

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Objective

This example shows how to use the Count7 Component as a down counter on a PSoC® 4 device.

Requirements

Tool: PSoC Creator 4.2

Programming Language: C (Arm® GCC 5.4.1)

Associated Parts: PSoC 4 devices with UDBs

Related Hardware: CY8CKIT-042 PSoC 4 Pioneer Kit

Overview

This example demonstrates the count-down and enable option features of the Count7 Component. A Control Register Component is used to drive the Count7 enable signal. The Count7 output is read both directly and through a Status Register Component. Both values are displayed on the terminal via UART. A kit button is used to control whether the Count7 Component is enabled.

Hardware Setup

This code example is set up for CY8CKIT-042. If you are using a different kit, see [Reusing this Example](#). In this kit, the USB-UART bridge in the KitProg2 module is used:

1. Connect the \UART:rx\ pin P0[4] to P12[7] on header J8.
2. Connect the \UART:tx\ pin P0[5] to P12[6] on header J8.

Other kits use different pins for the UART. Make sure that you select the correct pins for your kit.

Software Setup

This design requires a terminal emulator such as PuTTY or Tera Term running on your computer.

Operation

1. Ensure that the correct pins are connected for your kit, as noted in the [Hardware Setup](#) section.
2. Connect the USB cable between the PC and the PSoC 4 Pioneer Kit.
3. Build the project and program it into the PSoC 4 device. Choose **Debug > Program**. For more information on device programming, see PSoC Creator Help.
4. Open a terminal emulator on your computer and configure the program to the appropriate COM port. Configure the baud rate to 115200, data bits to 8, no parity bits, stop bit as 1, and no control flow.
5. Confirm that the terminal display shows the Component counting down, and that the count and status register values are the same ([Figure 1](#)). Press kit button SW2 and confirm that counting stops and restarts.

Figure 1. Project Terminal Output

Design and Implementation

The Count7 timer period can be varied. In this example, Count7 is configured with a period of 128, so the first count is 127 and Count7 resets when it reaches 0. A kit button and a control register are used to enable the counter, as [Figure 2](#) shows. The status register allows for reading of the counter output.

Firmware does the following:

1. Starts the UART and Count7 operation.
2. Configures the Switch_InterruptHandler interrupt handler.
3. Before obtaining the current value of the counter, the counter is stopped. The counter is restarted after getting a copy of the count.
4. The counter is read directly, and its digital outputs are read via the status register. If either value has changed, the UART displays both values. The two values should always be the same.

When the button is pressed, Switch_ISR interrupt occurs, Switch_InterruptHandler is called, and the Control register output is toggled.

Figure 2. PSoC Creator Project Schematic

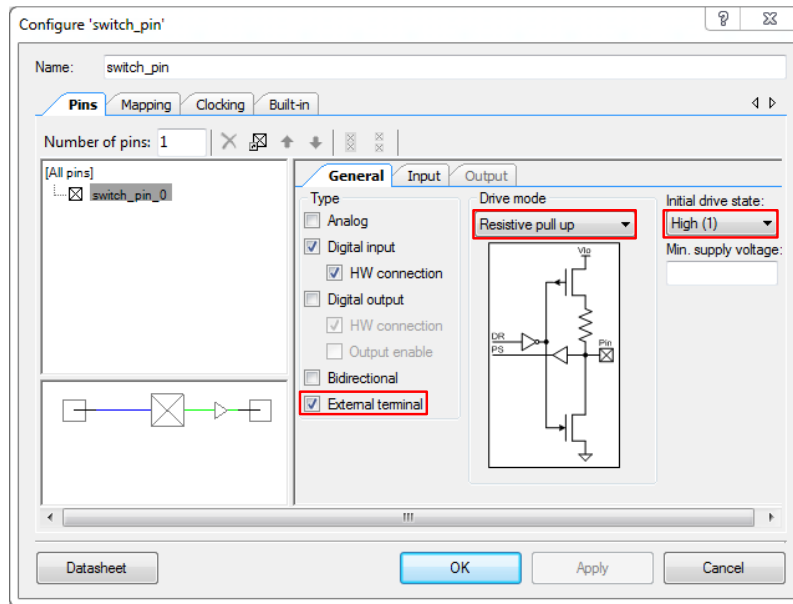

Components and Settings

[Table 1](#) lists the PSoC Creator Components used in this example, how they are used in the design, and the non-default settings required so they function as intended.

Table 1. PSoC Creator Components

Component	Instance Name	Purpose	Non-default Settings
Down Counter (7-bit) [v1.0]	Count7	Implements the down counter functionality	Set EnableSignal to Enabled
Control Register [v1.80]	Control_Reg	Allows for digital signal outputs	Set Outputs to 1
Status Register [v1.90]	Status_Reg	Allows for digital signals to be read	Set Inputs to 7
Digital Input Pin [v2.20]	Switch_pin	Handles the SW2 connection on the device	See Figure 3
UART (SCB mode) [v4.0]	UART	Handles UART communication	None
Interrupt [v1.70]	Switch_ISR	Handles Interrupt	None

Figure 3. switch_pin Parameter Settings

For information on the hardware resources used by a Component, see the Component datasheet.

Reusing this Example

This example is designed for the CY8CKIT-042 pioneer kit. To port the design to a different PSoC 4 device and/or kit, change the target device using the Device Selector and update the pin assignments in the Design Wide Resources Pins settings as needed. Table 2 shows pin assignments required for UART operation on other PSoC 4 devices.

Note: This project cannot be built for PSoC 4 devices with no UDBs.

Table 2. Pin Assignments for Different Kits

Pin Name	Development Kit			
	CY8CKIT-042	CY8CKIT-042-BLE	CY8CKIT-044	CY8CKIT-046
\UART:rx\	P0[4]	P1[4]	P7[0]	P3[0]
\UART:tx\	P0[5]	P1[5]	P7[1]	P3[1]

In some cases, a resource used by a code example (for example, an IP block) is not supported on another device. In that case the example will not work. If you build the code targeted at such a device, you will get errors. See the device datasheet for information on what a device supports.
