

18-Mbit (512 K × 32) Pipelined SRAM

Features

- Supports bus operation up to 166 MHz
- Available speed grades are 166 MHz
- Registered inputs and outputs for pipelined operation
- 3.3 V core power supply
- 2.5 V or 3.3 V I/O power supply
- Fast clock-to-output times
 - 3.4 ns (for 166 MHz device)
- Provides high performance 3-1-1-1 access rate
- User selectable burst counter supporting Intel Pentium® interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed write
- Asynchronous output enable
- Single cycle chip deselect
- CY7C1384D is available in JEDEC-standard Pb-free 100-pin TQFP
- ZZ sleep mode option

Functional Description

The CY7C1384D SRAM integrates 524,288 × 32 SRAM cells with advanced synchronous peripheral circuitry and a two-bit counter for internal burst operation. All synchronous inputs are gated by registers controlled by a positive edge triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining chip_enable ($\overline{CE}_1$), depth-expansion chip enables ($\overline{CE}_2$ and $\overline{CE}_3$), burst control inputs ($\overline{ADSC}$, $\overline{ADSP}$, and $\overline{ADV}$), write enables ($\overline{BW}_X$, and $\overline{BWE}$), and global write ($\overline{GW}$). Asynchronous inputs include the output enable ($\overline{OE}$) and the ZZ pin.

Addresses and chip enables are registered at rising edge of clock when address strobe processor ($\overline{ADSP}$) or address strobe controller ($\overline{ADSC}$) are active. Subsequent burst addresses can be internally generated as they are controlled by the advance pin ($\overline{ADV}$).

Address, data inputs, and write controls are registered on-chip to initiate a self-timed write cycle. This part supports byte write operations (see [Truth Table on page 7](#) for further details). Write cycles can be one to two or four bytes wide as controlled by the byte write control inputs. $\overline{GW}$ when active LOW causes all bytes to be written.

The CY7C1384D operates from a +3.3 V core power supply while all outputs operate with a +2.5 or +3.3 V power supply. All inputs and outputs are JEDEC-standard and JESD8-5-compatible.

CY7C1384D (512 K × 32)

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CO}) is 3.4 ns (166 MHz device).

CY7C1384D supports secondary cache in systems using a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486™ processors. The linear burst sequence suits processors that use a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the processor address strobe (ADSP) or the controller address strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the byte write enable ($\overline{BWE}$) and byte write select ($\overline{BW_X}$) inputs. A global write enable ($\overline{GW}$) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous chip selects ($\overline{CE_1}$, CE_2 , $\overline{CE_3}$) and an asynchronous output enable ($\overline{OE}$) provide for easy bank selection and output tri-state control. ADSP is ignored if $\overline{CE_1}$ is HIGH.

Single Read Accesses

This access is initiated when the following conditions are satisfied at clock rise: (1) ADSP or ADSC is asserted LOW, (2) $\overline{CE_1}$, CE_2 , $\overline{CE_3}$ are all asserted active, and (3) the write signals ($\overline{GW}$, $\overline{BWE}$) are all deserialized HIGH. ADSP is ignored if $\overline{CE_1}$ is HIGH. The address presented to the address inputs (A) is stored into the address advancement logic and the address register while being presented to the memory array. The corresponding data is enabled to propagate to the input of the output registers. At the rising edge of the next clock, the data is enabled to propagate through the output register and onto the data bus within 3.4 ns (166 MHz device) if $\overline{OE}$ is active LOW. The only exception occurs when the SRAM is emerging from a deselected state to a selected state; its outputs are always tri-stated during the first cycle of the access. After the first cycle of the access, the outputs are controlled by the $\overline{OE}$ signal. Consecutive single read cycles are supported. Once the SRAM is deselected at clock rise by the chip select and either ADSP or ADSC signals, its output tri-states immediately.

Single Write Accesses Initiated by ADSP

This access is initiated when both the following conditions are satisfied at clock rise: (1) ADSP is asserted LOW and (2) $\overline{CE_1}$, CE_2 , and $\overline{CE_3}$ are all asserted active. The address presented to A is loaded into the address register and the address advancement logic while being delivered to the memory array.

The write signals ($\overline{GW}$, $\overline{BWE}$, and $\overline{BW_X}$) and ADV inputs are ignored during this first cycle.

ADSP triggered write accesses require two clock cycles to complete. If $\overline{GW}$ is asserted LOW on the second clock rise, the data presented to the DQs inputs is written into the corresponding address location in the memory array. If $\overline{GW}$ is HIGH, then the write operation is controlled by $\overline{BWE}$ and $\overline{BW_X}$ signals.

CY7C1384D provides byte write capability that is described in the write cycle descriptions table. Asserting the byte write enable input ($\overline{BWE}$) with the selected byte write ($\overline{BW_X}$) input, selectively writes to only the desired bytes. Bytes not selected during a byte write operation remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

CY7C1384D is a common I/O device, the output enable ($\overline{OE}$) must be deserialized HIGH before presenting data to the DQs inputs. Doing so tri-states the output drivers. As a safety precaution, DQs are automatically tri-stated whenever a write cycle is detected, regardless of the state of $\overline{OE}$.

Single Write Accesses Initiated by ADSC

ADSC write accesses are initiated when the following conditions are satisfied: (1) ADSC is asserted LOW, (2) ADSP is deserialized HIGH, (3) $\overline{CE_1}$, CE_2 , and $\overline{CE_3}$ are all asserted active, and (4) the appropriate combination of the write inputs ($\overline{GW}$, $\overline{BWE}$, and $\overline{BW_X}$) are asserted active to conduct a write to the desired byte(s). ADSC-triggered Write accesses require a single clock cycle to complete. The address presented to A is loaded into the address register and the address advancement logic while being delivered to the memory array. The ADV input is ignored during this cycle. If a global write is conducted, the data presented to the DQs is written into the corresponding address location in the memory core. If a byte write is conducted, only the selected bytes are written. Bytes not selected during a byte write operation remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

CY7C1384D is a common I/O device, the output enable ($\overline{OE}$) must be deserialized HIGH before presenting data to the DQs inputs. Doing so tri-states the output drivers. As a safety precaution, DQs are automatically tri-stated whenever a write cycle is detected, regardless of the state of $\overline{OE}$.

Burst Sequences

CY7C1384D provides a two-bit wraparound counter, fed by A1:A0, that implements an interleaved or a linear burst sequence. The interleaved burst sequence is designed specifically to support Intel Pentium applications. The linear burst sequence is designed to support processors that follow a linear burst sequence. The burst sequence is user selectable through the MODE input.

Asserting ADV LOW at clock rise automatically increments the burst counter to the next address in the burst sequence. Both read and write burst operations are supported.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation sleep mode. Two clock cycles are required to enter into or exit from this sleep mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the sleep mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the sleep mode. $\overline{CE}_1$, $\overline{CE}_2$, $\overline{CE}_3$, ADSP, and ADSC must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

WRITE Cycle, Suspend Burst	Current	H	X	X	L	X	H	H	L	X	L-H	D

Notes

1. X = Don't Care, H = Logic HIGH, L = Logic LOW.
2. $\overline{WRITE}$ = L when any one or more byte write enable signals, and $\overline{BWE} = L$ or $\overline{GW} = L$. $\overline{WRITE}$ = H when all byte write enable signals, $\overline{BWE}$, $\overline{GW}$ = H.
3. The DQ pins are controlled by the current cycle and the $\overline{OE}$ signal. $\overline{OE}$ is asynchronous and is not sampled with the clock.
4. The SRAM always initiates a read cycle when $\overline{ADSP}$ is asserted, regardless of the state of $\overline{GW}$, $\overline{BWE}$, or $\overline{BW}_x$. Writes may occur only on subsequent clocks after the $\overline{ADSP}$ or with the assertion of $\overline{ADSC}$. As a result, $\overline{OE}$ must be driven HIGH prior to the start of the write cycle to allow the outputs to tri-state. $\overline{OE}$ is a don't care for the remainder of the write cycle.
5. $\overline{OE}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tri-state when $\overline{OE}$ is inactive or when the device is deselected, and all data bits behave as output when $\overline{OE}$ is active (LOW).

Truth Table for Read/Write

The Truth Table for Read/Write for CY7C1384D follows. [6, 7]

Function (CY7C1384D)	$\overline{GW}$	$\overline{BWE}$	$\overline{BW_D}$	$\overline{BW_C}$	$\overline{BW_B}$	$\overline{BW_A}$
Read	H	H	X	X	X	X
Read	H	L	H	H	H	H
Write Byte A – (DQ _A)	H	L	H	H	H	L
Write Byte B – (DQ _B)	H	L	H	H	L	H
Write Bytes B, A	H	L	H	H	L	L
Write Byte C – (DQ _C)	H	L	H	L	H	H
Write Bytes C, A	H	L	H	L	H	L
Write Bytes C, B	H	L	H	L	L	H
Write Bytes C, B, A	H	L	H	L	L	L
Write Byte D – (DQ _D)	H	L	L	H	H	H
Write Bytes D, A	H	L	L	H	H	L
Write Bytes D, B	H	L	L	H	L	H
Write Bytes D, B, A	H	L	L	H	L	L
Write Bytes D, C	H	L	L	L	H	H
Write Bytes D, C, A	H	L	L	L	H	L
Write Bytes D, C, B	H	L	L	L	L	H
Write All Bytes	H	L	L	L	L	L
Write All Bytes	L	X	X	X	X	X

Notes

6. X = Don't Care, H = Logic HIGH, L = Logic LOW.

7. Table only lists a partial listing of the byte write combinations. Any combination of $\overline{BW}_x$ is valid. Appropriate write is done based on which byte write is active.

Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. For user guidelines, not tested.

Storage Temperature -65 °C to +150 °C

Ambient Temperature
with Power Applied -55 °C to +125 °C

Supply Voltage on V_{DD} Relative to GND -0.3 V to +4.6 V

Supply Voltage on V_{DDQ} Relative to GND -0.3 V to + V_{DD}

DC Voltage Applied to Outputs
in tri-state -0.5 V to $V_{DDQ} + 0.5$ V

DC Input Voltage -0.5 V to $V_{DD} + 0.5$ V

Current into Outputs (LOW) 20 mA

Static Discharge Voltage
(per MIL-STD-883, Method 3015) > 2001 V

Latch-up Current > 200 mA

Operating Range

Range	Ambient Temperature	V_{DD}	V_{DDQ}
Industrial	-40 °C to +85 °C	3.3 V – 5% / + 10%	2.5 V – 5% to V_{DD}

Electrical Characteristics

Over the Operating Range

Parameter ^[8, 9]	Description	Test Conditions	Min	Max	Unit
V_{DD}	Power Supply Voltage		3.135	3.6	V
V_{DDQ}	I/O Supply Voltage	for 3.3 V I/O	3.135	V_{DD}	V
		for 2.5 V I/O	2.375	2.625	V

	Input Current of MODE	Input = V_{SS}	-30	–	μ A
		Input = V_{DD}	–	5	μ A
	Input Current of ZZ	Input = V_{SS}	-5	–	μ A
		Input = V_{DD}	–	30	μ A
I_{OZ}	Output Leakage Current	$GND \leq V_I \leq V_{DDQ}$, Output Disabled	-5	5	μ A
I_{DD}	V_{DD} Operating Supply Current	$V_{DD} = \text{Max}$, $I_{OUT} = 0$ mA, $f = f_{MAX} = 1/t_{CYC}$	–	275	mA
I_{SB1}	Automatic CE Power Down Current – TTL Inputs	$V_{DD} = \text{Max}$, Device Deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$, $f = f_{MAX} = 1/t_{CYC}$	–	140	mA
I_{SB2}	Automatic CE Power Down Current – CMOS Inputs	$V_{DD} = \text{Max}$, Device Deselected, $V_{IN} \leq 0.3$ V or $V_{IN} \geq V_{DDQ} - 0.3$ V, $f = 0$	–	70	mA
I_{SB3}	Automatic CE Power Down Current – CMOS Inputs	$V_{DD} = \text{Max}$, Device Deselected, $V_{IN} \leq 0.3$ V or $V_{IN} \geq V_{DDQ} - 0.3$ V, $f = f_{MAX} = 1/t_{CYC}$	–	125	mA
I_{SB4}	Automatic CE Power Down Current – TTL Inputs	$V_{DD} = \text{Max}$, Device Deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$, $f = 0$	–	80	mA

Notes

8. Overshoot: $V_{IH(AC)} < V_{DD} + 1.5$ V (pulse width less than $t_{CYC}/2$), undershoot: $V_{IL(AC)} > -2$ V (pulse width less than $t_{CYC}/2$).

9. TPower up: Assumes a linear ramp from 0 V to $V_{DD(min)}$ within 200 ms. During this time $V_{IH} < V_{DD}$ and $V_{DDQ} \leq V_{DD}$.

Capacitance

Parameter ^[10]	Description	Test Conditions	100-pin TQFP Package	Unit
C_{IN}	Input Capacitance	$T_A = 25\text{ }^{\circ}\text{C}$, $f = 1\text{ MHz}$, $V_{DD} = 3.3\text{ V}$, $V_{DDQ} = 2.5\text{ V}$	5	pF
C_{CLK}	Clock Input Capacitance		5	pF
C_{IO}	Input/Output Capacitance		5	pF

Thermal Resistance

Notes

11. Timing reference level is 1.5 V when $V_{DDQ} = 3.3$ V and is 1.25 V when $V_{DDQ} = 2.5$ V.

12. Test conditions shown in (a) of [Figure 2 on page 10](#) unless otherwise noted.

13. This part has a voltage regulator internally; t_{POWER} is the time that the power needs to be supplied above $V_{DD(\text{minimum})}$ initially before a read or write operation can be initiated.

14. t_{CHZ} , t_{CLZ} , $t_{OE\overline{L}Z}$, and $t_{OE\overline{H}Z}$ are specified with AC test conditions shown in part (b) of [Figure 2 on page 10](#). Transition is measured ± 200 mV from steady-state voltage.

15. At any given voltage and temperature, $t_{OE\overline{H}Z}$ is less than $t_{OE\overline{L}Z}$ and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.

16. This parameter is sampled and not 100% tested.

Switching Waveforms

$\overline{\text{OE}}$	Output Enable
SRAM	Static Random Access Memory
TQFP	Thin Quad Flat Pack
TTL	Transistor-Transistor Logic

Document Conventions

Units of Measure

Symbol	Unit of Measure
$^{\circ}\text{C}$	degree Celsius
MHz	megahertz
μA	microampere
mA	milliampere
mm	millimeter
ms	millisecond
mV	millivolt
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
V	volt
W	watt

Document History Page

Document Title: CY7C1384D, 18-Mbit (512 K × 32) Pipelined SRAM Document Number: 001-74017				
Rev.	ECN No.	Submission Date	Orig. of Change	Description of Change
**	3489511	01/10/2012	NJY	New data sheet
*A	3607309	05/03/2012	PRIT	Changed status from Preliminary to Final.
*B	4573182	11/18/2014	PRIT	Updated Functional Description : Added "For a complete list of related documentation, click here ." at the end. Updated Package Diagrams : spec 51-85050 – Changed revision from *D to *E.
*C	5071495	01/04/2016	PRIT	Updated to new template. Completing Sunset Review.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).

Products

Automotive	cypress.com/go/automotive
Clocks & Buffers	cypress.com/go/clocks
Interface	cypress.com/go/interface
Lighting & Power Control	cypress.com/go/powerpsoc
Memory	cypress.com/go/memory
PSoC	cypress.com/go/psoc
Touch Sensing	cypress.com/go/touch
USB Controllers	cypress.com/go/USB
Wireless/RF	cypress.com/go/wireless

© Cypress Semiconductor Corporation, 2012-2016. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
