1 Introduction

Infineon’s 3D Magnetic sensor 2 Go is a compact evaluation kit (EvalKit) to familiarize the user with the 3D magnetic sensor and enable measurements for product evaluations. The EvalKit contains all the required hardware. The software can be downloaded free of charge at the Infineon web.

This user’s manual defines the different parts of the EvalKit, describes the software installation process and clarifies how the Graphical User Interface (GUI) has to be used to take measurements.

This user’s manual is meant for the software version v 2.0.1 which is compatible with the EvalBoard versions starting from V 2.0 upwards.

1.1 EvalKit content

The evaluation kit (EvalKit) contains:

- The 3D evaluation board (EvalBoard); a ready-to-use printed circuit board (PCB) with the 3D sensor.
- A standalone magnet.

The EvalKit references for ordering are provided in Table 1.

To use the EvalKit the user has to acquire a USB cable with a micro USB connection-end for the EvalBoard side and a conventional USB connection for the PC side.

1.2 Software

The required software to run the 3D Magnetic sensor 2 Go EvalBoard can be found at the Infineon site under http://www.infineon.com/sensors2go by clicking at “3D Magnetic Sensor 2GO”.

The software package contains:

- Graphical User Interface (GUI) to be installed on the PC for user evaluation.
- Firmware to be flashed into the microcontroller to enable communication with the 3D sensor.
- USB driver J-Link from Segger to enable connection between PC and EvalBoard.

This software was designed to be used with Windows 7 and it is compatible with both 32-bit and 64-bit system types. It has also been used with Windows 10 at 64 bits. Other versions may also work, but have not been tested.

The USB protocols capabilities are defined by the Segger driver. Versions USB 2.0 and USB 3.0 should be compatible.
Introduction

The software version v 2.0.1 can be used in EvalBoard versions starting from V 2.0 upwards. The software version v 1.0 was for the first EvalBoard version V 1.0, which is no longer supported. An overview of the EvalBoard and Software versions compatibility can be found in Table 1.

The software Infineon 3D Magnetic Sensor 2 Go will be used to enable a communication between the sensor and to set the different possible modes. In those modes the update rate of the magnetic field measured (X, Y and Z components) and current consumption vary. The modes can be changed in the GUI with a menu, providing the bytes for proper sensor configuration.

The hardware is based on the XMC2Go-Kit. More technical documents and detailed description you can find at http://www.infineon.com/xmc2go.

1.3 Magnet heads

As described in Chapter 1.1, a standalone magnet is provided with the EvalKit. This can be manually placed to a desired position and carry 3D measurements.

In addition, Infineon offers magnet heads which can be mounted on the EvalBoard. Two magnet heads are currently available and can be ordered separately:

- Joystick
- Rotate knob (rotate and push button control element)

2 EvalBoard description

The evaluation board (EvalBoard) is a ready-to-use printed circuit board (PCB) which contains:

- 3D magnetic sensor (TLV493D-A1B6 or other model depending on the order code)
- XMC1100 microcontroller based on ARM Cortex™-M0 at 48MHz frequency connected to the 3D sensor.
- XMC4200 microcontroller based on ARM Cortex™-M4 at 144MHz frequency used for the debugging and the USB communication.
- Micro USB connector for power supply and communication with the Graphical User Interface (GUI).
- LED for indication of power supply and debugging.
- Two LEDs for user configuration.
- Voltage regulator, reverse current protection diode and ESD protection diode.
- Pin Headers to access data lines (e.g. via oscilloscope, external microcontroller).

The different components and its location are shown in Figure 3. The 3D magnetic sensor can be separated from the rest of the EvalBoard by cutting the break line.

2.1 Optional external power supply

The 3D Magnetic Sensor 2 Go EvalBoard is supplied via the USB cable. It is also possible to provide an external power supply. If this is the case, a few considerations must be taken into account as described below.

The 3D Magnetic Sensor 2 Go EvalBoard must be supplied by external 5 Volt DC power supply connected to the micro USB plug. The voltage regulator shifts the voltage level to 3.3V for the microcontrollers and the 3D magnetic sensor. The Power & Debug LED indicates that the presence of the generated 3.3V supply voltage.

Out of the box with the pre-programmed application and the on-board debugger in operation the EvalBoard typically draws about 75 mA. This current can be delivered via the USB plug of a PC, which is specified to deliver up to 500 mA. An on-board reverse current protection diode will ensure safe operation and protects the USB port of the Laptop/PC in case power is provided through the pin header X1.
EvalBoard description

It is not recommended to apply an additional power supply to the \( V_{DD} \) pin of X1 (3.3V) when the board is powered via USB, because the 3.3V supply could drive against the on-board power supply. The \( V_{DD} \) pin can be used to power an external circuit. But care must be taken not to draw more current than 150mA, which is the maximum current the on-board voltage regulator can deliver. After power-up the Debug LED starts blinking. In case there is connection to a PC via the Debug USB plug and the USB Debug Device drivers are installed on this PC, the Debug LED will turn from blinking to constant illumination.

2.2 Pin header connector

The pin headers X1 and X2 can be used to extend the evaluation board or to perform measurements on the XMC1100. The order of pins available at X1 and X2 corresponds to the pinning schema of the XMC1100 Microcontroller in the TSSOP-16 pin package. The pinning table is also printed onto the bottom side of the PCB (depending on the version). The pin header X3 can be used to access directly the 3D magnetic sensor pins.

![Figure 4 EvalBoard pin header connectors](image)

The different 3D sensor pins can be accessed via the pin headers in the EvalBoard as shown in Table 3.

2.3 EvalBoard Schematic

Schematics of the different blocks from the EvalBoard are provided in case further details are required. The 3D magnetic sensor user can also re-use these schematics to design customized PCBs for evaluation purposes. The user (integrator) is responsible for the correct functioning on system level as well as for the validation and testing.

Software installation

3 Software installation

In this chapter the installation of the software will be described. Make sure to have administration rights on your PC before starting the installation.

Step 1: Enter the Infineon web to access the software. The link to the software is mentioned in Chapter 1.2, the web looks like in Figure 11. Double click to the software link to start the download.

Figure 11  Download “3D Magnetic Sensor 2 Go” software

Step 2: Save the file in your computer.

Figure 12  Save the software
Software installation

Step 3: Open the folder where the software was saved. Double click the .msi icon and the screen from Figure 13 will appear. Click “Next”.

![Figure 13 Start software installation](image)

Step 4: Read the license agreement and tick the box to accept the terms. It is also possible to print the license agreement. Click “Next” to continue with the installation.

![Figure 14 Accept license agreement](image)
Software installation

Step 5: Select the folder where the software should be installed. It is recommended to use the default folder suggested by the system.

![Select Installation Folder](image1)

**Figure 15** Select installation folder

Step 6: Confirm installation

![Confirm Installation](image2)

**Figure 16** confirm installation
Software installation

Step 7: The setup for the installation is complete.

The 3D Magnetic 2Go Graphical User Interface (GUI) is successfully installed. A shortcut to the GUI can be found in the Windows Start menu. Still, before using it the software installation must continue, since a USB driver has to be installed as well.
Step 8: Start the installation of the required USB driver from Segger. The window shown in Figure 19 is automatically opened.

![Driver installation](image1)

**Figure 19  Driver installation**

Step 9: Read the license agreement of the driver and click “I Agree” to accept the terms.

![License agreement](image2)

**Figure 20  Accept the driver’s license agreement**
Step 10: Install the USB Driver for J-Link (box by default ticked). By default a shortcut to the driver will be created (“Create entry in start menu”). This can be unticked if desired by the user.

Figure 21   Accept the driver’s license agreement

Step 11: Select the folder where the driver should be installed. It is recommended to use the default folder suggested by the system.

Figure 22   Select driver’s installation folder
Software installation

Step 12: Click “Ok” for the J-Link DLL.

Figure 23  Accept DLL

Step 13: USB driver installation completed

Figure 24  USB driver installation completed
4 3D magnetic sensor evaluation

This chapter details how to use the Graphical User Interface (GUI) to start the 3D magnetic sensor evaluation.

Step 1: Connect the EvalBoard to the PC via the USB cable. Use the Micro USB port for the EvalBoard and USB port for the PC. A LED in the EvalBoard will switch on indicating the EvalBoard is supplied with enough power.

Step 2: Open the 3D Magnetic 2Go GUI by clicking the shortcut in the start menu as shown previously in Figure 18. On the top left side click “Flash MCU”. A sub-menu with the option “Flash” appear. Click “Flash” to flash the microcontroller firmware required to run the 3D sensor. The LED blinks while the firmware is being flashed. Flashing the firmware is only required the first time that an EvalBoard is used.

Figure 25  Flash the firmware

Step 3: Once the firmware has been flashed a programmer (the EvalBoard) will appear in the list. If this is not the case click the “Refresh” button (the curved arrow placed on the right bottom corner of the “Programmer” box). Once the programmer has been selected click the “Connect” button (placed on the left bottom corner of the “Programmer” box). The connection between PC and EvalBoard has now been established.

Figure 26  Connect to the EvalBoard
3D magnetic sensor evaluation

Step 4: Select the sensor to evaluate.

Figure 27  3D sensor selection

Step 5: Select the 3D configuration on the menu on the left-hand side. As the TLV493D has been selected in the previous step, the default mode is power-down. In power-down mode no measurements are taken. Therefore the user can select the ultra low power mode, the low power mode, the fast mode or the master controlled mode. After selecting the mode, click “Start” to start measurements.

Figure 28  Select 3D configuration
3D magnetic sensor evaluation

Step 6: The X, Y and Z values will be plotted in three separate graphs. The Y-axis of these graphs represents the magnetic field from -200mT to 200mT. On the X-axis each sample is plotted. Additionally a table is provided with the X, Y, Z and Temperature values. This table can be saved for further evaluations by clicking “Save” on the bottom of the table. Be aware that for the fast mode, no temperature values are provided in the GUI (although by default the 3D magnetic sensor does take temperature measurements).

Figure 29  3D measurements

Step 7: If a new mode wants to be evaluated click “Stop” on the left side. “Save” the data and “Clear” it. Select a new configuration and press “Start” again.
4.1 Application views with the magnet heads

Additional views representing real case applications can also be visualized. These views are purely graphical. The magnet heads mentioned in Chapter 1.3 can be used for this purpose.

In the “Joystick View” a 3D space will be represented with a stick in it. As a magnet moves in any direction around the 3D magnetic sensor EvalBoard, so will the stick.

![Joystick View](image)

**Figure 30 Joystick View**

The magnet used in the Joystick magnet head is an axial magnetized magnet. The magnet material is ferrite, of class Y35, which is equivalent to a remanence of between 400 and 410mT. The magnet disk has a size of 5mm diameter and 5mm thickness.

![Magnet](image)

**Figure 31 Magnet used in the Joystick magnet head**
3D magnetic sensor evaluation

In the “Polar Coordinates” a rotate knob will be represented. The knob is a control element with which the user can do two kinds of movements: turn it (clockwise or counterclockwise) and push it.

When the user turns the knobs, the 3D magnetic sensor measures the X and Y magnetic field components to which can be used to determine the position through 360° degrees, therefore the 3D magnetic sensor is used to detect a rotation movement. When this happens the white stripe on the knob represented on the GUI will turn accordingly to the knob from the magnet head.

When the user pushes the knob, the 3D magnetic sensor measures the Z magnetic field component, therefore a linear movement is detected. The ring around the knob represented on the GUI will change colour.

Figure 32  Polar Coordinates

The magnet used in the Rotate Knob magnet head is a diametrically magnetized magnet. The magnet material is Neodymium Iron Boron (NdFeB) of class N45. The magnet is protected against corrosion with Nickel coating (Ni-Cu-Ni). The magnet size is 4mm diameter and 10mm thickness.

Figure 33  Magnet used in the Rotate Knob magnet head
