

This application toggles an LED with a Dual Timer and periodically switches the system source clock between Main and PLL to vary the toggling speed.

Overview

The firmware toggles the system source clock between the Main clock (CLKMO) and PLL. A Dual timer is used to fire a periodic interrupt, which toggles the state of an LED. Every 5 seconds the source clock changes and the LED blink rate changes markedly.

Requirements

Tool: PSoC Creator 4.0

Programming Language: C (GCC 4.9.3)

Associated Parts: All S6E1 parts

Related Hardware: [FM0-V48-S6E1A1](#) and [FM0-64L-S6E1C3](#)

Design

The schematic file includes CLK, DT and GPIO Components, renamed as shown below.

The firmware performs following functions:

1. Initialize the LED GPIO (off) and enable read
2. Initialize and start the dual timer which toggles the LED in an interrupt
3. Enable the main and PLL clocks
4. Clear the count of toggles, switch to main clock, and wait 5 seconds
5. Clear the count of toggles, switch to PLL clock, and wait 5 seconds
6. Repeat from step #4

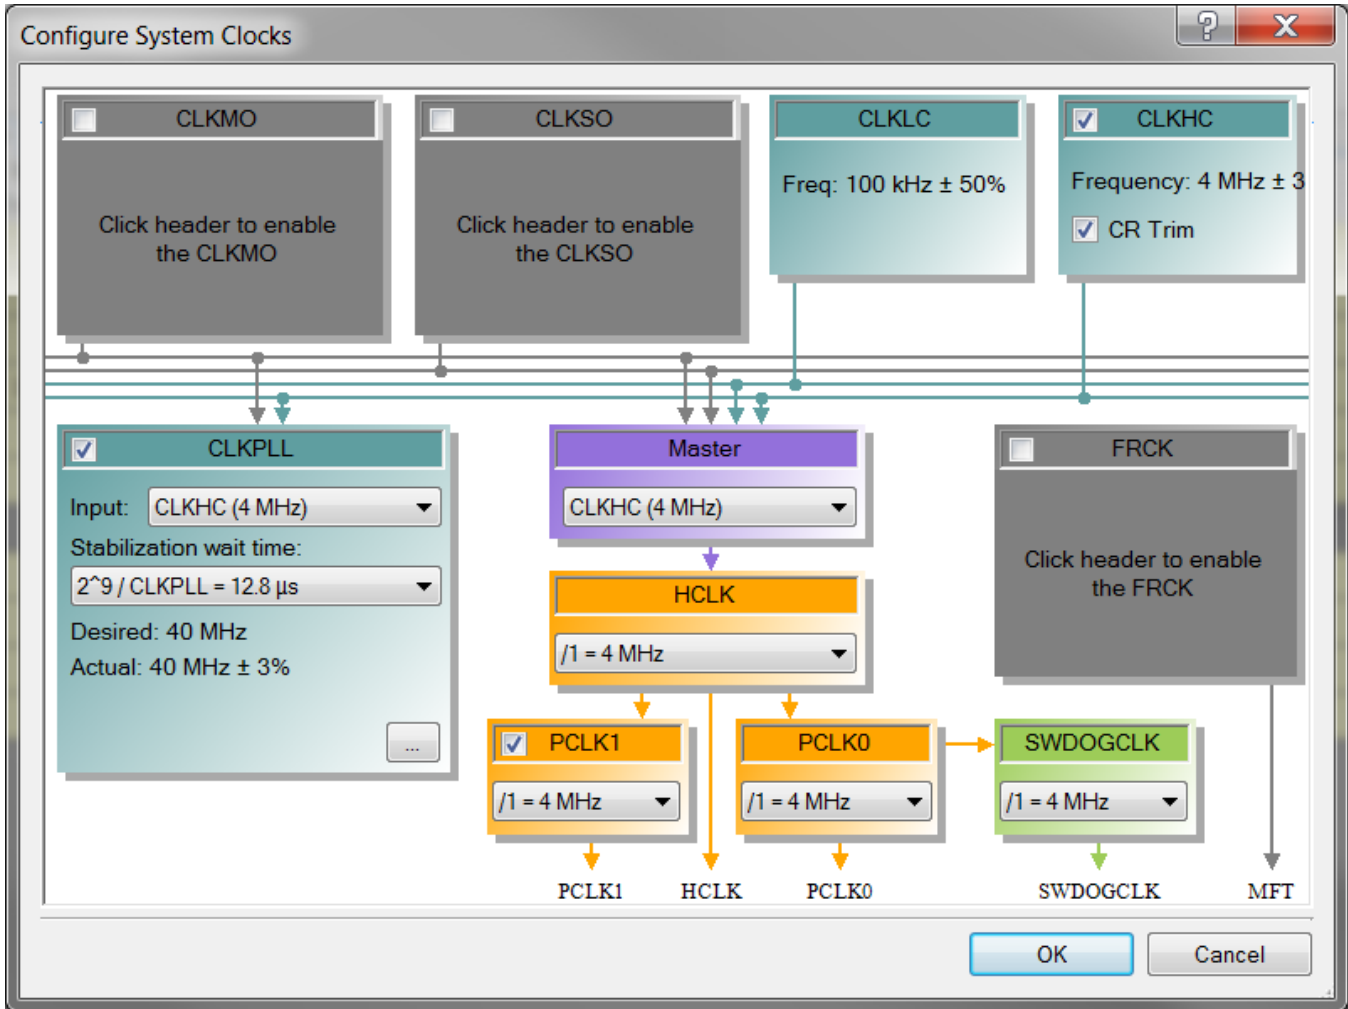

Design Considerations

PLL Configuration

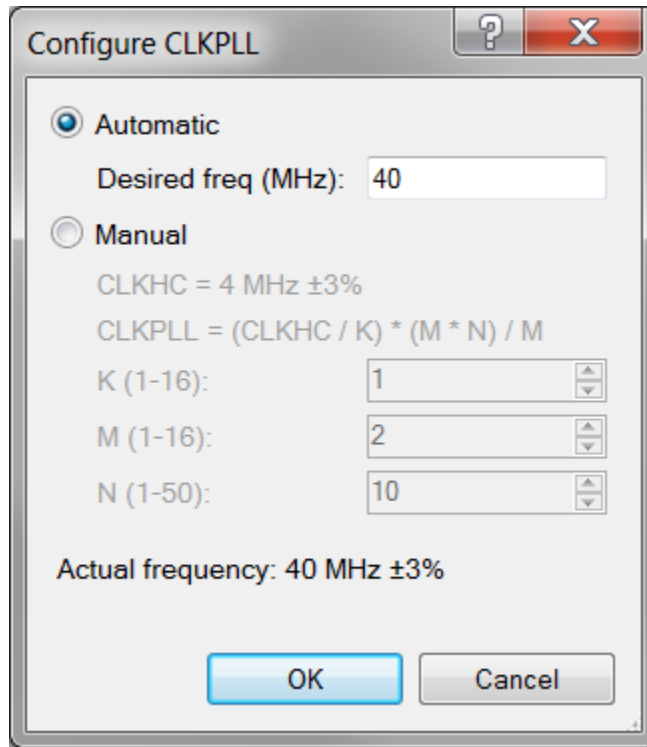

The PLL is set up in the System Clocks editor. It is configured to run at 40 MHz, which is noticeably faster than CLKMO (4 MHz on S6E1A devices, 8 MHz on S6E1C) so that the LED blinks sat a very different speed when the source is changed.

The System Clocks editor, shown below, is launched by double-clicking on any system clock in the DWR editor.

CE216669 – FM0+ CLK Driving Dual Timer

The desired frequency is set by pressing the configure button in the CLKPLL block to present the Configure PLL dialog.

PDL Installation

The project assumes that you have installed the PDL in the location specified in the Project Management panel of the Tools > Options dialog. If that location is incorrect you will see the build error “The given PDL path is invalid. Unable to find required PDSC file.” To correct this problem in a newly-created project open the Project > Properties dialog and enter the correct path to the PDL. To avoid the problem in projects you create in the future, make sure you put the correct path in the Tools > Options dialog.

Pin Selection

The project includes control files to automatically place the GPIO onto the appropriate pin for the supported kit hardware. To change the pin selection, delete the control file or over-ride the control file selections in the Design Wide Resources Pin Editor.

Hardware Setup

The GPIO is connected to the green LED.

Table 1 lists the pin connections required to use this code example on FM0+ kits.

Table 1. List of Pins

Pin	FM0-V48-S6E1A1	FM0-64L-S6E1C3
Green_LED:GPIO	P61	P3E

Components

Table 2 lists the PSoC Creator Components used in this example, as well as the hardware resources used by each.

Table 2. List of PSoC Creator Components

Component	Version	Hardware Resources
PDL_CLK	1.0	None
PDL_DT	1.0	DT block (one channel)
PDL_GPIO	1.0	GPIO pin

Parameter Settings

The CLK and GPIO Components use their default parameter settings. Only the Component instance names have been changed for readability.

The CLK Component is present in the design to cause the CLK module functions to be included from the PDL.

The DT Component uses mostly default parameter settings, with the following modifications.

Table 3: Component Settings

Tab	Setting	Value
None	Name	DT
Timer	U8Ch0PrescalerDiv	16
Interrupts	bCh0IrqEnable	true
	bCh0TouchNvic	true

Operation

Program the kit and observe the rate of the blinking green LED. It repeatedly blinks slowly for 5 seconds and then much faster for 5 seconds.
