

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Objective

This code example implements a CapSense® trackpad and interfaces the trackpad as a USB Mouse Human Interface Device (HID) to a Windows PC.

Overview

This code example implements a CapSense trackpad and two button sensors using a PSoC 4100S device. The PSoC device is interfaced to a Windows PC as a mouse using the USB HID protocol.

The trackpad controls the cursor on the PC and the two button sensors act as right-click and left-click buttons. To reduce the power consumed by the PSoC device and provide an optimum touch response, this code example implements two modes: Fast Scan and Slow Scan.

Figure 1. Trackpad and Button Sensors on CY8CKIT-041-41XX

Note: The above figure shows the kit without the Overlay

Requirements

Tool: PSoC Creator™ 4.0 and later versions

Programming Language: C (ARM® GCC 4.9.3)

Associated Parts: All PSoC 4100S parts

Related Hardware: CY8CKIT-041-41XX PSoC 4100S Pioneer Kit

Design

Figure 2 shows the PSoC Creator schematic of this code example. This code example uses the CapSense, EZI2C Slave, and Pin Components.

The CapSense Component is configured to scan a 7x7 trackpad widget, two button widgets, and one ganged widget. Trackpad touch coordinates are used to control the position of the mouse cursor on the PC. The two button widgets are used for left-click and right-click operations. The ganged sensor is a combination of all the column sensors of the trackpad widget and the two button widgets. The ganged sensor is used to implement the wake-on-approach feature; that is, the device detects an approaching finger at a distance of 2 cm from the trackpad. The Red LED glows when either a proximity or touch event is detected.

The EZI2C Slave Component is used to transfer the trackpad and button sensor data to the onboard KitProg2. KitProg2 acts as an I²C-USB HID bridge. It reads the trackpad and button sensor data from the PSoC 4100S device via the I²C interface and interfaces to the PC as a USB HID Mouse. The I²C Component is also used for CapSense tuning. When tuning is enabled, the HID mouse functionality is disabled.

To optimize device power consumption and provide an optimum touch response, this code example implements two power modes: Fast Scan mode and Slow Scan mode. When the user is interacting with the trackpad or button sensors, the device is in the Fast Scan mode; when the sensors are inactive for a specific duration, the Slow Scan mode is used. In the Fast Scan mode, all the trackpad sensors and button sensors are scanned at a refresh rate of 50 Hz and the I²C buffer is updated with trackpad XY coordinates and the button sensor status. This mode provides an optimum touch response but consumes higher power when compared to the Slow Scan mode.

In the Slow Scan mode, the trackpad column sensors and two button sensors are ganged and scanned as a single sensor at a refresh rate of 6 Hz. The Slow Scan mode consumes a lower average power but provides a slower touch response. The watchdog timer is used to periodically wake up the device from the deep-sleep mode at a refresh rate of 50 Hz in the Fast Scan mode and 6 Hz in the Slow Scan mode.

CE216892 USB-HID Trackpad

This code example implements a CapSense® trackpad and interfaces the trackpad as a USB Mouse Human Interface Device (HID) to a Windows PC.

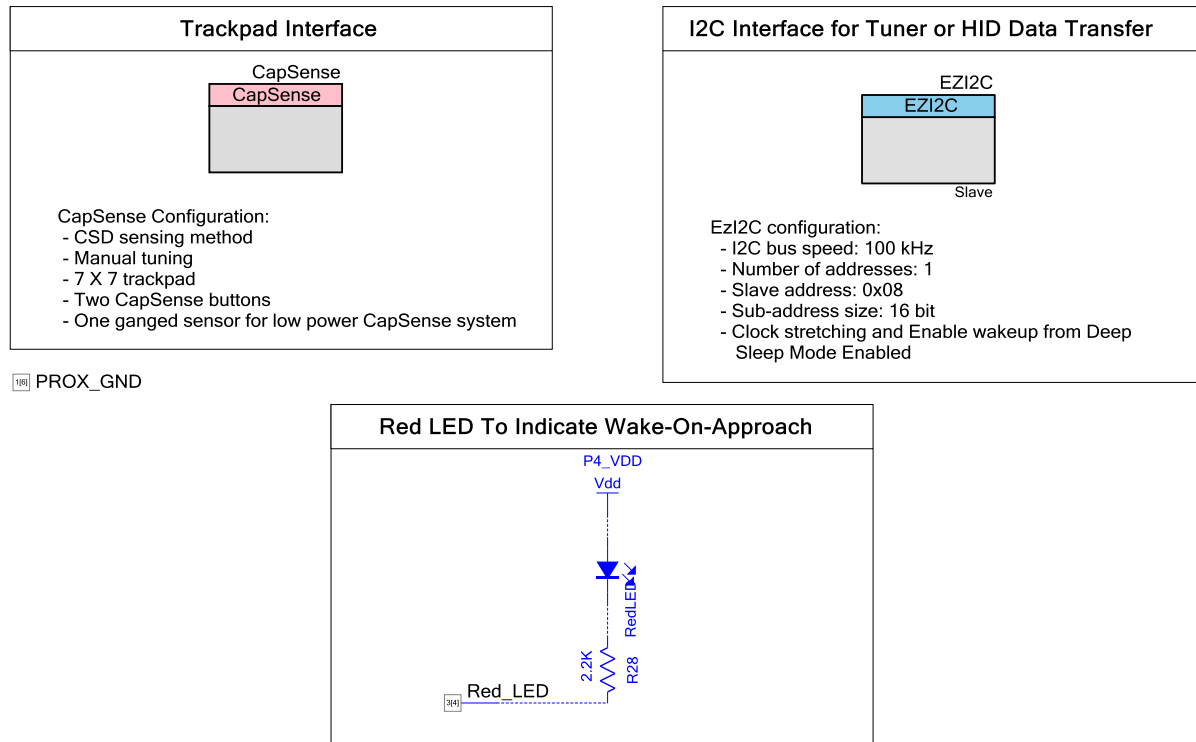

Figure 3. Firmware Flowchart

Design Considerations

This code example is designed to run on the [CY8CKIT-041-41XX PSoC 4100S Pioneer Kit](#) with the PSoC 4100S device. To port the design to other PSoC 4 devices and kits, you must change the target device in Device Selector, change the pin assignments in the .cydwr settings, and re-tune the CapSense sensors. For the tuning procedure, see [AN85951 – PSoC 4 and PSoC Analog Coprocessor CapSense Design Guide](#).

This code example uses the internal shield drive mode and therefore the shield performance, i.e., shield switching between V_{REF} and ground depends on the operating voltage of the device. For the tuning procedure, see [AN85951 – PSoC 4 and PSoC Analog Coprocessor CapSense Design Guide](#).

After plugging the kit to the USB port, CapSense initialization is delayed by 100 ms to ensure the baseline is initialized to a stable raw count value. This is required only when the power supply is not stable while the CapSense calibration is in process.

Note: The maximum response time to detect an approaching finger in the Slow Scan mode is equal to the refresh interval in the Slow Scan mode multiplied by the IIR filter delay. Therefore, the response to wake-on-approach appears to be slow. You can reduce the refresh interval (macro `LOOP_TIME_SLOWSCANMODE` in `main.c` file) in the Slow Scan mode to achieve a fast response time at the expense of a high average power consumption.

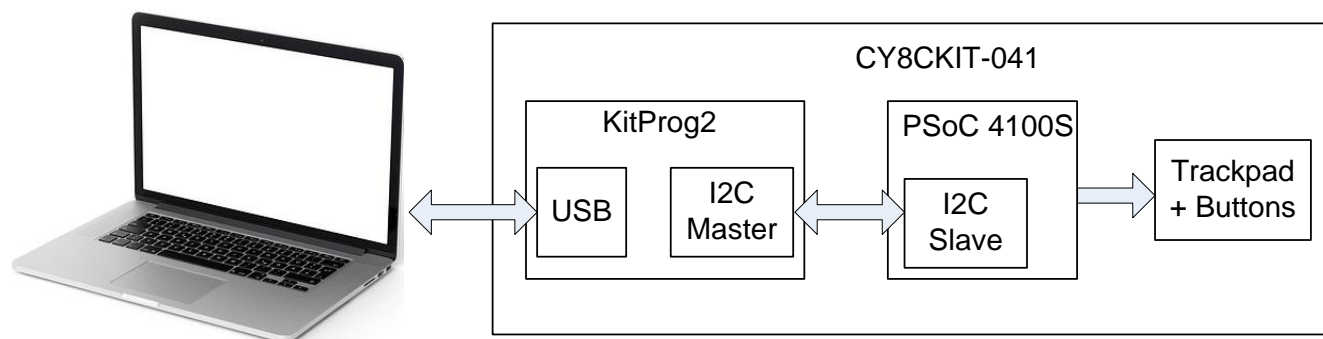

Hardware Setup

The code example works with default settings on the CY8CKIT-041-41XX PSoC 4100S Pioneer Kit. If the settings are different from the default values, see the “Switches Default Position” table in the kit guide to reset to the default settings.

Software Setup

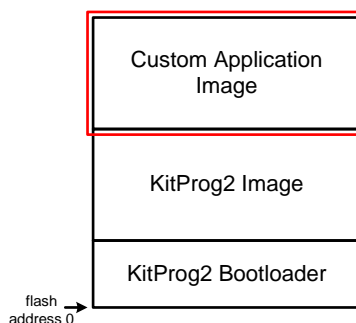

KitProg2 on the CY8CKIT-041-41XX PSoC 4100S Pioneer Kit is used to read the trackpad and button data from PSoC 4100S device via I²C communication and send this data to PC via USB communication, as shown in [Figure 4](#).

Figure 4. CY8CKIT-041 Interfaced as a USB-HID device to a Windows PC

To support programming/debugging and I²C-USB HID mode, KitProg2 (a PSoC 5LP device) supports dual-image bootloading as shown in [Figure 5](#); the KitProg2 firmware (for programming/debugging) is the first image and a custom application (for I²C-USB HID) is loaded as a second image. In this code example, the custom application image acts as a USB-HID interface to the PC and reads the trackpad data from the PSoC 4100S device via an I²C interface.

Figure 5. Dual-Image Bootloadable in KitProg2

Bootloading KitProg2 with Custom HID

To bootload the custom application image to KitProg2, follow the steps below:

1. Press and hold the switch SW3 while connecting the kit to the PC. If the switch is pressed for more than 100 ms during power up, KitProg2 enters the bootloader mode. The amber status LED will start blinking to indicate that KitProg2 has entered the bootloader mode.
2. In PSoC Creator, navigate to **Tools > Bootloader Host**. In the bootloader host window, confirm that the USB bootloader is listed in the **Ports** window as shown in Figure 6. If it does not appear as shown, click on “**Filters...**” and verify that “**Show USB Devices**” is selected and that the VID and PID are set to **04B4** and **F146** (you can also leave the PID blank).

Figure 6. Bootloading Custom USB-HID on KitProg2

3. Click **Open File** and navigate to <install directory>\Cypress\CY8CKIT-041-41XX PSoC 4100S Pioneer Kit\1.0\Firmware\PSoC 4100S\CE216892 USB-HID Trackpad. Select the *KitProg2_Custom_2.cyacd* file and click **OK**.
4. Click **Program** and confirm that the bootloadable is programmed to the KitProg2 device by observing that the Green and Red status LEDs are turned ON. KitProg2 now interfaces to the PC as a USB HID Mouse.
Note: It may take a few seconds for the kit to enumerate as an HID mouse on the PC.
5. To switch KitProg2 from the custom HID application to programming/debugging mode, press the switch SW3 on the kit for more than two seconds. Once you release SW3, the amber status LED should be ON. If the amber LED shows a breathing effect, press and release SW3 quickly (less than two seconds). For details on the KitProg2 operation, refer to [KitProg2 User Guide](#).

Components

Table 1 lists the PSoC Creator Components used in this project, as well as the hardware resources used by each component.

Table 1. List of PSoC Creator Components

| Component | Instance Name | Version | Hardware Resources |
|------------------------|---------------|---------|----------------------|
| CapSense | CapSense | v3.10 | CSD and 18 GPIO pins |
| EZ12C Slave (SCB mode) | EZ12C | v3.20 | SCB and 2 GPIO Pins |
| Digital Output Pin | Red_LED | v2.20 | 1 GPIO pin |

Parameter Settings

CapSense

Figure 7 through Figure 12 show the CapSense Component settings that are changed from default values. See the [CapSense Component datasheet](#) for additional information.

Figure 7. CapSense Component – Basic Tab Configuration

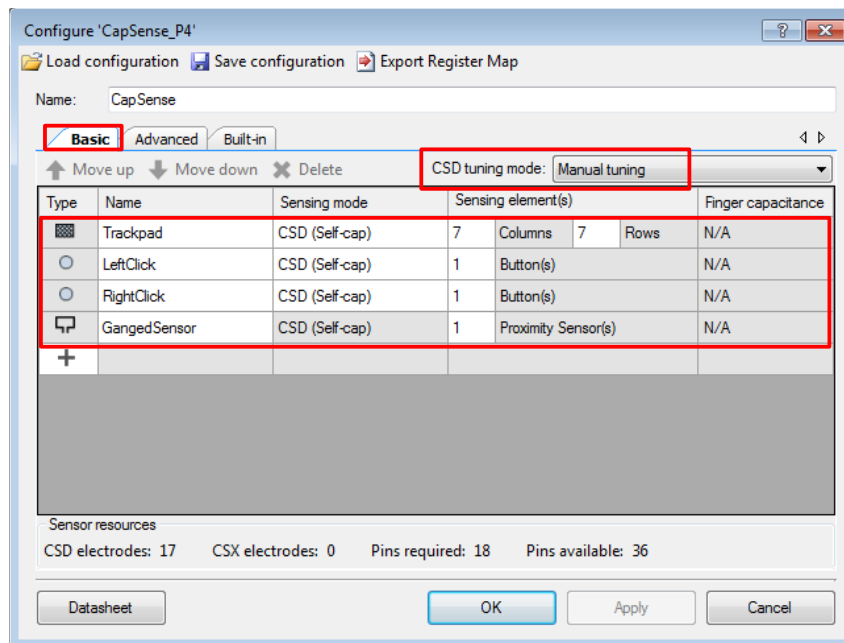

Figure 8. CapSense Component – Advanced Tab CSD Configuration

Figure 9. CapSense Component – Advanced Tab Widget Details Configuration for Trackpad

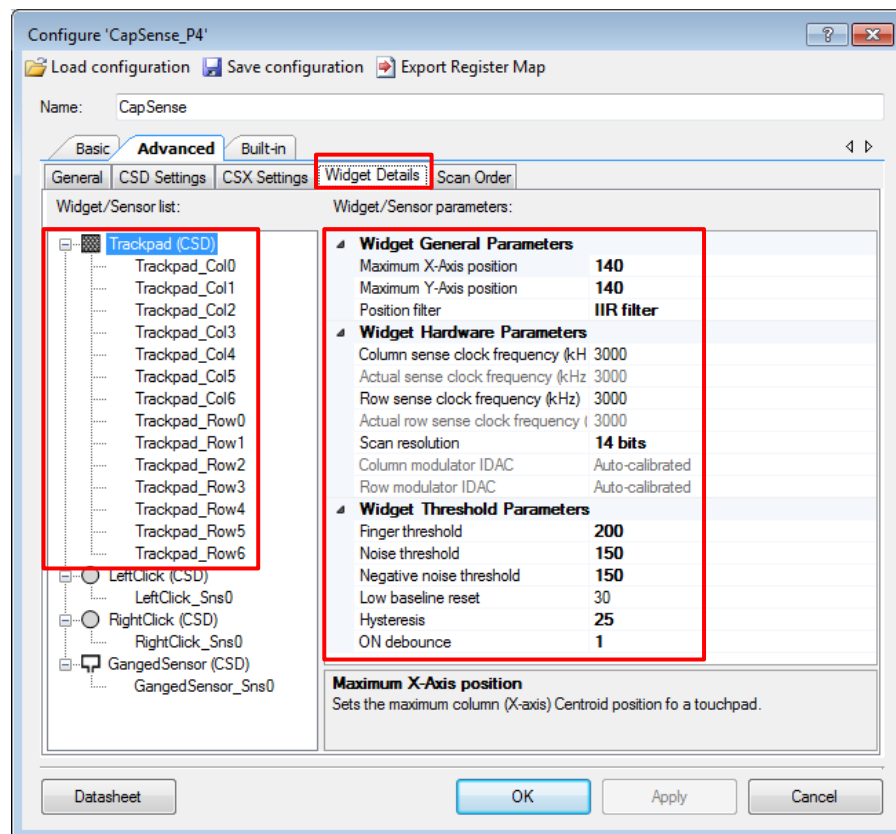

Figure 10. CapSense Component- Advanced Tab Widget Details Configuration for Left/Right Click Button

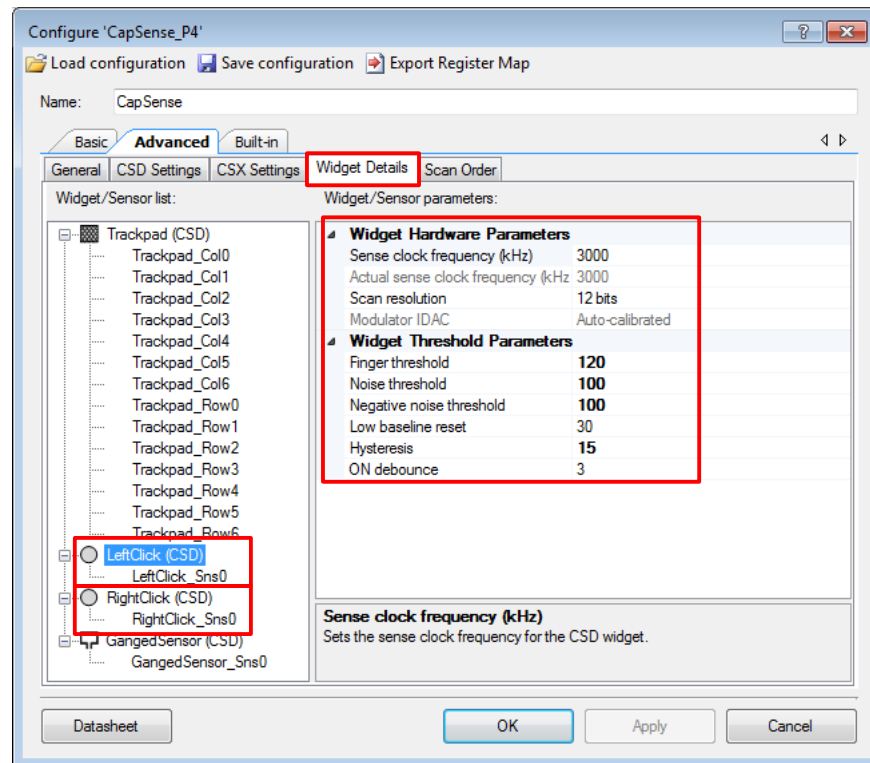

Figure 11. CapSense Component- Advanced Tab Widget Details Configuration for GangedSensor

EZ12C Slave

Figure 13 shows the non-default EZ12C Slave Component settings. See the [SCB Component datasheet](#) for additional information.

Figure 13. EZ12C Component Basic Tab Configuration

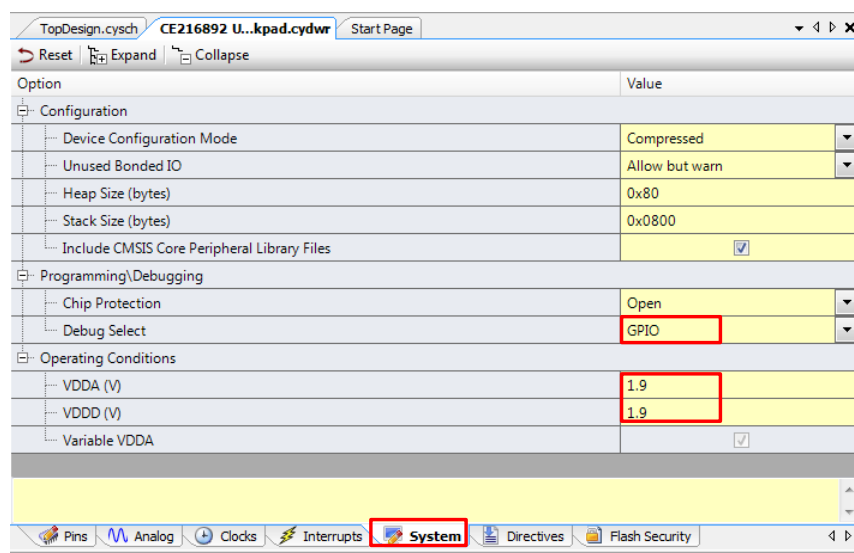

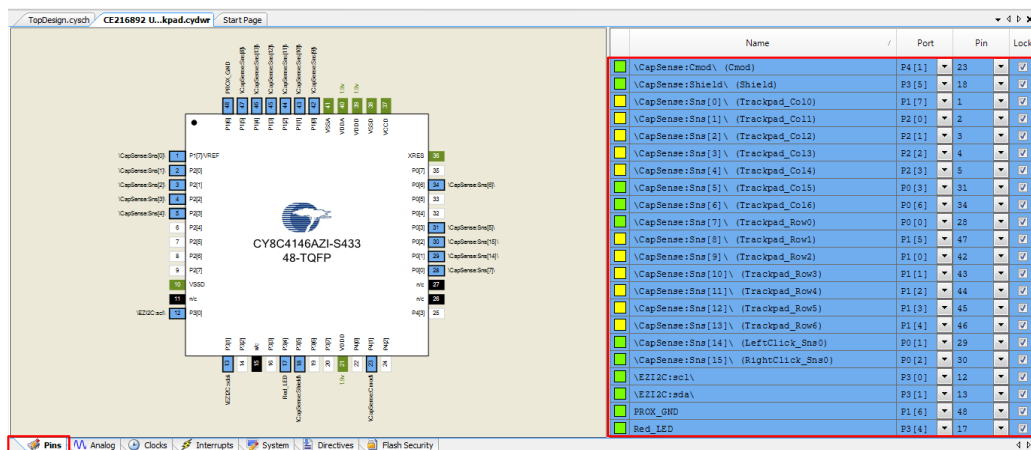

Figure 14 and Figure 15 show the non-default **.cydwr** settings for the project.

| VDDA (V) | V _{REF} (V) |
|------------|----------------------|
| < 2.7 | 1.2 |
| 2.7 to 4.8 | 2.1 |
| >= 4.8 | 4.2 |

Operation

1. The custom application should be bootloaded before testing the project. See the [Software Setup](#) section for details on how to bootstrap the custom application.
2. Select the *CE216892 USB-HID Trackpad.cywrk* file in the PSoC Creator Start Page, under **Examples and Kits > Kits > CY8CKIT-041-41XX**. Select a location to save the code example.
3. Build the project (**Build > CE216892 USB-HID Trackpad**).
4. Connect the PSoC 4100S Pioneer Kit to your computer using the USB cable provided. Ensure that the kit is in programming/debugging mode (Amber status LED is always ON). If the kit is not in the programming/debugging mode, see [KitProg2 User Guide](#) for details on how to switch KitProg2 to programming/debugging mode.
5. Program the PSoC 4100S device (**Debug > Program**). See the CY8CKIT-041-41XX Kit Guide for details on programming the kit.
6. Press the switch SW3 on the kit for more than five seconds to switch KitProg2 from programming mode to custom application mode. The red and green status LEDs will be on when the custom application mode is running.
7. Press the RESET switch on the kit to initialize the PSoC 4100S device. Wait for the device to enumerate as an HID mouse on the PC.
8. Hover your finger over the trackpad or button sensors at a distance of 2 cm from the kit and notice that the red LED is turned ON indicating that proximity is detected.
9. Slide your finger on the trackpad to control the mouse pointer on your windows PC. Touch the CapSense buttons to trigger the mouse left-click and right-click actions.
10. Using the water dropper provided, pour small water droplets (< 3 mm) on the trackpad. Notice that the trackpad does not false trigger even when water droplets are on the trackpad. Remove the water droplets and notice that the trackpad works normally when a finger is present on the trackpad.
11. To switch KitProg2 back to programming/debugging mode, press the switch SW3 for more than two seconds and then release. Confirm that the amber LED is continuously ON, indicating that KitProg2 is re-enumerated in the KitProg2 programmer and debugger mode.

The example project supports viewing CapSense data via the CapSense Tuner. To read the CapSense data via the CapSense Tuner, the `TUNER_ENABLE` macro in the *main.c* file should be set to '1' and KitProg2 should be in the programming/debugging mode. For details on how to launch the tuner and read the CapSense data, refer to the [CapSense Component Datasheet](#).

Note: Because the Tuner uses I²C for reading CapSense data, the mouse functionality will be disabled when the `TUNER_ENABLE` macro is set to '1'.

Upgrade Information

The code example is updated to the latest version of PSoC Creator and therefore does not require an upgrade.

PSoC Resources

Cypress provides a wealth of data at www.cypress.com to help you to select the right PSoC device for your design, and quickly and effectively integrate the device into your design. For a comprehensive list of resources, see [KBA86521, How to Design with PSoC 3, PSoC 4, and PSoC 5LP](#). The following is an abbreviated list for PSoC 4:

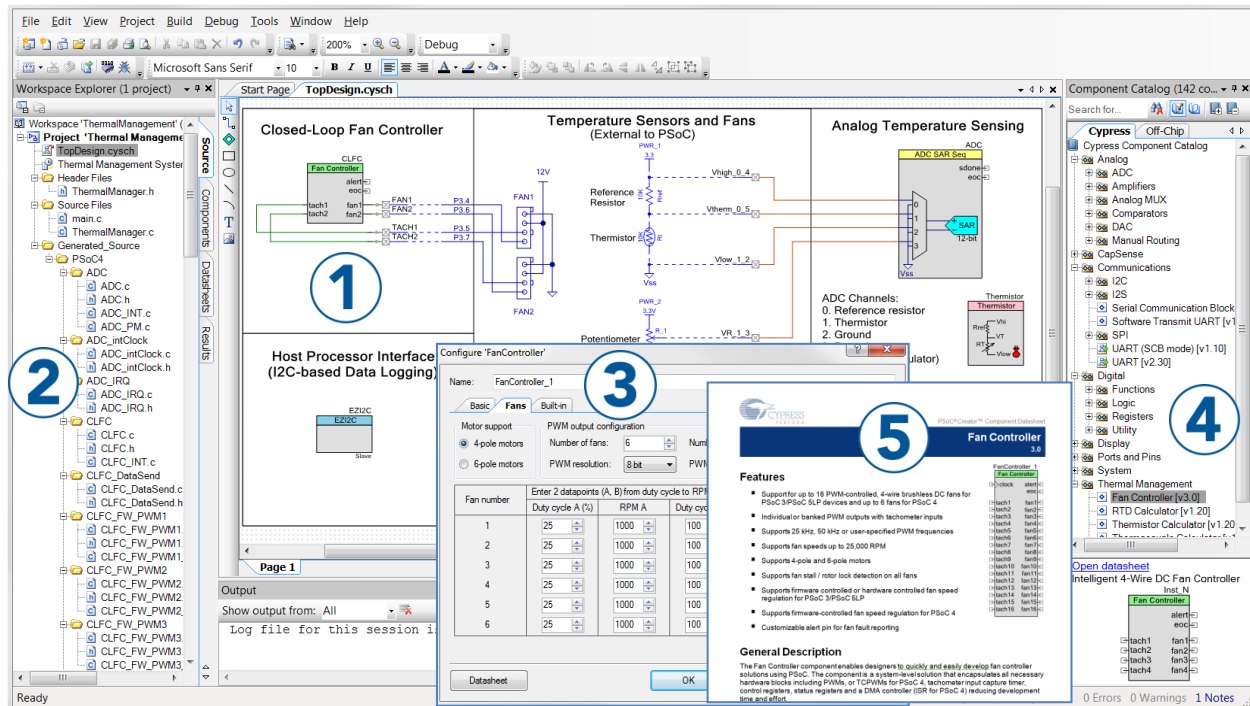

- **Overview:** [PSoC Portfolio](#), [PSoC Roadmap](#)
- **Product Selectors:** [PSoC 1](#), [PSoC 3](#), [PSoC 4](#), or [PSoC 5LP](#). In addition, PSoC Creator includes a device selection tool.
- **Datasheets** describe and provide electrical specifications for the PSoC 3, PSoC 4, and PSoC 5LP device families.
- **CapSense Design Guides:** Learn how to design capacitive touch-sensing applications with the PSoC 3, PSoC 4, and PSoC 5LP families of devices.
- **Application Notes** and **Code Examples** cover a broad range of topics, from basic to advanced level. Many of the application notes include code examples.
- **Technical Reference Manuals (TRM)** provide detailed descriptions of the architecture and registers in each of the PSoC 3, PSoC 4, and PSoC 5LP device families.
- **PSoC Training Videos:** These videos provide step-by-step instructions on getting started building complex designs with PSoC.
- **Development Kits:**
 - [CY8CKIT-041](#) PSoC 4 S-Series Pioneer kit is easy-to-use and inexpensive development platform. This kit include connectors for Arduino™ compatible shields.
 - [CY8CKIT-145](#) is a very low-cost prototyping platform for evaluating PSoC 4 S-Series devices.
- The [MiniProg3](#) device provides an interface for flash programming and debug.

PSoC Creator

PSoC Creator is a free Windows-based Integrated Design Environment (IDE). It enables concurrent hardware and firmware design of systems based on PSoC 3, PSoC 4, and PSoC 5LP. See [Figure 16](#) – with PSoC Creator, you can:

1. Drag and drop Components to build your hardware system design in the main design workspace
2. Co-design your application firmware with the PSoC hardware
3. Configure Components using configuration tools
4. Explore the library of 100+ Components
5. Review Component datasheets
