

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

## Objective

This code example demonstrates inductive sensing for buttons and proximity using CY8CKIT-148 PSoC 4700S Inductive Sensing Evaluation Kit.

## Overview

PSoC® 4700S Inductive Sensing Evaluation Kit has three coils with a metal overlay for buttons and one coil for proximity sensing. This code example is designed to detect the button press and the proximity of a metallic object using inductive sensing function of MagSense™ Component and control the LEDs on the kit. When any button is pressed, corresponding LED is turned ON and when the metal target (provided with the kit) is brought near the proximity sensor, the LEDs turn ON depending on how close the metal target is to the sensor. Note that multi-touch is not allowed because of the use of common metal overlay over the three buttons.

## Requirements

**Tool:** PSoC Creator™ 4.2

**Programming Language:** C (Arm® GCC 5.4.1 and Arm MDK 5.22)

**Associated Parts:** All PSoC 4700S parts

**Related Hardware:** CY8CKIT-148 PSoC 4700S Inductive Sensing Evaluation Kit

## Hardware Setup

This example uses the kit's default configuration. Refer to the kit guide to ensure that the kit is configured correctly. This example requires that the kit is placed on a non-metallic platform.

## Software Setup

None.

## Operation

1. Connect the kit to your PC using the USB Type-A to Type-C cable provided with the kit.
2. Install the MagSense Component from the PSoC Creator using the instructions provided in the [User Guide](#) of the kit.
3. Build the project and program the PSoC 4700S device from PSoC Creator by choosing **Debug > Program**. For more information on device programming, see PSoC Creator Help.
4. Press any inductive sensing button (one at a time) and observe that the corresponding LED is turned ON.
5. Bring the metal target from the distance of 2 cm towards the proximity coil. Observe LED 7 to LED 4 turns ON as the metal target approaches the sensor.

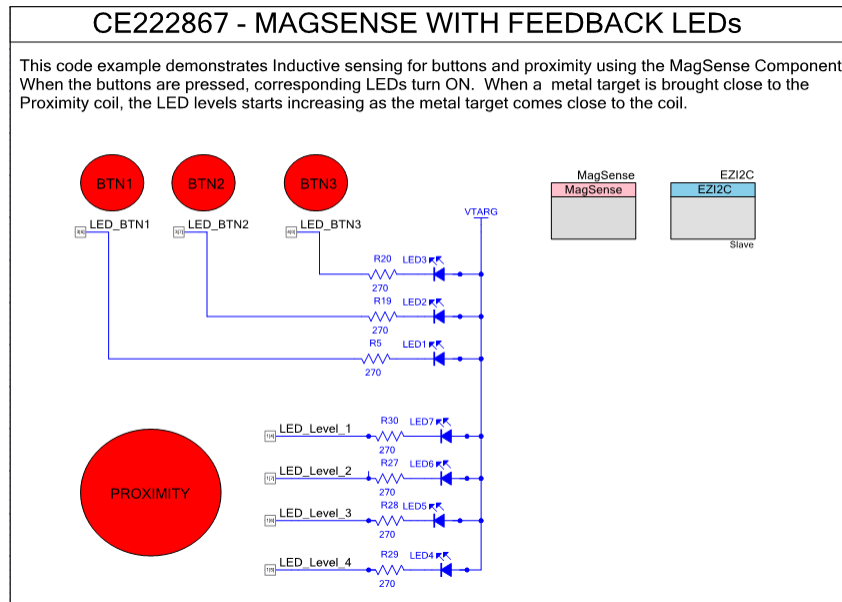

**Note:** When you press the button or keep the metal target close to the proximity sensor for a longer duration, auto-reset feature of the MagSense Component will automatically reset the button or the proximity sensor along with the LEDs.

## Design and Implementation

Figure 1 shows the PSoC Creator schematic for this code example. MagSense Component is configured for three buttons and one proximity sensor. Digital output pins are placed to drive the LEDs.

To monitor the sensor data, MagSense Tuner feature is used which requires the EZI2C Slave Component. To understand the detailed procedure on using the Tuner and selecting values for Thresholds and Baselines, refer to the [Inductive Sensing Design Guide](#).

Figure 1. Top Design Schematic

To tune the buttons, it is necessary to first measure the inductance and the resistance of the coil alone and then with an aluminum overlay. Similarly, for the proximity sensor, measure the inductance and the resistance of the coil alone and then with the metal target at 2 cm spacing. Table 1 shows the measurement of inductance and resistance of the coil using an LCR meter along with the external capacitor and the resistor on the kit. Based on the measured values, the resonant frequency for buttons are calculated to be 959 kHz and for the proximity sensor, it is calculated to be 793 kHz.

**Note:** To measure the values of L and R of the coil, make sure to isolate it from other parts of the kit by desoldering the series and parallel components of the coil.

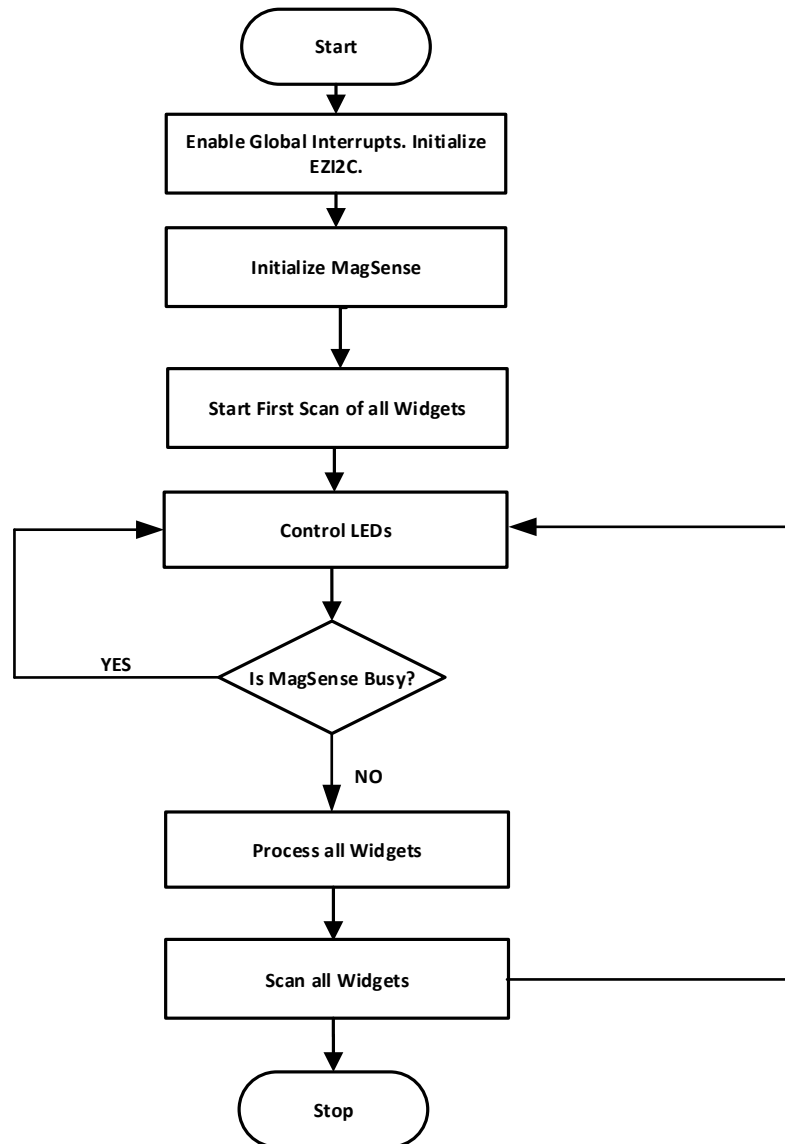

Table 1. Measurement of Lp and Rs using an LCR meter and values for External Components

	Feature	Lp (Inductance)	Rs (Resistance)	External Parallel Capacitor	External Series Resistor
Without Aluminum Target	BTN1	14.1uH	7 Ohm	C41: 5nF	R32: 330 Ohm
	BTN2	14.1uH	6.78 Ohm	C46: 5nF	R39: 330 Ohm
	BTN3	14.13uH	6.9 Ohm	C51: 5nF	R49: 330 Ohm
	PROX	55.8uH	16.9 Ohm	C42: 2.2nF	R34: 330 Ohm
With Aluminum Target	BTN1	5.5uH	8.9 Ohm	C41: 5nF	R32: 330 Ohm
	BTN2	5.42uH	8.5 Ohm	C46: 5nF	R39: 330 Ohm
	BTN3	5.51uH	8.73 Ohm	C51: 5nF	R49: 330 Ohm
	PROX	18.3uH	20 Ohm	C42: 2.2nF	R34: 330 Ohm

See [Figure 3](#) to [Figure 8](#) for the tuned values of the kit. The tuning procedure is discussed in detail in the Inductive Sensing Design Guide. Once tuning has been completed, sensitivity can be adjusted by reducing the excitation frequency below the resonant frequency by about 5% to 10% depending on the application requirements.

The *main.c* file of the project contains the scanning algorithm described in [Figure 2](#)

Figure 2. Flowchart of main.c

## Components and Settings

Table 2 lists the PSoC Creator Components used in this example, how they are used in the design, and the non-default settings required so they function as intended.

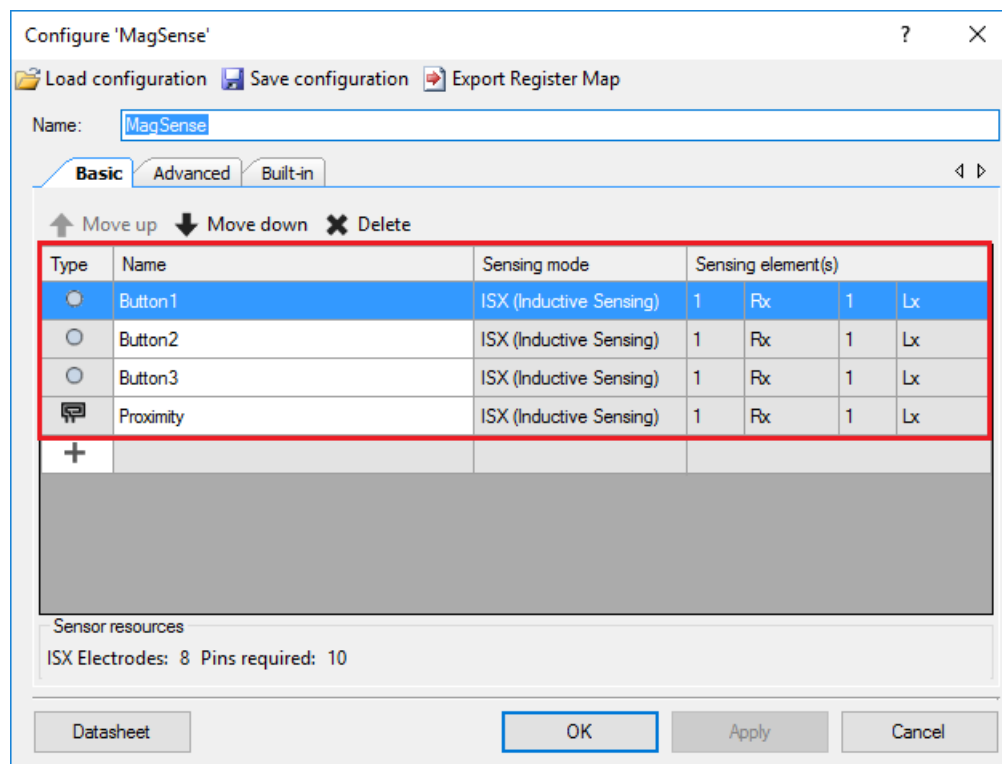

Table 2. PSoC Creator Components

Component	Instance Name	Purpose	Non-default Settings
MagSense (6.0)	MagSense	Inductive Sensor configuration and processing	Figure 3 to Figure 8
PSoC 4 Serial Communication Block (SCB) (4.0)	EZI2C	Communication with external interfaces or with Tuner	Figure 9.
Digital Output Pin (2.20)	LED_BTN1	Provide visual feedback for BTN1 press	Figure 10.
Digital Output Pin (2.20)	LED_BTN2	Provide visual feedback for BTN2 press	
Digital Output Pin (2.20)	LED_BTN3	Provide visual feedback for BTN3 press	
Digital Output Pin (2.20)	LED_Level_1	Provide visual feedback for Proximity	
Digital Output Pin (2.20)	LED_Level_2	Provide visual feedback for Proximity	
Digital Output Pin (2.20)	LED_Level_3	Provide visual feedback for Proximity	
Digital Output Pin (2.20)	LED_Level_4	Provide visual feedback for Proximity	

For information on the hardware resources used by a Component, see the Component datasheet.

Figure 3 shows the configuration for the MagSense Component.

Figure 3. MagSense Component Configuration Basic Tab

Enabling filters are necessary to eliminate noise. Figure 4 shows the settings for filter assignments on the component.

Auto-reset feature is enabled to prevent latch-up of sensors which can happen due to following reasons:

1. Touching the tank circuit
2. Touching the coils
3. Keeping the device on a metallic platform

The auto-reset feature will reset all sensors after about 2 seconds.

## Reusing This Example

This example is designed for the CY8CKIT-148 PSoC 4700S Inductive Sensing Evaluation Kit. To port this design to a different PSoC 4700S MCU device and/or kit, change the target device using the Device Selector and update the pin assignments in the Design Wide Resources Pins settings as needed. Additional tuning is required for the code to be reused with other boards.

In some cases, a resource used by the code example (for example, an IP block) is not supported on another device apart from 4700S device. In that case, the example will not work. If you build the example targeted at such a device, you will get errors. See the device datasheet for information on what that device supports.
