

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

32-Mbit (2M × 16/4M × 8) Static RAM

Features

- Thin small outline package I (TSOP I) configurable as 2M × 16 or as 4M × 8 static RAM (SRAM)
- High-speed up to 55 ns
- Wide voltage range: 2.2 V to 3.6 V and 4.5 V to 5.5 V
- Ultra low standby power
 - Typical standby current: 3 μA
 - Maximum standby current: 25 μA
- Ultra low active power
 - Typical active current: 4.5 mA at f = 1 MHz
- Easy memory expansion with $\overline{CE}_1$, CE_2 , and $\overline{OE}$ Features
- Automatic power-down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Available in Pb-free 48-ball TSOP I package

Functional Description

The CY62177ESL is a high performance CMOS static RAM organized as 2M words by 16 bits and 4M words by 8 bits. This device features advanced circuit design to provide ultra low active current. It is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption by 99 percent when addresses are not toggling. The device can also be put into standby mode when deselected ($\overline{CE}_1$ HIGH or CE_2 LOW or both BHE and BLE are HIGH). The input and output pins (I/O₀ through I/O₁₅) are placed in a high impedance state when: deselected ($\overline{CE}_1$ HIGH or CE_2 LOW), outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH), or during a write operation ($\overline{CE}_1$ LOW, CE_2 HIGH and WE LOW).

To write to the device, take Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Write Enable (WE) input LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O₀ through I/O₇), is written into the location specified on the address pins (A₀ through A₂₀). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O₈ through I/O₁₅) is written to the location specified on the address pins (A₀ through A₂₀). To read from the device, take Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins appear on I/O₀ to I/O₇. If Byte High Enable (BHE) is LOW, then data from memory appears on I/O₈ to I/O₁₅. See the [Truth Table](#) on page 11 for a complete description of read and write modes.

Notes

1. NC pins are not connected on the die.
2. The BYTE pin in the 48-pin TSOP-I package has to be tied to V_{CC} to use the device as a 2M × 16 SRAM. The 48-pin TSOP I package can also be used as a 4M × 8 SRAM by tying the BYTE signal to V_{SS}. In the 4M × 8 configuration, Pin 45 is A21, while BHE, BLE, and I/O₈ to I/O₁₄ pins are not used.
3. Datasheet Specifications are not guaranteed in the range of 3.6 V to 4.5 V.
4. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = 3 V, and V_{CC} = 5 V, T_A = 25 °C.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage temperature -65 °C to + 150 °C

Ambient temperature
with power applied -55 °C to + 125 °C

Supply voltage

Notes

5. $V_{IL(min)}$ = -2.0 V for pulse durations less than 20 ns.

6. $V_{IH(max)}$ = $V_{CC} + 0.75\text{ V}$ for pulse durations less than 20 ns.

7. Full Device AC operation assumes a 100 μs ramp time from 0 to V_{CC} (min) and 200 μs wait time after V_{CC} stabilization.

8. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = 3\text{ V}$, and $V_{CC} = 5\text{ V}$, $T_A = 25\text{ °C}$

9. Under DC conditions the device meets a V_{IL} of 0.8 V. However, in dynamic conditions Input LOW voltage applied to the device must not be higher than 0.7 V.

10. Chip enables (CE_1 and CE_2), byte enables (BHE and BLE) and $BYTE$ must be tied to CMOS levels to meet the I_{SB2}/I_{CCDR} spec. Other inputs can be left floating.

Notes

12. Typical values are included only for reference and are not guaranteed or tested. Typical values are measured at $V_{CC} = 3\text{ V}$, and $V_{CC} = 5\text{ V}$, $T_A = 25\text{ }^\circ\text{C}$.
13. Chip enables (CE1 and CE2), byte enables (BHE and BLE) and BYTE must be tied to CMOS levels to meet the I_{SB2}/I_{CCDR} spec. Other inputs can be left floating.
14. Tested initially and after any design or process changes that may affect these parameters.
15. Full device operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min)} \geq 100\text{ }\mu\text{s}$ or stable at $V_{CC(min)} \geq 100\text{ }\mu\text{s}$.
16. BHE.BLE is the AND of both BHE and BLE. Chip is deselected by either disabling the chip enable signals or by disabling both $\overline{BHE}$ and $\overline{BLE}$.

Notes

17. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Note [AN66311](#). However, the issue has been fixed and in production now, and hence, this Application Note is no longer applicable. It is available for download on our website as it contains information on the date code of the parts, beyond which the fix has been in production.
18. Test conditions for all parameters other than tristate parameters assume signal transition time of 1 V/ns, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in [Figure 2](#) on page 5.
19. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
20. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
21. The internal Write time of the memory is defined by the overlap of $\overline{WE}$, $CE_1 = V_{IL}$, BHE and/or BLE = V_{IL} , and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

Switching Waveforms

Figure 4. Read Cycle No. 1 (Address Transition Controlled) [22, 23]

Figure 5. Read Cycle No. 2 ($\overline{OE}$ Controlled) [23, 24]

Notes

22. The device is continuously selected. $\overline{OE}$, $\overline{CE}_1 = V_{IL}$, $\overline{BHE}$ and/or $\overline{BLE} = V_{IL}$, and $CE_2 = V_{IH}$.

23. $\overline{WE}$ is HIGH for read cycle.

24. Address valid prior to or coincident with $\overline{CE}_1$, $\overline{BHE}$, $\overline{BLE}$ transition LOW and CE_2 transition HIGH.

Switching Waveforms (continued)

Figure 7. Write Cycle No. 2 ($\overline{CE}_1$ or $\overline{CE}_2$ Controlled) [25, 26, 27]

Notes

25. The internal Write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE}_1 = V_{IL}$, $\overline{BHE}$ and/or $\overline{BLE} = V_{IL}$, and $\overline{CE}_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

26. Data I/O is high impedance if $\overline{OE} = V_{IH}$.

27. If $\overline{CE}_1$ goes HIGH and $\overline{CE}_2$ goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

28. During this period the I/Os are in output state and input signals should not be applied.

Switching Waveforms (continued)

Figure 9. Write Cycle No. 4 ($\overline{BHE}/\overline{BLE}$ Controlled, $\overline{OE}$ LOW) ^[29]

Notes

29. If $\overline{CE}_1$ goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

30. During this period the I/Os are in output state and input signals should not be applied.

No computing device can be absolutely secure. Therefore, despite security measures implemented in Cypress hardware or software products, Cypress does not assume any liability arising out of any security breach, such as unauthorized access to or use of a Cypress product. In addition, the products described in these materials may contain design defects or errors known as errata which may cause the product to deviate from published specifications. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. You shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.
