# OneEye\_DAS\_Shell\_1 for KIT\_AURIX\_TC334\_LK Shell via DAS interface using OneEye

AURIX<sup>™</sup> TC3xx Microcontroller Training V1.0.0

Please read the Important Notice and Warnings at the end of this document

A Shell is used to parse a command line and call the corresponding command execution. A OneEye pipe is used to interface OneEye with the Shell through the DAS interface.

After configuring the OneEye DAS interface, the Shell from iLLDs is used to interpret and manage commands like "info" or "help". The example creates a OneEye pipe and the corresponding DPipe that is used to interface the shell.

### Introduction

- OneEye is a GUI that enables the creation of interactive Graphical User Interface. Graphical elements can be drag from a toolbox and drop onto the GUI. The behavior of the created GUI can be customized. Different communication interfaces like UART, Ethernet, CAN, DAS can be used to interact with the embedded system
- The DAS (Device Access Server) can be used in line with Infineon Microcontroller Starter Kits, Application Kits and DAP MiniWiggler to access the micro controller resources
- Recommendation: It is recommended to go through some of the basic tutorials listed in the help embedded in OneEye (Menu: Help -> OneEye help). This enables a quicker rampup in the OneEye concept and ensure a nice journey with OneEye

### Hardware setup

This code example has been developed for the board KIT\_A2G\_TC334\_LITE.

The board should be connected to the PC through the USB port 1

#### Configuring the OneEye pipe

A OneEye pipe (*Ifx\_OneEyeDasPipe*) is a special object that is recognized by OneEye and enables streaming of data between OneEye and the microcontroller. The OneEye pipe is initialized with *Ifx\_OneEyeDasPipe\_init()*. The *size* parameter passed for the configuration corresponds to the buffer allocated for the data transmission, in this example 2 buffers of 512 bytes are allocated, one for TX and one for the RX direction. The *Ifx\_OneEyeDasPipe\_h* file can be found in the Libraries\OneEye directory.

### Configuring the DPipe

A DPipe is initialized with *lfx\_OneEyeDasPipe\_stdlfDPipeInit()*. The DPipe enables access by the shell to the OneEye Pipe.

### Configuring the Shell

The shell is initialized with *lfx\_Shell\_init()* passing a pointer to the previously initialized DPipe.

### **Running the Shell**

The shell is executed in the background loop by calling *lfx\_Shell\_process()*.

# Run and Test

- After code compilation, flash the device using the Flash button 1 to ensure that the program is running on the device
- For this training, the OneEye application is required for visualizing the values. OneEye can be opened inside the AURIX<sup>™</sup> Development Studio using the following icon:

In this training, the OneEye configuration is provided inside the Libraries folder. The following steps are needed to configure the OneEye from a brand-new configuration.

### Setup OneEye for editing

Select the OneEye menu "**Options -> Edit mode**" (if not already checked) to enable the edit mode. Select the OneEye menu "**View -> Browser box**", "**View -> Property box**", "**View -> Tool box**" (if not already checked) to display the browser, property box, and tool box. Close the Welcome screen if it was shown.

layout		

#### Configuring the DAS interface

When the OneEye configuration is created by ADS, it is already setup with a DAS interface. Select the DAS interface in the Browser box \_\_\_\_\_.

Notice the "system-key" {ADS} that enables the connection to the device in parallel with the ADS debugger.

#### Create a debug box to get access to variables from the .elf file

A debugBox item is already setup by default when ADS creates the OneEye configuration, preconfigured with the project .elf file path.

Select the DAS interface in the Browser box

Set the id property to "elf", which enables to group variables into the signal tree later.

#### Open the debug box viewer and connect to the device

Select the OneEye menu "**View -> Debug box viewer**" (if not already checked) to display the debug box. Select the debug box with the id "(elf)" 1 if not yet selected by default. Note that the debug box enables the selection of the .elf file to be used to get information about the variables.

The **Filter** field 2, enables to filter variables by name. E.g. in this example, entering "g\_" will filter for global variables.

To enable the connection with the microcontroller and have read / write access to variables, check the "DAS connection status" box 3.

Del	oug box viewer							
(e	lf) 1						~	
	3 DAS connection status: I   G Clear							
	Name	Size	^	Name	Value	Address		
	g_oneEyeDasPipe	60		g_oneEyeDasPipe	-	0x700005FC		
	g_shellCommands	48						
	g_cpuSyncEvent	4	$\checkmark$					

#### **Create signals for the Pipe**

In the debug box, search for the **g\_oneEyeDasPipe**<sup>1</sup> variable, right click on it and select "**Create pipe for: g\_oneEyeDasPipe**". The watch should appear on the right side of the debug box \_\_\_\_\_\_. Watches are periodically polled for new values on the micro controller.

Two signals are also automatically created to access the pipe **3**, one for the OneEye to microcontroller direction (*ToTarget*), and one for the microcontroller to OneEye direction (*FromTarget*).

#### Create a text box to display the shell text

Drag and drop a **textEdit** item from the toolbox onto the layout, and set its **data-in** property to **elf.g\_oneEyeDasPipe.FromTarget**.

OneEye		- 🗆	×
File Options View Help

Tree View	FromTarget		~
Browser box & X			
Path     Object     Title       > signals			

#### Create a line edit to enter key stroke to the shell

Drag and drop a **lineEdit** item from the toolbox onto the layout, and set its **data-out** property to **elf.g\_oneEyeDasPipe.ToTarget**. **Check** the **capture-key** property to enable each key stroke to be send.

OneEye						_		$\times$

#### Test the shell interface

The shell textbox should display the "Hello World !" text **1**, if it is not the case, check that the "**DAS connection status**" is checked in the debug box viewer.

Enter "info" in the **ToTarget** lineEdit field 2 and press ENTER, the microcontroller will execute the **printShellInfo()** function and should answer as below to acknowledge the command.

OneEye				_		×
File Options View Help	-					
Tool box 🗗 🗙		Hello World !	Property box			đΧ

<	ToTarget		max	0		<b>v</b>

Save your configuration with CTRL+S.

Exit the edit mode with the OneEye menu "**Options -> Edit mode**" and close the "**Debug box viewer**" to only see the GUI 3.
