

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Objective

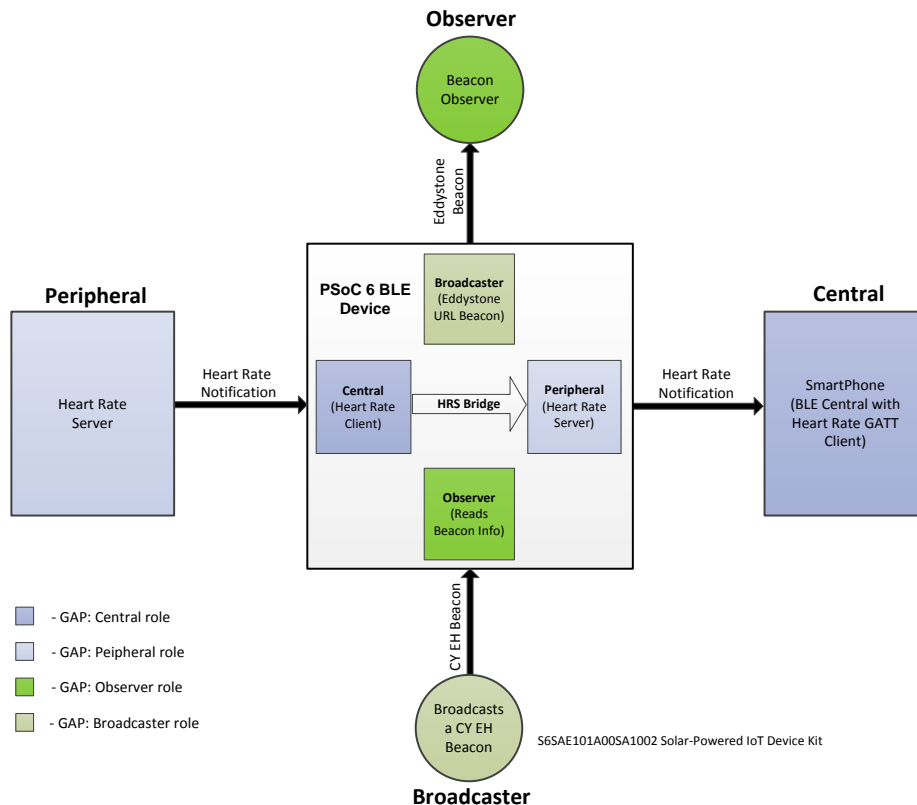

This example demonstrates the capability of the PSoC 6 BLE device to be in all Generic Access Profile (GAP) roles (Central, Peripheral, Observer, and Broadcaster) simultaneously.

Overview

This example demonstrates the device communication with the four peer Bluetooth Low Energy (BLE) devices, each operating in a different GAP role:

- The Central connection supports a [Heart Rate Sensor \(HRS\)](#) Generic Attribute Profile (GATT) Client and works with the existing HRS Sensor code example (CE217639) that runs on the PSoC 6 BLE device.
- The Peripheral connection supports the Heart Rate Sensor (HRS) GATT Server, which acts as a bridge to transfer data received from the peer Peripheral to the peer Central device. The peer Central device can be either a CySmart host emulation tool or Heart Rate Collector code example (CE217639) that runs on the PSoC 6 BLE device. This code example simulates heart-rate data and sends it to the peer Central device, or operates as a bridge for HRS data when a Peripheral device is connected.
- The Broadcaster profile continuously broadcasts the [Eddystone URL](#) beacon with [Cypress web page](#).
- The Observer profile parses [Cypress Energy Harvesting Beacon](#) or [AltBeacon](#) and displays the beacon Universally Unique Identifier (UUID) and the Received Signal Strength Indication (RSSI) value.

Figure 1. Multi-Role Block Diagram

Requirements

Tool: PSoC Creator™ 4.2 or later

Programming Language: C (ARM® GCC 5.4-2016-q2-update or later)

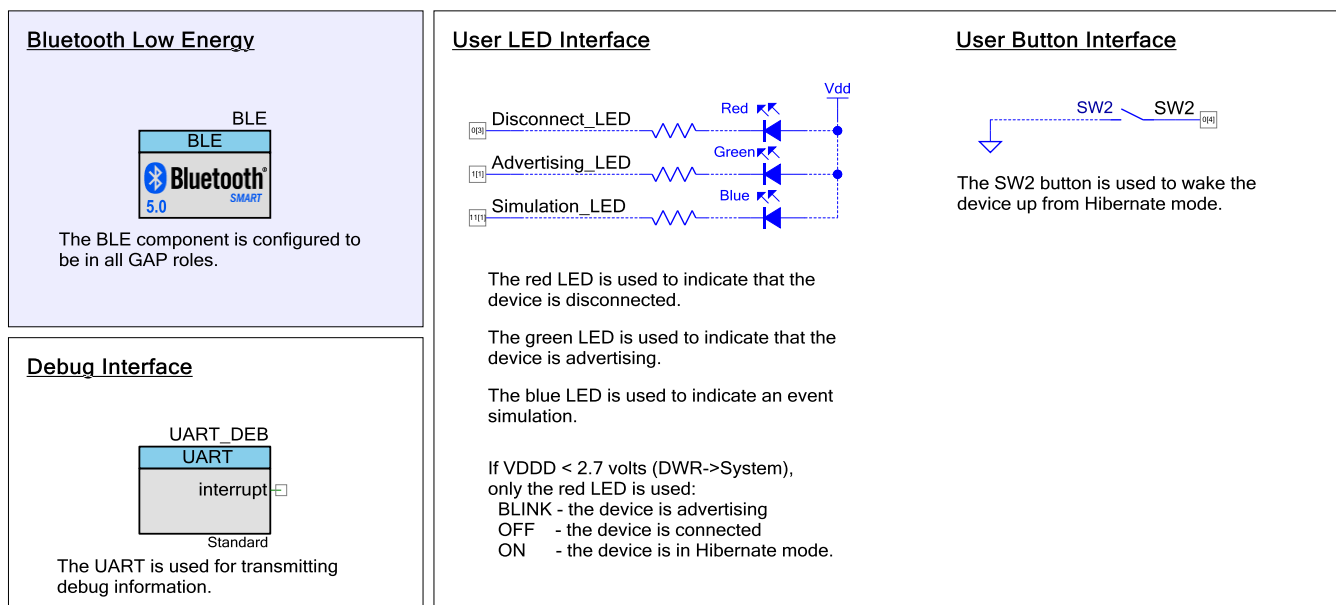

Associated Parts: All PSoC 6 parts

Related Hardware: CY8CKIT-062 PSoC® 6 BLE Pioneer Kit

Design

Figure 2 shows the top design schematic.

Figure 2. BLE Multi-Role Code-Example Schematic

After a startup, the *main()* function initializes the BLE Component. To operate, the Component requires several callback functions to receive events from the BLE Stack. *AppCallBack()* receives general BLE events. *HeartRateCallBack()* and *BasCallBack()* receive events specific to the service's attribute operations. The example uses the UART Component for displaying debug information and entering commands through the Terminal emulator application. Table 1 lists the terminal commands.

Table 1. Terminal Commands List

Command	Description
a	Start connectable advertisement as a Heart Rate Monitor (HRM) Server.
s	Start scanning for an HRM sensor.
c	Send a connect request to the peer device (HRM sensor).
b	Start broadcasting as Eddystone URL Beacon .
o	Start scanning in the Observer role.
d	Send a disconnect request to the peer device.
p	Print the list of connected devices.
1	Stop scanning.
2	Stop advertising.

The above list is prompted to the Terminal emulator when you enter 'h' in the application.

Design Considerations

Using UART for Debugging

Download and install a serial port communication program. Freeware such as Bray's Terminal and PuTTY are available on the web.

1. Connect the PC and kit with a USB cable.
2. Open the device manager program in your PC, find a COM port that the kit is connected to, and note the port number.
3. Open the serial port communication program and select the previously noted COM port.
4. Configure the Baud rate, Parity, Stop bits, and Flow control information in the Putty configuration window. The default settings: Baud rate – 115200, Parity – None, Stop bits – 1, Flow control – XON/XOFF. These settings must match the configuration of the PSoC Creator UART component in the project.
5. Start communicating with the device as explained in Operation.

UART debugging can be disabled by setting the `DEBUG_UART_ENABLED` to `DISABLED` in the `common.h` file.

Switching the CPU Cores Usage

This section describes how to switch between different CPU cores usage (Single core/ Dual core) in the BLE PDL examples.

The BLE component has the CPU Core parameter that defines the cores usage. It can take the following values:

- **Single core (Complete Component on CM0+)** – only CM0+ core will be used.
- **Single core (Complete Component on CM4)** – only CM4 core will be used.
- **Dual core (Controller on CM0+, Host and Profiles on CM4)** – both cores will be used: CM0+ for the Controller and CM4 for the Host and Profiles.

The BLE examples' structure allows easy switching between different CPU cores options.

Important to remember:

- All application host-files must be run on the host core.
- The BLESS interrupt must be assigned to the core where the controller runs.
- All additional interrupts (SW2, MCWDT, etc.) used in the example must be assigned to the host core.

Steps for switching the CPU Cores usage:

1. In the BLE customizer **General** tab, select appropriate CPU core option.
2. Change the cores Properties to CortexM4 or CortexC0p for the project folder Host Files in dependence of which CPU core was chosen in step 1. It should be:
 - for **Single core (Complete Component on CM0+)** option – **CM0+**
 - for **Single core (Complete Component on CM4)** option – **CM4**
 - for **Dual core (Controller on CM0+, Host and Profiles on CM4)** option – **CM4**
3. Assign the BLE_bless_isr and other peripheral (button – SW2, timer(s) etc.) interrupts to appropriate core in DWR-> interrupts tab:
 - for **Single core (Complete Component on CM0+)** option: BLE_bless_isr and peripheral interrupts on **CM0+**
 - for **Single core (Complete Component on CM4)** option: BLE_bless_isr and peripheral interrupts on **CM4**
 - for **Dual core (Controller on CM0+, Host and Profiles on CM4)** option: BLE_bless_isr interrupt on **CM0+**, other peripheral interrupts on **CM4**

Figure 3. Steps for Switching the CPU Cores Usage

Hardware Setup

The code example was created for the **CY8CKIT-062 PSoC® 6 BLE Pioneer Kit**.

Table 2 lists the pin assignment and connections required on the development board for the supported kits.

Table 2. Pin Assignment

Pin Name	Development Kit	Comment
	CY8CKIT-062	
\UART_DEB:rx\	P5[0]	
\UART_DEB:tx\	P5[1]	
\UART_DEB:rts\	P5[2]	
\UART_DEB:cts\	P5[3]	
Advertising_LED	P1[1]	The green color of the RGB LED
Disconnect_LED	P0[3]	The red color of the RGB LED
Simulation_LED	P11[1]	The blue color of the RGB LED
SW2	P0[4]	

LED Behavior for V_{DD} Voltage < 2.7 V

If the V_{DD} voltage is set to less than 2.7 V in the DWR settings of the **System** tab, only the red LED is used. The red LED blinks to indicate that the device is advertising. The red LED is OFF when a device is connected to a peer device. When the device is in Hibernate mode, the red LED stays ON.

Table 3 lists the PSoC Creator components used in this example and the hardware resources used by each of the components.

Table 3. PSoC Creator Components List

Component	Hardware Resources
UART_DEB	1 SCB
BLE	1 BLE, 1 Interrupt
SW2	1 pin
Disconnect_LED, Advertising_LED, Simulation_LED	3 pins

Parameter Settings

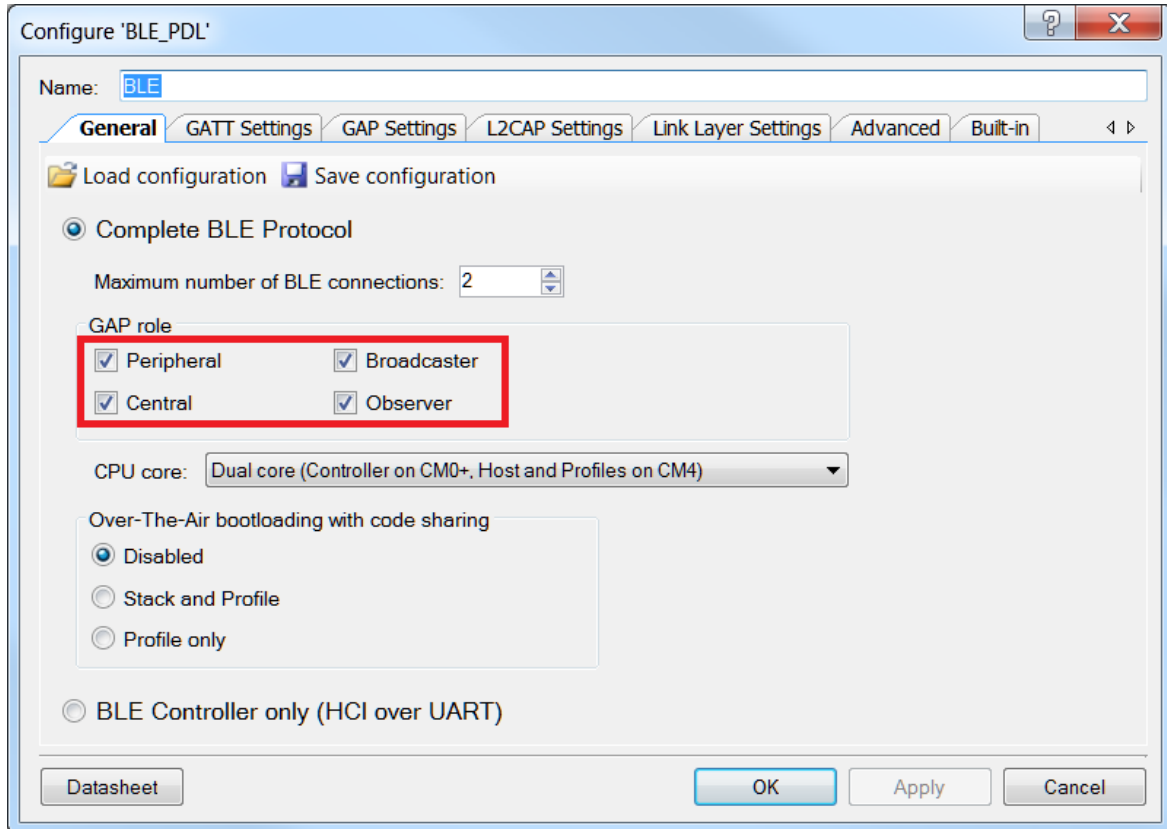

The BLE Component is configured to support the GAP Peripheral, Central, Broadcaster, and Observer roles:

- In the GAP Central role, the component operates as a GATT Client with the Heart Rate Service (HRS), Battery Service (BAS) and Device Information Service (DIS).
- In the GAP Peripheral role, the component operates as a GATT Server with the same set of services and additional Custom Service with a 16-bit UUID equal to 0xFEAA (Eddystone -URL Service).
- In the GAP Broadcaster role, the component uses the Broadcaster configuration 0 with the following parameters:
 - Advertising type: Non-connectable undirected advertising
 - Advertising packet:
 - Service UUID: Eddystone -URL Service
 - Service Data: Eddystone -URL Service, Data: 0x10, 0x00, 0x00, 'c', 'y', 'p', 'r', 'e', 's', 's', 0x00
 - In the GAP Observer role, the component uses the Observer configuration 0 with the following parameters:
 - Scanning state: Passive
 - Fast scan parameters:
 - Scan window: 5 ms
 - Scan interval: 5 ms

The BLE Component is also configured to have:

- Public Device Address: 00A050-000201
- Device name: BLE Multi Role
- Security Level: Unauthenticated pairing with encryption
- Bonding requirements: Bonding

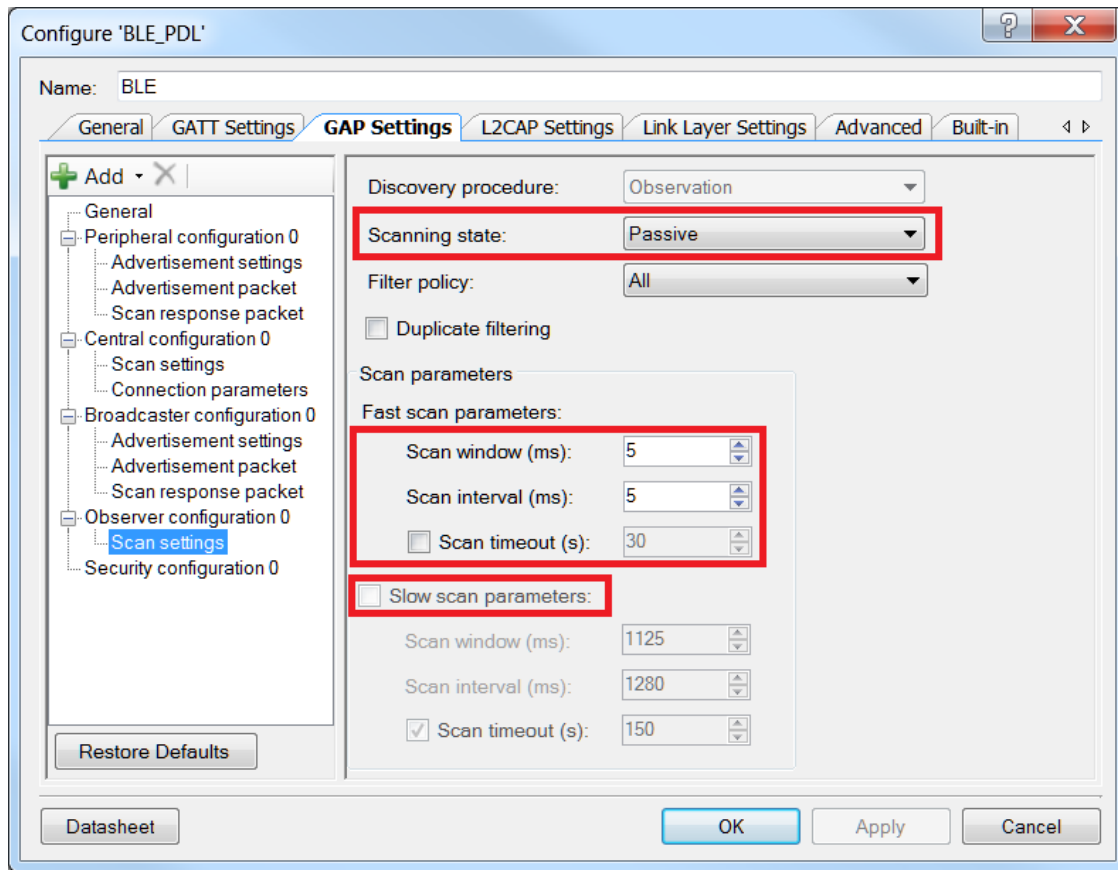

Figure 13. GAP Settings → Security Configuration

Operation

1. Build and program the BLE Multi-Role project into [CY8CKIT-062 PSoC® 6 BLE Pioneer Kit](#).
2. Build and program the BLE HRS Sensor project (CE217639) into the [CY8CKIT-062 PSoC® 6 BLE Pioneer Kit](#). The BLE HRS Sensor project has implemented simulation of all the constituents of the Heart Rate Measurement characteristic. The simulation includes the Heart Rate simulation, RR-Interval calculation, Energy Expended simulation, and simulation of rare sensor disconnection. The output of simulated data may appear in the debug serial terminal as follows:

```
CY_BLE_EVT_HRSC_NOTIFICATION: Heart Rate: 156 Energy Expended: 11040 RR-Interval 0: 384 RR-Interval 1: 385
CY_BLE_EVT_HRSC_NOTIFICATION: Sensor Contact is supported but not detected
```

The message “Sensor Contact is supported but not detected” is received during simulation of the rare sensor disconnection: the Heart Rate Measurement characteristic with the Flag “Sensor Contacts Status Bits” is equal to “Sensor Contact feature is supported, but not detected”. For details on the Heart Rate Service characteristic data structures and behavior, see n the [HRS Specification](#).

3. Run a serial port communication program (Bray’s Terminal, Putty, and so on) for the BLE Multi Role project.
4. Perform the Central operation. In the serial port communication program window, press ‘s’ to start scanning for advertising devices. When the scan report from the device with the Heart Rate Service in the advertisement data is received, the device address is automatically appended to the peerAddr list. Press ‘c’ to connect, and then select the number that corresponds to the device with the required address. To connect to another device, press ‘c’ again, and select a device for connection.

The output on the client’s serial port communication program may appear as follows:

<div>Operation Menu</div> <div>Press 's'</div> <div>Press 'c'</div> <div>Press '1'</div>	<p>BLE Multi Role Example BLE Stack Version: 5.0.0.718</p> <p>CY_BLE_EVT_STACK_ON, StartAdvertisement Select operation: 'a' -- start connectable advertisement as HRM Server 's' -- start scanning for the HRM sensor 'c' -- send connect request to peer device (HRM sensor). This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. You shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.
