ORIGA™ 2L High Temperature

Original Product Authentication and Brand Protection Solution

Features
- Asymmetric authentication based on Elliptic Curve Cryptographic (ECC)
- ORIGA™ Digital Certificate (ODC) with device personalization
- Large NVM for storage of device behavior and logistic information
- Ultra slim chip scale package – RoHS compliant
- MIPI BIF (Battery Interface) standardized single-wire interface for communication between mobile device and battery

Applications
- Battery authentication for mobile phones, computing devices, digital imaging, power tools, drones etc.
- Power supply units and (fast) AC adaptors
- Power cables

Description
The Infineon ORIGA ORIGinal product Authentication chip helps OEMs and system manufacturers to ensure the authenticity and safety of their original products. It offers a cost effective yet very robust cryptographic solution to protect against unauthorized aftermarket replacements and copies. With more than 0.5 Billion ORIGAs deployed at major OEM customers, the new ORIGA™ 2L in extra small chip scale package is particularly suited for applications with very stringent space and cost requirements. The product reduces cost by eliminating the need for additional secure key storage ICs in the host system. ORIGA™ 2L also features the market leading strong asymmetric cryptography engine introduced with ORIGA™ 2 and 3.5 kbits of user non-volatile lockable memory with a well-defined data map covering all functions. The incorporated power management unit reduces power consumption and has over-under voltage protection up to ±20 V. The MIPI BIF compliant single wire host interface allows operation using a single dedicated contact which reduces size and, in turn, improves reliability, robustness, performance, and system cost.

## Revision History
1 Overview

Infineon Technologies’ novel ORIGA™ ORIGinal product Authentication chip assists OEMs and system manufacturers to ensure the authenticity and safety of their ORIGinal products. It offers a robust cryptographic solution designed to protect against unauthorized aftermarket replacements and clones.

In its second generation ORIGA™ 2L incarnation, it is especially suited for the Authentication of batteries, but can be used for the authentication of any other accessory, consumable or original spare part as well as long as three contacts can be attached to the chip to power it and communicate with it.

1.1 General Description

ORIGA™ 2L is an integrated Battery Authentication IC. It features a built-in strong asymmetric cryptography engine and 3.5 kbits of user non-volatile memory with a well defined data map covering all functions. The device has a built-in power management unit to reduce power consumption and is tolerant to over-voltages.

Furthermore, it also contains an integrated junction temperature sensor which can be set to interrupt the external host controller through the MIPI Battery (digital) Interface. Figure 1 shows the ORIGA™ 2L device Battery Authentication IC function overview.

![Function Overview](image-url)
1.2 Application Domain

The main area of application is authentication leading to increased safety, functionality and reliability of the accessories, replacement parts and disposables. The Infineon Technologies’ ORIGA™ family lends itself for use in multiple application domains which use its safety and highly reliable authentication features. These protect the systems from unauthorized accessories, replacement parts and disposables. Such unauthorized accessories will be easily and immediately detected, allowing the systems decide a suitable next execution step.

Application Domain Examples

- Batteries
  - Computing Devices, Digital Imaging, Mobile Phones
- Printer Cartridges
- Accessories
  - Earphones, Speakers, Docking Stations, Game Controller, Chargers
- Other Peripherals
- Original Replacement Parts
- Medical Equipment & Diagnostic Supplies
- Authentication of system services, functionalities and parts in networked systems

1.3 Personalization and Key Management

Authentication Chips are produced in a standard version. For different customers and different applications these chips have to be individualized / personalized. This is done by configuring chips with customer specific information (keys, etc).

---

**Figure 2** Personalization

- **IFX test and personalization facility**
- **Customer Environment**
  - Only the unprotected NVM can be accessed or written at this point.
  - After Wafer test the secure storage is locked, the UID can not be changed, the secret key can not be accessed from the outside.
ORIGA™ 2L High Temperature
Original Product Authentication and Brand Protection Solution

Overview

Personalization must be performed in a controlled, trusted and protected environment, to prevent any misuse or illegal use of chips. Customer parameters must be protected against unauthorized knowledge or use.

Infineon's security chip manufacturing and testing facility is security certified and evaluated by a third party authority, and it meets the requirements for performing the critical personalization flow.

ORIGA™ customers (or their approved contracted manufacturers) receive unique sets of key pairs associated with customers’ products.

The secret key should be the same for one accessory product type (e.g. headset) or across a range of products (battery, headset, docking station) to assure interoperability. The corresponding host side public key will be provided to the customer with the host side personalization package.
2 System Configuration

Figure 3 shows how the ORIGA™ 2L device Battery Authentication IC can be used in a single Lithium Ion cell battery pack application as a digital single wire Primary Class II slave to a master controller. It can be supplied from the battery pack cell with BIF pin connected to BCL, as shown. A Lithium Ion cell battery pack always contains protection circuit, called Safety Function in the diagram. (This is not included in SLE95201H). The MIPI Battery Interface specification mentions about the host battery insertion/removal Presence Detector which is useful for creating interrupts to the Host IC SW layer.

![Figure 3 Rechargeable Smart Battery Pack Application.](image)

**Attention:** * External ESD components depend on system ESD requirement.

Attention: A 4.7K Ohm pull-up resistor at the host controller GPIO is recommended. For bigger pull-up values, please ensure the signal rise and fall time meet BIF specification and requirement.

### 2.1 Advantages

Infineon Technologies' ORIGA™ 2L family offers the following advantages:

- Advanced security using unique asymmetrical public/private key cryptography with two different keys for encryption and decryption
- Improved total system cost by allowing robust host-side implementation in software without compromising security
- Reducing maintenance or support efforts created by wrong accessories
- Improved safety of the system by ensuring system integrity and control
- Large Non-Volatile Memory (NVM) for storage of device behavior or logistic information (e.g. storage of number of usage cycles, user data and logistic chain traceability)
- The NVM is large enough for ORIGA™ Digital Certificate (ODC) security upgrade allowing unique key pairs for each device (optionally available)
- Convenient Temperature Monitoring and fast battery presence detection
- MIPI BIF compliant single wire Battery Interface
ORIGA™ 2L High Temperature
Original Product Authentication and Brand Protection Solution

System Features

3 System Features

3.1 Asymmetric Cryptography Engine
- Elliptic Curve Cryptography (ECC) – 131-bit key authentication
- ORIGA™ Digital Certification
- Integrated Random Number Generator (RNG)
- Unique challenge/response used in each authentication
- Software library available for easy host integration

3.2 Non-Volatile Memory (NVM)
- 3.5 kbits of user space with minimum of 10 years storage
- User programmable Write Lock
- Fast NVM access via Brust read/write mode

3.3 BIF Interface
- Please refer to Standardization Specification for digital protocol and interface

3.4 Power Management
- On-chip over voltage protection (OVP) against faulty power supply
- Single Supply Voltage for Authentication Function
- Power Up and Down Control via Digital Interface
- Power Standby and Sleep Modes

3.5 Package
- Package Width of 1.86mm is suitable for slim battery pack
- WLB-5 package.
  - Package Size: 1.81mm ± 0.05mm X 1.406mm ± 0.05mm
- Pitch: 0.5mm
- Height: 0.7mm (Max)
- The packages comply with RoHS standard
- Operating ambient temperature of -30°C to 110°C

3.6 Others
- ESD
  - HBM = 2kV
  - CDM = 500V
4 Electrical Characteristics

Stresses above the max. values listed here may cause permanent damage to the device. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

6 Evaluation Kit

The ORIGA™ EvalKit USB Stick allows a complete evaluation of all the features of ORIGA™ family. Each Evaluation kit contains dual ORIGA™ SLE95050 and SLE95200. Do note that these are not High Temperature parts and please contact Infineon for High Temperature part evaluation. After installing the demo software from the CD, user will be able to communicate with the on-board ORIGA™ devices.
