

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

The CY9AA30N Series are highly integrated 32-bit microcontrollers that are dedicated for embedded controllers with low-power consumption mode and competitive cost. The CY9AA30N Series are based on the ARM Cortex-M3 Processor with on-chip Flash memory and SRAM, and has peripheral functions such as LCD Controller, Motor Control Timers, ADCs, DACs and Communication Interfaces (UART, CSIO, I<sup>2</sup>C). The products which are described in this data sheet are placed into TYPE7 product categories in FM3 Family Peripheral Manual.

## Features

### 32-bit ARM Cortex-M3 Core

Processor version: r2p1

Up to 20 MHz Operation Frequency

Integrated Nested Vectored Interrupt Controller (NVIC): 1 channel NMI (non-maskable interrupt) and 32 channels' peripheral interrupts and 8 priority levels

24-bit System timer (Sys Tick): System timer for OS task management

### On-chip Memories

[Flash memory]

Up to 128 Kbytes

Read cycle: 0 wait-cycle

Security function for code protection

[SRAM]

This series contains a total of up to 16 Kbyte on-chip SRAM that is connected to System bus of Cortex-M3 core.

SRAM1: Up to 16 Kbytes

### LCD controller (LCDC)

Selectable from 44 SEG x 4 COM (Max) or 40 SEG x 8 COM (Max)

Internal divide resistor is contained (selectable from 10kΩ or 100kΩ for the resistor value)

LCD drive power supply (bias) pin (VV4 to VV0)

Interrupt function synchronized with the LCD module frame frequency

With blinking function

Inverted display function

### Multi-function Serial Interface (Max 8 channels)

Operation mode is selectable from the followings for each channel

UART

CSIO

I<sup>2</sup>C

[UART]

Full duplex double buffer

Selection with or without parity supported

Built-in dedicated baud rate generator

External clock available as a serial clock

Various error detection functions available (parity errors, framing errors, and overrun errors)

[CSIO]

Full duplex double buffer

Built-in dedicated baud rate generator

Overrun error detection function available

[I<sup>2</sup>C]

Standard-mode (Max 100 kbps) / Fast-mode (Max 400 kbps) supported

### A/D Converter (Max 16 channels)

[12-bit A/D Converter]

Successive Approximation type

Conversion time: Min 1.0 μs

Priority conversion available (priority at 2 levels)

Scanning conversion mode

Built-in FIFO for conversion data storage (for SCAN conversion: 16 steps, for Priority conversion: 4 steps)

### D/A Converter (Max 2 channels)

R-2R type

10-bit resolution

### Base Timer (Max 8channels)

Operation mode is selectable from the followings for each channel.

16-bit PWM timer

16-bit PPG timer

16-/32-bit reload timer

16-/32-bit PWC timer

### General-Purpose I/O Port

This series can use its pins as general-purpose I/O ports when they are not used for peripherals. Moreover, the port relocate function is built in. It can set which I/O port the peripheral function can be allocated to.

Capable of pull-up control per pin

Capable of reading pin level directly

Built-in the port relocate function

Up to 84 high-speed general-purpose I/O Ports@100 pin Package

Some ports are 5V tolerant I/O  
 See "List of Pin Functions" and "I/O Circuit Type" to confirm the corresponding pins.

### Multi-function Timer

The Multi-function timer is composed of the following blocks.

16-bit free-run timer × 3 ch.

Input capture × 4 ch.

Output compare × 6 ch.

A/D activating compare × 3 ch.

Waveform generator × 3 ch.

16-bit PPG timer × 3 ch.  
 IGBT mode is contained.

The following function can be used to achieve the motor control.

PWM signal output function

DC chopper waveform output function

Dead time function

Input capture function

A/D convertor activate function

DTIF (Motor emergency stop) interrupt function

### HDMI-CEC/Remote Control Receiver (Up to 2 channels)

HDMI- CEC receiver / Remote control receiver

- Operating modes supporting the following standards can be selected
  - SIRCS
  - NEC/Association for Electric Home Appliances
  - HDMI-CEC
- Capable of adjusting detection timings for start bit and data bit
- Equipped with noise filter

HDMI-CEC transmitter

- Header block automatic transmission by judging Signal free
- Generating status interrupt by detecting Arbitration lost
- Generating START, EOM, ACK automatically to output CEC transmission by setting 1 byte data
- Generating transmission status interrupt when transmitting 1 block (1 byte data and EOM/ACK)

### Real-time clock (RTC)

The Real-time clock can count Year/Month/Day/Hour/Minute/Second/A day of the week from 00 to 99.

The interrupt function with specifying date and time (Year/Month/Day/Hour/Minute) is available. This function is also available by specifying only Year, Month, Day, Hour or Minute.

Timer interrupt function after set time or each set time.

Capable of rewriting the time with continuing the time count. Leap year automatic count is available.

### External Interrupt Controller Unit

Up to 16 external interrupt input pins

Include one non-maskable interrupt (NMI) input pin

### Watchdog Timer (2 channels)

A watchdog timer can generate interrupts or a reset when a time-out value is reached.

This series consists of two different watchdogs, a Hardware watchdog and a Software watchdog.

The Hardware watchdog timer is clocked by the built-in Low-speed CR oscillator. Therefore, the Hardware watchdog is active in any low-power consumption mode except RTC, Stop, Deep Standby RTC and Deep Standby Stop modes.

### Clock and Reset

[Clocks]

Selectable from five clock sources (2 external oscillators, 2 built-in CR oscillators, and Main PLL).

Main Clock: 4 MHz to 20 MHz

Sub Clock: 32.768 kHz

Built-in High-speed CR Clock: 4 MHz

Built-in Low-speed CR Clock: 100 kHz

Main PLL Clock

[Resets]

Reset requests from INITX pin

Power-on reset

Software reset

Watchdog timers reset

Low-voltage detection reset

Clock Super Visor reset

### Clock Super Visor (CSV)

Clocks generated by built-in CR oscillators are used to supervise abnormality of the external clocks.

If external clock failure (clock stop) is detected, reset is asserted.

If external frequency anomaly is detected, interrupt or reset is asserted.

**Low-Voltage Detector (LVD)**

This Series includes 2-stage monitoring of voltage on the VCC. When the voltage falls below the voltage that has been set, Low-Voltage Detector generates an interrupt or reset.

LVD1: error reporting via interrupt

LVD2: auto-reset operation

**Low-Power Consumption Mode**

Six low-power consumption modes supported.

Sleep

Timer

RTC

Stop

Deep Standby RTC

Deep Standby Stop

The backup register is 16 byte

**Debug**

Serial Wire JTAG Debug Port (SWJ-DP)

**Power Supply**

Wide range voltage: VCC = 1.8 V to 5.5 V

VCC = 2.2 V to 5.5 V (when LCDC is used)

## 3. Pin Assignment

LQD064/LQG064

**Note:**

– The number after the underscore (“\_”) in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

VNC064

**Note:**

- The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

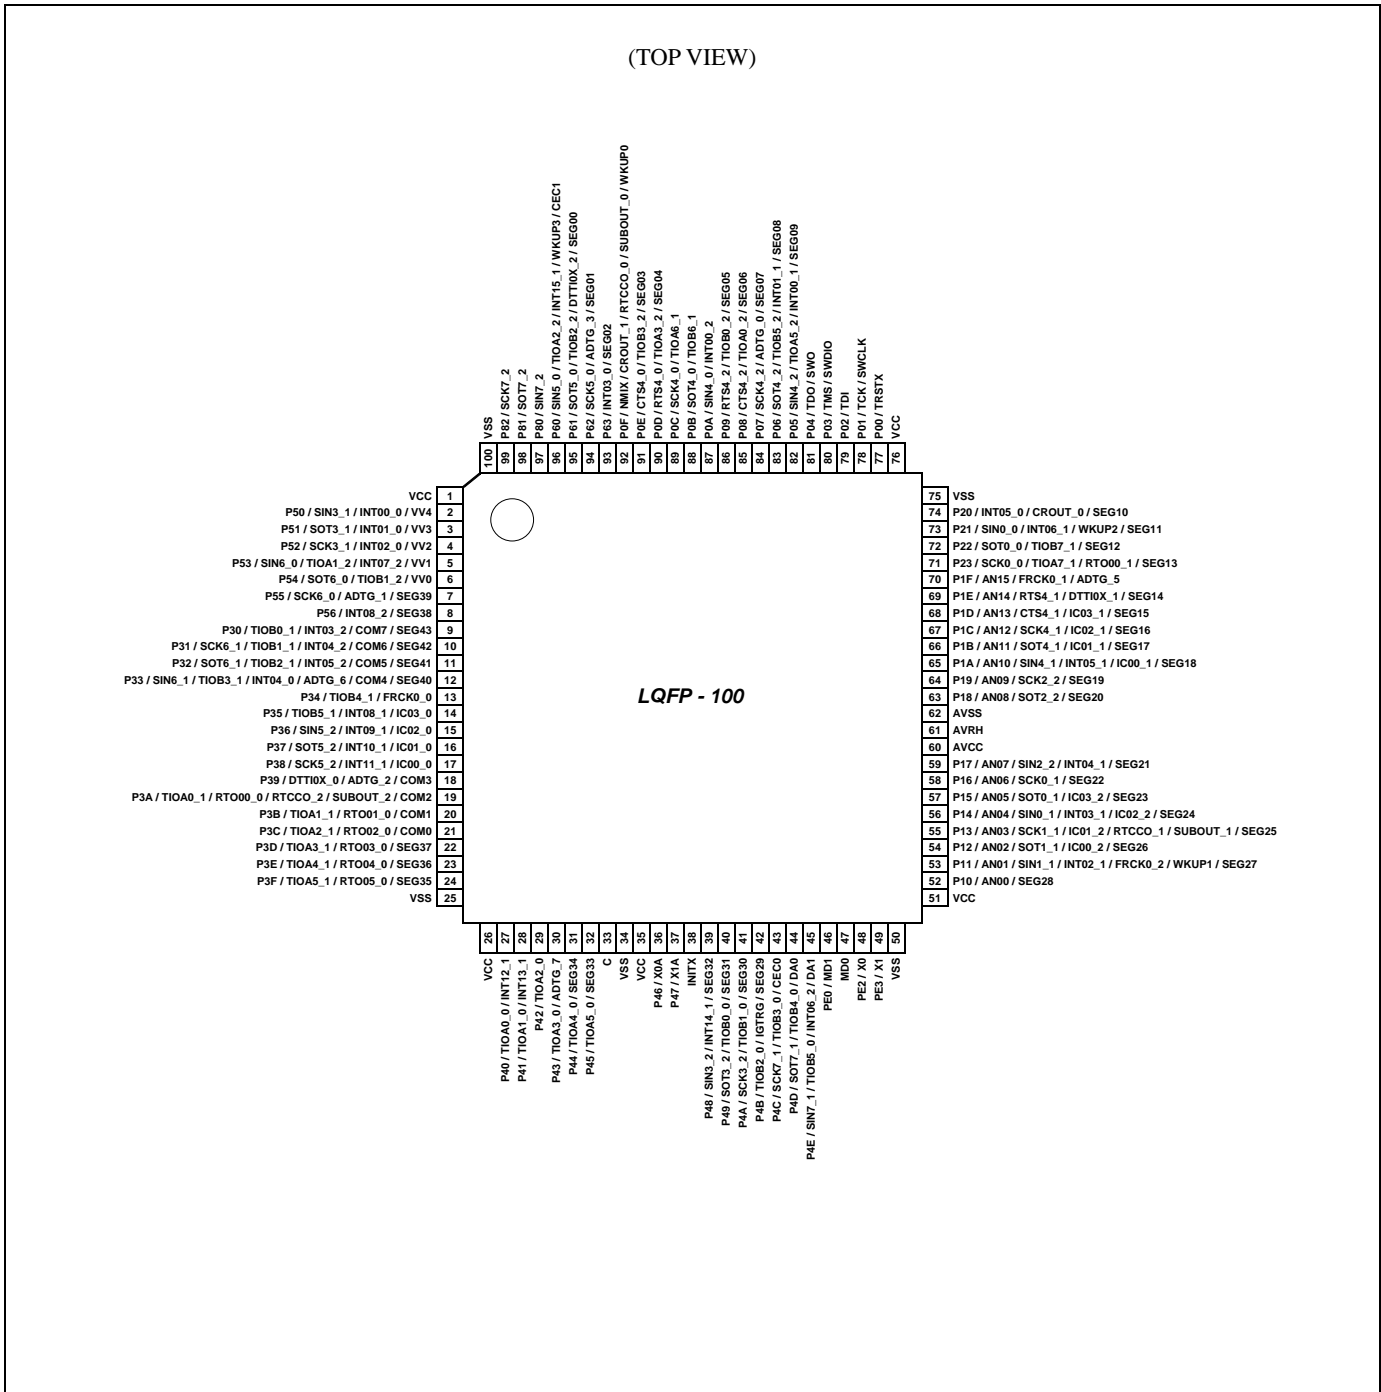

LQH080/LQJ080

**Note:**

- The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

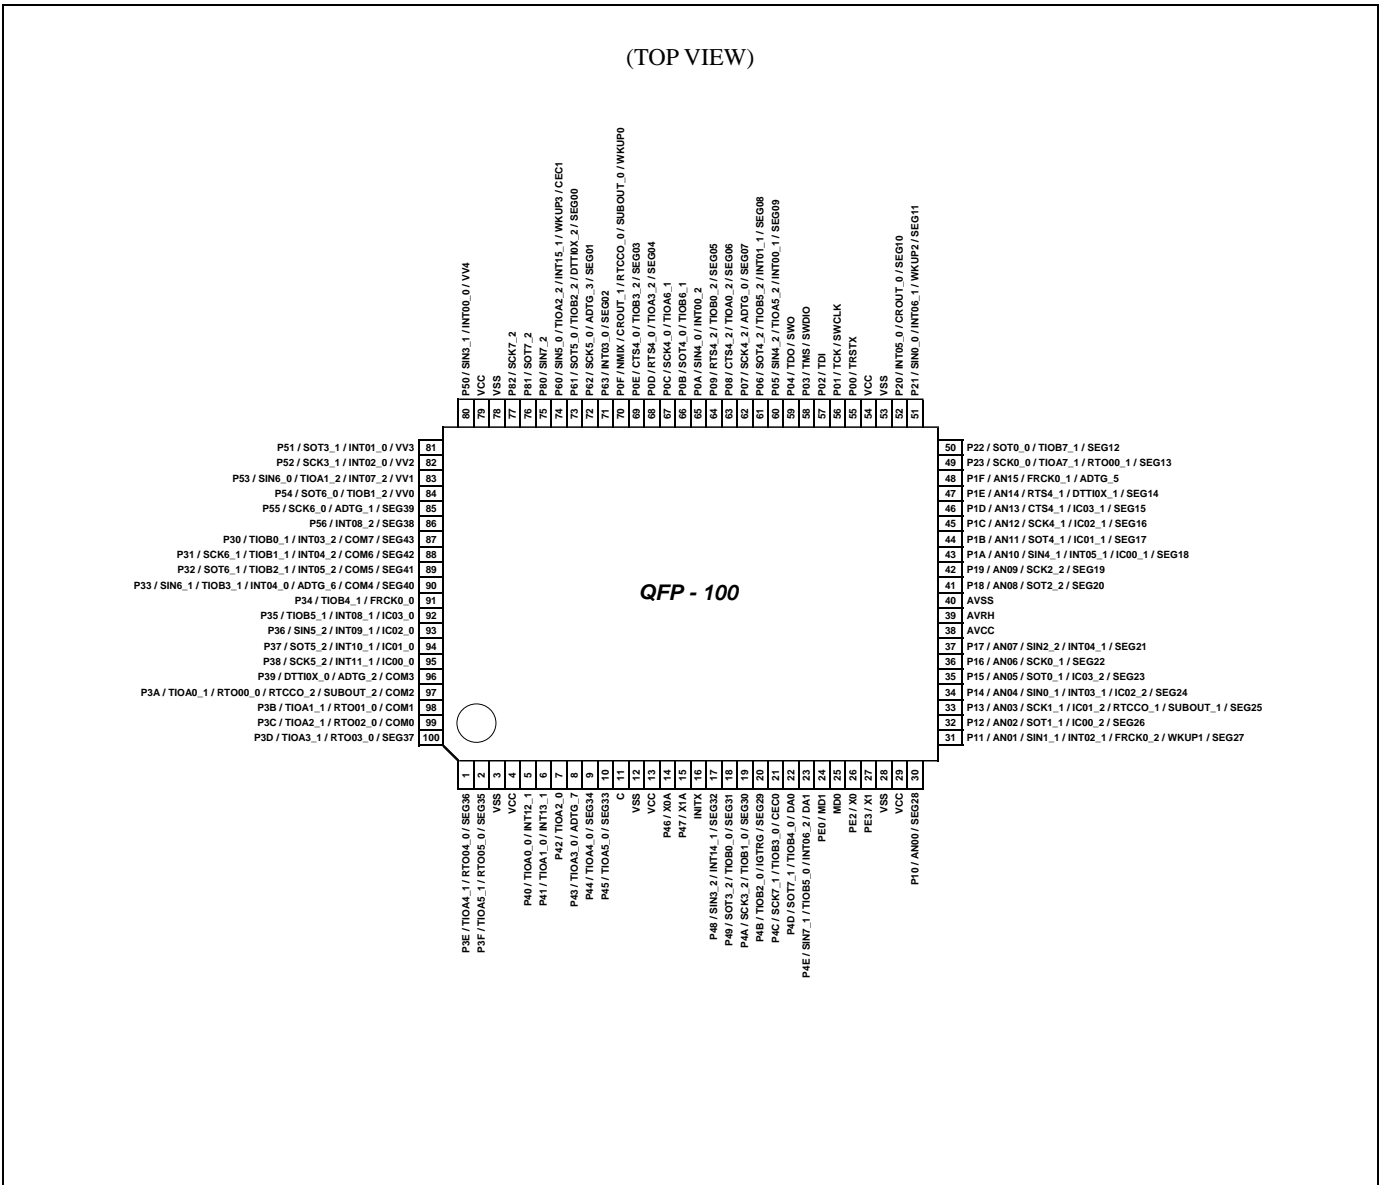

LQI100

**Note:**

— The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

PQH100

**Note:**

– The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

**List of pin functions**

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## 6. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

### 6.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

#### Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

#### Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

#### Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

##### 1. Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

##### 2. Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

##### 3. Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

#### Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

**CAUTION:** The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
2. Be sure that abnormal current flows do not occur during the power-on sequence.

#### Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

#### Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

#### Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

**CAUTION:** Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

## 6.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress' recommended conditions. For detailed information about mount conditions, contact your sales representative.

### Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

### Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

#### Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

#### Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.  
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

#### Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

#### Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
3. Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ). Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

### 6.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

2. Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

3. Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

4. Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

5. Smoke, Flame

**CAUTION:** Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

## 7. Handling Devices

### Power supply pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with each Power supply pins and GND pins of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1  $\mu\text{F}$  be connected as a bypass capacitor between each Power supply pin and GND pin, between AVCC pin and AVSS pin near this device.

### Stabilizing power supply voltage

A malfunction may occur when the power supply voltage fluctuates rapidly even though the fluctuation is within the recommended operating conditions of the VCC power supply voltage. As a rule, with voltage stabilization, suppress the voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the VCC value in the recommended operating conditions, and the transient fluctuation rate does not exceed 0.1 V/ $\mu\text{s}$  when there is a momentary fluctuation on switching the power supply.

### Crystal oscillator circuit

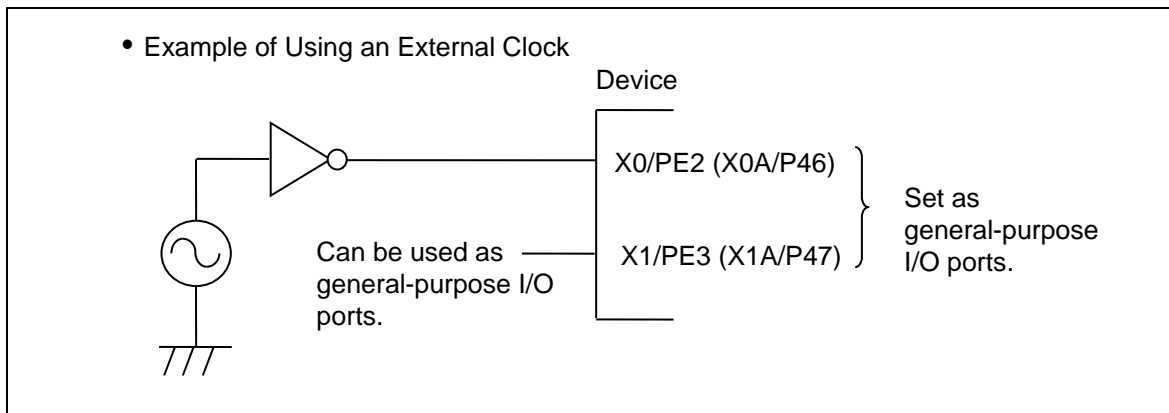

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator, and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane as this is expected to produce stable operation.

Evaluate oscillation of your using crystal oscillator by your mount board.

### Using an external clock

To use the external clock, set general-purpose I/O ports to input the clock to X0/PE2 and X0A/P46 pin.

### Handling when using Multi-function serial pin as I<sup>2</sup>C pin

If it is using the multi-function serial pin as I<sup>2</sup>C pins, P-ch transistor of digital output is always disable. However, I<sup>2</sup>C pins need to keep the electrical characteristic like other pins and not to connect to the external I<sup>2</sup>C bus system with power OFF.

## C Pin

This series contains the regulator. Be sure to connect a smoothing capacitor ( $C_s$ ) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor. However, some laminated ceramic capacitors have the characteristics of capacitance variation due to thermal fluctuation (F characteristics and Y5V characteristics). Please select the capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of a capacitor. A smoothing capacitor of about  $4.7 \mu\text{F}$  would be recommended for this series.

## Mode pins (MD0, MD1)

Connect the MD pin (MD0, MD1) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistance stays low, as well as the distance between the mode pins and VCC pins or VSS pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

## Notes on power-on

Turn power on/off in the following order or at the same time.

If not using the A/D converter, connect AVCC = VCC and AVSS = VSS.

Turning on : VCC → AVCC → AVRH

Turning off : AVRH → AVCC → VCC

## Serial Communication

There is a possibility to receive wrong data due to the noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider the case of receiving wrong data due to noise; perform error detection such as by applying a checksum of data at the end.

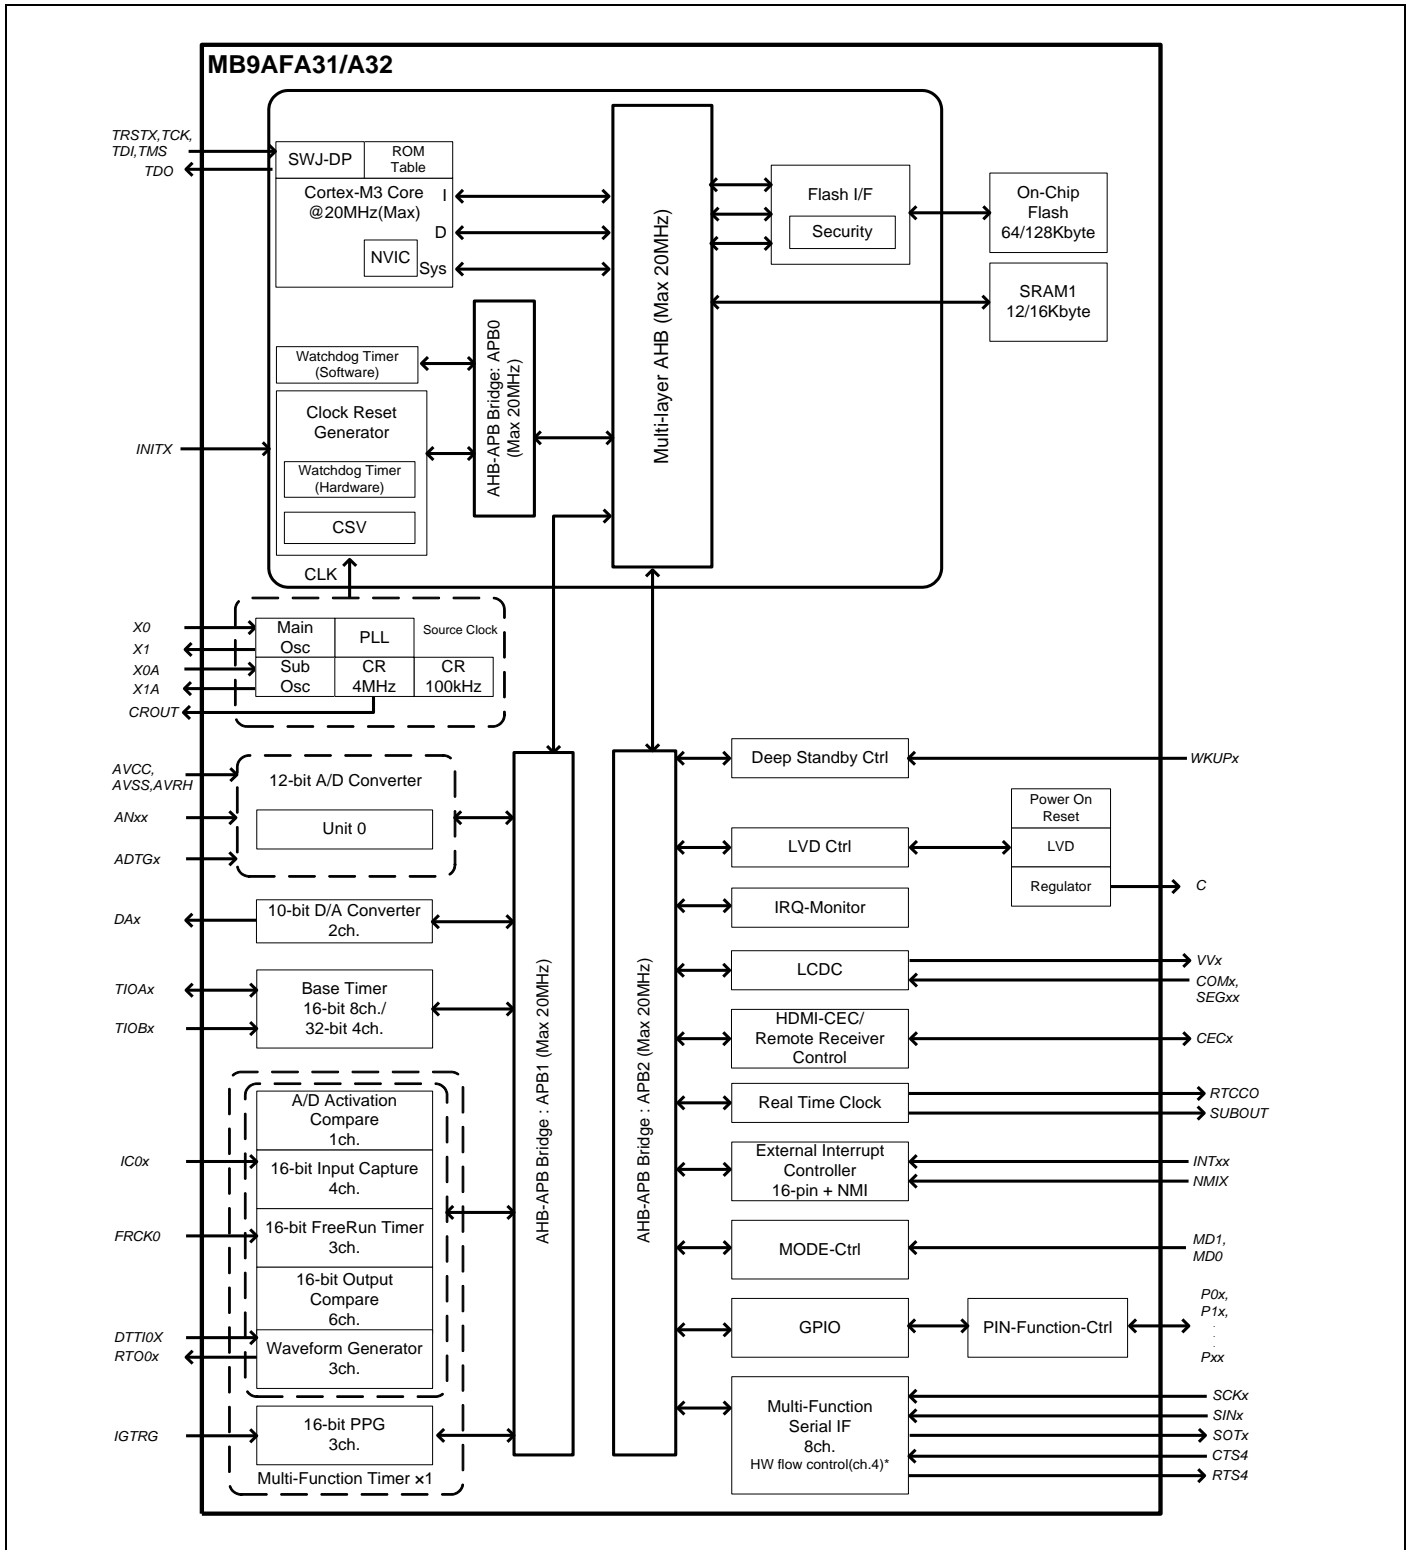

If an error is detected, retransmit the data.

Differences in features among the products with different memory sizes and between Flash memory products and MASK products

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash memory products and MASK products are different because chip layout and memory structures are different.

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

## 11. Pin Status in Each CPU State

The terms used for pin status have the following meanings.

**INITX = 0**

This is the period when the INITX pin is the L level.

**INITX = 1**

This is the period when the INITX pin is the H level.

**SPL = 0**

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB\_CTL) is set to 0.

**SPL = 1**

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB\_CTL) is set to 1.

**Input enabled**

Indicates that the input function can be used.

**Internal input fixed at 0**

This is the status that the input function cannot be used. Internal input is fixed at L.

**Hi-Z**

Indicates that the pin drive transistor is disabled and the pin is put in the Hi-Z state.

**Setting disabled**

Indicates that the setting is disabled.

**Maintain previous state**

Maintains the state that was immediately prior to entering the current mode.

If a built-in peripheral function is operating, the output follows the peripheral function.

If the pin is being used as a port, that output is maintained.

**Analog input is enabled**

Indicates that the analog input is enabled.

**Trace output**

Indicates that the trace function can be used.

**GPIO selected**

In Deep Standby mode, pins switch to the general-purpose I/O port.

## 12. Electrical Characteristics

### 12.1 Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1,*2	V <sub>CC</sub>	V <sub>SS</sub> - 0.5	V <sub>SS</sub> + 6.5	V	
Analog power supply voltage*1,*3	AV <sub>CC</sub>	V <sub>SS</sub> - 0.5	V <sub>SS</sub> + 6.5	V	
Analog reference voltage*1,*3	AV <sub>RH</sub>	V <sub>SS</sub> - 0.5	V <sub>SS</sub> + 6.5	V	
LCD input voltage*1,*3	V <sub>V4</sub> to V <sub>V0</sub>	V <sub>SS</sub> - 0.5	V <sub>SS</sub> + 6.5	V	
Input voltage*1	V <sub>I</sub>	V <sub>SS</sub> - 0.5	V <sub>CC</sub> + 0.5 (≤ 6.5 V)	V	
		V <sub>SS</sub> - 0.5	V <sub>SS</sub> + 6.5	V	5 V tolerant
Analog pin input voltage*1	V <sub>IA</sub>	V <sub>SS</sub> - 0.5	AV <sub>CC</sub> + 0.5 (≤ 6.5 V)	V	
Output voltage*1	V <sub>O</sub>	V <sub>SS</sub> - 0.5	V <sub>CC</sub> + 0.5 (≤ 6.5 V)	V	
L level maximum output current*4	I <sub>OL</sub>	-	10	mA	
L level average output current*5	I <sub>OLAV</sub>	-	4	mA	
L level total maximum output current	∑I <sub>OL</sub>	-	100	mA	
L level total average output current*6	∑I <sub>OLAV</sub>	-	50	mA	
H level maximum output current*4	I <sub>OH</sub>	-	-10	mA	
H level average output current*5	I <sub>OHAV</sub>	-	-4	mA	
H level total maximum output current	∑I <sub>OH</sub>	-	-100	mA	
H level total average output current*6	∑I <sub>OHAV</sub>	-	-50	mA	
Power consumption	P <sub>D</sub>	-	400	mW	
Storage temperature	T <sub>STG</sub>	- 55	+ 150	°C	

\*1: These parameters are based on the condition that V<sub>SS</sub> = AV<sub>SS</sub> = 0 V.

\*2: V<sub>CC</sub> must not drop below V<sub>SS</sub> - 0.5 V.

\*3: Be careful not to exceed V<sub>CC</sub> + 0.5 V, for example, when the power is turned on.

\*4: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

\*5: The average output current is defined as the average current value flowing through any one of the corresponding pins for a 100 ms period.

\*6: The total average output current is defined as the average current value flowing through all of corresponding pins for a 100 ms.

#### **WARNING:**

— Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings.

Do not exceed any of these ratings.

**12.2 Recommended Operating Conditions**

\*2: When LCD is used

\*3: See "C Pin" in Handling Devices for the smoothing capacitor.

**WARNING:**

- *The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions. Any use of semiconductor devices will be under their recommended operating condition. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.*

\*1: The conversion time is the value of sampling time ( $t_s$ ) + compare time ( $t_c$ ).

The condition of the minimum conversion time is the following.

$AV_{CC} \geq 2.7 V$ , HCLK=20 MHz      sampling time: 0.3  $\mu s$ , compare time: 0.7  $\mu s$

$AV_{CC} < 2.7 V$ , HCLK=20 MHz      sampling time: 1.2  $\mu s$ , compare time: 2.8  $\mu s$

Ensure that it satisfies the value of the sampling time ( $t_s$ ) and compare clock cycle ( $t_{CCK}$ ).

For setting\*4 of the sampling time and compare clock cycle, see Chapter 1-1: A/D Converter in FM3 Family Peripheral Manual Analog Macro Part.

The register settings of the A/D Converter are reflected in the operation according to the APB bus clock timing.

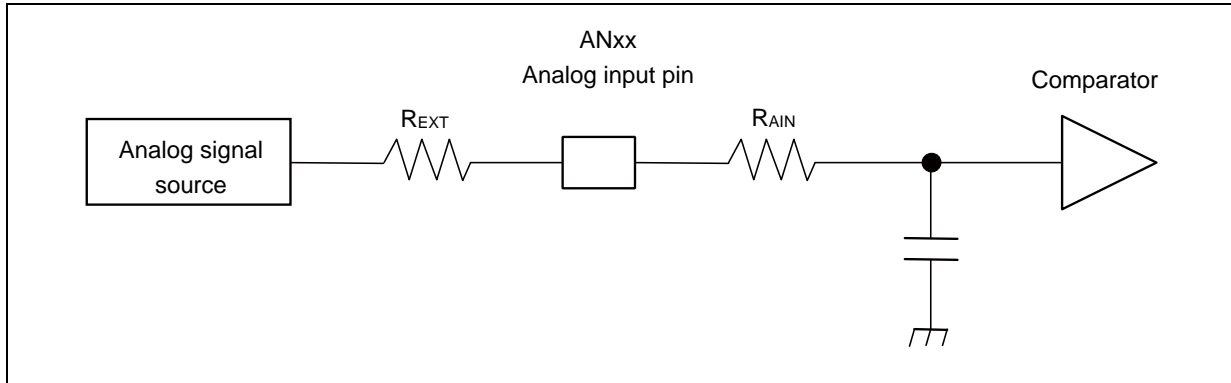

For the number of the APB bus to which the A/D Converter is connected, see Block Diagram.

The Base clock (HCLK) is used to generate the sampling time and the compare clock cycle.

\*2: A necessary sampling time changes by external impedance.

Ensure to set the sampling time to satisfy (Equation 1).

\*3: The compare time ( $t_c$ ) is the value of (Equation 2).

(Equation 1)  $t_s \geq (R_{AIN} + R_{EXT}) \times C_{AIN} \times 9$

$t_s$ : Sampling time

$R_{AIN}$ : Input resistor of A/D = 0.9 k $\Omega$  at 4.5 V  $\leq$  AV<sub>CC</sub>  $\leq$  5.5 V

Input resistor of A/D = 1.6 k $\Omega$  at 2.7 V  $\leq$  AV<sub>CC</sub> < 4.5 V

Input resistor of A/D = 4.0 k $\Omega$  at 1.8 V  $\leq$  AV<sub>CC</sub> < 2.7 V

$C_{AIN}$ : Input capacity of A/D = 15 pF at 1.8 V  $\leq$  AV<sub>CC</sub>  $\leq$  5.5 V

$R_{EXT}$ : Output impedance of external circuit

(Equation 2)  $t_c = t_{CCK} \times 14$

$t_c$ : Compare time

$t_{CCK}$ : Compare clock cycle

Definition of 12-bit A/D Converter Terms

- Resolution: Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity: Deviation of the line between the zero-transition point (0b000000000000←→0b000000000001) and the full-scale transition point (0b111111111110←→0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity: Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

## 12.8 Flash Memory Write/Erase Characteristics

### 12.8.1 Write / Erase time

(V<sub>CC</sub> = 2.0V to 5.5V, T<sub>A</sub> = - 40°C to + 85°C)

Parameter		Value		Unit	Remarks
		Typ*	Max*		
Sector erase time	Large Sector	1.6	7.5	s	Includes write time prior to internal erase
	Small Sector	0.4	2.1		
Half word (16-bit) write time		25	400	μs	Not including system-level overhead time.
Chip erase time		4	19.2	s	Includes write time prior to internal erase

\*: The typical value is immediately after shipment, the maximum value is guarantee value under 100,000 cycle of erase/write.

### 12.8.2 Write cycles and data hold time

Erase/write cycles (cycle)	Data hold time (year)	Remarks
1,000	20 *	
10,000	10 *	
100,000	5*	

\*: At average + 85°C

## 12.9 Return Time from Low-Power Consumption Mode

### 12.9.1 Return Factor: Interrupt/WKUP

The return time from Low-Power consumption mode is indicated as follows. It is from receiving the return factor to starting the program operation.

Return Count Time

( $V_{CC} = 1.65V$  to  $3.6V$ ,  $V_{SS} = 0V$ ,  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ )

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max*		
Sleep mode	t <sub>ICNT</sub>	t <sub>cycc</sub>		μs	
High-speed CR Timer mode, Main Timer mode, PLL Timer mode		40	80	μs	
Low-speed CR Timer mode		630	1260	μs	
Sub Timer mode		630	1260	μs	
RTC mode, Stop mode		1083	2100	μs	
Deep Standby RTC mode Deep Standby Stop mode		1099	2127	μs	

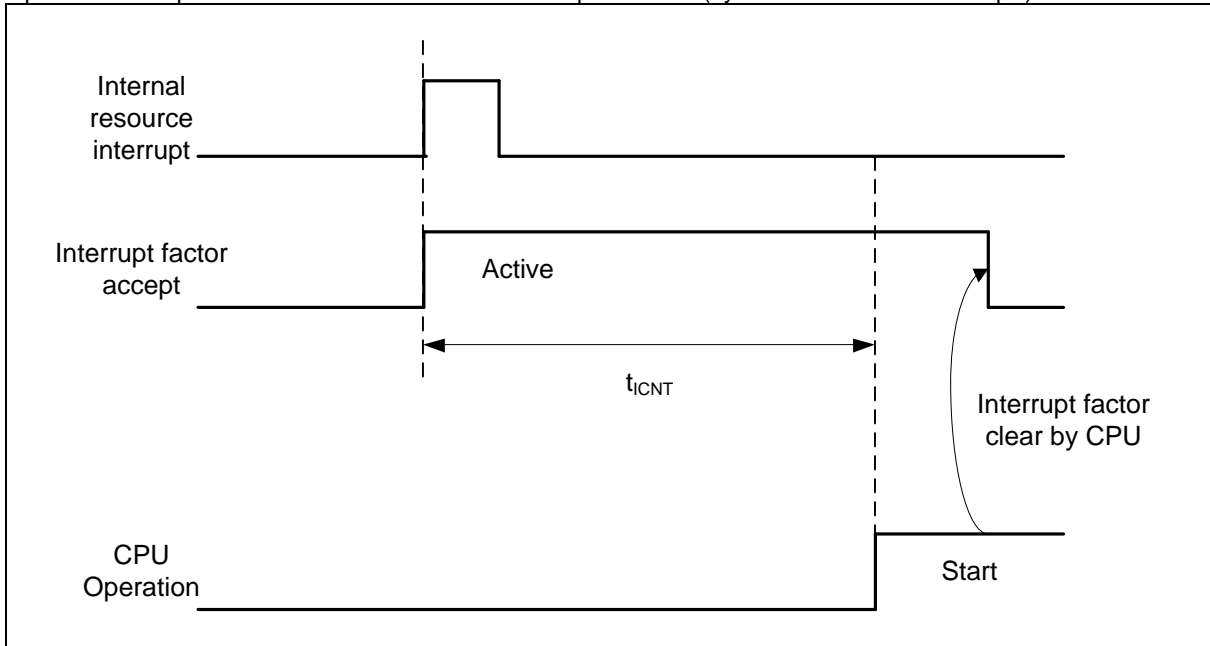

\*: The maximum value depends on the accuracy of built-in CR.

Operation example of return from Low-Power consumption mode (by external interrupt\*)

\*: External interrupt is set to detecting fall edge.

Operation example of return from Low-Power consumption mode (by internal resource interrupt\*)

\*: Internal resource interrupt is not included in return factor by the kind of Low-Power consumption mode.

- Notes:**
- The return factor is different in each Low-Power consumption modes. See Chapter 6: Low Power Consumption Mode and Operations of Standby Modes in FM3 Family Peripheral Manual.
  - When interrupt recovers, the operation mode that CPU recovers depend on the state before the Low-Power consumption mode transition. See Chapter 6: Low Power Consumption Mode in FM3 Family Peripheral Manual.

**12.9.2 Return Factor: Reset**

The return time from Low-Power consumption mode is indicated as follows. It is from releasing reset to starting the program operation.

Return Count Time

( $V_{CC} = 1.65V$  to  $3.6V$ ,  $V_{SS} = 0V$ ,  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ )

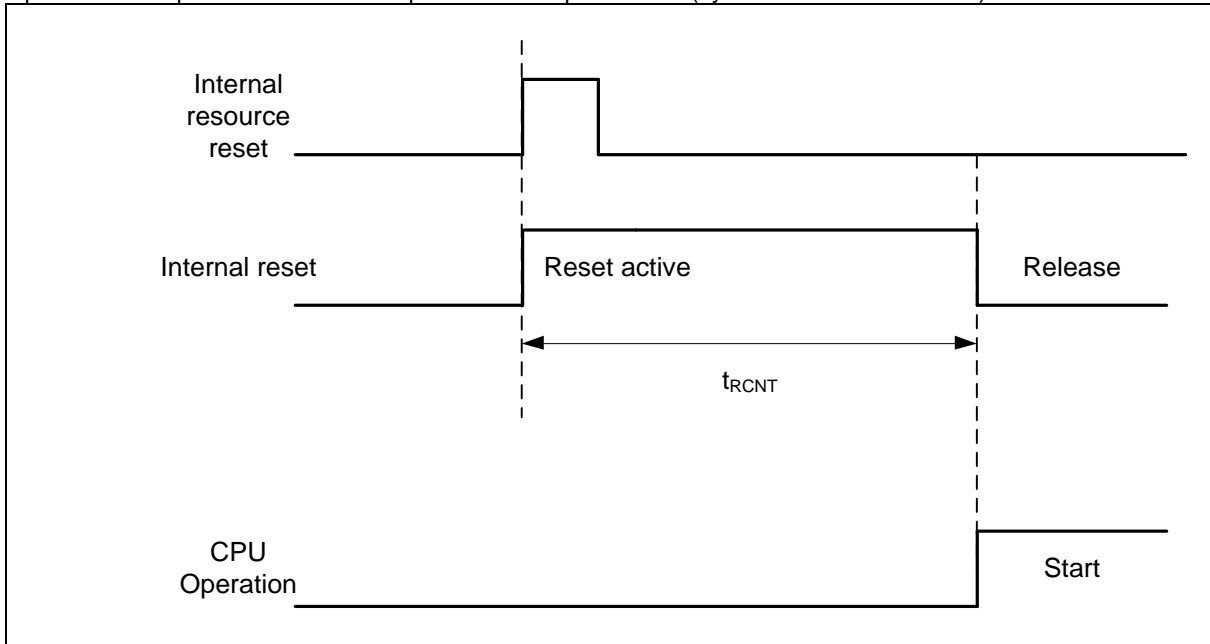

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max*		
Sleep mode	t <sub>RCNT</sub>	359	647	μs	
High-speed CR Timer mode, Main Timer mode, PLL Timer mode		359	647	μs	
Low-speed CR Timer mode		929	1787	μs	
Sub Timer mode		929	1787	μs	
RTC/Stop mode		1099	2127	μs	
Deep Standby RTC mode Deep Standby Stop mode		1099	2127	μs	

\*: The maximum value depends on the accuracy of built-in CR.

Operation example of return from Low-Power consumption mode (by INITX)

Operation example of return from low power consumption mode (by internal resource reset\*)

\*: Internal resource reset is not included in return factor by the kind of Low-Power consumption mode.

- Notes:**
- The return factor is different in each Low-Power consumption modes. See Chapter 6: Low Power Consumption Mode and Operations of Standby Modes in FM3 Family Peripheral Manual.
  - When interrupt recovers, the operation mode that CPU recovers depend on the state before the Low-Power consumption mode transition. See Chapter 6: Low Power Consumption Mode in FM3 Family Peripheral Manual.
  - The time during the power-on reset/low-voltage detection reset is excluded. See Power-on Reset Timing in AC Characteristics in Electrical Characteristics for the detail on the time during the power-on reset/low-voltage detection reset.
  - When in recovery from reset, CPU changes to the High-speed CR Run mode. When using the main clock or the PLL clock, it is necessary to add the main clock oscillation stabilization wait time or the Main PLL clock stabilization wait time.
  - The internal resource reset means the watchdog reset and the CSV reset.

- ALL DIMENSIONS ARE IN MILLIMETERS.
- DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
- DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
- TO BE DETERMINED AT SEATING PLANE C.
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
- DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
- REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS, DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
- DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBER PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
- THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
- A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.
