HITFET™ - BTS3011TE

Smart Low-Side Power Switch

1 Overview

Features
• Single channel device
• Digital Feedback
• Current limitation trigger concept
• 3.3 and 5 V compatible logic inputs
• Electrostatic discharge protection (ESD)
• Green Product (RoHS compliant)
• AEC Qualified

Applications
• Suitable for resistive, inductive and capacitive loads
• Replaces electromechanical relays, fuses and discrete circuits
• Most suitable for inductive loads as well as loads with inrush currents

Description
The BTS3011TE is a 11 mΩ single channel Smart Low-Side Power Switch with in a PG-TO252-5 package providing embedded protective functions. The power transistor is built by an N-channel vertical power MOSFET.

The device is monolithically integrated. The BTS3011TE is automotive qualified and is optimized for 12 V automotive and industrial applications.

HITFET™ - BTS3011TE
Smart Low-Side Power Switch

Overview

Diagnostic Functions

• Short circuit to battery
• Over temperature
• Stable latching diagnostic signal

Protection Functions

• Over temperature shutdown with delayed auto restart
• Active clamp over voltage protection of the OUTput
• Current limitation with current limitation trigger
• Enhanced short circuit protection

Detailed Description

The device is able to switch all kind of resistive, inductive and capacitive loads, limited by maximum clamping energy and maximum current capabilities.

The BTS3011TE offers dedicated ESD protection on the IN, VDD and STATUS pin referring to the Ground pin, as well as an over voltage clamping of the Drain/OUT to Source/GND.

The over voltage protection gets activated during inductive turn off conditions or other over voltage events (such as load dump). The power MOSFET is limiting the drain-source voltage, if it rises above the V_{OUT(CLAMP)}.

The over temperature protection prevents the device from overheating due to overload and/or bad cooling conditions.

The BTS3011TE has a delayed auto restart thermal shut-down function. The device will turn on again, If the input pin is still high after a delayed time t_{D(RESTART)} considering the junction temperature has dropped below the thermal hysteresis.

1) Not subject to production test, specified by design.
2) \(V_{\text{BAT(LD)}}\) is setup without the DUT connected to the generator per ISO7637-1;
\(R_i\) is the internal resistance of the load dump test pulse generator;
\(t_d\) is the pulse duration time for load dump pulse (pulse 5) according ISO 7637-1, -2.
3) ESD susceptibility, HBM according to ANSI/ESDA/JEDEC JS-001 (1.5 k\(\Omega\), 100 pF)
4) ESD susceptibility, Charged Device Model “CDM” ESDA STM5.3.1 or ANSI/ESD S.5.3.1

Notes
1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

1) Not subject to production test, specified by design.
2) Specified $R_{\text{thJSP}}$ value is simulated at natural convection on a cold plate setup (all pins are fixed to ambient temperature). $T_c = 85^\circ$C. Device is loaded with 1 W power.
3) Specified $R_{\text{thJA}}$ value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; The product (Chip and Package) was simulated on a 76.2 x 114.3 x 1.5 mm board with 2 inner copper layers (2 x 70 µm Cu, 2 x 35 µm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer. $T_a = 85^\circ$C. Device is loaded with 1 W power.
4) Specified $R_{\text{thJA}}$ value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; The product (Chip and Package) was simulated on a 76.2 x 114.3 x 1.5 mm board with additional heatspreading copper area of 600mm^2 and 70 µm thickness. $T_a = 85^\circ$C. Device is loaded with 1 W power.
4.3.1 PCB set up (from THB report)

The following PCB set up was implemented to determine the transient thermal impedance.

**Figure 4** Cross section JEDEC 2s2p.

**Figure 5** Cross section JEDEC 1s0p.

**Figure 6** PCB layout.
4.3.2 Transient Thermal Impedance

Figure 7  Typical transient thermal impedance $Z_{thJA} = f(t_p)$, $T_a = 85 \, ^\circ C$
Value is according to Jedec JESD51-2,-7 at natural convection on FR4 2s2p board; The product (Chip and Package) was simulated on a 76.2 x 114.3 x 1.5 mm$^3$ board with 2 inner copper layers (2 x 70 um Cu, 2 x 35 um Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer. Device is dissipating 1 W power.

Figure 8  Typical transient thermal impedance $Z_{thJA} = f(t_p)$, $T_a = 85 \, ^\circ C$
Value is according to Jedec JESD51-3 at natural convection on FR4 1s0p board. Device is dissipating 1 W power.
5 Power Stage

5.1 Output On-state Resistance

The on-state resistance depends on the supply voltage as well as on the junction temperature $T_J$. Figure 9 shows this dependencies in terms of temperature and voltage for the typical on-state resistance $R_{DS(ON)}$. The behavior in reverse polarity is described in chapter “Reverse Current Capability” on Page 16.

![Figure 9 Typical On-State Resistance, $R_{DS(ON)} = f(T_J)$; $V_{DD} = 5$ V, 3 V; $V_{IN} = high$](image)

A high signal at the input pin causes the power DMOS to switch ON with a dedicated slope. To achieve the specified $R_{DS(ON)}$ and switching speed, a 5 V supply is required.
5.2 Resistive Load Output Timing

Figure 10 shows the typical timing when switching a resistive load.

![Figure 10](Switching.emf)

Figure 10  Definition of Power Output Timing for Resistive Load

5.3 Inductive Load

5.3.1 Output Clamping

When switching off inductive loads with low side switches, the drain-source voltage $V_{\text{OUT}}$ rises above battery potential, because the inductance intends to continue driving the current. To prevent unwanted high voltages the device has a voltage clamping mechanism to keep the voltage at $V_{\text{OUT(CLAMP)}}$. During this clamping operation mode the device heats up as it dissipates the energy from the inductance. Therefore the maximum allowed load inductance is limited. See Figure 11 and Figure 12 for more details.

![Figure 11](Output Clamp Circuitry.emf)

Figure 11  Output Clamp Circuitry
5.3.2 Maximum Load Inductance

While demagnetization of inductive loads, energy has to be dissipated in the BTS3011TE. This energy can be calculated by the following equation:

\[
E = V_{OUT(CLAMP)} \times \left[ \frac{V_{BAT} - V_{OUT(CLAMP)}}{R_L} \right] \times \ln \left( 1 - \frac{R_L \times I_L}{V_{BAT} - V_{OUT(CLAMP)}} \right) + I_L \times \frac{L}{R_L}
\]

(5.1)

Following equation simplifies under assumption of \( R_L = 0 \)

\[
E = \frac{1}{2} L I_L^2 \times \left( 1 - \frac{V_{BAT}}{V_{BAT} - V_{OUT(CLAMP)}} \right)
\]

(5.2)

**Figure 12** Switching an Inductive Load

**Note:** Repetitive switching of inductive load by VDD instead of using the input is a not recommended operation and may affect the device reliability and reduce the lifetime.

**Figure 13** shows the inductance / current combination the BTS3011TE can handle.

For maximum single avalanche energy please also refer to \( E_{AS} \) parameter in **Page 8**
Figure 13  Maximum load inductance for single pulse

\[ L = f(I_L); \]
\[ T_{J(0)} = 150^\circ C; V_{BAT} = 13.5 \text{ V} \]

5.4 Reverse Current Capability

A reverse battery situation means the OUT pin is pulled below GND potential to \(-V_{BAT}\) via the load \(Z_L\).

In this situation the load is driven by a current through the intrinsic body diode of the BTS3011TE and all protection, such as current limitation, over temperature or over voltage clamping, are not active.

OT is active in inverse current if DMOS is ON.

In certain application case (for example in a bridge or half-bridge configuration) the intrinsic reverse body diode is used for freewheeling of an inductive load. In this case the device is still supplied but an inverse current is flowing from GND to OUT(drain) and the OUT will be pulled below GND.

In inverse or reverse operation via the reverse body diode, the device is dissipating a power loss which is defined by the driven current and the voltage drop on the body diode \(-V_{DS}\).

The BTS3011TE is capable of switching ON during inverse current by setting the IN high. In this condition, the over temperature is active.

5.5 Characteristics

Please see “Power Stage” on Page 24 for electrical characteristic table.
Protection Functions

The device provides embedded protection functions. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operation. Protection functions are not to be used for continuous or repetitive operation.

6.1 Over Voltage Clamping on OUTPUT

The BTS3011TE is equipped with a voltage clamp circuitry that keeps the drain-source voltage $V_{DS}$ at a certain level $V_{OUT(CLAMP)}$. The over voltage clamping is overruling the other protection functions. Power dissipation has to be limited to not exceed the maximum allowed junction temperature.

This function is also used in terms of inductive clamping. Please see also “Output Clamping” on Page 14 for more details.

6.2 Thermal Protection

The device is protected against over temperature due to overload and/or bad cooling conditions by an integrated temperature sensor. The thermal protection is available if the device is active.

The device incorporates an absolute ($T_{J(SD)}$) and a dynamic temperature limitation ($\Delta T_{J(SW)}$). Triggering one of them will cause the output to switch off.

The BTS3011TE has a delayed thermal-restart function. If the input (IN) is still high the device will turn on again after a delayed time $t_{D(RESTART)}$ considering the junction temperature has dropped below the thermal hysteresis.

![Figure 14 - Thermal protective switch OFF scenario with thermal restart](image)

**Note:** For better understanding, the time scale is not linear. The real timing of this drawing is application dependant and cannot be described.
6.3 Overcurrent Limitation / Short Circuit Behavior

This device is providing a smart overcurrent limitation intended to provide protection against short circuit conditions while allowing also load inrush currents higher than the current limitation level. To achieve this, the device has a current limitation level \( I_{L(LIM)} \) which is triggered by a higher trigger level \( I_{L(LIM)_TRIGGER} \).

The condition short circuit is an overload condition on the device. If the load current \( I_L \) reaches the current limitation trigger level \( I_{L(LIM)_TRIGGER} \), the internal current limitation will be activated and the device limits the current to a lower value \( I_{L(LIM)} \). The device then starts heating up. When the thermal shutdown temperature \( T_{J(SD)} \) is reached, the device turns off. The time from the beginning of current limitation until the over temperature switch off depends strongly on the cooling conditions.

If input is still high, the device will turn on again after a delayed time \( t_{D(RESTART)} \) considering the junction temperature has dropped below the thermal hysteresis. The current limitation trigger is a latched signal. It will be only reset by input (IN) pin low and resetting the latch fault signal (STATUS pin = high. See Chapter 7 Diagnostics) at the same time. This means if the input stays high all the time during short circuit, the current will be limited to \( I_{L(LIM)} \) during the following pulses (while on thermal restart). It also means that the output current remains limited to the current limitation level \( I_{L(LIM)} \) as long as the current limitation trigger is not reset.

**Figure 15** shows this behavior.

---

**Figure 15** Short circuit protection via current limitation and thermal switch off, with latched fault signal on STATUS-pin
Behavior with overload current below current limitation trigger level

The lower current limitation level \( I_{L(LIM)} \) will be also triggered by a thermal shutdown. This could be the case in terms of overload with a current still below the current limitation trigger level \( (I_L < I_{L(LIM)TRIGGER}) \).

Note: For better understanding, the time scale is not linear. The real timing of this drawing is application dependant and cannot be described.

Figure 16  Example of overload behavior with thermal shutdown

Note: For better understanding, the time scale is not linear. The real timing of this drawing is application dependant and cannot be described.

6.4 Characteristics

Please see “Protection” on Page 26 for electrical characteristic table.
7 Diagnostics

The BTS3011TE provides a latching digital fault feedback signal on the STATUS pin triggered by an over temperature shutdown.

7.1 Functional Description of the STATUS Pin

The BTS3011TE provides digital status information via the STATUS pin to give an alarm feedback to a connected microcontroller. Please see Figure 17 “Feedback and control of STATUS pin” on Page 20

Normal operation mode

In normal operation (no fault is detected) the STATUS pin’s logic is set “high”. It is pulled up via an external Resistor ($R_{\text{STATUS}}$). Internally it is connected to an open drain MOSFET through an internal resistor.

Fault operation

In case of a thermal shutdown (fault), an internal MOSFET connected to the STATUS pin, pulls its voltage down to GND, providing a “low” level signal to the microcontroller. Fault mode operation remains active independent from the input pin state or internal restarts until it is reset.

Reset latch fault signal (external pull up)

To reset the latch fault signal of the BTS3011TE, the STATUS pin has to be pulled up to 5 V (recommended $V_{\text{DD}}$). Resetting the fault signal will not reset the current limitation trigger signal. To do so, the INPUT pin has to be set in logic “low” at the same time the STATUS pin is set “high”. In this case, the fault latch signal and the current limitation trigger will be reset (assuming the temperature has dropped below $\Delta T_{J,HYS}$). Please refer to Figure 15 and Figure 16.

![Image of circuit diagram](image)

Figure 17 Feedback and control of STATUS pin

For recommended values of external components please see “Application Information” on Page 40

7.2 Characteristics

Please see “Diagnostics” on Page 27 for electrical characteristic table.
8 Supply and Input Stage

8.1 Supply Circuit

The supply pin $V_{DD}$ is protected against ESD pulses as shown in Figure 18. The device supply is not internal regulated but directly taken from an external supply. Therefore a reverse polarity protected and buffered 5 V (or 3.3 V) voltage supply is required. To achieve the specified $R_{DS(ON)}$ and switching speed a 5 V supply is required.

The device shall be supplied via the $V_{DD}$ pin before applying an input signal $V_{IN}$ to ensure the correct functionality of the device.

![Supply Circuit Diagram](Supply_Stage.emf)

**Figure 18  Supply Circuit**

8.1.1 Undervoltage Shutdown

In order to ensure a stable and defined device behavior under all allowed conditions the supply voltage $V_{DD}$ is monitored.

The output switches off, if the supply voltage $V_{DD}$ drops below the switch-off threshold $V_{DD(TH)}$. In this case also all latches will be reset. The device functions are only given for supply voltages above the supply voltage threshold $V_{DD(SD)\text{MAX}}$. There is no failure feedback ensured for $V_{DD} < V_{DD(SD)}$. 
8.2 Input Circuit

Figure 19 shows the input circuit of the BTS3011TE. Due to an internal pull-down it is ensured that the device switches off in case of open input pin. A Zener structure protects the input circuit against ESD pulses. As the BTS3011TE has a supply pin, the $R_{DS(ON)}$ of the power MOS is independent of the voltage on the IN pin (assumed $V_{DD}$ is sufficient).

![Input circuit diagram](Input.emf)

Figure 19  Simplified INput circuitry
Supply and Input Stage

8.3 Characteristics

Please see “Supply and Input Stage” on Page 28 for electrical characteristic table.
9  Electrical Characteristics

Note: Characteristics show the deviation of parameter at given input voltage and junction temperature. Typical values show the typical parameters expected from manufacturing and in typical application condition. All voltages and currents naming and polarity in accordance to Figure 3 “Naming Definition of electrical parameters” on Page 7

9.1  Power Stage

Please see Chapter “Power Stage” on Page 13 for parameter description and further details.

1) Not subject to production test, calculated by $R_{thJA}$ and $R_{DS(ON)}$

2) Not subject to production test, specified by design

3) Not subject to production test, calculated slew rate between 90% and 50%; $dV/dt = (V_{OUT(90%)} - V_{OUT(50%)}) / |(t_{90%} - t_{50%})|$

4) Not subject to production test, calculated slew rate between 50% and 90%; $dV/dt = (V_{OUT(50%)} - V_{OUT(90%)}) / |(t_{50%} - t_{90%})|$
9.2 Protection

Please see Chapter “Protection Functions” on Page 17 for parameter description and further details.

Note: Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

### Table 7 Electrical characteristics: Protection

\( T_j = -40°C \) to +150°C, \( V_{DD} = 3.0 \text{ V} \) to 5.5 V; \( V_{BAT} = 6 \text{ V} \) to 18 V, all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

11 Application Information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

Application Diagram

An application example with the BTS3011TE is shown below.

![Application Diagram](image)

Figure 42 Simplified application diagram

Note: This is a very simplified example of an application circuit. The function must be verified in the real application.

</table>

11.1 Design and Layout Recommendations/Considerations

As consequence of the fast switching times for high currents, special care has to be taken with the PCB layout. Stray inductances have to be minimized.
12 Package Outlines BTS3011TE

Figure 43 PG-TO252-5

Transistor Outline Package

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

For further information on alternative packages, please visit our website: [http://www.infineon.com/packages](http://www.infineon.com/packages).
