

Features

- Very high speed: 45 ns
 - Wide voltage range: 2.20 V to 3.60 V
- Pin compatible with CY62138CV30
- Ultra low standby power
 - Typical standby current: 1 μ A
 - Maximum standby current: 7 μ A
- Ultra low active power
 - Typical active current: 2 mA at f = 1 MHz
- Easy memory expansion with $\overline{CE}$ and $\overline{OE}$ features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Offered in Pb-free 36-ball ball grid array (BGA) package

Functional Description

The CY62138EV30 is a high performance CMOS static RAM organized as 256K words by eight bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption. The device can be put into standby mode reducing power consumption when deselected ($\overline{CE}$ HIGH).

Writing to the device is accomplished by taking Chip Enable ($\overline{CE}$) and Write Enable ($\overline{WE}$) inputs LOW. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{18}).

Reading from the device is accomplished by taking Chip Enable ($\overline{CE}$) and Output Enable ($\overline{OE}$) LOW while forcing Write Enable ($\overline{WE}$) HIGH. Under these conditions, the contents of the memory location specified by the address pins appear on the I/O pins.

The eight input and output pins (I/O_0 through I/O_7) are placed in a high impedance state when the device is deselected ($\overline{CE}$ HIGH), the outputs are disabled ($\overline{OE}$ HIGH), or during a write operation ($\overline{CE}$ LOW and $\overline{WE}$ LOW).

I_{SB2} ^[7]	Automatic CE power down current – CMOS inputs	$\overline{CE} \geq V_{CC} - 0.2$ V, $V_{IN} \geq V_{CC} - 0.2$ V or $V_{IN} \leq 0.2$ V, $f = 0$, $V_{CC} = 3.60$ V	—	1	7	μA

Notes

- $V_{IL(min.)} = -2.0$ V for pulse durations less than 20 ns.
- $V_{IH(max.)} = V_{CC} + 0.75$ V for pulse durations less than 20 ns.
- Full device AC operation assumes a 100 μs ramp time from 0 to $V_{CC(min.)}$ and 200 μs wait time after V_{CC} stabilization.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC(typ.)}$, $T_A = 25$ °C.
- Chip enable ($\overline{CE}$) must be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} specification. Other inputs can be left floating.

Notes

13. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the chip enable signal as described in the Application Note [AN66311](#). However, the issue has been fixed and in production now, and hence, this Application Notes is no longer applicable. It is available for download on our website as it contains information on the date code of the parts, beyond which the fix has been in production.
14. Test conditions for all parameters other than three-state parameters assume signal transition time of 3 ns or less (1 V/ns), timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in [Figure 2 on page 5](#).
15. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
16. t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the output enter a high impedance state.
17. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE} = V_{IL}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.
18. The minimum write cycle pulse width for Write Cycle No. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) should be equal to the sum of t_{SD} and t_{HZWE} .

Switching Waveforms

Figure 4. Read Cycle No. 1: Address Transition Controlled [19, 20]

Figure 5. Read Cycle No. 2: $\overline{OE}$ Controlled [21, 22]

Notes

19. Device is continuously selected. $\overline{OE}$, $\overline{CE} = V_{IL}$.
20. $\overline{WE}$ is HIGH for read cycle.
21. $\overline{WE}$ is HIGH for read cycle.
22. Address valid prior to or coincident with $\overline{CE}$ transition LOW.

Switching Waveforms (continued)

Figure 6. Write Cycle No. 1: $\overline{\text{WE}}$ Controlled [23, 24]

Figure 7. Write Cycle No. 2: $\overline{\text{CE}}$ Controlled [23, 24]

Notes

23. Data I/O is high impedance if $\overline{\text{OE}} = V_{\text{IH}}$.
 24. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ HIGH, the output remains in high impedance state.
 25. During this period, the I/Os are in output state and input signals should not be applied.

Switching Waveforms (continued)

Figure 8. Write Cycle No. 3: $\overline{WE}$ Controlled, $\overline{OE}$ LOW [26, 27]

Notes

- 26. If $\overline{CE}$ goes HIGH simultaneously with $\overline{WE}$ HIGH, the output remains in high impedance state.
- 27. The minimum write cycle pulse width should be equal to the sum of t_{SD} and t_{HZWE} .
- 28. During this period, the I/Os are in output state and input signals should not be applied.

Truth Table
