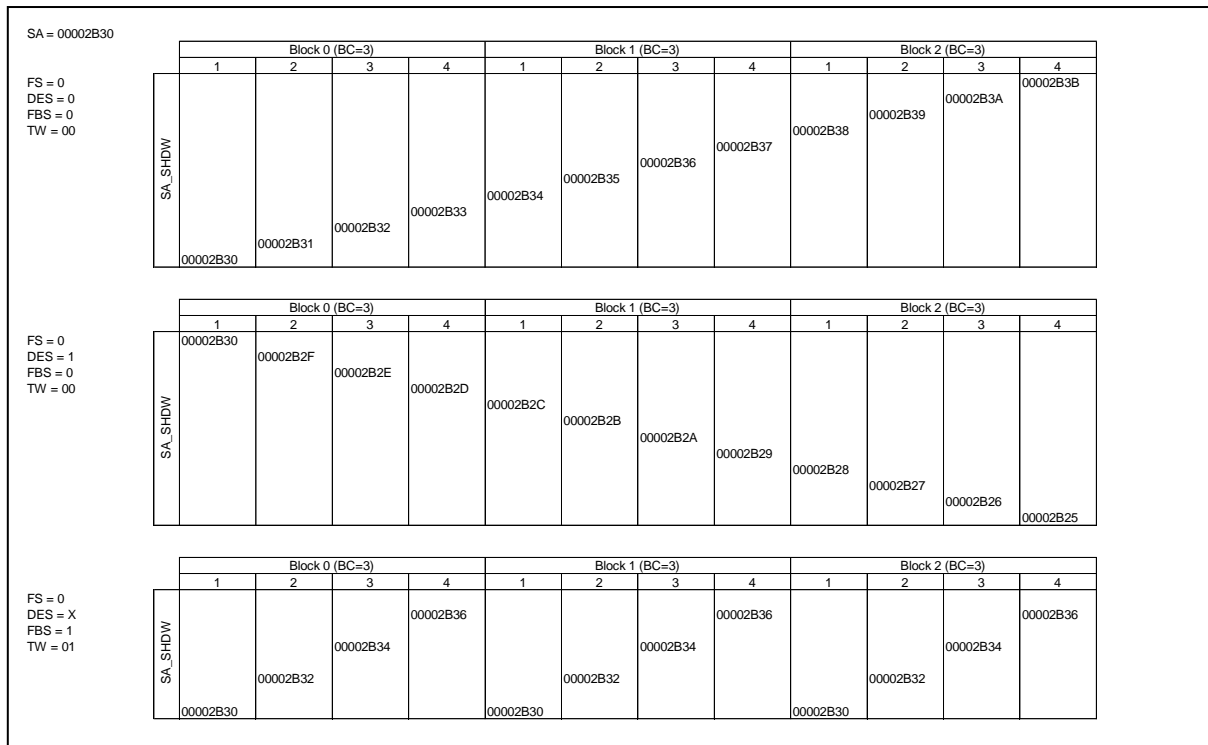

After each successful read data transfer Source Address Shadow (DMAi_SASHDWn:SASHDW) will be either incremented, decremented, or remains unaltered. The behavior is determined by the settings of Fixed Source Address, Decrement Source Address, or Fixed Block Source Address. Destination Address Shadow (DMAi_DASHDWn:DASHDW) exhibits the same behavior with respect to the settings of Fixed Destination Address, Decrement Destination Address, or Fixed Block Destination Address and will be updated after each successful write data transfer. The tables below list the possible combinations and the resulting action.

Table 3-2 Source Address Shadow Update Behavior

DMAi_Dn:FS	DMAi_Dn:DES	DMAi_Dn:FBS	Description of DMAi_SASHDWn:SASHDW Update Behavior
0	0	0	SASHDW is incremented at each successful read data transfer. Size of address increment depends on Transfer Width.
0	1	0	SASHDW is decremented at each successful read data transfer. Size of address decrement depends on Transfer Width.
0	X	1	SASHDW is incremented at each successful read data transfer. SASHDW is updated with the value stored in DMAi_SAn at the end of a block.
1	X	X	SASHDW remains constant.

Table 3-3 Destination Address Shadow Update Behavior

DMAi_Dn:FD	DMAi_Dn:DED	DMAi_Dn:FBD	Description of DMAi_DASHDWn:DASHDW Update Behavior
0	0	0	DASHDW is incremented at each successful write data transfer. Size of address increment depends on Transfer Width.
0	1	0	DASHDW is decremented at each successful write data transfer. Size of address decrement depends on Transfer Width.
0	X	1	DASHDW is incremented at each successful write data transfer. DASHDW is updated with the value stored in DMAi_DAn at the end of a block.
1	X	X	DASHDW remains constant.

Figure 3-1 Illustration of DMAi_SASHDWn:SASHDW Update

At the successful end of a DMA transfer Source Address or Destination Address can be updated with the value stored in Source Address Shadow or Destination Address Shadow respective. This can be configured with the bits Update Source Address (DMAi_Dn:US) or Update Destination Address (DMAi_Dn:UD).

DMA Transfer Size

The DMA transfer size is calculated by the following formula:

$$\begin{aligned} \text{DMA transfer size [byte]} &= \text{Number of data transfers} * (2^{\text{Transfer Width}/8-1}) \\ &= (\text{DMAi_An:BC} + 1) * (\text{DMAi_An:TC} + 1) * (2^{\text{DMAi_Bn:TW}}) \end{aligned}$$

Transfer Count (DMAi_An:TC[15:0]) determines the number of blocks to be transferred in a DMA transfer. Block Count (DMAi_An:BC[3:0]) determines the number of data transfers in each block.

DMA Transfer Completion and Error Handling

Each DMA channel issues an interrupt at the end of a DMA transfer. This can be either a completion interrupt if the DMA transfer completed successfully or an error interrupt in case of an error condition or a stop request. A completion interrupt is signaled with flag of DIRQ (DMAi_Bn:DQ) and an error interrupt with flag of EDIRQ (DMAi_Bn:EQ). There is a DMA transfer end code associated with each interrupt which is encoded in Stop Status (DMAi_Bn:SS[2:0]).

If a DMA transfer is completed successfully and the completion interrupt raised, Stop Status will show 'normal end' (DMAi_Bn:SS = 0b101). If it is ended in error and the error interrupt raised, Stop Status will show one of the following possibilities:

- Stop request (DMAi_Bn:SS = 0b010)
- Source access error (DMAi_Bn:SS = 0b011)
- Destination access error (DMAi_Bn:SS = 0b100)

A 'stop request' during a running DMA transfer can be caused by assertion of the stop request signal (DSTP) of the DMA transfer requesting client, if the DMA channel is disabled (DMAi_An:EB), if the complete DMA Controller is disabled (DMAi_R:DE), or if a debug event occurs and the DMA Controller is configured to stop on a debug event.

Both interrupts, completion as well as error interrupt can be masked with bits Completion Interrupt (DMAi_Bn:CI) and Error Interrupt (DMAi_Bn:EI) respective. If these bits are set to "1" the interrupts are not masked. All unmasked completion interrupts are ORed and signaled to the Interrupt Controller. The same is done for the error interrupts.

All completion Interrupt Flags are in addition to the channel registers, available in two 32-bit registers (DMAi_DIRQ1 and DMAi_DIRQ2) for easier software handling. All Error Interrupts are handled in the same way and are available in register DMAi_EDIRQ1 and DMAi_EDIRQ2.

Completion interrupt DMAi_Bn:DQ must be cleared by setting Clear DIRQ (DMAi_Cn:CD). Error interrupt EQ must be cleared by setting Clear EDIRQ (DMAi_Cn:CE). Stop Status will be cleared to 'initial value' (DMAi_Bn:SS = 0b000) if DMAi_Bn:DQ or DMAi_Bn:EQ is set to "1".

Note:

- *For new transfer request accepted during on-going DMA transfer or after previous DMA transfer completion, this DMA controller starts the next transfer by clearing the interrupt flag. Therefore, in case it is unnecessary to start DMA transfer for next transfer request, it is required to disable DMA channel and clear transfer request of DMA client, and then clear the interrupt flag.*

Source and Destination Protection

Each DMA channel has the possibility to define source and destination protection information independently. This information will be used by the AHB master and driven on the AHB protection control signals (HPROTM[3:0]) for use by peripherals which have implemented access protection as defined by the AHB protocol. Protection information must be provided by Source Protection (DMAi_Bn:SP[3:0]) or Destination Protection (DMAi_Bn:DP[3:0]) if used. DMA Controller does only data transfers thus DMAi_Bn:SP[0] and DMAi_Bn:DP[0] are statically set to "1". Initial value indicates a 'Not cacheable/Not bufferable/Privileged access/Data access' source and destination protection.

Channel Disabling and Halting

After reset a DMA channel is disabled by default in order to properly configure it before a DMA request is serviced. DMA channel is enabled by setting Channel Enable (DMAi_An:EB) to "1". After setting DMAi_An:EB to "1" the channel waits for a DMA request.

Each DMA channel can be independently disabled. This is done by setting Channel Enable (DMAi_An:EB) to "0". Setting this bit to "0" can be done at any time but has different effects when it is done. If DMAi_An:EB is set to "0" during a running DMA transfer, the transfer is stopped at the next transfer gap, an error interrupt is raised and the channel is disabled. Transfer gap means the DMAC has transferred a block of data and the AHB master interface releases the bus request for a few cycles.

When DMAi_An:EB is set to "0" while an interrupt is pending (DMAi_Bn:DQ = 1 or DMAi_Bn:EQ = 1) or no DMA transfer is running there will be no other effect besides the channel is disabled.

Channel halting is done by setting Pause Bit (DMAi_An:PB) to "1". If this bit is set to "1" during a running DMA transfer, it will halt after completion of the current transferred block. If it is set to "1" before receiving a transfer request the halt state is entered immediately. Clearing this bit will put the channel into run state and it will wait for the next transfer request to continue the DMA transfer or if a transfer request is already pending, it will continue immediately.

Burst Transfer Mode

Burst transfer mode is almost identical to the block transfer mode. The only difference is the request of a DMA transfer. Whereas in block transfer mode one request for each block of data is needed, in burst transfer mode only one request is needed at the begin of a DMA transfer for the complete transfer. The requests needed for subsequent blocks of data is generated internally by the DMA Controller itself.

3.2. DMA Client Matrix

This section describes configuration and behavior of the DMA Client Matrix.

Overview

The DMA Client Matrix provides the possibility to route 'M' DMA clients to 'N' DMA channels. 'M' is greater than or equal to 'N'. The selection which DMA channel serves which DMA client will be set with Client Interface (DMAi_CMCHICn:CI). The configuration of the internal DMA clients will be done with the registers DMAi_CMICICm.

Modes of Operation

Each DMA Client Interface can work in one of the following modes:

1. Disabled mode

Internal DMA clients:

An internal DMA Client Interface is disabled if it is not selected by any of the DMA Client Matrix Channel Configuration Registers (DMAi_CMCHICn:CI). Reconfiguration of the internal DMA Client Interface shall only be done in disabled mode.

2. Normal mode

In this mode a DMA channel is routed directly to the specified (DMAi_CMCHICn:CI) DMA client. The operation of the DMA Client Matrix in this mode is fully transparent and behaves as if the DMA client would be connected directly to the DMA Channel Interface.

Functional Description

Purpose of the DMA Client Matrix is to provide flexibility in the use of available DMA channels. The configuration of the DMA Client Matrix is intended to be static and shall be done after the boot code execution when the software is setting up the system.

Structure of the DMA Client Matrix

The DMA Client Matrix will be a full matrix where each DMA Client Interface 'm' can be routed to every DMA Channel Interface 'n'.

DMA Client Matrix Configuration

The configuration of the DMA Client Matrix is done with the following registers:

- DMAC Client Matrix Internal Client Configuration Registers (DMAi_CMICICm)
- DMAC Client Matrix Channel Interface Configuration Registers (DMAi_CMCHICn)

The DMAC Client Matrix Internal Client Interface Configuration Register contains two signal behavior bits. For their function see the descriptions below:

The Config bit Behavior Request Acknowledge, DMAi_CMICICm:BEHREQACK, sets the behavior of the output signal DREQ_ACK[m] if the internal DMA Client Interface 'm' is not selected in any of the Channel Configuration Registers (DMAi_CMCHICn). The user can choose that DREQ_ACK[m] drives inactive level or that DREQ[m] is connected to DREQ_ACK[m] in that case. The later can be used to reset a, due to software misbehavior, falsely set DMA request signal without violating the two-way handshake protocol.

The Config bit Behavior Stop Acknowledge, DMAi_CMICm:BEHSTPACK, sets the behavior of the output signal DSTP_ACK[m] if the internal DMA Client Interface 'm' is not selected in any of the channel Configuration Registers (DMAi_CMCHICn:CI). The user can choose that DSTP_ACK[m] drives inactive level or that DSTP[m] is connected to DSTP_ACK[m] in that case.

The DMAC Client Matrix Channel Interface Configuration Register contains up to nine selection bits. For their function see the description below:

The Selection bits Client Interface, DMAi_CMCHICn:CI, specify which DMA Client Interface 'm' is connected to the DMA Channel Interface 'n'. The configuration of these bits must take place before DMAi_R:DE and DMAi_An:EB is set to "1". The client interface number must be programmed as binary value to DMAi_CMCHICn:CI. Setting of CI makes the connection between DMA Client Interface defined by the value of CI and DMA Channel Interface 'n'. Selecting twice or more times the same DMA Client Interface in any of the DMA Client Matrix Channel Configuration Registers results in unpredictable behavior of the DMAC and must be avoided.

Availability of certain DMA clients depends on specific device. Refer to "CHAPTER: Overview" for the availability of DMA clients.

Automatic Reconfiguration of DMA Client Matrix

DMA Client Matrix can be reconfigured by a request from DMA Additional Control block. When DMA Additional Control Block launch a request to reconfigure the DMA Client Matrix (CMCHIC reload event trigger), DMAi_CMCHICn register value is automatically updated by the value in the specified bank.

Please refer "CHAPTER : DMA COMPLEX SUBSYSTEM" for more details.

Initialization and Application Information

Reset

The reset state of each DMA Client Matrix Configuration bit is shown in the register description of DMAi_CMICm, and DMAi_CMCHICn. To summarize it, after hardware reset, all internal DMA Client Interfaces are disabled, all signals set to high-active level, and DMA Channel Interface 0 - 'N-1' is configured to route to DMA Client Interface 0 - 'N-1'.

Note:

- *Selecting the same DMA Client Interface in two or more DMA Channel Interfaces leads to unpredictable behavior of the DMAC. Therefore DMAi_CMCHICn:CI must be properly configured before enabling the DMAC and one or more of its channels.*

3.3. DMA Arbiter

This section describes configuration and behavior of the DMA arbiter which chooses a DMA channel based on the arbitration scheme.

Overview

The DMA arbiter is responsible for choosing a DMA channel based on the arbitration scheme selected in the Global Configuration Register (DMAi_R:PR). There are three arbitration schemes available:

- Fixed priority
- Dynamic priority
- Round-robin

The arbitration schemes are explained in detail in the following sections. The arbitration scheme can be changed any time, however it becomes effective only after the current running data transfer has been completed at the next transfer gap.

About the timing of the priority judgement, it is judged after the end of transferring 1 block, and before the start of transferring the next block.

Fixed Priority

In fixed priority arbitration scheme the DMA channels have a 'fixed' priority which can be set with Priority Number (DMAi_Bn:PN). Priority Number equal to "0" has the highest priority, whereas Priority Number equal to 127 has the lowest priority. DMA channels with equal Priority Number, the channel with the lowest channel number 'n' has the highest priority. The initial value of DMAi_Bn:PN is 127. Priority Number can be changed any time, however it becomes effective only after the current running data transfer has been completed at the next transfer gap. Fixed priority arbitration example shows an arbitration example for eight DMA channels to illustrate the behavior.

Table 3-4 Fixed Priority Arbitration Scheme

Arbitration Cycle	Requesting DMA Channel 'n'	PN of Requesting DMA Channel 'n'	Grant Given to DMA Channel 'n'
X+1	2	0	2
	4	2	
	7	6	
X+2	4	2	4
	7	6	
	8	5	
X+3	4	2	4
	7	6	
	8	5	
X+4	1	5	1
	7	6	
	8	5	
X+5	3	9	8
	7	6	
	8	5	

Dynamic Priority

The dynamic priority arbitration scheme is an extension of the fixed priority arbitration scheme. The priority of the DMA channels is dynamically adjusted based on the criterion whether a channel got a grant or not. If a channels request was granted its dynamic Priority Number is loaded with the Priority Number stored in DMAi_Bn:PN and if a channels request was not granted its dynamic Priority Number is decremented by "1". The arbiter is giving grant to the requesting DMA channel with the lowest dynamic Priority Number. If two or more requesting channels have equal dynamic Priority Numbers the DMA channel with the lowest channel number 'n' has the highest priority and will win the arbitration process. Priority Number can be changed any time, however it becomes effective after it has been re-loaded by the channel, i.e. after the channel has won the arbitration. Dynamic priority arbitration example shows an arbitration example for four DMA channels to illustrate the behavior.

Note:

- In case a channel's re-programmed Priority Number should become effective immediately (not only after the re-programmed channel has won the arbitration), this behavior can be forced by changing the arbitration scheme to Fixed priority and then changing it back to dynamic priority while in halt state. However, it must be noted that the dynamic priority of all channels will be re-loaded with Priority Number (DMAi_Bn:PN) and not only the re-programmed channels.

Table 3-5 Dynamic Priority Arbitration Scheme

Arbitration Cycle	Requesting DMA Channel		Dynamic PN of DMA Channel	PN of DMA Channel	Grant Given to DMA Channel
1	Ch. 0	Yes	1	1	0
	Ch. 1	Yes	2	2	
	Ch. 2	Yes	3	3	
	Ch. 3	No	3	3	
2	Ch. 0	No	1	1	1
	Ch. 1	Yes	1	2	
	Ch. 2	Yes	2	3	
	Ch. 3	No	3	3	
3	Ch. 0	No	1	1	2
	Ch. 1	No	2	2	
	Ch. 2	Yes	1	3	
	Ch. 3	Yes	3	3	
4	Ch. 0	No	1	1	1
	Ch. 1	Yes	2	2	
	Ch. 2	No	3	3	
	Ch. 3	Yes	2	3	
5	Ch. 0	No	1	1	3
	Ch. 1	No	2	2	
	Ch. 2	Yes	3	3	
	Ch. 3	Yes	1	3	

Round-robin

In round-robin arbitration scheme the turn is rotated in directional and cyclic order from DMA channel 0 to DMA channel 'n'. At most one DMA channel request can be granted at any time, this is defined as a turn being given. The turn is moved forward at each transfer gap. The turn's rotation is not strictly

round-robin in order not to waste an arbitration phase by giving the turn to a non-requesting DMA channel. Instead the turn is given to the next requesting DMA channel in the rotation direction. If no DMA channel was served last (only possible in initial state) the requesting DMA channel with the lowest channel number 'n' has the highest priority and will win the arbitration process. Round-robin arbitration example shows an arbitration example for eight DMA channels to illustrate the behavior.

Table 3-6 Round-Robin Priority Arbitration Scheme

Arbitration Cycle	Requesting DMA Channel	Grant Given to DMA Channel	Last Served DMA Channel
1	2	2	None
	4		
	7		
2	4	4	2
	7		
	8		
3	4	7	4
	7		
	8		
4	1	8	7
	4		
	8		
5	1	1	8
	4		
	7		

Application Information

Fixed Priority Arbitration

With this arbitration scheme the DMA channel request from the channel with the highest priority will be selected for service. If the DMAC is programmed that channel 0 is assigned the highest priority and this channel has a higher service request rate compared to the other channels, it is possible that this channel absorbs the complete bandwidth of the DMA Controller, means that the other channels will not be serviced.

Dynamic Priority Arbitration

With this arbitration scheme starving is tried to be avoided by assigning a requesting channel which got no grant the next higher priority level. However starving cannot be avoided if the DMAC is not programmed properly i.e. if channel 0 is assigned the highest priority the other channels cannot reach a higher priority than channel 0. If this channel has in addition a higher service request rate that the other channels, it will use the complete bandwidth of the DMAC.

Round-Robin Arbitration

With this arbitration scheme starving of requesting channels is not possible even if channel 0 has a service request rate, which is equal to or exceeds the arbitration rate.

3.4. DMA AHB Slave Interface

This section describes information about the slave interface of the DMAC.

This is the DMA Controller's system interface through which the DMACs registers are accessed.

Supported Data Transfers

The slave interface supports 8-, 16-, and 32-bit wide AHB data transfers. 16-bit and 32-bit accesses shall be 16-bit address respective 32-bit address aligned.

Single data and fixed incremental burst accesses are supported (SINGLE, INCR4, INCR8, and INCR16).

Note:

- *DMAi_Dn register must be accessed by 8-bit access.*
- *All writing to DMA Controller registers must be done in privileged mode.*

Data Transfer Response

The DMA AHB slave interface responds with the following possibilities to any kind of access:

- OKAY response
- ERROR response

The ERROR response will be given for accesses where a protection error or a register access error occurs.

Protection Error

A protection error is raised if any of following conditions is met.

- Writing registers in user mode.

Register Access Error

A register access error is raised if a read or write to a reserved address location is attempted. For the location of the reserved addresses see Memory layout of DMA Controller registers.

A register access error is raised if a write access is attempted to read only registers.

3.5. Additional Information

This section gives additional information for using DMAC.

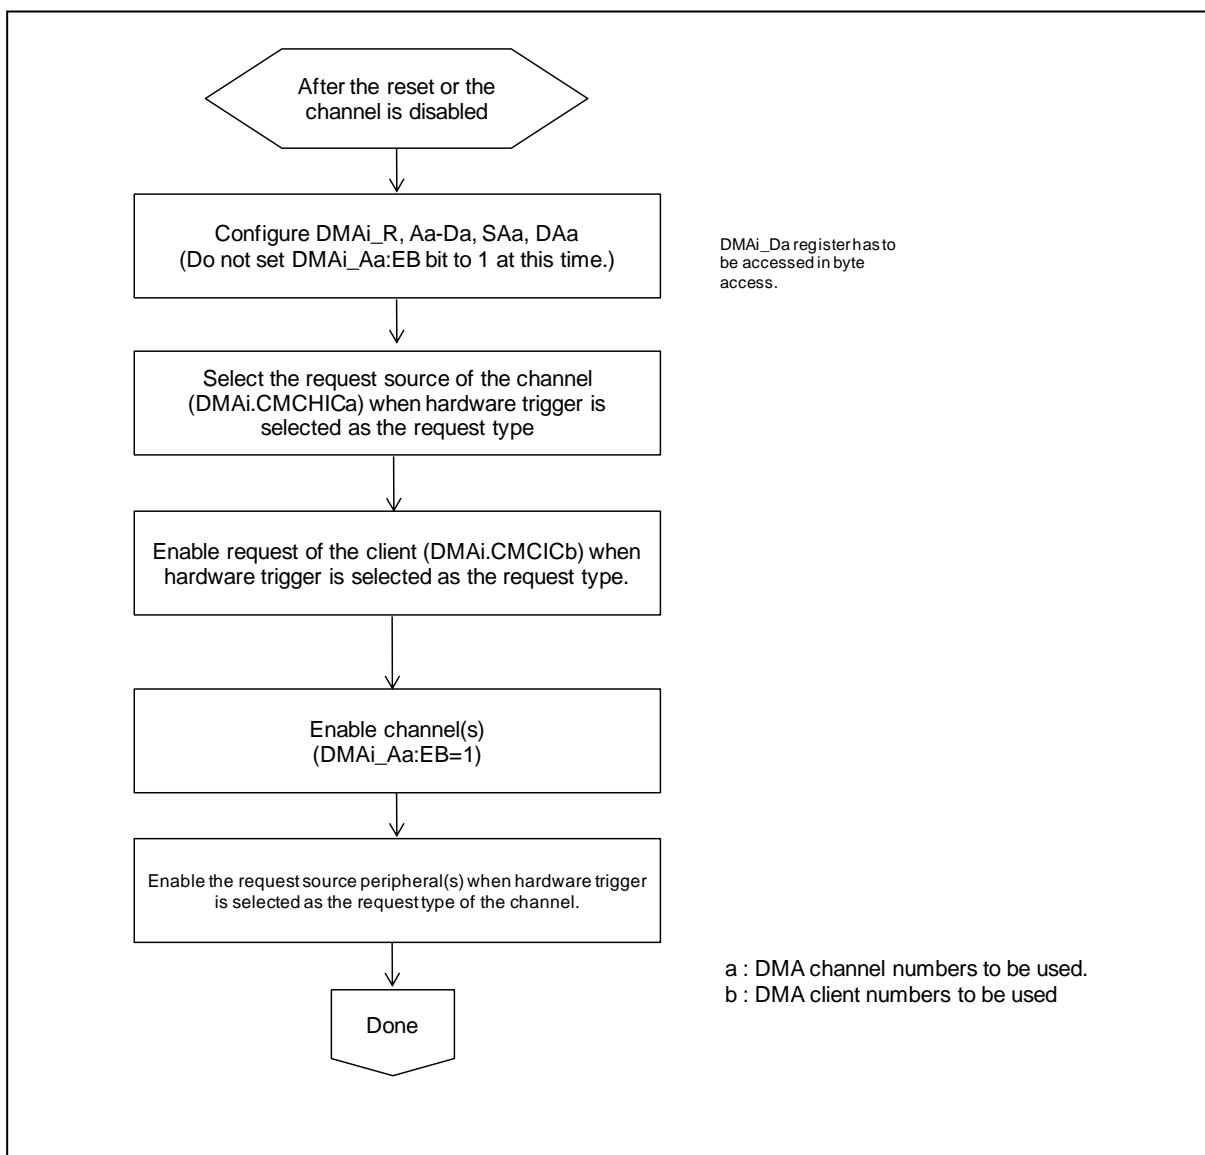

Stopping Clock for DMA Controller or entering PSS(Power Saving State) Mode

- Before stopping clock for DMA controller or entering PSS(Power Saving State) mode, please make sure followings :
 - All DMAC channels are disabled and their operations are completely stopped.
 - No pending or ongoing register access to DMA controller.
- Do not access DMA controller registers before the clock for DMA resumes.

0x0000_2840(DMAC#0) 0x0000_6840(DMAC#1)	Reserved			

'i' represents instance number of DMAC. i = 0

'n' represents channel number. n = 0, 1, 2, ...,15.

'N' represents number of DMAC channels per DMAC instance. N = 16 in this product.

'm' represents client number. m = 8, 9, ..., (product specification).

'M' represents number of client I/F. M = (product specification) in this product.

Notes:

- Please refer "CHAPTER: Overview" for the maximum numbers.
- *1: Initial value of DMAi_CMCHICn:CI[7:0] is 'n'.

4.1. DMA Controller Global Configuration Register (DMAi_R)

This register handles the enabling and halting of the entire DMA Controller, arbitration scheme of the DMA channel arbiter can be chosen, enabling of debug function, and the DMACs behavior in case of a 'debug event' can be selected.

[bit31] DE : DMA enable(DE)

If this bit is set to "0", the DMAC is disabled. This also means that all DMA channels are disabled independent of the settings of DMAi_An:EB.

If this bit is set to "1", the DMAC is enabled and the enabling of the channels depend on the setting of DMAi_An:EB.

When this bit is set to "0" during a DMA transfer, the channel which is in the middle of a transfer stops at the next transfer gap.

The transfer gap means that DMAC de-asserts bus request to the bus arbiter for a short time in the middle of a DMA transfer after a block of data has been transferred. This ensures that the bus is not completely blocked by a very long DMA transfer.

Bit	Description
0	DMAC globally disabled
1	DMAC globally enabled

[bit30] DSHR : DMA stop/halt request flag

This bit indicates that the DMA transfers of all channels have been requested to halt or disable.

This bit is set to "0" by hardware if none of the conditions below are true.

This bit is set to "1" by hardware if one or more of the conditions below are true.

Conditions for DMA Stop/Halt Request Flag:

- DMAi_R:DE is set to "0" (all channels are disabled)
- DMAi_R:DH is set to "1" (all channels are halted)
- DMAi_R:DBE is set to "1", DMAi_R:DB is set to '10' (stop on debug events), and a debug event is pending
- DMAi_R:DBE is set to "1", DMAi_R:DB is set to '01' (halt on debug events), and a debug event is pending

Bit	Description
0	Indicates that global halt/disable condition of DMAC is removed
1	Indicates that DMA transfers of all channels are requested to halt or disable

[bit29] DBE : Debug enable

This bit determines whether DMAC reacts on a debug event (i.e. debugger break point).

The behavior of the DMAC on the occurrence of a debug event depends on configuration bits, Debug Behavior (DMAi_R:DB).

Bit	Description
0	DMAC does not react on debug events
1	DMAC reacts on debug events. Reaction depends on setting of Debug Behavior (DMAi_R:DB)

[bit28:27] PR[1:0] : Priority type

These bits select the arbitration scheme of the DMAC arbiter. In case of dynamic priority, channel priority is updated at the transfer gap.

Bits	Description
00	Fixed priority
01	Dynamic priority
10	Round robin
11	Reserved

[bit26] DH : DMA halt

When this bit is set to a "1", all DMA channels are halted and do not perform DMA transfers until this bit is set back to "0". After it is cleared the halted DMA transfers continue at the point they were halted.

If this bit is set to "1" while a DMA transfer is ongoing, DMAC halts the transfer at the next transfer gap.

About the transfer gap, refer to the description of DMAi_R:DE bit.

[bit25:24] DB[1:0] : Debug behavior

Bits	Description
00	DMAC continues on debug event
01	DMAC halts all transfers on debug event
10	DMAC stops all transfers on debug event
11	Reserved

[bit0] DSHS : DMA stop/halt status flag

Bit	Description
0	Indicate that DMA transfer of at least one channel is running
1	Indicate that DMA transfers of all channels are halted or disabled

4.2. DMA Controller Global Completion Interrupt 1 Register (DMAi_DIRQ1)

The DMA Controller Global Completion Interrupt 1 Register combines the completion Interrupt Flags (DMAi_Bn:DQ) from DMA channels 0 to 31.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

[bit31:0] DIRQ : Global completion interrupt 1

This is a read-only register which gives the status of DIRQ of channels 0 to 31. Channels which are not available on a particular device reads "0".

Note:

- Channels 16 to 63 are not available in this product.

4.3. DMA Controller Global Completion Interrupt 2 Register (DMAi_DIRQ2)

The DMA Controller Global Completion Interrupt 2 Register combines the completion Interrupt Flags (DMAi_Bn:DQ) from DMA channels 32 to 63.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

[bit31:0] DIRQ : Global completion interrupt 2

This is a read-only register which gives the status of DIRQ of channels 32 to 63. Channels which are not available on a particular device reads "0".

Note:

- Channels 16 to 63 are not available in this product.

4.4. DMA Controller Global Error Interrupt 1 Register (DMAi_EDIRQ1)

The DMA Controller Global Error Interrupt 1 Register combines the Error Interrupt Flags (DMAi_Bn_EQ) from DMA channels 0 to 31.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] EDIRQ : Global error interrupt 1

This is a read-only register which gives the status of EDIRQ of channels 0 to 31. Channels which are not available on a particular device reads "0".

Note:

- Channels 16 to 63 are not available in this product.

4.5. DMA Controller Global Error Interrupt 2 Register (DMAi_EDIRQ2)

The DMA Controller Global Error Interrupt 2 Register combines the Error Interrupt Flags (DMAi_Bn:EQ) from DMA channels 32 to 63.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] EDIRQ : Global error interrupt 2

This is a read-only register which gives the status of EDIRQ of channels 32 to 63. Channels which are not available on a particular device reads "0".

Note:

- Channels 16 to 63 are not available in this product.

4.6. DMA Controller ID Register (DMAi_ID)

The DMA Controller ID Register always returns a constant. This register offers no function.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	MID[31]	MID[30]	MID[29]	MID[28]	MID[27]	MID[26]	MID[25]	MID[24]

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] MID : Module number

Always return 0x00010500

4.7. DMA Controller Channel Configuration A Register Channel 'n' (DMAi_An)

The register specifies whether to enable or halt a DMA channel. It specifies the source of a DMA transfer request and DMA transfer parameters Block Count, Transfer Count, Beat Limit, Alternate, and Timeout.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24
Field	EB	PB	ST	IS[1]	IS[0]	AL	BL[1]	BL[0]

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31] EB : Enable bit

This bit is used to enable/disable a DMA channel. If this bit is set to "1", the channel is enabled and waits for a request to start a DMA transfer (Before that, DMAi_R:DE bit needs to be set to "1" already). If this bit is set to "0", the channel is disabled and does not perform a DMA transfer. When this bit is set to "0" during a running DMA transfer which will not complete at the next transfer gap, the DMA transfer is terminated. This is regarded as a forced stop and an error interrupt is generated. When this bit is set to "0" while the last block of a DMA transfer is running, the DMA transfer completes at the next transfer gap and a completion interrupt is generated. About the transfer gap, refer to the description of DMAi_R:DE bit. This bit is useful to re-configure each configuration register of the channel after a DMA transfer.

Bit	Description
0	Channel is disabled
1	Channel is enabled

[bit30] PB : Pause bit

This bit is used to halt the transfer of the DMA channel. If this bit is set to "1", this channel halts the transfer and does not perform a DMA transfer until this bit is cleared.

When this bit is set to "1" while no transfer is ongoing DMAC enters the halt state immediately. When it was set to "1" during a running transfer, the halt state is entered at the next transfer gap. If the DMA transfer completes at the next transfer gap a completion interrupt is issued.

When this bit is set to "0" the halt condition is cleared and DMAC waits for the next request to continue the DMA transfer.

This bit is useful to halt a DMA transfer without re-configuration of each configuration register of the channel.

Bit	Description
0	Channel is not halted
1	Channel is halted

[bit29] ST : Software trigger

This bit is used to generate a software request. This bit can only be used when all of following conditions are satisfied.

- DMAi_Bn:SR = 1.
- The stop status (DMAi_Bn:SS) is either initial or normal.
- DIRQ is cleared.
- EDIRQ is cleared.
- In Block transfer mode, the previous transfer has been completed.

When this bit is set to "1", DMA transfer is requested because software request has been received. The DMAC sets this bit to "0" if the Software Trigger has been recognized, an internal channel request for service is set, and Software Trigger Ready (DMAi_Bn:SR) is set to "0". The software request is successful when DMAi_Bn:SR changes its status from "1" to "0". ST can only be read as "0".

Bit	Description
0	No software request
1	Software request

[bit28:27] IS[1:0] : Input select

These bits are used to select the trigger source of a DMA transfer request. When the trigger source of a DMA transfer is a software request, IS bits are set to '00'. When the trigger source of a DMA transfer is a hardware request, IS bits are set to '01'.

Bits	Description
00	Software request
01	Hardware request
10	Reserved
11	Reserved

[bit26] AL : Alternate

This bit decides whether the data transfers should alternate between read and write or should be contiguous reads followed by contiguous writes. The alternation takes place after each incremental read burst and after each single data read.

Bit	Description
0	Contiguous
1	Alternate

[bit25:24] BL[1:0] : Beat limit

Beat Limit controls the maximum burst length the AHB master can make on the AHB bus for this DMA channel.

Bits	Description
00	Single transfer (SINGLE)
01	4-beat incrementing burst (INCR4)
10	8-beat incrementing burst (INCR8)
11	16-beat incrementing burst (INCR16)

These bits are used in combination with Block Count to decide which type of burst has to be transmitted over the AHB interface.

[bit23:20] BC[3:0] : Block count

These bits specify the total length of a single block in block/burst transfer mode. The maximum block count is 16. For e.g. if BC = 4, the number of data transfers is 5 (BC + 1).

Alternate, Block Count, and Beat Limit together decide the bursts generated by the AHB master.

[bit19:16] TO[3:0] : Timeout

The bits are reserved in this product. Write 0b1111 to the bits.

[bit15:0] TC[15:0] : Transfer count

These bits are used to specify the transfer count for the block/burst transfer. The maximum transfer count is 65536. If TC is set to zero then one transfer is done and if TC is set to 65535 then 65536 transfers are done.

In burst and block transfer mode the TC represents the number of blocks of data transfers that the channel has to make before DMA 'End of Processing' (DEOP) is generated. For e.g. if TC = 9 and DMAi_An:BC = 9 then total number of transfers the DMAC does = (DMAi_An:BC + 1) x (TC + 1) = 10 x 10 = 100 transfers before DEOP is generated.

4.8. DMA Controller Channel Configuration B Register Channel 'n' (DMAi_Bn)

This register contains Error and Completion Interrupt Flags, and Interrupt Mask bits. Stop status of DMA operation is available in this register. Operation mode selection, transfer width, source, and destination protection information are located here. Software trigger ready flag shows readiness of DMA channel to receive a Software Trigger. Priority Number for DMA channel arbiter can be set here for fixed and dynamic priority arbitration scheme.

[bit31] DQ : Flag of DIRQ

DQ is set to "1" when a DMA transfer completed successfully. DQ is cleared by hardware if DMAi_Cn:CD (Clear DIRQ) bit is set to "1". Otherwise the value is retained.

[bit30] EQ : Flag of EDIRQ

EQ is set to "1" when a DMA transfer is finished with an error. EQ is cleared by hardware if DMAi_Cn:CE (Clear EDIRQ) bit is set to "1". Otherwise the value is retained.

[bit29:28] MS[1:0] : Mode select

MS sets the transfer mode of the channel.

Bits	Description
00	Block transfer mode
01	Burst transfer mode
10	Reserved
11	Reserved

[bit27:26] TW[1:0] : Transfer width

TW specifies the data width for every data transfer of the DMA transfer.

Bits	Description
00	Byte
01	Half word
10	Word
11	Double word

[bit25] SR : Software trigger ready

This bit is used to indicate a condition* that the DMA channel is ready to receive a software request. The following conditions can cause that the DMA channel is not ready to receive a software request. If one or more of the conditions below are true SR is set to "0" by hardware. If none of the conditions are true SR is set to "1" by hardware.

- DMAi_R:DE == 0; DMAC is disabled
- DMAi_R:DH == 1; All DMA channels are halted
- DMAi_An:EB == 0; DMA channel is disabled
- DMAi_An:PB == 1; DMA channel is halted
- DMAi_An:IS != 0b00; Input select is not set to software
- DEBUG == 1 and DMAi_R:DE == 1 and DMAi_R:DB == 0b01 or DMAi_R:DB == 0b10, debug event is pending while debug flag is set and Debug Behavior is set to HALT or STOP
- DMA transfer is active and a software request is pending

*: Refer the explanation of DMAi_An:ST bit in DMA Controller Channel Configuration A Register Channel 'n' (DMAi_An) for the rest of the conditions.

[bit20] EI : Error interrupt enable

This bit is used to control the issue of an error interrupt (EDIRQ). If this bit is set to "1", an error interrupt is issued due to any of the following transfer errors:

- Transfer stop request by signal DSTP, or disable the transfer with DMAi_An:EB or DMAi_R:DE, or debug event (if DMAi_R:DBE == 1 and DMAi_R:DB[1:0] == 0b10)
- Source access error
- Destination access error

Bit	Description
0	Error interrupt issuance is disabled
1	Error interrupt issuance is enabled

[bit19] CI : Completion interrupt enable

This bit is used to control the issue of a completion interrupt (DIRQ). If this bit is set to "1", a completion interrupt is issued after the DMA transfer completed normally.

Bit	Description
0	Completion interrupt issuance is disabled
1	Completion interrupt issuance is enabled

[bit18:16] SS[2:0] : Stop status

These bits are used to show the end code of DMA transfer. SS is set by hardware when an error or completion interrupt is raised and it is cleared by hardware when either DMAi_Cn:CE or DMAi_Cn:CD is set to "1".

Bits	Description
000	Initial value. Status : None
001	Reserved
010	Stop request by: - DSTP - Channel disable (DMAi_An:EB= 0) - DMA disable (DMAi_R:DE= 0) - Debug event (DMAi_R:DBE= 1 and DMAi_R:DB= 0b10) Status : Stop
011	Source access error Status : Error
100	Destination access error Status : Error
101	Normal end Status : End
110	Reserved
111	Reserved

When different events occur at the same time, the end code is displayed according to the following priority:

1. Reset
2. Cleared by clearing completion/error interrupt (DIRQ/EDIRQ)
3. Source access error
4. Destination access error
5. Stop request

Note:

- If the interrupt bit is cleared then Stop Status is also cleared.

[bit15:12] SP[3:0] : Source protection

These bits are used to control source access protection. During source accesses HPROTM is driven with SP during the AHB address phase.

- SP[3]: 0: Not cacheable
- SP[3]: 1: Cacheable
- SP[2]: 0: Not bufferable
- SP[2]: 1: Bufferable
- SP[1]: 0: User access
- SP[1]: 1: Privileged access
- SP[0]: 0: Instruction access (DMAC only makes data accesses thus SP[0] is fixed to "1" and writing it to "0" has no effect.)
- SP[0]: 1: Data access

SP is considered by sources which support protection control function.

Note:

- Configuration of DP[3] has an effect.
 - DP[3]=0: Posted write buffer in HPM is used. Due to the posted write behavior, DMA cannot trap the error returned from the destination even if there is an error in the write access (e.g.: The destination register/memory requires Privilege level for writing, but DP[1] is "0").
 - DP[3]=0: Posted write buffer in HPM is unused. DMA always traps the error when there is an error in the write access. (DMAi_Bn:EQ)
- Configuration of DP[2] has no effect.

[bit11:8] DP[3:0] : Destination protection

These bits are used to control destination access protection. During destination accesses HPROTM is driven with DP during the AHB address phase.

- DP[3]: 0: Not cacheable
- DP[3]: 1: Cacheable
- DP[2]: 0: Not bufferable
- DP[2]: 1: Bufferable
- DP[1]: 0: User access
- DP[1]: 1: Privileged access
- DP[0]: 0: Instruction access (DMAC only makes data accesses thus DP[0] is fixed to "1" and writing it to "0" has no effect.)
- DP[0]: 1: Data access

DP is only considered by destinations which support protection control function.

Note:

- Configuration of DP[3] has an effect.
 - DP[3]=1: Posted write buffer in HPM is used. Due to the posted write behavior, DMA cannot trap the error returned from the destination even if there is an error in the write access (e.g.: The destination register/memory requires Privilege level for writing, but DP[1] is "0").
 - DP[3]=0: Posted write buffer in HPM is unused. DMA always traps the error when there is an error in the write access. (DMAi_Bn:EQ)
- Configuration of DP[2] has no effect.

[bit6:0] PN[6:0] : Priority number

These bits are used to specify the Priority Number. The Priority Number is needed if fixed priority or dynamic priority has been selected as arbitration scheme. It has no significance if round robin arbitration scheme is selected. The channel with lower priority number value has a higher priority.

4.9. DMA Controller Channel Configuration Source Address Register Channel 'n' (DMAi_SAn)

This register holds the source address for the DMA transfer of channel 'n'.

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] SA : Source address

These bits are used to specify the source address to start a DMA transfer. Source Address is updated with the value of DMAi_SASHDWn at the end of a DMA transfer if Update Source Address (DMAi_Dn:US) is set to "1", Fixed Block Source Address (DMAi_Dn:FBS) is set to "0", and the transfer ends successfully. Otherwise it retains its value.

Note:

- DMAi_SAn register must be loaded with aligned addresses with respect to the transfer width. If non-aligned addresses are loaded the DMAC converts it to an aligned address according to the setting of Transfer Width (DMAi_Bn:TW).

Note:

- Disable the channel (i.e. DMAi_R:DE=0 or DMAi_An:EB = 0) before configuring this register.

4.10. DMA Controller Channel Configuration Destination Address Register Channel 'n' (DMAi_DAn)

This register holds the destination address for the DMA transfer of channel 'n'.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] DA : Destination address

These bits are used to specify the destination address to start a DMA transfer. Destination Address is updated with the value of DMAi_DASHDWn at the end of a DMA transfer if Update Destination Address (DMAi_Dn:UD) is set to "1", Fixed Block Destination Address (DMAi_Dn:FBD) is set to "0", and the transfer ends successfully. Otherwise it retains its value.

Note:

- DMAi_DAn register must be loaded with aligned addresses with respect to the transfer width. If non-aligned addresses are loaded the DMAC converts it to an aligned address according to the setting of Transfer Width (DMAi_Bn:TW).

Note:

- Disable the channel (i.e. DMAi_R:DE=0 or DMAi_An:EB = 0) before configuring this register.

4.11. DMA Controller Channel Configuration C Register Channel 'n' (DMAi_Cn)

The DMA Controller Channel Configuration C Register is used to clear the Interrupt Flags set in the DMAi_Bn register. By writing a "1" to a bit in this register, the software can clear the corresponding flag in the DMAi_Bn register.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit8] CE : Clear EDIRQ

Setting this bit clears the EDIRQ flag bit (DMAi_Bn:EQ). DMAC clears this bit automatically.

[bit0] CD : Clear DIRQ

Setting this bit clears the DIRQ flag bit (DMAi_Bn:DQ). DMAC clears this bit automatically.

4.12. DMA Controller Channel Configuration D Register Channel 'n' (DMAi_Dn)

This register controls the DMA channels addressing behavior for a DMA transfer. Addressing can be independently chosen for source and destination.

Initial Value	0	0	0	0	0	0	0	0

Note:

- This register must be accessed by 8-bit access to the effective bits.

[bit31] FS : Fixed Source address

This bit is used to keep the source address at a fix value.

Bit	Description
0	Source address is incremented
1	Source address is kept fix. AHB master only makes single transfers to access the source

[bit30] DES : Decrement source address

If this bit is set the source address on the AHB interface is decremented on each AHB transfer. In this mode the AHB master makes only single transfers to access the source.

Bit	Description
0	Source address is incremented
1	Source address is decremented

Note:

- Fixed Source Address (DMAi_Dn:FS) has higher priority than Decrement Source Address. This bit is only effective if DMAi_Dn:FS = 0 and DMAi_Dn:FBS = 0.

[bit29] US : Update source address

Bit	Description
0	DMAi_SAn is not updated after DMA transfer is successfully completed. DMAi_SAn is retained
1	DMAi_SAn is updated with the next address after the DMA transfer is successfully completed. E.g. last source address is 0x0BF000FC

Note:

- This bit is only effective if DMAi_Dn:FBS = 0

[bit28] FBS : Fixed block source address

Bit	Description
0	Start address of first block of DMA transfer is set to the value stored in DMAi_SAn. Start address of consecutive blocks is the address following the previous block last address (according to Transfer Width (DMAi_Bn:TW))
1	Start address of each block is set to the value stored in DMAi_SAn

Note:

- Setting of FBS is only effective if DMAi_Dn:FS = 0 and (DMAi_Bn:MS = 0b00 (block transfer mode) or DMAi_Bn:MS = 0b01 (burst transfer mode)).

[bit15] FD : Fixed destination address

This bit is used to keep the destination address at a fix value.

Bit	Description
0	Destination address is incremented
1	Destination address is kept fixed. AHB master only makes single transfers to access the destination

[bit14] DED : Decrement destination address

If this bit is set the destination address on the AHB interface is decremented on each AHB transfer. In this mode the AHB master makes only single transfers to access the destination.

Bit	Description
0	Destination address is incremented
1	Destination address is decremented

Note:

- Fixed Destination Address (*DMAi_Dn:FD*) has higher priority than Decrement Destination Address. This bit is only effective if *DMAi_Dn:FD* = 0 and *DMAi_Dn:FBD* = 0.

[bit13] UD : Update destination address

Bit	Description
0	<i>DMAi_DAn</i> is not updated after DMA transfer is successfully completed. <i>DMAi_DAn</i> is retained
1	<i>DMAi_DAn</i> is updated with the next address after the DMA transfer is successfully completed. E.g. last destination address was 0x0BF40010, <i>DMAi_Bn:TW</i> = 10 (word) then <i>DMAi_DAn</i> is updated with address 0x0BF40014.

Note:

- This bit is effective only if *DMAi_Dn:FBD* = 0

[bit12] FBD : Fixed block destination address

Bit	Description
0	Start address of first block of DMA transfer is set to the value stored in <i>DMAi_DAn</i> . Start address of consecutive blocks is the address following the previous block last address (according to Transfer Width (<i>DMAi_Bn:TW</i>))
1	Start address of each block is set to the value stored in <i>DMAi_DAn</i>

Note:

- Setting of *FBD* is only effective if *FD* = 0 and (*DMAi_Bn:MS* = 0b00 (block transfer mode) or *DMAi_Bn:MS* = 0b01 (burst transfer mode)).

4.13. DMA Controller Channel Configuration E Register Channel 'n' (DMAi_En)

This register is prepared for reserved features. Do not use this register.

[bit31] EE : Reserved

Always write "0" to the bit when writing.

[bit30:16] DC[14:0] : Reserved

Always write "0" to the bits when writing.

[bit15:0] IC[15:0] : Reserved

Always write "0" to the bits when writing.

4.14. DMA Controller Channel Configuration Source Address Shadow Register Channel 'n' (DMAi_SASHDWn)

This register holds the address of the last source data transfer for the DMA transfer of channel 'n' in case of a source access error. If the DMA transfer is stopped it contains the next address following the last successful data transfer.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] SASHDW[31:0] : Source address shadow

At the start of a DMA transfer this register contains a copy of DMAi_SAN. During a DMA transfer it is either incremented, decremented, or stays constant according to the settings of DMAi_Dn:FS, DMAi_Dn:DES, DMAi_Dn:US, and DMAi_Dn:FBS. In case of a source access error SASHDW shows the address of the read access which causes the error. In case of a stop of the DMA transfer it shows the next address following the last read access done.

Note:

- SASHDW does not show an aligned address if a non-aligned address is loaded into DMAi_SAN initially. However the DMAC will have made the read access to address SASHDW aligned according to the setting of Transfer Width (DMAi_Bn:TW).

4.15. DMA Controller Channel Configuration Destination Address Shadow Register Channel 'n' (DMAi_DASHDWn)

This register holds the address of the last destination data transfer for the DMA transfer of channel 'n' in case of a destination access error. If the DMA transfer is stopped it contains the next address following the last successful data transfer.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

Protection	WP							
Initial Value	0	0	0	0	0	0	0	0

[bit31:0] DASHDW[31:0] : Destination address shadow

At the start of a DMA transfer this register contains a copy of DMAi_DAn. During a DMA transfer it is either incremented, decremented, or stays constant according to the settings of DMAi_Dn:FD, DMAi_Dn:DED, DMAi_Dn:UD, and DMAi_Dn:FBD. In case of a destination access error DASHDW shows the address of the write access which causes the error. In case of a stop of the DMA transfer it shows the next address following the last write access done.

Note:

- DASHDW does not show an aligned address if a non-aligned address is loaded into DMAi_DAn initially. However the DMAC will have made the write access to address DASHDW aligned according to the setting of Transfer Width (DMAi_Bn:TW).

4.16. DMA Controller Client Matrix Internal Client Interface Configuration Register 'm' (DMAi_CMICICm)

This register controls internal client interface 'm'. Behavioral config bits determine the behavior of the acknowledge signals in case the DMA client is not selected. Also that this register controls enables DMA request for some peripherals.

bit	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24

Initial Value	0	0	0	0	0	0	0	0

Notes:

- Attribute of the 27th bit (BEHSTPACK) of DMAi_CMICICm has "R/W" and "R0,WX" by difference of product specifications.
- DMAi_CMICICm registers are not implemented depending on the product specification. In case of register access to those DMAi_CMICICm registers, response of bus error will occur
- About the implementation of these registers, please see the product's HWM.

[bit28] Reserved

Always write "0" to this bit.

[bit27] BEHSTPACK : Behavior stop acknowledge

BEHSTPACK sets the behavior of the Internal DMA Client Interface 'm' output signal DSTP_ACK[m] if the client interface is not selected in any of the Channel Configuration Registers (DMAi_CMCHICn).

Bit	Description
0	DSTP_ACK[m] outputs inactive logic level
1	DSTP[m] connects directly to DSTP_ACK[m]

[bit25] BEHREQACK : Behavior request acknowledge

BEHREQACK sets the behavior of the Internal DMA Client Interface 'm' output signal DREQ_ACK[m] if the client interface is not selected in any of the Channel Configuration Registers (DMAi_CMCHICn).

Bit	Description (1)
0	DREQ_ACK[m] outputs inactive logic level.
1	DREQ[m] connects directly to DREQ_ACK[m].

This bit also works as DMA request enable signal to the corresponding peripheral which send DMA request by IRQ. The bit must be changed while the peripheral function is disabled to guarantee that its IRQ is kept to disabled.

Bit	Description (2)
0	For the corresponding peripheral whose DMA request is controlled by IRQ: DMA request by IRQ is disabled.
1	For the corresponding peripheral whose DMA request is controlled by IRQ: DMA request by IRQ is enabled.

4.17. DMA Controller Client Matrix Channel Interface Configuration

Register 'n' (DMAi_CMCHICn)

This register controls internal channel interface 'n'. Behavioral config bits determine the behavior of the acknowledge signals in case the DMA client is not selected. Also the register contains bit fields which configure the behavior of CMCHIC reload event.

*1: Initial value of DMAi_CMCHICn:CI[8:0] is 'n'.

(e.g.) Initial value of DMAi_CMCHIC0:CI[8:0]= 0b000000000

Initial value of DMAi_CMCHIC5:CI[8:0]= 0b000000101

[bit29:24] RLESEL[5:0] : Reload event selection replacement

The bits specified the CMCHIC reload event. Please refer "CHAPTER: DMA COMPLEX SUBSYSTEM" for more details.

Bits	Description
000000	CMCHIC Reload event of DMAi_CMCHICn is disabled.
000100	Negative edge of TOT of Reload Timer ch.0 in the corresponding DMA Additional Control
000101	Negative edge of TOT of Reload Timer ch.1 in the corresponding DMA Additional Control
000110	Negative edge of TOT of Reload Timer ch.2 in the corresponding DMA Additional Control
000111	Negative edge of TOT of Reload Timer ch.3 in the corresponding DMA Additional Control
001000 to 001111	CMCHIC Reload event of DMAi_CMCHICn is disabled.
010000	BSTART from ch.0
010001	BSTART from ch.1
.....
011111	BSTART from ch.15
100000	BDONE from ch.0
100001	BDONE from ch.1
.....
101111	BDONE from ch.15
Else	No signal is selected

[bit18:16] RLSLOT[2:0] : Reload slot replacement

The bit specifies which bank is copied DMAi_CMCHICn at CMCHIC reload event. Please refer "CHAPTER: DMA COMPLEX SUBSYSTEM" for more details.

Bits	Description
000	Value of DMAAn_CMCHICRDB0 register is copied to DMAi_CMCHICn at CMCHIC reload event.
001	Value of DMAAn_CMCHICRDB1 register is copied to DMAi_CMCHICn at CMCHIC reload event.
.....
111	Value of DMAAn_CMCHICRDB8 register is copied to DMAi_CMCHICn at CMCHIC reload event.

[bit8:0] CI[8:0] : Client interface

Client Interface specifies that DMA channel 'n' is routed to the DMA Client given by the binary value of CI.

5. Additional Information

This section tabulates additional information of DMAC.

Following items are additional information of the DMAC in this product.

- "Debug event" is asserted by any of following condition :
 - CPU is in debug state

Notes:

When the channel is used with Multi-function Serial Interface to write the transmission data or read the reception data.

- When corresponding TXBLKEN (at transmission) or RXBLKEN (at reception) is 0:

Configure DMAi_An:BC[3:0] to "0000".

- When corresponding TXBLKEN (at transmission) or RXBLKEN (at reception) is 1:

Configure DMAi_An:BC[3:0] to a suitable value regarding TBSIZE (at transmission) or FBYTE (at reception).

CHAPTER 28: DMA COMPLEX SUBSYSTEM

This chapter explains DMA COMPLEX SUBSYSTEM.

1. Overview
2. Configuration and Block Diagram
3. Operation of the DMA COMPLEX SUBSYSTEM
4. Registers
5. Overview in DMA COMPLEX SUBSYSTEM
6. Configuration and Block Diagram in DMA COMPLEX SUBSYSTEM
7. Operation of the 32-Bit Reload Timer in DMA COMPLEX SUBSYSTEM
8. Registers in DMA COMPLEX SUBSYSTEM

DMACOMP-TXXPT03P01R01L08-E1-XX

1. Overview

This section gives a brief overview of DMA COMPLEX SUBSYSTEM.

The DMA COMPLEX SUBSYSTEM consists of DMA Controller, DMA Additional Control block and MPU16 AHB which operate in combination.

The DMA COMPLEX SUBSYSTEM offers following features:

- DMA transfer by DMA Controller. Please refer to "CHAPTER: DMA Controller" for more detail.
- Protect for unauthorized bus access by DMA Controller. Please refer to "CHAPTER: MPU16 AHB" for more detail.
- More debug assist features by DMA Additional Control block.
- Complicated DMA transfer request using dedicated Reload Timer inside DMA Complex Subsystem.

2. Configuration and Block Diagram

This section shows a block diagram of DMA COMPLEX SUBSYSTEM and DMA Additional Control block.

Figure 2-1 Entire Block Diagram of DMA Complex Subsystem

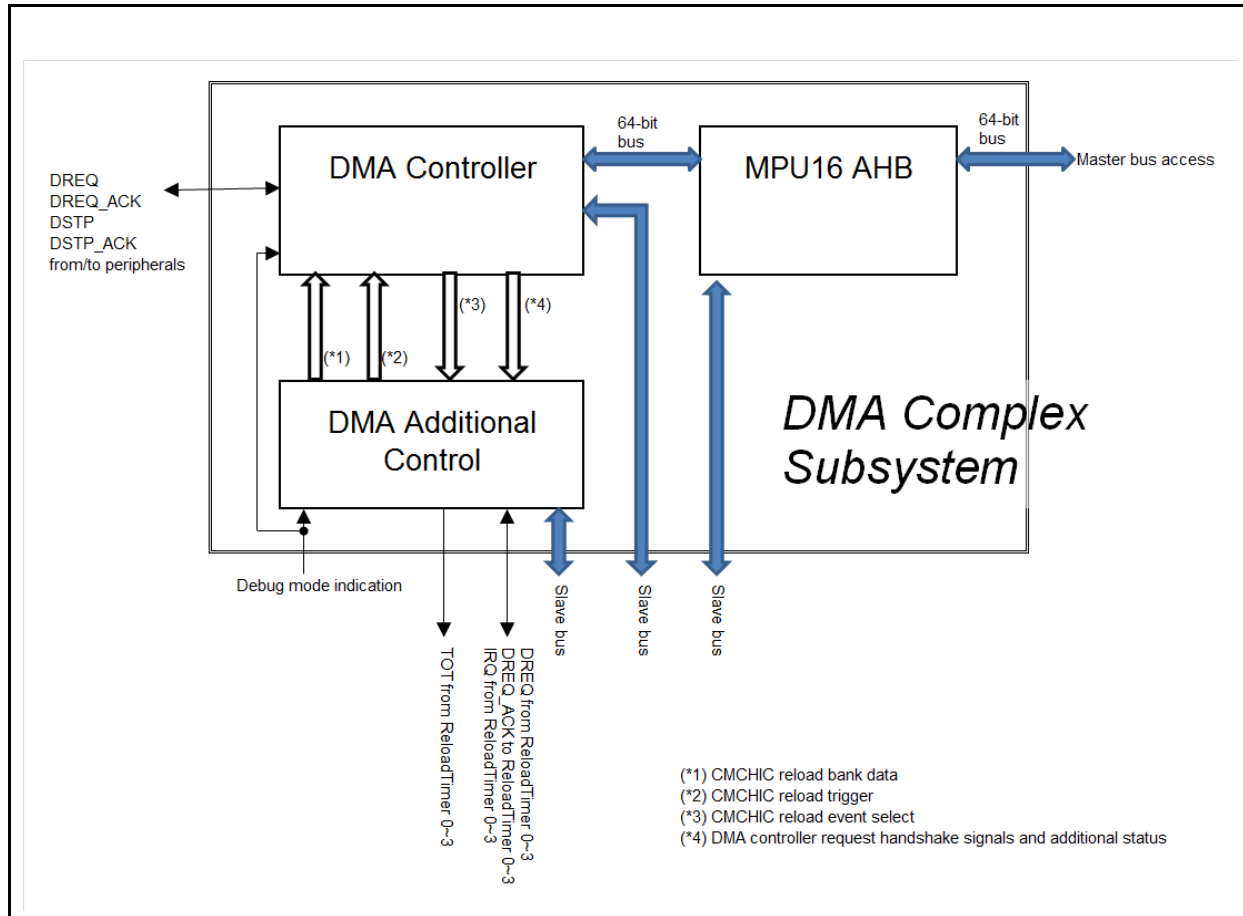

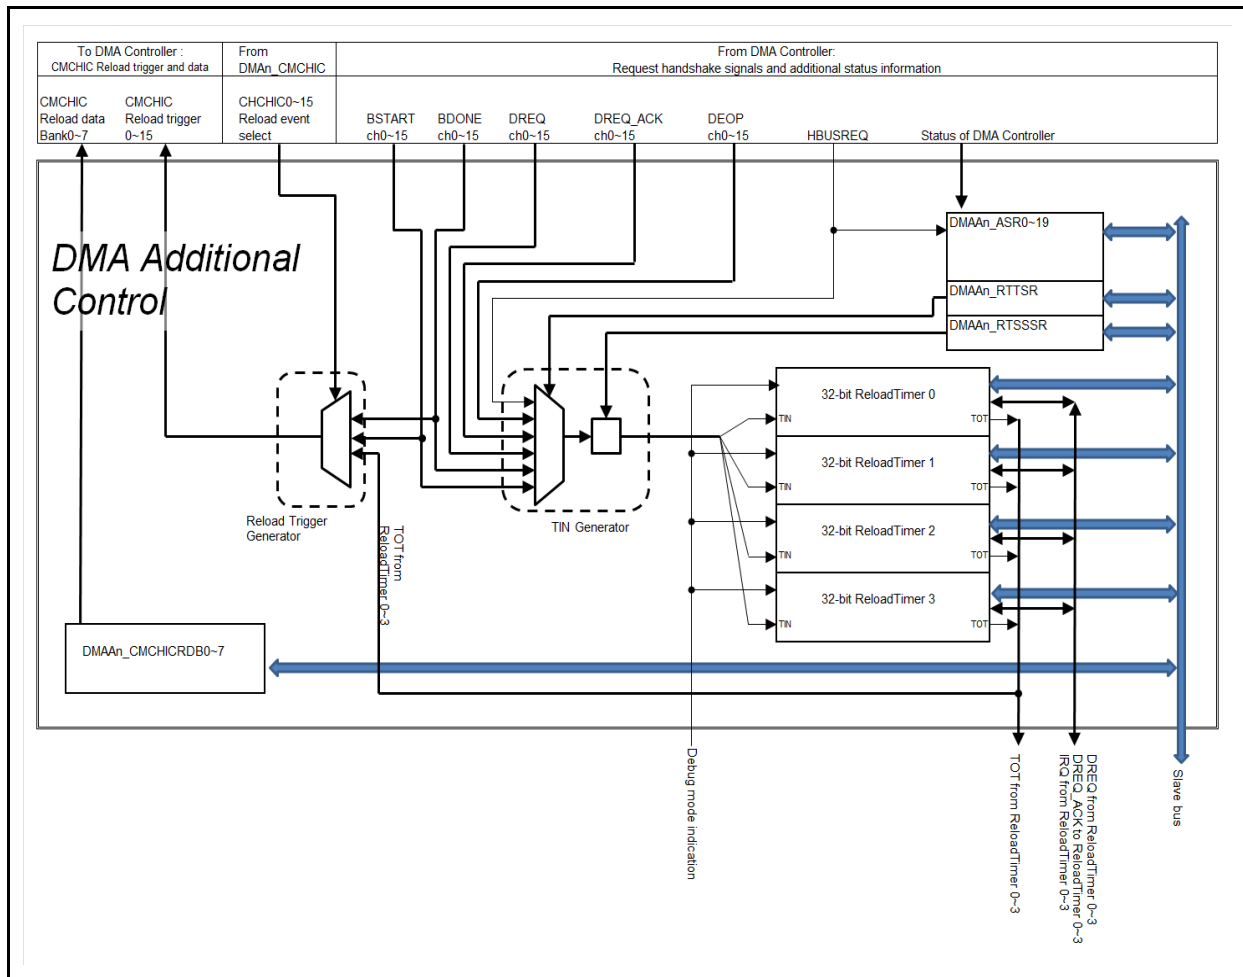

Figure 2-2 Entire Block Diagram of DMA Additional Control Block

3. Operation of the DMA COMPLEX SUBSYSTEM

This section describes the operation of DMA COMPLEX SUBSYSTEM.

The DMA COMPLEX SUBSYSTEM consists of following blocks:

- DMA Controller
- MPU16 AHB which operate in combination.
- DMA Additional Control block

The DMA Controller gives high-performance DMA transfer. Please refer to "CHAPTER: DMA Controller" for the details.

The MPU16 AHB is a memory protection unit which is inserted to a master bus and it offers protection features against unauthorized access by the DMA transfer. To cover all 16 channels for preventing unauthorized writing, the MPU16 AHB has 16 + 1 regions. Please refer to "CHAPTER: MPU16 AHB" for the details.

DMA Additional Control block offers more function for generating complicated DMA requests and obtaining DMA Controller status using its dedicated Reload Timer and additional status registers. DMA Additional Control block operation is explained in this section.

3.1. Additional Status Registers

This section is an introduction for additional status registers inside DMA Additional Control block.

DMA Additional Control block has several read-only status registers which offers several information of current DMA Controller status. Refer to "4 Registers" for more details of the registers.

3.2. CMCHIC Reloading

This section gives the explanation for CMCHIC reloading.

DMA_n_CMCHIC_i registers have CMCHIC reload feature. When DMA_n_CMCHIC_i register receives CMCHIC reload trigger, the contents of DMA_n_CMCHIC_i registers value is replaced to the specified DMA_A_CMCHICRDB_j register value. Where 'j' is specified by DMA_n_CMCHIC_i:RLSLOT[2:0].

CMCHIC reload trigger is generated in Reload Trigger Generator block in DMA Additional Control block when specified CMCHIC reload event happens. Where, the CMCHIC reload event is specified by DMA_n_CMCHIC_i:RLESEL[5:0] bits.

By CMCHIC reloading, client peripherals can be reconfigured as following figures.

Figure 3-1 Example of CMCHIC Reload Usage: Switching Client Peripheral

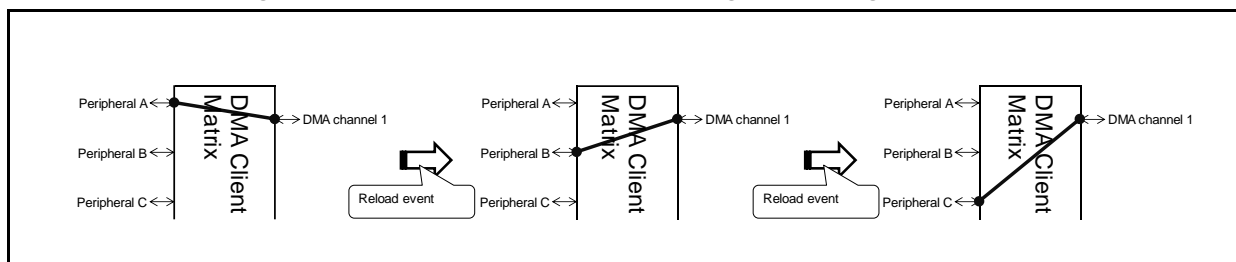

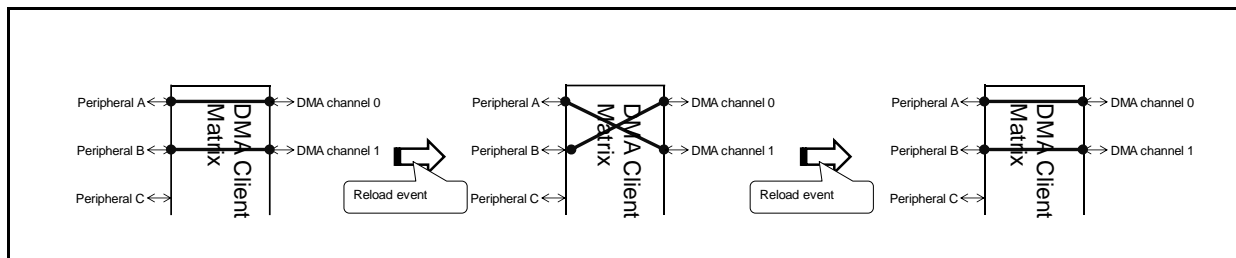

Figure 3-2 Example of CMCHIC Reload Usage: Swapping Client and Channel Connection

The CMCHIC reload event must not happen in middle of DREQ and DREQ_ACK handshaking. So the DMA trigger condition (e.g.: FIFO alarm value to trigger DMA request) must be carefully configured to make sure that any reload event does not happen in middle of DREQ and DREQ_ACK handshaking.

3.3. Reload Timer in DMA Additional Control

This section gives the explanation for Reload Timer in DMA Additional Control block.

The DMA Additional Control block has four 32-bit Reload Timer instances. The Reload Timer instances are used to following applications:

- Capturing events from DMA Controller
- Counting events from DMA Controller
- Generating another DMA request
- Generating IRQ
- Output pulse signal to TOT

Please refer to 3.3.1 for the connection of TIN input of Reload Timer instance is connected.

Please refer to 3.3.2 for the usage examples of Reload Timer.

Note:

- *TIN inputs of the Reload Timer in DMA Additional Controls are connected to DMA Complex Subsystem internal signals therefore they cannot be used to capture external pin inputs. Please refer to 3.3.1 Reload Timer Trigger Inputs and 4.7 DMA Additional Control Reload Timer Trigger Select Register (DMAAn_RTTSR) for TIN connection.*

3.3.1. Reload Timer Trigger Inputs

In this section, TIN sources of Reload Timer inside DMA Additional Control blocks are tabulated.

DMA Controller outputs some of DMA request handshakes and some of DMA status signals to be referred in DMA Additional Control block. In DMA Additional Control block, they are connected to the TIN input of Reload Timer via TIN generator block. The TIN source is selected by DMAAn_RTTSR register.

Table 3-1 Reload Timer TIN Input Selection

Source	Description
DREQ[i]	DMA request to DMA channel i from corresponding peripheral.
DREQ_ACK[i]	Acknowledge to the DMA request from DMA channel i.
DEOP[i]	DMA End of Operation. When the all blocks of block transfer or a burst transfer of DMA channel i is completed, the DEOP signal is asserted. It will be de-asserted soon.
BSTART[i]	Block transfer start. It will asserted at start of a transfer of a block by DMA channel i.
BDONE[i]	Block transfer done. It is asserted at completion of the current block of DMA channel i.
HBUSREQ	HBUSREQ is asserted to "1" at transfer starts. HBUSREQ is de-asserted to "0" at transfer completion of current block. By referring to HBUSREQ, "transfer gap" can be observed. Please refer to "CHAPTER : DMA Controller" for the "transfer gap".
Software trigger	When bit 'j' of DMAAn_RTSSSR is written, a "0"→"1"→"0" pulse will be given to TIN of ReloadTimer channel j. Using the DMAAn_RTSSSR, all of four Reload Timer can be triggered at the same time. Software trigger is always able to be used regardless DMAAn_RTTSR setting.

'i' indicates channel number of DMA.

'j' indicates channel number of Reload Timer in the DMA Additional Control block.

3.3.2. Reload Timer Usage Examples

In this section, usage examples of Reload Timer are given.

Table 3-2 Reload Timer Usage Examples

Usage	Description
Periodic timer interrupt generator	It can be used as periodic timer interrupt source.
Periodic timer DMA trigger	It can be uses as periodic timer DMA trigger.
Route BSTART / BDONE / DREQ / DREQ_ACK / DEOP / HBUSREQ to TOT output.	Assertion or de-assertion of these signals can be observed by TOT by triggering the timer and output TOT by the timer event.
Count the number of BSTART / BDONE / DREQ / DREQ_ACK / DEOP / HBUSREQ events.	By using these signals as counting clock of the Reload Timer, number of these signal events can be counted.
Obtain timestamp of BSTART / BDONE / DREQ / DREQ_ACK / DEOP / HBUSREQ event.	By using these signals as the start trigger of timer, the timestamp of these signal events can be calculated.
Trigger 2nd DMA channel by request / completion of 1st DMA channel transfer.	By following configuration, another DMA trigger can be generated by a DMA transfer request / completion. - TIN input : DREQ_ACK / BDONE / DEOP - ReloadTimer DMAAn_RLTm_DMACFG:ENDMAUF = 1
Trigger a block transfer to 2nd DMA channel per completion of 3 blocks of 1st DMA channel.	By following configuration, transfer requests can be generated at every four block transfer completion. - TIN input : BDONE - Use Reload timer in event counter mode (DMAAn_RLTm_TMCSR:CSL[2:0]= 0b110) - ReloadTimer DMAAn_RLTm_DMACFG:ENDMAUF= 1 - ReloadTimer DMAAn_RLTm_TMRLR= 0x00000002
Generating CMCHIC reload trigger.	TOT of Reload Timer can be used as CMCHIC reload event.

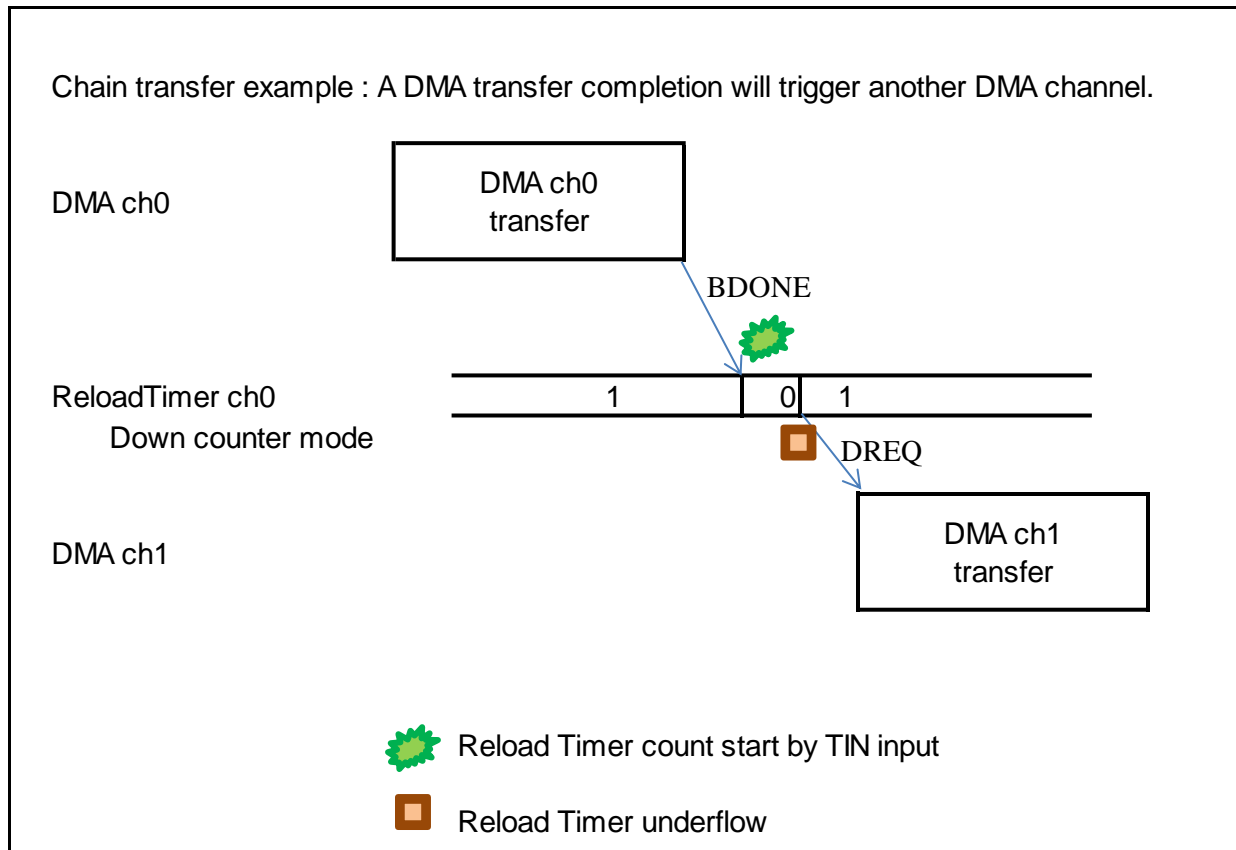

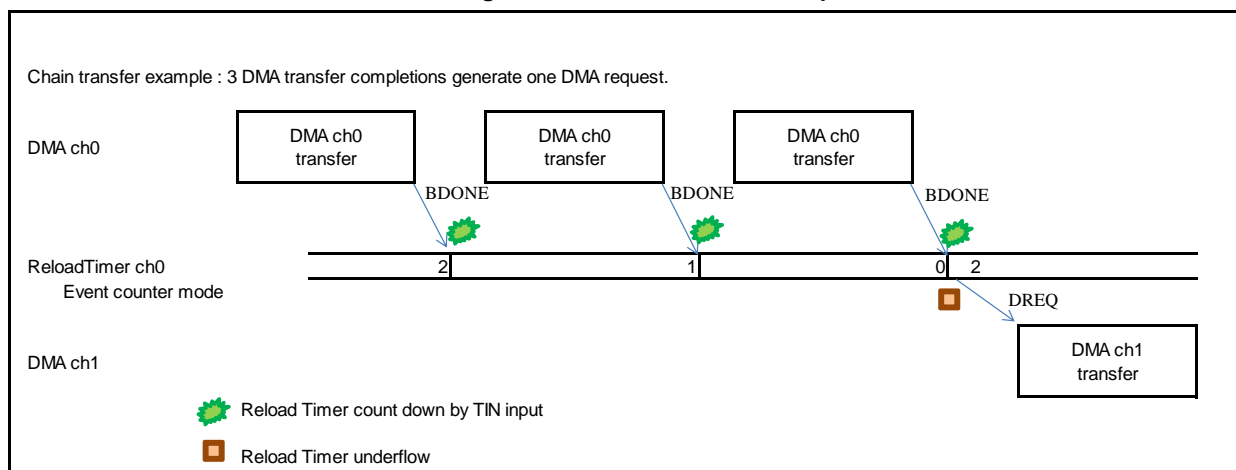

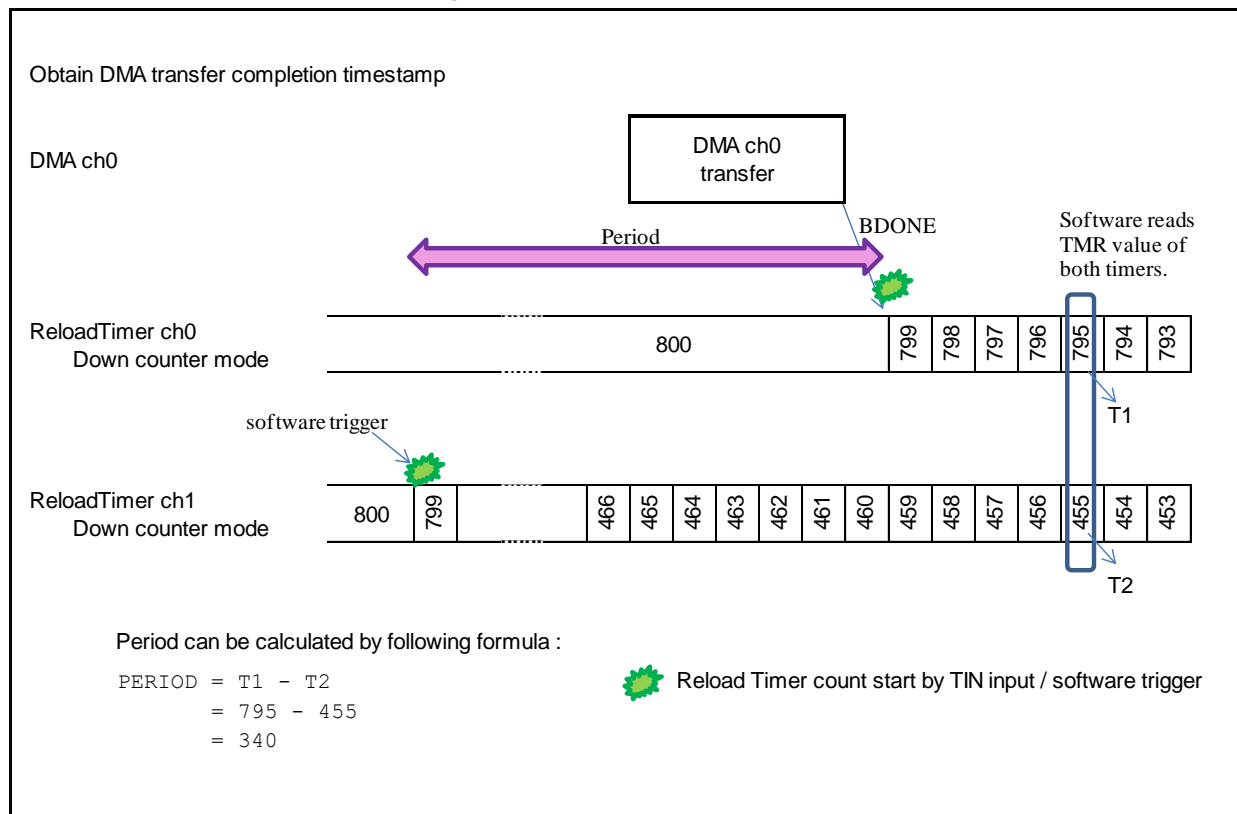

Figure 3-3 Chain Transfer Example**Figure 3-4 Chain Transfer Example**

Figure 3-5 Example to Obtain Timestamp

4. Registers

This section describes the registers of DMA Additional Control block.

Please refer to "CHAPTER: DMA Controller" for the registers in DMA Controller.

Please refer to "CHAPTER: MPU16 AHB" for the registers in MPU16 AHB.

The DMA Additional Control block has four "32-bit Reload Timer" instances. Please refer to 8 Registers in DMA COMPLEX SUBSYSTEM.

[bit30:24] RLT3TS[6:0]: Reload timer 3 trigger select

This bit selects the TIN source of Reload Timer 3 in DMA Additional Control block.

[bit22:16] RLT2TS[6:0]: Reload timer 2 trigger select

This bit selects the TIN source of Reload Timer 2 in DMA Additional Control block.

[bit14:8] RLT1TS[6:0]: Reload timer 1 trigger select

This bit selects the TIN source of Reload Timer 1 in DMA Additional Control block.

[bit6:0] RLT0TS[6:0]: Reload timer 0 trigger select

This bit selects the TIN source of Reload Timer 0 in DMA Additional Control block.

RLTkTS[6:0] (k = 3,2,1,0)	Description
0x00 to 0x0F	DREQ to DMA channel 0 to 15
0x10 to 0x1F	DREQ_ACK from DMA channel 0 to 15
0x20 to 0x2F	BSTART from DMA channel 0 to 15
0x30 to 0x3F	BDONE from DMA channel 0 to 15
0x40 to 0x4F	DEOP from DMA channel 0 to 15
0x50	HBUSREQ
Else	TIN is tied to "0".

Note:

- *Software trigger by DMAAn_RTSSSR register is always able to be used regardless RLTkTS[6:0] value.*

4.8. DMA Additional Control Reload Timer Synchronous Software Start Register (DMAAn_RTSSSR)

By using this register, a "0"-->"1"-->"0" pulse can be given to the TIN inputs of Reload Timer instances. The Reload Timer instances can be triggered simultaneously by using this register.

BIT_OFFSET	31	30	29	28	27	26	25	24

[bit3:0] SSSR[3:0]: Synchronous software start register

By writing to "1" to bit k (k=3,2,1,0), a "0"→"1"→"0" pulse is given to TIN input of Reload Timer instance 'k'. Writing "0" has no effects.

SSSR[k] (k = 3,2,1,0)	Description
1	Give "0"→"1"→"0" pulse to TIN input of Reload Timer instance 'k'.
0	No effect.

5. Overview in DMA COMPLEX SUBSYSTEM

This section gives a brief overview of the 32-bit Reload Timer in DMA COMPLEX SUBSYSTEM.

Features of 32-Bit Reload Timer

The 32-bit Reload Timer consists of a 32-bit down counter, a 32-bit Reload register, one input(TIN), one output (TOT), and control registers. The 32-bit Reload Timer has the following features:

- External(TIN can capture DMA event (*1)) and internal clock/event source
- Trigger signal programmable as rising/falling edge or both
- Gated count function
- One-shot or reload counter mode
- Counter state can be made visible at external pin (*2)
- Prescaler with six different settings for the internal clock and two different settings for the external clock
- Support for MCU debug mode

Notes:

- (*1) For the connection, please refer to 3.3.1 Reload Timer Trigger Inputs.
- (*2) Please refer to device specific datasheet whether the external output pin is supported or not.

DMA and Interrupts

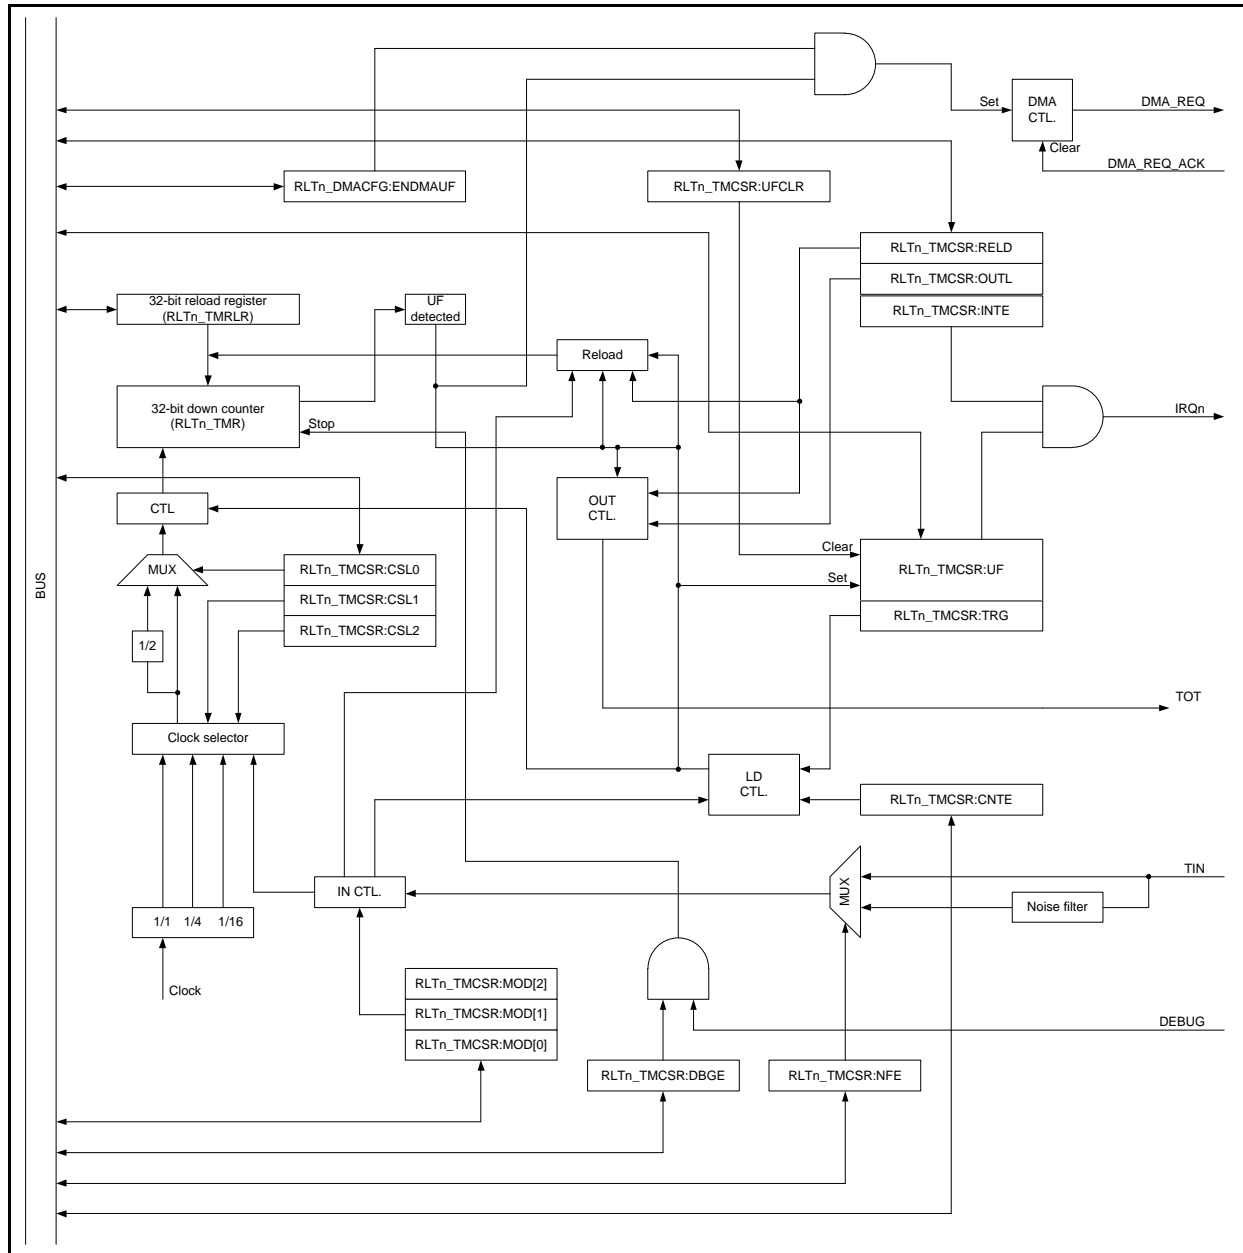

The 32-bit Reload Timer can generate DMA request which can be used to start DMA transfers.

The 32-bit Reload Timer can generate interrupt in case of underflow.

6. Configuration and Block Diagram in DMA COMPLEX SUBSYSTEM

This section shows a block diagram of the 32-bit Reload Timer in DMA COMPLEX SUBSYSTEM.

Figure 6-1 Block Diagram of 32-Bit Reload Timer in DMA COMPLEX SUBSYSTEM

Notes:

- In the figure(s) in this section, *RLTn_XXXXX* means *DMAAn_RLTm_XXXXX* register.
- Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).
- For the connection of TIN, please refer to 3.3.1 Reload Timer Trigger Inputs.

7. Operation of the 32-Bit Reload Timer in DMA COMPLEX SUBSYSTEM

This section describes the operation of the 32-bit Reload Timer in DMA COMPLEX SUBSYSTEM.

7.1 Internal Clock and External Event Counter Operations of 32-Bit Reload Timer

7.2 Underflow Operation of 32-Bit Reload Timer

7.3 Output Functions of 32-Bit Reload Timer

7.4 Counter Operation State

7.5 DMA Operation

7.1. Internal Clock and External Event Counter Operations of 32-Bit Reload Timer

In internal clock mode, the peripheral clock with different divider settings can be selected as the clock source for operating the Reload Timer. The external input TIN can be selected as either a trigger input, or as a gate input by a register setting.

In event counter mode, the TIN is used as an external event input. Each active edge on this input (rising, falling, or both) decrements the counter.

When DMAAn_RLTm_TMCSR:CSL0 = 1, then each second event is counted.

Internal Clock Operation of 32-Bit Reload Timer

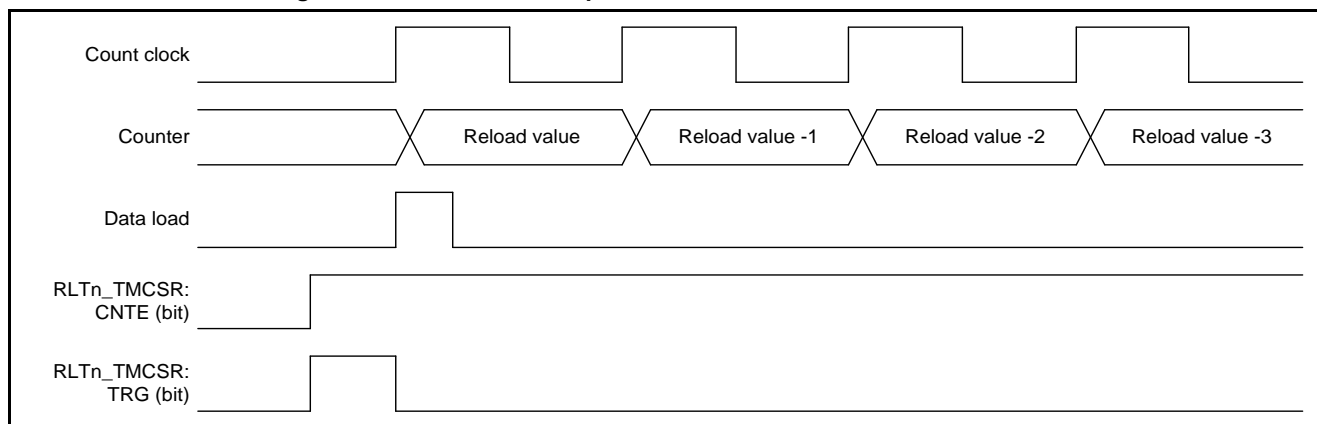

Writing "1" to both DMAAn_RLTm_TMCSR:CNTE and DMAAn_RLTm_TMCSR:TRG bits enables and starts counting at the same time. Using the DMAAn_RLTm_TMCSR:TRG bit as a trigger input is always available when the timer is enabled (DMAAn_RLTm_TMCSR:CNTE = 1), regardless of the operation mode.

Figure 7-1 shows counter activation and counter operation.

Notes:

- In the figure(s) in this section, *RLTn_XXXXX* means *DMAAn_RLTm_XXXXX* register.
- Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).

Figure 7-1 Activation and Operation of 32-Bit Reload Timer Counter

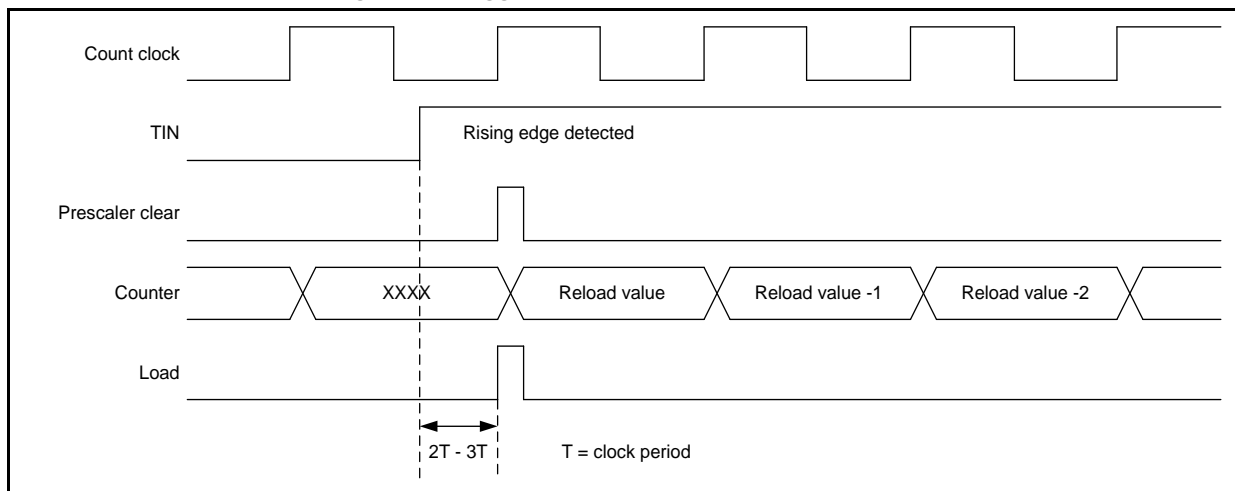

Input Functions of 32-Bit Reload Timer (In Internal Clock Mode)

The TIN input can be used as either a trigger input, or as a gate input, when an internal clock is selected as the clock source.

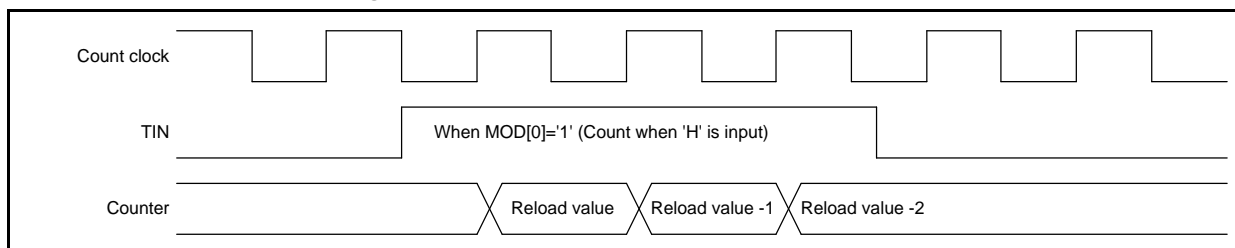

Trigger Input

When used as a trigger input, an active edge causes the timer to load the reload register contents and resets the internal prescaler. Then, count operation starts. For the minimum pulse width length of TIN refer to device specific datasheet.

Figure 7-2 Trigger Input Operation of 32-Bit Reload Timer

Gate Input

When used as a gate input, the counter only counts while the active level specified by the DMAAn_RLTm_TMCSR:MOD[0] bit is input to the TIN. In this case, the count clock continues to operate unless stopped. The software trigger can be used in gate mode, regardless of the gate level. For the minimum pulse width length of TIN refer to device specific datasheet.

Figure 7-3 Gate Input Operation of 32-Bit Reload Timer

External Event Counter

When external event count mode is selected, the TIN is used as an external event input. The counter counts on the active edge specified in the DMAAn_RLTm_TMCSR. For the minimum pulse width length of TIN refer to device specific datasheet.

7.2. Underflow Operation of 32-Bit Reload Timer

An underflow is defined for this timer as the time when the counter value changes from 0x00000000 to 0xFFFFFFFF or reload occurs (DMAAn_RLTm_TMCSR:RELD= 1). Therefore, an underflow occurs after (reload register setting + 1) counts.

Underflow Operation of 32-Bit Reload Timer

If the DMAAn_RLTm_TMCSR:RELD bit is "1" and an underflow occurs, the contents of the reload register is loaded into the counter and counting continues.

If the DMAAn_RLTm_TMCSR:RELD bit is "0", counting stops when counter reaches 0xFFFFFFFF.

The DMAAn_RLTm_TMCSR:UF bit is set when the underflow occurs. If the DMAAn_RLTm_TMCSR:INTE bit is "1" at this time, an interrupt request is generated.

Figure 7-4 shows the operation when an underflow occurs with various values of DMAAn_RLTm_TMCSR:RELD. Figure 7-5 shows the clearing operation of underflow flag.

Notes:

- In the figure(s) in this section, *RLTn_XXXXX* means DMAAn_RLTm_XXXXX register.
- Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).

Figure 7-4 Underflow Operation of 32-Bit Reload Timer

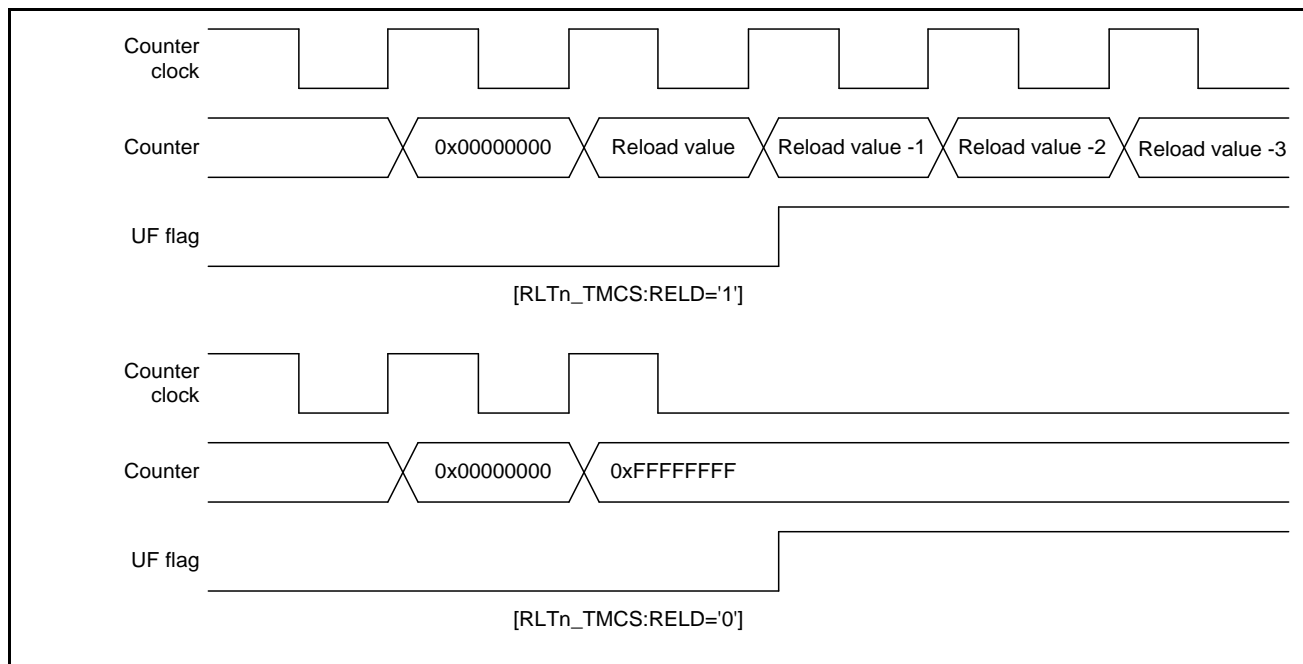

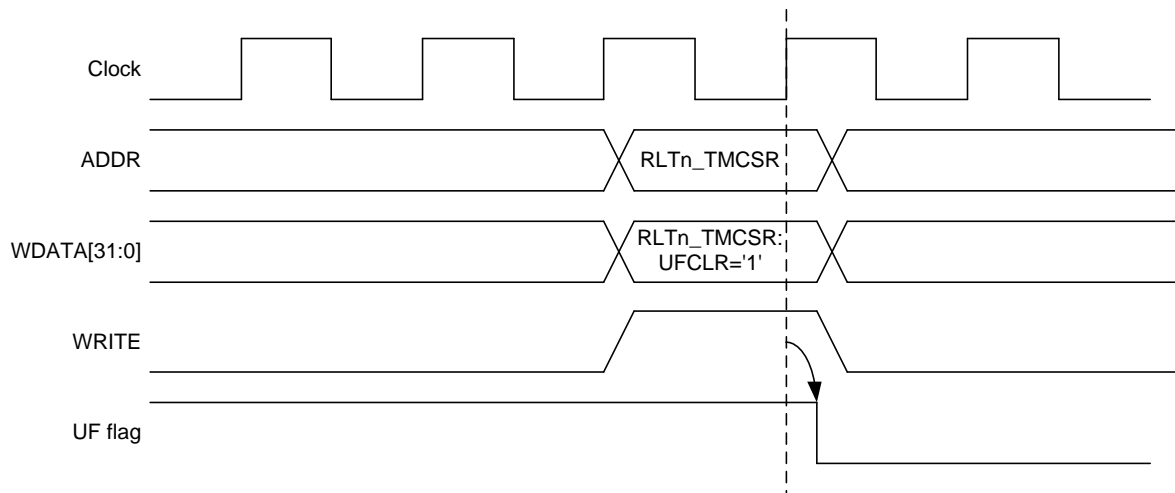

Figure 7-5 Clearing of Underflow Bit

7.3. Output Functions of 32-Bit Reload Timer

In reload mode, the TOT output performs toggle output (inverts at each underflow). In one-shot mode, the TOT output is used as a pulse output that shows the configured level while the counting is in progress.

Output Signal Functions of 32-Bit Reload Timer

The DMAAn_RLTm_TMCSR:OUTL bit sets the output polarity.

When DMAAn_RLTm_TMCSR:OUTL = 0, the initial value for toggle output is "L" and the one-shot pulse output is "H" while the count is in progress.

When DMAAn_RLTm_TMCSR:OUTL = 1, the output waveforms are opposite.

Figure 7-6 and Figure 7-7 show the output signal functions.

Notes:

- In the figure(s) in this section, *RLTn_XXXXX* means *DMAAn_RLTm_XXXXX* register.
- Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).

Figure 7-6 Output Signal Function of 32-Bit Reload Timer in Reload Mode

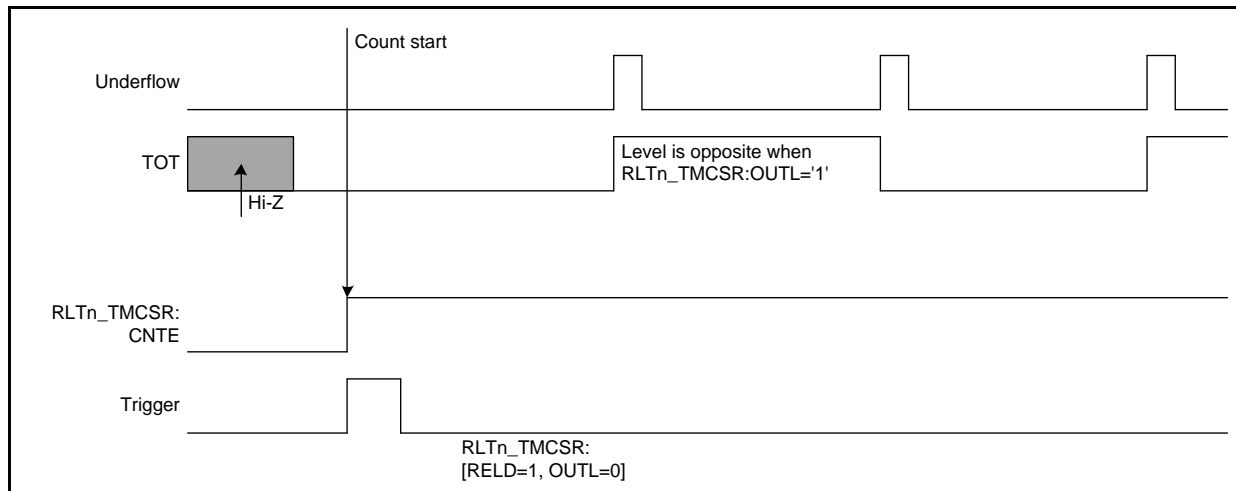

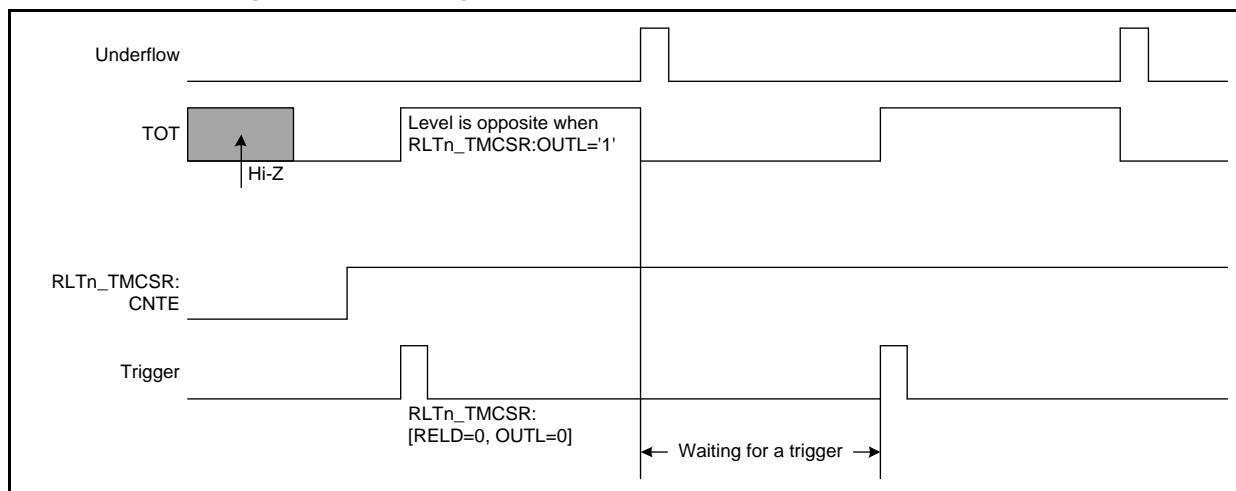

Figure 7-7 Output Signal Function of 32-Bit Reload Timer in One-Shot Mode

7.4. Counter Operation State

The counter state is determined by DMAAn_RLTm_TMCSR:CNTE bit in the Timer Control Status Register and the internal WAIT signal.

Available States for Reload Timer Are:

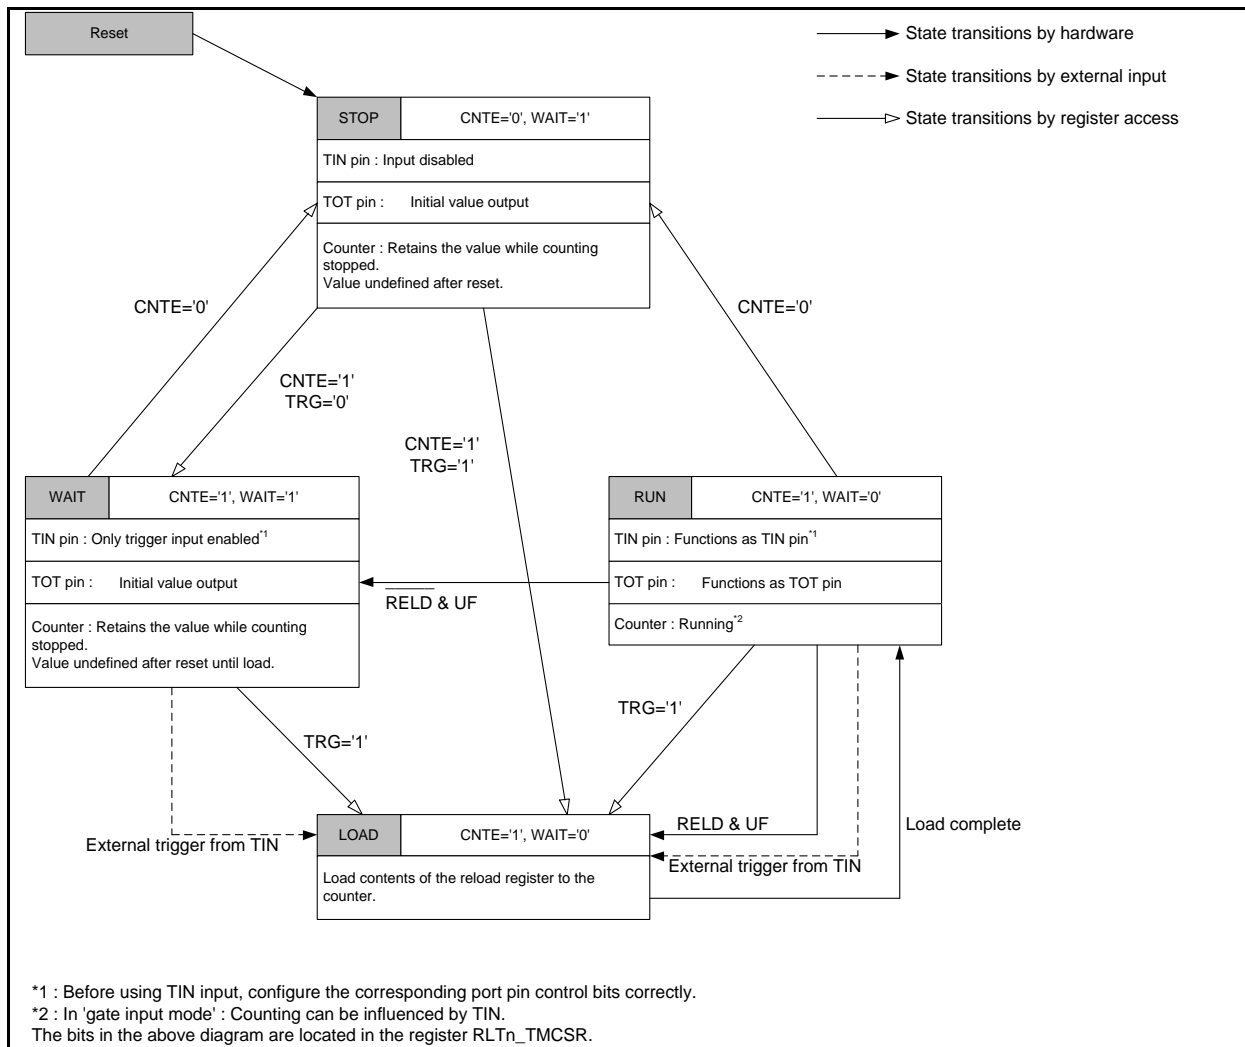

Stop state: DMAAn_RLTm_TMCSR:CNTE = 0 and WAIT = 1

Wait state: DMAAn_RLTm_TMCSR:CNTE = 1 and WAIT = 1

Run state: DMAAn_RLTm_TMCSR:CNTE = 1 and WAIT = 0

Counter Operation States

Figure 7-8 Counter Operation States

Notes:

- In the figure(s) in this section, RLTrn_XXXXX means DMAAn_RLTm_XXXXX register.
- Registers of the same type are provided for individual RLTrs, and "m" in the abbreviated register name indicates the RLTr number m (0 to 3).
- For the connection of TIN, please refer to 3.3.1 Reload Timer Trigger Inputs.

7.5. DMA Operation

The DMA support is determined by the DMAAn_RLTm_DMACFG:ENDMAUF bit. Setting this bit enables DMA request generation for DMA. Assertion of DMA_REQ_ACK signal acknowledges request and hence DMA_REQ signal gets de-asserted.

Enabling DMA Support

Writing "1" to DMAAn_RLTm_DMACFG:ENDMAUF enables DMA request generation for DMA when DMAAn_RLTm_TMCSR:UF bit sets. However, writing "0" to DMAAn_RLTm_DMACFG:ENDMAUF disables DMA request generation even if DMAAn_RLTm_TMCSR:UF bit sets.

When DMA_REQ_ACK is asserted the DMA_REQ signal gets de-asserted by acknowledging the DMA request.

Figure 7-9 shows behavior of DMA_REQ_ACK when asserted.

Note:

- Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).

Figure 7-9 De-Asserting DMA_REQ Signal

8. Registers in DMA COMPLEX SUBSYSTEM

This section describes the registers of 32-bit Reload Timer in DMA COMPLEX SUBSYSTEM.

Table 8-1 Memory Layout of 32-Bit Reload Timer Registers

Offset	+3	+2	+1	+0
0x00000000	DMAAn_RLTm_DMACFG 00000000_00000000_00000000_00000000			
0x00000004	Reserved			
0x00000008	DMAAn_RLTm_TMCSR 00000000_00000000_00000000_00000000			
0x0000000C	Reserved			
0x00000010	DMAAn_RLTm_TMRLR XXXXXXXX_XXXXXXXX_XXXXXXXX_XXXXXXXX			
0x00000014	DMAAn_RLTm_TMR XXXXXXXX_XXXXXXXX_XXXXXXXX_XXXXXXXX			

Note:

- The initial register value after reset indicates as follows:
 - "1": Initial value "1"
 - "0": Initial value "0"
 - "X": Initial value undefined
 - "-": Reserved bit/Undefined bit
 - "*": Initial value "0" or "1" according to the setting

8.1. DMA Configuration Register (DMAAn_RLTm_DMACFG)

The DMA Configuration Register controls the DMA request generation for underflow condition.

Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).

[bit31:25] Reserved

[bit24] CNTE: Count enable

The Count Enable (CNTE) bit is a timer count enable bit.

Bit	Description
0	Stops count operation
1	Sets the timer to wait for a trigger

[bit23:19] Reserved

[bit18] TRG: Trigger

Software trigger bit.

Bit	Description
0	No effect
1	Applies a software trigger, causing the timer to load the reload register content to the counter and starts counting

Notes:

- Applying a trigger using this register is only valid when `DMAAn_RLTm_TMCSR:CNT` = 1. If `DMAAn_RLTm_TMCSR:CNT` = 0, writing "1" to TRG has no effect.
- Set this bit in 'gate input mode' and in 'event count mode' to load the reload register content before counting starts.

[bit17] UFCLR: Underflow interrupt clear

Bit	Description
0	No effect
1	Clears <code>DMAAn_RLTm_TMCSR:UF</code> bit

[bit16] UF: Underflow

The Underflow (UF) is timer interrupt request flag.

Bit	Description
0	No underflow occurred
1	When an underflow occurred

Note:

- UF bit is cleared by writing "1" to `DMAAn_RLTm_TMCSR:UFCLR` bit.

[bit15:13] MOD: Operation mode

The Operation Mode (MOD[2:0]) bits set the operation mode and input (TIN) functions.

Table 8-2 and Table 8-3 list the MOD[2:0] bit settings.

[bit12] CSL2: Clock select 2

The Clock Select 2 (CSL2) bit specifies the clock/event source and the clock division ratio.

Table 8-4 lists the selected clock sources for different CSL0/1/2 settings.

[bit11] CSL1: Clock select 1

The Clock Select 1 (CSL1) bit specifies the clock/event source and the clock division ratio.

Table 8-4 lists the selected clock sources for different CSL0/1/2 settings.

[bit10] CSL0: Clock select 0

The Clock Select 0 (CSL0) bit specifies the count clock division ratio.

Table 8-4 lists the selected clock sources for different CSL0/1/2 settings.

[bit9] Reserved**[bit8] NFE: Noise filter enable**

Always write "0" to this bit.

[bit7] DBGE: Debug mode enable

This bit is used to enable/disable debug mode for RLT.

Bit	Description
0	Debug mode disabled
1	Debug mode enabled

Notes:

- When DBGE is set to "1" and the processor is in debug state, the timer counter operation is paused, and writing to the DMAAn_RLTm_TMRLR register directly updates the timer counter (DMAAn_RLTm_TMR register). When the processor leaves debug state or DBGE is set to "0", the timer counter operation is resumed.

[bit6] Reserved

[bit5] OUTL: Output level

This Output Level (OUTL) bit sets the output level for the TOT.

Refer to Table 8-5.

[bit4] RELD: Reload

This Reload (RELD) bit enables reload operations.

Refer to Table 8-5.

Bit	Description
0	The timer operates in one-shot mode. In this mode, the count operation stops when an underflow occurs due to the counter value changing from 0x00000000 to 0xFFFFFFFF
1	The timer operates in reload mode. In this mode, the timer loads the reload register contents into the counter and continues counting whenever an underflow occurs

[bit3] INTE: Interrupt enable

Timer interrupt request enable bit.

Bit	Description
0	No interrupt request is generated even when the DMAAn_RLTm_TMCSR:UF bit changes to "1"
1	An interrupt request is generated when the DMAAn_RLTm_TMCSR:UF bit changes to "1"

[bit2:0] Reserved

Table 8-2 DMAAn_RLTm_TMCSR:MOD[2:0] Bit Settings for Internal Clock Mode (DMAAn_RLTm_TMCSR:CSL1 / DMAAn_RLTm_TMCSR:CSL2 = 0b00, 0b01, or 0b10)

x	0	0	-	-
	0	1	Event input	Rising edge
	1	0		Falling edge
	1	1		Both edge

Table 8-4 Clock Sources for DMAAn_RLTm_TMCSR:CSL0 / DMAAn_RLTm_TMCSR:CSL1 / DMAAn_RLTm_TMCSR:CSL2 Bit Settings

CSL2	CSL1	CSL0	Count Clock (Time for Peripheral Clock)
0	0	0	1/1
0	0	1	1/2
0	1	0	1/4
0	1	1	1/8
1	0	0	1/16
1	0	1	1/32
1	1	0	External event count mode, each event on TIN
1	1	1	External event count mode, each second event on TIN

Table 8-5 DMAAn_RLTm_TMCSR: DMAAn_RLTm_TMCSR:OUTL, and DMAAn_RLTm_TMCSR:RELD Settings

OUTL	RELD	Output Waveform
0	0	Output an "H" level pulse during counting.
1	0	Output an "L" level pulse during counting.
0	1	Toggle output. Starts with "L" level output. Changes level on timer reload.
1	1	Toggle output. Starts with "H" level output. Changes level on timer reload.

Note:

- Bits marked 'x' in the table can be set to any value.

8.3. 32-Bit Reload Register (DMAAn_RLTm_TMRLR)

The Timer Reload Register holds the reload value of the 32-bit Reload Timer in DMA COMPLEX SUBSYSTEM. Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).

BIT_OFFSET	31	30	29	28	27	26	25	24

[bit31:0] TMRLR: Timer reload register

The Timer Reload Register (DMAAn_RLTm_TMRLR) is a 32-bit reload register holds the reload value. Initial value is undefined.

This register can be accessed only in 32-bit/64-bit mode.

When DMAAn_RLTm_TMCSR:DBGE is set to "1" and the processor is in debug state, writing to this register updates the timer counter immediately.

Note:

- This register is not initialized by Hard Reset (i.e. "X").

8.4. 32-Bit Timer Register (DMAAn_RLTm_TMR)

Reading this register returns the count value of the 32-bit Reload Timer in DMA COMPLEX SUBSYSTEM. The initial value is undefined. Registers of the same type are provided for individual RLTs, and "m" in the abbreviated register name indicates the RLT number m (0 to 3).

BIT_OFFSET	31	30	29	28	27	26	25	24

INITIAL_VALUE	XXXXXXXX							

[bit31:0] TMR: Timer register

Reading this Timer Register (DMAAn_RLTm_TMR) returns the count value of the 32-bit Reload Timer. Initial value is undefined.

This register can be accessed only in 32-bit/64-bit mode.

Note:

- This register is not initialized by Hard Reset (i.e. "X").

CHAPTER 29: MPU16 AHB

This chapter explains the function and operation of the Memory Protection Unit for the AMBA Advanced High Speed Bus (MPU16 AHB).

1. Outline of the MPU16 AHB
2. MPU16 AHB Registers
3. Operation of the MPU16 AHB

MPU16AHB-TXXPT03P01R01L06-E1-XX

1. Outline of the MPU16 AHB

This section describes the features and the block diagram of the MPU16 AHB.

Features of MPU16 AHB

The MPU16 AHB module monitors the accesses from AHB Masters and checks each access against an authorized set of Access Permissions. Access Permissions (known as “permission attributes” from here onwards) are defined by Access Permissions (AP) bits. These AP bits are explained in Section MPU access permissions.

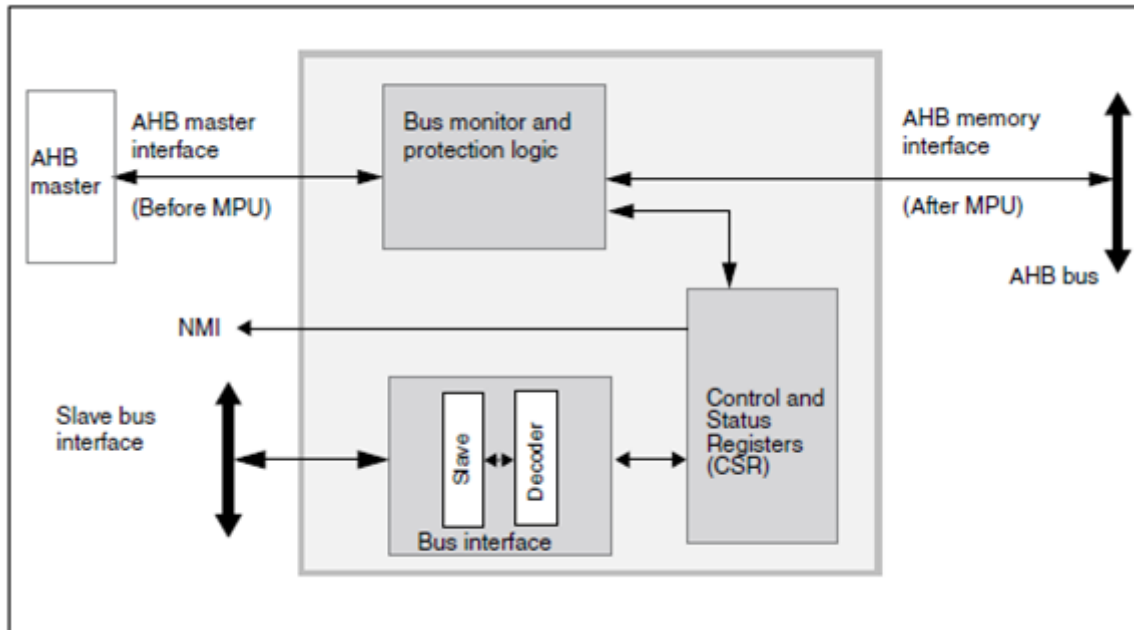

The MPU16 AHB provides 16 regions and one background region. Each region has corresponding Access Permission bits that define the permission attributes for that particular region. Any unauthorized access to that memory space is flagged using a non-maskable interrupt. MPU16 AHB also collects information about unauthorized bus access and stores it in its internal registers.

The features of the MPU16 AHB module are listed in this section:

- Each of the 16 regions in MPU16 AHB is specified using corresponding start address and end address
- The background region covers the entire 4GB address space
- With an unauthorized access, the MPU16 AHB generates an NMI to the CPU
- The MPU16 AHB collects information about the AHB Master bus access that caused the unauthorized access
- It supports 8-, 16- and 32-bit bus accesses for the configuration of the MPU16 AHB registers
- It supports lock and unlock feature to protect registers from illegal write accesses
- The modification of registers in the MPU16 AHB is only allowed in privileged mode
- MPU16 AHB registers can be written only after execution of the unlock sequence
- It supports a privileged mode overwrite feature that allows the privilege attribute of the memory side AHB interface to be overwritten

2. Configuration and Diagram

Figure 2-1 Block Diagram of MPU16 AHB

Bus Interface

The bus masters can access the MPU16 AHB module through its slave bus interface.

Bus Monitor and Protection Logic

This logic monitors the transfers on AHB master interface bus. It finds out the region/s where the current transfer belongs to and then applies permissions based on the region match. It signals any permission violation using an NMI interrupt. All transfers on the AHB Master Interface (including the one that caused permission violation) are blocked until the NMI is cleared.

Control and Status Registers

The operation of the MPU16 AHB can be controlled and monitored through its Control and Status Registers (CSR). For more details about the CSR refer to Section 2.

3. MPU16 AHB Registers

The MPU16 AHB module contains various registers to configure its operation, to monitor its status and to read the information it has collected from the AHB master interface at the time of a memory protection violation.

The MPU16 AHB module is allocated 4 KB of MCU address space for mapping the Configuration and Status Registers (CSRs). The address area allocated to the MPU16 AHB and the CSRs in the MPU16 AHB are explained in this section.

The suffix 'n' in the register name indicates that the register is an instance 'n' of the module.

Registers of MPU16 AHB

The following registers are available for the MPU16 AHB:

- MPU16 AHB Control Register (MPUHN_CTRL0)
- MPU16 AHB NMI Enable Register (MPUHN_NMIEN)
- MPU16 AHB Memory Error Control Register (MPUHN_MERRC)
- MPU16 AHB Memory Error Address Register (MPUHN_MERRA)
- MPU16 AHB Region Control Registers (MPUHN_CTRL1 to 16)
- MPU16 AHB Start Address Registers (MPUHN_SADDR1 to 16)
- MPU16 AHB End Address Registers (MPUHN_EADDR1 to 16)
- MPU16 AHB Unlock Register (MPUHN_UNLOCK)
- MPU16 AHB Module ID Register (MPUHN_MID)

3.1. MPU16 AHB Control Register (MPUHN_CTRL0)

MPU16 AHB Control Register can be used by the software to configure the MPU16 AHB. This register provides enable bit to enable the MPU16 AHB monitoring and protection function. It also provides permission attributes for background region. It also provides controls for enabling or disabling of privileged mode overwrite feature. Lastly it provides status of MPU16 AHB lock bit and Non-Maskable Interrupt flag.

Bit Position	Bit Field Name	Bit Description
[31:27]	Reserved	-
[26:24]	AP	Access Permissions for Background Region These bits are used to control access permissions for a background region. For more details about these bits, refer to Table 3-1. Note: AP[2:0] bits for background region can only be written when the MPU is disabled (MPUHN_CTRL0:MPUEN = 0).
[23:18]	Reserved	-
[17]	MPUENC	MPU AHB Enable Control 0: MPU AHB Monitoring and Protection Function is disabled 1: MPU AHB Monitoring and Protection Function is enabled

Bit Position	Bit Field Name	Bit Description
[16]	MPUEN	MPU AHB Enable Status 0: MPU AHB Monitoring and Protection Function is disabled. All accesses from the AHB Master Interface are passed on to the AHB memory interface without any protection 1: MPU AHB Monitoring and Protection Function is enabled
[15:13]	Reserved	-
[12]	PROT	Privileged Mode Attribute When the privileged mode overwrite feature is available and POEN = 1, the privilege attribute on AHB memory interface is controlled by this bit. 0: Non-privileged mode 1: Privileged mode
[11]	POEN	Privileged Mode Overwrite Feature Enable 0: Privileged mode overwrite feature is disabled 1: Privileged mode overwrite feature is enabled
[10]	Reserved	Reserved. Always write "0".
[9]	Reserved	-
[8]	LST	MPU Lock Status 0: MPU AHB is unlocked; registers in MPU AHB can be written 1: MPU AHB is locked; no registers (other than MPUHn_UNLOCK register) in MPU AHB can be written
[7:2]	Reserved	-
[1]	NMICL	NMI Interrupt Clear 0: No effect 1: Clears the NMI interrupt flag Read returns "0".
[0]	NMI	NMI Interrupt Flag This interrupt flag indicates that the memory protection violation was detected for an AHB transfer.

Note:

- The register bits MPUHn_CTRL0:AP[2:0], MPUHn_CTRL0:POEN and MPUHn_CTRL0:PROT can only be written when the MPU is disabled (MPUHn_CTRL0:MPUEN = 0).

3.2. MPU16 AHB NMI Enable Register (MPUHN_NMIEN)

MPU16 AHB NMI Enable Register can be used by software to reset the NMI enable bit. The default value of the NMI enable bit is 1. This bit can be reset by software only once after a reset operation.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	NMIEN
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	1

Table 3-3 MPU16 AHB NMI Enable Register (MPUHN_NMIEN) Bits

Bit Position	Bit Field Name	Bit Description
[31:8]	Reserved	-
[7:1]	Reserved	-
[0]	NMIEN	NMI Interrupt Enable This bit decides whether the NMI interrupt flag is routed to an NMI interrupt signal or not. 0: NMI interrupt flag does not trigger an NMI interrupt signal 1: NMI interrupt flag triggers an NMI interrupt signal The value of this bit can be changed only once after reset.

3.3. MPU16 AHB Memory Error Control Register (MPUHN_MERRC)

This is a read-only register that provides the control information of AHB transfer for which memory protection violation was detected. This register can be read to get the privileged mode and transfer mode (write/read) information of the AHB transfer.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	HPROT	HWRITE
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Table 3-4 MPU16 AHB Memory Error Control Register (MPUHN_MERRC) Bits

Bit Position	Bit Field Name	Bit Description
[31:8]	Reserved	-
[7:2]	Reserved	-
[1]	HPROT	AHB Transfer Privileged Mode. This bit provides the status of the HPROT signal of the AHB transfer for which memory protection violation is detected.
[0]	HWRITE	AHB Transfer Mode. This bit provides the status of the HWRITE signal of the AHB transfer for which memory protection violation is detected.

Note:

- This register is read-only. Write to this register will return a bus error.

3.4. MPU AHB Memory Error Address Register (MPU_{Hn}_MERRA)

This is a read-only register that provides the address of AHB transfer for which memory protection violation was detected.

Bit	31	30	29	28	27	26	25	24
Field	HADDR[31]	HADDR[30]	HADDR[29]	HADDR[28]	HADDR[27]	HADDR[26]	HADDR[25]	HADDR[24]
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	HADDR[23]	HADDR[22]	HADDR[21]	HADDR[20]	HADDR[19]	HADDR[18]	HADDR[17]	HADDR[16]
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	HADDR[15]	HADDR[14]	HADDR[13]	HADDR[12]	HADDR[11]	HADDR[10]	HADDR[9]	HADDR[8]
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	HADDR[7]	HADDR[6]	HADDR[5]	HADDR[4]	HADDR[3]	HADDR[2]	HADDR[1]	HADDR[0]
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Table 3-5 MPU16 AHB Memory Error Address Register (MPU_{Hn}_MERRA) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	HADDR	AHB Address. The address of an AHB transfer for which memory protection violation was detected.

Note:

- This register is read-only. Write to this register will return a bus error.

3.5. MPU16 AHB Region Control Registers (MPUHN_CTRL1 to 16)

MPU16 AHB Region Control Register is used to specify access permission for a particular region. Software can also use this register for enabling or disabling the particular region.

MPUHN_CTRL1 Control Register for Region 1 is explained below.

Bit	31	30	29	28	27	26	25	24
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	Reserved	Reserved	Reserved	Reserved	Reserved	AP[2]	AP[1]	AP[0]
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	MPUENC	MPUEN
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R/W	R,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Table 3-6 MPU16 AHB Region Control Register for Region 1 (MPUHN_CTRL1) Bits

Bit Position	Bit Field Name	Bit Description
[31:16]	Reserved	-
[15:11]	Reserved	-
[10:8]	AP	Access Permissions These bits are used to control access permissions for region 1. For a detailed description of these bits refer to Table 3-1.
[7:2]	Reserved	-
[1]	MPUENC	Enable Control 0: Memory Protection for region 1 is disabled 1: Memory Protection for region 1 is enabled The enable status of the region can be read through the MPUHN_CTRL1:MPUEN bit.

Bit Position	Bit Field Name	Bit Description
[0]	MPUEN	Enable Status 0: Memory Protection for region 1 is disabled 1: Memory Protection for region 1 is enabled This is a read-only bit; writing to this bit has no effect.

Note:

- For all 16 MPU16 AHB Region Control registers, the Access Permission bits (i.e. MPUHn_CTRL1 to 16:AP) can only be written when the corresponding region is disabled (i.e. MPUHn_CTRL1 to 16:MPUEN = 0) or the MPU is disabled (MPUHn_CTRL0:MPUEN = 0). This also implies that when MPUHn_CTRL0:MPUEN = 1 and MPUHn_CTRL1 to 16:MPUEN = 1:
 - 32- or 16-bit access to this register is not allowed
 - 8-bit access is required to disable the MPU

3.6. MPU16 AHB Start Address Registers (MPUHN_SADDR1 to 16)

Each region in MPU16 AHB can be defined by specifying the start address and end address for that particular region. The MPUHN_SADDR1 to 16 registers are used to specify the start address for the 16 regions. The start address indicates the first address for that region. MPUHN_SADDR1 is the Start Address Register for Region 1 and is explained below.

Bit	31	30	29	28	27	26	25	24
Field	SADDR[31]	SADDR[30]	SADDR[29]	SADDR[28]	SADDR[27]	SADDR[26]	SADDR[25]	SADDR[24]
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	SADDR[23]	SADDR[22]	SADDR[21]	SADDR[20]	SADDR[19]	SADDR[18]	SADDR[17]	SADDR[16]
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	SADDR[15]	SADDR[14]	SADDR[13]	SADDR[12]	SADDR[11]	SADDR[10]	SADDR[9]	SADDR[8]
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	SADDR[7]	SADDR[6]	SADDR[5]	SADDR[4]	SADDR[3]	SADDR[2]	SADDR[1]	SADDR[0]
R/W Attribute	R/W	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Table 3-7 MPU16 AHB Start Address Register for Region 1 (MPUHN_SADDR1) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	SADDR	Start Address Start address for region 1

Note:

- the MPUHN_SADDR1 to 16 registers can only be written when the corresponding region is disabled (MPUHN_CTRL1 to 16:MPUEN = 0) or the MPU is disabled (MPUHN_CTRL0:MPUEN = 0).

3.7. MPU16 AHB End Address Registers (MPU_{Hn}_EADDR1 to 16)

Each region in MPU16 AHB can be defined by specifying a start address and end address for that particular region. MPU_{Hn}_EADDR1 to 16 registers are used to specify the end addresses for the 16 regions. The end address indicates the last address for that region. The MPU_{Hn}_EADDR1 End Address Register for Region 1 is explained below.

Bit	31	30	29	28	27	26	25	24
Field	EADDR[31]	EADDR[30]	EADDR[29]	EADDR[28]	EADDR[27]	EADDR[26]	EADDR[25]	EADDR[24]
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	EADDR[23]	EADDR[22]	EADDR[21]	EADDR[20]	EADDR[19]	EADDR[18]	EADDR[17]	EADDR[16]
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	EADDR[15]	EADDR[14]	EADDR[13]	EADDR[12]	EADDR[11]	EADDR[10]	EADDR[9]	EADDR[8]
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	WPS							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	EADDR[7]	EADDR[6]	EADDR[5]	EADDR[4]	EADDR[3]	EADDR[2]	EADDR[1]	EADDR[0]
R/W Attribute	R/W	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX
Protection Attribute	WPS							
Initial Value	0	1	1	1	1	1	1	1

Table 3-8 MPU16 AHB End Address Register for Region 1 (MPU_{Hn}_EADDR1) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	EADDR	End Address End address for region 1

Note:

- MPU_{Hn}_EADDR1 to 16 registers can only be written when the corresponding region is disabled (MPU_{Hn}_CTRL1 to 16:MPUEN = 0) or the MPU is disabled (MPU_{Hn}_CTRL0:MPUEN = 0).

3.8. MPU16 AHB Unlock Register (MPUHN_UNLOCK)

The software can use this register to lock or unlock the MPU16 AHB registers for write access.

Bit	31	30	29	28	27	26	25	24
Field	UNLOCK[31]	UNLOCK[30]	UNLOCK[29]	UNLOCK[28]	UNLOCK[27]	UNLOCK[26]	UNLOCK[25]	UNLOCK[24]
R/W Attribute	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	UNLOCK[23]	UNLOCK[22]	UNLOCK[21]	UNLOCK[20]	UNLOCK[19]	UNLOCK[18]	UNLOCK[17]	UNLOCK[16]
R/W Attribute	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	UNLOCK[15]	UNLOCK[14]	UNLOCK[13]	UNLOCK[12]	UNLOCK[11]	UNLOCK[10]	UNLOCK[9]	UNLOCK[8]
R/W Attribute	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	UNLOCK[7]	UNLOCK[6]	UNLOCK[5]	UNLOCK[4]	UNLOCK[3]	UNLOCK[2]	UNLOCK[1]	UNLOCK[0]
R/W Attribute	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W
Protection Attribute	WP							
Initial Value	0	0	0	0	0	0	0	0

Table 3-9 MPU16 AHB Unlock Register (MPUHN_UNLOCK) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	UNLOCK	<p>MPU16 AHB Unlock</p> <p>The MPU16 AHB Unlock Register protects the MPU16 AHB module from being modified accidentally by software. The MPU16 AHB registers cannot be written until this register has been written with a specific unlock value. The correct value for unlocking can be written only in privileged mode. Reading this register always returns "0". To lock the MPU16 AHB again software must write another value specific to lock. A write access to the MPU16 AHB registers without unlocking or writing value other than the lock or unlock value to this register causes a protection error.</p> <p>Unlock value: 0xACCABB56 Lock value: 0x112ABB56</p> <p>Notes:</p> <ol style="list-style-type: none"> 1. This register cannot be written by an 8- or 16-bit write access; any such access causes a protection error.

3.9. MPU16 AHB Module ID Register (MPUHN_MID)

This is a read-only register which returns a meaningless constant.

Bit	31	30	29	28	27	26	25	24
Field	MID[31]	MID[30]	MID[29]	MID[28]	MID[27]	MID[26]	MID[25]	MID[24]
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	MID[23]	MID[22]	MID[21]	MID[20]	MID[19]	MID[18]	MID[17]	MID[16]
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R1,WX	R1,WX	R0,WX	R1,WX
Protection Attribute	-							
Initial Value	0	0	0	0	1	1	0	1

Bit	15	14	13	12	11	10	9	8
Field	MID[15]	MID[14]	MID[13]	MID[12]	MID[11]	MID[10]	MID[9]	MID[8]
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	MID[7]	MID[6]	MID[5]	MID[4]	MID[3]	MID[2]	MID[1]	MID[0]
R/W Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

Table 3-10 MPU16 AHB Module ID Register (MPUHN_MID) Bits

Bit Position	Bit Field Name	Bit Description
[31:0]	MID	Return a meaningless constant.

Note:

- This register is read-only. Write to this register will return a bus error.

4. Operation of the MPU16 AHB

This section describes the operation of the MPU16 AHB.

MPU16 AHB Region Granularity and Priority Decision

The MPU16 AHB supports up to 16 regions and provides the start and end addresses for each of these 16 regions. MPU16 AHB regions are defined with a granularity of 128 bytes.

Each region is identified as Region 1, Region 2, Region 3 and so on up to Region 16, which is given highest priority. Region 15 has second highest priority and so on down to Region 1, which has the second lowest priority. The Background Region is designated the lowest priority region.

The Start Address specifies the first address of the region and is specified by registers MPUHn_SADDR1 to MPUHn_SADDR16 for region 1 to region 16 respectively. Since the region granularity is 128bytes, the least significant 7 bits of the start addresses will read 0.

End Addresses are specified by registers MPUHn_EADDR1 to MPUHn_EADDR16 for region 1 to region 16 respectively. The least significant 7 bits of the End Address registers are read only bits and will always read 1. This ensures the granularity of 128 bytes.

In the MPU16 AHB, regions may overlap each other, as shown in Figure 3-1. Hence it is also possible that an AHB address for any transfer may match with multiple regions. Whenever the AHB Transfer Address matches with multiple regions, the permissions corresponding to the highest priority region (among all matching regions) is applied.

AHB Burst Monitoring

The MPU16 AHB only supports Single Transfer Monitoring and not Burst Monitoring.

Before starting a burst transfer, MPU16_AHB calculates address range which is accessed by the burst transfer.

When the burst transfer violates the protection, the MPU16_AHB blocks entire of the burst transfer before MPU16_AHB starting the transfer.

Priority Decision of MPU

MPU16 AHB offers the starting address and the ending address of 16 each region.

The region is permitted to overlap mutually in MPU16 AHB.

Therefore, the AHB address of an arbitrary forwarding might be corresponding to two or more regions.

MPU supports 16 regions or less, and each region is identified as region 1, region 2, and region 3.... region 16.

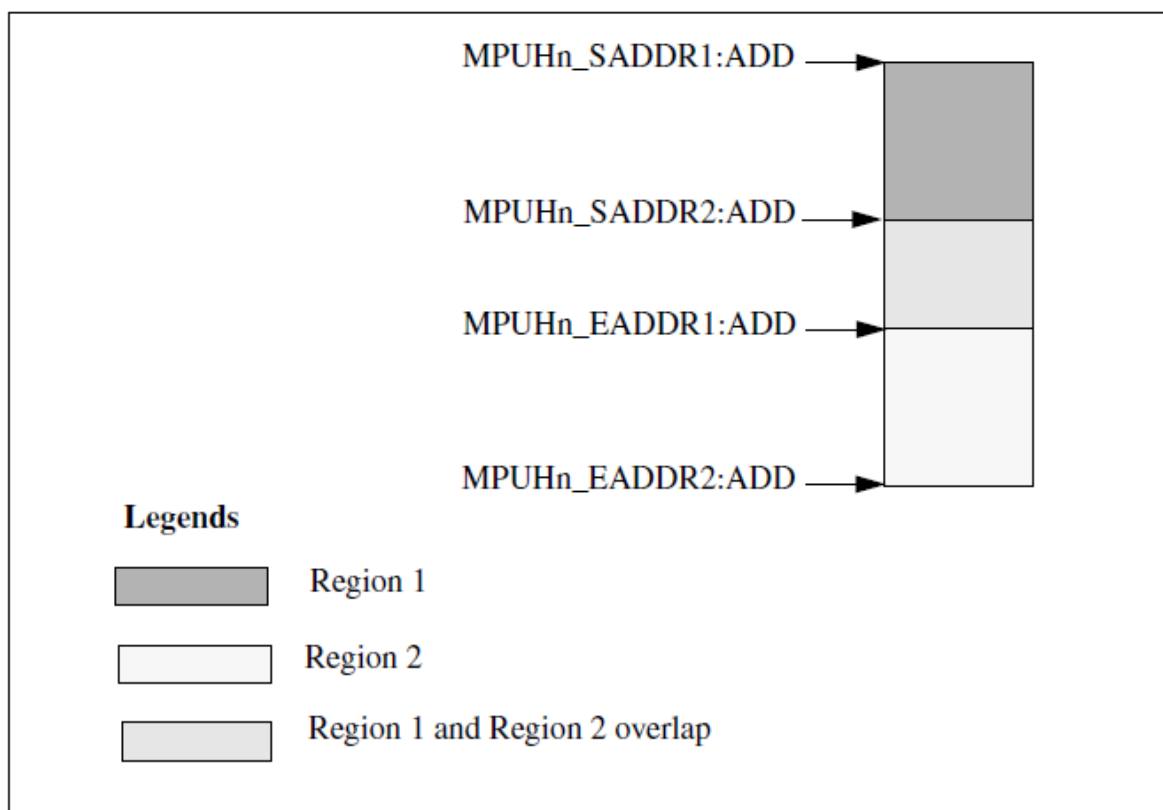

The priority of region 16 is the highest, and the priority of region 15 is high in the second.

The priority of the backing ground region is lowest most, and the priority of region 1 does secondarily by being low.

When the address of the AHB forwarding is corresponding to two or more regions, the permission attribute corresponding to the region with the highest priority in a corresponding region is applied.

The example of the overlap in region 1 and region 2 with Figure 3-1 is shown.

Figure 4-1 Example Region Overlapping

MPU Access Permissions

Region Control registers in the MPU16 AHB (i.e. MPUHn_CTRL1 to MPUHn_CTRL16) are used to control the access permission to Regions 1 to 16. Also MPUHn_CTRL0 is used to control the access permission for the Background Region.

Table 3-1 describes Access Permission bits (AP) in these registers and corresponding permission attributes.

Table 4-1 Access Permissions

AP Bits	Access in Privileged Mode	Access in Non-Privileged Mode	Comment
000 (default)	No access	No access	All bus accesses are blocked and hence would generate a memory protection violation.
001	Read, write	No access	Reads and writes are permitted in privileged mode only. Any access in non-privileged mode would generate a memory protection violation.
010	Read, write	Read only	Reads and writes are permitted in privileged mode. Only reads are permitted in non-privileged mode. Writes in non-privileged mode would generate a memory protection violation.
011	Read, write	Read, write	All bus transfers are permitted. No memory protection violation is generated in this mode.
100	No access	No access	All bus accesses are blocked and hence generate a memory protection violation.
101	Read only	No access	Reads are permitted in privileged mode only. Writes in privileged mode and any access in non-privileged mode would generate a memory protection violation.
110	Read only	Read only	Reads are permitted in privileged as well as non-privileged mode. Any write access would generate a memory protection violation.
111	Read, write	Read, write	All bus transfers are permitted. No memory protection violation is generated in this mode.

Bus Monitor and Protection Logic

All transfers on the AHB Master Interface are monitored and checked for permitted access.

- Bus monitor and protection logic within the MPU16 AHB compares the address of the current transfer with the start and end addresses of each region to find a region match, i.e. where the current transfer matches one of the 16 defined regions.

- As explained in Section “MPU16 AHB region granularity and priority decision”, the AHB transfer address may match multiple regions where the permission attributes of the region with highest priority are checked against the attributes of the currently applied transfer from the AHB master.
- If the attributes of the currently applied transfer are within the permitted attributes, the current transaction is passed on to the AHB memory interface.
- If the attributes are not within permitted attributes, the current transfer is blocked. The Non-Maskable Interrupt flag (MPUHN_CTRL0:NMI) is set. The address and control information of the current transfer is stored in MPUHN_MERRA and MPUHN_MERRC respectively.
- All further transfers are blocked until the MPUHN_CTRL0:NMI flag is cleared by software. Further monitoring of the AHB transfer addresses is also stalled until the MPUHN_CTRL0:NMI flag is cleared.

When a transfer is blocked, the MPU16 AHB performs the following actions:

- It drives idle transfers on the AHB memory interface
- It generates an error response on the AHB master interface

Privileged Mode Overwrite Feature

The MPU16 AHB supports privileged mode overwrite feature.

When this mode is enabled, the privileged mode attribute on the AHB memory interface is set by setting the MPUHN_CTRL0:PROT bit as explained in Section 2.1.

Note:

- *Bus monitor and protection logic for detecting memory protection violation uses the privileged mode attribute on the AHB master interface and not the MPUHN_CTRL0:PROT bit, even when the privileged mode overwrite feature is enabled.*

CHAPTER 30: CAN FD Controller(MCAN3.0.1)

This chapter explains the functions and operations of the CAN FD Controller.

1. Overview
2. Configuration
3. Explanation of Operations
4. Setup Procedure Examples
5. Registers
6. Message RAM

CANFD-TXXPT03P01R01L05-E1-XX

1. Overview

The CAN FD Controller performs communication according to ISO11898-1 (CAN specification Rev. 2.0 part A, B) and to the CAN FD specification V1.0.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN Core to a Message RAM as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN Core as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 192 filter elements where each one can be configured as a range, as a bit mask, or as a dedicated ID filter.

The CAN FD Controller is accessible by the CPU using a data width of 8/16/32-bits. The CAN FD Controller's clock domain concept allows the separation between the two input clocks, the CAN clock and the Bus clock.

Features of the CAN FD Controller

- Conforms with ISO11898-1 (CAN specification Rev. 2.0 part A, B) and the CAN FD specification V1.0
- CAN FD with up to 64 data bytes supported
- CAN Error Logging
- Acceptance filtering
- Two configurable Receive FIFOs
- Separate signaling on reception of High Priority Messages
- Up to 64 dedicated Receive Buffers
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM access for CPU
- Programmable loop-back test mode
- Maskable interrupts
- Two clock domains (CAN clock and Bus clock)
- Power-down support
- Debug on CAN support

Note:

- *Debug on CAN feature is not supported for TRAVEO™ T1G Platform.*

2. Configuration

This section provides configuration related information about the CAN FD controller.

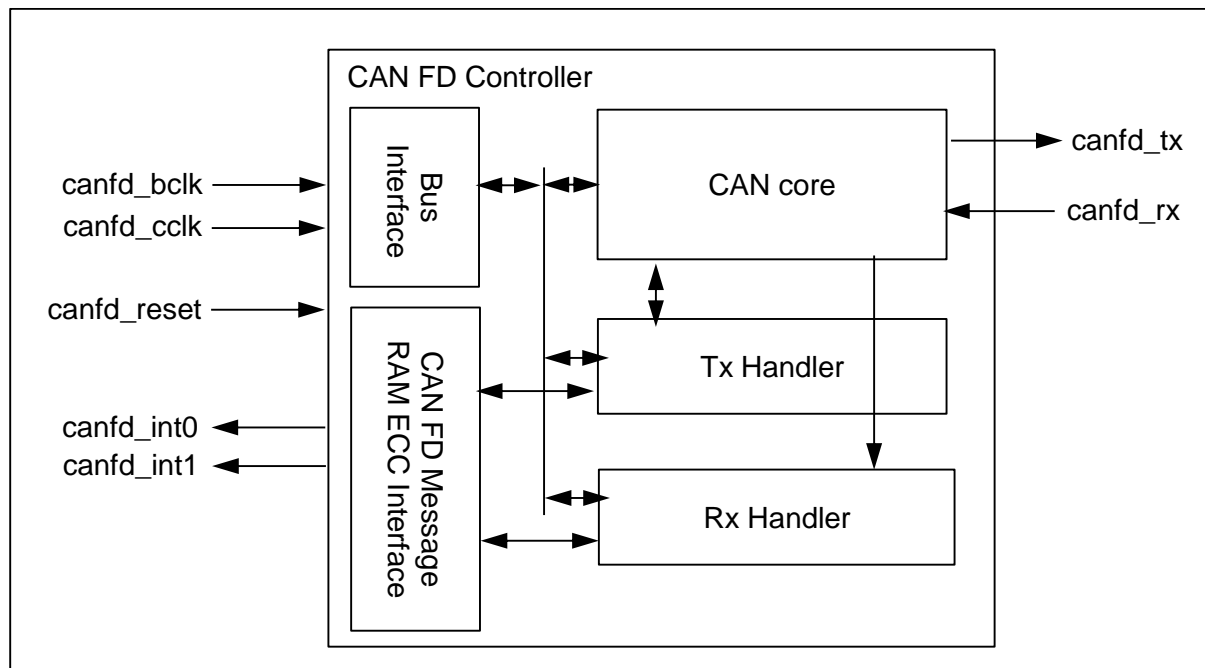

2.1. Block Diagram

2.2. Dual Clock Sources

2.3. Dual Interrupt Lines

2.1. Block Diagram

Figure 2-1 CAN FD Controller Block Diagram

CAN Core

CAN Protocol Controller. Handles all ISO 11898-1 protocol functions. Supports 11-bit and 29-bit identifiers.

CAN FD Message RAM ECC Interface

Interface with the CAN FD Message RAM ECC module. This module contains

- a Message RAM that stores messages to be transmitted, received messages, acceptance filter elements, and Tx Events, and
- ECC (Error Correction Code) logic for the Message RAM.

Bus Interface

CPU interface bus with a data width of 8/16/32-bits.

Tx Handler

Controls the message transfer from the Message RAM to the CAN Core. A maximum of 32 Tx Buffers can be configured for transmission. Tx buffers can be used as dedicated Tx Buffers, as Tx FIFO, part of a Tx Queue, or as a combination of them. A Tx Event FIFO stores Tx timestamps together with the corresponding Message ID. Transmit cancellation is also supported.

Rx Handler

Controls the transfer of received messages from the CAN Core to the Message RAM. The Rx Handler supports two Receive FIFOs, each of configurable size, and up to 64 dedicated Rx Buffers for storage of all messages that have passed acceptance filtering. A dedicated Rx Buffer, in contrast to a Receive FIFO, is used to store only messages with a specific identifier. An Rx timestamp is stored together with each message. Up to 128 filters can be defined for 11-bit IDs and up to 64 filters for 29-bit IDs.

2.2. Dual Clock Sources

The two clocks of the CAN FD Controller must be configured to meet the following requirement in order to guarantee proper operation:

Bus clock (canfd_bclk) frequency > CAN clock (canfd_cclk) frequency

2.3. Dual Interrupt Lines

The CAN FD Controller provides two interrupt lines. Interrupts can be routed either to canfd_int0 or to canfd_int1. By default all interrupts are routed to interrupt line canfd_int0. By programming bits Enable Interrupt Line 0 (ILE.EINT0) and Enable Interrupt Line 1 (ILE.EINT1) the interrupt lines can be enabled or disabled separately.

3. Explanation of Operations

This section explains the operations of the CAN FD Controller.

- 3.1. Operating Modes
- 3.2. Timestamp Generation
- 3.3. Timeout Counter
- 3.4. Rx Handling
- 3.5. Tx Handling
- 3.6. FIFO Acknowledge Handling
- 3.7. Configuring the CAN Bit Timing

3.1. Operating Modes

This section explains the operating modes of the CAN FD Controller.

- 3.1.1. Software Initialization
- 3.1.2. Normal Operation
- 3.1.3. CAN FD Operation
- 3.1.4. Transceiver Delay Compensation
- 3.1.5. Restricted Operation Mode
- 3.1.6. Bus Monitoring Mode
- 3.1.7. Disabled Automatic Retransmission
- 3.1.8. Power Down (Sleep Mode)
- 3.1.9. Test Modes

3.1.1. Software Initialization

Setting/Resetting the Initialization Bit (CCCR.INIT)

Software initialization is started by setting bit Initialization (CCCR.INIT),

- either by software or by a hardware reset,
- when an uncorrected bit error was detected in the Message RAM,
- or by going Bus_Off.

While CCCR.INIT is set,

- message transfer from and to the CAN bus is stopped,
- the status of the CAN bus output canfd_tx is recessive,
- the protocol error counters are unchanged.

Setting CCCR.INIT does not change any configuration register.

Resetting CCCR.INIT finishes the software initialization. Afterwards the CAN FD Controller synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of

11 consecutive recessive bits (\equiv Bus_Idle) before it can take part in bus activities and start the message transfer.

Notes:

- In case of setting CCCR.INIT to "1" during Normal Operation, set CCCR.INIT to "1" by issuing a Clock Stop Request via CCCR.CSR = 1. Before resetting CCCR.INIT first reset CCCR.CSR.
- When halting transmissions or receptions via CCCR.INIT = 1, cancel any pending transmissions (Tx Buffer Request Pending Register TXBRP \neq 0x00000000) by setting Tx Buffer Cancellation Request Register TXBCR to 0xFFFF_FFFF.

Access/Set/Reset Properties of Registers Affected by Configuration Change Enable (CCCR.CCE)

Access to the configuration registers is only enabled when both bits CCCR.INIT and Configuration Change Enable (CCCR.CCE) are set (protected write). CCCR.CCE can only be set/reset while CCCR.INIT = 1. CCCR.CCE is automatically reset when CCCR.INIT is reset.

The following registers are reset when CCCR.CCE is set

- HPMS - High Priority Message Status
- RXF0S - Rx FIFO 0 Status
- RXF1S - Rx FIFO 1 Status
- TXFQS - Tx FIFO/Queue Status
- TXBRP - Tx Buffer Request Pending
- TXBTO - Tx Buffer Transmission Occurred
- TXBCF - Tx Buffer Cancellation Finished
- TXEFS - Tx Event FIFO Status

In addition

- the Timeout Counter value (TOCV.TOC[15:0]) is preset to the value configured by the Timeout Period (TOCC.TOP[15:0]) when CCCR.CCE is set.
- the state machines of the Tx Handler and Rx Handler are held in idle state while CCCR.CCE = 1.

The following registers are only writeable while CCCR.CCE = 0.

- TXBAR - Tx Buffer Add Request
- TXBCR - Tx Buffer Cancellation Request

Test Mode Enable (CCCR.TEST) and Bus Monitoring Mode (CCCR.MON) can only be set by the CPU while CCCR.INIT = 1 and CCCR.CCE = 1. Both bits may be reset at any time.

Disable Automatic Retransmission (CCCR.DAR) can only be set/reset while CCCR.INIT = 1 and CCCR.CCE = 1.

Note:

- To set CCCR.INIT and CCCR.CCE to "1", the CPU must follow the procedure below. In case of setting CCCR.CCE to "1" just after hardware reset, it isn't necessary to follow the procedure.
1. Cancel all pending transmission requests by setting Tx Buffer Cancellation Request Register TXBCR to 0xFFFF_FFFF (the Tx Buffer Request Pending Register TXBRP will be reset to "0")

2. *Issue a clock stop request by setting Clock Stop Request (CCCR.CSR) to "1"*
3. *Wait till both CCCR.INIT and Clock Stop Acknowledge (CCCR.CSA) are "1"*
4. *First reset CCCR.CSR*
5. *Then reset CCCR.INIT*
6. *Wait till CCCR.INIT is "0"*
7. *Issue a second clock stop request by setting CCCR.CSR to "1"*
8. *Wait till both CCCR.INIT and CCCR.CSA are "1"*
9. *Set CCCR.CCE to "1" and reset CCCR.CSR*

Message RAM Initialization

The Message RAM should be zeroized before configuration of the CAN FD Controller in order to prevent Message RAM bit errors when reading uninitialized words, and also to avoid unexpected filter element configurations in the Message RAM.

3.1.2. Normal Operation

Once the CAN FD Controller is initialized and Initialization (CCCR.INIT) is reset to "0", the CAN FD Controller synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC (Data Length Code) are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

3.1.3. CAN FD Operation

There are two variants in the CAN FD frame format,

- the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes.
- the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

Enabling the CAN Operation Mode via CAN Mode Enable (CCCR.CME[1:0])

The CAN operation mode is enabled by programming CAN Mode Enable (CCCR.CME[1:0]). The transmission properties of the enabled CAN Mode can be changed via CAN Mode Request (CCCR.CMR[1:0]). See next paragraph for details).

- In case CCCR.CME[1:0] = 0b00, transmission and reception of CAN frames according to ISO 11898-1 is enabled.
- In case CCCR.CME[1:0] = 0b01, transmission of long CAN FD frames and reception of long and fast CAN FD frames is enabled.
- With CCCR.CME[1:0] = 0b10/0b11, transmission and reception of long and fast CAN FD frames is enabled.

CCCR.CME[1:0] can only be changed while Initialization (CCCR.INIT) and Configuration Change Enable (CCCR.CCE) are both set.

Changing CAN Operation Modes via CAN Mode Request (CCCR.CMR[1:0])

When initialization is left (CCCR.INIT set to "0"), a mode change to the CAN FD protocol option has to be requested by writing to CAN Mode Request (CCCR.CMR[1:0]).

A mode change requested by writing to CCCR.CMR[1:0] is allowed only when no transmission requests are pending (Tx Buffer Request Pending Register TXBRP = 0x00000000). If necessary, cancel pending transmission requests before changing the CAN operation mode. When the CAN FD Controller reaches idle phase after such mode change request, CCCR.CMR[1:0] is reset to 0b00 and the status flags CAN FD Bit Rate Switching (CCCR.FDBS) and CAN FD Operation (CCCR.FDO) are set accordingly. In case the requested CAN operation mode is not enabled, the value written to CCCR.CMR[1:0] is retained until it is overwritten by the next mode change request. Default is CAN operation according to ISO11898-1.

It is not necessary to change the CAN operation mode after system startup. A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significantly higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in Bus Monitoring mode until programming has completed. Then all nodes switch back to CAN communication according ISO11898-1.
- Wake-up messages in CAN Partial Networking have to be transmitted in CAN format.

Interpretation of Received Frames

When CCCR.CME[1:0] ≠ 0b00, received CAN FD frames are interpreted according to the CAN FD Specification. The reserved bit in CAN frames with 11-bit identifiers and the first reserved bit in CAN frames with 29-bit identifiers will be decoded as EDL bit. EDL = recessive signifies a CAN FD frame, EDL = dominant signifies a standard CAN frame. In a CAN FD frame, the two bits following EDL, r0 and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by r0 = dominant and BRS = recessive. The coding of r0 = recessive in a CAN FD frame is used to detect Protocol Exception Events (see "3.4.5. Protocol Exception Event").

Reception of CAN frames according to ISO 11898-1 is possible in all CAN operation modes.

Format of Transmitted Frames

The status bits CAN FD Operation (CCCR.FDO) and CAN FD Bit Rate Switching (CCCR.FDBS) indicate the format of transmitted frames.

- When CCCR.FDO is set, frames will be transmitted in CAN FD format with EDL = recessive.
- When both CCCR.FDO and CCCR.FDBS are set, frames will be transmitted in CAN FD format with bit rate switching and both bits EDL and BRS = recessive.

The DLC Field

In the CAN FD format, the coding of the DLC differs from the CAN format. The DLC codes 0 to 8 have the same coding as in CAN, the codes 9 to 15, which in CAN all code a data field of 8 bytes, are coded according to Table 3-1 below.

Table 3-1 Coding of DLC in CAN FD

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

Bit Rate Switching

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal bit timing is used as defined by the Bit Timing & Prescaler Register (BTP). In the following CAN FD data phase, the fast bit timing is used as defined by the Fast Bit Timing & Prescaler Register (FBTP). The bit timing is switched back from the fast timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN clock frequency (canfd_cclk).

Example:

- *With a CAN clock frequency of 20MHz and the shortest configurable bit time of 4 tq, the bit rate in the data phase is 5 Mbit/s.*

The Error Status Indicator ESI

In both data frame formats, CAN FD long and CAN FD fast, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

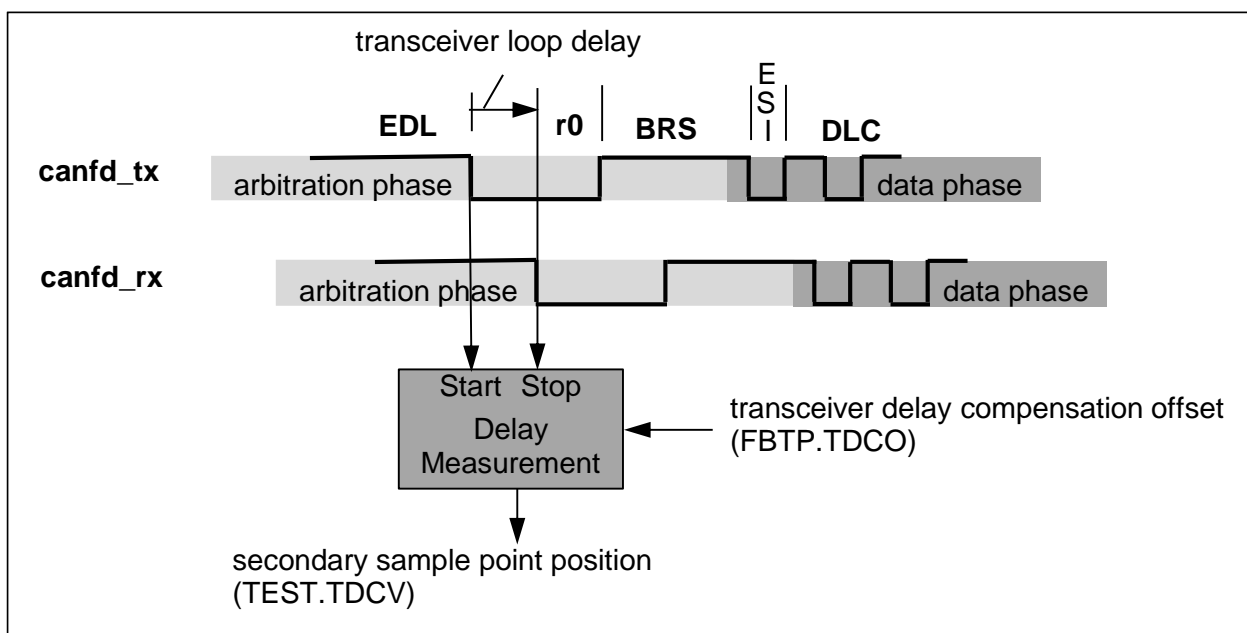

3.1.4. Transceiver Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin `canfd_tx` the protocol controller receives the transmitted data from its local CAN transceiver via pin `canfd_rx`. The received data is delayed by the CAN transceiver's loop delay. In case this delay is greater than the time segment before the sample point of a data phase bit time, a bit error is detected. In order to enable a data phase bit time (fast bit time) that is even shorter than the transceiver loop delay, the delay compensation is introduced. Without transceiver delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the transceiver's loop delay.

3.1.4.1 Description

The CAN FD protocol unit has implemented a delay compensation mechanism to compensate the CAN transceiver's loop delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver. Figure 3-1 below describes how the transceiver loop delay is measured.

Figure 3-1 Transceiver Delay Measurement

Within each CAN FD frame, the transmitter measures the delay between the data transmitted at pin `canfd_tx` and the data received at pin `canfd_rx`. The measurement is done once, at the falling edge of bit EDL to bit r0. The delay is measured in `canfd_cclk` periods.

A secondary sample point position is calculated by adding a configurable transceiver delay compensation offset (FBTP.TDCO[4:0]) to the measured transceiver delay. This transceiver delay compensation value (TEST.TDCV[5:0]) is the sum of the measured transceiver delay and the transceiver delay compensation offset. The transceiver delay compensation offset is chosen to adjust

the secondary sample point inside the bit time (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of time quanta t_q .

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected at the secondary sample point, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

For the transceiver delay compensation, the sum of the measured delay from `canfd_tx` to `canfd_rx` and the configured transceiver delay compensation offset (`FBTP.TDCO[4:0]`) must meet both of the following boundary conditions:

- has to be less than 3 bit times in the data phase.
- has to be less or equal 63 `canfd_cclk` periods. In case this sum exceeds 63 `canfd_cclk` periods, the maximum value of 63 `canfd_cclk` periods is used for transceiver delay compensation.

The actual delay compensation value is monitored by reading the Transceiver Delay Compensation Value (`TEST.TDCV[5:0]`).

3.1.4.2 Configuration and Status

Compensation for the transceiver loop delay by the CAN FD Controller is enabled via the Transceiver Delay Compensation bit (`FBTP.TDC`). The transceiver delay compensation offset is configured via the Transceiver Delay Compensation Offset field (`FBTP.TDCO[4:0]`). The actual delay compensation value applied by the CAN FD Controller's protocol engine (i.e. the measured delay plus the offset) can be read from the Transceiver Delay Compensation Value field (`TEST.TDCV[5:0]`).

3.1.5. Restricted Operation Mode

In Restricted Operation Mode the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented.

The CPU can set the CAN FD Controller into Restricted Operation Mode by setting the Restricted Operation Mode bit (`CCCR.ASM`). `CCCR.ASM` can only be set by the CPU when both Configuration Change Enable (`CCCR.CCE`) and Initialization (`CCCR.INIT`) are set to "1". `CCCR.ASM` can be reset by the CPU at any time.

Restricted Operation Mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the CPU must follow the procedure below:

1. Cancel all pending transmission requests by setting Tx Buffer Cancellation Request Register `TXBCR` to `0xFFFF_FFFF` (the Tx Buffer Request Pending Register `TXBRP` will be reset to "0")
2. Issue a clock stop request by setting Clock Stop Request (`CCCR.CSR`) to "1"
3. Wait till both `CCCR.INIT` and Clock Stop Acknowledge (`CCCR.CSA`) are "1"
4. First reset `CCCR.CSR`
5. Then reset `CCCR.INIT`
6. Wait till `CCCR.INIT` is "0"
7. Issue a second clock stop request by setting `CCCR.CSR` to "1"

8. Wait till both CCCR.INIT and CCCR.CSA are "1"
9. Set CCCR.CCE to "1" and reset CCCR.CSR and CCCR.ASM
10. Restart the CAN FD Controller by setting CCCR.INIT to "0"
11. Wait till CCCR.INIT is "0"
12. Reconfigure the CAN Operation Modes CAN FD Operation (CCCR.FDO) and CAN FD Bit Rate Switching (CCCR.FDBS) via CAN Mode Request (CCCR.CMR[1:0])
13. Request the transmissions cancelled in the first step

The Restricted Operation Mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

3.1.6. Bus Monitoring Mode

The CAN FD Controller is set in Bus Monitoring Mode by programming the Bus Monitoring Mode bit (CCCR.MON) to one. In Bus Monitoring Mode (see ISO11898-1, 10.12 Bus monitoring), the CAN FD Controller is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the CAN FD Controller is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the CAN FD Controller monitors this dominant bit, although the CAN bus may remain in recessive state. The Tx Buffer Request Pending register (TXBRP) will be cleared when setting Configuration Change Enable CCCR.CCE = 1 upon entering Bus Monitoring Mode via CCCR.MON = 1, and will be held in reset state while it is in this mode.

The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. Figure 3-2 shows the connection of signals canfd_tx and canfd_rx to the CAN FD Controller in Bus Monitoring Mode.

Figure 3-2 Pin Control in Bus Monitoring Mode

3.1.7. Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the CAN FD Controller provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. The automatic retransmission may be disabled via the Disable Automatic Retransmission bit (CCCR.DAR).

In DAR mode all transmissions are automatically cancelled after they started on the CAN bus. In this mode the CAN FD Controller will internally reset the corresponding Tx Buffer's Tx Request Pending bit (TXBRP.TRPn) when one of the following conditions occur:

- A successful transmission has occurred. This can be observed as
 - Corresponding Tx Buffer Transmission Occurred bit TXBTO.TOn set
 - Corresponding Tx Buffer Cancellation Finished bit TXBCF.CFn not set
 or, in case a successful transmission was executed in spite of cancellation,
 - Corresponding Tx Buffer Transmission Occurred bit TXBTO.TOn set
 - Corresponding Tx Buffer Cancellation Finished bit TXBCF.CFn set
- A transmission has not yet been started at the point of cancellation
- A transmission has been aborted due to lost arbitration or frame transmission disturbed. This can be observed by
 - Corresponding Tx Buffer Transmission Occurred bit TXBTO.TOn not set
 - Corresponding Tx Buffer Cancellation Finished bit TXBCF.CFn set

Note:

- *Do not use the same Tx Buffer for consecutive DAR transmissions or wait at least for 4 nominal bit times after successful transmission before requesting the next transmission from the same Tx Buffer.*

3.1.8. Power Down (Sleep Mode)

The CAN FD Controller can be set into power down mode via Clock Stop Request (CCCR.CSR).

When all pending transmission requests have completed (when Tx Buffer Request Pending Register TXBRP = 0x00000000), the CAN FD Controller waits until bus idle state is detected. Then the CAN FD Controller sets Initialization (CCCR.INIT) to one to prevent any further CAN transfers. Now the CAN FD Controller acknowledges that it is ready for power down by setting Clock Stop Acknowledge (CCCR.CSA) to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to CCCR.INIT will have no effect. Now the CAN FD Controller clock inputs canfd_bclk and canfd_cclk may be switched off.

To leave power down mode, the application has to turn on the CAN FD Controller clocks before resetting Clock Stop Request (CCCR.CSR). The CAN FD Controller will acknowledge this by resetting CCCR.CSA. Afterwards, the application can restart CAN communication by resetting CCCR.INIT.

3.1.9. Test Modes

To enable write access to the Test register TEST, Test Mode Enable (CCCR.TEST) has to be set to one. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin canfd_tx by programming Control of Transmit Pin (TEST.TX). These are

- the default function – the serial data output
- drive the CAN Sample Point signal to monitor the CAN FD Controller's bit timing
- drive constant dominant values
- drive constant recessive values.

The actual value at pin canfd_rx can be read from Receive Pin (TEST.RX). Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between the CAN clock and Bus clock domains, there may be a delay of several Bus clock periods between writing to TEST.TX until the new configuration is visible at output pin canfd_tx. This applies also when reading input pin canfd_rx via TEST.RX.

Note:

- *Test modes should be used for self test only. The software control for pin canfd_tx interferes with all CAN protocol functions. It is not recommended to use test modes for application.*

3.1.9.1 External Loop Back Mode

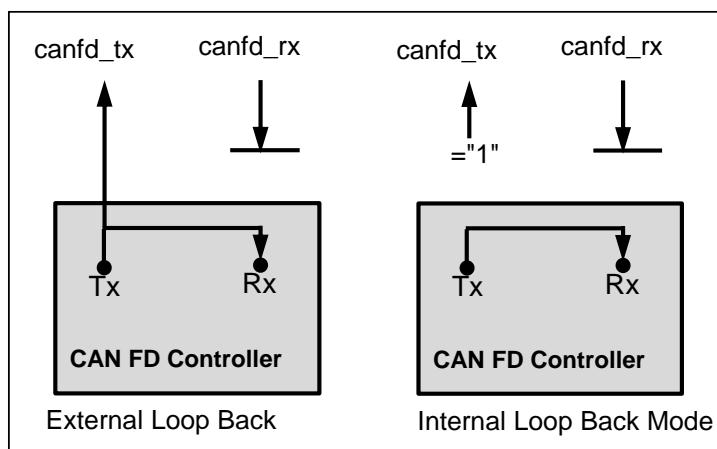

The CAN FD Controller can be set in External Loop Back Mode by programming the Loop Back Mode bit (TEST.LBCK) to one. In External Loop Back Mode, the CAN FD Controller treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into a dedicated Rx Buffer or an Rx FIFO. Figure 3-3 shows the connection of signals canfd_tx and canfd_rx to the CAN FD Controller in External Loop Back Mode.

This mode is provided for hardware self test. The CAN FD Controller ignores acknowledge errors in External Loop Back Mode. In this mode the CAN FD Controller performs an internal feedback from its Tx output to its Rx input. The actual value of the canfd_rx input pin is disregarded by the CAN FD Controller. The transmitted messages can be monitored at the canfd_tx pin.

3.1.9.2 Internal Loop Back Mode

Internal Loop Back Mode is entered by programming bits Loop Back Mode (TEST.LBCK) and Bus Monitoring Mode (CCCR.MON) to one. This mode can be used for a "Hot Self test", meaning the CAN FD Controller can be tested without affecting a running CAN system connected to the pins canfd_tx and canfd_rx. In this mode pin canfd_rx is disconnected from the CAN FD Controller and pin canfd_tx is held recessive. Figure 3-3 shows the connection of canfd_tx and canfd_rx to the CAN FD Controller in case of Internal Loop Back Mode.

Figure 3-3 Pin Control in Loop Back Modes

3.2. Timestamp Generation

For timestamp generation the CAN FD Controller supplies a 16-bit wrap-around counter. On start of frame reception/transmission the counter value is captured and stored into the timestamp section of an Rx Buffer and FIFO or Tx Event FIFO element (fields RXTS[15:0] and TXTS[15:0] of the respective elements).

For more details, see "5.8. Timestamp Counter Configuration (MCG_CANFDx_TSCC, CPG_CANFDx_TSCC)" and "5.9. Timestamp Counter Value (MCG_CANFDx_TSCV, CPG_CANFDx_TSCV)".

3.3. Timeout Counter

To signal timeout conditions, the CAN FD Controller supplies a 16-bit Timeout Counter. For Rx FIFO 0, Rx FIFO 1, and Tx Event FIFO triggered operations, it starts down counting when an element is stored, and stops counting when the FIFO is emptied by the CPU. The Timeout Counter may also be triggered by a "0" write to the Initialization bit CCCR.INIT, and count down repeatedly until CCCR.INIT is set back to "1".

The Timeout Counter operates as down-counter and uses the same prescaler controlled by Timestamp Counter Prescaler (TSCC.TCP[3:0]) as the Timestamp Counter. The Timeout Counter is configured via register Timeout Counter Configuration (TOCC). The actual counter value can be read from Timeout Counter (TOCV.TOC[15:0]). The Timeout Counter is operable only when CCCR.INIT = 0. It is stopped when Initialization CCCR.INIT = 1, e.g. when the CAN FD Controller enters Bus_Off state.

The operation mode is selected by the Timeout Select field TOCC.TOS[1:0]. For details, see "5.11. Timeout Counter Value (MCG_CANFDx_TOCV, CPG_CANFDx_TOCV)".

Note:

- When Timestamp Select TSCC.TSS[1:0] = 0b01, the clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore, if the baud rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

3.4. Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the dedicated Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

3.4.1. Acceptance Filtering

3.4.2. Rx FIFOs

3.4.3. Dedicated Rx Buffers

3.4.4. Debug on CAN Support

3.4.5. Protocol Exception Event

3.4.1. Acceptance Filtering

The CAN FD Controller offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to a dedicated Rx Buffer or to Rx FIFO 0, 1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

Main Features

- Each filter element can be configured as
 - range filter (from - to)
 - filter for one or two specific IDs (dual filter)
 - classic bit mask filter
 - filter for a single dedicated ID
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled/disabled individually
- Filters are checked sequentially from filter element 0, execution stops with the first matching filter element

Related Configuration Registers

- Extended ID Filter Configuration XIDFC
- Extended ID AND Mask XIDAM

Filter Properties

Depending on the configuration of the filter element configuration fields (SFEC[2:0]/EFEC[2:0]) a match triggers one of the following actions:

- Store received frame in Rx FIFO 0 or Rx FIFO 1
- Store received frame in dedicated Rx Buffer
- Reject received frame
- Set High Priority Message interrupt flag IR.HPM
- Set High Priority Message interrupt flag IR.HPM and store received frame in Rx FIFO 0 or Rx FIFO 1

Description

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching dedicated Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bits to the matching dedicated Rx Buffer or Rx FIFO.

If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the affected dedicated Rx Buffer or Rx FIFO:

- Dedicated Rx Buffer
New Data flag NDAT1/2.NDn of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type see Last Error Code (PSR.LEC[2:0]) respectively Fast Last Error Code (PSR.FLEC[2:0]).
- Rx FIFO
Put index of matching Rx FIFO RXFnS.FnPI[5:0] is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see PSR.LEC[2:0] respectively PSR.FLEC[2:0].

In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in "3.4.2.2. Rx FIFO Overwrite Mode" have to be considered.

3.4.1.1 Filter Types

Range Filter

A range filter matches all received frames with Message IDs in the range defined by the Standard Message ID Filter Element SFID1[10:0]/SFID2[10:0] fields resp. Extended Message ID Filter Element EFID1[28:0]/EFID2[28:0] fields (the range includes the end points SFID1[10:0]/SFID2[10:0] resp. EFID1[28:0]/EFID2[28:0]).

There are two possibilities for the Extended Filter Type of the Extended Message ID Filter Element (EFT[1:0]) when range filtering is used together with extended frames:

- EFT[1:0] = 0b00:
The Message ID of received frames is ANDed with the Extended ID AND Mask (XIDAM) before the range filter is applied
- EFT[1:0] = 0b11:
The Extended ID AND Mask (XIDAM) is not used for range filtering

Filter for Specific IDs (Dual Filter)

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SFID1[10:0] = SFID2[10:0] resp. EFID1[28:0] = EFID2[28:0].

Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SFID1[10:0]/EFID1[28:0] is used as Message ID filter, while SFID2[10:0]/EFID2[28:0] is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

Filter for a Single Dedicated ID

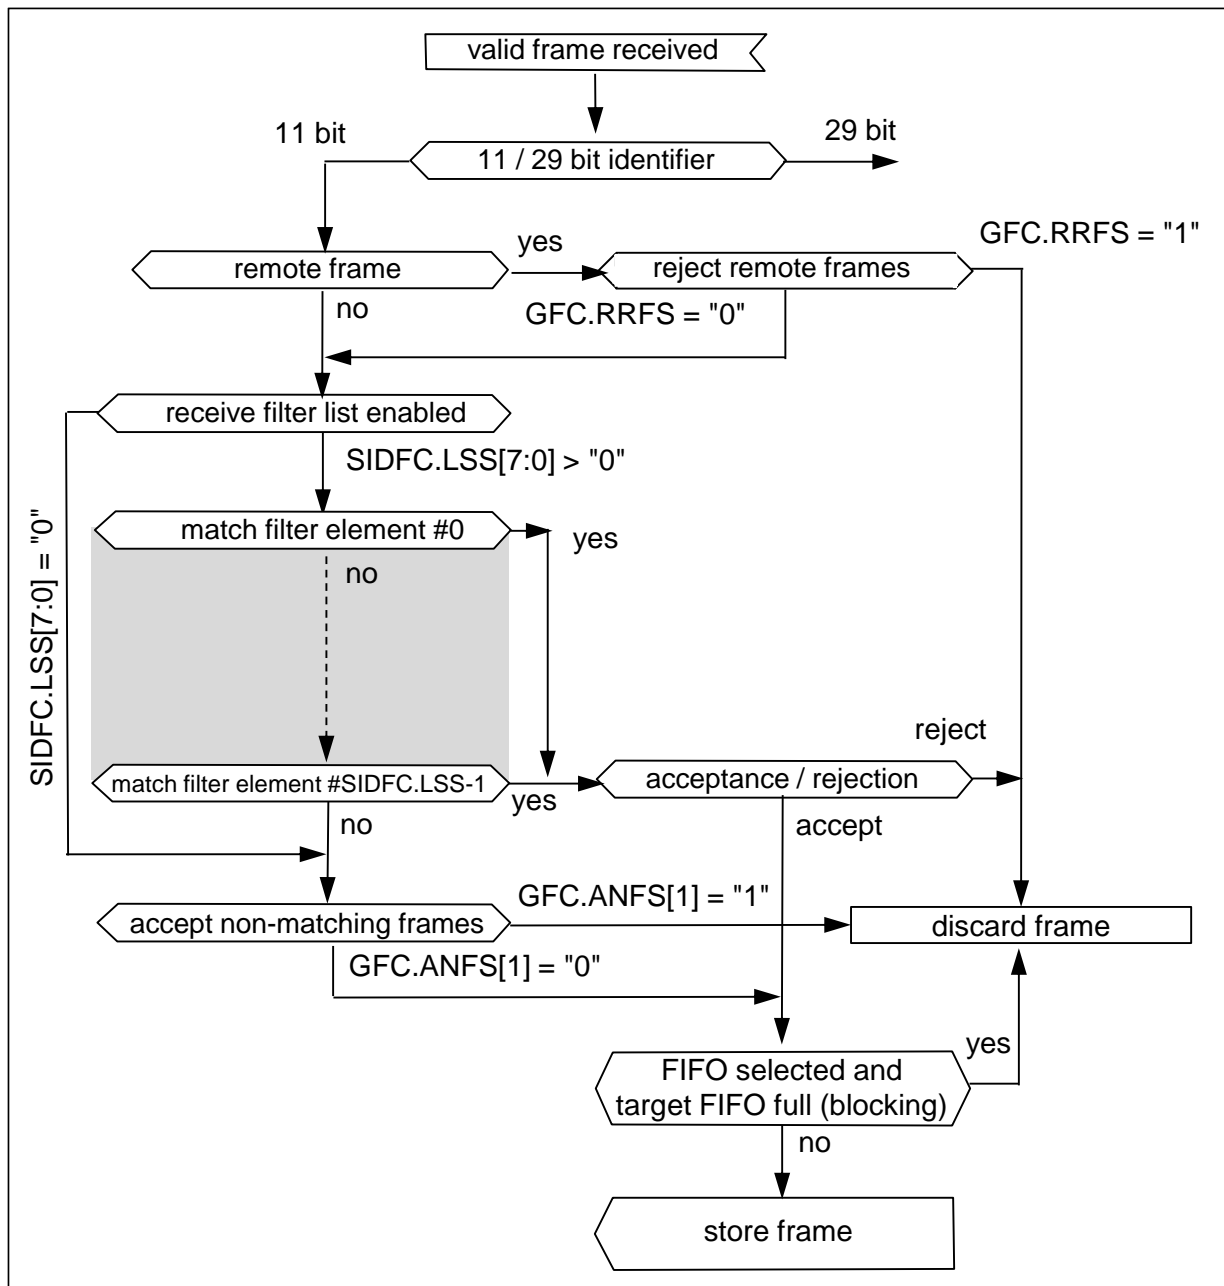

A filter for a single dedicated ID stores received messages in dedicated Rx Buffers if the received ID matches SFID1[10:0]/EFID1[28:0]. SFID2[10:0]/EFID2[28:0] is used to configure the offset to the Rx Buffer Start Address (RXBC.RBSA[15:2]) of where the message is to be stored, and also to define how the message is to be treated (Debug message or Dedicated Rx message).

3.4.1.2 Standard Message ID Filtering

Figure 3-4 below shows the flow for standard Message ID (11-bit Identifier) filtering.

Controlled by the Global Filter Configuration GFC and the Standard ID Filter Configuration SIDFC, Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

Figure 3-4 Standard Message ID Filter Path

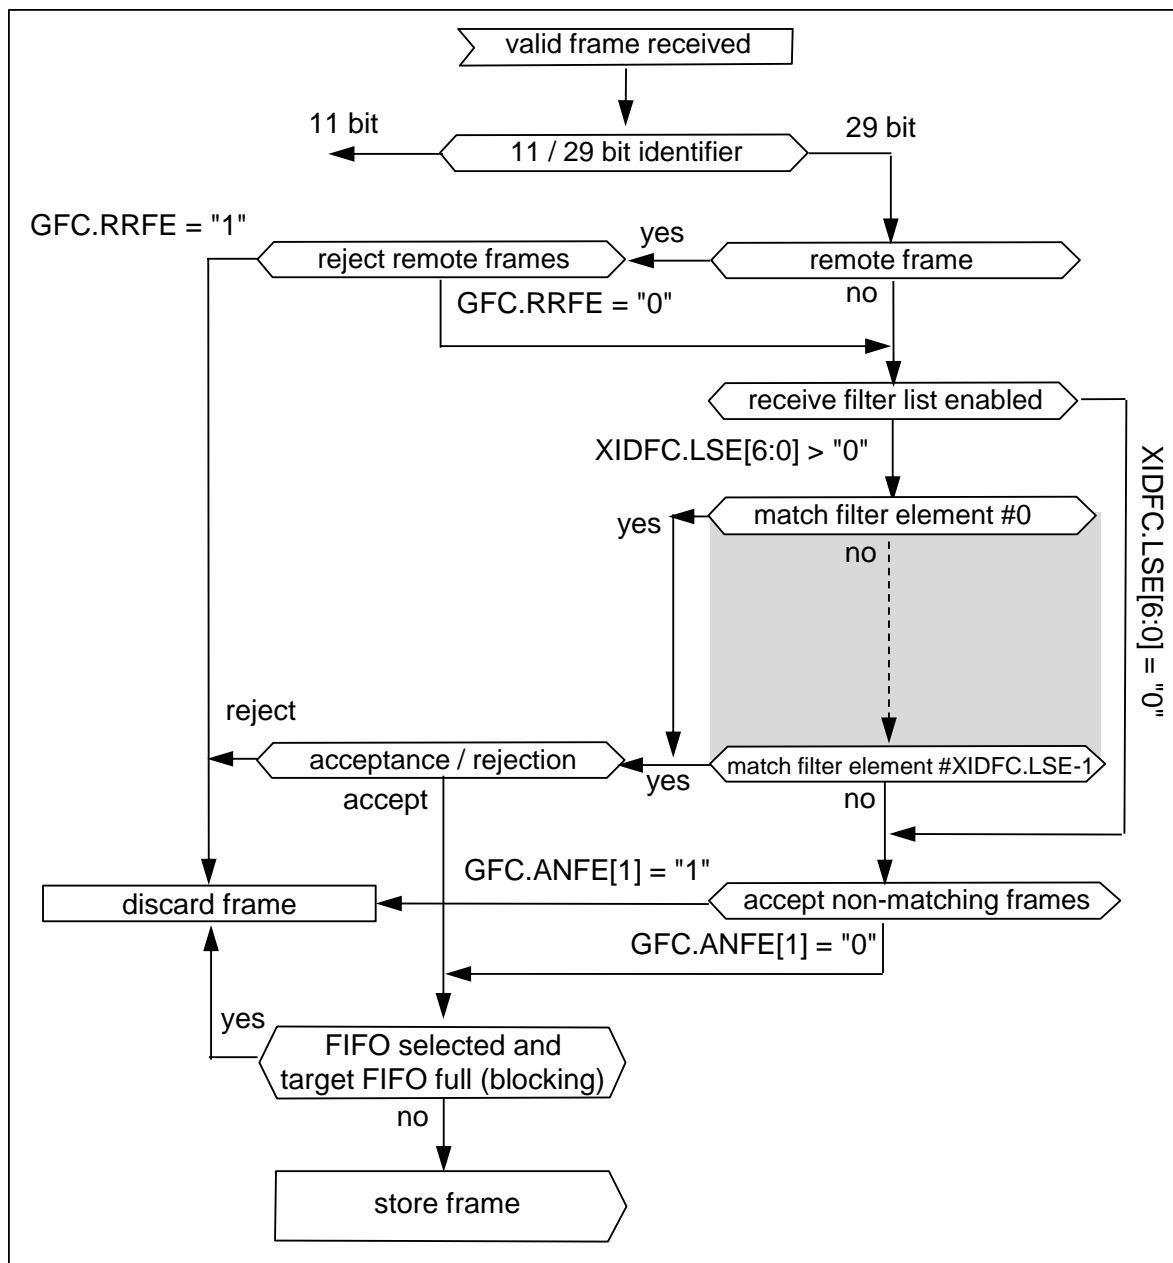

3.4.1.3 Extended Message ID Filtering

Figure 3-5 below shows the flow for extended Message ID (29-bit Identifier) filtering.

Controlled by the Global Filter Configuration GFC and the Extended ID Filter Configuration XIDFC, Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The Extended ID AND Mask XIDAM.EIDM[28:0] is ANDed with the received identifier before the filter list is executed.

Figure 3-5 Extended Message ID Filter Path

3.4.2. Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 and 1 Configuration registers RXF0C and RXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level RXFnS.FnFL[6:0] reaches the Rx FIFO watermark configured by Rx FIFO n Watermark (RXFnC.FnWM[6:0]), interrupt flag Rx FIFO n Watermark Reached (IR.RFnW) is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index an Rx FIFO Full condition is signaled by Rx FIFO n Full (RXFnS.FnF). In addition interrupt flag Rx FIFO n Full (IR.RFnF) is set.

Figure 3-6 RX FIFO Status

Addressing Rx Buffers

An Rx Buffer allocates Element Size 32-bit words in the Message RAM (see Table 3-2). Therefore when reading from an Rx FIFO, the start address of an Rx Buffer will be

*Rx FIFO Get Index (RXFnS.FnGI[5:0]) × Element Size
+ corresponding Rx FIFO start address (RXFnC.FnSA[15:2]).*

Table 3-2 Rx Buffer/FIFO Element Size

RXESC.RBDS[2:0] RXESC.FnDS[2:0]	Data Field [Bytes]	Element Size [RAM Words]
000	8	4
001	12	5
010	16	6
011	20	7

RXESC.RBDS[2:0] RXESC.FnDS[2:0]	Data Field [Bytes]	Element Size [RAM Words]
100	24	8
101	32	10
110	48	14
111	64	18

3.4.2.1 Rx FIFO Blocking Mode

The Rx FIFO blocking mode is configured by FIFO n Operation Mode $RXFnC.FnOM = 0$. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached ($RXFnS.FnPI[5:0] = RXFnS.FnGI[5:0]$), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signaled by Rx FIFO n Full ($RXFnS.FnF = 1$). In addition interrupt flag Rx FIFO n Full (IR.RFnF) is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signaled by Rx FIFO n Message Lost $RXFnS.RFnL = 1$. In addition interrupt flag Rx FIFO n Message Lost (IR.RFnL) is set.

3.4.2.2 Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by FIFO n Operation Mode $RXFnC.FnOM = 1$.

When an Rx FIFO full condition ($RXFnS.FnPI[5:0] = RXFnS.FnGI[5:0]$) is signaled by Rx FIFO n Full $RXFnS.FnF = 1$, the next message accepted for the Rx FIFO will overwrite the oldest Rx FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signaled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the CPU is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. Figure 3-7 shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

Figure 3-7 RX FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index (RXFnA.FnAI[5:0]). This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (Rx FIFO n Full RXFnS.FnF = 0).

3.4.3. Dedicated Rx Buffers

The CAN FD Controller supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via the Rx Buffer Start Address field (RXBC.RBSA[15:2]).

For each dedicated Rx Buffer a Standard or Extended Message ID Filter Element with SFEC[2:0]/EFEC[2:0] = 0b111 and SFID2[10:9]/EFID2[10:9] = 0b00 has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag IR.DRX (Message stored to Dedicated Rx Buffer) in the interrupt register is set.

Table 3-3 Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register NDAT1, 2 is set. As long as the New Data flag is set, the respective dedicated Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the CPU by writing a "1" to the respective bit position.

While a dedicated Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific dedicated Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another dedicated Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

Addressing Dedicated Rx Buffers

A Dedicated Rx Buffer allocates Element Size 32-bit words in the Message RAM (see Table 3-2).

Therefore the start address of a dedicated Rx Buffer in the Message RAM is calculated by

(Offset defined in Message ID Filter Element SFID2[5:0] resp. EFID2[5:0]) × Element Size + Rx Buffer Start Address (RXBC.RBSA[15:2]).

3.4.4. Debug on CAN Support

For debug handling, three consecutive Rx buffers (e.g. #61, #62, #63) can be used for storage of three specific debug messages A, B, and C. The format is the same as for a dedicated Rx Buffer or an Rx FIFO element.

For filtering of debug messages Standard/Extended Filter Elements with Standard/Extended Filter Configuration SFEC[2:0]/EFEC[2:0] = 0b111 have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by the lower six bits of the Standard/Extended Message ID Filter Element fields SFID2[5:0]/EFID2[5:0]. The upper two bits SFID2[10:9]/EFID2[10:9] are used to define the Debug Message that is to be stored in the respective Rx Buffer.

When a debug message is stored, neither the respective New Data flag (NDAT1.NDn / NDAT2.NDn) nor the interrupt IR.DRX (Message stored to Dedicated Rx Buffer) are set.

After the three messages have been received in correct order, a DMA transfer is requested. After the DMA transfer has completed, the CAN FD Controller is prepared to receive the next set of debug messages.

Table 3-4 Example Filter Configuration for Debug Messages

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID debug message A	01	11 1101
1	ID debug message B	10	11 1110
2	ID debug message C	11	11 1111

Notes:

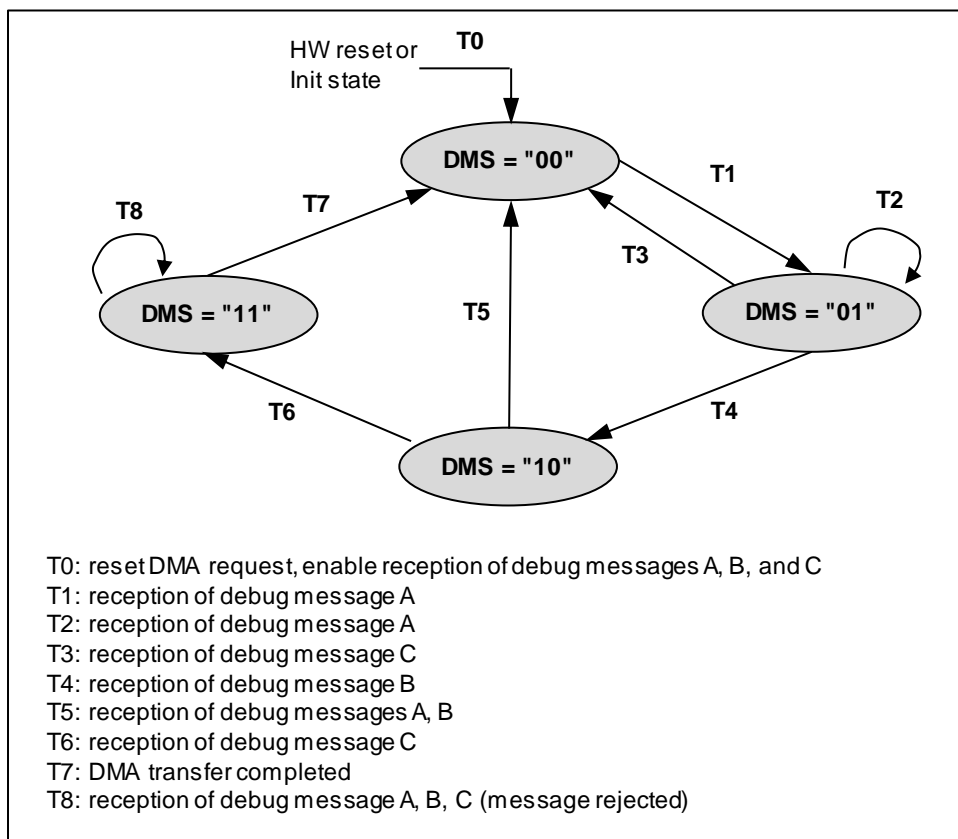

- Debug on CAN feature is not supported for TRAVEO™ T1G Platform.
- DMA transfer request is not supported also.

3.4.4.1 Debug Message Handling

The debug message handling state machine assures that debug messages are stored to three consecutive Rx Buffers in correct order. In case of missing messages the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in correct order.

The status of the debug message handling state machine is signaled via the Debug Message Status field (RXF1S.DMS[1:0]).

Figure 3-8 Debug Message Handling State Machine

Notes:

- Debug message is used for Debug on CAN feature.
- Debug on CAN feature is not supported for TRAVEO™ T1G Platform.

3.4.5. Protocol Exception Event

When the CAN FD Controller is enabled for CAN FD operation (CCCR.CME ≠ 0b00) and the CAN FD Controller detects the r0 bit following the EDL bit in a received message to be recessive, it treats this detection as a Protocol Exception Event. As reaction to the Protocol Exception Event,

- the error counters (ECR.REC[6:0] and ECR.TEC[7:0]) are not changed
- hard synchronization is enabled
- the CAN FD Controller will send recessive bits

The CAN FD Controller will also start an internal bit counter that counts the number of recessive bits detected on the CAN bus. If the counter detects eleven consecutive recessive bits, the CAN FD Controller will recover from the Protocol Exception Event and enter an idle state. In case an edge that causes synchronization is detected during the wait period, the CAN FD Controller will reset the internal bit counter and restart counting the number of recessive bits detected.

If the CAN FD Controller

- receives a message directly after the Protocol Exception Event, interrupt flag Message RAM Access Failure (IR.MRAF) will be asserted although the message has been received correctly.
- transmits a message directly after the Protocol Exception Event, IR.MRAF will not be asserted, but that frame will be transmitted with faulty frame format and cause an error frame.

Only the first message after a Protocol Exception Event is affected, all following messages (received or transmitted) will have no problem.

3.5. Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The Tx Buffer element is described in "6.3. Tx Buffer Element".

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when the Tx Buffer Request Pending register TXBRP is updated, or when a transmission has been started.

3.5.1. Transmit Pause

3.5.2. Dedicated Tx Buffers

3.5.3. Tx FIFO

3.5.5. Mixed Dedicated Tx Buffers/Tx FIFO

3.5.6. Mixed Dedicated Tx Buffers/Tx Queue

3.5.7. Transmit Cancellation

3.5.8. Tx Event Handling

3.5.1. Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU (Electronic Control Unit) sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two nominal bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by the Transmit Pause bit (CCCR.TXP). If the bit is set, the CAN FD Controller will, each time it has successfully transmitted a message, pause for two nominal bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (CCCR.TXP = 0).

This feature loses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

3.5.2. Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first. These Tx buffers shall be requested in ascending order with lowest buffer number first. Alternatively all Tx buffers configured with the same Message ID can be requested simultaneously by a single write access to TXBAR.

If the data section has been updated, a transmission is requested by an Add Request via TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

Addressing Dedicated Tx Buffers

A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see Table 3-5).

Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by

transmit buffer index (0 to 31) × Element Size + Tx Buffers Start Address (TXBC.TBSA[15:2]).

Table 3-5 Tx Buffer/FIFO/Queue Element Size

TXESC.TBDS[2:0]	Data Field [Bytes]	Element Size [RAM Words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

3.5.3. Tx FIFO

Tx FIFO operation is configured by programming the Tx FIFO/Queue Mode bit (TXBC.TFQM) to "0". Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Tx FIFO Get Index (TXFQS.TFGI[4:0]). After each transmission, the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The CAN FD Controller calculates the number of available (free) Tx FIFO elements TXFQS.TFFL[5:0] (Tx FIFO Free Level) as difference between Tx FIFO Get Index (TXFQS.TFGI[4:0]) and Tx FIFO/Queue Put Index (TXFQS.TFQPI[4:0]).

Adding Messages and Requesting Transmissions

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index (TXFQS.TFQPI[4:0]). An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (TXFQS.TFQF = 1) is signaled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a "1" to the Add Request bit (TXBAR.ARn. n is the index of the requested Tx Buffer) related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via the Tx Buffer Add Request register (TXBAR) by requesting all n Tx FIFO Buffers in a single command. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level (TXFQS.TFFL[5:0]). Transmission should not be requested to Tx Buffers outside the Put Index since this will cause the TXFQS.TFFL[5:0] to return a false value.

Cancelling Transmissions

Transmit Cancellation is intended for Tx Queues and Dedicated Tx Buffers. Cancelling requested Tx FIFO Buffer transmissions are not supported and is not recommended, except for the case where all Tx Buffers within the Tx FIFO are cancelled simultaneously (with a single command).

In the case that a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

Addressing Tx Buffers in the Tx FIFO

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see Table 3-5). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by

Tx FIFO/Queue Put Index (TXFQS.TFQPI[4:0]) (0 to 31) × Element Size
 + *Tx Buffers Start Address (TXBC.TBSA[15:2]).*

3.5.4. Tx Queue

Tx Queue operation is configured by programming the Tx FIFO/Queue Mode bit TXBC.TFQM to "1". Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). If multiple Tx Queue buffers are configured with the same Message ID, the transmission order depends on numbers of the buffers where the messages were stored for transmission. As these buffer numbers depend on the then current states of the PUT index, a prediction of the transmission order is not possible.

Adding Messages and Requesting Transmissions

New messages have to be written to the Tx Buffer referenced by the Tx FIFO/Queue Put Index TXFQS.TFQPI[4:0]. The PUT Index always points to that free buffer of the Tx Queue with the lowest buffer number. In case that the Tx Queue is full (TXFQS.TFQF = 1), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use the Tx Buffer Request Pending register TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

Addressing Tx Buffers in the Tx Queue

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see Table 3-5). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by

*Tx FIFO/Queue Put Index (TXFQS.TFQPI[4:0]) (0 to 31) × Element Size
+ Tx Buffers Start Address (TXBC.TBSA[15:2]).*

3.5.5. Mixed Dedicated Tx Buffers/Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx FIFO.

The number of Dedicated Tx Buffers is configured by TXBC.NDTB[5:0].

The number of Tx Buffers assigned to the Tx FIFO is configured by the Tx FIFO/Queue Size TXBC.TFQS[5:0]. In case TXBC.TFQS[5:0] is programmed to zero, only Dedicated Tx Buffers are used.

Figure 3-9 Example of Mixed Configuration Dedicated Tx Buffers/Tx FIFO

Tx Prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by the Tx FIFO Get Index TXFQS.TFGI[4:0])
- Buffer with lowest Message ID gets highest priority and is transmitted next

Note:

- *Mixed Dedicated Tx Buffers/Tx FIFO isn't supported. Don't use combination Dedicated Tx Buffers and Tx FIFO.*

3.5.6. Mixed Dedicated Tx Buffers/Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx Queue.

The number of Dedicated Tx Buffers is configured by TXBC.NDTB[5:0].

The number of Tx Queue Buffers is configured by the Tx FIFO/Queue Size TXBC.TFQS[5:0]. In case TXBC.TFQS[5:0] is programmed to zero, only Dedicated Tx Buffers are used.

Figure 3-10 Example of Mixed Configuration Dedicated Tx Buffers/Tx Queue

Tx Prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

3.5.7. Transmit Cancellation

The CAN FD Controller supports transmit cancellation. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer the CPU has to write a "1" to the corresponding bit position of the Tx Buffer Cancellation Request register TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signaled by setting the corresponding bit of the Tx Buffer Cancellation Finished register TXBCF to "1".

A cancellation request resets the corresponding Transmission Request Pending bit (TXBRP.TRPn). In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP.TRPn bit remains set as long as the transmission is in progress.

- If the transmission was successful, the corresponding Transmission Occurred (TXBTO.TOn) and Cancellation Finished (TXBCF.CFn) bits are set.
- If the transmission was not successful (the transmission has been aborted due to lost arbitration, error occurred during frame transmission), it is not repeated and only the corresponding Cancellation Finished bit (TXBCF.CFn) is set.

TXBCF.CFn is also set when the transmission has not yet been started at the point of cancellation,

The cancellation request bits (TXBCR.CRn) are reset directly after the corresponding Transmission Request Pending bit (TXBRP.TRPn) has been reset.

Note:

- *In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority (a greater message ID) than the second message in this node.*

3.5.8. Tx Event Handling

To support Tx event handling the CAN FD Controller has implemented a Tx Event FIFO. After the CAN FD Controller has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer MM[7:0] is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured by Event FIFO Size (TXEFC.EFS[5:0]) to a maximum of 32 elements.

When a Tx Event FIFO full condition is signaled by interrupt flag Tx Event FIFO Full (IR.TEFF), no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index TXEFS.EFGI[4:0] has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag Tx Event FIFO Element Lost IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level TXEFS.EFFL[5:0] reaches the Tx Event FIFO watermark configured by TXEFC.EFWM[5:0], interrupt flag Tx Event FIFO Watermark Reached IR.TEFW is set.

Addressing Tx Events in the Tx Event FIFO

The start address when reading from the Tx Event FIFO will be

$2 \times \text{Tx Event FIFO Get Index TXEFS.EFGI}[4:0] + \text{Tx Event FIFO start address TXEFC.EFSA}[15:2]$.

3.6. FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO (RXF0S.F0GI[5:0], RXF1S.F1GI[5:0], and TXEFS.EFGI[4:0], respectively) are controlled by writing to the corresponding FIFO Acknowledge Index (RXF0A.F0AI[5:0], RXF1A.F1AI[5:0], and TXEFA.EFAI[4:0], respectively). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

- When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index. (Multiple elements may be read by repeating this operation)
- When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the CPU has free access to the Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the Rx FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position, alter the Rx FIFO's Fill Level, and also cause some of the older Rx FIFO elements to be lost.

Note:

- *The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The CAN FD Controller does not check for erroneous values.*

3.7. Configuring the CAN Bit Timing

Each CAN node in the CAN network has its own clock generator (usually a quartz oscillator). The time parameter of the bit time can be configured individually for each CAN node. Even if each CAN node's oscillator has a different period, a common bit rate can be generated.

The oscillator frequencies vary slightly because of changes in temperature or voltage, or deterioration of components. As long as the frequencies vary only within the tolerance range of the oscillators, the CAN nodes can compensate for the different bit rates by resynchronizing to the bit stream.

3.7.1. CAN Bit Timing

The CAN FD specification V1.0 defines two bit times - nominal bit time and fast bit time (the CAN FD specification V1.0 calls these nominal bit time and data bit time). The nominal bit time is for the arbitration phase. The fast bit time has an equal or shorter length and can be used to accelerate the data phase (see Bit Rate Switching in "3.1.3.CAN FD Operation" for details).

The basic construction of a bit time is shared with both the nominal and fast bit times. The bit time can be divided into four segments according to the CAN specifications (see Figure 3-11): the synchronization segment (Sync_Seg), the propagation time segment (Prop_Seg), the phase buffer segment 1 (Phase_Seg1), and the phase buffer segment 2 (Phase_Seg2). The sample point, the point of time at which the bus level is read and interpreted as the value of that respective bit, is located at the end of Phase_Seg1.

Figure 3-11 Bit Time Construction

Each segment consists of a programmable number of time quanta, which is a multiple of the time quantum that is defined by `canfd_cclk` and a prescaler. The values and prescalers used to define these parameters differ for the nominal and fast bit times, and are configured by BTP (Bit Timing & Prescaler Register) and FBTP (Fast Bit Timing & Prescaler Register) as shown in the table below (Table 3-6).

Table 3-6 Bit Time Parameters

Parameter	Description
Time quantum tq (nominal) and tqf (fast)	Time quantum. Derived by multiplying the basic unit time quanta (i.e. the <code>canfd_cclk</code> period) with the respective prescaler. The time quantum is configured by the CAN FD Controller as nominal: $tq = (BTP.BRP[9:0] + 1) \times \text{canfd_cclk period}$ fast: $tqf = (FBTP.FBRP[4:0] + 1) \times \text{canfd_cclk period}$
Sync_Seg	Sync_Seg is fixed to 1 time quantum as defined by the CAN specifications and is therefore not configurable (inherently built into the CAN FD Controller). nominal: 1 tq fast: 1 tqf
Prop_Seg	Prop_Seg is the part of the bit time that is used to compensate for the physical delay times within the network. The CAN FD Controller configures the sum of Prop_Seg and Phase_Seg1 with a single parameter, i.e. nominal: $\text{Prop_Seg} + \text{Phase_Seg1} = BTP.TSEG1[5:0] + 1$ fast: $\text{Prop_Seg} + \text{Phase_Seg1} = FBTP.FTSEG1[3:0] + 1$
Phase_Seg1	Phase_Seg1 is used to compensate for edge phase errors before the sampling point. Can be lengthened by the resynchronization jump width. The sum of Prop_Seg and Phase_Seg1 is configured by the CAN FD Controller as nominal: $BTP.TSEG1[5:0] + 1$ fast: $FBTP.FTSEG1[3:0] + 1$

Parameter	Description
Phase_Seg2	<p>Phase_Seg2 is used to compensate for edge phase errors after the sampling point. Can be shortened by the resynchronization jump width.</p> <p>Phase_Seg2 is configured by the CAN FD Controller as nominal: BTP.TSEG2[3:0] + 1 fast: FBTP.FTSEG2[2:0] + 1</p>
SJW	<p>Resynchronization Jump Width. Used to adjust the length of Phase_Seg1 and Phase_Seg2. SJW will not be longer than either Phase_Seg1 or Phase_Seg2.</p> <p>SJW is configured by the CAN FD Controller as nominal: BTP.SJW[3:0] + 1 fast: FBTP.FSJW[1:0] + 1</p>

These relations result in the following equations for the nominal and fast bit times:

Nominal Bit time

$$= [\text{Sync_Seg} + \text{Prop_Seg} + \text{Phase_Seg1} + \text{Phase_Seg2}] \times t_q$$

$$= [1 + (\text{BTP.TSEG1}[5:0] + 1) + (\text{BTP.TSEG2}[3:0] + 1)] \times [(\text{BTP.BRP}[9:0] + 1) \times \text{canfd_cclk period}]$$

and for the fast bit time

$$= [1 + (\text{FBTP.FTSEG1}[3:0] + 1) + (\text{FBTP.FTSEG2}[2:0] + 1)] \times [(\text{FBTP.FBRP}[4:0] + 1) \times \text{canfd_cclk period}]$$

Note:

- The Information Processing Time (IPT) of the CAN FD Controller is zero, meaning the data for the next bit is available at the first CAN clock edge after the sample point. Therefore, the IPT does not have to be accounted for when configuring Phase_Seg2, which is the maximum of Phase_Seg1 and the IPT.

3.7.2. CAN Bit Rates

Since the bit rate is the inverse of the bit time, the nominal bit rate is

$$1 / \{[1 + (\text{BTP.TSEG1}[5:0] + 1) + (\text{BTP.TSEG2}[3:0] + 1)] \times [(\text{BTP.BRP}[9:0] + 1) \times \text{canfd_cclk period}]\}$$

and the FD bit rate is

$$1 / \{[1 + (\text{FBTP.FTSEG1}[3:0] + 1) + (\text{FBTP.FTSEG2}[2:0] + 1)] \times [(\text{FBTP.FBRP}[4:0] + 1) \times \text{canfd_cclk period}]\}$$

From these formula we can see that the bit rates of the CAN FD Controller will depend on the CAN clock (i.e. canfd_cclk) period, and the range each parameter can be configured to. The tables below lists examples of the configurable bit rates at varying CAN clock frequencies. Empty boxes indicate that the desired bit rate cannot be configured at the specified input CAN clock frequency.

Table 3-7 Example Configurations for Nominal Bit Rates

CAN clock frequency	8MHz		10MHz		16MHz		20MHz		32MHz		40MHz	
configuration nominal bit rate	# of tq's	BTP.BRP + 1	# of tq's	BTP.BRP + 1	# of tq's	BTP.BRP + 1	# of tq's	BTP.BRP + 1	# of tq's	BTP.BRP + 1	# of tq's	BTP.BRP + 1
125kbps	64tq 32tq 16tq 8tq	1 2 4 8	80tq 40tq 20tq 10tq	1 2 4 8	64tq 32tq 16tq 8tq	2 4 8 16	80tq 40tq 20tq 10tq	2 4 8 16	64tq 32tq 16tq 8tq	4 8 16 32	80tq 40tq 20tq 10tq	4 8 16 32
250kbps	32tq 16tq 8tq	1 2 4	40tq 20tq 10tq	1 2 4	64tq 32tq 16tq 8tq	1 2 4 8	80tq 40tq 20tq 10tq	1 2 4 8	64tq 32tq 16tq 8tq	2 4 8 16	80tq 40tq 20tq 10tq	2 4 8 16
500kbps	16tq 8tq	1 2	20tq 10tq	1 2	32tq 16tq 8tq	1 2 4	40tq 20tq 10tq	1 2 4	64tq 32tq 16tq 8tq	1 2 4 8	80tq 40tq 20tq 10tq	1 2 4 8

Table 3-8 Example Configurations for FD Bit Rates

CAN clock frequency	8MHz		10MHz		16MHz		20MHz		32MHz		40MHz	
configuration FD bit rate	# of tq's	FBTP.FBRP + 1	# of tq's	FBTP.FBRP + 1	# of tq's	FBTP.FBRP + 1	# of tq's	FBTP.FBRP + 1	# of tq's	FBTP.FBRP + 1	# of tq's	FBTP.FBRP + 1
500kbps	16tqf 8tqf	1 2	20tqf 10tqf	1 2	16tqf 8tqf	2 4	20tqf 10tqf	2 4	16tqf 8tqf	4 8	20tqf 10tqf	4 8
1Mbps	8tqf	1	10tqf	1	16tqf 8tqf	1 2	20tqf 10tqf	1 2	16tqf 8tqf	2 4	20tqf 10tqf	2 4
2Mbps					8tqf	1	10tqf	1	16tqf 8tqf	1 2	20tqf 10tqf	1 2
4Mbps									8tqf	1	10tqf	1
5Mbps											8tqf	1

Note:

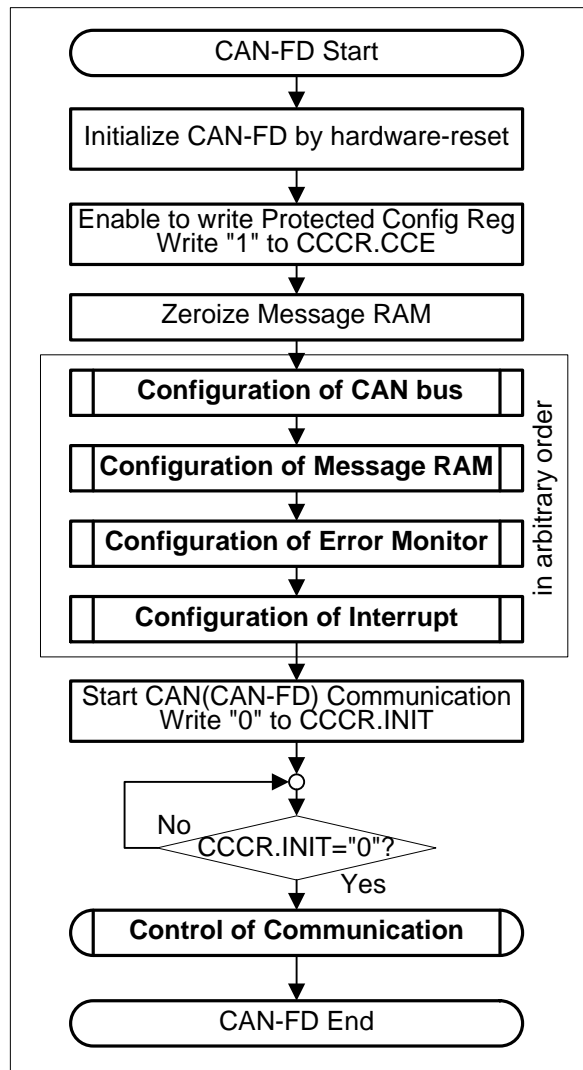

- The user must configure the CAN bit timings so they comply with the corresponding CAN standards to ensure proper communication on the CAN bus.

4. Setup Procedure Examples

This section provides examples of setup procedures for the CAN FD Controller.

- 4.1. Configuration of CAN Bus
- 4.2. Configuration of Message RAM
 - 4.2.1. Configuration of ID Filter List
 - 4.2.2. Configuration of Rx Buffer and Rx FIFO
 - 4.2.3. Configuration of Tx Buffer and Tx FIFO/Queue
 - 4.2.4. Configuration of ID Filter
- 4.3. Configuration of Error Monitor
- 4.4. Configuration of Interrupt
- 4.5. Control of Communication
 - 4.5.1. CAN Transmit Mode Change
 - 4.5.2. Configuration of Transmission Frame
- 4.6. Interrupt Handling Operation
 - 4.6.1. Bus_Off Status Handling Operation
 - 4.6.2. Message RAM Access Failure Handling Operation
 - 4.6.2.1. CCCR.CCE Setting Operation
 - 4.6.3. Bit Error Handling Operation
 - 4.6.4. Tx Event FIFO Handling Operation
 - 4.6.5. Dedicated Rx Buffer Handling Operation
 - 4.6.6. High Priority Message Handling Operation
 - 4.6.7. Rx FIFO Handling Operation

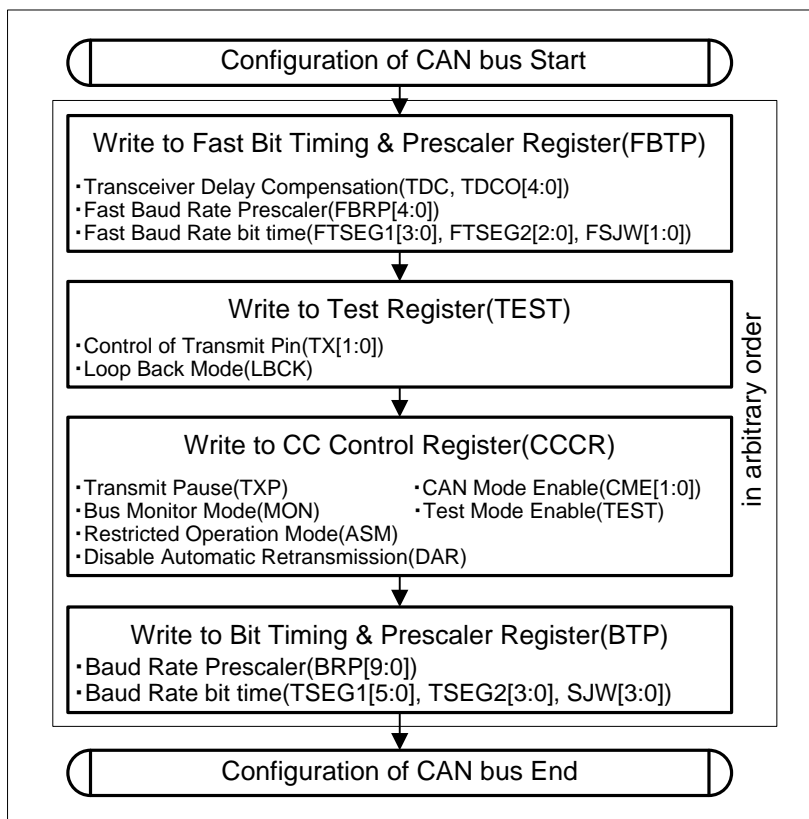

Figure 4-1 shows the general flow of a program. The following sections will describe each step in more detail.

Figure 4-1 General Program Flow

4.1. Configuration of CAN Bus

Figure 4-2 lists what to configure in order to set up the CAN bus related functions.

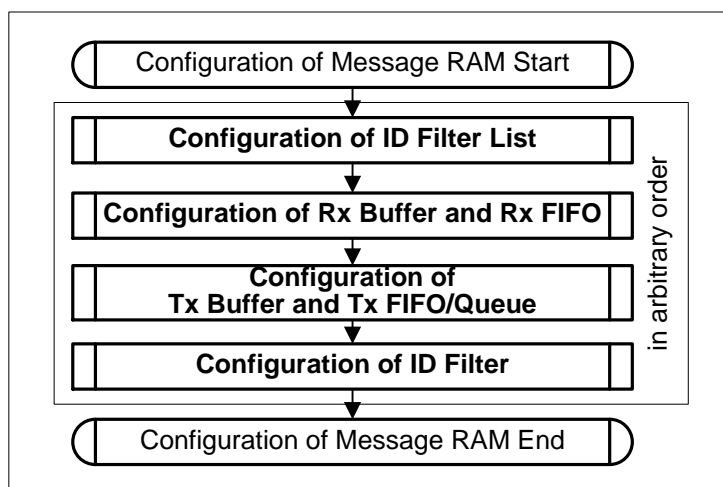

Figure 4-2 Flow Diagram "Configuration of CAN Bus"

4.2. Configuration of Message RAM

Figure 4-3 shows the overall configuration procedure of the Message RAM.

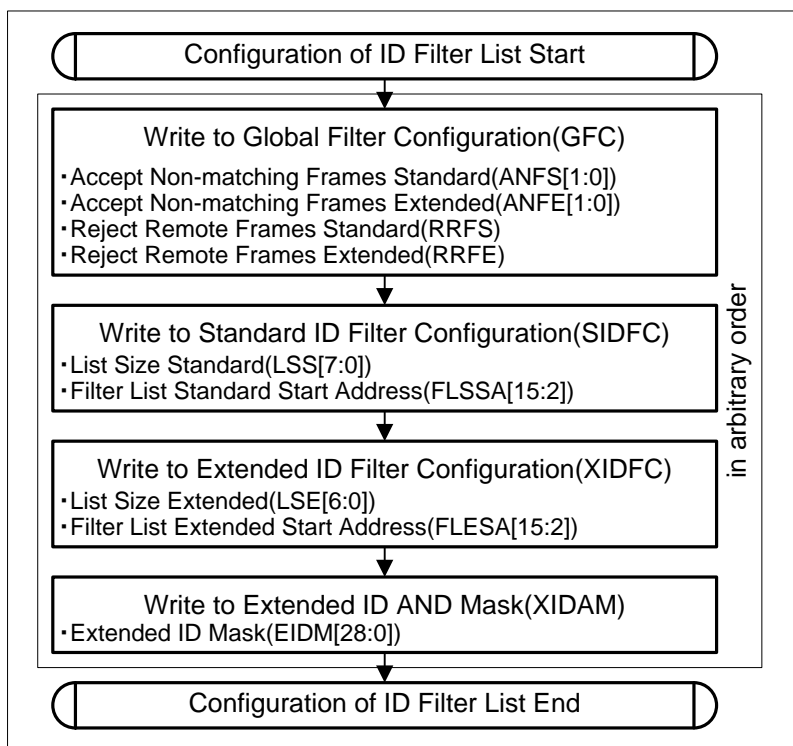

Figure 4-3 Flow Diagram "Configuration of Message RAM"

4.2.1. Configuration of ID Filter List

Figure 4-4 lists what to configure in order to set up the ID Filter lists.

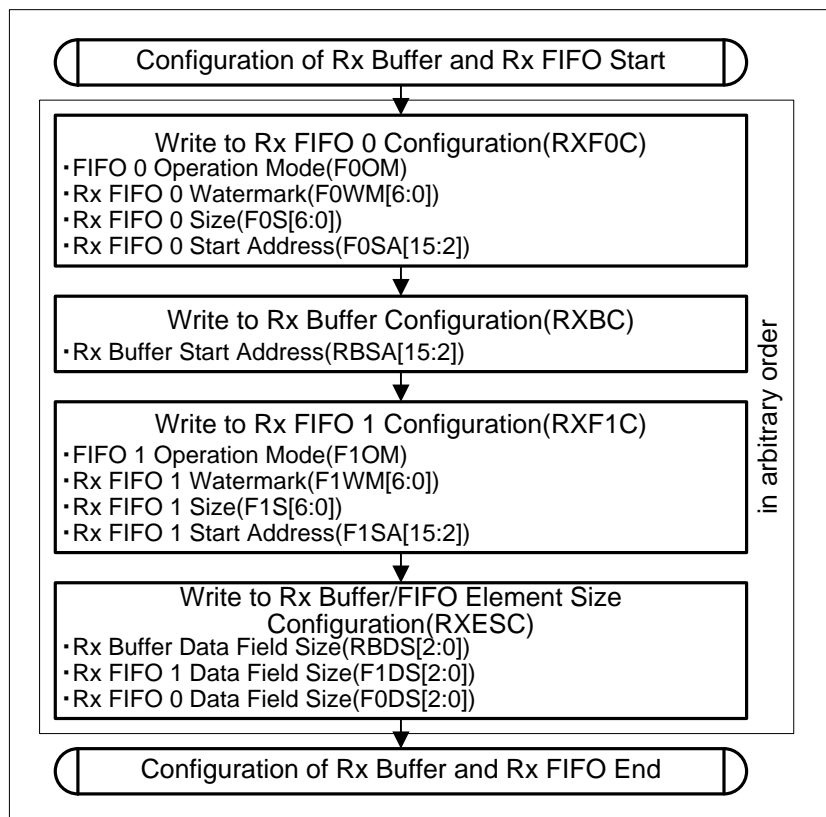

Figure 4-4 Flow Diagram "Configuration of ID Filter List"

4.2.2. Configuration of Rx Buffer and Rx FIFO

Figure 4-5 lists what to configure in order to set up the Dedicated Rx Buffers and Rx FIFOs.

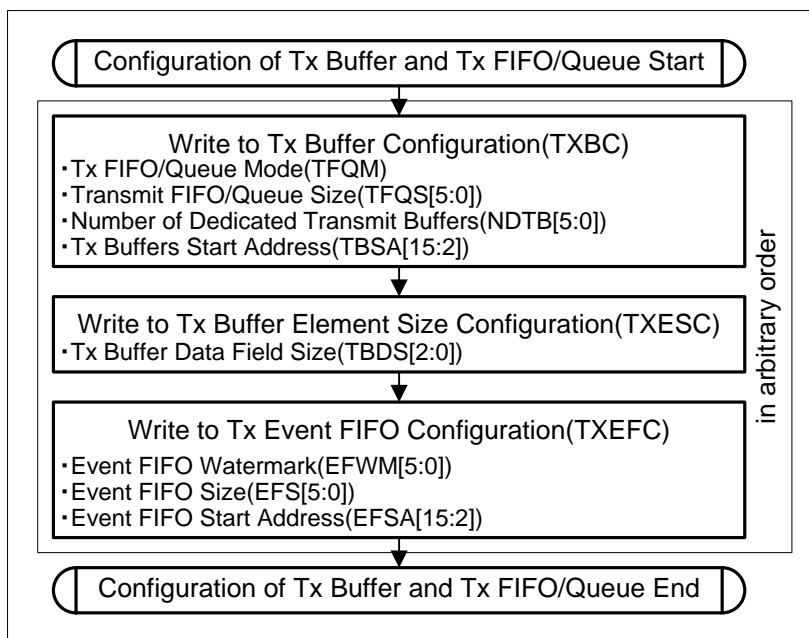

Figure 4-5 Flow Diagram "Configuration of Rx Buffer and Rx FIFO"

4.2.3. Configuration of Tx Buffer and Tx FIFO/Queue

Figure 4-6 lists what to configure in order to set up the Tx Buffers and Tx Event FIFO.

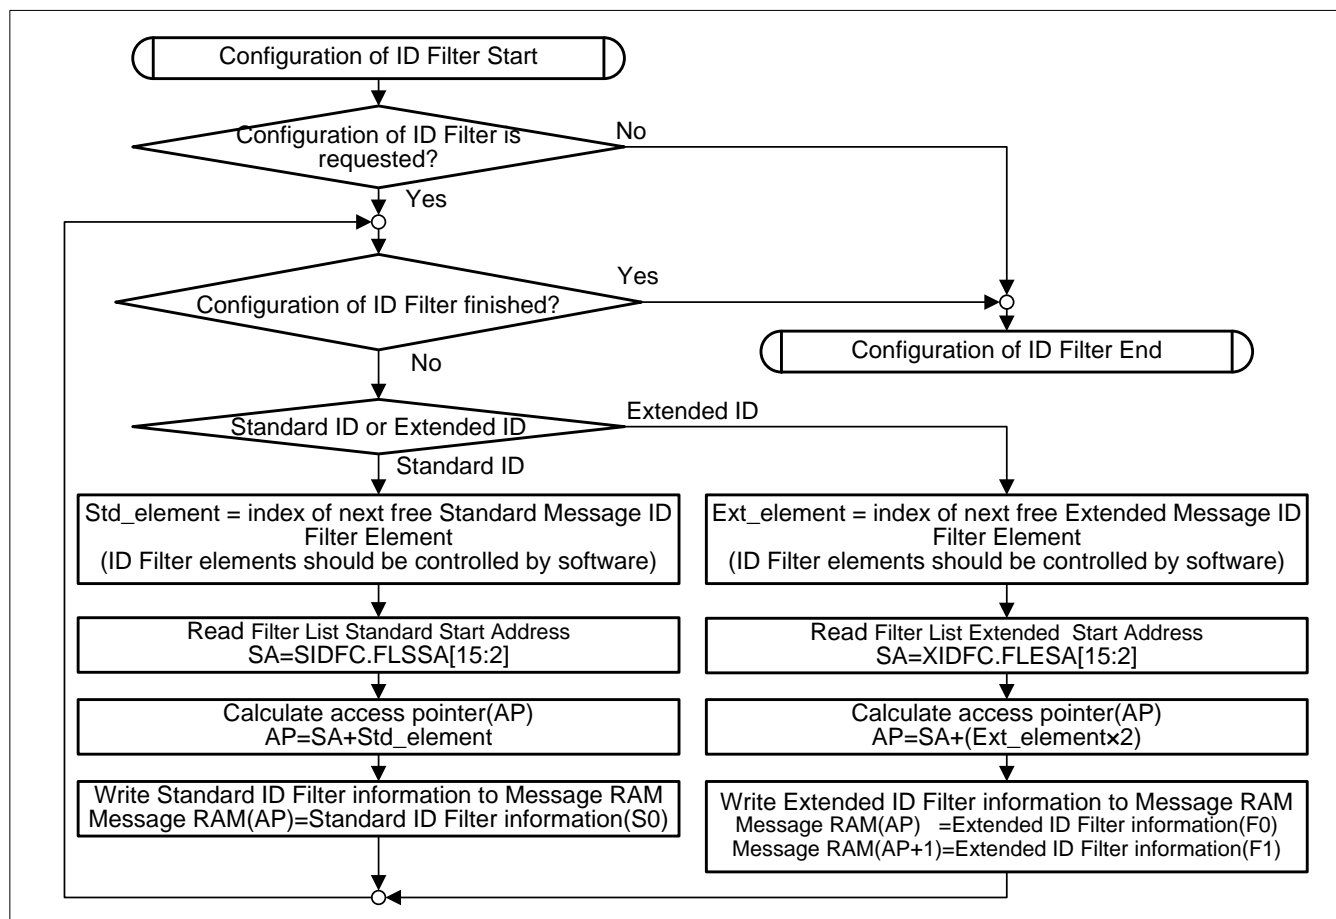

Figure 4-6 Flow Diagram "Configuration of Tx Buffer and Tx FIFO/Queue"

4.2.4. Configuration of ID Filter

Figure 4-7 shows the steps to set up an ID Filter.

Figure 4-7 Flow Diagram "Configuration of ID Filter"

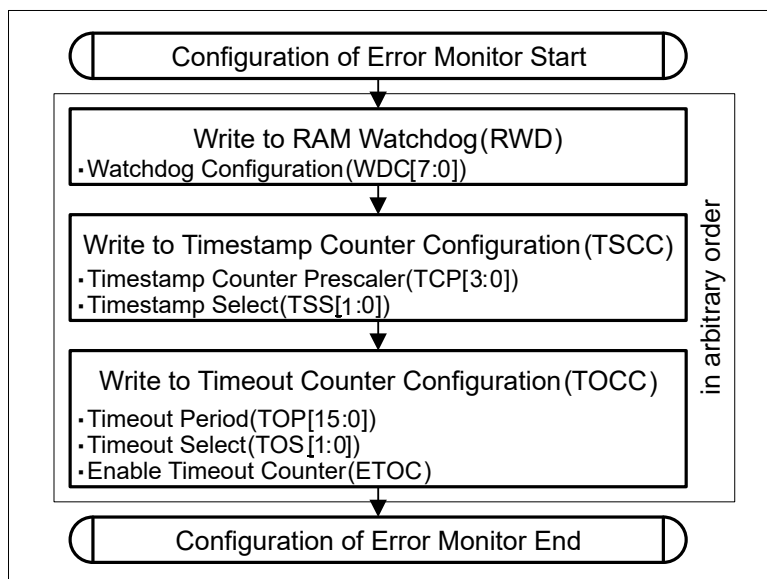

Note:

- Use 32-bit word address values when calculating the pointers in the flow diagram above.

4.3. Configuration of Error Monitor

Figure 4-8 lists the error monitoring functions that can be used.

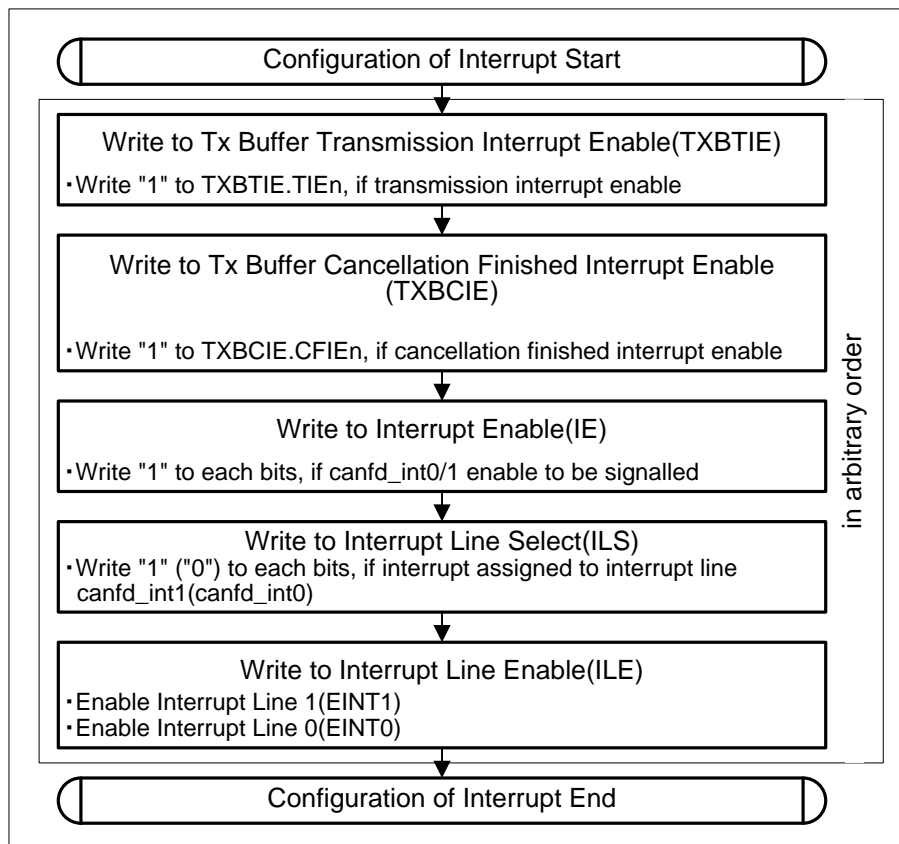

Figure 4-8 Flow Diagram "Configuration of Error Monitor"

4.4. Configuration of Interrupt

Figure 4-9 lists what to configure in order to set up the Interrupt related logic.

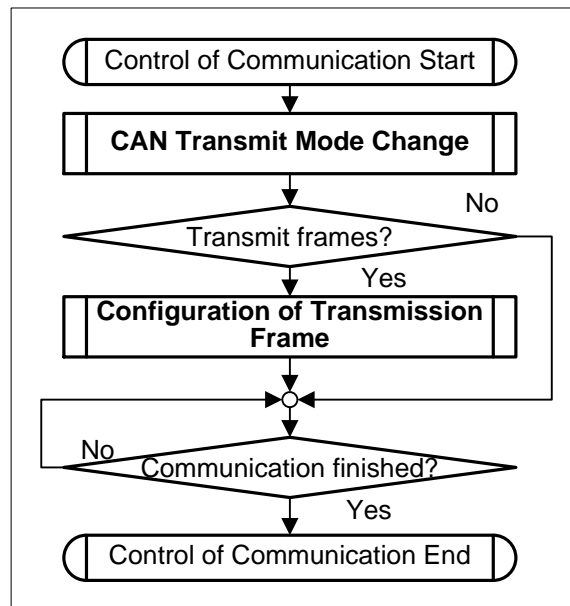

Figure 4-9 Flow Diagram "Configuration of Interrupt"

4.5. Control of Communication

Figure 4-10 shows the overall configuration procedure for communication on the CAN bus.

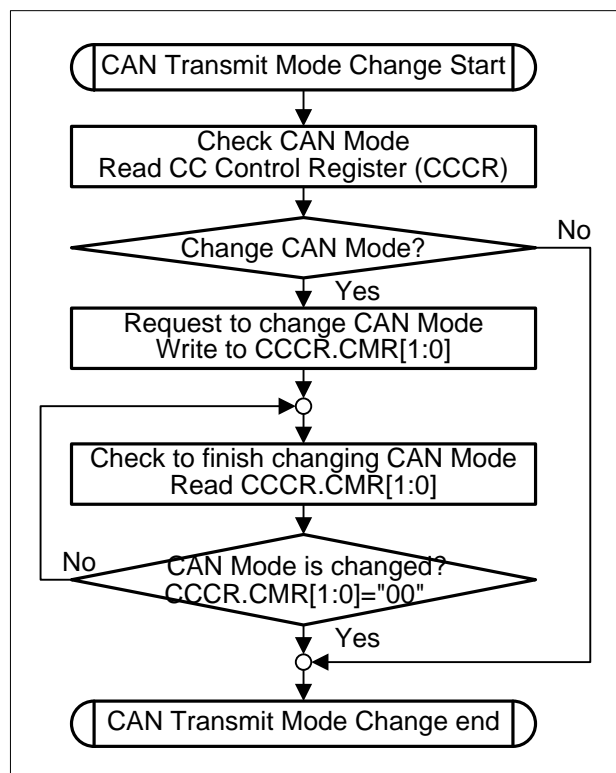

Figure 4-10 Flow Diagram "Control of Communication"

4.5.1. CAN Transmit Mode Change

Figure 4-11 shows how the CAN transmission properties CCCR.FDBS (CAN FD Bit Rate Switching) and CCCR.FDO (CAN FD Operation) can be changed for a specific CAN Mode Enable (CCCR.CME[1:0]) setting.

Figure 4-11 Flow Diagram "CAN Transmit Mode Change"

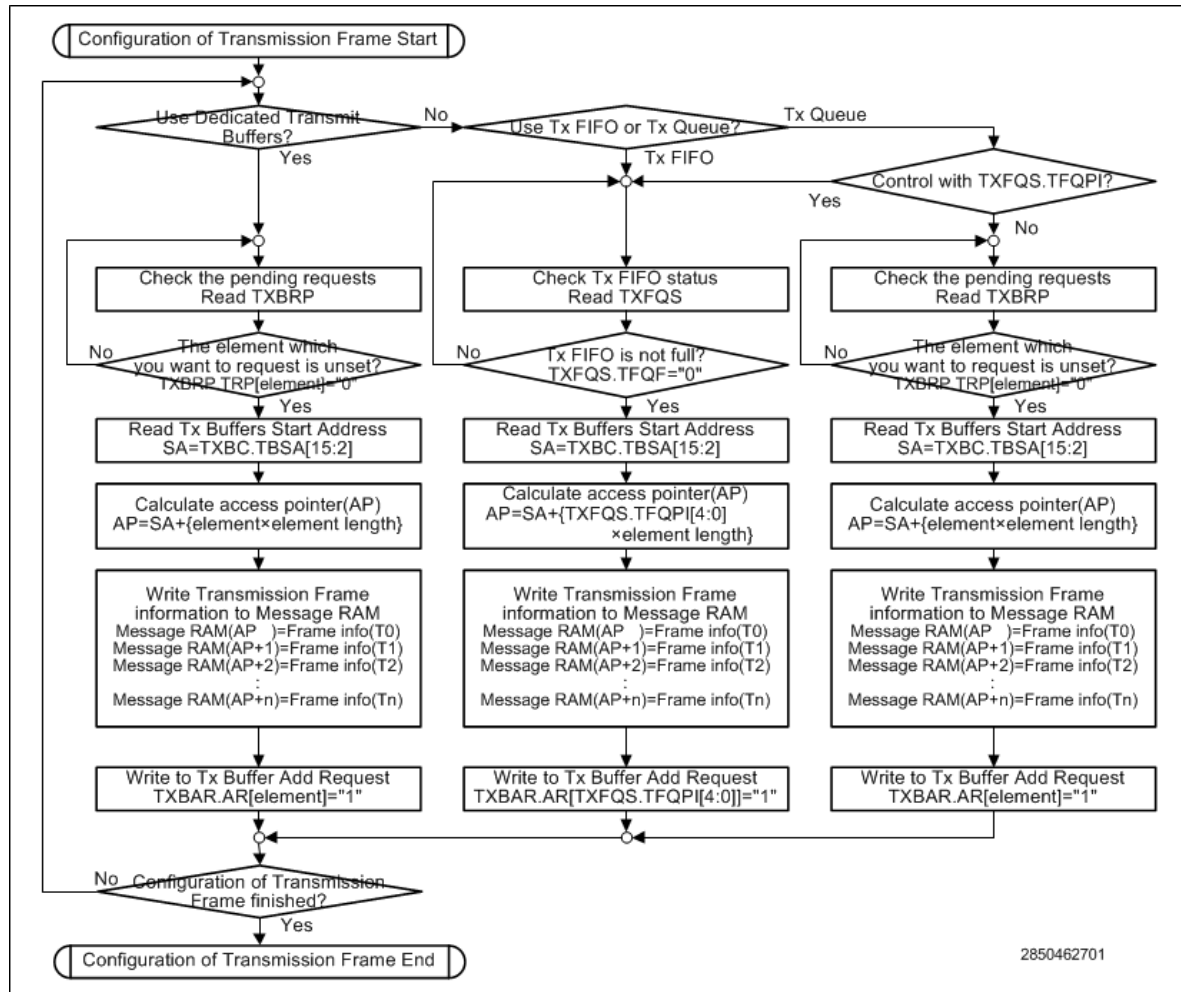

Note:

- A mode change requested by writing to CCCR.CMR[1:0] is allowed only when no transmission requests are pending. If necessary, cancel pending transmission requests before changing the CAN operation mode.

4.5.2. Configuration of Transmission Frame

Figure 4-12 shows how to set and transmit frames.

Figure 4-12 Flow Diagram "Configuration of Transmission Frame"

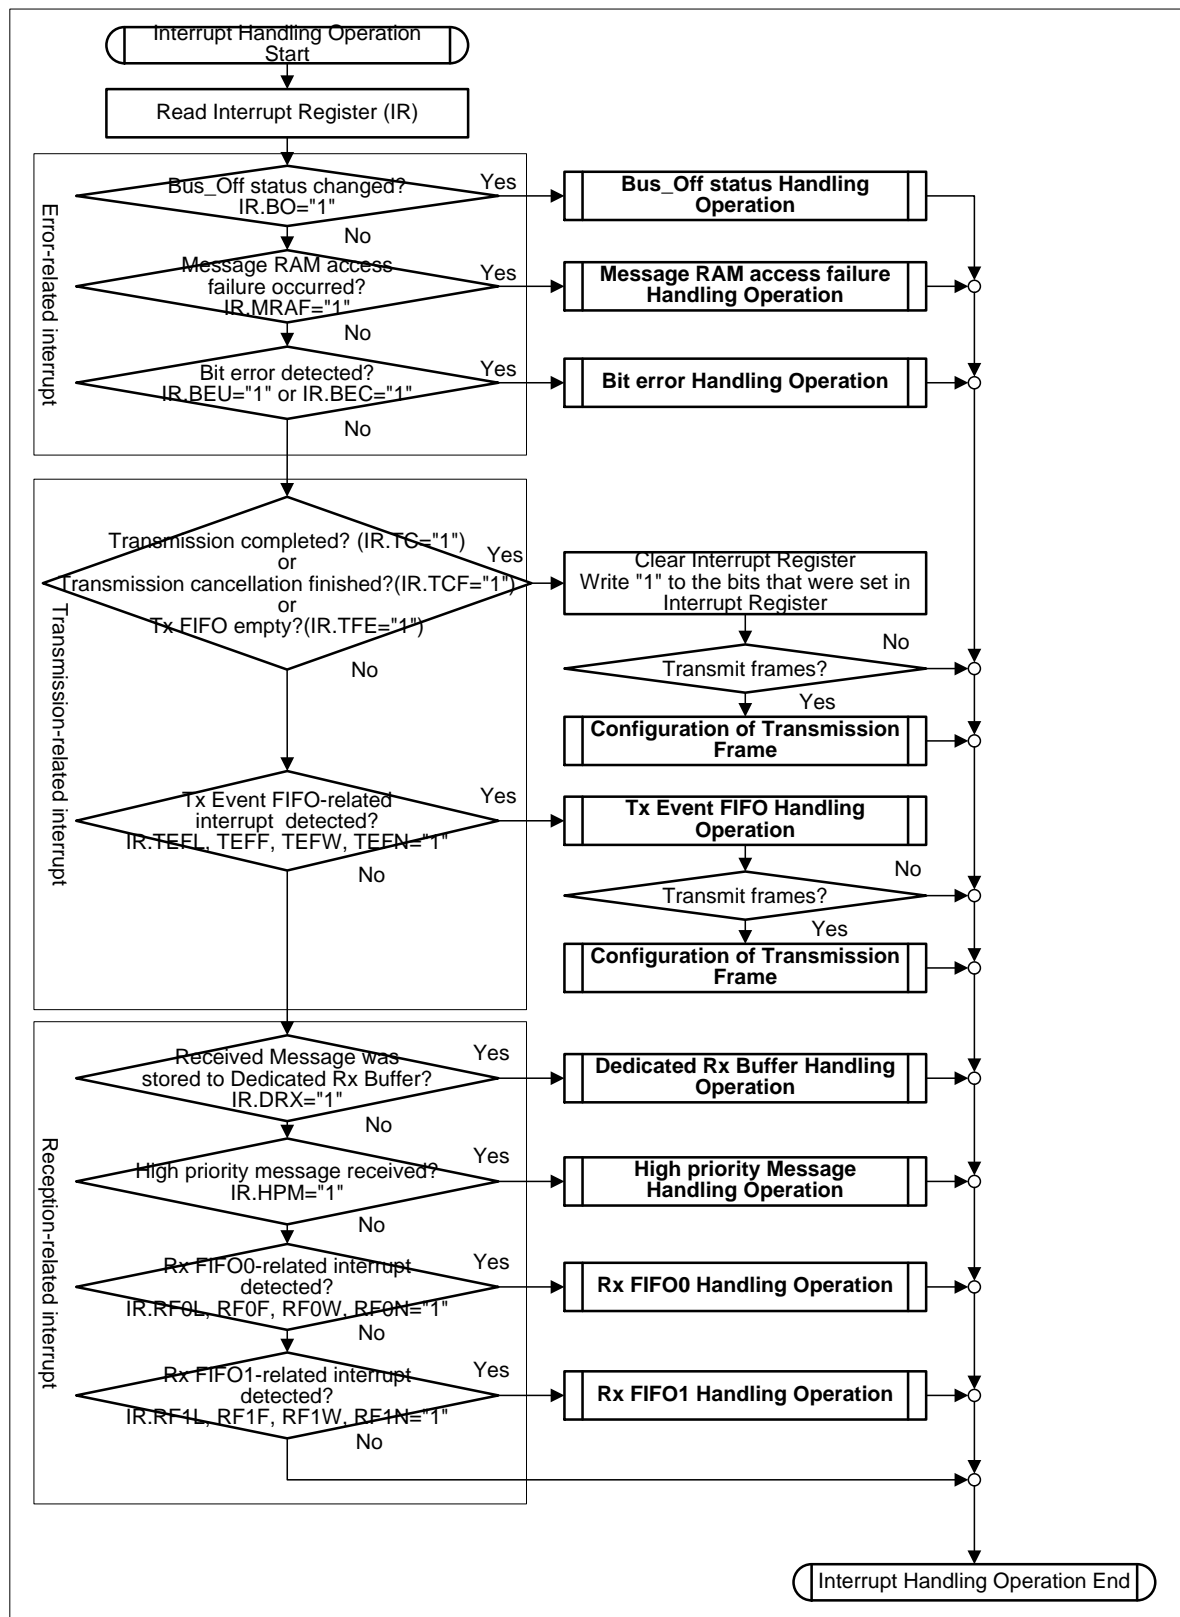

Notes:

- Use 32-bit word address values when calculating the pointers in the flow diagram above.
- Dedicated Transmit Buffers are normally configured with a single specific identifier.

4.6. Interrupt Handling Operation

Figure 4-13 shows the overall picture of how interrupts are processed.

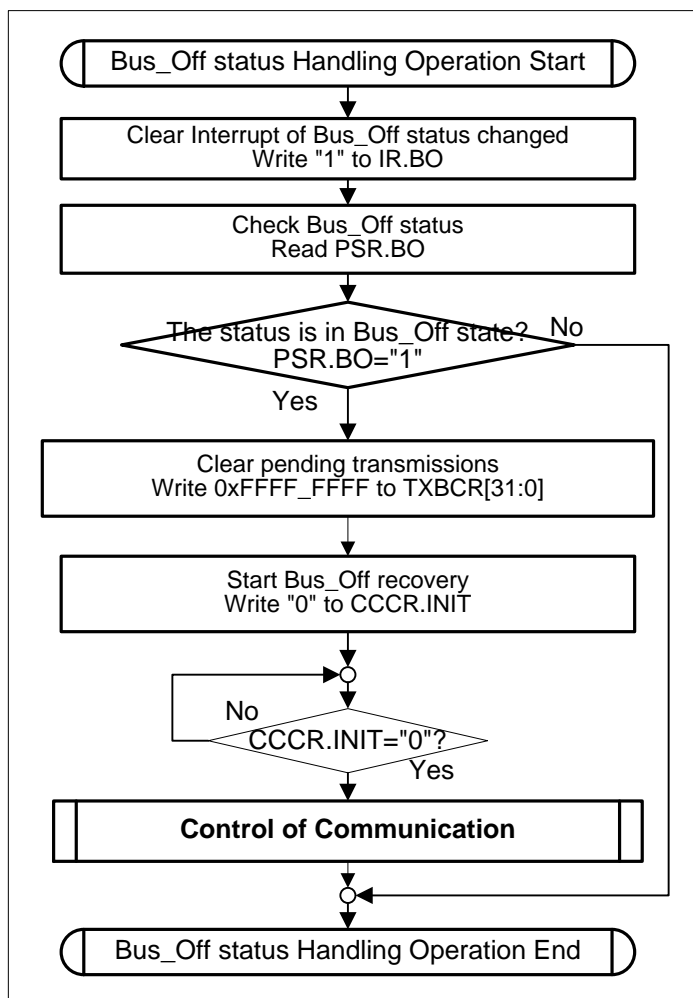

Figure 4-13 Flow Diagram "Interrupt Handling Operation"

4.6.1. Bus_Off Status Handling Operation

Figure 4-14 shows how to process a "Bus_Off Status" interrupt (IR.BO).

Figure 4-14 Flow Diagram "Bus_Off Status Handling Operation"

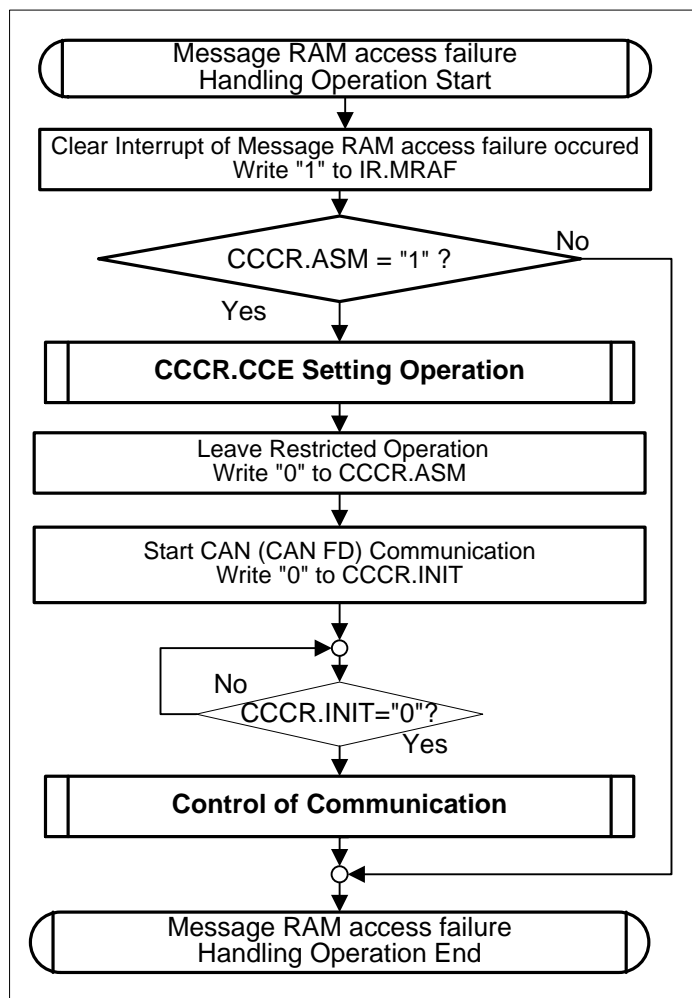

Note:

- Once the Initialization bit (CCCR.INIT) has been cleared by the CPU, the CAN FD Controller will then wait for 129 occurrences of Bus Idle (129×11 consecutive recessive bits) before resuming normal operation.

4.6.2. Message RAM Access Failure Handling Operation

Figure 4-15 shows how to process a "Message RAM Access Failure" interrupt (IR.MRAF).

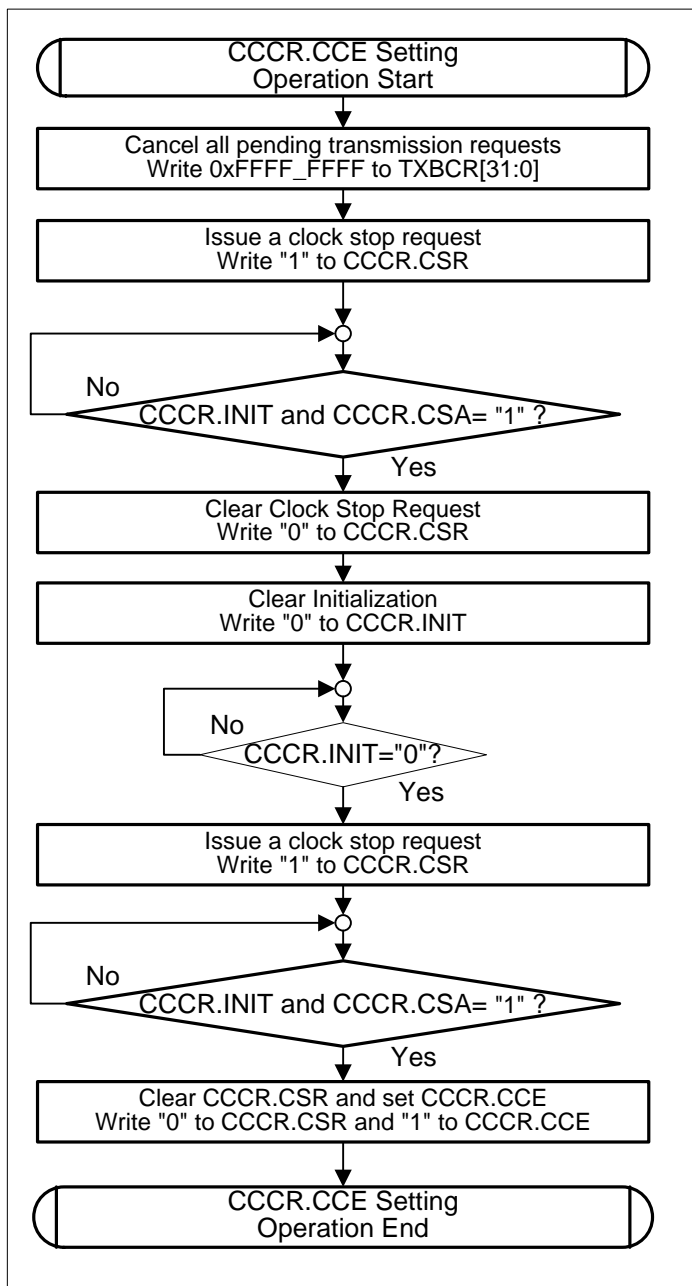

Figure 4-15 Flow Diagram "Message RAM Access Failure Handling Operation"

4.6.2.1 CCCR.CCE Setting Operation

Figure 4-16 shows how to process a "Setting CCCR.CCE".

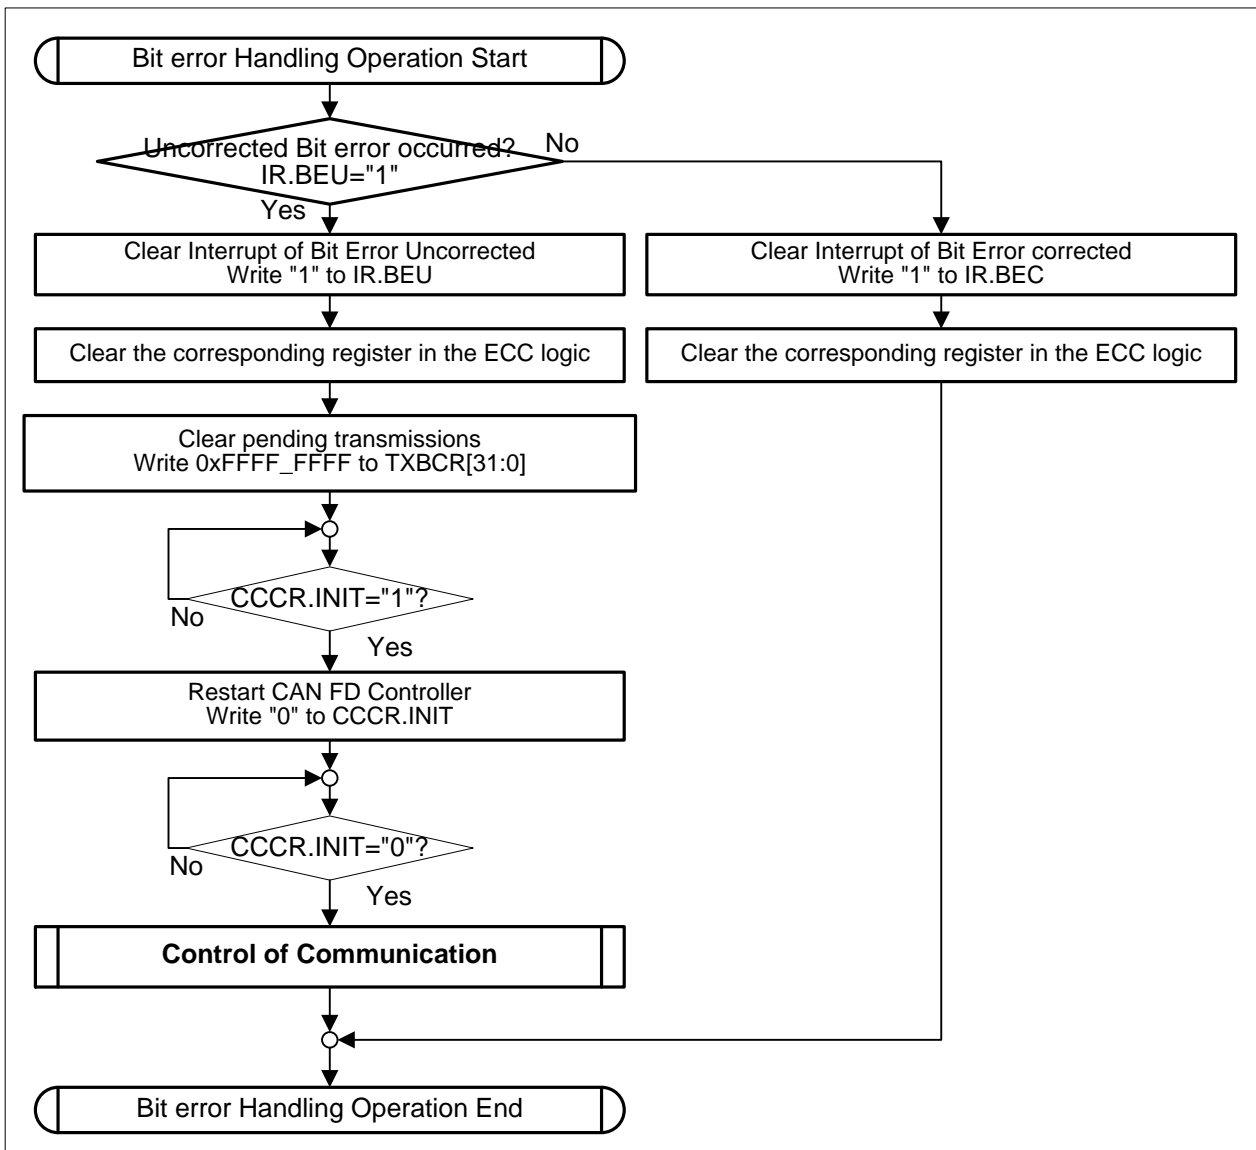

Figure 4-16 Flow Diagram "CCCR.CCE Setting Operation"

4.6.3. Bit Error Handling Operation

Figure 4-17 shows how to process the "Bit Error" interrupts (IR.BEU, IR.BEC).

Figure 4-17 Flow Diagram "Bit Error Handling Operation"

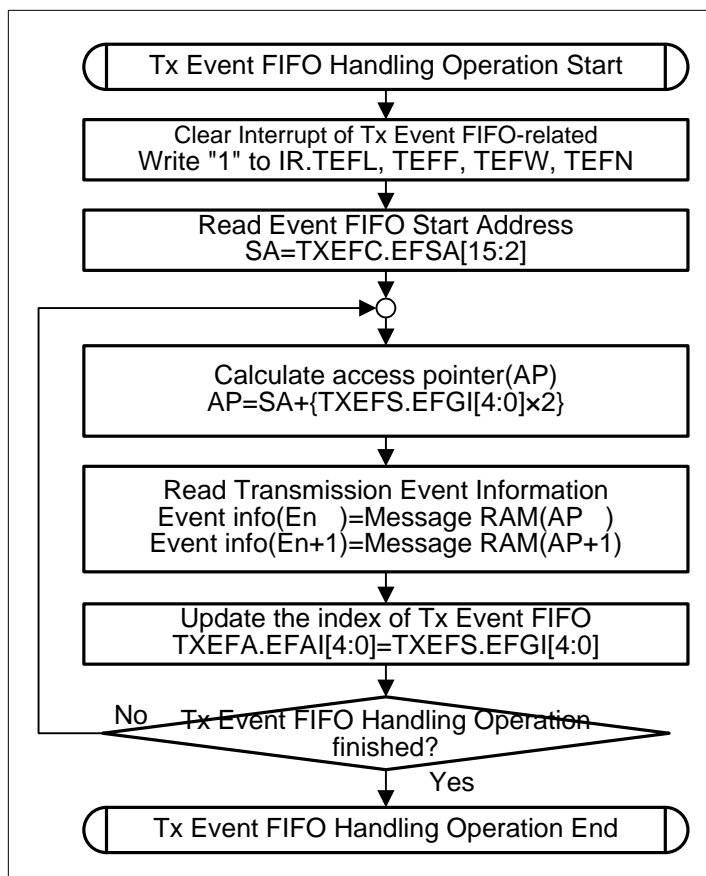

Note:

- In case Bit Error Uncorrected IR.BEU occurs, due to the synchronization mechanism between the Bus clock and the CAN clock, there may be a delay until Initialization CCCR.INIT set to "1". Therefore the programmer has to assure that CCCR.INIT has been set to "1" by reading CCCR.INIT before resetting CCCR.INIT to "0".

4.6.4. Tx Event FIFO Handling Operation

Figure 4-18 shows how to process Tx Event FIFO related interrupts.

Figure 4-18 Flow Diagram "Tx Event FIFO Handling Operation"

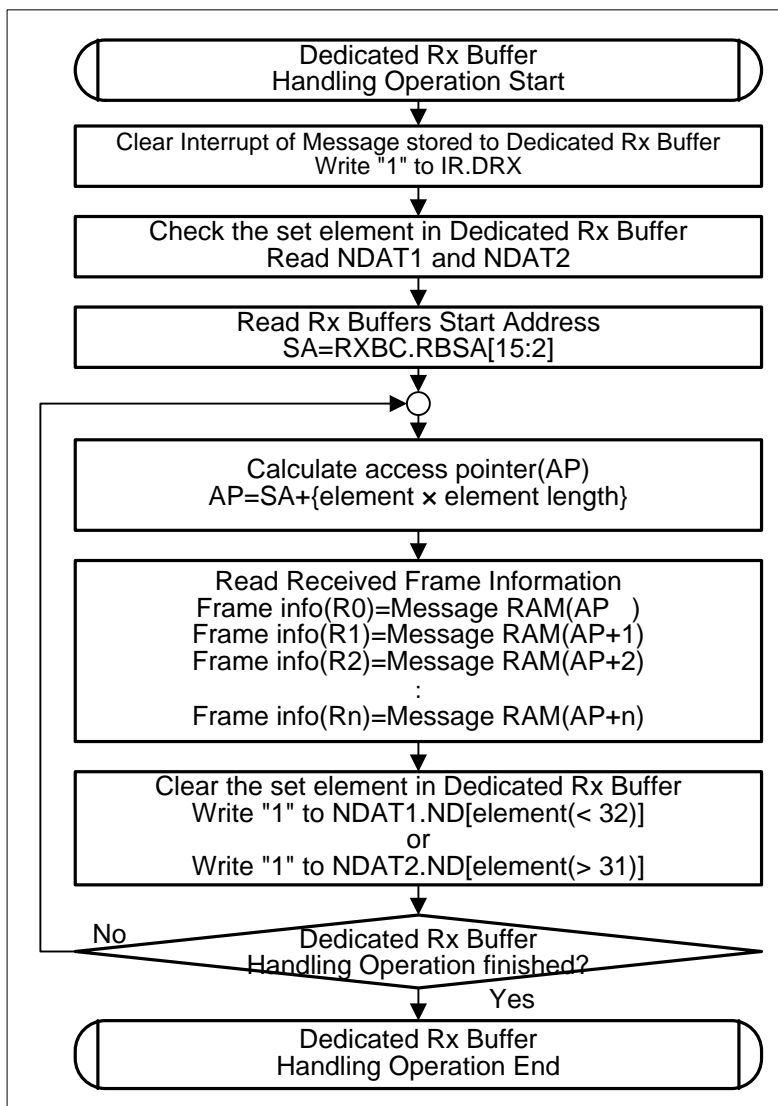

Note:

- Use 32-bit word address values when calculating the pointers in the flow diagram above.

4.6.5. Dedicated Rx Buffer Handling Operation

Figure 4-19 shows how to process a "Message stored to Dedicated Rx Buffer" interrupt (IR.DRX).

Figure 4-19 Flow Diagram "Dedicated Rx Buffer Handling Operation"

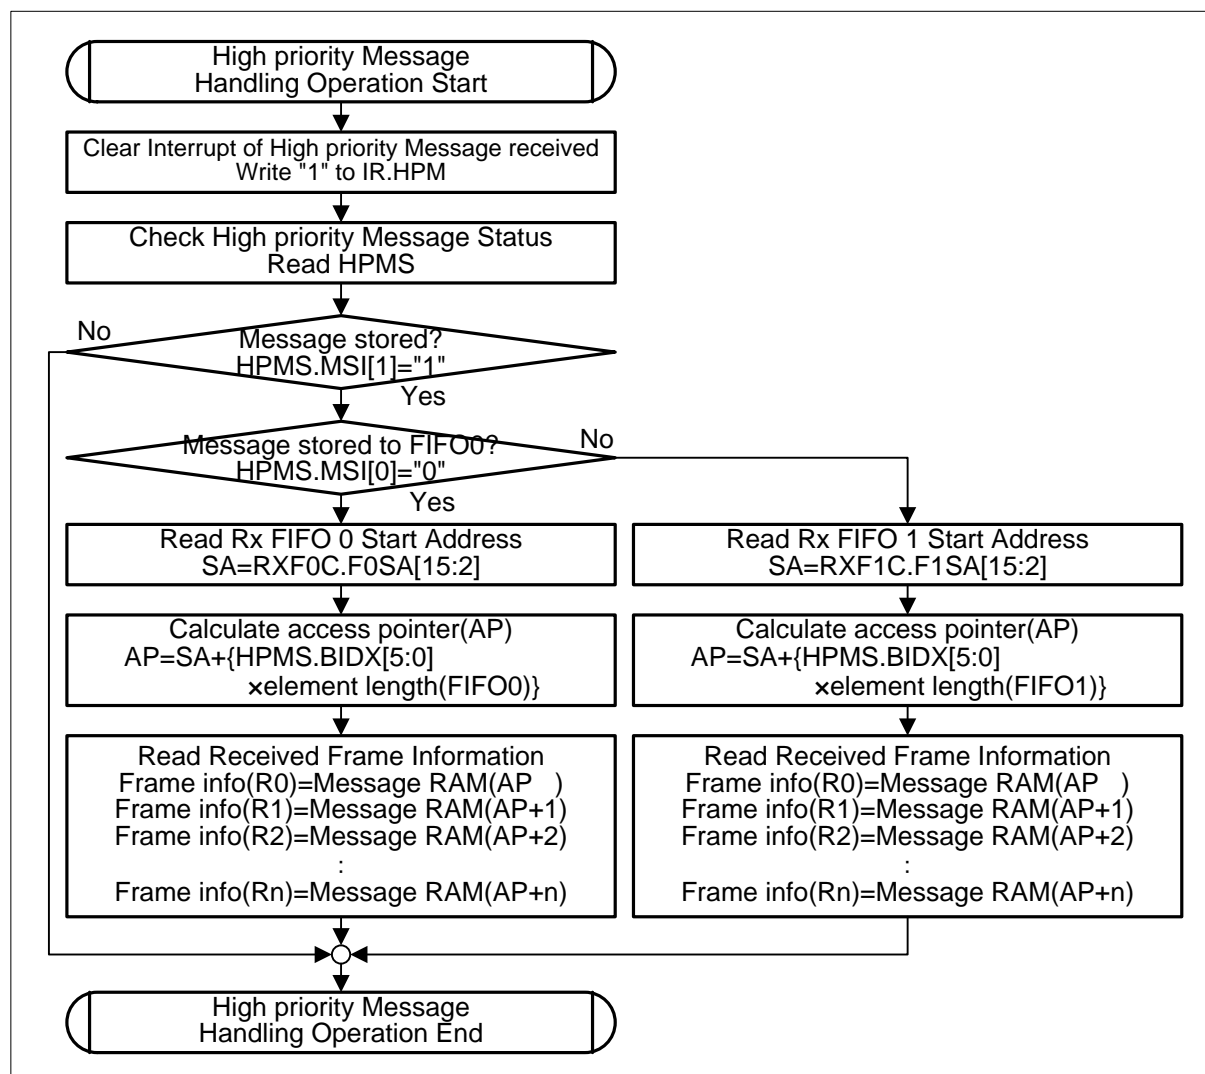

Note:

- Use 32-bit word address values when calculating the pointers in the flow diagram above.

4.6.6. High Priority Message Handling Operation

Figure 4-20 shows how to process a High Priority Message interrupt (IR.HPM).

Figure 4-20 Flow Diagram "High Priority Message Handling Operation"

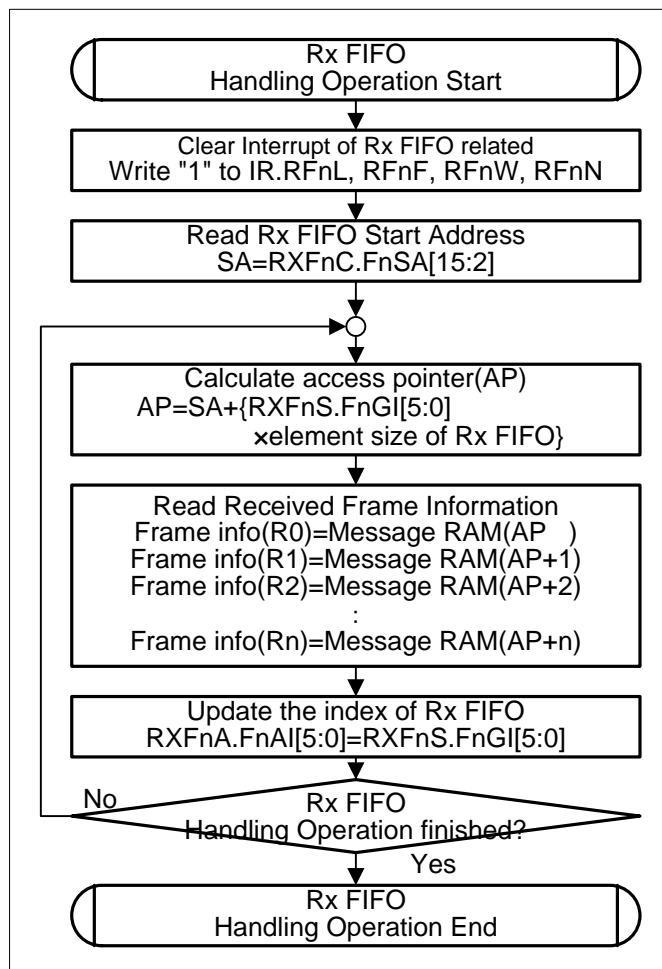

Note:

- Use 32-bit word address values when calculating the pointers in the flow diagram above.

4.6.7. Rx FIFO Handling Operation

Figure 4-21 shows how to process Rx FIFO related interrupts.

Figure 4-21 Flow Diagram "Rx FIFO Handling Operation"

Notes:

- Use 32-bit word address values when calculating the pointers in the flow diagram above.
- The "n"s in the register/bit names (e.g. "RXFnS.FnGI") stand for "0" or "1".
- If a high priority message is received and processed by the "High priority Message Handling Operation" flow, this flow (i.e. Rx FIFO Handling Operation) may be skipped for that particular message. The following message received by the Rx FIFO may resume with this flow again.

5. Registers

This section explains the configuration and functions of the registers used for the CAN FD Controller.

Hardware Reset Description

After hardware reset, the registers of the CAN FD Controller hold the reset values as indicated in each relative register description. Additionally the Bus_Off state is reset and the output canfd_tx is set to recessive. Setting the Initialization bit CCCR.INIT to "1" in the CC Control Register enables software initialization. The CAN FD Controller does not influence the CAN bus until the CPU resets CCCR.INIT to "0".

Register Map

The CAN FD Controller allocates an address space of 256 bytes for the registers.

All registers are organized as 32-bit registers. The registers are accessible by the CPU using a data width of 8 bit (byte access), 16 bit (half-word access), or 32 bit (word access).

Note:

- As an exception, the Protocol Status Register (PSR) does not allow byte accessing.

Write access by the CPU to several of the registers/bits that configure the basic operation of the CAN FD Controller is possible only with Configuration Change Enable CCCR.CCE= 1 AND Initialization CCCR.INIT= 1.

There is a delay from writing to a command register until the update of the related status register bits due to clock domain crossing.

Table 5-1 List of Registers for the CAN FD Controller

Abbreviation	Register Name	Reference
CREL	Core Release Register	5.1
ENDN	Endian Register	5.2
FBTP	Fast Bit Timing & Prescaler Register	5.3
TEST	Test Register	5.4
RWD	RAM Watchdog	5.5
CCCR	CC Control Register	5.6
BTP	Bit Timing & Prescaler Register	5.7
TSCC	Timestamp Counter Configuration	5.8
TSCV	Timestamp Counter Value	5.9
TOCC	Timeout Counter Configuration	5.10
TOCV	Timeout Counter Value	5.11
ECR	Error Counter Register	5.12
PSR	Protocol Status Register	5.13
IR	Interrupt Register	5.14
IE	Interrupt Enable	5.15
ILS	Interrupt Line Select	5.16
ILE	Interrupt Line Enable	5.17
GFC	Global Filter Configuration	5.18
SIDFC	Standard ID Filter Configuration	5.19
XIDFC	Extended ID Filter Configuration	5.20

Abbreviation	Register Name	Reference
XIDAM	Extended ID AND Mask	5.21
HPMS	High Priority Message Status	5.22
NDAT1	New Data 1	5.23
NDAT2	New Data 2	5.24
RXF0C	Rx FIFO 0 Configuration	5.25
RXF0S	Rx FIFO 0 Status	5.26
RXF0A	Rx FIFO 0 Acknowledge	5.27
RXBC	Rx Buffer Configuration	5.28
RXF1C	Rx FIFO 1 Configuration	5.29
RXF1S	Rx FIFO 1 Status	5.30
RXF1A	Rx FIFO 1 Acknowledge	5.31
RXESC	Rx Buffer/FIFO Element Size Configuration	5.32
TXBC	Tx Buffer Configuration	5.33
TXFQS	Tx FIFO/Queue Status	5.34
TXESC	Tx Buffer Element Size Configuration	5.35
TXBRP	Tx Buffer Request Pending	5.36
TXBAR	Tx Buffer Add Request	5.37
TXBCR	Tx Buffer Cancellation Request	5.38
TXBTO	Tx Buffer Transmission Occurred	5.39
TXBCF	Tx Buffer Cancellation Finished	5.40
TXBTIE	Tx Buffer Transmission Interrupt Enable	5.41
TXBCIE	Tx Buffer Cancellation Finished Interrupt Enable	5.42
TXEFC	Tx Event FIFO Configuration	5.43
TXEFS	Tx Event FIFO Status	5.44
TXEFA	Tx Event FIFO Acknowledge	5.45

Table 5-3 Register Mirror Area CAN FD CONTROLLER

Address of Register Mirror Area	Mirrored Peripheral	Mirror Area Behavior	PPU
0000_C000 to 0000_FFFF	MCU_CONFIG CAN FD ch.0	Accessing this region results to the access to MCU_CONFIG CAN FD ch.0 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #47 as well as the mirrored peripheral.
0000_C000 to 0000_FFFF	MCU_CONFIG CAN FD ch.1	Accessing this region results to the access to MCU_CONFIG CAN FD ch.1 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #48 as well as the mirrored peripheral.
0000_C000 to 0000_FFFF	MCU_CONFIG CAN FD ch.2	Accessing this region results to the access to MCU_CONFIG CAN FD ch.2 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #49 as well as the mirrored peripheral.
0000_C000 to 0000_FFFF	CommonPERI#0 CAN FD ch.0	Accessing this region results to the access to CommonPERI#0 CAN FD ch.0 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #256 as well as the mirrored peripheral.
0000_C000 to 0000_FFFF	CommonPERI#0 CAN FD ch.1	Accessing this region results to the access to CommonPERI#0 CAN FD ch.1 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #257 as well as the mirrored peripheral.
0000_C000 to 0000_FFFF	CommonPERI#0 CAN FD ch.2	Accessing this region results to the access to CommonPERI#0 CAN FD ch.2 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #258 as well as the mirrored peripheral.
0000_C000 to 0000_FFFF	CommonPERI#0 CAN FD ch.3	Accessing this region results to the access to CommonPERI#0 CAN FD ch.3 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #259 as well as the mirrored peripheral.
0000_C000 to 0000_FFFF	CommonPERI#0 CAN FD ch.4	Accessing this region results to the access to CommonPERI#0 CAN FD ch.4 Message RAM area (0000_0000 to 0000_BFFF)	This area is covered by PPU #260 as well as the mirrored peripheral.

5.1. Core Release Register (MCG_CANFDx_CREL, CPG_CANFDx_CREL)

The Core Release Register displays the revision of the CAN FD Controller.

bit	31	30	29	28	27	26	25	24
Field	REL[3:0]				STEP[3:0]			
R/W Attribute	R,WX				R,WX			
Protection	-				-			
Attribute								
Initial value	0x3				0x0			

bit	23	22	21	20	19	18	17	16
Field	SUBSTEP[3:0]				YEAR[3:0]			
R/W Attribute	R,WX				R,WX			
Protection	-				-			
Attribute								
Initial value	0x1				0x3			

bit	15	14	13	12	11	10	9	8
Field	MON[7:0]							
R/W Attribute	R,WX							
Protection	-							
Attribute								
Initial value	0x05							

bit	7	6	5	4	3	2	1	0
Field	DAY[7:0]							
R/W Attribute	R,WX							
Protection	-							
Attribute								
Initial value	0x06							

[bit31:28] REL[3:0]: Core Release

One digit, BCD-coded.

[bit27:24] STEP[3:0]: Step of Core Release

One digit, BCD-coded.

[bit23:20] SUBSTEP[3:0]: Sub-step of Core Release

One digit, BCD-coded.

[bit19:16] YEAR[3:0]: Time Stamp Year

One digit, BCD-coded.

[bit15:8] MON[7:0]: Time Stamp Month

Two digits, BCD-coded.

[bit7:0] DAY[7:0]: Time Stamp Day

Two digits, BCD-coded.

Table 5-4 Example for Coding of Revisions

Release	Step	SubStep	Year	Month	Day	Name
3	0	1	3	05	06	Revision 3.0.1, Date 2013/05/06

5.2. Endian Register (MCG_CANFDx_ENDN, CPG_CANFDx_ENDN)

The Endian Register can be used to check the endian-ness of the CAN FD Controller when accessed by the CPU.

bit	31	30	29	28	27	26	25	24
Field	ETV[31:24]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial value	0x87							

bit	23	22	21	20	19	18	17	16
Field	ETV[23:16]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial value	0x65							

bit	15	14	13	12	11	10	9	8
Field	ETV[15:8]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial value	0x43							

bit	7	6	5	4	3	2	1	0
Field	ETV[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial value	0x21							

[bit31:0] ETV[31:0]: Endian-ness Test Value

The endian-ness test value is 0x87654321.

5.3. Fast Bit Timing & Prescaler Register (MCG_CANFDx_FBTP, CPG_CANFDx_FBTP)

The Fast Bit Timing & Prescaler Register configures the fast bit time and the offset value for Transceiver Delay Compensation.

This register is only writable if bits Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) are set.

See "3.1.4. Transceiver Delay Compensation" for a description of the TDCO[4:0] and TDC fields.

See "3.7. Configuring the CAN Bit Timing" for a description of all other fields.

Notes:

- With a CAN clock (*canfd_cclk*) of 8 MHz, the reset value of 0x00000A33 configures the CAN FD Controller for a FD bit rate of 500 kBit/s.
- The bit rate configured for the CAN FD data phase via the Fast Bit Timing & Prescaler Register (FBTP) must be higher or equal to the bit rate configured for the arbitration phase via the Bit Timing & Prescaler Register (BTP).

bit	31	30	29	28	27	26	25	24
Field	Reserved				TDCO[4:0]			
R/W Attribute	R0,W0				R/W			
Protection Attribute	-				-			
Initial value	000				00000			

bit	23	22	21	20	19	18	17	16
Field	TDC	Reserved			FBRP[4:0]			
R/W Attribute	R/W	R0,W0			R/W			
Protection Attribute	-	-			-			
Initial value	0	00			00000			

Bit	15	14	13	12	11	10	9	8
Field	Reserved				FTSEG1[3:0]			
R/W Attribute	R0,W0				R/W			
Protection Attribute	-				-			
Initial value	0000				0xA			

bit	7	6	5	4	3	2	1	0
Field	Reserved	FTSEG2[2:0]			Reserved		FSJW[1:0]	
R/W Attribute	R0,W0	R/W			R0,W0		R/W	
Protection Attribute	-	-			-		-	
Initial value	0	011			00		11	

[bit31:29] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit28:24] TDCO[4:0]: Transceiver Delay Compensation Offset

TDCO[4:0]	Description
0x00-0x1F	Offset value defining the distance between the measured delay (the delay from canfd_tx to canfd_rx) and the secondary sample point. Valid values are 0 to 31 canfd_cclk periods.

[bit23] TDC: Transceiver Delay Compensation

Bit	Description
0	Transceiver Delay Compensation disabled.
1	Transceiver Delay Compensation enabled.

[bit22:21] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit20:16] FBRP[4:0]: Fast Baud Rate Prescaler

FBRP[4:0]	Description
0x00-0x1F	The value by which the oscillator frequency is divided for generating the fast bit time quanta. The fast bit time is built up from a multiple of this quanta. Valid values for the Fast Baud Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

[bit15:12] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit11:8] FTSEG1[3:0]: Fast time segment before sample point

FTSEG1[3:0]	Description
0x1-0xF	Valid values are 1 to 15. The value 0 must not be used. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

[bit7] Reserved: Reserved bit

When writing, always write "0". When reading, "0" is always read.

[bit6:4] FTSEG2[2:0]: Fast time segment after sample point

FTSEG2[2:0]	Description
0x0-0x7	Valid values are 0 to 7. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

[bit3:2] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit1:0] FSJW[1:0]: Fast (Re) Synchronization Jump Width

FSJW[1:0]	Description
0x0-0x3	Valid values are 0 to 3. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

5.4. Test Register (MCG_CANFDx_TEST, CPG_CANFDx_TEST)

The Test Register monitors the canfd_rx/canfd_tx pins and displays the Transceiver Delay Compensation value. It is also used to enable the Loop Back Modes.

Write access to the Test Register has to be enabled by setting the Test Mode Enable bit CCCR.TEST to "1".

All Test Register functions are set to their reset values when bit CCCR.TEST is reset.

Loop Back Mode and software control of pin canfd_tx are hardware test modes. Programming of TX ≠ 0b00 may disturb the message transfer on the CAN bus.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	15	14	13	12	11	10	9	8
Field	Reserved		TDCV[5:0]					
R/W Attribute	R0,W0		R,WX					
Protection Attribute	-		-					
Initial value	00		000000					

bit	7	6	5	4	3	2	1	0
Field	RX	TX[1:0]		LBCK	Reserved			
R/W Attribute	R,WX	R/W		R/W	R0,W0			
Protection Attribute	-	-		-	-			
Initial value	U	00		0	0000			

U = undefined. The RX bit will reflect the actual level at pin canfd_rx.

[bit31:14] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit13:8] TDCV[5:0]: Transceiver Delay Compensation Value

TDCV[5:0]	Description
0x00-0x3F	Position of the secondary sample point, defined by the sum of the measured delay from canfd_tx to canfd_rx and the Transceiver Delay Compensation Offset (FBTP.TDCO[4:0]). Valid values are 0 to 63 canfd_clk periods.

[bit7] RX: Receive Pin

Monitors the actual value of pin canfd_rx

Bit	Description
0	The CAN bus is dominant (dominant level at pin canfd_rx).
1	The CAN bus is recessive (recessive level at pin canfd_rx).

[bit6:5] TX[1:0]: Control of Transmit Pin

Bits	Description
00	Reset value. canfd_tx controlled by the CAN Core, updated at the end of the bit time.
01	Sample Point can be monitored at pin canfd_tx.
10	Dominant level at pin canfd_tx.
11	Recessive level at pin canfd_tx.

[bit4] LBCK: Loop Back Mode

Bit	Description
0	Reset value, Loop Back Mode is disabled.
1	Loop Back Mode is enabled.

[bit3:0] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

5.5. RAM Watchdog (MCG_CANFDx_RWD, CPG_CANFDx_RWD)

The RAM Watchdog monitors the Message RAM to see if it is ready to be accessed or not.

A Message RAM access starts the RAM Watchdog Counter with the value configured by the Watchdog Configuration (RWD.WDC[7:0]). The counter is reloaded with RWD.WDC when a successful access to the Message RAM has been completed. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag Watchdog Interrupt (IR.WDI) is set.

The RAM Watchdog Counter is clocked by the Bus clock (canfd_bclk).

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	15	14	13	12	11	10	9	8
Field	WDV[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial value	0x00							

bit	7	6	5	4	3	2	1	0
Field	WDC[7:0]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	0x00							

[bit31:16] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit15:8] WDV[7:0]: Watchdog Value

WDV[7:0]	Description
0x00-0xFF	Actual Message RAM Watchdog Counter Value

[bit7:0] WDC[7:0]: Watchdog Configuration

Start value of the Message RAM Watchdog Counter. With the reset value of 0x00 the counter is disabled.

Write access to this field is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

5.6. CC Control Register (MCG_CANFDx_CCCR, CPG_CANFDx_CCCR)

The CC Control Register configures various operating modes of the CAN FD Controller.

For details about setting and resetting of single bits see "3.1.1. Software Initialization".

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	15	14	13	12	11	10	9	8
Field	Reserved	TXP	FDBS	FDO	CMR[1:0]	CME[1:0]		
R/W Attribute	R0,W0	R/W	R,WX	R,WX	R/W	R/W		
Protection Attribute	-	-	-	-	-	-		
Initial value	0	0	0	0	00	00		

bit	7	6	5	4	3	2	1	0
Field	TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
R/W Attribute	R/W	R/W	R/W	R/W	R,WX	R/W	R/W	R/W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	1

[bit31:15] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit14] TXP: Transmit Pause

If this bit is set, the CAN FD Controller pauses for two nominal bit times before starting the next transmission after it has successfully transmitted a frame.

Write access to this bit is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

Bit	Description
0	Transmit pause disabled.
1	Transmit pause enabled.

[bit13] FDBS: CAN FD Bit Rate Switching

This bit is configured via CCCR.CMR[1:0]. FDBS is reset to "0" when Initialization (CCCR.INIT) is set to "1".

Bit	Description
0	This node transmits no frames with bit rate switching.
1	This node transmits all frames (excl. remote frames) with bit rate switching.

[bit12] FDO: CAN FD Operation

This bit is configured via CCCR.CMR[1:0]. FDO is reset to "0" when Initialization (CCCR.INIT) is set to "1".

Bit	Description
0	This node transmits all frames in CAN format according to ISO11898-1.
1	This node transmits all frames (excl. remote frames) in CAN FD format.

[bit11:10] CMR[1:0]: CAN Mode Request

A change of the CAN operation mode is requested by writing to this bit field. After change to the requested operation mode the bit field is reset to 0b00 and the status flags CAN FD Bit Rate Switching (CCCR.FDBS) and CAN FD Operation (CCCR.FDO) are set accordingly.

In case the requested CAN operation mode is not enabled, the value written to CMR[1:0] is retained until it is overwritten by the next mode change request.

In case CAN Mode Enable CCCR.CME[1:0] = 0b01/0b10/0b11 a change to CAN operation according to ISO 11898-1 is always possible.

Default is CAN operation according to ISO11898-1 (CCCR.FDBS = 0 and CCCR.FDO = 0).

Bits	Description
00	Unchanged.
01	Request CAN FD operation.
10	Request CAN FD operation with bit rate switching.
11	Request CAN operation according ISO11898-1.

[bit9:8] CME[1:0]: CAN Mode Enable

Write access to this bit is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

Bits	Description
00	CAN operation according to ISO11898-1 enabled.
01	CAN FD operation enabled.
10	CAN FD operation with bit rate switching enabled.
11	CAN FD operation with bit rate switching enabled.

Note:

- When CME[1:0] = 0b00, received frames are strictly interpreted according to ISO11898-1, which leads to the transmission of an error frame when receiving a CAN FD frame. In case CME[1:0] = 0b01, transmission of long CAN FD frames and reception of long and fast CAN FD frames is enabled.

With $CME[1:0] = 0b10/0b11$, transmission and reception of long and fast CAN FD frames is enabled.

[bit7] TEST: Test Mode Enable

Bit TEST can only be set by the CPU when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

The bit can be reset by the CPU at any time.

Bit	Description
0	Normal operation, register TEST holds reset values.
1	Test Mode, write access to register TEST enabled.

[bit6] DAR: Disable Automatic Retransmission

Write access to this bit is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1". For a description of DAR mode, see "3.1.7. Disabled Automatic Retransmission".

Bit	Description
0	Automatic retransmission of messages not transmitted successfully enabled.
1	Automatic retransmission disabled.

Note:

- When CCCR.DAR is set "1", always set "00" to first two identifier (Arbitration field) bits on transmission frame configuration.

[bit5] MON: Bus Monitoring Mode

Bit MON can only be set by the CPU when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

The bit can be reset by the CPU at any time.

Bit	Description
0	Bus Monitoring Mode is disabled.
1	Bus Monitoring Mode is enabled.

[bit4] CSR: Clock Stop Request

For a description of Power Down, see "3.1.8. Power Down (Sleep Mode)".

Bit	Description
0	No clock stop is requested.
1	Clock stop requested. When clock stop is requested, first CCCR.INIT and then CCCR.CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

[bit3] CSA: Clock Stop Acknowledge

For a description of Power Down, see "3.1.8. Power Down (Sleep Mode)".

Bit	Description
0	No clock stop acknowledged.
1	CAN FD Controller may be set in power down by stopping canfd_bclk and canfd_cclk.

[bit2] ASM: Restricted Operation Mode

Bit ASM can only be set by the CPU when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1"

The bit can be reset by the CPU at any time, but must follow the procedure as described in "4.6.2. Message RAM Access Failure Handling Operation".

For a description of the Restricted Operation Mode see "3.1.5. Restricted Operation Mode".

Bit	Description
0	Normal CAN operation.
1	Restricted Operation Mode active.

[bit1] CCE: Configuration Change Enable

Write access to this bit is possible only when the Initialization (CCCR.INIT) bit is "1". This bit (CCCR.CCE) is reset to "0" when CCCR.INIT is set to "0".

Bit	Description
0	The CPU has no write access to the protected configuration registers.
1	The CPU has write access to the protected configuration registers (while bit Initialization CCCR.INIT = 1).

Note:

- The CPU must follow the procedure as described in "3.1.1. Software Initialization" to set CCCR.CCE, but it isn't necessary to follow the procedure, in case of setting CCCR.CCE just after hardware reset.

[bit0] INIT: Initialization

Bit	Description
0	Normal Operation.
1	Initialization is started.

Notes:

- Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to Initialization CCCR.INIT can be read back (the maximum length of the delay is four Bus clocks plus five CAN clocks). Therefore the programmer has to assure that the previous value written to CCCR.INIT has been accepted by reading CCCR.INIT before setting CCCR.INIT to a new value.
- In case of setting CCCR.INIT to "1" during Normal Operation, set CCCR.INIT to "1" by issuing a Clock Stop Request via CCCR.CSR = 1. Before resetting CCCR.INIT first reset CCCR.CSR.

5.7. Bit Timing & Prescaler Register (MCG_CANFDx_BTP, CPG_CANFDx_BTP)

The Bit Timing & Prescaler Register configures the nominal bit time of the CAN FD Controller.

This register is only writable if bits Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) are set.

See "3.7. Configuring the CAN Bit Timing" for a description of the Bit Timing.

Note:

- With a CAN clock (*canfd_cclk*) of 8 MHz, the reset value of 0x00000A33 configures the CAN FD Controller for a bit rate of 500 kBit/s.

Note:

- In environments that include CAN FD enabled nodes, do not use bit timing configurations where Time Segment after sample point and the Baud Rate Prescaler are both zero (i.e. *BTP.TSEG2[3:0]* = 0x0 and *BTP.BRP[9:0]* = 0x000). Such settings will cause the r1 bit (for CAN format frames) or EDL bit (for CAN FD format frames) to be transmitted opposite the protocol defined level.
In a CAN only environment, a bit timing configuration where Time Segment after sample point and the Baud Rate Prescaler are both zero (i.e. *BTP.TSEG2[3:0]* = 0x0 and *BTP.BRP[9:0]* = 0x000) may be used although this configuration will cause the r1 bit to be transmitted opposite the protocol defined level.

Details

The r1 bit (for CAN format frames) or EDL bit (for CAN FD format frames) will be transmitted opposite the protocol defined level for the following cases (all conditions within each case must be fulfilled).

Case 1:

- The CAN FD Controller is configured to CAN operation mode according to ISO 11898-1 (CAN FD Bit Rate Switching (CCCR.FDBS) and CAN FD Operation (CCCR.FDO) are both zero)
- Time Segment after sample point and the Baud Rate Prescaler are both zero (i.e. *BTP.TSEG2[3:0]* = 0x0 and *BTP.BRP[9:0]* = 0x000)
- An extended frame format message with the MSB of the Identifier (ID28) set to "1" is transmitted (XTD bit = 1 and ID[28] = 1 in the corresponding Tx Buffer Element)

Case 2:

- The CAN FD Controller is configured to CAN FD operation mode (CAN FD Operation (CCCR.FDO) is "1")
- Time Segment after sample point and the Baud Rate Prescaler are both zero (i.e. *BTP.TSEG2[3:0]* = 0x0 and *BTP.BRP[9:0]* = 0x000)
- A Standard Frame format message is transmitted (XTD bit = 0 in the corresponding Tx Buffer Element)

Case 3:

- The CAN FD Controller is configured to CAN FD operation mode (CAN FD Operation (CCCR.FDO) is "1")

- Time Segment after sample point and the Baud Rate Prescaler are both zero (i.e. $BTP.TSEG2[3:0] = 0x0$ and $BTP.BRP[9:0] = 0x000$)
- An extended frame format message with the MSB of the Identifier (ID28) set to "0" is transmitted (XTD bit = 1 and ID[28] = 0 in the corresponding Tx Buffer Element)

bit	31	30	29	28	27	26	25	24
Field	Reserved						BRP[9:8]	
R/W Attribute	R0,W0						R/W	
Protection Attribute	-						-	
Initial value	000000						00	

bit	23	22	21	20	19	18	17	16
Field	BRP[7:0]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	Reserved		TSEG1[5:0]					
R/W Attribute	R0,W0		R/W					
Protection Attribute	-		-					
Initial value	00		001010					

Bit	7	6	5	4	3	2	1	0
Field	TSEG2[3:0]				SJW[3:0]			
R/W Attribute	R/W				R/W			
Protection Attribute	-				-			
Initial value	0x3				0x3			

[bit31:26] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit25:16] BRP[9:0]: Baud Rate Prescaler

BRP[9:0]	Description
0x000-0x3FF	The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are 0 to 1023. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

[bit15:14] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit13:8] TSEG1[5:0]: Time segment before sample point

TSEG1[5:0]	Description
0x01-0x3F	Valid values are 1 to 63. The value 0 must not be used. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

[bit7:4] TSEG2[3:0]: Time segment after sample point

TSEG2[3:0]	Description
0x0-0xF	Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

[bit3:0] SJW[3:0]: (Re) Synchronization Jump Width

SJW[3:0]	Description
0x0-0xF	Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

5.8. Timestamp Counter Configuration (MCG_CANFDx_TSCC, CPG_CANFDx_TSCC)

The Timestamp Counter Configuration holds the settings for Timestamp Generation.

Write access to the Timestamp Counter Configuration (TSCC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

For a description of the Timestamp Counter see "3.2. Timestamp Generation".

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	Reserved				TCP[3:0]			
R/W Attribute	R0,W0				R/W			
Protection Attribute	-				-			
Initial value	0x0				0x0			

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	7	6	5	4	3	2	1	0
Field	Reserved						TSS[1:0]	
R/W Attribute	R0,W0						R/W	
Protection Attribute	-						-	
Initial value	000000						00	

[bit31:20] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit19:16] TCP[3:0]: Timestamp Counter Prescaler

TCP[3:0]	Description
0x0-0xF	Configures the timestamp and timeout counters time unit in multiples of bit times [1 to 16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

Note:

- For each timestamp and timeout counter time unit tick, the CAN FD Controller counts the number of bit times that have elapsed with an internal counter, up to the configured `TSCC.TCP[3:0]` value. This internal counter is not initialized by Initialization (`CCCR.INIT`), but only by a hardware reset.

[bit15:2] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit1:0] TSS[1:0]: Timestamp Select

Bits	Description
00	Timestamp counter (<code>TSCV.TSC[15:0]</code>) value always 0x0000.
01	Timestamp counter value incremented according to Timestamp Counter Prescaler (<code>TSCC.TCP[3:0]</code>).
10	Timestamp counter value of a counter external to the CAN FD Controller used.
11	Same as 0b00.

Note:

- When Timestamp Select `TSCC.TSS[1:0] = 0b01`, the clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore, if the baud rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

5.9. Timestamp Counter Value (MCG_CANFDx_TSCV, CPG_CANFDx_TSCV)

Holds the value of the Timestamp Counter.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	15	14	13	12	11	10	9	8
Field	TSC[15:8]							
R/W Attribute	R,W							
Protection Attribute	-							
Initial value	0x00							

bit	7	6	5	4	3	2	1	0
Field	TSC[7:0]							
R/W Attribute	R,W							
Protection Attribute	-							
Initial value	0x00							

[bit31:16] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit15:0] TSC[15:0]: Timestamp Counter

The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx).

- When Timestamp Select TSCC.TSS[1:0] = 0b01, the Timestamp Counter TSCV.TSC[15:0] is incremented in multiples of bit times [1 to 16] depending on the configuration of the Timestamp Counter Prescaler (TSCC.TCP[3:0]). A wrap around sets interrupt flag Timestamp Wraparound (IR.TSW). Write access to TSCV resets the counter to zero.
- When Timestamp Select TSCC.TSS[1:0] = 0b10, TSCV.TSC[15:0] reflects a 16-bit Timestamp Counter value obtained from a counter external to the CAN FD Controller. For this case, a write access has no impact and will not clear the counter value.

Note:

- A "wrap around" is a change of the Timestamp Counter value from non-zero to zero not caused by write access to Timestamp Counter Value (TSCV). Such write access will not set IR.TSW to "1".

5.10. Timeout Counter Configuration (MCG_CANFDx_TOCC, CPG_CANFDx_TOCC)

The Timeout Counter Configuration holds the settings for the Timeout Counter.

Write access to the Timeout Counter Configuration (TOCC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

For a description of the Timeout Counter see "3.3. Timeout Counter".

bit	31	30	29	28	27	26	25	24
Field	TOP[15:8]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	0xFF							

bit	23	22	21	20	19	18	17	16
Field	TOP[7:0]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	0xFF							

bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	7	6	5	4	3	2	1	0
Field	Reserved					TOS[1:0]		ETOC
R/W Attribute	R0,W0					R/W		R/W
Protection Attribute	-					-		-
Initial value	00000					00		0

[bit31:16] TOP[15:0]: Timeout Period

Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

[bit15:3] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit2:1] TOS[1:0]: Timeout Select

When operating in Continuous mode (TOS = 0b00), a write to Timeout Counter Value (TOCV) presets the counter to the value configured by Timeout Period (TOCC.TOP[15:0]) and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs (TOS = 0b01/0b10/0b11), an empty FIFO presets the counter to the value configured by Timeout Period (TOCC.TOP[15:0]). Down-counting is started when the first FIFO element is stored.

Bits	Description
00	Continuous operation.
01	Timeout controlled by Tx Event FIFO.
10	Timeout controlled by Rx FIFO 0.
11	Timeout controlled by Rx FIFO 1.

[bit0] ETOC: Enable Timeout Counter

Bit	Description
0	Timeout Counter disabled.
1	Timeout Counter enabled.

5.11. Timeout Counter Value (MCG_CANFDx_TOCV, CPG_CANFDx_TOCV)

Holds the value of the Timeout Counter.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	TOC[15:8]							
R/W Attribute	R,W							
Protection Attribute	-							
Initial value	0xFF							

bit	7	6	5	4	3	2	1	0
Field	TOC[7:0]							
R/W Attribute	R,W							
Protection Attribute	-							
Initial value	0xFF							

[bit31:16] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit15:0] TOC[15:0]: Timeout Counter

The Timeout Counter is decremented in multiples of bit times [1 to 16] depending on the configuration of Timestamp Counter Prescaler (TSCC.TCP[3:0]). Setting Configuration Change Enable (CCCR.CCE) will preset the Timeout Counter (TOCV.TOC[15:0]) to the Timeout Period value (TOCC.TOP[15:0]).

- When Timeout Select TOCC.TOS[1:0] = 0b00 (Continuous Mode), the counter starts when Initialization CCCR.INIT is reset. A write to the Timeout Counter Value register TOCV presets the counter to the value configured by Timeout Period (TOCC.TOP[15:0]) and continues down-counting. When the counter reaches zero, interrupt flag Timeout Occurred (IR.TOO) is set, and the counter is immediately restarted at Timeout Period (TOCC.TOP[15:0]).

- When Timeout Select TOCC.TOS \neq 0b00 (counter is controlled by one of the FIFOs), an empty FIFO presets the counter to the value configured by Timeout Period (TOCC.TOP[15:0]). Down-counting is started when the first FIFO element is stored. In this setting, writing to Timeout Counter Value (TOCV) has no effect. When the counter reaches zero, interrupt flag Timeout Occurred (IR.TOO) is set, and the Timeout Counter is stopped.

5.12. Error Counter Register (MCG_CANFDx_ECR, CPG_CANFDx_ECR)

Holds the values of the Error Counters.

Note:

- When Restricted Operation Mode (CCCR.ASM) is set, the CAN protocol controller does not increment the Transmit Error Counter (ECR.TEC[7:0]) and Receive Error Counter (ECR.REC[6:0]) when a CAN protocol error is detected, but CAN Error Logging (ECR.CEL[7:0]) is still incremented.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	RX,W0							
Protection Attribute	-							
Initial value	0xXX							

bit	23	22	21	20	19	18	17	16
Field	CEL[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial value	0x00							

bit	15	14	13	12	11	10	9	8
Field	RP	REC[6:0]						
R/W Attribute	R,WX	R,WX						
Protection Attribute	-	-						
Initial value	0	0000000						

bit	7	6	5	4	3	2	1	0
Field	TEC[7:0]							
R/W Attribute	R,WX							
Protection Attribute	-							
Initial value	0x00							

[bit31:24] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit23:16] CEL[7:0]: CAN Error Logging

The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL.

The counter stops at 0xFF; the next increment of Transmit Error Counter (ECR.TEC[7:0]) or Receive Error Counter (ECR.REC[6:0]) sets interrupt flag Error Logging Overflow (IR.ELO).

[bit15] RP: Receive Error Passive

Bit	Description
0	The Receive Error Counter is below the error passive level of 128.
1	The Receive Error Counter has reached the error passive level of 128.

[bit14:8] REC[6:0]: Receive Error Counter

REC[6:0]	Description
0-127	Actual state of the Receive Error Counter, values between 0 and 127.

[bit7:0] TEC[7:0]: Transmit Error Counter

TEC[7:0]	Description
0-255	Actual state of the Transmit Error Counter, values between 0 and 255.

5.13. Protocol Status Register (MCG_CANFDx_PSR, CPG_CANFDx_PSR)

The Protocol Status Register displays the CAN protocol status of the CAN FD Controller.

Note:

- The PSR register accepts only 16 bit half-word and 32 bit word accesses. 8 bit byte accesses to this register are prohibited.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	RX,W0							
Protection Attribute	-							
Initial value	0xXX							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	RX,W0							
Protection Attribute	-							
Initial value	0xXX							

bit	15	14	13	12	11	10	9	8
Field	Reserved		REDL	RBRS	RESI	FLEC[2:0]		
R/W Attribute	RX,W0		R,WX	R,WX	R,WX	R,WX		
Protection Attribute	-		-	-	-	-		
Initial value	XX		0	0	0	111		

Bit	7	6	5	4	3	2	1	0
Field	BO	EW	EP	ACT[1:0]		LEC[2:0]		
R/W Attribute	R,WX	R,WX	R,WX	R,WX		R,WX		
Protection Attribute	-	-	-	-		-		
Initial value	0	0	0	00		111		

[bit31:14] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit13] REDL: Received a CAN FD Message

This bit is set independent of acceptance filtering. A read access will reset this bit to "0".

Bit	Description
0	Since this bit was reset by the CPU, no CAN FD message has been received.
1	Message in CAN FD format with EDL flag set has been received.

Note:

- Once set to "1", REDL will be held at "1" until it is reset to "0" by the CPU.

[bit12] RBRS: BRS flag of last received CAN FD Message

This bit is set together with "Received a CAN FD Message" (PSR.REDL), independent of acceptance filtering. A read access will reset this bit to "0".

Bit	Description
0	Last received CAN FD message did not have its BRS flag set.
1	Last received CAN FD message had its BRS flag set.

[bit11] RESI: ESI flag of last received CAN FD Message

This bit is set together with "Received a CAN FD Message" (PSR.REDL), independent of acceptance filtering. A read access will reset this bit to "0".

Bit	Description
0	Last received CAN FD message did not have its ESI flag set.
1	Last received CAN FD message had its ESI flag set.

[bit10:8] FLEC[2:0]: Fast Last Error Code

Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for Last Error Code (PSR.LEC[2:0]).

This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

A read access will set this field to 7.

[bit7] BO: Bus_Off Status

Bit	Description
0	The CAN FD Controller is not Bus_Off.
1	The CAN FD Controller is in Bus_Off state.

[bit6] EW: Warning Status

Bit	Description
0	Both error counters are below the Error_Warning limit of 96.
1	At least one of error counter has reached the Error_Warning limit of 96.

[bit5] EP: Error Passive

Bit	Description
0	The CAN FD Controller is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected.
1	The CAN FD Controller is in the Error_Passive state.

[bit4:3] ACT[1:0]: Activity

Monitors the CAN communication state. This field is reset to 0b00 when Initialize (CCCR.INIT) is set to "1".

Bits	Description
00	Synchronizing - node is synchronizing on CAN communication.
01	Idle - node is neither receiver nor transmitter.
10	Receiver - node is operating as receiver.
11	Transmitter - node is operating as transmitter.

[bit2:0] LEC[2:0]: Last Error Code

The LEC indicates the type of the last error to occur on the CAN bus.

This field will be cleared to 0 when a message has been transferred (reception or transmission) without error.

LEC[2:0]	Description
0	No Error: No error occurred since LEC has been reset by successful reception or transmission.
1	Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.
2	Form Error: A fixed format part of a received frame has the wrong format.
3	AckError: The message transmitted by the CAN FD Controller was not acknowledged by another node.
4	Bit1Error: During the transmission of a message (with the exception of the arbitration field), the CAN FD Controller wanted to send a recessive level, but the monitored bus value was dominant.
5	Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the CAN FD Controller wanted to send a dominant level, but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).
6	CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data.
7	NoChange: Any read access to the Protocol Status Register (PSR) re-initializes the Last Error Code field (LEC[2:0]) to 7. When the LEC[2:0] shows the value 7, no CAN bus event was detected since the last CPU read access to the Protocol Status Register.

Notes:

- When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in the Fast Last Error Code field (PSR.FLEC[2:0]) instead of the Last Error Code field (PSR.LEC[2:0]). An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.
- The Bus_Off recovery sequence (see CAN Specification Rev. 2.0 or ISO11898-1) cannot be shortened by setting or resetting Initialization (CCCR.INIT). If the CAN FD Controller goes Bus_Off, it will set CCCR.INIT of its own accord, stopping all bus activities. Once CCCR.INIT has been cleared by the CPU, the CAN FD Controller will then wait for 129 occurrences of Bus

Idle (129 × 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus_Off recovery sequence, the Receive and Transmit Error Counters (ECR.REC[6:0] and ECR.TEC[7:0]) will be reset. During the waiting time after the resetting of CCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to the Last Error Code field (PSR.LEC[2:0]), enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed, and to monitor the Bus_Off recovery sequence. The Receive Error Counter (ECR.REC[6:0]) is used to count these sequences

5.14. Interrupt Register (MCG_CANFDx_IR, CPG_CANFDx_IR)

The Interrupt Register holds the flags that are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the CPU clears them. A flag is cleared by writing a "1" to the corresponding bit position. Writing a "0" has no effect. A hard reset will clear the register.

The configuration of Interrupt Enable (IE) controls whether an interrupt is generated.

The configuration of Interrupt Line Select (ILS) controls on which interrupt line (canfd_int0/1) an interrupt is signaled.

Note:

- The TEFW, RF1W, and RF0W interrupts are asserted only when their respective FIFO levels are equal to their configured watermarks. If at this point the interrupt is cleared, and the respective FIFO continues to be filled, the interrupt will not be re-asserted even if the respective FIFO level is greater than the configured watermark.

bit	31	30	29	28	27	26	25	24
Field	STE	FOE	ACKE	BE	CRCE	WDI	BO	EW

Initial value	0	0	0	0	0	0	0	0

[bit31] STE: Stuff Error

Bit	Description
0	No Stuff Error detected.
1	More than 5 equal bits in a sequence occurred.

[bit30] FOE: Format Error

Bit	Description
0	No Format Error detected.
1	A fixed format part of a received frame has the wrong format.

[bit29] ACKE: Acknowledge Error

Bit	Description
0	No Acknowledge Error detected.
1	A transmitted message was not acknowledged by another node.

[bit28] BE: Bit Error

Bit	Description
0	No Bit0Error/Bit1Error detected.
1	CAN FD Controller wanted to send a recessive/dominant level, but monitored bus level was dominant/recessive.

[bit27] CRCE: CRC Error

Bit	Description
0	No CRC Error detected.
1	Received CRC did not match the calculated CRC.

[bit26] WDI: Watchdog Interrupt

Bit	Description
0	No Message RAM Watchdog event occurred.
1	Message RAM Watchdog event due to incomplete access of Message RAM.

[bit25] BO: Bus_Off Status

Bit	Description
0	Bus_Off status unchanged.
1	Bus_Off status changed.

[bit24] EW: Warning Status

Bit	Description
0	Error_Warning status unchanged.
1	Error_Warning status changed.

[bit23] EP: Error Passive

Bit	Description
0	Error_Passive status unchanged.
1	Error_Passive status changed.

[bit22] ELO: Error Logging Overflow

Bit	Description
0	CAN Error Logging Counter (ECR.CEL[7:0]) did not overflow.
1	Overflow of CAN Error Logging Counter (ECR.CEL[7:0]) occurred.

[bit21] BEU: Bit Error Uncorrected

Message RAM bit error during access from CAN FD Controller detected, but could not be corrected by the ECC (Error Correction Code) logic attached to the Message RAM.

An uncorrected Message RAM bit error sets Initialization (CCCR.INIT) to "1". This is done to avoid transmission of corrupted data.

Bit	Description
0	No bit error detected when reading from Message RAM.
1	Bit error detected, but could not be corrected.

Note:

- The corresponding bit in the ECC logic must also be cleared when clearing IR.BEU.

[bit20] BEC: Bit Error Corrected

Message RAM bit error during access from CAN FD Controller detected and corrected by the ECC logic attached to the Message RAM.

Bit	Description
0	No bit error detected when reading from Message RAM.
1	Bit error detected and corrected by ECC logic.

Note:

- The corresponding bit in the ECC logic must also be cleared when clearing IR.BEC.

[bit19] DRX: Message stored to Dedicated Rx Buffer

The flag is set whenever a received message has been stored into a dedicated Rx Buffer. This flag is not set by reception of a Debug message.

Bit	Description
0	No Rx Buffer updated.
1	At least one received message stored into an Rx Buffer.

[bit18] TOO: Timeout Occurred

Bit	Description
0	No timeout.
1	Timeout reached.

[bit17] MRAF: Message RAM Access Failure

The flag is set, when the Rx Handler

- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. Such behavior will occur also when a Protocol Exception Event is detected, since this will cause the Rx Handler to halt for that frame (see "3.4.5. Protocol Exception Event").
- completed message reception operation, but was not able to write the message to the Message RAM. In this case message storage is aborted.

In both cases the Rx FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.

The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the CAN FD Controller is switched into Restricted Operation Mode (see "3.1.5. Restricted Operation Mode"). To leave Restricted Operation Mode, the CPU has to reset the Restricted Operation Mode bit (CCCR.ASM). See "4.6.2. Message RAM Access Failure Handling Operation" for a detailed procedure of how to leave the Restricted Operation Mode.

Bit	Description
0	No Message RAM access failure occurred.
1	Message RAM access failure occurred.

[bit16] TSW: Timestamp Wraparound

Bit	Description
0	No timestamp counter wrap-around.
1	Timestamp counter wrapped around.

[bit15] TEFL: Tx Event FIFO Element Lost

Bit	Description
0	No Tx Event FIFO element lost.
1	Tx Event FIFO element lost. Also set after write attempt to Tx Event FIFO of size zero.

[bit14] TEFF: Tx Event FIFO Full

Bit	Description
0	Tx Event FIFO not full.
1	Tx Event FIFO full.

[bit13] TEFW: Tx Event FIFO Watermark Reached

Bit	Description
0	Tx Event FIFO fill level below watermark.
1	Tx Event FIFO fill level reached watermark.

[bit12] TEFN: Tx Event FIFO New Entry

Bit	Description
0	Tx Event FIFO unchanged.
1	Tx Handler wrote Tx Event FIFO element.

[bit11] TFE: Tx FIFO Empty

Bit	Description
0	Tx FIFO non-empty.
1	Tx FIFO empty.

Note:

- The TFE bit will not be asserted for an empty Tx Queue.

[bit10] TCF: Transmission Cancellation Finished

Bit	Description
0	No transmission cancellation finished.
1	Transmission cancellation finished.

[bit9] TC: Transmission Completed

Bit	Description
0	No transmission completed.
1	Transmission completed.

[bit8] HPM: High Priority Message

Bit	Description
0	No high priority message received.
1	High priority message received.

[bit7] RF1L: Rx FIFO 1 Message Lost

Bit	Description
0	No Rx FIFO 1 message lost.
1	Rx FIFO 1 message lost. Also set after write attempt to Rx FIFO 1 of size zero.

[bit6] RF1F: Rx FIFO 1 Full

Bit	Description
0	Rx FIFO 1 not full.
1	Rx FIFO 1 full.

[bit5] RF1W: Rx FIFO 1 Watermark Reached

Bit	Description
0	Rx FIFO 1 fill level below watermark.
1	Rx FIFO 1 fill level reached watermark.

[bit4] RF1N: Rx FIFO 1 New Message

Bit	Description
0	No new message written to Rx FIFO 1.
1	New message written to Rx FIFO 1.

[bit3] RF0L: Rx FIFO 0 Message Lost

Bit	Description
0	No Rx FIFO 0 message lost.
1	Rx FIFO 0 message lost. Also set after write attempt to Rx FIFO 0 of size zero.

[bit2] RF0F: Rx FIFO 0 Full

Bit	Description
0	Rx FIFO 0 not full.
1	Rx FIFO 0 full.

[bit1] RF0W: Rx FIFO 0 Watermark Reached

Bit	Description
0	Rx FIFO 0 fill level below watermark.
1	Rx FIFO 0 fill level reached watermark.

[bit0] RF0N: Rx FIFO 0 New Message

Bit	Description
0	No new message written to Rx FIFO 0.
1	New message written to Rx FIFO 0.

5.15. Interrupt Enable (MCG_CANFDx_IE, CPG_CANFDx_IE)

The settings in the Interrupt Enable register determine which status changes in the Interrupt Register (IR) will be signaled on an interrupt line.

Bit	Description
0	Interrupt disabled.
1	Interrupt enabled.

bit	31	30	29	28	27	26	25	24
Field	STEE	FOEE	ACKEE	BEE	CRCEE	WDIE	BOE	EWE

[bit10] TCFE: Transmission Cancellation Finished Interrupt Enable

[bit9] TCE: Transmission Completed Interrupt Enable

[bit8] HPME: High Priority Message Interrupt Enable

[bit7] RF1LE: Rx FIFO 1 Message Lost Interrupt Enable

[bit6] RF1FE: Rx FIFO 1 Full Interrupt Enable

[bit5] RF1WE: Rx FIFO 1 Watermark Reached Interrupt Enable

[bit4] RF1NE: Rx FIFO 1 New Message Interrupt Enable

[bit3] RF0LE: Rx FIFO 0 Message Lost Interrupt Enable

[bit2] RF0FE: Rx FIFO 0 Full Interrupt Enable

[bit1] RF0WE: Rx FIFO 0 Watermark Reached Interrupt Enable

[bit0] RF0NE: Rx FIFO 0 New Message Interrupt Enable

5.16. Interrupt Line Select (MCG_CANFDx_ILS, CPG_CANFDx_ILS)

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register (IR) to one of the two CAN FD Controller interrupt lines (canfd_int0/1).

Bit	Description
0	Interrupt assigned to interrupt line canfd_int0.
1	Interrupt assigned to interrupt line canfd_int1.

bit	31	30	29	28	27	26	25	24
Field	STEL	FOEL	ACKEL	BEL	CRCEL	WDIL	BOL	EWL

[bit2] RF0FL: Rx FIFO 0 Full Interrupt Line

[bit1] RF0WL: Rx FIFO 0 Watermark Reached Interrupt Line

[bit0] RF0NL: Rx FIFO 0 New Message Interrupt Line

5.17. Interrupt Line Enable (MCG_CANFDx_ILE, CPG_CANFDx_ILE)

Interrupt Line Enable can separately enable/disable each of the two interrupt lines to the CPU by the values set to Enable Interrupt Line 0 (ILE.EINT0) and Enable Interrupt Line 1 (ILE.EINT1).

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	7	6	5	4	3	2	1	0
Field	Reserved						EINT1	EINT0
R/W Attribute	R0,W0						R/W	R/W
Protection Attribute	-						-	-
Initial value	000000						0	0

[bit31:2] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit1] EINT1: Enable Interrupt Line 1

Bit	Description
0	Interrupt line canfd_int1 disabled.
1	Interrupt line canfd_int1 enabled.

[bit0] EINT0: Enable Interrupt Line 0

Bit	Description
0	Interrupt line canfd_int0 disabled.
1	Interrupt line canfd_int0 enabled.

5.18. Global Filter Configuration (MCG_CANFDx_GFC, CPG_CANFDx_GFC)

Global settings for Message ID filtering. The Global Filter Configuration (GFC) controls the filter path for standard and extended messages as described in Figure 3-4 and Figure 3-5.

Write access to the Global Filter Configuration (GFC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	7	6	5	4	3	2	1	0
Field	Reserved	ANFS[1:0]		ANFE[1:0]		RRFS	RRFE	
R/W Attribute	R0,W0	R/W		R/W		R/W	R/W	
Protection Attribute	-	-		-		-	-	
Initial value	00	00		00		0	0	

[bit31:6] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit5:4] ANFS[1:0]: Accept Non-matching Frames Standard

Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

Bits	Description
00	Accept in Rx FIFO 0.
01	Accept in Rx FIFO 1.
10	Reject.

11	Reject.
----	---------

[bit3:2] ANFE[1:0]: Accept Non-matching Frames Extended

Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

Bits	Description
00	Accept in Rx FIFO 0.
01	Accept in Rx FIFO 1.
10	Reject.
11	Reject.

[bit1] RRFS: Reject Remote Frames Standard

Bit	Description
0	Filter remote frames with 11-bit standard IDs.
1	Reject all remote frames with 11-bit standard IDs.

[bit0] RRFE: Reject Remote Frames Extended

Bit	Description
0	Filter remote frames with 29-bit extended IDs.
1	Reject all remote frames with 29-bit extended IDs.

5.19. Standard ID Filter Configuration (MCG_CANFDx_SIDFC, CPG_CANFDx_SIDFC)

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as described in Figure 3-4.

Write access to the Standard ID Filter Configuration (SIDFC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	LSS[7:0]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	FLSSA[15:8]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	00000000							

bit	7	6	5	4	3	2	1	0
Field	FLSSA[7:2]						Reserved	
R/W Attribute	R/W						R0,W0	
Protection Attribute	-						-	
Initial value	000000						00	

[bit31:24] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit23:16] LSS[7:0]: List Size Standard

LSS[7:0]	Description
0	No standard Message ID filter.
1 to 128	Number of standard Message ID filter elements.
>128	Values greater than 128 are interpreted as 128.

[bit15:2] FLSSA[15:2]: Filter List Standard Start Address

Start address of standard Message ID filter list (32-bit word address, see Figure 6-1).

[bit1:0] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

5.20. Extended ID Filter Configuration (MCG_CANFDx_XIDFC, CPG_CANFDx_XIDFC)

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for extended messages as described in Figure 3-5.

Write access to the Extended ID Filter Configuration (XIDFC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	23	22	21	20	19	18	17	16
Field	Reserved	LSE[6:0]						
R/W Attribute	R0,W0	R/W						
Protection Attribute	-	-						
Initial value	0	0000000						

Bit	15	14	13	12	11	10	9	8
Field	FLESA[15:8]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	00000000							

Bit	7	6	5	4	3	2	1	0
Field	FLESA[7:2]						Reserved	
R/W Attribute	R/W						R0,W0	
Protection Attribute	-						-	
Initial value	000000						00	

[bit31:23] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit22:16] LSE[6:0]: List Size Extended

LSE[6:0]	Description
0	No extended Message ID filter.
1 to 64	Number of extended Message ID filter elements.
>64	Values greater than 64 are interpreted as 64.

[bit15:2] FLESA[15:2]: Filter List Extended Start Address

Start address of extended Message ID filter list (32-bit word address, see Figure 6-1).

[bit1:0] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

5.21. Extended ID AND Mask (MCG_CANFDx_XIDAM, CPG_CANFDx_XIDAM)

The Extended ID AND Mask defines the valid bits of a 29-bit ID for acceptance filtering.

Write access to the Extended ID AND Mask (XIDAM) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

bit	31	30	29	28	27	26	25	24
Field	Reserved			EIDM[28:24]				
R/W Attribute	R0,W0			R/W

R/W Attribute	R/W							
Protection Attribute	-							
Initial value	0xFF							

bit	7	6	5	4	3	2	1	0
Field	EIDM[7:0]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	0xFF							

[bit31:29] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit28:0] EIDM[28:0]: Extended ID Mask

For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame.

With the reset value of all bits set to one the mask is not active.

5.22. High Priority Message Status (MCG_CANFDx_HPMS, CPG_CANFDx_HPMS)

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Note:

- If all the following conditions are fulfilled, set at least 1 to both List Size Standard (SIDFC.LSS[7:0]) and List Size Extended (XIDFC.LSE[6:0]).
 - To use high priority events
 - To use both standard and extended frame format

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	RX,W0							
Protection Attribute	-							
Initial value	0xXX							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	RX,W0							
Protection Attribute	-							
Initial value	0xXX							

Bit	15	14	13	12	11	10	9	8
Field	FLST	FIDX[6:0]						
R/W Attribute	R,WX	R,WX						
Protection Attribute	-	-						
Initial value	0	0000000						

Bit	7	6	5	4	3	2	1	0
Field	MSI[1:0]		BIDX[5:0]					
R/W Attribute	R,WX		R,WX					
Protection Attribute	-		-					
Initial value	00		000000					

[bit31:16] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit15] FLST: Filter List

Indicates the filter list of the matching filter element.

Bit	Description
0	Standard Filter List.
1	Extended Filter List.

[bit14:8] FIDX[6:0]: Filter Index

FIDX[6:0]	Description
0 to 127	Index of matching Rx acceptance filter element. Range is 0 to List Size Standard/Extended minus 1 (i.e. SIDFC.LSS[7:0] - 1 resp. XIDFC.LSE[6:0] - 1).

[bit7:6] MSI[1:0]: Message Storage Indicator

Bits	Description
00	No Rx FIFO selected.
01	Rx FIFO message lost.
10	Message stored in Rx FIFO 0.
11	Message stored in Rx FIFO 1.

[bit5:0] BIDX[5:0]: Buffer Index

Index of Rx FIFO element to which the message was stored. Only valid when bit[1] of the Message Storage Indicator MSI[1] = 1.

5.23. New Data 1 (MCG_CANFDx_NDAT1, CPG_CANFDx_NDAT1)

New Data 1 holds flags that are set when the respective dedicated Rx Buffer receives a frame.

bit	31	30	29	28	27	26	25	24
Field	ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	ND23	ND22	ND21	ND20	ND19	ND18	ND17	ND16
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	ND15	ND14	ND13	ND12	ND11	ND10	ND9	ND8
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	ND7	ND6	ND5	ND4	ND3	ND2	ND1	ND0
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit31:0] ND[31:0]: New Data

The register holds the New Data flags of dedicated Rx Buffers 0 to 31.

The flags are set when the respective dedicated Rx Buffer has been updated from a received frame.

The flags remain set until the CPU clears them.

A flag is cleared by writing a "1" to the corresponding bit position. Writing a "0" has no effect. A hard reset will clear the register.

Bit	Description
0	Rx Buffer not updated.
1	Rx Buffer updated from new message.

5.24. New Data 2 (MCG_CANFDx_NDAT 2, CPG_CANFDx_NDAT 2)

New Data 2 holds flags that are set when the respective dedicated Rx Buffer receives a frame.

bit	31	30	29	28	27	26	25	24
Field	ND63	ND62	ND61	ND60	ND59	ND58	ND57	ND56
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
Field	ND55	ND54	ND53	ND52	ND51	ND50	ND49	ND48
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	ND47	ND46	ND45	ND44	ND43	ND42	ND41	ND40
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	ND39	ND38	ND37	ND36	ND35	ND34	ND33	ND32
R/W Attribute	R,W	R,W	R,W	R,W	R,W	R,W	R,W	R,W
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit31:0] ND[63:32]: New Data

The register holds the New Data flags of dedicated Rx Buffers 32 to 63.

The flags are set when the respective dedicated Rx Buffer has been updated from a received frame.

The flags remain set until the CPU clears them.

A flag is cleared by writing a "1" to the corresponding bit position. Writing a "0" has no effect. A hard reset will clear the register.

Bit	Description
0	Rx Buffer not updated.
1	Rx Buffer updated from new message.

5.25. Rx FIFO 0 Configuration (MCG_CANFDx_RXF0C, CPG_CANFDx_RXF0C)

Settings for the Rx FIFO 0.

Write access to the Rx FIFO 0 Configuration (RXF0C) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

bit	31	30	29	28	27	26	25	24
Field	F0OM	F0WM[6:0]						
R/W Attribute	R/W	R/W						
Protection Attribute	-	-						
Initial value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	Reserved	F0S[6:0]						
R/W Attribute	R0,W0	R/W						
Protection Attribute	-	-						
Initial value	0	0000000						

Bit	15	14	13	12	11	10	9	8
Field	F0SA[15:8]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	00000000							

Bit	7	6	5	4	3	2	1	0
Field	F0SA[7:2]						Reserved	
R/W Attribute	R/W						R0,W0	
Protection Attribute	-						-	
Initial value	000000						00	

[bit31] F0OM: FIFO 0 Operation Mode

Rx FIFO 0 can be operated in blocking or in overwrite mode (see "3.4.2. Rx FIFOs").

Bit	Description
0	Rx FIFO 0 blocking mode.
1	Rx FIFO 0 overwrite mode.

[bit30:24] F0WM[6:0]: Rx FIFO 0 Watermark

F0WM[6:0]	Description
0	Watermark interrupt disabled.
1 to 64	Level for Rx FIFO 0 Watermark Reached interrupt (IR.RF0W).
>64	Watermark interrupt disabled.

[bit23] Reserved: Reserved bit

When writing, always write "0". When reading, "0" is always read.

[bit22:16] F0S[6:0]: Rx FIFO 0 Size

The Rx FIFO 0 elements are indexed from 0 to F0S[6:0] - 1.

F0S[6:0]	Description
0	No Rx FIFO 0.
1 to 64	Number of Rx FIFO 0 elements.
>64	Values greater than 64 are interpreted as 64.

[bit15:2] F0SA[15:2]: Rx FIFO 0 Start Address

Start address of Rx FIFO 0 in Message RAM (32-bit word address, see Figure 6-1).

[bit1:0] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

5.26. Rx FIFO 0 Status (MCG_CANFDx_RXF0S, CPG_CANFDx_RXF0S)

Status of the Rx FIFO 0.

bit	31	30	29	28	27	26	25	24
Field	Reserved						RF0L	F0F
R/W Attribute	RX,W0						R,WX	R,WX
Protection Attribute	-						-	-
Initial value	XXXXXX						0	0

Bit	23	22	21	20	19	18	17	16
Field	Reserved		F0PI[5:0]					
R/W Attribute	RX,W0		R,WX					
Protection Attribute	-		-					
Initial value	XX		000000					

Bit	15	14	13	12	11	10	9	8
Field	Reserved		F0GI[5:0]					
R/W Attribute	RX,W0		R,WX					
Protection Attribute	-		-					
Initial value	XX		000000					

Bit	7	6	5	4	3	2	1	0
Field	Reserved	F0FL[6:0]						
R/W Attribute	RX,W0	R,WX						
Protection Attribute	-	-						
Initial value	X	0000000						

[bit31:26] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit25] RF0L: Rx FIFO 0 Message Lost

This bit is a copy of interrupt flag IR.RF0L (Rx FIFO 0 Message Lost).

When IR.RF0L is reset, this bit is also reset.

Bit	Description
0	No Rx FIFO 0 message lost.
1	Rx FIFO 0 message lost. Also set after write attempt to Rx FIFO 0 of size zero.

Note:

- Overwriting a message when the FIFO is in overwrite mode ($RXF0C.FOOM = 1$) will not set this flag.

[bit24] F0F: Rx FIFO 0 Full

Bit	Description
0	Rx FIFO 0 not full.
1	Rx FIFO 0 full.

[bit23:22] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit21:16] F0PI[5:0]: Rx FIFO 0 Put Index

F0PI[5:0]	Description
0 to 63	Rx FIFO 0 write index pointer, range 0 to 63.

[bit15:14] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit13:8] F0GI[5:0]: Rx FIFO 0 Get Index

F0GI[5:0]	Description
0 to 63	Rx FIFO 0 read index pointer, range 0 to 63.

[bit7] Reserved: Reserved bit

When writing, always write "0". The read value is undefined.

[bit6:0] F0FL[6:0]: Rx FIFO 0 Fill Level

F0FL[6:0]	Description
0 to 64	Number of elements stored in Rx FIFO 0, range 0 to 64.

5.27. Rx FIFO 0 Acknowledge (MCG_CANFDx_RXF0A, CPG_CANFDx_RXF0A)

The Rx FIFO 0 Acknowledge is used to acknowledge that the CPU has read a message or a sequence of messages from the Rx FIFO 0 to indicate to the CAN FD Controller that the corresponding Message RAM area may be released. See "3.6. FIFO Acknowledge Handling" for details.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	7	6	5	4	3	2	1	0
Field	Reserved		F0AI[5:0]					
R/W Attribute	R0,W0		R/W					
Protection Attribute	-		-					
Initial value	00		000000					

[bit31:6] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit5:0] F0AI[5:0]: Rx FIFO 0 Acknowledge Index

After the CPU has read a message or a sequence of messages from Rx FIFO 0, it has to write the buffer index of the last element read from Rx FIFO 0 to this field (F0AI[5:0]). This will set the Rx FIFO 0 Get Index RXF0S.F0GI[5:0] to F0AI[5:0] + 1 and update the FIFO 0 Fill Level RXF0S.F0FL[6:0].

5.28. Rx Buffer Configuration (MCG_CANFDx_RXBC, CPG_CANFDx_RXBC)

Defines the start address of the Rx Buffers section in the Message RAM.

Write access to the Rx Buffer Configuration (RXBC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	RBSA[15:8]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	00000000							

bit	7	6	5	4	3	2	1	0
Field	RBSA[7:2]						Reserved	
R/W Attribute	R/W						R0,W0	
Protection Attribute	-						-	
Initial value	000000						00	

[bit31:16] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit15:2] RBSA[15:2]: Rx Buffer Start Address

Configures the start address of the Rx Buffers section in the Message RAM (32-bit word address).

Also used to reference debug messages A, B, C.

[bit1:0] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

5.29. Rx FIFO 1 Configuration (MCG_CANFDx_RXF1C, CPG_CANFDx_RXF1C)

Settings for the Rx FIFO 1.

Write access to the Rx FIFO 1 Configuration (RXF1C) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

bit	31	30	29	28	27	26	25	24
Field	F1OM	F1WM[6:0]						
R/W Attribute	R/W	R/W						
Protection Attribute	-	-						
Initial value	0	0000000						

bit	23	22	21	20	19	18	17	16
Field	Reserved	F1S[6:0]						
R/W Attribute	R0,W0	R/W						
Protection Attribute	-	-						
Initial value	0	0000000						

bit	15	14	13	12	11	10	9	8
Field	F1SA[15:8]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	00000000							

bit	7	6	5	4	3	2	1	0
Field	F1SA[7:2]						Reserved	
R/W Attribute	R/W						R0,W0	
Protection Attribute	-						-	
Initial value	000000						00	

[bit31] F1OM: FIFO 1 Operation Mode

Rx FIFO 1 can be operated in blocking or in overwrite mode (see "3.4.2. Rx FIFOs").

bit	Description
0	Rx FIFO 1 blocking mode.
1	Rx FIFO 1 overwrite mode.

[bit30:24] F1WM[6:0]: Rx FIFO 1 Watermark

F1WM[6:0]	Description
0	Watermark interrupt disabled.
1 to 64	Level for Rx FIFO 1 Watermark Reached interrupt (IR.RF1W).
>64	Watermark interrupt disabled.

[bit23] Reserved: Reserved bit

When writing, always write "0". When reading, "0" is always read.

[bit22:16] F1S[6:0]: Rx FIFO 1 Size

The Rx FIFO 1 elements are indexed from 0 to F1S[6:0] - 1.

F1S[6:0]	Description
0	No Rx FIFO 1.
1 to 64	Number of Rx FIFO 1 elements.
>64	Values greater than 64 are interpreted as 64.

[bit15:2] F1SA[15:2]: Rx FIFO 1 Start Address

Start address of Rx FIFO 1 in Message RAM (32-bit word address, see Figure 6-1).

[bit1:0] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

5.30. Rx FIFO 1 Status (MCG_CANFDx_RXF1S, CPG_CANFDx_RXF1S)

Status of the Rx FIFO 1.

bit	31	30	29	28	27	26	25	24
Field	DMS[1:0]		Reserved				RF1L	F1F
R/W Attribute	R,WX		RX,W0				R,WX	R,WX
Protection Attribute	-		-				-	-
Initial value	00		XXXX				0	0

bit	23	22	21	20	19	18	17	16
Field	Reserved		F1PI[5:0]					
R/W Attribute	RX,W0		R,WX					
Protection Attribute	-		-					
Initial value	XX		000000					

Bit	15	14	13	12	11	10	9	8
Field	Reserved		F1GI[5:0]					
R/W Attribute	RX,W0		R,WX					
Protection Attribute	-		-					
Initial value	XX		000000					

Bit	7	6	5	4	3	2	1	0
Field	Reserved	F1FL[6:0]						
R/W Attribute	RX,W0	R,WX						
Protection Attribute	-	-						
Initial value	X	0000000						

[bit31:30] DMS[1:0]: Debug Message Status

Bits	Description
00	Idle state, wait for reception of debug messages, DMA request is cleared.
01	Debug message A received.
10	Debug messages A, B received.
11	Debug messages A, B, C received, DMA request is set.

Notes:

- Debug message is used for Debug on CAN feature.
- Debug on CAN feature is not supported for TRAVEO™ T1G Platform.

[bit29:26] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit25] RF1L: Rx FIFO 1 Message Lost

This bit is a copy of interrupt flag IR.RF1L (Rx FIFO 1 Message Lost).

When IR.RF1L is reset, this bit is also reset.

Bit	Description
0	No Rx FIFO 1 message lost.
1	Rx FIFO 1 message lost. Also set after write attempt to Rx FIFO 1 of size zero.

Note:

- Overwriting a message when the FIFO is in overwrite mode ($RXF1C.F1OM = 1$) will not set this flag.

[bit24] F1F: Rx FIFO 1 Full

Bit	Description
0	Rx FIFO 1 not full.
1	Rx FIFO 1 full.

[bit23:22] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit21:16] F1PI[5:0]: Rx FIFO 1 Put Index

F1PI[5:0]	Description
0 to 63	Rx FIFO 1 write index pointer, range 0 to 63.

[bit15:14] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit13:8] F1GI[5:0]: Rx FIFO 1 Get Index

F1GI[5:0]	Description
0 to 63	Rx FIFO 1 read index pointer, range 0 to 63.

[bit7] Reserved: Reserved bit

When writing, always write "0". The read value is undefined.

[bit6:0] F1FL[6:0]: Rx FIFO 1 Fill Level

F1FL[6:0]	Description
0 to 64	Number of elements stored in Rx FIFO 1, range 0 to 64.

5.31. Rx FIFO 1 Acknowledge (MCG_CANFDx_RXF1A, CPG_CANFDx_RXF1A)

The Rx FIFO 1 Acknowledge is used to acknowledge that the CPU has read a message or a sequence of messages from the Rx FIFO 1 to indicate to the CAN FD Controller that the corresponding Message RAM area may be released. See "3.6. FIFO Acknowledge Handling" for details.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	7	6	5	4	3	2	1	0
Field	Reserved		F1AI[5:0]					
R/W Attribute	R0,W0		R/W					
Protection Attribute	-		-					
Initial value	00		000000					

[bit31:6] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit5:0] F1AI[5:0]: Rx FIFO 1 Acknowledge Index

After the CPU has read a message or a sequence of messages from Rx FIFO 1, it has to write the buffer index of the last element read from Rx FIFO 1 to this field (F1AI[5:0]). This will set the Rx FIFO 1 Get Index RXF1S.F1GI[5:0] to F1AI[5:0] + 1 and update the FIFO 1 Fill Level RXF1S.F1FL[6:0].

5.32. Rx Buffer/FIFO Element Size Configuration (MCG_CANFDx_RXESC, CPG_CANFDx_RXESC)

Configures the number of data bytes belonging to an Rx Buffer and FIFO element. Data field sizes > 8 bytes are intended for CAN FD operation only.

Write access to the Rx Buffer/FIFO Element Size Configuration (RXESC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

Note:

- In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Rx Buffer or Rx FIFO, only the number of bytes as configured by this register (i.e. RXESC) are stored to the Rx Buffer resp. Rx FIFO element. The rest of the frame's data field is ignored.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0

Bit	15	14	13	12	11	10	9	8
Field	Reserved					RBDS[2:0]		
R/W Attribute	R0,W0					R/W		
Protection Attribute	-					-		
Initial value	00000					000		

Bit	7	6	5	4	3	2	1	0
Field	Reserved	F1DS[2:0]			Reserved	F0DS[2:0]		
R/W Attribute	R0,W0	R/W			R0,W0	R/W		
Protection Attribute	-	-			-	-		
Initial value	0	000			0	000		

[bit31:11] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit10:8] RBDS[2:0]: Rx Buffer Data Field Size

Bits	Description
000	8 byte data field.
001	12 byte data field.
010	16 byte data field.
011	20 byte data field.
100	24 byte data field.
101	32 byte data field.
110	48 byte data field.
111	64 byte data field.

[bit7] Reserved: Reserved bit

When writing, always write "0". When reading, "0" is always read.

[bit6:4] F1DS[2:0]: Rx FIFO 1 Data Field Size

Bits	Description
000	8 byte data field.
001	12 byte data field.
010	16 byte data field.
011	20 byte data field.
100	24 byte data field.
101	32 byte data field.
110	48 byte data field.
111	64 byte data field.

[bit3] Reserved: Reserved bit

When writing, always write "0". When reading, "0" is always read.

[bit2:0] F0DS[2:0]: Rx FIFO 0 Data Field Size

Bits	Description
000	8 byte data field.
001	12 byte data field.
010	16 byte data field.
011	20 byte data field.
100	24 byte data field.
101	32 byte data field.
110	48 byte data field.
111	64 byte data field.

5.33. Tx Buffer Configuration (MCG_CANFDx_TXBC, CPG_CANFDx_TXBC)

Settings for Tx Buffers stored in the Message RAM.

Write access to the Tx Buffer Configuration (TXBC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

Note:

- Be aware that the sum of Transmit FIFO/Queue Size (TXBC.TFQS[5:0]) and Number of Dedicated Transmit Buffers (TXBC. NDTB[5:0]) may be not greater than 32. There is no check for erroneous configurations.
- The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.
- Don't use combination Tx FIFO and Dedicated Tx Buffers. In case of setting "1" to Tx FIFO/Queue Mode (TXBC.TFQM), set 0 to TXBC. NDTB[5:0].

bit	31	30	29	28	27	26	25	24
Field	Reserved	TFQM	TFQS[5:0]					
R/W Attribute	R0,W0	R/W	R/W					
Protection Attribute	-	-	-					
Initial value	0	0	000000					

bit	23	22	21	20	19	18	17	16
Field	Reserved		NDTB[5:0]					
R/W Attribute	R0,W0		R/W					
Protection Attribute	-		-					
Initial value	00		000000					

bit	15	14	13	12	11	10	9	8
Field	TBSA[15:8]							
R/W Attribute	R/W							
Protection Attribute	-							
Initial value	00000000							

bit	7	6	5	4	3	2	1	0
Field	TBSA[7:2]						Reserved	
R/W Attribute	R/W						R0,W0	
Protection Attribute	-						-	
Initial value	000000						00	

[bit31] Reserved: Reserved bit

When writing, always write "0". When reading, "0" is always read.

[bit30] TFQM: Tx FIFO/Queue Mode

Bit	Description
0	Tx FIFO operation.
1	Tx Queue operation.

[bit29:24] TFQS[5:0]: Transmit FIFO/Queue Size

TFQS[5:0]	Description
0	No Tx FIFO/Queue.
1 to 32	Number of Tx Buffers used for Tx FIFO/Queue.
>32	Values greater than 32 are interpreted as 32.

[bit23:22] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit21:16] NDTB[5:0]: Number of Dedicated Transmit Buffers

NDTB[5:0]	Description
0	No Dedicated Tx Buffers.
1 to 32	Number of Dedicated Tx Buffers.
>32	Values greater than 32 are interpreted as 32.

[bit15:2] TBSA[15:2]: Tx Buffers Start Address

Start address of Tx Buffers section in Message RAM (32-bit word address, see Figure 6-1).

[bit1:0] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

5.34. Tx FIFO/Queue Status (MCG_CANFDx_TXFQS, CPG_CANFDx_TXFQS)

The Tx FIFO/Queue status is related to the pending Tx requests listed in the Tx Buffer Request Pending register TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (TXBRP not yet updated).

Note:

- In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices (TXFQS.TFQPI[4:0] resp. TXFQS.TFGI[4:0]) indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.

Example:

- For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	RX,W0							
Protection Attribute	-							
Initial value	0xXX							

bit	23	22	21	20	19	18	17	16
Field	Reserved		TFQF	TFQPI[4:0]				
R/W Attribute	RX,W0		R,WX	R,WX				
Protection Attribute	-		-	-				
Initial value	XX		0	00000				

Bit	15	14	13	12	11	10	9	8
Field	Reserved			TFGI[4:0]				
R/W Attribute	RX,W0			R,WX				
Protection Attribute	-			-				
Initial value	XXX			00000				

Bit	7	6	5	4	3	2	1	0
Field	Reserved		TFFL[5:0]					
R/W Attribute	RX,W0		R,WX					
Protection Attribute	-		-					
Initial value	XX		000000					

[bit31:22] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit21] TFQF: Tx FIFO/Queue Full

Bit	Description
0	Tx FIFO/Queue not full.
1	Tx FIFO/Queue full.

[bit20:16] TFQPI[4:0]: Tx FIFO/Queue Put Index

TFQPI[4:0]	Description
0 to 31	Tx FIFO/Queue write index pointer, range 0 to 31.

[bit15:13] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit12:8] TFGI[4:0]: Tx FIFO Get Index

TFGI[4:0]	Description
0 to 31	Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (Tx FIFO/Queue Mode TXBC.TFQM = 1).

[bit7:6] Reserved: Reserved bits

When writing, always write "0". The read value is undefined.

[bit5:0] TFFL[5:0]: Tx FIFO Free Level

TFFL[5:0]	Description
0 to 32	Number of consecutive free Tx FIFO elements starting from the Tx FIFO Get Index (TXFQS.TFGI[4:0]), range 0 to 32. Read as zero when Tx Queue operation is configured (Tx FIFO/Queue Mode TXBC.TFQM = 1).

5.35. Tx Buffer Element Size Configuration (MCG_CANFDx_TXESC, CPG_CANFDx_TXESC)

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

Write access to the Tx Buffer Element Size Configuration (TXESC) is possible only when the Configuration Change Enable (CCCR.CCE) and Initialization (CCCR.INIT) bits are both "1".

Note:

- In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size TXESC.TBDS[2:0], the bytes not defined by the Tx Buffer are transmitted as 0xCC (padding bytes).

bit	31	30	29	28	27	26	25	24
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	23	22	21	20	19	18	17	16
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	15	14	13	12	11	10	9	8
Field	Reserved							
R/W Attribute	R0,W0							
Protection Attribute	-							
Initial value	0x00							

Bit	7	6	5	4	3	2	1	0
Field	Reserved					TBDS[2:0]		
R/W Attribute	R0,W0					R/W		
Protection Attribute	-					-		
Initial value	00000					000		

[bit31:3] Reserved: Reserved bits

When writing, always write "0". When reading, "0" is always read.

[bit2:0] TBDS[2:0]: Tx Buffer Data Field Size

Bits	Description
000	8 byte data field.
001	12 byte data field.
010	16 byte data field.
011	20 byte data field.
100	24 byte data field.
101	32 byte data field.
110	48 byte data field.
111	64 byte data field.

5.36. Tx Buffer Request Pending (MCG_CANFDx_TXBRP, CPG_CANFDx_TXBRP)

Tx Buffer Request Pending holds the status of the transmission requests of each corresponding Tx Buffer.

bit	31	30	29	28	27	26	25	24
Field	TRP31	TRP30	TRP29	TRP28	TRP27	TRP26	TRP25	TRP24
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	TRP23	TRP22	TRP21	TRP20	TRP19	TRP18	TRP17	TRP16
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Field	TRP15	TRP14	TRP13	TRP12	TRP11	TRP10	TRP9	TRP8
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Field	TRP7	TRP6	TRP5	TRP4	TRP3	TRP2	TRP1	TRP0
R/W Attribute	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX	R,WX
Protection Attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit31:0] TRP[31:0]: Transmission Request Pending

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register TXBAR (Tx Buffer Add Request). The bits are reset after a requested transmission has completed or has been cancelled via register TXBCR (Tx Buffer Cancellation Request).

TXBRP bits are set only for those Tx Buffers that are configured by the TXBC.TFQS[5:0] (Transmit FIFO/Queue Size) and TXBC.NDTB[5:0] (Number of Dedicated Transmit Buffers) fields. After a TXBRP bit has been set, a Tx scan (see "3.5. Tx Handling") is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

Bit	Description
0	No transmission request pending.
1	Transmission request pending.

Note:

- *TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding TXBRP bit is reset.*

5.37. Tx Buffer Add Request (MCG_CANFDx_TXBAR, CPG_CANFDx_TXBAR)

Tx Buffer Add Request is used to request the transmission of each corresponding Tx Buffer.

bit	31	30	29	28	27	26	25	24
Field	AR31	AR30	AR29	AR28	AR27	AR26	AR25	AR24
