

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Objective

This code example demonstrates the implementation of gesture detection in PSoC® 4 with a CapSense® linear slider using the PSoC Creator™ CapSense Component.

Requirements

Tool: PSoC Creator 4.2

Programming Language: C (Arm® GCC 5.4.1)

Associated Parts: PSoC 4000S and PSoC 4100S devices

Related Hardware: [CY8CKIT-149 PSoC 4100S Plus Prototyping Kit](#)

Overview

CapSense Sliders are used for controls requiring gradual adjustments. Examples include a lighting control, volume control, graphic equalizer, and speed control. With gesture detection capability on the CapSense slider, a slider can detect a touch, position movement as well as gestures, which allows the implementation of advanced and sophisticated capacitive sensing-based user interfaces.

This code example demonstrates the implementation of gesture detection on CapSense linear slider using the CapSense Component. To demonstrate the gesture functionality, PSoC 4 controls three LEDs, whose brightness is controlled based on the position detected on the slider and turned ON and OFF based on the detected gestures. Alternatively, the CapSense software tuner can be used for real-time tuning and monitoring of detected gestures.

The CapSense Component requires a time stamp implemented in application firmware for the gesture detection algorithm. This code example also demonstrates three different ways to implement the time stamp for the CapSense Component.

Hardware Setup

This code example is set up to use CY8CKIT-149 by default, but this code example can be used with other PSoC 4 devices. To see how to migrate this code example to a new device, see [Reusing this Example](#).

Software Setup

No software setup required.

Operation

1. Connect CY8CKIT-149 to your computer using a USB cable.
2. Build the project and program it into the PSoC 4 device. Choose **Debug > Program**. For more information on device programming, see PSoC Creator Help.
3. Tap the slider once and confirm that the LED connected to P5[5] turns OFF; tap it again and confirm that the LED turns back ON.
4. Slide your finger slowly up and down the slider and confirm that the LED connected to P5[5] changes brightness.
5. Flick your finger across the slider starting on the left-hand side and slide right quickly, confirm that the LED connected to P1[0] turns OFF; doing this again will turn the LED back ON.
6. Flick your finger across the slider starting on the right-hand side and slide left quickly, confirm that the LED connected to P2[2] turns OFF; doing this again will turn the LED back ON.

7. In PSoC Creator, right-click on the CapSense Component and select **Launch Tuner**. Click **Connect**, select **I2C**, and then click **Start**. Ensure that the data rate is set to 400 kbps. Go to the **Gesture View** tab and select **Synchronized**. As each gesture is performed, confirm that the gesture shows up under the **Detected Gesture** portion of the page. Note that when the tuner is used, LEDs will only respond correctly to a gesture when using USING_SYS_TICK_CALLBACK. For directions on how to use this and for more information see [Timestamp](#).

Design and Implementation

Each gesture is captured and is used to control different LEDs. The tuner also shows different gestures that the slider has detected and shows a picture on the screen as shown in [Figure 1](#). All CapSense Gesture settings can be manipulated as seen in [Components and Settings](#).

Figure 1. Flick Left, Click, Flick Right Gestures

Timestamp

CapSense gestures use a timestamp to determine what gesture was detected. This code example describes three ways to accomplish this. This can be changed by changing the `#define TIMESTAMP_METHOD` to `USING_SYS_TICK_CALLBACK`, `USING_MAIN_LOOP`, or `USING_APP_TIMESTAMP`. Note that only `USING_SYS_TICK_CALLBACK` will properly control the LEDs while using the tuner. This is because the callback will update the timestamp based on the system clock. The other two methods update only when their functions are called, which means that if the time between function calls changes, for example taking time to send data to the tuner, the timestamp controlling the gestures is inaccurate.

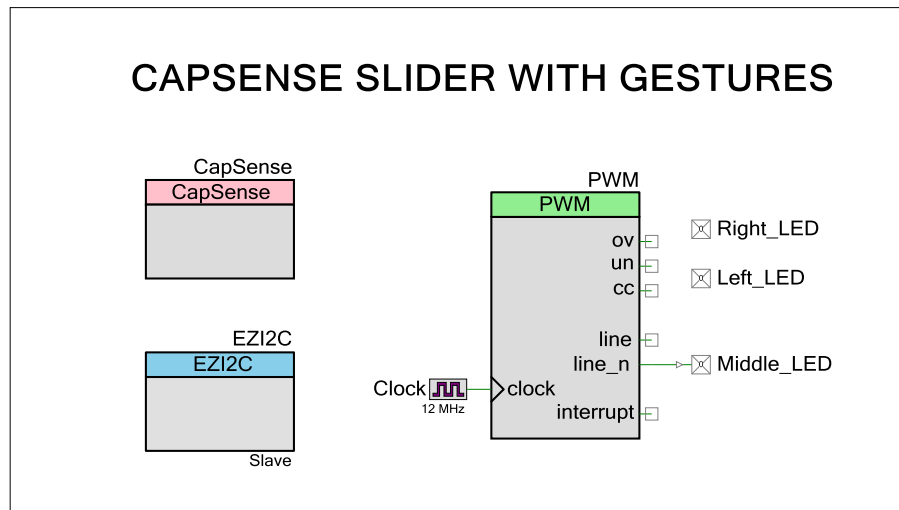

CapSense Slider and Gestures

In the CE224820_CapSense_Slider_Gestures example, the following functions are performed:

1. Initialize and start all hardware components.
2. Link the communication buffer for the EZI2C Component to the CapSense data structure.
3. Set up one of the three different timestamp methods depending on the value of `#define TIMESTAMP_METHOD`:
 - `USING_SYS_TICK_CALLBACK` increments the timestamp through a callback function using the system clock.
 - `USING_MAIN_LOOP` increments the timestamp every time `CapSense_IncrementGestureTimestamp` is called in the main loop.
 - `USING_APP_TIMESTAMP` increments the timestamp by keeping a counter, which is then passed into the `CapSense_SetGestureTimestamp` function.
4. The CapSense Component scans all widgets, and when complete, processes all data.
5. Store the gesture and use it in a switch statement to control the LEDs.
6. Send all data to the tuner.
7. Scan CapSense widgets before restarting the loop.

Figure 2 shows the top-level design of the PSoC Creator project:

Components and Settings

Table 1 lists the PSoC Creator Components used in this example, how they are used in the design, and the non-default settings required so they function as intended.

Table 1. PSoC Creator Components

Component	Instance Name	Purpose	Non-default Settings
CapSense	CapSense	Processes all data from the sensors	For Linear slider, see Figure 3 . For Click Gesture settings, see Figure 4 . For Swipe Gesture settings, see Figure 5 .
EZI2C	EZI2C	Transmits data from the kit to the tuner	Change the Data rate to 400 (kbps) and the Sub-address size to 16 .
PWM	PWM	Controls the duty cycle of the middle light	Under the PWM tab deselect all interrupts, change the period to 10000 , and the Compare value to 5000 .

For information on the hardware resources used by a Component, see the Component datasheet.

Reusing this Example

This code example can be used with two kits, CY8CKIT-149 or CY8CKIT-145-40xx. Ensure the following before porting this code example:

1. All the pins are unlocked in Design Wide Resources.
2. If using CY8CKIT-149, ensure that the number of elements is six under Basic in the CapSense Component configuration. If using CY8CKIT-145-40xx, ensure that the number of elements is five. [Figure 3](#) shows how to change the number from **six** to **five** under Sensing elements.

To port the code to a new device, in PSoC Creator, select **Project > Device Selector** and change to the target device.

In some cases, a resource used by a code example (for example, an IP block) is not supported on another device. In that case, the example does not work. If you build the code targeted at such a device, errors occur. See the device datasheet for information on what a particular device supports.
