Functional Description

The CYRS1049DV33 is a high-performance complementary metal oxide semiconductor (CMOS) static RAM organized as 512K words by 8 bits with RadStop™ technology. Cypress' state-of-the-art RadStop technology is radiation hardened through proprietary design and process hardening techniques. The 4-Mbit fast asynchronous SRAM with RadStop technology is also QML V certified with Defense Logistics Agency Land and Maritime (DLAM).

To write to the device, take Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the eight I/O pins (I/O₀ through I/O₇) is then written into the location specified on the address pins (A₀ through A₁₈).

To read from the device, take Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing the Write Enable (\overline{WE}) HIGH. Under these conditions, the contents of the memory location specified by the address pins appear on the I/O pins. See the [Truth Table on page 12](#) for a complete description of read and write modes.

The eight input or output pins (I/O₀ through I/O₇) are placed in a high impedance state when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE} LOW, and \overline{WE} LOW)

The CYRS1049DV33 is available in a ceramic 36-pin Flat package with center power and ground (revolutionary) pinout.

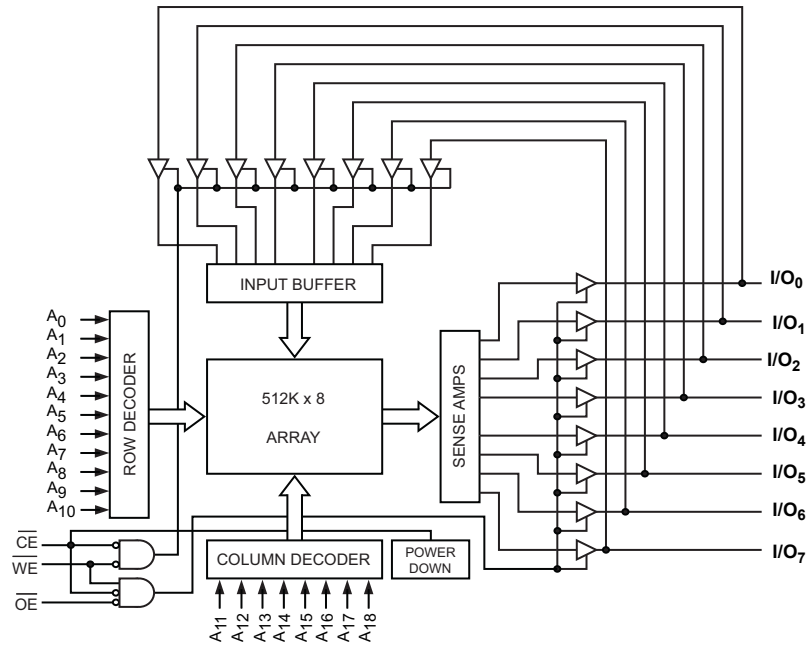

Easy memory expansion is provided by utilizing \overline{OE} , \overline{CE} , and tri-state drivers.

Notes

8. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
9. t_{POWER} gives the minimum amount of time that the power supply should be at typical V_{CC} values until the first memory access is performed.
10. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , t_{HZBE} is less than t_{LZBE} , and t_{HZWE} is less than t_{LZWE} for any given device.
11. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (c) of [Figure 2 on page 6](#). Transition is measured when the outputs enter a high impedance state.
12. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. \overline{CE} and \overline{WE} must be LOW to initiate a write and the transition of either of these signals can terminate the write. The input data setup and hold timing should be referenced to the leading edge of the signal that terminates the write.
13. The minimum write cycle time for Write Cycle No. 4 (WE Controlled, OE LOW) is the sum of t_{HZWE} and t_{SD} .

Notes

- 14. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$.
- 15. \overline{WE} is HIGH for read cycle.

Notes

- 17. Data I/O is high impedance if $\overline{\text{OE}} = V_{IH}$.
- 18. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ going HIGH, the output remains in a high impedance state.
- 19. During this period the I/Os are in the output state and input signals should not be applied.
