## CIPOS™

# Control Integrated POver System

*Dual In-Line PFC integrated Intelligent Power Module  
3 $\phi$ -bridge 600V/10A, Single phase PFC 650V/30A*

### Features

#### Package

- Dual In-Line molded module
- Lead-free terminal plating; RoHS compliant
- Very low thermal resistance due to DCB

#### Inverter

- TRENCHSTOP™ IGBT3
- Rugged SOI gate driver technology with stability against transient and negative voltage
- Allowable negative VS potential up to -11V for signal transmission at VBS=15V
- Integrated bootstrap functionality
- Over current shutdown
- Temperature monitor
- Under-voltage lockout at all channels
- Low side common emitter
- Cross-conduction prevention
- All of 6 switches turn off during protection

#### PFC

- TRENCHSTOP™ 5
- Rapid switching emitter controlled diode

### Target Applications

- Home appliances
- Low power motor drives

### Description

The CIPOS™ module family offers the chance for integrating various power and control components to increase reliability, optimize PCB size and system costs.

It is designed to control three phase AC motors and permanent magnet motors with single phase PFC in variable speed drives for applications like an air conditioning and low power motor drives. The package concept is specially adapted to power applications, which need good thermal conduction and electrical isolation, but also EMI-save control and overload protection.

TRENCHSTOP™ IGBT3 and anti-parallel diodes are combined with an optimized SOI gate driver for excellent electrical performance.

### System Configuration

- 3 half bridges with TRENCHSTOP™ IGBT3 and anti parallel diodes
- 3 $\phi$  SOI gate driver
- Single phase PFC with TRENCHSTOP™ 5 and Rapid switching emitter controlled diode
- Thermistor
- Pin-to-heatsink clearance distance typ. 1.6mm

## Pin Description

### HIN(U,V,W) and LIN(U,V,W) (Low side and high side control pins, Pin 7 - 12)

These pins are positive logic and they are responsible for the control of the integrated IGBT. The Schmitt-trigger input thresholds of them are such to guarantee LSTTL and CMOS compatibility down to 3.3V controller outputs. Pull-down resistor of about 5kΩ is internally provided to pre-bias inputs during supply start-up and a zener clamp is provided for pin protection purposes. Input Schmitt-trigger and noise filter provide beneficial noise rejection to short input pulses.

The noise filter suppresses control pulses which are below the filter time  $t_{FILIN}$ . The filter acts according to Figure 4.

Figure 3 Input pin structure

Figure 4 Input filter timing diagram

It is recommended for proper work of this product not to provide input pulse-width lower than 1 $\mu$ s.

The integrated gate drive provides additionally a shoot through prevention capability which avoids the simultaneous on-state of two gate drivers of the same leg (i.e. HO1 and LO1, HO2 and LO2, HO3 and LO3). When two inputs of a same leg are activated, only former activated one is activated so that the leg is kept steadily in a safe state.

A minimum deadtime insertion of typically 380ns is also provided by driver IC, in order to reduce cross-conduction of the external power switches.

**VFO (Fault-output and NTC, Pin 14)**

The VFO pin indicates a module failure in case of under voltage at pin VDD or in case of triggered over current detection at ITRIP. A pull-up resistor is externally required to bias the NTC.

**Figure 5 Internal circuit at pin VFO**

The same pin provides direct access to the NTC, which is referenced to VSS. An external pull-up resistor connected to +5V ensures that the resulting voltage can be directly connected to the microcontroller.

**ITRIP (Over current detection function, Pin 15)**

CIPOS™ provides an over current detection function by connecting the ITRIP input with the motor current feedback. The ITRIP comparator threshold (typ. 0.47V) is referenced to VSS ground. An input noise filter (typ:  $t_{ITRIPMIN} = 530ns$ ) prevents the driver to detect false over-current events.

Over current detection generates a shut down of all outputs of the gate driver after the shutdown propagation delay of typically 1000ns.

**VDD, VSS (Low side control supply and reference, Pin 13, 16)**

VDD is the low side supply and it provides power both to input logic and to low side output power stage. Input logic is referenced to VSS ground.

The under-voltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of  $V_{DDUV+} = 12.1V$  is present.

The IC shuts down all the gate drivers' power outputs, when the VDD supply voltage is below  $V_{DDUV-} = 10.4V$ . This prevents the external power switches from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

**VB(U,V,W) and VS(U,V,W) (High side supplies, Pin 1 - 6)**

VB to VS is the high side supply voltage. The high side circuit can float with respect to VSS following the external high side power device emitter voltage. Due to the low power consumption, the floating driver stage is supplied by integrated bootstrap circuit.

The under-voltage detection operates with a rising supply threshold of typical  $V_{BSUV+} = 12.1V$  and a falling threshold of  $V_{BSUV-} = 10.4V$ .

VS(U,V,W) provide a high robustness against negative voltage in respect of VSS of -50V transiently. This ensures very stable designs even under rough conditions.

**N (Low side emitter, Pin 17)**

The low side emitters are available for current measurements. It is recommended to keep the connection to pin VSS as short as possible in order to avoid unnecessary inductive voltage drops.

**W, V, U (High side emitter and low side collector, Pin 18 - 20)**

These pins are motor U, V, W input pins

**P (Positive bus input voltage, Pin 21)**

The high side IGBTs and PFC diode cathode are connected to the bus voltage. It is noted that the bus voltage does not exceed 450V.

**X, NX, GX (Single boost PFC, Pins 22-24)**

These pins are emitter, collector and gate of IGBT for single boost PFC.

## Circuit of a Typical Application

**Figure 9 Application circuit**

Because PFC IGBT inside this product has very high speed switching characteristics, considerable large surge voltage between P and NX terminals and switching noise on signaling path are generated easily. Please pay attention to the below items for optimized application circuit design.

1. Input circuit
  - To reduce input signal noise by high speed switching, the RIN and CIN filter circuit should be mounted. (100Ω, 1nF)
  - C<sub>IN</sub> should be placed as close to VSS pin as possible.
2. Itrip circuit
  - To prevent protection function errors, C<sub>TRIP</sub> should be placed as close to Itrip and VSS pins as possible.
3. VFO circuit
  - VFO output is an open drain output. This signal line should be pulled up to the positive side of the 5V/3.3V logic power supply with a proper resistor R<sub>PU</sub>. It is recommended that RC filter be placed as close to the controller as possible.
4. VB-VS circuit
  - Capacitor for high side floating supply voltage should be placed as close to VB and VS pins as possible.
5. Snubber capacitor
  - The wiring between CIPOS™ Mini and snubber capacitor including shunt resistor should be as short as possible.
6. Shunt resistor
  - Each shunt resistor of SMD type should be used for reducing its stray inductance.
7. Ground pattern
  - Each ground pattern should be separated at only one point of shunt resistor as short as possible.
  - Power ground pattern between PFC and Inverter should be connected as short as possible.
8. Anti parallel diode
  - It's mandatory to connect anti-parallel diode (2A, voltage rating higher than 650V) to PFC IGBT.
9. Input surge voltage protection circuit
  - This protection circuit is necessary for PFC IGBT to be protected from excessive surge voltage.
