BGA123L4 as Low Current Low Noise Amplifier for GNSS Applications

About this document

Scope and purpose

This application note describes Infineon’s GNSS MMIC: BGA123L4 as low current Low Noise Amplifier for GNSS applications (1550 – 1615 MHz) with 0402 components for matching.

1. The BGA123L4 is a Silicon Germanium Low Noise Amplifier supporting 1550 – 1615 MHz.
2. The target application is GNSS applications (1550 – 1615 MHz).
3. In this report, the performance of BGA123L4 is measured on a Rogers4003 board. This device is matched with 0402 size external components. Performance deviation, when matched with 0201 components, is also presented.
4. Key performance parameters at 1.8 V, 1575 MHz
   Noise figure = 0.75 dB
   Insertion gain = 18.3 dB
   Input return loss = 9.5 dB
   Output return loss = 14.8 dB
   Inband Input IP3 = -14.5 dBm
5. Key performance parameters at 1.2 V, 1575 MHz
   Noise figure = 0.80 dB
   Insertion gain = 18.0 dB
   Input return loss = 9.3 dB
   Output return loss = 13.8 dB
   Inband Input IP3 = -14.8 dBm

1 Introduction of Global Navigation Satellite Systems (GNSSs)

1.1 Global Navigation Satellite Systems (GNSSs)

Global Navigation Satellite Systems (GNSSs) are among the fastest growing businesses in the electronic industry. Today, four GNSS systems are in operation: the United States GPS, the Russian GLobal Orbiting Navigation Satellite System (GLONASS), the Chinese BeiDou Navigation Satellite System (BDS), and the European Union Galileo navigation system. Main market segments include the Personal Navigation Devices (PND), GNSS-enabled mobile phones and GNSS-enabled portable devices.

The main challenges for the growing GNSS-enabled mobile phone segment are to achieve high sensitivity and high immunity defined by government regulations against interference of cellular signals for safety and emergency reasons. This means GNSS signals must be received at very low power levels (down to less than -130 dBm) in mobile phones in the vicinity of co-existing high-power cellular signals.

The main challenges for the GNSS-enabled portable devices are to obtain a long battery operation time, and low Time-To-First Fix (TTFF) to quickly locate the device.

1.2 Infineon Product Portfolio for GNSS Applications

Infineon offers a complete product portfolio to all customers designing high-performance flexible RF frontend solutions for all GNSS systems:

- **Low Noise Amplifiers (LNAs):** Infineon offers a wide range of products such as high-performance Monolithic Microwave Integrated Circuits (MMICs) as well as cost effective and high-end RF transistors

- **Transient Voltage Suppression (TVS) Diodes:** Infineon devices can protect GNSS antennas reliably up to 20 kV
Infineon Technologies is among the market leaders in GNSS Low Noise Amplifiers (LNAs) for navigation applications. The GNSS MMIC LNA products offer low Noise Figure (NF), high gain and low power consumption. In addition they are designed with high out-of-band linearity performance to enhance interference immunity.

1.3 Key Features of GNSS Low Noise Amplifiers

**Low Noise Figure & High Gain**

The power levels of satellite signals received by a GPS/GNSS receiver are as low as -130 dBm. Such systems must be very sensitive. An external LNA with low NF and high gain is required to boost the sensitivity of the system and Time-To-First Fix (TTFF).

**High robustness against coexistence of out-of-band jammer signals**

In the presence of very weak GNSS satellite signals, there is no inband interference signal in the GNSS receiver frontends.

In case of mobile phone systems, GNSS signals coexist with strong jammer signals from other RF applications, e.g. 3G/4G, wireless LAN, etc. The above out-of-band jammer signals can mix to produce intermodulation products in the GNSS receiver frequency band. Compared with the received signal level from GNSS satellites, the resulted intermodulation products are significant interference, LNAs with high robustness against out-of-band interference signals are required.

**Low Current Consumption**

Power consumption is an important feature in many GNSS systems that are mainly battery-operated mobile devices. Infineon’s LNAs have an integrated power on/off feature which provides for low power consumption and increased stand-by time for GNSS handsets. Moreover, the low current consumption (e.g. 1.1 mA) makes Infineon’s LNAs suitable for portable devices such as GNSS enabled wearables and connected IoT devices.

Please visit [www.infineon.com](http://www.infineon.com) for more details on LNA products for navigation in mobile phones and portable devices.
2 BGA123L4 Overview

2.1 Features

- Operating frequencies: 1550 - 1615 MHz
- Ultra low current consumption: 1.1 mA
- Wide supply voltage range: 1.1 V to 3.6 V
- High insertion power gain: 18.2 dB
- Low noise figure: 0.75 dB
- 2 kV HBM ESD protection (including AI pin)
- Ultra small TSLP-4-11 leadless package (footprint: 0.7 x 0.7 x 0.31 mm³)
- RF output internally matched to 50 Ohm
- Only one external SMD component necessary
- Pb-free (RoHS complaint) package
- B7HF Silicon Germanium technology

2.2 Key Applications of BGA123L4

BGA123L4 is designed to enhance GNSS signal sensitivity especially in wearables and mobile cellular IoT devices. With 18.2 dB gain and only 0.75 dB noise figure it ensures high system sensitivity. The current needed is only 1.1 mA which means just 1.3 mW power consumption, which is critical to help to conserve batteries. The wide supply voltage range of 1.1 V to 3.6 V ensures flexible design and high compatibility. It supports all GNSS systems including GPS, GLONASS, Beidou and Galileo.
BGA123L4 Overview

2.3 Description

The BGA123L4 is an ultra low noise amplifier for Global Navigation Satellite Systems (GNSS) which covers all GNSS frequency bands from 1550 MHz to 1615 MHz like GPS, GLONASS, Beidou, Galileo and others. The LNA provides 18.2 dB gain and 0.75 dB noise figure at a current consumption of only 1.1 mA in the application configuration described in Figure 4. The BGA123L4 is based upon Infineon Technologies’ B7HF Silicon Germanium technology. It operates from 1.1 V to 3.6 V supply voltage.

3 Application Circuit and Performance Overview

In this chapter the performance of the application circuit, the schematic and bill-on-materials are presented.

**Device:** BGA123L4

**Application:** GNSS Applications

**PCB Marking:** GL05

**EVB Order No.:** AN551

### 3.1 Summary of Measurement Results

The performance of BGA123L4 for GNSS applications is summarized in the following table.

Note: DC block function is NOT integrated at input of BGA123L4. The DC block might be realized with pre-filter in GNSS applications.

Note: The RF bypass capacitor C2 at the DC power supply pin filters out the power supply noise and stabilizes the DC supply. The RF bypass capacitor C2 is not necessary if a clean and stable DC supply can be ensured.
