## Highlights

The MATH Co-Processor provides a 32-bit signed or unsigned divider as well as a 24-bit CORDIC for trigonometric calculations. Both DIVIDER and CORDIC can operate in parallel next to the CORTEX<sup>®</sup>-M0 CPU core.

## Key features

- › 32-bit hardware divide for signed and unsigned long integer numbers
- › Trigonometric functions executed in parallel to CPU operation
- › Vector rotation (PARK transform) executed in 24-bit resolution

## Customer benefits

- › The calculation time of a divide operation is reduced to 50%
- › Increase of computational power for real time critical tasks
- › Field oriented motor control algorithms are implemented with high resolution

# MATH

## 32-bit divide

- › Signed/unsigned 32-bit division in 35 kernel clock cycles
- › Operands pre-processing with configurable number of:
  - Left shifts for dividend
  - Right shifts for divisor
- › Result post-processing with configurable number of shifts and shift direction

# Agenda

Function	Rotation Mode	Vectoring Mode
	$d_i = \text{sign}(z_i), z_i \rightarrow 0$	$d_i = -\text{sign}(y_i), y_i \rightarrow 0$
<b>Circular</b> $m = 1$ $e_i = \text{atan}(2^{-i})$	$X_{\text{final}} = K[X \cos(Z) - Y \sin(Z)] / \text{MPS}$ $Y_{\text{final}} = K[Y \cos(Z) + X \sin(Z)] / \text{MPS}$ $Z_{\text{final}} = 0$ where $K \approx 1.646760258121$	$X_{\text{final}} = K \sqrt{X^2 + Y^2} / \text{MPS}$ $Y_{\text{final}} = 0$ $Z_{\text{final}} = Z + \text{atan}(Y / X)$ where $K \approx 1.646760258121$
<b>Linear</b> $m = 0$ $e_i = 2^{-i}$	$X_{\text{final}} = X / \text{MPS}$ $Y_{\text{final}} = [Y + X Z] / \text{MPS}$ $Z_{\text{final}} = 0$	$X_{\text{final}} = X / \text{MPS}$ $Y_{\text{final}} = 0$ $Z_{\text{final}} = Z + Y / X$
<b>Hyperbolic</b> $m = -1$ $e_i = \text{atanh}(2^{-i})$	$X_{\text{final}} = k[X \cosh(Z) + Y \sinh(Z)] / \text{MPS}$ $Y_{\text{final}} = k[Y \cosh(Z) + X \sinh(Z)] / \text{MPS}$ $Z_{\text{final}} = 0$ where $k \approx 0.828159360960$	$X_{\text{final}} = k \sqrt{X^2 - Y^2} / \text{MPS}$ $Y_{\text{final}} = 0$ $Z_{\text{final}} = Z + \text{atanh}(Y / X)$ where $k \approx 0.828159360960$

To calculate  $\sin(\text{angle})$  and  $\cos(\text{angle})$

- › Setup function to "Circular", "Rotation Mode"
- ›  $X = 1/K, Y = 0, Z = \text{"angle"}$
- › Result\_X =  $\cos(\text{angle})$
- › Result\_Y =  $\sin(\text{angle})$

Function	Rotation Mode	Vectoring Mode
	$d_i = \text{sign}(z_i), z_i \rightarrow 0$	$d_i = -\text{sign}(y_i), y_i \rightarrow 0$
<b>Circular</b> $m = 1$ $e_i = \text{atan}(2^{-i})$	$X_{\text{final}} = K[X \cos(Z) - Y \sin(Z)] / \text{MPS}$ $Y_{\text{final}} = K[Y \cos(Z) + X \sin(Z)] / \text{MPS}$ $Z_{\text{final}} = 0$ where $K \approx 1.646760258121$	$X_{\text{final}} = K \sqrt{X^2 + Y^2} / \text{MPS}$ $Y_{\text{final}} = 0$ $Z_{\text{final}} = Z + \text{atan}(Y / X)$ where $K \approx 1.646760258121$
<b>Linear</b> $m = 0$ $e_i = 2^{-i}$	$X_{\text{final}} = X / \text{MPS}$ $Y_{\text{final}} = [Y + X Z] / \text{MPS}$ $Z_{\text{final}} = 0$	$X_{\text{final}} = X / \text{MPS}$ $Y_{\text{final}} = 0$ $Z_{\text{final}} = Z + Y / X$
<b>Hyperbolic</b> $m = -1$ $e_i = \text{atanh}(2^{-i})$	$X_{\text{final}} = k[X \cosh(Z) + Y \sinh(Z)] / \text{MPS}$ $Y_{\text{final}} = k[Y \cosh(Z) + X \sinh(Z)] / \text{MPS}$ $Z_{\text{final}} = 0$ where $k \approx 0.828159360960$	$X_{\text{final}} = k \sqrt{X^2 - Y^2} / \text{MPS}$ $Y_{\text{final}} = 0$ $Z_{\text{final}} = Z + \text{atanh}(Y / X)$ where $k \approx 0.828159360960$

To calculate  $\arctan(Y/X)$

- › Setup function to “Circular”, “Vectoring Mode”
- ›  $Z = 0$
- ›  $\text{Result\_X} = K \sqrt{X^2 + Y^2}$
- ›  $\text{Result\_Z} = \arctan(Y/X)$

### Park transform

$$i_d = i_\alpha \cos \varphi + i_\beta \sin \varphi$$

$$i_q = -i_\alpha \sin \varphi + i_\beta \cos \varphi$$

To calculate Park transform

- › Setup function to “Circular”, “Rotation Mode”
- ›  $X = i_\beta, Y = i_\alpha, Z = \varphi$
- › Result\_X = iq
- › Result\_Y = id

# MATH

## System integration

The math co-processor can be clocked with a frequency of up to 64 MHz and is accessible via the SFR interface. The sub-blocks, a 32-bit divider and a 24-bit CORDIC can be used next to the CPU independently. The execution of the math unit can be configured to be twice the MCU clock. Hence a divide is executed in 18 CPU clocks and a CORDIC function takes up to 31 CPU clocks.

In some use cases, the result of one sub-block is needed as data input for the other sub-block. A hardware mechanism is provided for autonomous execution of both calculation with result chaining.

The result that is read from the SFR-interface is always provided as the latest result after processing the math unit's command. In case the read instruction is executed while the math is still busy, the bus-interface will add wait states until the latest result is available.

### › Target applications

- Motor control
- Intelligent lighting
- Power conversion

XMC1100	XMC1200	XMC1300

7

Benchmarking results

### CORDIC's result to DIV's input

- › Result of the CORDIC operation can be “forward” directly to the Divider operand register, DVD and DVS

### DIV's result to CORDIC's input

- › QUOT and RMD result can be “forward” directly to the CORDIC operand register, CORD[Z:X]

### Global Control Register (GLBCON)

**DVDRC**

**DVSRC**

**CORDXRC**

**CORDYRC**

**CORDZRC**

#### Dividend Register Result Chaining

The DVD register in DIV will be updated with the selected result register value when the result chaining trigger event occurs.

- 000<sub>B</sub> No result chaining is selected
- 001<sub>B</sub> QUOT register is the selected source
- 010<sub>B</sub> RMD register is the selected source
- 011<sub>B</sub> CORRX is the selected source
- 100<sub>B</sub> CORRY is the selected source
- 101<sub>B</sub> CORRZ is the selected source

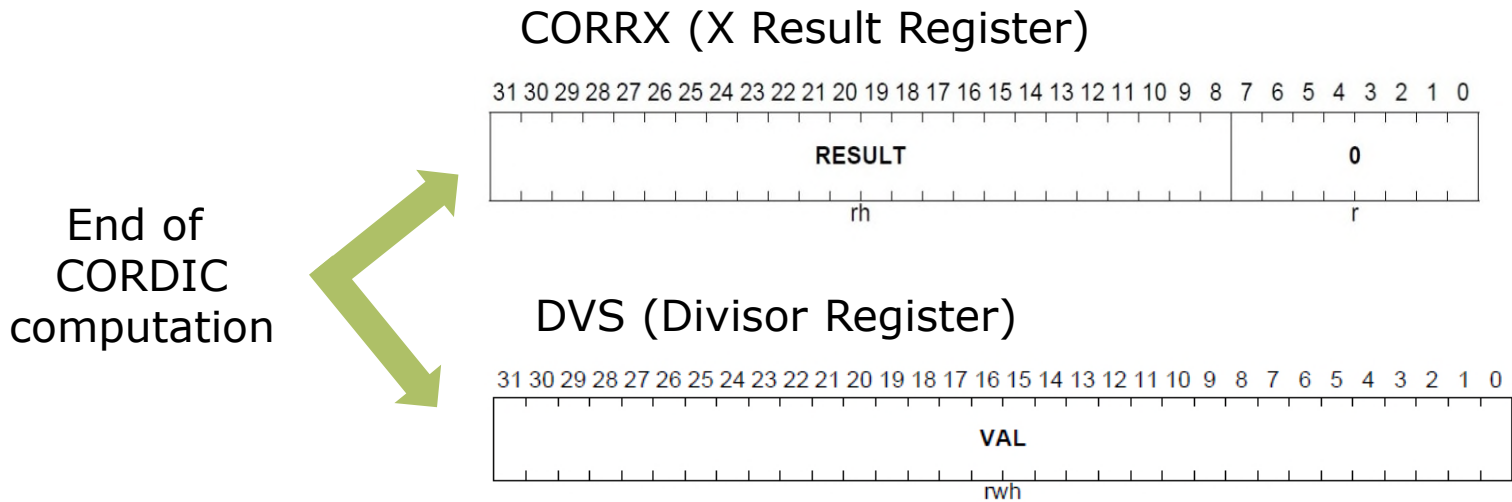

#### CORDX Register Result Chaining

The CORDX register in CORDIC will be updated with the selected result register value when the result chaining trigger event occurs.

- 00<sub>B</sub> No result chaining is selected
- 01<sub>B</sub> QUOT register is the selected source
- 10<sub>B</sub> RMD register is the selected source

The next few slides illustrate a simple example for result chaining

After the computation of the CORDIC operation, the result will be written to CORRX. This result will also be written to DIV's DVS.

# MATH

## Result chaining between Divider & CORDIC (4/6)

### DVS (Divisor Register)

- › As the 24-bit CORDIC result is assigned to bit[8 to 31], it might be necessary for some pre-processing of the input value before the DIV operation
- › DIVCON.DVSSRC – right shift the input value before the division operation

Value at DVS

DVSSRC = 8  
Right shift by 8

Value use for the  
Division operation

Function	Vectoring Mode
	$d_i = -\text{sign}(y_i), y_i \rightarrow 0$
<b>Circular</b> $m = 1$ $e_i = \text{atan}(2^{-i})$	$X_{\text{final}} = K \sqrt{X^2 + Y^2} / \text{MPS}$ $Y_{\text{final}} = 0$ $Z_{\text{final}} = Z + \text{atan}(Y / X)$ where $K \approx 1.646760258121$

- › CORDIC is setup to Circular Vectoring Mode
- › CORDIC will start when CORDX is written
- › DIV will start when DVS is written
- › The result of CORDIC's CORR<sub>X</sub> will also update DIV's DVS with the same value
- › This action will trigger the DIV operation to start
- › The DIV's post-processing compensated for the difference in bit length of CORDIC(24-bit) and DIV(32-bit)
- › As a result, the writing of CORDIC's CORD<sub>X</sub> orderly start both CORDIC and DIV

```
GLBCON = 0x0003;
    // DVSRC = 011b;           // DVS result will be updated when
                               // CORRX has new result

DIVCON = 0x08000000;
    // ST_MODE = 0;           // Auto-Start when DVS is written
    // DVSSRC = 8;            // DVS value will be shifted right by 8

DVD = 0x12345678;           // Preload the Dividend value first

CON = 0x0020;
    // MODE = 01b;           // Circular Mode
    // ROTVEC = 0;           // Vectoring Mode
    // ST_MODE = 0;           // Auto-Start when CORDX is written

CORDY = (0x5678<<8);       // Load Y parameter
CORDX = (0x1234<<8);       // Load X parameter and start CORDIC
                               // Result Chain to DIV's DVS will auto start DIV
```

# Agenda

Result chaining between Divider & CORDIC

7

Benchmarking results

- › Execution time of a division operation and a cosine operation running on the MATH library is benchmarked against that of a similar operation running on standard C library
- › Conditions:
  - Execution time refers to complete function execution, inclusive of co-processor configuration, writing of operands and state checking
  - Ratio of PCLK to MCLK is 2:1
  - Compilers from IFX, Keil and IAR were used

# MATH

## Benchmarking results (2/2)

- › The benchmarking results are shown in the table below:

Compiler	Division (MCLK cycles)		Cosine (MCLK cycles)	
	With MATH LIB	With Std C LIB	With MATH LIB	With Std C LIB
IAR EWARM v7.10	99	712	234	4574
Keil $\mu$ Vision v5.10	95	230	238	6514
DAVE™ v3.1.10	114	415	258	9832

- › Significant performance boosts are seen when using MATH library over standard C library:
  - ~ 7x performance for division
  - ~ 38x performance for cosine
