

1-Mbit (128 K × 8) Static RAM

Features

- Pin- and function-compatible with CY7C109B/CY7C1009B
- High speed
 - $t_{AA} = 10 \text{ ns}$
- Low active power
 - $I_{CC} = 80 \text{ mA}$ at 10 ns
- Low CMOS standby power
 - $I_{SB2} = 3 \text{ mA}$
- 2.0 V Data Retention
- Automatic power-down when deselected
- TTL-compatible inputs and outputs
- Easy memory expansion with $\overline{CE}_1$, CE_2 and $\overline{OE}$ options
- CY7C109D available in Pb-free 32-pin 400-Mil wide Molded SOJ and 32-pin TSOP I packages. CY7C1009D available in Pb-free 32-pin 300-Mil wide Molded SOJ package

Functional Description

The CY7C109D/CY7C1009D ^[1] is a high-performance CMOS static RAM organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable ($\overline{CE}_1$), an active HIGH Chip Enable (CE_2), an active LOW Output Enable ($\overline{OE}$), and tri-state drivers. The eight input and output pins (I/O_0 through I/O_7) are placed in a high-impedance state when:

($\overline{OE}$), and tri-state drivers. The eight input and output pins (I/O_0 through I/O_7) are placed in a high-impedance state when:

- Deselected ($\overline{CE}_1$ HIGH or CE_2 LOW),
- Outputs are disabled ($\overline{OE}$ HIGH),
- When the write operation is active ($\overline{CE}_1$ LOW, CE_2 HIGH, and $\overline{WE}$ LOW)

Write to the device by taking Chip Enable One ($\overline{CE}_1$) and Write Enable ($\overline{WE}$) inputs LOW and Chip Enable Two (CE_2) input HIGH. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{16}).

Read from the device by taking Chip Enable One ($\overline{CE}_1$) and Output Enable ($\overline{OE}$) LOW while forcing Write Enable ($\overline{WE}$) and Chip Enable Two (CE_2) HIGH. Under these conditions, the contents of the memory location specified by the address pins appears on the I/O pins.

The CY7C109D/CY7C1009D device is suitable for interfacing with processors that have TTL I/P levels. It is not suitable for processors that require CMOS I/P levels. Please see [Electrical Characteristics on page 4](#) for more details and suggested alternatives.

t _{LZWE}	$\overline{\text{WE}}$ HIGH to Low Z ^[12]	3	–	ns
t _{HZWE}	$\overline{\text{WE}}$ LOW to High Z ^[11, 12]	–	5	ns

Notes

9. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified $I_{\text{OL}}/I_{\text{OH}}$ and 30-pF load capacitance.
10. t_{POWER} gives the minimum amount of time that the power supply should be at typical V_{CC} values until the first memory access can be performed.
11. t_{HZOE} , t_{HZCE} and t_{HZWE} are specified with a load capacitance of 5 pF as in part (c) of Figure 3 on page 5. Transition is measured when the outputs enter a high impedance state.
12. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
13. This parameter is guaranteed by design and is not tested.
14. The internal write time of the memory is defined by the overlap of $\overline{\text{CE}}_1$ LOW, CE_2 HIGH, and $\overline{\text{WE}}$ LOW. $\overline{\text{CE}}_1$ and $\overline{\text{WE}}$ must be LOW and CE_2 HIGH to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
15. The minimum write cycle time for Write Cycle No. 3 ($\overline{\text{WE}}$ controlled, OE LOW) is the sum of t_{HZWE} and t_{SD} .

Switching Waveforms

Figure 5. Read Cycle No. 1 (Address Transition Controlled) [16, 17]

Figure 6. Read Cycle No. 2 ($\overline{OE}$ Controlled) [17, 18]

Notes

16. Device is continuously selected. $\overline{OE}$, $\overline{CE}_1 = V_{IL}$, $CE_2 = V_{IH}$.

17. $\overline{WE}$ is HIGH for read cycle.

18. Address valid prior to or coincident with $\overline{CE}_1$ transition LOW and CE_2 transition HIGH.

Figure 8. Write Cycle No. 2 ($\overline{WE}$ Controlled, $\overline{OE}$ HIGH During Write) [19, 20]

Notes

19. Data I/O is high impedance if $\overline{OE} = V_{IH}$.

20. If $\overline{CE}_1$ goes HIGH or CE_2 goes LOW simultaneously with $\overline{WE}$ going HIGH, the output remains in a high-impedance state.

21. During this period the I/Os are in the output state and input signals should not be applied.

Switching Waveforms (continued)

Figure 9. Write Cycle No. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) [22, 23]

Notes

22. The minimum write cycle pulse width should be equal to the sum of t_{SD} and t_{HZWE} .

23. If $\overline{CE}_1$ goes HIGH or $\overline{CE}_2$ goes LOW simultaneously with $\overline{WE}$ going HIGH, the output remains in a high-impedance state.

24. During this period the I/Os are in the output state and input signals should not be applied.
