Functional Description

The CY7C1051H[1] is a high-performance CMOS fast static RAM automotive part with embedded ECC.

To write to the device, take Chip Enable ($\overline{CE}$) and Write Enable ($\overline{WE}$) inputs LOW. If Byte LOW Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O_0–I/O_7), is written into the location specified on the address pins (A_0–A_{18}). If Byte HIGH Enable ($\overline{BHE}$) is LOW, then data from I/O pins (I/O_8–I/O_{15}) is written into the location specified on the address pins (A_0–A_{18}).

To read from the device, take Chip Enable ($\overline{CE}$) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte LOW Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins appears on I/O_0–I/O_7. If Byte HIGH Enable ($\overline{BHE}$) is LOW, then data from memory appears on I/O_8 to I/O_{15}. See the Truth Table on page 11 for a complete description of read and write modes.

The input/output pins (I/O_0–I/O_{15}) are placed in a high-impedance state when the device is deselected ($\overline{CE}$ HIGH), the outputs are disabled ($\overline{OE}$ HIGH), the $\overline{BHE}$ and $\overline{BLE}$ are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or a write operation ($\overline{CE}$ LOW, and $\overline{WE}$ LOW) is in progress.

The CY7C1051H is available in 44-pin TSOP II and 48-ball VFBGA package.

Notes

9. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V.
10. t_{POWER} gives the minimum amount of time that the power supply must be at typical V_{CC} values until the first memory access can be performed.
11. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZOE} is less than t_{LZOE}, t_{HZBE} is less than t_{LZBE}, and t_{HZWE} is less than t_{LZWE} for any device.
12. t_{HZOE}, t_{HZCE}, t_{HZBE} and t_{HZWE} are specified with a load capacitance of 5 pF as in part (d) of Figure 3 on page 5.Transition is measured when the outputs enter a high impedance state.
13. These parameters are guaranteed by design and are not tested.
14. The internal write time of the memory is defined by the overlap of $\overline{CE}$ LOW, and $\overline{WE}$ LOW. $\overline{CE}$ and $\overline{WE}$ must be LOW to initiate a write, and the transition of either of these signals can terminate the write. The input data setup and hold timing must refer to the leading edge of the signal that terminates the write.
15. The minimum write cycle time for Write Cycle No. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) is the sum of t_{HZWE} and t_{SD}.

Switching Waveforms

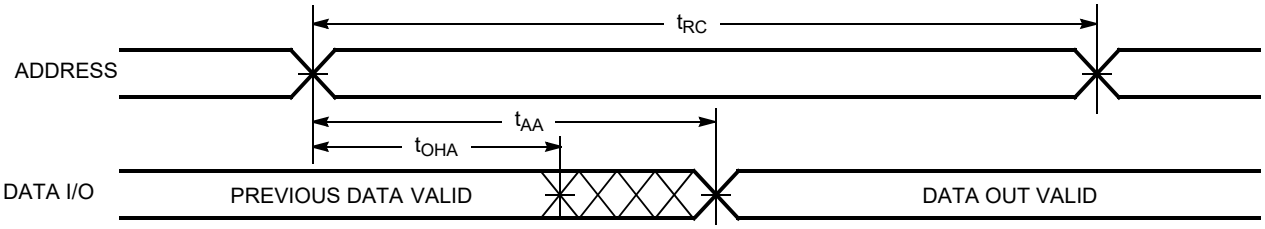

Figure 6. Read Cycle No. 2 ($\overline{OE}$ Controlled) [17, 18]

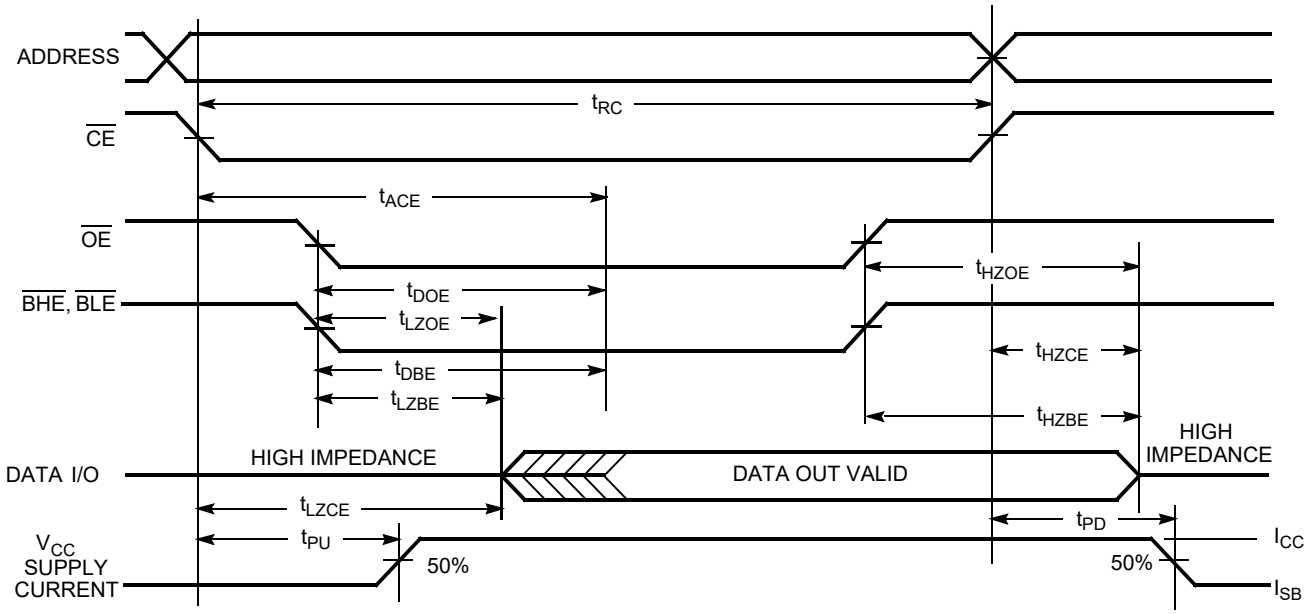

Notes
16. Device is continuously selected. $\overline{OE}$, $\overline{CE}$ = V_{IL}, $\overline{BHE}$, $\overline{BLE}$, or both = V_{IL}.
17. $\overline{WE}$ is HIGH for Read cycle.
18. Address valid before or coincident with $\overline{CE}$ transition LOW.

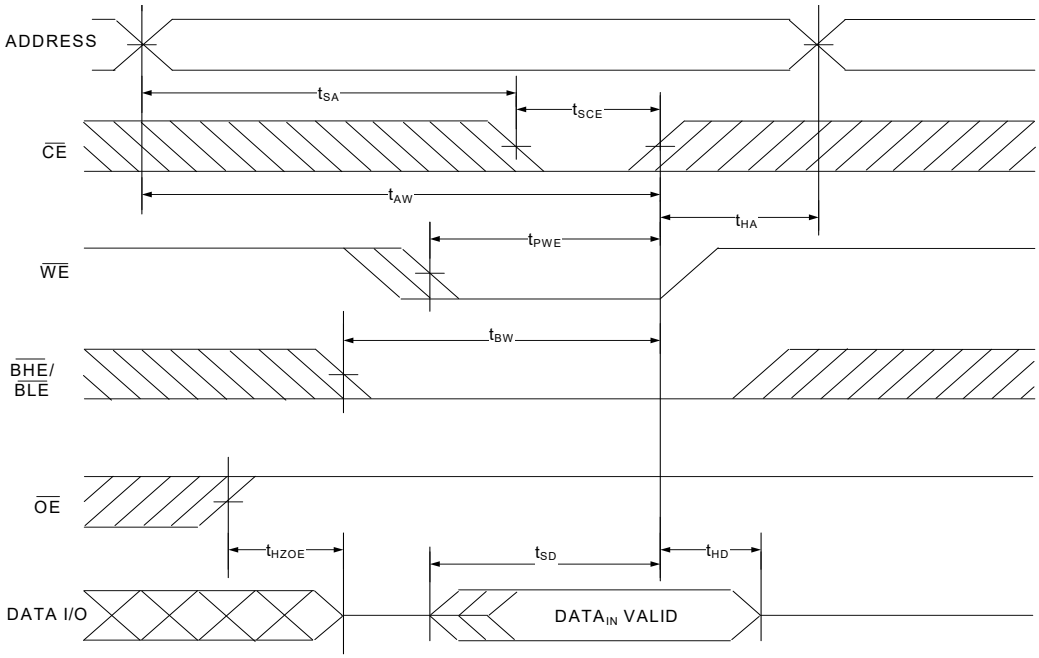

Figure 8. Write Cycle No. 2 ($\overline{BLE}$ or $\overline{BHE}$ Controlled) [19, 20, 21]

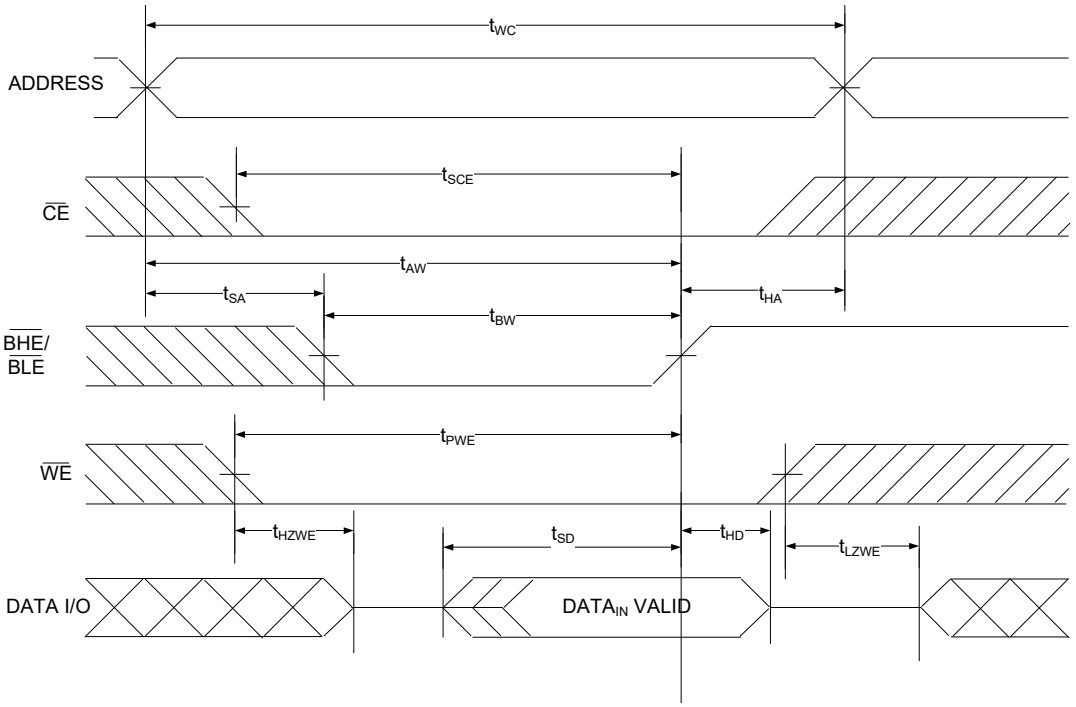

Notes

19. The internal write time of the memory is defined by the overlap of $\overline{WE}$ = V_{IL}, $\overline{CE}$ = V_{IL}, and $\overline{BHE}$ or $\overline{BLE}$ = V_{IL}. These signals must be LOW to initiate a write and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
20. Data I/O is in high-impedance state if $\overline{CE}$ = V_{IH}, or $\overline{OE}$ = V_{IH} or $\overline{BHE}$, and/or $\overline{BLE}$ = V_{IH}.
21. During this period, the I/Os are in output state. Do not apply input signals.

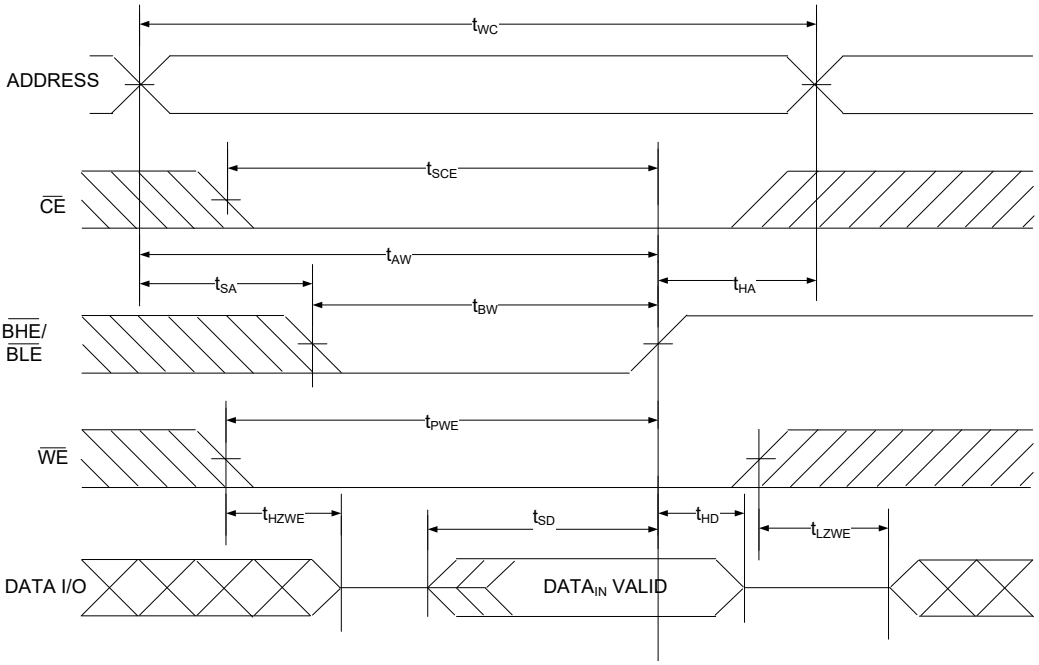

Figure 10. Write Cycle No. 4 ($\overline{WE}$ Controlled) [23, 24]

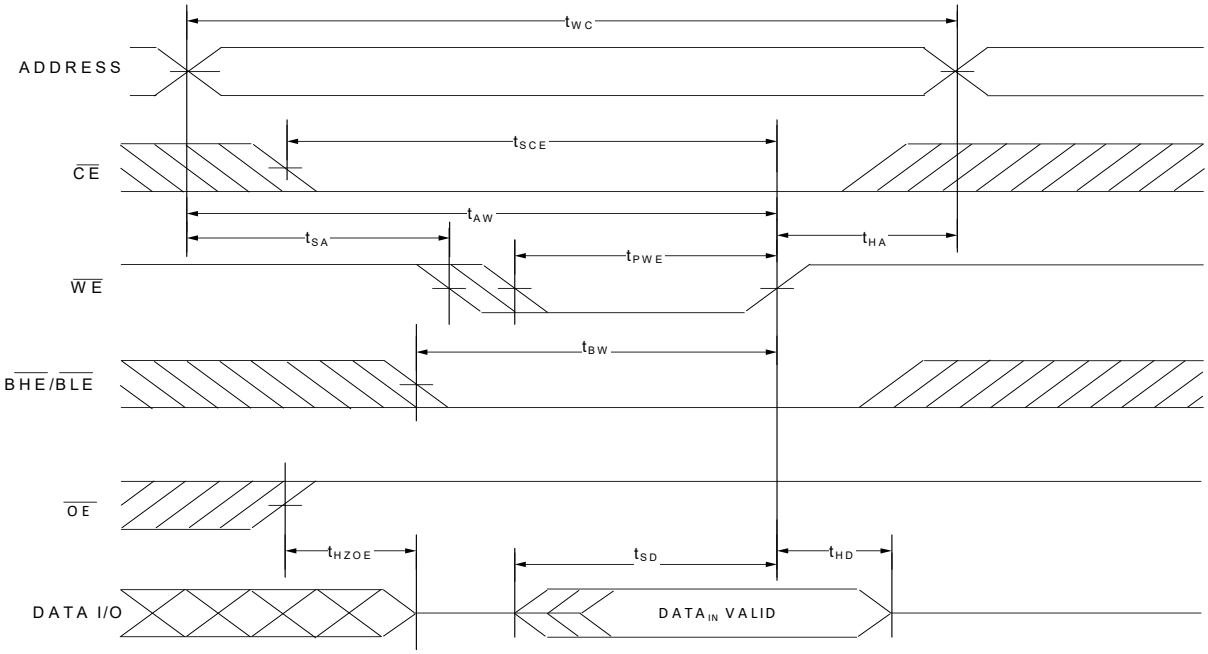

Notes

22. The minimum write pulse width for Write Cycle No. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) should be sum of t_{HZWE} and t_{SD}.
23. The internal write time of the memory is defined by the overlap of $\overline{WE}$ = V_{IL}, $\overline{CE}$ = V_{IL}, and $\overline{BHE}$ or $\overline{BLE}$ = V_{IL}. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
24. Data I/O is in high impedance state if $\overline{CE}$ = V_{IH}, or $\overline{OE}$ = V_{IH} or $\overline{BHE}$, and/or $\overline{BLE}$ = V_{IH}.
25. During this period the I/Os are in output state. Do not apply input signals.
