

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Objective

This code example demonstrates the features of PSoC® Analog Coprocessor by designing an analog front end (AFE) for an ambient light sensor (ALS).

Overview

The ALS output is a weak current signal proportional to the ambient light illuminance. This code example provides an AFE design consisting of a trans-impedance amplifier (TIA) to condition the ALS output signal. The conditioned signal from the TIA is measured using a 12-bit SAR ADC. The resulting ADC output is calibrated into percentage for the ambient light illuminance range of 0 to 1000 lux. For the demonstration, the LED intensity is changed based on the calculated percentage value.

Requirements

Tool: PSoC Creator 3.3 SP2.3

Programming Language: C (GCC 4.7.3)

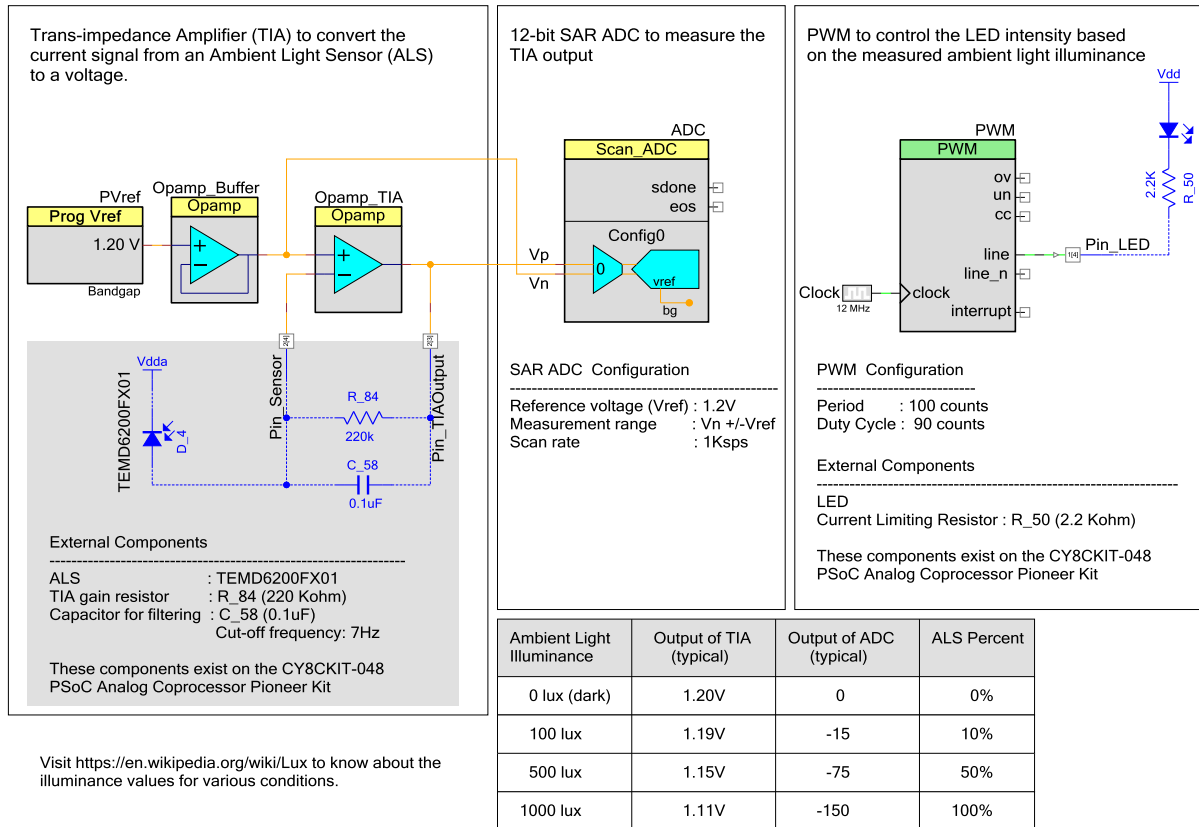

Associated Parts: All PSoC Analog Coprocessor parts

Related Hardware: [CY8CKIT-048 PSoC Analog Coprocessor Pioneer Kit](#)

Design

TIA is implemented using one of the four opamps available in the PSoC Analog Coprocessor device and the external passive components. The external passive components are required for setting the TIA gain and to filter the sensor signal. The non-inverting input of the TIA is driven by a buffered 1.20-V bandgap voltage signal, which causes a DC bias of 1.20 V at the TIA output. The Bandgap voltage signal is generated using a Programmable Voltage Reference (PVref) Component and it is buffered using an Opamp Component. With the increasing ambient light illuminance, the reverse current through the ALS results in the TIA output voltage to drop proportionally from 1.20 V, which is measured using a 12-bit SAR ADC. The PWM Component is placed to drive an external LED.

Figure 1. ALS Sensor Interface Schematic

In the firmware, the measured TIA output is filtered and calibrated in terms of percentage. The calculated percentage value is used to change the duty cycle of the PWM driving the LED.

Design Considerations

- **TIA Gain.** It sets the sensitivity of the ALS current measurement; higher the gain, better the sensitivity. In this code example, the TIA gain is changed using the feedback resistor R_84 (see Figure 1).
- **System Response Speed.** The response speed depends on the filter capacitor C_58 (see Figure 1) and the IIR low-pass filter implemented in firmware.
- **Low-Power Operation.** This code example can be easily modified to use the low-power modes - Sleep and Deep-Sleep. To use the Sleep mode, keep the CPU in Sleep mode until the new ADC result is available. Enable the ADC interrupt to wake up the CPU for processing the ADC result. To use the Deep-Sleep mode, enable the Deep-Sleep operation of the Opamp and use a watchdog timer (WDT) to wake up the CPU at regular intervals for the measurement.
- **Design Extension.** The project can be extended to create a closed-loop system, such as the backlight controller, by using the PWM signal to drive an external buck/boost switching circuit.

This code example is designed for use with the **CY8CKIT-048 PSoC Analog Coprocessor Pioneer Kit**. The kit has the required external components. If you are using other development platform, wire the external components to the device as Figure 1 shows.

Components

Table 1 lists the PSoC Creator Components used in this example, as well as hardware resources used by each of them.

Table 1. List of PSoC Creator Components

Component	Instance Name	Version	Hardware Resources
Opamp	Opamp_TIA	v1.20	½ Continuous Time Block (CTB)
PVref	PVref	v1.0	¼ Programmable reference block (PRB)
Opamp	Opamp_Buffer	V1.20	½ Continuous Time Block (CTB)
Scanning SAR ADC	ADC	v1.0	1 SAR ADC
PWM (TCPWM Mode)	PWM	v2.10	1 TCPWM
Clock	Clock	v2.20	1 Peripheral Clock Divider
Analog Pin	Pin_Sensor Pin_TIAOutput	v2.20	2 Pins
Digital Output Pin	Pin_LED	v2.20	1 Pin

Parameter Settings

The following figures show the changed settings for the major Components used in this example.

Figure 2. Opamp_TIA Configuration

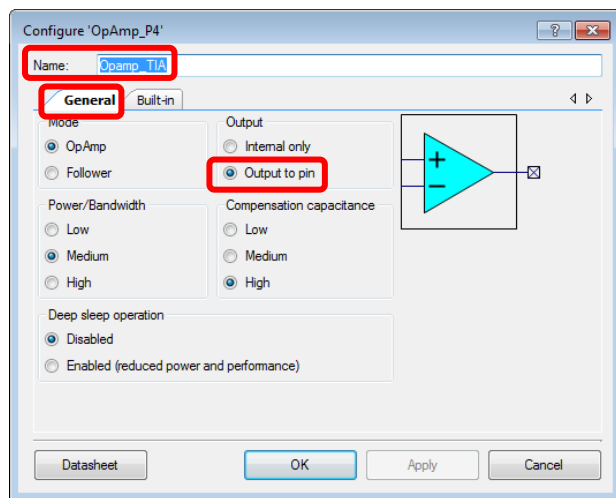

Figure 3. PVref Configuration

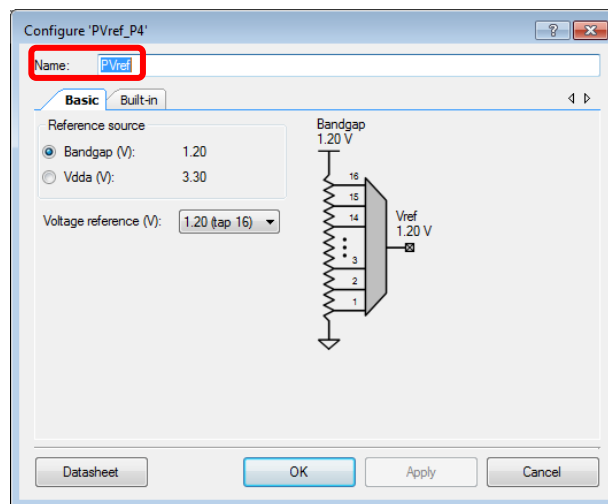

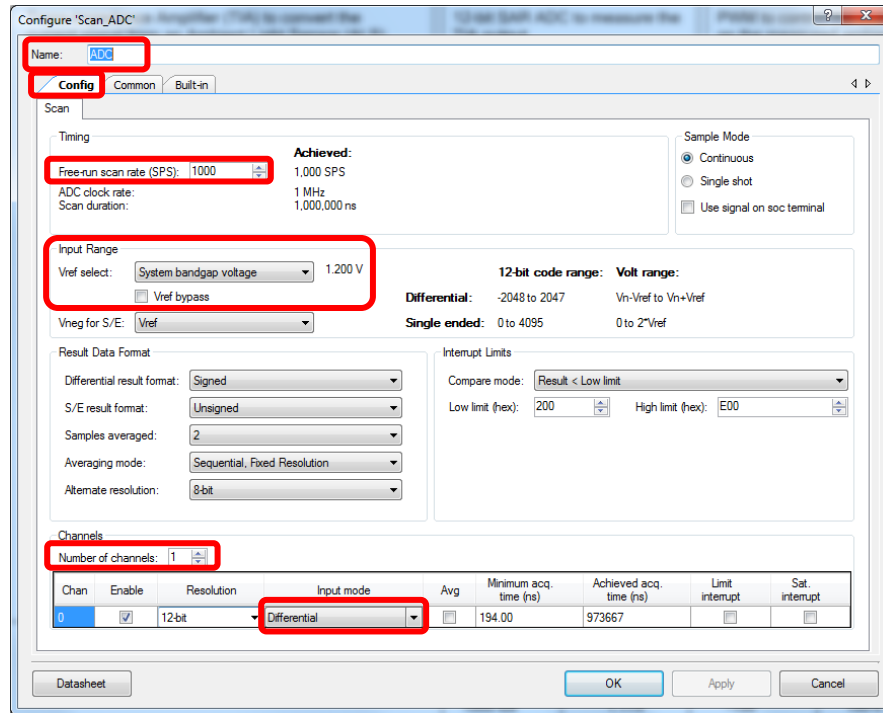

Figure 4. ADC Configuration

Operation

Do the following:

1. Connect the PSoC Analog Coprocessor Pioneer board to your computer's USB port as Figure 5 shows.

Figure 5. CY8CKIT-048 PSoC Analog Coprocessor Pioneer Board

2. Build the project, and program the device
3. Move your hand over the ambient light sensor (ALS), and observe that the red LED intensity varies accordingly. You may need to move the test setup to a location with sufficient ambient light.

PSoC Resources

Cypress provides a wealth of data at www.cypress.com to help you to select the right PSoC device for your design, and quickly and effectively integrate the device into your design. For a comprehensive list of resources, see [KBA86521](#), [How to Design with PSoC 3](#), [PSoC 4](#), [PSoC 5LP](#) and [PSoC Analog Coprocessor](#). The following is an abbreviated list for PSoC Analog Coprocessor:

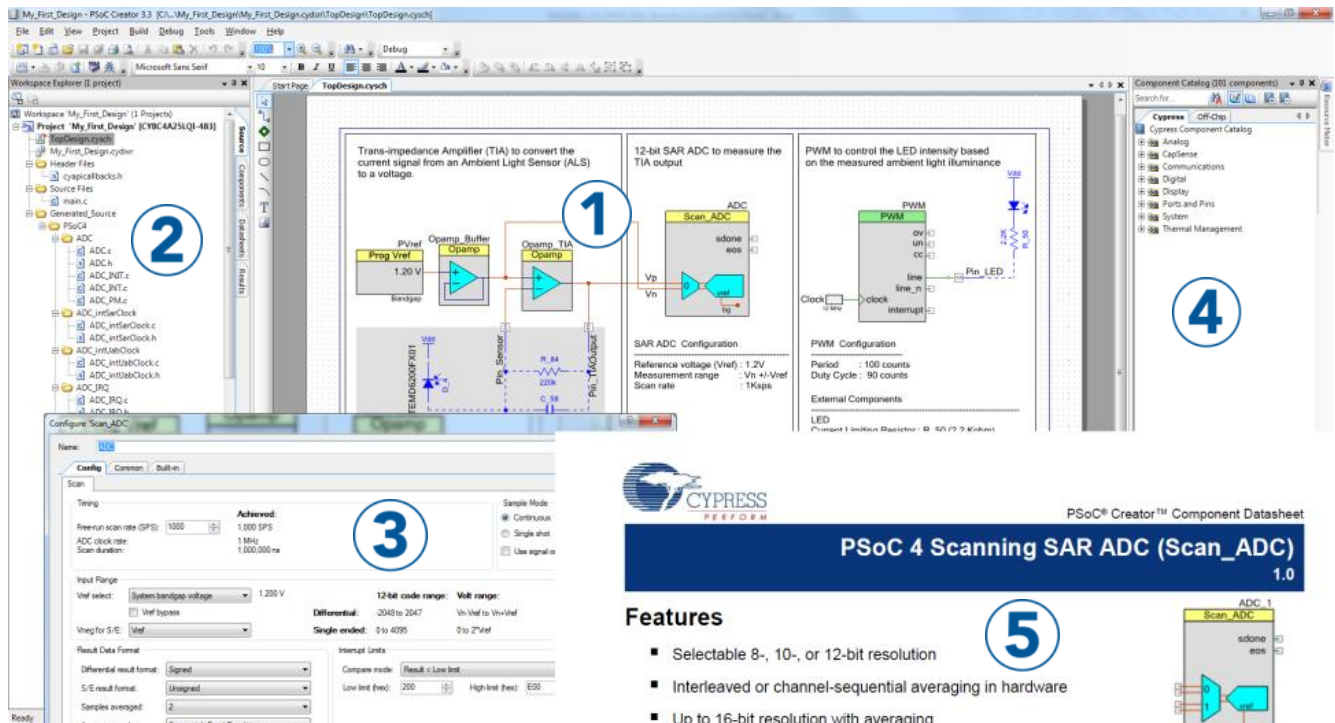

- **Overview:** [PSoC Portfolio](#), [PSoC Roadmap](#)
- **Product Selectors:** [PSoC 1](#), [PSoC 3](#), [PSoC 4](#), [PSoC 5LP](#), or [PSoC Analog Coprocessor](#). In addition, [PSoC Creator](#) includes a device selection tool.
- **Datasheets** describe and provide electrical specifications for the PSoC 3, PSoC 4, PSoC 5LP, and PSoC Analog Coprocessor device families.
- **CapSense® Design Guides:** Learn how to design capacitive touch-sensing applications with the [PSoC 3](#), [PSoC 4](#), [PSoC 5LP](#), and [PSoC Analog Coprocessor](#) families of devices.
- **Application Notes** and **Code Examples** cover a broad range of topics, from basic to advanced level. Many of the application notes include code examples.
- **Technical Reference Manuals (TRM)** provide detailed descriptions of the architecture and registers in each of the PSoC 3, PSoC 4, PSoC 5LP, and PSoC Analog Coprocessor device families.
- **Development Kits:** The [CY8CKIT-048](#) PSoC Analog Coprocessor Pioneer Kit is an easy-to-use and inexpensive development platform. This kit can function as a standalone kit or as an Arduino shield.

PSoC Creator

[PSoC Creator](#) is a free Windows-based Integrated Design Environment (IDE). It enables concurrent hardware and firmware design of systems based on PSoC 3, PSoC 4, PSoC 5LP, and PSoC Analog Coprocessor (see [Figure 6](#)). With PSoC Creator, you can:

1. Drag and drop Components to build your hardware system design in the main design workspace
2. Codesign your application firmware with the PSoC hardware
3. Configure Components using configuration tools
4. Explore the library of 100+ Components
5. Review Component datasheets

Figure 6. PSoC Creator Features

The screenshot displays the PSoC Creator 3.3 IDE interface. The main workspace shows a hardware design with a Trans-impedance Amplifier (TIA) and a 12-bit SAR ADC. The TIA is configured to convert the current signal from an Ambient Light Sensor (ALS) to a voltage. The ADC is configured to measure the TIA output. The design is annotated with numbered circles 1 through 5, corresponding to the features listed in the adjacent table.

Feature Number	Description
1	Drag and drop Components to build your hardware system design in the main design workspace
2	Codesign your application firmware with the PSoC hardware
3	Configure Components using configuration tools
4	Explore the library of 100+ Components
5	Review Component datasheets

The configuration tool for the Scan_ADC component is shown, displaying settings for the 12-bit SAR ADC. The input range is set to 0 to 2Vref, and the output range is set to 0 to 4095. The result data format is set to Signed, and the S/E result format is set to Integer. The sample mode is set to Continuous.

The PSoC 4 Scanning SAR ADC (Scan_ADC) 1.0 component datasheet is also displayed, showing the features:

- Selectable 8-, 10-, or 12-bit resolution
- Interleaved or channel-sequential averaging in hardware
- Up to 16-bit resolution with averaging
