

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

This document, including any software or firmware included or referenced in this document (“Software”), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress’s patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. No computing device can be absolutely secure. Therefore, despite security measures implemented in Cypress hardware or software products, Cypress shall have no liability arising out of any security breach, such as unauthorized access to or use of a Cypress product. CYPRESS DOES NOT REPRESENT, WARRANT, OR GUARANTEE THAT CYPRESS PRODUCTS, OR SYSTEMS CREATED USING CYPRESS PRODUCTS, WILL BE FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (collectively, “Security Breach”). Cypress disclaims any liability relating to any Security Breach, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any Security Breach. In addition, the products described in these materials may contain design defects or errors known as errata which may cause the product to deviate from published specifications. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. “High-Risk Device” means any device or system whose failure could cause personal injury, death, or property damage. Examples of High-Risk Devices are weapons, nuclear installations, surgical implants, and other medical devices. “Critical Component” means any component of a High-Risk Device whose failure to perform can be reasonably expected to cause, directly or indirectly, the failure of the High-Risk Device, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any use of a Cypress product as a Critical Component in a High-Risk Device. You shall indemnify and hold Cypress, including its affiliates, and its directors, officers, employees, agents, distributors, and assigns harmless from and against all claims, costs, damages, and expenses, arising out of any claim, including claims for product liability, personal injury or death, or property damage arising from any use of a Cypress product as a Critical Component in a High-Risk Device. Cypress products are not intended or authorized for use as a Critical Component in any High-Risk Device except to the limited extent that (i) Cypress’s published data sheet for the product explicitly states Cypress has qualified the product for use in a specific High-Risk Device, or (ii) Cypress has given you advance written authorization to use the product as a Critical Component in the specific High-Risk Device and you have signed a separate indemnification agreement.

Cypress, the Cypress logo, and combinations thereof, PSoC, CapSense, EZ-USB, F-RAM, Traveo, WICED, and ModusToolbox are trademarks or registered trademarks of Cypress or a subsidiary of Cypress in the United States or in other countries. For a more complete list of Cypress trademarks, visit cypress.com. Other names and brands may be claimed as property of their respective owners.

Register Mapping

The Register Mapping section discusses the registers of the PMG1-S1 device. This document should be used in conjunction with [PMG1 Family PMG1-S1 Architecture Technical Reference Manual \(TRM\)](#). Register Mapping section lists all the registers in mapping tables, in address order.

Register General Conventions

The register conventions specific to this section and the Register Reference chapter are listed in this table.

Convention	Example	Description
'x' in a register name	ACBxxCR1	Multiple instances/address ranges of the same register
R	R : 00	Read register or bit(s)
W	W : 00	Write register or bit(s)
WOC	WOC:0	Write one to clear
WZC	WZC:0	Write zero to clear
RC	RC:0	Read to clear
WC	WC:0	Write to clear
NA	NA:000	Reserved
None	None: 0	Reserved
U	R:U	Undefined
00	RW : 00	Reset value is 0x00
XX	RW : XX	Register is not reset

Acronyms

This table lists the acronyms used in this document

Acronyms

Symbol	Unit of Measure
ABUS	analog output bus
AC	alternating current
ADC	analog-to-digital converter
ADV	advertising
AES	Advanced Encryption Standard
AHB	AMBA (advanced microcontroller bus architecture) high-performance bus, an ARM data transfer bus
API	application programming interface
APOR	analog power-on reset
BC	broadcast clock
BLE	Bluetooth Low Energy (Bluetooth Smart)
BLESS	BLE subsystem
BOM	bill of materials
BR	bit rate

Acronyms (continued)

Symbol	Unit of Measure
BRA	bus request acknowledge
BRQ	bus request
CAN	controller area network
CI	carry in
CMP	compare
CO	carry out
CPU	central processing unit
CRC	cyclic redundancy check
CSD	CapSense sigma delta
CT	continuous time
DAC	digital-to-analog converter
DC	direct current
DI	digital or data input
DMA	direct memory access
DNL	differential nonlinearity
DO	digital or data output
DSI	digital signal interface
DSM	deep-sleep mode
ECO	external crystal oscillator
EEPROM	electrically erasable programmable read only memory
EMIF	external memory interface
FB	feedback
FIFO	first in first out
FSR	full scale range
GAP	generic access profile
GATT	generic attribute profile
GFSK	Gaussian frequency-shift keying
GPIO	general purpose I/O
HCI	host-controller interface (BLE stack)
HFCLK	high-frequency clock
I ² C	inter-integrated circuit
IDE	integrated development environment
ILO	internal low-speed oscillator
IMO	internal main oscillator
INL	integral nonlinearity
I/O	input/output
IOR	I/O read
IOW	I/O write
IRES	initial power on reset
IRA	interrupt request acknowledge
IRQ	interrupt request
ISR	interrupt service routine
IVR	interrupt vector read
L2CAP	logical link control and adaptation protocol

Acronyms (continued)

Symbol	Unit of Measure
LRb	last received bit
LRB	last received byte
LSb	least significant bit
LSB	least significant byte
LUT	lookup table
MISO	master-in-slave-out
MMIO	memory mapped input/output
MOSI	master-out-slave-in
MSb	most significant bit
MSB	most significant byte
PC	program counter
PCH	program counter high
PCL	program counter low
PD	power down
PDU	protocol data unit
PGA	programmable gain amplifier
PHY	physical layer
PM	power management
PMA	PSoC memory arbiter
POR	power-on reset
PPOR	precision power-on reset
PRS	pseudo random sequence
PSoC®	Programmable System-on-Chip
PSRR	power supply rejection ratio
PSSDC	power system sleep duty cycle
PWM	pulse width modulator
RAM	random-access memory
RETI	return from interrupt
RF	radio frequency
ROM	read only memory
RW	read/write
SAR	successive approximation register
SC	switched capacitor
SCB	serial communication block
SIE	serial interface engine
SIO	special I/O
SE0	single-ended zero
SNR	signal-to-noise ratio
SOF	start of frame
SOI	start of instruction
SP	stack pointer
SPD	sequential phase detector
SPI	serial peripheral interconnect
SPIM	serial peripheral interconnect master

Acronyms (continued)

Symbol	Unit of Measure
SPIS	serial peripheral interconnect slave
SRAM	static random-access memory
SROM	supervisory read only memory
SSADC	single slope ADC
SSC	supervisory system call
SYSCLK	system clock
SWD	single wire debug
TC	terminal count
TD	transaction descriptors
UART	universal asynchronous receiver/transmitter
UDB	universal digital block
USB	universal serial bus
USBIO	USB I/O
WCO	watch crystal oscillator
WDT	watchdog timer
WDR	watchdog reset
XRES	external reset
XRES_N	external reset, active low

1 Cortex M0 (CM0) Registers

This section discusses the CM0 registers. It lists all the registers in mapping tables, in address order.

1.1 Register Details

Register Name	Address
CM0_DWT_PID4	0xE0001FD0
CM0_DWT_PID0	0xE0001FE0
CM0_DWT_PID1	0xE0001FE4
CM0_DWT_PID2	0xE0001FE8
CM0_DWT_PID3	0xE0001FEC
CM0_DWT_CID0	0xE0001FF0
CM0_DWT_CID1	0xE0001FF4
CM0_DWT_CID2	0xE0001FF8
CM0_DWT_CID3	0xE0001FFC
CM0_BP_PID4	0xE0002FD0
CM0_BP_PID0	0xE0002FE0
CM0_BP_PID1	0xE0002FE4
CM0_BP_PID2	0xE0002FE8
CM0_BP_PID3	0xE0002FEC
CM0_BP_CID0	0xE0002FF0
CM0_BP_CID1	0xE0002FF4
CM0_BP_CID2	0xE0002FF8
CM0_BP_CID3	0xE0002FFC
CM0_SYST_CSR	0xE000E010
CM0_SYST_RVR	0xE000E014
CM0_SYST_CVR	0xE000E018
CM0_SYST_CALIB	0xE000E01C
CM0_ISER	0xE000E100
CM0_ICER	0xE000E180
CM0_ISPR	0xE000E200
CM0_ICPR	0xE000E280
CM0_IPRO	0xE000E400

Register Name	Address
CM0_IPR1	0xE000E404
CM0_IPR2	0xE000E408
CM0_IPR3	0xE000E40C
CM0_IPR4	0xE000E410
CM0_IPR5	0xE000E414
CM0_IPR6	0xE000E418
CM0_IPR7	0xE000E41C
CM0_CPUID	0xE000ED00
CM0_ICSR	0xE000ED04
CM0_AIRCR	0xE000ED0C
CM0_SCR	0xE000ED10
CM0_CCR	0xE000ED14
CM0_SHPR2	0xE000ED1C
CM0_SHPR3	0xE000ED20
CM0_SHCSR	0xE000ED24
CM0_SCS_PID4	0xE000EFD0
CM0_SCS_PID0	0xE000EFE0
CM0_SCS_PID1	0xE000EFE4
CM0_SCS_PID2	0xE000EFE8
CM0_SCS_PID3	0xE000EFEC
CM0_SCS_CID0	0xE000EFF0
CM0_SCS_CID1	0xE000EFF4
CM0_SCS_CID2	0xE000EFF8
CM0_SCS_CID3	0xE000FFFC
CM0_ROM_SCS	0xE00FF000
CM0_ROM_DWT	0xE00FF004
CM0_ROM_BPU	0xE00FF008
CM0_ROM_END	0xE00FF00C
CM0_ROM_CSMT	0xE00FF0CC
CM0_ROM_PID4	0xE00FFFD0
CM0_ROM_PID0	0xE00FFFE0
CM0_ROM_PID1	0xE00FFFE4
CM0_ROM_PID2	0xE00FFFE8
CM0_ROM_PID3	0xE00FF FEC
CM0_ROM_CID0	0xE00FFFF0
CM0_ROM_CID1	0xE00FFFF4
CM0_ROM_CID2	0xE00FFFF8
CM0_ROM_CID3	0xE00FFFFC

1.1.1 CM0_DWT_PID4

Watchpoint Unit CoreSight ROM Table Peripheral ID #4

Address: 0xE0001FD0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #4 Default Value: 4

1.1.2 CM0_DWT_PID0

Watchpoint Unit CoreSight ROM Table Peripheral ID #0

Address: 0xE0001FE0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #0 Default Value: 10

1.1.3 CM0_DWT_PID1

Watchpoint Unit CoreSight ROM Table Peripheral ID #1

Address: 0xE0001FE4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							
Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							
Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							
Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #1 Default Value: 176

1.1.4 CM0_DWT_PID2

Watchpoint Unit CoreSight ROM Table Peripheral ID #2

Address: 0xE0001FE8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #2 Default Value: 11

1.1.5 CM0_DWT_PID3

Watchpoint Unit CoreSight ROM Table Peripheral ID #3

Address: 0xE0001FEC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #3 Default Value: 0

1.1.6 CM0_DWT_CID0

Watchpoint Unit CoreSight ROM Table Component ID #0

Address: 0xE0001FF0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component ID #0 Default Value: 13

1.1.7 CM0_DWT_CID1

Watchpoint Unit CoreSight ROM Table Component ID #1

Address: 0xE0001FF4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							
Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							
Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							
Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component ID #1 Default Value: 224

1.1.8 CM0_DWT_CID2

Watchpoint Unit CoreSight ROM Table Component ID #2

Address: 0xE0001FF8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component ID #2 Default Value: 5

1.1.9 CM0_DWT_CID3

Watchpoint Unit CoreSight ROM Table Component ID #3

Address: 0xE0001FFC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component ID #3 Default Value: 177

1.1.10 CM0_BP_PID4

Breakpoint Unit CoreSight ROM Table Peripheral ID #4

Address: 0xE0002FD0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #4 Default Value: 4

1.1.11 CM0_BP_PID0

Breakpoint Unit CoreSight ROM Table Peripheral ID #0

Address: 0xE0002FE0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #0 Default Value: 11

1.1.12 CM0_BP_PID1

Breakpoint Unit CoreSight ROM Table Peripheral ID #1

Address: 0xE0002FE4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #1 Default Value: 176

1.1.13 CM0_BP_PID2

Breakpoint Unit CoreSight ROM Table Peripheral ID #2

Address: 0xE0002FE8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #2 Default Value: 11

1.1.14 CM0_BP_PID3

Breakpoint Unit CoreSight ROM Table Peripheral ID #3

Address: 0xE0002FEC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Peripheral ID #3 Default Value: 0

1.1.15 CM0_BP_CID0

Breakpoint Unit CoreSight ROM Table Component ID #0

Address: 0xE0002FF0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	None							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	None							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	None							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component ID #0 Default Value: 13

1.1.16 CM0_BP_CID1

Breakpoint Unit CoreSight ROM Table Component ID #1

Address: 0xE0002FF4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	None							
Name	VALUE [7:0]

1.1.19 CM0_SYST_CSR

SysTick Control & Status

Address: 0xE000E010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None					RW	RW	RW
HW Access	None					R	R	R
Name	None [7:3]					CLK-SOURCE	TICKINT	ENABLE

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							R
HW Access	None							RW
Name	None [23:17]							COUNT-FLAG

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
16	COUNTFLAG	<p>Indicates whether the counter has counted to "0" since the last read of this register: '0': counter has not counted to "0". '1': counter has counted to "0".</p> <p>COUNTFLAG is set to '1' by a count transition from "1" to "0". COUNTFLAG is cleared to '0' by a read of this register, and by any write to the SYST_CVR register. Default Value: 0</p>

1.1.19 CM0_SYST_CSR (continued)

2	CLKSOURCE	<p>Indicates the SysTick counter clock source:</p> <p>'0': SysTick uses the low frequency clock "clk_lf". For this mode to function, "clk_lf" should be less than half the frequency of "clk_sys". Note that "clk_lf" is generated by a low accuracy ILO (Internal Low power Oscillator), with a target frequency of 32.768 kHz (frequency can be as low as 15 KHz and as high as 60 kHz).</p> <p>'1': SysTick uses the system/processor clock "clk_sys".</p> <p>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided. in SF, TSG6M products, this functionality is not provided. For these products, this field should be set to '1', such that SysTick uses the system clock "clk_sys".</p> <p>Default Value: 0</p>
1	TICKINT	<p>Indicates whether counting to "0" causes the status of the SysTick exception to change to pending:</p> <p>'0': count to "0" does not affect the SysTick exception status.</p> <p>'1': count to "0" changes the SysTick exception status to pending.</p> <p>Changing the value of the counter to "0" by writing zero to the SYST_CVR register to "0" never changes the status of the SysTick exception.</p> <p>Default Value: 0</p>
0	ENABLE	<p>Indicates the enabled status of the SysTick counter:</p> <p>'0': counter is disabled.</p> <p>'1': counter is operating.</p> <p>Default Value: 0</p>

1.1.20 CM0_SYST_RVR

SysTick Reload Value

Address: 0xE000E014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R

Name	RELOAD [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	RELOAD [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 0	RELOAD	The value to load into the SYST_CVR register when the counter reaches 0. Default Value: X

1.1.21 CM0_SYST_CVR

SysTick Current Value

Address: 0xE000E018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	CURRENT [7:0]							
Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	CURRENT [15:8]							
Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	CURRENT [23:16]							
Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 0	CURRENT	Current counter value. This is the value of the counter at the time it is sampled. Default Value: X

1.1.22 CM0_SYST_CALIB

SysTick Calibration Value

Address: 0xE000E01C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	TENMS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	TENMS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	RW							
Name	TENMS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	R	None					
HW Access	None	RW	None					
Name	NOREF	SKEW	None [29:24]					

Bits	Name	Description
31	NOREF	<p>Indicates whether a implementation defined reference clock is provided: '0': the reference clock is provided. '1': the reference clock is not provided. When this bit is '1', the SYST_CSR.CLKSOURCE is forced to '1' and cannot be cleared to '0'.</p> <p>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '0'. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '1'. Default Value: 0</p>
30	SKEW	<p>Indicates whether the 10ms calibration value is exact: '0': 10ms calibration value is exact. '1': 10ms calibration value is inexact, because of the clock frequency.</p> <p>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '1' (due to the low accuracy ILO). In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '0'. Default Value: X</p>

1.1.22 CM0_SYST_CALIB (continued)

23 : 0 TENMS

Optionally, holds a reload value to be used for 10ms (100Hz) timing, subject to system clock skew errors. If this field is "0", the calibration value is not known.

In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is 0x00:00147. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is 0x00:0000.
Default Value: X

1.1.23 CM0_ISER

Interrupt Set-Enable Register

HW Access	RW							
Name	VECTACTIVE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R				None			R
HW Access	RW				None			RW
Name	VECTPENDING [15:12]				None [11:9]			VECTACTIVE

Bits	23	22	21	20	19	18	17	16
SW Access	R	R	None	R				
HW Access	RW	RW	None	RW				
Name	ISRPRE-EMPT	ISRPEND-ING	None	VECTPENDING [20:16]				

Bits	31	30	29	28	27	26	25	24
SW Access	RW1S	None		RW1S	RW1C	RW1S	RW1C	None
HW Access	RW	None		RW	R	RW	R	None
Name	NMIPEND-SET	None [30:29]		PENDSV-SET	PENDSV-CLR	PENDST-SETb	PENDST-CLR	None

Bits	Name	Description
31	NMIPENDSET	Activates an NMI exception or reads back the current state. Because NMI is the highest priority exception, it activates as soon as it is registered. Default Value: 0
28	PENDSVSET	Sets a pending PendSV interrupt or reads back the current state. Use this normally to request a context switch. Writing PENDSVSET and PENDSVCLR to '1' concurrently is UNPREDICTABLE. Default Value: 0
27	PENDSVCLR	Clears a pending PendSV interrupt. Default Value: 0
26	PENDSTSETb	Sets a pending SysTick or reads back the current state. Writing PENDSTSET and PENDSTCLR to '1' concurrently is UNPREDICTABLE. Default Value: 0
25	PENDSTCLR	Clears a pending SysTick, whether set here or by the timer hardware. Default Value: 0

1.1.36 CM0_ICSR (continued)

23	ISRPREEMPT	Indicates whether a pending exception will be serviced on exit from debug halt state. Default Value: 0
22	ISRPENDING	Indicates if an external configurable, NVIC generated, interrupt is pending. Default Value: 0
20 : 12	VECTPENDING	The exception number for the highest priority pending exception. 0= No pending exceptions. The pending state includes the effect of memory-mapped enable and mask registers. It does not include the PRIMASK special-purpose register qualifier. Default Value: 0
8 : 0	VECTACTIVE	The exception number for the current executing exception. 0= Thread mode. This is the same value as IPSR[8:0] Default Value: 0

1.1.37 CM0_AIRCR

Application Interrupt and Reset Control Register

Address: 0xE000ED0C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None					RW1S	RW1C	None
HW Access	None					R	R	None
Name	None [7:3]					SYSRESE- TREQ	VECTCL- RACTIVE	None

Bits	15	14	13	12	11	10	9	8
SW Access	R	None						
HW Access	None	None						
Name	ENDIAN- NESS	None [14:8]						

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	VECTKEY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	VECTKEY [31:24]							

Bits	Name	Description
31 : 16	VECTKEY	Vector Key. The value 0x05FA must be written to this register, otherwise the register write is UNPREDICTABLE. Readback value is UNKNOWN. Default Value: X
15	ENDIANNESS	Indicates the memory system data endianness: 0 little endian 1 big endian. See Endian support on page A3-44 for more information. Default Value: 0
2	SYSRESETREQ	System Reset Request. Writing 1 to this bit asserts a signal to request a reset by the external system. This will cause a full system reset of the CPU and all other components in the device. See Reset management on page B1-240 for more information. Default Value: 0
1	VECTCLRACTIVE	Clears all active state information for fixed and configurable exceptions. The effect of writing a 1 to this bit if the processor is not halted in Debug state is UNPREDICTABLE. Default Value: 0

1.1.38 CM0_SCR

System Control Register

Address: 0xE000ED10

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			RW	None	RW	RW	None
HW Access	None			R	None	R	R	None
Name	None [7:5]			SEVON- PEND	None	SLEEP- DEEP	SLEEPON- EXIT	None

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
4	SEVONPEND	Determines whether an interrupt transition from inactive state to pending state is a wakeup event: 0: transitions from inactive to pending are not wakeup events. 1: transitions from inactive to pending are wakeup events. See WFE on page A6-197 for more information. Default Value: 0
2	SLEEPDEEP	An implementation can use this bit to select DeepSleep/Hibernate power modes upon execution of WFI/WFE: 0: Select Sleep mode 1: Select DeepSleep/Hibernate (depends on PWR_CONTROL.HIBERNATE) Default Value: 0
1	SLEEPONEXIT	Determines whether, on an exit from an ISR that returns to the base level of execution priority, the processor enters a sleep state: 0 do not enter sleep state. 1 enter sleep state. See Power management on page B1-240 for more information. Default Value: 0

1.1.39 CM0_CCR

Configuration and Control Register

Address: 0xE000ED14

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None				R	None		
HW Access	None				None	None		
Name	None [7:4]				UNALIGN_TRP	None [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	None						R	None
HW Access	None						None	None

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9	STKALIGN	1: On exception entry, the SP used prior to the exception is adjusted to be 8-byte aligned and the context to restore it is saved. The SP is restored on the associated exception return. Default Value: 1
3	UNALIGN_TRP	1: unaligned word and halfword accesses generate a HardFault exception. Default Value: 1

1.1.40 CM0_SHPR2

2 Timer, Counter, PWM Counter (CNT) Registers

This section discusses the CNT registers. It lists all the registers in mapping tables, in address order.

2.1 Register Details

Register Name	Address
TCPWM_CNT0_STATUS	0x40090100
TCPWM_CNT0_STATUS	0x40090104
TCPWM_CNT0_COUNTER	0x40090108
TCPWM_CNT0_CC	0x4009010C
TCPWM_CNT0_CC_BUFF	0x40090110
TCPWM_CNT0_PERIOD	0x40090114
TCPWM_CNT0_PERIOD_BUFF	0x40090118
TCPWM_CNT0_TR_CTRL0	0x40090120
TCPWM_CNT0_TR_CTRL1	0x40090124
TCPWM_CNT0_TR_CTRL2	0x40090128
TCPWM_CNT0_INTR	0x40090130
TCPWM_CNT0_INTR_SET	0x40090134
TCPWM_CNT0_INTR_MASK	0x40090138
TCPWM_CNT0_INTR_MASKED	0x4009013C
TCPWM_CNT1_CTRL	0x40090140
TCPWM_CNT1_STATUS	0x40090144
TCPWM_CNT1_COUNTER	0x40090148
TCPWM_CNT1_CC	0x4009014C
TCPWM_CNT1_CC_BUFF	0x40090150
TCPWM_CNT1_PERIOD	0x40090154
TCPWM_CNT1_PERIOD_BUFF	0x40090158
TCPWM_CNT1_TR_CTRL0	0x40090160
TCPWM_CNT1_TR_CTRL1	0x40090164
TCPWM_CNT1_TR_CTRL2	0x40090168
TCPWM_CNT1_INTR	0x40090170
TCPWM_CNT1_INTR_SET	0x40090174
TCPWM_CNT1_INTR_MASK	0x40090178

Register Name	Address
TCPWM_CNT1_INTR_MASKED	0x4009017C

2.1.1 TCPWM_CNT0_CTRL

Counter control register

Address: 0x40090100

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None				RW	RW	RW	RW
HW Access	None				R	R	R	R
Name	None [7:4]				PWM_STO P_ON_KILL	PWM_SYN C_KILL	AUTO_REL OAD_PERI OD	AUTO_REL OAD_CC

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	GENERIC [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None		RW		None	RW	RW	
HW Access	None		R		None	R	R	
Name	None [23:22]		QUADRATURE_MODE [21:20]		None	ONE_SHOT	UP_DOWN_MODE [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	None					RW		
HW Access	None					R		
Name	None [31:27]					MODE [26:24]		

Bits	Name	Description
26 : 24	MODE	Counter mode. Default Value: 0 0x0: TIMER: Timer mode 0x2: CAPTURE: Capture mode 0x3: QUAD: Quadrature encoding mode 0x4: PWM: Pulse width modulation (PWM) mode 0x5: PWM_DT: PWM with deadtime insertion mode 0x6: PWM_PR: Pseudo random pulse width modulation

2.1.1 TCPWM_CNT0_CTRL (continued)

21 : 20	QUADRATURE_MODE	<p>In QUAD mode selects quadrature encoding mode (X1/X2/X4). In PWM, PWM_DT and PWM_PR modes, these two bits can be used to invert "dt_line_out" and "dt_line_compl_out". Inversion is the last step in generation of "dt_line_out" and "dt_line_compl_out"; i.e. a disabled output line "dt_line_out" has the value QUADRATURE_MODE[0] and a disabled output line "dt_line_compl_out" has the value QUADRATURE_MODE[1]. Default Value: 0</p> <p>0x0: X1: X1 encoding (QUAD mode)</p> <p>0x1: X2: X2 encoding (QUAD mode)</p> <p>0x1: INV_OUT: When bit 0 is '1', QUADRATURE_MODE[0] inverts "dt_line_out" (PWM/PWM_DT modes)</p> <p>0x2: X4: X4 encoding (QUAD mode)</p> <p>0x2: INV_COMPL_OUT: When bit 1 is '1', QUADRATURE_MODE[1] inverts "dt_line_compl_out" (PWM/PWM_DT modes)</p>
18	ONE_SHOT	<p>When '0', counter runs continuous. When '1', counter is turned off by hardware when a terminal count event is generated. Default Value: 0</p>
17 : 16	UP_DOWN_MODE	<p>Determines counter direction. Default Value: 0</p> <p>0x0: COUNT_UP: Count up (to PERIOD). An overflow event is generated when the counter reaches PERIOD. A terminal count event is generated when the counter reaches PERIOD.</p> <p>0x1: COUNT_DOWN: Count down (to "0"). An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0".</p> <p>0x2: COUNT_UPDN1: Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter reaches PERIOD. An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0".</p> <p>0x3: COUNT_UPDN2: Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter reaches PERIOD. An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0" AND when the counter reaches PERIOD (this counter direction can be used for PWM functionality with asymmetrical updates).</p>
15 : 8	GENERIC	<p>Generic 8-bit control field. In PWM_DT mode, this field is used to determine the dead time: amount of dead time cycles in the counter clock domain. In all other modes, the lower 3 bits of this field determine pre-scaling of the selected counter clock. Default Value: 0</p> <p>0x0: DIVBY1: Divide by 1 (other-than-PWM_DT mode)</p> <p>0x1: DIVBY2: Divide by 2 (other-than-PWM_DT mode)</p> <p>0x2: DIVBY4: Divide by 4 (other-than-PWM_DT mode)</p>

2.1.1 TCPWM_CNT0_CTRL (continued)

		0x3: DIVBY8: Divide by 8 (other-than-PWM_DT mode)
		0x4: DIVBY16: Divide by 16 (other-than-PWM_DT mode)
		0x5: DIVBY32: Divide by 32 (other-than-PWM_DT mode)
		0x6: DIVBY64: Divide by 64 (other-than-PWM_DT mode)
		0x7: DIVBY128: Divide by 128 (other-than-PWM_DT mode)
3	PWM_STOP_ON_KILL	Specifies whether the counter stops on a kill events: '0': kill event does NOT stop counter. '1': kill event stops counter. This field has a function in PWM, PWM_DT and PWM_PR modes only. Default Value: 0
2	PWM_SYNC_KILL	Specifies asynchronous/synchronous kill behavior: '1': synchronous kill mode: the kill event disables the "dt_line_out" and "dt_line_compl_out" signals till the next terminal count event (synchronous kill). In synchronous kill mode, STOP_EDGE should be RISING_EDGE. '0': asynchronous kill mode: the kill event only disables the "dt_line_out" and "dt_line_compl_out" signals when present. In asynchronous kill mode, STOP_EDGE should be NO_EDGE_DET. This field has a function in PWM and PWM_DT modes only. This field is only used when PWM_STOP_ON_KILL is '0'. Default Value: 0
1	AUTO_RELOAD_PERIOD	Specifies switching of the PERIOD and buffered PERIOD values. This field has a function in PWM, PWM_DT and PWM_PR modes. '0': never switch. '1': switch on a terminal count event with and actively pending siwtch event. Default Value: 0
0	AUTO_RELOAD_CC	Specifies switching of the CC and buffered CC values. This field has a function in TIMER, PWM, PWM_DT and PWM_PR modes. Timer mode: '0': never switch. '1': switch on a compare match event. PWM, PWM_DT, PWM_PR modes: '0': never switch. '1': switch on a terminal count event with an actively pending switch event. Default Value: 0

2.1.2 TCPWM_CNT0_STATUS

Counter status register

Address: 0x40090104

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							R
HW Access	None							RW
Name	None [7:1]							DOWN

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	GENERIC [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R	None						
HW Access	RW	None						
Name	RUNNING	None [30:24]						

Bits	Name	Description
31	RUNNING	When '0', the counter is NOT running. When '1', the counter is running. Default Value: 0
15 : 8	GENERIC	Generic 8-bit counter field. In PWM_DT mode, this counter is used for dead time insertion. In all other modes, this counter is used for pre-scaling the selected counter clock. PWM_DT mode can NOT use prescaled clock functionality. Default Value: 0
0	DOWN	When '0', counter is counting up. When '1', counter is counting down. In QUAD mode, this field indicates the direction of the latest counter change: '0' when last incremented and '1' when last decremented. Default Value: 0

2.1.3 TCPWM_CNT0_COUNTER

Counter count register

Address: 0x40090108

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	COUNTER [7:0]							
Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	COUNTER [15:8]							
Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							
Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	COUNTER	16-bit counter value. It is advised to not write to this field when the counter is running. Default Value: 0

2.1.4 TCPWM_CNT0_CC

Counter compare/capture register

Address: 0x4009010C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	CC [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	CC [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	CC	In CAPTURE mode, captures the counter value. In other modes, compared to counter value. Default Value: 65535

2.1.5 TCPWM_CNT0_CC_BUFF

Counter buffered compare/capture register

Address: 0x40090110

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	CC [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	CC [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	CC	Additional buffer for counter CC register. Default Value: 65535

2.1.6 TCPWM_CNT0_PERIOD

Counter period register

Address: 0x40090114

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	PERIOD [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	PERIOD [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	PERIOD	Period value: upper value of the counter. When the counter should count for n cycles, this field should be set to n-1. Default Value: 65535

2.1.7 TCPWM_CNT0_PERIOD_BUFF

Counter buffered period register

Address: 0x40090118

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	RW							
Name	PERIOD [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	RW							
Name	PERIOD [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	PERIOD	Additional buffer for counter PERIOD register. Default Value: 65535

2.1.8 TCPWM_CNT0_TR_CTRL0

Counter trigger control register 0

Address: 0x40090120

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	COUNT_SEL [7:4]				CAPTURE_SEL [3:0]			
Bits	15	14	13	12	11	10	9	8
SW Access	RW				RW			
HW Access	R				R			
Name	STOP_SEL [15:12]				RELOAD_SEL [11:8]			
Bits	23	22	21	20	19	18	17	16
SW Access	None				RW			
HW Access	None				R			
Name	None [23:20]				START_SEL [19:16]			
Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	START_SEL	Selects one of the 16 input triggers as a start trigger. In QUAD mode, this is the second phase (phi B). Default Value: 0
15 : 12	STOP_SEL	Selects one of the 16 input triggers as a stop trigger. In PWM, PWM_DT and PWM_PR modes, this is the kill trigger. In these modes, the kill trigger is used to either temporarily block the PWM outputs (PWM_STOP_ON_KILL is '0') or stop the functionality (PWM_STOP_ON_KILL is '1'). For the PWM and PWM_DT modes, the blocking of the output signals can be asynchronous (STOP_EDGE should be NO_EDGE_DET) in which case the blocking is as long as the trigger is '1' or synchronous (STOP_EDGE should be RISING_EDGE) in which case it extends till the next terminal count event. Default Value: 0
11 : 8	RELOAD_SEL	Selects one of the 16 input triggers as a reload trigger. In QUAD mode, this is the index or revolution pulse. In this mode, it will update the counter with the value in the TCPWM_CNTn_PERIOD register. Default Value: 0
7 : 4	COUNT_SEL	Selects one of the 16 input triggers as a count trigger. In QUAD mode, this is the first phase (phi A). Default setting selects input trigger 1, which is always '1'. Default Value: 1

2.1.8 TCPWM_CNT0_TR_CTRL0 (continued)

3 : 0	CAPTURE_SEL	<p>Selects one of the 16 input triggers as a capture trigger. Input trigger 0 is always '0' and input trigger 1 is always '1'. Input trigger 2 is the first external trigger line (tcpwm.tr_in[0]).</p> <p>In the PWM, PWM_DT and PWM_PR modes this trigger is used to switch the values if the compare and period registers with their buffer counterparts.</p> <p>Default Value: 0</p>
-------	-------------	--

2.1.9 TCPWM_CNT0_TR_CTRL1

Counter trigger control register 1

Address: 0x40090124

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW		RW		RW	
HW Access	R		R		R		R	
Name	STOP_EDGE [7:6]		RELOAD_EDGE [5:4]		COUNT_EDGE [3:2]		CAPTURE_EDGE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None						RW	
HW Access	None						R	
Name	None [15:10]						START_EDGE [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9 : 8	START_EDGE	<p>A start event will start the counter; i.e. the counter will become running. Starting does NOT enable the counter. A start event will not initialize the counter whereas the reload event does. Default Value: 3</p> <p>0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.</p> <p>0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.</p> <p>0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.</p> <p>0x3: NO_EDGE_DET: No edge detection, use trigger as is.</p>
7 : 6	STOP_EDGE	<p>A stop event, will stop the counter; i.e. it will no longer be running. Stopping will NOT disable the counter. Default Value: 3</p> <p>0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.</p>

2.1.9 TCPWM_CNT0_TR_CTRL1 (continued)

		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.
5 : 4	RELOAD_EDGE	A reload event will initialize the counter. When counting up, the counter is initialized to "0". When counting down, the counter is initialized with PERIOD. Default Value: 3
		0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.
		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.
3 : 2	COUNT_EDGE	A counter event will increase or decrease the counter by '1'. Default Value: 3
		0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.
		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.
1 : 0	CAPTURE_EDGE	A capture event will copy the counter value into the CC register. Default Value: 3
		0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.
		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.

2.1.10 TCPWM_CNT0_TR_CTRL2

Counter trigger control register 2

Address: 0x40090128

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None		RW		RW		RW	
HW Access	None		R		R		R	
Name	None [7:6]		UNDERFLOW_MODE [5:4]		OVERFLOW_MODE [3:2]		CC_MATCH_MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
5 : 4	UNDERFLOW_MODE	<p>Determines the effect of a counter underflow event (COUNTER reaches "0") on the "line_out" output signals. Default Value: 3</p> <p>0x0: SET: Set to '1'</p> <p>0x1: CLEAR: Set to '0'</p> <p>0x2: INVERT: Invert</p> <p>0x3: NO_CHANGE: No Change</p>
3 : 2	OVERFLOW_MODE	<p>Determines the effect of a counter overflow event (COUNTER reaches PERIOD) on the "line_out" output signals. Default Value: 3</p> <p>0x0: SET: Set to '1'</p>

2.1.10 TCPWM_CNT0_TR_CTRL2 (continued)

		0x1: CLEAR: Set to '0'
		0x2: INVERT: Invert
		0x3: NO_CHANGE: No Change
1 : 0	CC_MATCH_MODE	Determines the effect of a compare match event (COUNTER equals CC register) on the "line_out" output signals. Note that INVERT is especially useful for center aligned pulse width modulation. To generate a duty cycle of 0%, the counter CC register should be set to "0". For a 100% duty cycle, the counter CC register should be set to larger than the counter PERIOD register. Default Value: 3
		0x0: SET: Set to '1'
		0x1: CLEAR: Set to '0'
		0x2: INVERT: Invert
		0x3: NO_CHANGE: No Change

2.1.11 TCPWM_CNT0_INTR

Interrupt request register.

Address: 0x40090130

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW1C	RW1C
HW Access	None						RW1S	RW1S
Name	None [7:2]						CC_MATCH	TC

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	None					RW		
HW Access	None					R		
Name	None [31:27]					MODE [26:24]		

Bits	Name	Description
26 : 24	MODE	Counter mode. Default Value: 0 0x0: TIMER: Timer mode 0x2: CAPTURE: Capture mode 0x3: QUAD: Quadrature encoding mode 0x4: PWM: Pulse width modulation (PWM) mode 0x5: PWM_DT: PWM with deadtime insertion mode 0x6: PWM_PR: Pseudo random pulse width modulation

2.1.15 TCPWM_CNT1_CTRL (continued)

21 : 20	QUADRATURE_MODE	<p>In QUAD mode selects quadrature encoding mode (X1/X2/X4). In PWM, PWM_DT and PWM_PR modes, these two bits can be used to invert "dt_line_out" and "dt_line_compl_out". Inversion is the last step in generation of "dt_line_out" and "dt_line_compl_out"; i.e. a disabled output line "dt_line_out" has the value QUADRATURE_MODE[0] and a disabled output line "dt_line_compl_out" has the value QUADRATURE_MODE[1]. Default Value: 0</p> <p>0x0: X1: X1 encoding (QUAD mode)</p> <p>0x1: X2: X2 encoding (QUAD mode)</p> <p>0x1: INV_OUT: When bit 0 is '1', QUADRATURE_MODE[0] inverts "dt_line_out" (PWM/PWM_DT modes)</p> <p>0x2: X4: X4 encoding (QUAD mode)</p> <p>0x2: INV_COMPL_OUT: When bit 1 is '1', QUADRATURE_MODE[1] inverts "dt_line_compl_out" (PWM/PWM_DT modes)</p>
18	ONE_SHOT	<p>When '0', counter runs continuous. When '1', counter is turned off by hardware when a terminal count event is generated. Default Value: 0</p>
17 : 16	UP_DOWN_MODE	<p>Determines counter direction. Default Value: 0</p> <p>0x0: COUNT_UP: Count up (to PERIOD). An overflow event is generated when the counter reaches PERIOD. A terminal count event is generated when the counter reaches PERIOD.</p> <p>0x1: COUNT_DOWN: Count down (to "0"). An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0".</p> <p>0x2: COUNT_UPDN1: Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter reaches PERIOD. An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0".</p> <p>0x3: COUNT_UPDN2: Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter reaches PERIOD. An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0" AND when the counter reaches PERIOD (this counter direction can be used for PWM functionality with asymmetrical updates).</p>
15 : 8	GENERIC	<p>Generic 8-bit control field. In PWM_DT mode, this field is used to determine the dead time: amount of dead time cycles in the counter clock domain. In all other modes, the lower 3 bits of this field determine pre-scaling of the selected counter clock. Default Value: 0</p> <p>0x0: DIVBY1: Divide by 1 (other-than-PWM_DT mode)</p> <p>0x1: DIVBY2: Divide by 2 (other-than-PWM_DT mode)</p> <p>0x2: DIVBY4: Divide by 4 (other-than-PWM_DT mode)</p>

2.1.15 TCPWM_CNT1_CTRL (continued)

		0x3: DIVBY8: Divide by 8 (other-than-PWM_DT mode)
		0x4: DIVBY16: Divide by 16 (other-than-PWM_DT mode)
		0x5: DIVBY32: Divide by 32 (other-than-PWM_DT mode)
		0x6: DIVBY64: Divide by 64 (other-than-PWM_DT mode)
		0x7: DIVBY128: Divide by 128 (other-than-PWM_DT mode)
3	PWM_STOP_ON_KILL	Specifies whether the counter stops on a kill events: '0': kill event does NOT stop counter. '1': kill event stops counter. This field has a function in PWM, PWM_DT and PWM_PR modes only. Default Value: 0
2	PWM_SYNC_KILL	Specifies asynchronous/synchronous kill behavior: '1': synchronous kill mode: the kill event disables the "dt_line_out" and "dt_line_compl_out" signals till the next terminal count event (synchronous kill). In synchronous kill mode, STOP_EDGE should be RISING_EDGE. '0': asynchronous kill mode: the kill event only disables the "dt_line_out" and "dt_line_compl_out" signals when present. In asynchronous kill mode, STOP_EDGE should be NO_EDGE_DET. This field has a function in PWM and PWM_DT modes only. This field is only used when PWM_STOP_ON_KILL is '0'. Default Value: 0
1	AUTO_RELOAD_PERIOD	Specifies switching of the PERIOD and buffered PERIOD values. This field has a function in PWM, PWM_DT and PWM_PR modes. '0': never switch. '1': switch on a terminal count event with and actively pending siwtch event. Default Value: 0
0	AUTO_RELOAD_CC	Specifies switching of the CC and buffered CC values. This field has a function in TIMER, PWM, PWM_DT and PWM_PR modes. Timer mode: '0': never switch. '1': switch on a compare match event. PWM, PWM_DT, PWM_PR modes: '0': never switch. '1': switch on a terminal count event with an actively pending switch event. Default Value: 0

2.1.16 TCPWM_CNT1_STATUS

Counter status register

Address: 0x40090144

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							R
HW Access	None							RW
Name	None [7:1]							DOWN

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	GENERIC [15:8]

Bits	Name	Description
15 : 0	PERIOD	Additional buffer for counter PERIOD register. Default Value: 65535

2.1.22 TCPWM_CNT1_TR_CTRL0

Counter trigger control register 0

Address: 0x40090160

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	COUNT_SEL [7:4]				CAPTURE_SEL [3:0]			
Bits	15	14	13	12	11	10	9	8
SW Access	RW				RW			
HW Access	R				R			
Name	STOP_SEL [15:12]				RELOAD_SEL [11:8]			
Bits	23	22	21	20	19	18	17	16
SW Access	None				RW			
HW Access	None				R			
Name	None [23:20]				START_SEL [19:16]			
Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	START_SEL	Selects one of the 16 input triggers as a start trigger. In QUAD mode, this is the second phase (phi B). Default Value: 0
15 : 12	STOP_SEL	Selects one of the 16 input triggers as a stop trigger. In PWM, PWM_DT and PWM_PR modes, this is the kill trigger. In these modes, the kill trigger is used to either temporarily block the PWM outputs (PWM_STOP_ON_KILL is '0') or stop the functionality (PWM_STOP_ON_KILL is '1'). For the PWM and PWM_DT modes, the blocking of the output signals can be asynchronous (STOP_EDGE should be NO_EDGE_DET) in which case the blocking is as long as the trigger is '1' or synchronous (STOP_EDGE should be RISING_EDGE) in which case it extends till the next terminal count event. Default Value: 0
11 : 8	RELOAD_SEL	Selects one of the 16 input triggers as a reload trigger. In QUAD mode, this is the index or revolution pulse. In this mode, it will update the counter with the value in the TCPWM_CNTn_PERIOD register. Default Value: 0
7 : 4	COUNT_SEL	Selects one of the 16 input triggers as a count trigger. In QUAD mode, this is the first phase (phi A). Default setting selects input trigger 1, which is always '1'. Default Value: 1

2.1.22 TCPWM_CNT1_TR_CTRL0 (continued)

3 : 0	CAPTURE_SEL	<p>Selects one of the 16 input triggers as a capture trigger. Input trigger 0 is always '0' and input trigger 1 is always '1'. Input trigger 2 is the first external trigger line (tcpwm.tr_in[0]).</p> <p>In the PWM, PWM_DT and PWM_PR modes this trigger is used to switch the values if the compare and period registers with their buffer counterparts.</p> <p>Default Value: 0</p>
-------	-------------	--

2.1.23 TCPWM_CNT1_TR_CTRL1

Counter trigger control register 1

Address: 0x40090164

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW		RW		RW	
HW Access	R		R		R		R

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9 : 8	START_EDGE	<p>A start event will start the counter; i.e. the counter will become running. Starting does NOT enable the counter. A start event will not initialize the counter whereas the reload event does. Default Value: 3</p> <p>0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.</p> <p>0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.</p> <p>0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.</p> <p>0x3: NO_EDGE_DET: No edge detection, use trigger as is.</p>
7 : 6	STOP_EDGE	<p>A stop event, will stop the counter; i.e. it will no longer be running. Stopping will NOT disable the counter. Default Value: 3</p> <p>0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.</p>

2.1.23 TCPWM_CNT1_TR_CTRL1 (continued)

		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.
5 : 4	RELOAD_EDGE	A reload event will initialize the counter. When counting up, the counter is initialized to "0". When counting down, the counter is initialized with PERIOD. Default Value: 3
		0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.
		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.
3 : 2	COUNT_EDGE	A counter event will increase or decrease the counter by '1'. Default Value: 3
		0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.
		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.
1 : 0	CAPTURE_EDGE	A capture event will copy the counter value into the CC register. Default Value: 3
		0x0: RISING_EDGE: Rising edge. Any rising edge generates an event.
		0x1: FALLING_EDGE: Falling edge. Any falling edge generates an event.
		0x2: BOTH_EDGES: Rising AND falling edge. Any odd amount of edges generates an event.
		0x3: NO_EDGE_DET: No edge detection, use trigger as is.

2.1.24 TCPWM_CNT1_TR_CTRL2

Counter trigger control register 2

Address: 0x40090168

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None		RW		RW		RW	
HW Access	None		R		R		R	
Name	None [7:6]		UNDERFLOW_MODE [5:4]		OVERFLOW_MODE [3:2]		CC_MATCH_MODE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
5 : 4	UNDERFLOW_MODE	Determines the effect of a counter underflow event (COUNTER reaches "0") on the "line_out" output signals. Default Value: 3 0x0: SET: Set to '1' 0x1: CLEAR: Set to '0' 0x2: INVERT: Invert 0x3: NO_CHANGE: No Change
3 : 2	OVERFLOW_MODE	Determines the effect of a counter overflow event (COUNTER reaches PERIOD) on the "line_out" output signals. Default Value: 3 0x0: SET: Set to '1'

2.1.24 TCPWM_CNT1_TR_CTRL2 (continued)

		0x1: CLEAR: Set to '0'
		0x2: INVERT: Invert
		0x3: NO_CHANGE: No Change
1 : 0	CC_MATCH_MODE	Determines the effect of a compare match event (COUNTER equals CC register) on the "line_out" output signals. Note that INVERT is especially useful for center aligned pulse width modulation. To generate a duty cycle of 0%, the counter CC register should be set to "0". For a 100% duty cycle, the counter CC register should be set to larger than the counter PERIOD register. Default Value: 3
		0x0: SET: Set to '1'
		0x1: CLEAR: Set to '0'
		0x2: INVERT: Invert
		0x3: NO_CHANGE: No Change

Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	CC_MATCH	Logical and of corresponding request and mask bits. Default Value: 0
0	TC	Logical and of corresponding request and mask bits. Default Value: 0

3 CPU Sub System (CPUSS) Registers

This section discusses the CPUSS registers. It lists all the registers in mapping tables, in address order.

3.1 Register Details

Register Name	Address
CPUSS_CONFIG	0x40100000
CPUSS_SYSREQ	0x40100004
CPUSS_SYSARG	0x40100008
CPUSS_FLASH_CTL	0x40100030
CPUSS_ROM_CTL	0x40100034

3.1.1 CPUSS_CONFIG

Configuration register

Address: 0x40100000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							RW
HW Access	None							R
Name	None [7:1]							VECT_IN_RAM

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	VECT_IN_RAM	0': Vector Table is located at 0x0000:0000 in flash '1': Vector Table is located at 0x2000:0000 in SRAM Note that vectors for RESET and FAULT are always fetched from ROM. Value in flash/RAM is ignored for these vectors. Default Value: 0

3.1.2 CPUSS_SYSREQ

SYSCALL control register

Address: 0x40100004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	SYSCALL_COMMAND [7:0]							
Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	None							
Name	SYSCALL_COMMAND [15:8]							
Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							
Bits	31	30	29	28	27	26	25	24
SW Access	RW	R	R	RW	RW	None		
HW Access	R	A	RW	A	R	None		
Name	SYSCALL_REQ	HMASTER_0	ROM_ACCESS_EN	PRIVILEGED	DIS_RESET_VECT_REL	None [26:24]		

Bits	Name	Description
31	SYSCALL_REQ	CPU/DAP writes a '1' to this field to request a SystemCall. The HMASTER_0 field indicates the source of the write access. Setting this field to '1' immediate results in a NMI. The SystemCall NMI interrupt handler sets this field to '0' after servicing the request. Default Value: 0
30	HMASTER_0	Indicates the source of the write access to the SYSREQ register. '0': CPU write access. '1': DAP write access. HW sets this field when the SYSREQ register is written to and SYSCALL_REQ is '0' (the last time it is set is when SW sets SYSCALL_REQ from '0' to '1'). Default Value: 0
29	ROM_ACCESS_EN	Indicates that executing from Boot ROM is enabled. HW sets this field to '1', on reset or when the SystemCall NMI vector is fetched from Boot ROM. HW sets this field to '0', when the CPU is NOT executing from either Boot or System ROM. This bit is used for debug purposes only. Default Value: 1

3.1.2 CPUSS_SYSREQ (continued)

28	PRIVILEGED	Indicates whether the system is in privileged ('1') or user mode ('0'). Only CPU SW executing from ROM can set this field to '1' when ROM_ACCESS_EN is '1' (the CPU is executing a SystemCall NMI interrupt handler). Any other write to this field sets is to '0'. This field is used as the AHB-Lite hprot[1] signal to implement Cypress proprietary user/privileged modes. These modes are used to enable/disable access to specific MMIO registers and memory regions. Default Value: 1
27	DIS_RESET_VECT_REL	Disable Reset Vector fetch relocation: '0': CPU accesses to locations 0x0000:0000 - 0x0000:0007 are redirected to ROM. '1': CPU accesses to locations 0x0000:0000 - 0x0000:0007 are made to flash. Note that this field defaults to '0' on reset, ensuring actual reset vector fetches are always made to ROM. Note that this field does not affect DAP accesses. Flash DfT routines may set this bit to '1' to enable uninhibited read-back of programmed data in the first flash page. Default Value: 0
15 : 0	SYSCALL_COMMAND	Opcode of the system call being requested. Default Value: 0

3.1.3 CPUSS_SYSARG

SYSARG control register

Address: 0x40100008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	SYSCALL_ARG [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	None							
Name	SYSCALL_ARG [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	None							
Name	SYSCALL_ARG [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	None							
Name	SYSCALL_ARG [31:24]							

Bits	Name	Description
31 : 0	SYSCALL_ARG	Argument to System Call specified in SYSREQ. Semantics of argument depends on system call made. Typically a pointer to a parameter block. Default Value: 0

3.1.4 CPUSS_FLASH_CTL

FLASH control register

Address: 0x40100030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			RW	None		RW	
HW Access	None			R	None		R	
Name	None [7:5]			PREF_EN	None [3:2]		FLASH_WS [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							RW
HW Access	None							RW1C
Name	None [15:9]							FLASH_INV ALIDATE

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
8	FLASH_INVALIDATE	1': Invalidates the content of the flash controller's buffers. Default Value: 0
4	PREF_EN	Prefetch enable: '0': disabled. This is a desirable setting when FLASH_WS is "0" or when predictable execution behavior is required. '1': enabled. Default Value: 0
1 : 0	FLASH_WS	Amount of ROM wait states: "0": 0 wait states (fast flash: [0, 24] MHz system frequency, slow flash: [0, 16] MHz system frequency) "1": 1 wait state (fast flash: [24, 48] MHz system frequency, slow flash: [16, 32] MHz system frequency) "2": 2 wait states (slow flash: [32, 48] MHz system frequency) "3": 3 wait states (can be used to give more time for flash access if 2 wait states are not sufficient) Default Value: 0

3.1.5 CPUSS_ROM_CTL

ROM control register

Address: 0x40100034

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							RW
HW Access	None							R
Name	None [7:1]							ROM_WS

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	ROM_WS	<p>Amount of ROM wait states:</p> <p>'0': 0 wait states. Use this setting for newer, faster ROM design. Use this setting for older, slower ROM design and frequencies in the range [0, 24] MHz.</p> <p>'1': 1 wait state. Use this setting for older, slower ROM design and frequencies in the range <24, 48] MHz.</p> <p>CPUSSv2 supports two types of ROM memory: an older, slower design (operating at up to 24 MHz) and a newer, faster design (operating at up to 48 MHz). The older design requires 1 wait state for frequencies above 24 MHz. The newer design never requires wait states. All chips after Street Fighter will use the newer design. As a result, all chips after Street Fighter can always use 0 wait states.</p> <p>Default Value: 0</p>

4 CRYPTO Registers

This section discusses the CRYPTO registers. It lists all the registers in mapping tables, in address order.

4.1 Register Details

Register Name	Address
CRYPTO_CTL	0x400C0000
CRYPTO_STATUS	0x400C0004
CRYPTO_CMD	0x400C0008

4.1.1 CRYPTO_CTL

Control

Address: 0x400C0000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			RW				
HW Access	None			R				
Name	None [7:5]			OPCODE [4:0]				

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	None						
HW Access	R	None						
Name	ENABLED	None [30:24]						

Bits	Name	Description
31	ENABLED	IP enable: '0': Disabled. All non-retention registers (command and status registers) are reset to their default value when the IP is disabled. All retention registers retain their value when the IP is disabled. '1': Enabled. Default Value: 0
4 : 0	OPCODE	Specifies the operation: "0": AES forward block cipher. "1": AES inverse block cipher. "16": SHA operation. "24": CRC operation. otherwise: undefined. Default Value: 31 0x0: AES_FORWARD: SRC_CTL0.OFFSET specifies the offset of the key (as used in the first cipher round) in the memory buffer. SRC_CTL1.OFFSET specifies the offset of the plaintext in the memory buffer. DST_CTL0.OFFSET specifies the offset of the key (as used by the last cipher round) in the memory buffer. DST_CTL1.OFFSET specifies the offset of the cipher in the memory buffer.

4.1.1 CRYPTO_CTL (continued)

0x1: AES_INVERSE:

SRC_CTL0.OFFSET specifies the offset of the round key (as used in the first inverse cipher round) in the memory buffer.

SRC_CTL1.OFFSET specifies the offset of the ciphertext in the memory buffer.

DST_CTL0.OFFSET specifies the offset of the key (as used by the last inverse cipher round) in the memory buffer.

DST_CTL1.OFFSET specifies the offset of the plaintext in the memory buffer.

0x10: SHA:

SRC_CTL0.OFFSET specifies the offset of the message in the memory buffer.

SRC_CTL1.OFFSET specifies the offset of the input hash in the memory buffer.

DST_CTL0.OFFSET specifies the offset of a temporary buffer (to hold message schedule round constants) in the memory buffer.

DST_CTL1.OFFSET specifies the offset of the output hash in the memory buffer.

0x18: CRC:

SRC_CTL0.OFFSET specifies the offset of the data in the memory buffer.

When the operation has completed, the resulting CRC can be read from CRC_REM.

4.1.2 CRYPTO_STATUS

Status

Address: 0x400C0004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							R
HW Access	None							W
Name	None [7:1]							BUSY

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	BUSY	<p>Reflects the state of the component:</p> <p>'0': IP (AES, SHA, CRC component) is not busy.</p> <p>'1': IP (AES, SHA, CRC component) is busy performing a operation. An operation is started through the CMD register or through the "tr_in" input trigger. When the IP is busy, it is NOT possible to start another operation. When the IP is busy, it is possible to access the memory buffer (to prepare for another operation).</p> <p>Default Value: 0</p>

4.1.3 CRYPTO_CMD

Command

Address: 0x400C0008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							RW1S
HW Access	None							RW1C
Name	None [7:1]							START

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	START	<p>FW sets this field to '1' to start an operation as specified by CTL.OPCODE. HW sets this field to '0' to indicate that the operation has completed.</p> <p>HW can start an operation through the "tr_in" input trigger. A rising edge ('0' to '1' transition) on this trigger starts an operation (as specified by CTL.OPCODE). When an operation completes, a two cycle '1' pulse (on "clk_sys") is generated on the "tr_out" output trigger.</p> <p>SW and HW control over the start of an operation should not be mixed.</p> <p>When an operation is busy (STATUS.BUSY is '1'), no new operation can be started. A SW write to START is ignored and a HW input trigger "tr_in" rising edge is ignored.</p> <p>Default Value: 0</p>

4.1.4 CRYPTO_TR_CTL0

True random control 0

Address: 0x400C0280

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	SAMPLE_CLOCK_DIV [7:0]							
Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	RED_CLOCK_DIV [15:8]							
Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	INIT_DELAY [23:16]							
Bits	31	30	29	28	27	26	25	24
SW Access	None		RW	RW	None			RW
HW Access	None		R	R	None			R
Name	None [31:30]		STOP_ON_RC_DETECT	STOP_ON_AP_DETECT	None [27:25]			VON_NEUMANN_CORR

Bits	Name	Description
29	STOP_ON_RC_DETECT	Specifies if TRNG functionality is stopped on a repetition count test detection (when HW sets INTR.TR_RC_DETECT to '1'): '0': Functionality is stopped (TR_CMD fields are set to '0' by HW). '1': Functionality is NOT stopped. Default Value: 0
28	STOP_ON_AP_DETECT	Specifies if TRNG functionality is stopped on an adaptive proportion test detection (when HW sets INTR.TR_AP_DETECT to '1'): '0': Functionality is stopped (TR_CMD fields are set to '0' by HW). '1': Functionality is NOT stopped. Default Value: 0

4.1.4 CRYPTO_TR_CTL0 (continued)

24	VON_NEUMANN_CORR	<p>Specifies if the "von Neumann corrector" is disabled or enabled: '0': disabled. '1': enabled.</p> <p>The "von Neumann corrector" post-processes the reduced bits to remove a '0' or '1' bias. The corrector operates on reduced bit pairs ("oldest bit, newest bit"): "00": no bit is produced. "01": '0' bit is produced (oldest bit). "10": '1' bit is produced (oldest bit). "11": no bit is produced.</p> <p>Note that the corrector produces bits at a random pace and at a frequency that is 1/4 of the reduced bit frequency (reduced bits are processed in pairs, and half of the pairs do NOT produce a bit). Default Value: 0</p>
23 : 16	INIT_DELAY	<p>Specifies an initialization delay: number of removed/dropped samples before reduced bits are generated. This field should be programmed in the range [1, 255]. After starting the oscillators, at least the first 2 samples should be removed/dropped to clear the state of internal synchronizers. In addition, it is advised to drop the second 2 samples from the oscillators (to circumvent the semi-predictable oscillator startup behavior). This result in the default field value of "3". Field encoding is as follows: "0": 1 sample is dropped. "1": 2 samples are dropped. ... "255": 256 samples are dropped.</p> <p>The TR_INITIALIZED interrupt cause is set to '1', when the initialization delay is passed. Default Value: 3</p>
15 : 8	RED_CLOCK_DIV	<p>Specifies the clock divider that is used to produce reduced bits. "0": 1 reduced bit is produced for each sample. "1": 1 reduced bit is produced for each 2 samples. ... "255": 1 reduced bit is produced for each 256 samples.</p> <p>The reduced bits are considered random bits and shifted into TR_RESULT0.DATA32. Default Value: 0</p>
7 : 0	SAMPLE_CLOCK_DIV	<p>Specifies the clock divider that is used to sample oscillator data. This clock divider is wrt. "clk_sys". "0": sample clock is "clk_sys". "1": sample clock is "clk_sys"/2. ... "255": sample clock is "clk_sys"/256. Default Value: 0</p>

4.1.5 CRYPTO_TR_CTL1

True random control 1

Address: 0x400C0284

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None		RW					
HW Access	None		R					
Name	None [7:6]		DATA_BIT_SIZE [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]

SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
5 : 0	DATA_BIT_SIZE	<p>Specifies the number of bits in the generated true random number (TR_RESULT0.DATA32). When a new random bit is generated, this field is incremented by '1'. The value is in the range [0, 32] (a saturating counter is used).</p> <p>Note that SW can write this field. This functionality can be used prevent information leakage.</p> <p>Typically, this field is updated/decremented in the interrupt handler. The interrupt handler decrements the field by the number of consumed bits. If the interrupt handler does NOT update this field (and TR_RESULT.DATA_BIT_SIZE is unchanged), the TR_DATA_AVAILABLE interrupt cause will remain activated. Therefore, proper interrupt based usage is as follows:</p> <ul style="list-style-type: none"> - Consume bits from TR_RESULT0. - Write consumed bits in TR_RESULT0 to '0's (if information leakage needs to prevented). - Decrement TR_RESULT1 by the number of consumed bits. - Deactivate INTR.TR_DATA_AVAILABLE. <p>Default Value: 0</p>

4.1.8 CRYPTO_TR_CMD

True random command

Address: 0x400C0290

Retention: Not Retained

Name	WINDOW_INDEX [31:24]							

Bits	Name	Description
31 : 16	WINDOW_INDEX	Counter to keep track of the current index in the window (counts down from TR_MON_AP_CTL.WINDOW_SIZE to "0"). Default Value: 0
15 : 0	OCC_COUNT	Number of occurrences of the current active bit counter: "0": 0 occurrences ... "65535": 65535 occurrences Default Value: 0

4.1.19 CRYPTO_INTR

Interrupt request

Address: 0x400C07C0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW1C	RW1C	None				RW1C	RW1C
HW Access	RW1S	RW1S	None				RW1S	RW1S
Name	TR_DATA_AVAILABLE	TR_INITIALIZED	None [5:2]				ACCESS_ERROR	DONE

Bits	15	14	13	12	11	10	9	8
SW Access	None						RW1C	RW1C
HW Access	None						RW1S	RW1S
Name	None [15:10]						TR_RC_DETECT	TR_AP_DETECT

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9	TR_RC_DETECT	This interrupt cause is activated (HW sets the field to '1') when the true random number generator monitor adaptive proportion test detects a disproportionate occurrence of a specific bit value. Default Value: 0
8	TR_AP_DETECT	This interrupt cause is activated (HW sets the field to '1') when the true random number generator monitor repetition count test detects a repetition of a specific bit value. Default Value: 0
7	TR_DATA_AVAILABLE	This interrupt cause is activated (HW sets the field to '1') when the true random number generator has generated a data value of the specified bit size: (TR_RESULT.DATA_BIT_SIZE >= TR_CTL.DATA_BIT_SIZE). See TR_RESULT1.DATA_BIT_SIZE for proper deactivation of this interrupt cause. Default Value: 0
6	TR_INITIALIZED	This interrupt cause is activated (HW sets the field to '1') when the true random number generator is initialized. Default Value: 0

4.1.19 CRYPTO_INTR (continued)

1	ACCESS_ERROR	This interrupt cause is activated (HW sets the field to '1') when a command/operation is aborted due to a user/privileged mode violation of the buffer accesses. Default Value: 0
0	DONE	This interrupt cause is activated (HW sets the field to '1') when a command/operation completes. SW writes a '1' to this field to clear the interrupt cause. As an alternative to interrupt driven operation, SW can poll the STATUS.BUSY field to determine completion of an operation. Default Value: 0

4.1.20 CRYPTO_INTR_SET

Interrupt set request

Address: 0x400C07C4

4 GPIO Registers

This section discusses the GPIO registers. It lists all the registers in mapping tables, in address order.

4.1 Register Details

Register Name	Address
GPIO_INTR_CAUSE	0x40041000

4.1.1 GPIO_INTR_CAUSE

Interrupt port cause register

Address: 0x40041000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None		R					
HW Access	None		W					
Name	None [7:6]		PORT_INT [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
5 : 0	PORT_INT	<p>Each IO port has an associated bit field in this register. The bit field reflects the IO port's interrupt line (bit field <i>i</i> reflects "gpio_interrupts[i]" for IO port <i>i</i>). The register is used when the system uses a shared/combined interrupt line "gpio_interrupt". The SW ISR reads the register to determine which IO port(s) is responsible for the shared/combined interrupt line "gpio_interrupt". Once, the IO port(s) is determined, the IO port's INTR register is read to determine the IO pad(s) in the IO port that caused the interrupt.</p> <p>Default Value: 0</p>

4.1.1 GPIO_INTR_CAUSE (continued)

5 GPIO Port Registers

This section discusses the GPIO Port registers. It lists all the registers in mapping tables, in address order.

5.1 Register Details

Register Name	Address
GPIO_PRT0_DR	0x40040000
GPIO_PRT0_PS	0x40040004
GPIO_PRT0_PC	0x40040008
GPIO_PRT0_INTR_CFG	0x4004000C
GPIO_PRT0_INTR	0x40040010
GPIO_PRT0_PC2	0x40040018
GPIO_PRT0_DR_SET	0x40040040
GPIO_PRT0_DR_CLR	0x40040044
GPIO_PRT0_DR_INV	0x40040048
GPIO_PRT1_DR	0x40040100
GPIO_PRT1_PS	0x40040104
GPIO_PRT1_PC	0x40040108
GPIO_PRT1_INTR_CFG	0x4004010C
GPIO_PRT1_INTR	0x40040110
GPIO_PRT1_PC2	0x40040118
GPIO_PRT1_DR_SET	0x40040140
GPIO_PRT1_DR_CLR	0x40040144
GPIO_PRT1_DR_INV	0x40040148
GPIO_PRT2_DR	0x40040200
GPIO_PRT2_PS	0x40040204
GPIO_PRT2_PC	0x40040208
GPIO_PRT2_INTR_CFG	0x4004020C
GPIO_PRT2_INTR	0x40040210
GPIO_PRT2_PC2	0x40040218
GPIO_PRT2_DR_SET	0x40040240
GPIO_PRT2_DR_CLR	0x40040244
GPIO_PRT2_DR_INV	0x40040248

Register Name	Address
GPIO_PRT3_DR	0x40040300
GPIO_PRT3_PS	0x40040304
GPIO_PRT3_PC	0x40040308
GPIO_PRT3_INTR_CFG	0x4004030C
GPIO_PRT3_INTR	0x40040310
GPIO_PRT3_PC2	0x40040318
GPIO_PRT3_DR_SET	0x40040340
GPIO_PRT3_DR_CLR	0x40040344
GPIO_PRT3_DR_INV	0x40040348
GPIO_PRT4_DR	0x40040400
GPIO_PRT4_PS	0x40040404
GPIO_PRT4_PC	0x40040408
GPIO_PRT4_INTR_CFG	0x4004040C
GPIO_PRT4_INTR	0x40040410
GPIO_PRT4_PC2	0x40040418
GPIO_PRT4_DR_SET	0x40040440
GPIO_PRT4_DR_CLR	0x40040444
GPIO_PRT4_DR_INV	0x40040448
GPIO_PRT5_DR	0x40040500
GPIO_PRT5_PS	0x40040504
GPIO_PRT5_PC	0x40040508
GPIO_PRT5_INTR_CFG	0x4004050C
GPIO_PRT5_INTR	0x40040510
GPIO_PRT5_PC2	0x40040518
GPIO_PRT5_DR_SET	0x40040540
GPIO_PRT5_DR_CLR	0x40040544
GPIO_PRT5_DR_INV	0x40040548

5.1.1 GPIO_PRT0_DR

Port output data register

Address: 0x40040000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	RW
HW Access	None						RW	RW
Name	None [7:2]						DATA1	DATA0

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	DATA1	IO pad 1 output data. Default Value: 0
0	DATA0	IO pad 0 output data. Default Value: 0

5.1.2 GPIO_PRT0_PS

Port IO pad state register

Address: 0x40040004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						R	R
HW Access	None						W	W
Name	None [7:2]						DATA1	DATA0

Bits	15	14	13	12	11	10	9	8
SW Access	None							R
HW Access	None							W
Name	None [15:9]							FLT_DATA

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
8	FLT_DATA	Reads of this register return the logical state of the filtered pin. Default Value: 0
1	DATA1	IO pad 1 state. Default Value: 0
0	DATA0	IO pad 0 state: 1: Logic high, if the pin voltage is above the input buffer threshold, logic high. 0: Logic low, if the pin voltage is below that threshold, logic low. If the drive mode for the pin is set to high Z Analog, the pin state will read 0 independent of the voltage on the pin. Default Value: 0

5.1.3 GPIO_PRT0_PC

Port configuration register

Address: 0x40040008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None		RW			RW		
HW Access	None		R			R		
Name	None [7:6]		DM1 [5:3]			DM0 [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW		None				RW	RW
HW Access	R		None				R	R
Name	PORT_IB_MODE_SEL [31:30]		None [29:26]				PORT_SLOW	PORT_VTRIP_SEL

Bits	Name	Description
31 : 30	PORT_IB_MODE_SEL	<p>This field selects the input buffer reference. The size (1 or 2 bits) and functionality is dependent on the IO cell.</p> <p>For GPIOv2 IO cells, bit PORT_IB_MODE_SEL[1] is not used (GPIOv2 IO cell replaces GPIO IO cell):</p> <p>"0"/"2": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1"/"3": vcchib.</p> <p>For GPIO_OVTV2 and SIOv2 IO cells:</p> <p>"0": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1": vcchib.</p> <p>"2": OVT.</p> <p>"3": Reference (possibly from reference generator cell).</p> <p>For SIO IO cell, this field is present but not used as the SIO IO cell does not provide input buffer mode select functionality (SIOv2 IO cell will replace SIO IO cell, as soon as it is available).</p> <p>Default Value: 0</p>
25	PORT_SLOW	<p>This field controls the output edge rate of all pins on the port:</p> <p>'0': fast.</p> <p>'1': slow.</p> <p>Default Value: 0</p>

5.1.3 GPIO_PRT0_PC (continued)

24	PORT_VTRIP_SEL	<p>The GPIO cells include a VTRIP_SEL signal to alter the input buffer voltage. Note: this bit is ignored for SIO ports, the VTRIP_SEL settings in the SIO register are used instead (a separate VTRIP_SEL is provided for each pin pair).</p> <p>0: input buffer functions as a CMOS input buffer.</p> <p>1: input buffer functions as a LVTTTL input buffer.</p> <p>Default Value: 0</p>
5 : 3	DM1	<p>The GPIO drive mode for IO pad 1.</p> <p>Default Value: 0</p>
2 : 0	DM0	<p>The GPIO drive mode for IO pad 0.</p> <p>Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the HSIOM is properly configured (HSIOM_PRT_SELx) before turning the IO on here to avoid producing glitches on the bus.</p> <p>Default Value: 0</p> <p>0x0: OFF: Mode 0 (analog mode): Output buffer off (high Z). Input buffer off.</p> <p>0x1: INPUT: Mode 1: Output buffer off (high Z). Input buffer on.</p> <p>0x2: 0_PU: Mode 2: Strong pull down ('0'), weak/resistive pull up (PU). Input buffer on.</p> <p>0x3: PD_1: Mode 3: Weak/resistive pull down (PD), strong pull up ('1'). Input buffer on.</p> <p>0x4: 0_Z: Mode 4: Strong pull down ('0'), open drain (pull up off). Input buffer on.</p> <p>0x5: Z_1: Mode 5: Open drain (pull down off), strong pull up ('1'). Input buffer on.</p> <p>0x6: 0_1: Mode 6: Strong pull down ('0'), strong pull up ('1'). Input buffer on.</p> <p>0x7: PD_PU: Mode 7: Weak/resistive pull down (PD), weak/resistive pull up (PU). Input buffer on.</p>

5.1.4 GPIO_PRT0_INTR_CFG

Port interrupt configuration register

Address: 0x4004000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None				RW		RW	
HW Access	None				R		R	
Name	None [7:4]				EDGE1_SEL [3:2]		EDGE0_SEL [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None				RW		RW	
HW Access	None				R		R	
Name	None [23:21]				FLT_SEL [20:18]		FLT_EDGE_SEL [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
20 : 18	FLT_SEL	Selects which pin is routed through the 50ns glitch filter to provide a glitch-safe interrupt. Default Value: 0
17 : 16	FLT_EDGE_SEL	Same for the glitch filtered pin (selected by FLT_SELECT). Default Value: 0 0x0: DISABLE: Disabled 0x1: RISING: Rising edge 0x2: FALLING: Falling edge 0x3: BOTH: Both rising and falling edges
3 : 2	EDGE1_SEL	Sets which edge will trigger an IRQ for IO pad 1. Default Value: 0
1 : 0	EDGE0_SEL	Sets which edge will trigger an IRQ for IO pad 0. Default Value: 0

5.1.4 GPIO_PRT0_INTR_CFG (continued)

0x0: DISABLE:

Disabled

0x1: RISING:

Rising edge

0x2: FALLING:

Falling edge

0x3: BOTH:

Both rising and falling edges

5.1.5 GPIO_PRT0_INTR

Port interrupt status register

Address: 0x40040010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW1C	RW1C
HW Access	None						A	A
Name	None [7:2]						DATA1	DATA0

Bits	15	14	13	12	11	10	9	8
SW Access	None							RW1C
HW Access	None							A
Name	None [15:9]							FLT_DATA

Bits	23	22	21	20	19	18	17	16
SW Access	None						R	R
HW Access	None						W	W
Name	None [23:18]						PS_DATA1	PS_DATA0

Bits	31	30	29	28	27	26	25	24
SW Access	None							R
HW Access	None							W
Name	None [31:25]							PS_FLT_DATA

Bits	Name	Description
24	PS_FLT_DATA	This is a duplicate of the contents of the PS register, provided here to allow reading of both pin state and interrupt state of the port in a single read operation. Default Value: 0
17	PS_DATA1	Default Value: 0
16	PS_DATA0	Default Value: 0
8	FLT_DATA	Deglinted interrupt pending (selected by FLT_SELECT). Default Value: 0
1	DATA1	Interrupt pending on IO pad 1. Firmware writes 1 to clear the interrupt. Default Value: 0
0	DATA0	Interrupt pending on IO pad 0. Firmware writes 1 to clear the interrupt. Default Value: 0

5.1.6 GPIO_PRT0_PC2

Port configuration register 2

Address: 0x40040018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	RW
HW Access	None						R	R
Name	None [7:2]						INP_DIS1	INP_DIS0

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	INP_DIS1	Disables the input buffer for IO pad 1. Default Value: 0
0	INP_DIS0	Disables the input buffer for IO pad 0 independent of the port control drive mode (PC.DM). This bit should be set when analog signals are present on the pin and PC.DM != 0 is required to use the output driver. Default Value: 0

5.1.7 GPIO_PRT0_DR_SET

Port output data set register

Address: 0x40040040

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 0	DATA	IO pad i: '0': Output state DR.DATA[i] not affected. '1': Output state DR.DATA[i] set to '1'. Default Value: 0

5.1.8 GPIO_PRT0_DR_CLR

Port output data clear register

Address: 0x40040044

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 0	DATA	IO pad i: '0': Output state DR.DATA[i] not affected. '1': Output state DR.DATA[i] set to '0'. Default Value: 0

5.1.9 GPIO_PRT0_DR_INV

Port output data invert register

Address: 0x40040048

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	A							
Name	DATA [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 0	DATA	IO pad i: '0': Output state DR.DATA[i] not affected. '1': Output state DR.DATA[i] inverted ('0' => '1', '1' => '0'). Default Value: 0

5.1.10 GPIO_PRT1_DR

Port output data register

Address: 0x40040100

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			RW	RW	RW	RW	RW
HW Access	None			RW	RW	RW	RW	RW
Name	None [7:5]			DATA4	DATA3	DATA2	DATA1	DATA0

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
4	DATA4	IO pad 4 output data. Default Value: 0
3	DATA3	IO pad 3 output data. Default Value: 0
2	DATA2	IO pad 2 output data. Default Value: 0
1	DATA1	IO pad 1 output data. Default Value: 0
0	DATA0	IO pad 0 output data. Default Value: 0

5.1.11 GPIO_PRT1_PS

Port IO pad state register

Address: 0x40040104

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			R	R	R	R	R
HW Access	None			W	W	W	W	W
Name	None [7:5]			DATA4	DATA3	DATA2	DATA1	DATA0

Bits	15	14	13	12	11	10	9	8
SW Access	None							R
HW Access	None							W
Name	None [15:9]							FLT_DATA

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
8	FLT_DATA	Reads of this register return the logical state of the filtered pin. Default Value: 0
4	DATA4	IO pad 4 state. Default Value: 0
3	DATA3	IO pad 3 state. Default Value: 0
2	DATA2	IO pad 2 state. Default Value: 0
1	DATA1	IO pad 1 state. Default Value: 0
0	DATA0	IO pad 0 state: 1: Logic high, if the pin voltage is above the input buffer threshold, logic high. 0: Logic low, if the pin voltage is below that threshold, logic low. If the drive mode for the pin is set to high Z Analog, the pin state will read 0 independent of the voltage on the pin. Default Value: 0

5.1.12 GPIO_PRT1_PC

Port configuration register

Address: 0x40040108

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW			RW		
HW Access	R		R			R		
Name	DM2 [7:6]		DM1 [5:3]			DM0 [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	None	RW			RW			RW
HW Access	None	R			R			R
Name	None	DM4 [14:12]			DM3 [11:9]			DM2

Bits	23	22	21	20	19	18	17	16

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
8	FLT_DATA	Reads of this register return the logical state of the filtered pin. Default Value: 0
1	DATA1	IO pad 1 state. Default Value: 0
0	DATA0	IO pad 0 state: 1: Logic high, if the pin voltage is above the input buffer threshold, logic high. 0: Logic low, if the pin voltage is below that threshold, logic low. If the drive mode for the pin is set to high Z Analog, the pin state will read 0 independent of the voltage on the pin. Default Value: 0

5.1.48 GPIO_PRT5_PC

Port configuration register

Address: 0x40040508

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None		RW			RW		
HW Access	None		R			R

Bits	31	30	29	28	27	26	25	24
SW Access	RW		RW		RW	None	RW	RW
HW Access	R		R		R	None	R	R
Name	PORT_IB_MODE_SEL [31:30]		PORT_SLEW_CTL [29:28]		PORT_HYST_TRIM	None	PORT_SLOW	PORT_VTRIP_SEL

Bits	Name	Description
31 : 30	PORT_IB_MODE_SEL	<p>This field selects the input buffer reference. The size (1 or 2 bits) and functionality is dependent on the IO cell.</p> <p>For GPIOv2 IO cells, bit PORT_IB_MODE_SEL[1] is not used (GPIOv2 IO cell replaces GPIO IO cell):</p> <p>"0"/"2": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1"/"3": vcchib.</p> <p>For GPIO_OVTV2 and SIOv2 IO cells:</p> <p>"0": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1": vcchib.</p> <p>"2": OVT.</p> <p>"3": Reference (possibly from reference generator cell).</p> <p>For SIO IO cell, this field is present but not used as the SIO IO cell does not provide input buffer mode select functionality (SIOv2 IO cell will replace SIO IO cell, as soon as it is available).</p> <p>Default Value: 0</p>
29 : 28	PORT_SLEW_CTL	<p>Slew control. Only used in the O_Z drive mode (mode 4: strong pull down, open drain): This field is intended for I2C functionality. See BROS 001-70428 for more details.</p> <p>Default Value: 0</p>

5.1.48 GPIO_PRT5_PC (continued)

		0x0: PORT_SLEW_CTL_0: HS mode (100pf < Cb < 400pF, 1.71<5.5, Vext>3.0) FS mode (10pf<400pf, 1.71<5.5) (20-160ns)
		0x1: PORT_SLEW_CTL_1: HS mode (Cb<100pf, 1.71<5.5, Vext>2.8, F=1.7MHz) (10-80ns) FS+ Mode (Vext>2.8, 1.71<5.5) (20-120ns)
		0x2: PORT_SLEW_CTL_2: HS mode (100pf<400pf, 1.71<5.5, Vext<3.3) (20-160ns)
		0x3: PORT_SLEW_CTL_3: HS mode (Cb<100pf, 1.71<5.5, Vext<=2.8, F=1.7MHz) (10-80ns) FS+ mode (Vext<=2.8, 1.71<5.5) (20-120ns)
27	PORT_HYST_TRIM	This field is used to improve the hysteresis (to 10% of vddio) of the selectable trip point input buffer. The voltage reference comes from the VREFGEN block and is only available when using the VREFGEN block: '0': <= 2.2 V input signaling Voltage. '1': > 2.2 V input signaling Voltage. Default Value: 0
25	PORT_SLOW	This field controls the output edge rate of all pins on the port: '0': fast. '1': slow. Default Value: 0
24	PORT_VTRIP_SEL	The GPIO cells include a VTRIP_SEL signal to alter the input buffer voltage. Note: this bit is ignored for SIO ports, the VTRIP_SEL settings in the SIO register are used instead (a separate VTRIP_SEL is provided for each pin pair). 0: input buffer functions as a CMOS input buffer. 1: input buffer functions as a LVTTTL input buffer. Default Value: 0
5 : 3	DM1	The GPIO drive mode for IO pad 1. Default Value: 0
2 : 0	DM0	The GPIO drive mode for IO pad 0. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the HSIOM is properly configured (HSIOM_PRT_SELx) before turning the IO on here to avoid producing glitches on the bus. Default Value: 0
		0x0: OFF: Mode 0 (analog mode): Output buffer off (high Z). Input buffer off.
		0x1: INPUT: Mode 1: Output buffer off (high Z). Input buffer on.
		0x2: 0_PU: Mode 2: Strong pull down ('0'), weak/resistive pull up (PU). Input buffer on.
		0x3: PD_1: Mode 3: Weak/resistive pull down (PD), strong pull up ('1'). Input buffer on.
		0x4: 0_Z: Mode 4: Strong pull down ('0'), open drain (pull up off). Input buffer on.
		0x5: Z_1: Mode 5: Open drain (pull down off), strong pull up ('1'). Input buffer on.
		0x6: 0_1: Mode 6: Strong pull down ('0'), strong pull up ('1'). Input buffer on.

5.1.48 GPIO_PRT5_PC (continued)

0x7: PD_PU:

Mode 7: Weak/resistive pull down (PD), weak/resistive pull up (PU). Input buffer on.

5.1.49 GPIO_PRT5_INTR_CFG

Port interrupt configuration register

Address: 0x4004050C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None				RW		RW	
HW Access	None				R		R	
Name	None [7:4]				EDGE1_SEL [3:2]		EDGE0_SEL [1:0]

Bits	23	22	21	20	19	18	17	16
SW Access	None				RW		RW	
HW Access	None				R		R	
Name	None [23:21]				FLT_SEL [20:18]		FLT_EDGE_SEL [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
20 : 18	FLT_SEL	Selects which pin is routed through the 50ns glitch filter to provide a glitch-safe interrupt. Default Value: 0
17 : 16	FLT_EDGE_SEL	Same for the glitch filtered pin (selected by FLT_SELECT). Default Value: 0 0x0: DISABLE: Disabled 0x1: RISING: Rising edge 0x2: FALLING: Falling edge 0x3: BOTH: Both rising and falling edges
3 : 2	EDGE1_SEL	Sets which edge will trigger an IRQ for IO pad 1. Default Value: 0
1 : 0	EDGE0_SEL	Sets which edge will trigger an IRQ for IO pad 0. Default Value: 0

5.1.49 GPIO_PRT5_INTR_CFG (continued)

0x0: DISABLE:

Disabled

0x1: RISING:

Rising edge

0x2: FALLING:

Falling edge

0x3: BOTH:

Both rising and falling edges

5.1.50 GPIO_PRT5_INTR

Port interrupt status register

Address: 0x40040510

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW1C	RW1C
HW Access	None						A	A
Name	None [7:2]						DATA1	DATA0

Bits	15	14	13	12	11	10	9	8
SW Access	None							RW1C
HW Access	None							A
Name	None [15:9]							FLT_DATA

Bits	23	22	21	20	19	18	17	16

Name	None [23:18]						PS_DATA1	PS_DATA0

Bits	31	30	29	28	27	26	25	24
SW Access	None							R
HW Access	None							W
Name	None [31:25]							PS_FLT_DATA

Bits	Name	Description
24	PS_FLT_DATA	This is a duplicate of the contents of the PS register, provided here to allow reading of both pin state and interrupt state of the port in a single read operation. Default Value: 0
17	PS_DATA1	Default Value: 0
16	PS_DATA0	Default Value: 0
8	FLT_DATA	Deglinted interrupt pending (selected by FLT_SELECT). Default Value: 0
1	DATA1	Interrupt pending on IO pad 1. Firmware writes 1 to clear the interrupt. Default Value: 0
0	DATA0	Interrupt pending on IO pad 0. Firmware writes 1 to clear the interrupt. Default Value: 0

5.1.51 GPIO_PRT5_PC2

Port configuration register 2

Address: 0x40040518

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	RW
HW Access	None						R	R

Bits	Name	Description
7 : 0	DATA	IO pad i: '0': Output state DR.DATA[i] not affected. '1': Output state DR.DATA[i] inverted ('0' => '1', '1' => '0'). Default Value: 0

6 HSIOM Port Registers

This section discusses the HSIOM Port registers. It lists all the registers in mapping tables, in address order.

6.1 Register Details

Register Name	Address
HSIOM_PORT_SEL0	0x40020000
HSIOM_PORT_SEL1	0x40020100
HSIOM_PORT_SEL2	0x40020200
HSIOM_PORT_SEL3	0x40020300
HSIOM_PORT_SEL4	0x40020400
HSIOM_PORT_SEL5	0x40020500

6.1.1 HSIOM_PORT_SEL0

Port selection register

Address: 0x40020000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	RW				RW			
Name	IO1_SEL [7:4]				IO0_SEL [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 4	IO1_SEL	Selects connection for IO pad 1 route. Default Value: 0
3 : 0	IO0_SEL	Selects connection for IO pad 0 route. Default Value: 0
	0x0: GPIO:	SW controlled GPIO.
	0x1: GPIO_DSI:	SW controlled "out", DSI controlled "oe_n".
	0x2: DSI_DSI:	DSI controlled "out" and "oe_n".
	0x3: DSI_GPIO:	DSI controlled "out", SW controlled "oe_n".
	0x4: CSD_SENSE:	CSD sense connection (analog mode)
	0x5: CSD_SHIELD:	CSD shield connection (analog mode)

6.1.1 HSIOM_PORT_SELO (continued)

0x6: AMUXA:

AMUXBUS A connection.

0x7: AMUXB:

AMUXBUS B connection. This mode is also used for CSD GPIO charging. When CSD GPIO charging is enabled in CSD_CONTROL, "oe_n" is connected to "!csd_charge" signal (and IO pad is also still connected to AMUXBUS B).

0x8: ACT_0:

Chip specific Active source 0 connection.

0x9: ACT_1:

Chip specific Active source 1 connection.

0xa: ACT_2:

Chip specific Active source 2 connection.

0xb: ACT_3:

Chip specific Active source 3 connection.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

Chip specific DeepSleep source 0 connection.

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

Chip specific DeepSleep source 1 connection.

0xe: DS_2:

Chip specific DeepSleep source 2 connection.

0xf: DS_3:

Chip specific DeepSleep source 3 connection.

6.1.2 HSIOM_PORT_SEL1

Port selection register

Address: 0x40020100

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	RW				RW			
Name	IO1_SEL [7:4]				IO0_SEL [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	RW				RW			
HW Access	RW				RW			
Name	IO3_SEL [15:12]				IO2_SEL [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	None				RW			
HW Access	None				RW			
Name	None [23:20]				IO4_SEL [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	IO4_SEL	Selects connection for IO pad 4 route. Default Value: 0
15 : 12	IO3_SEL	Selects connection for IO pad 3 route. Default Value: 0
11 : 8	IO2_SEL	Selects connection for IO pad 2 route. Default Value: 0
7 : 4	IO1_SEL	Selects connection for IO pad 1 route. Default Value: 0
3 : 0	IO0_SEL	Selects connection for IO pad 0 route. Default Value: 0
0x0: GPIO: SW controlled GPIO.		
0x1: GPIO_DSI: SW controlled "out", DSI controlled "oe_n".		
0x2: DSI_DSI: DSI controlled "out" and "oe_n".		

6.1.2 HSIOM_PORT_SEL1 (continued)

0x3: DSI_GPIO:

DSI controlled "out", SW controlled "oe_n".

0x4: CSD_SENSE:

CSD sense connection (analog mode)

0x5: CSD_SHIELD:

CSD shield connection (analog mode)

0x6: AMUXA:

AMUXBUS A connection.

0x7: AMUXB:

AMUXBUS B connection. This mode is also used for CSD GPIO charging. When CSD GPIO charging is enabled in CSD_CONTROL, "oe_n" is connected to "!csd_charge" signal (and IO pad is also still connected to AMUXBUS B).

0x8: ACT_0:

Chip specific Active source 0 connection.

0x9: ACT_1:

Chip specific Active source 1 connection.

0xa: ACT_2:

Chip specific Active source 2 connection.

0xb: ACT_3:

Chip specific Active source 3 connection.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

Chip specific DeepSleep source 0 connection.

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

Chip specific DeepSleep source 1 connection.

0xe: DS_2:

Chip specific DeepSleep source 2 connection.

0xf: DS_3:

Chip specific DeepSleep source 3 connection.

6.1.3 HSIOM_PORT_SEL2

Port selection register

Address: 0x40020200

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	RW				RW			
Name	IO1_SEL [7:4]				IO0_SEL [3:0]

SW Access	None				RW			
HW Access	None				RW			
Name	None [15:12]				IO2_SEL [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11 : 8	IO2_SEL	Selects connection for IO pad 2 route. Default Value: 0
7 : 4	IO1_SEL	Selects connection for IO pad 1 route. Default Value: 0
3 : 0	IO0_SEL	Selects connection for IO pad 0 route. Default Value: 0
0x0: GPIO: SW controlled GPIO.		
0x1: GPIO_DSI: SW controlled "out", DSI controlled "oe_n".		
0x2: DSI_DSI: DSI controlled "out" and "oe_n".		
0x3: DSI_GPIO: DSI controlled "out", SW controlled "oe_n".		
0x4: CSD_SENSE: CSD sense connection (analog mode)		

6.1.3 HSIOM_PORT_SEL2 (continued)

0x5: CSD_SHIELD:

CSD shield connection (analog mode)

0x6: AMUXA:

AMUXBUS A connection.

0x7: AMUXB:

AMUXBUS B connection. This mode is also used for CSD GPIO charging. When CSD GPIO charging is enabled in CSD_CONTROL, "oe_n" is connected to "lcsd_charge" signal (and IO pad is also still connected to AMUXBUS B).

0x8: ACT_0:

Chip specific Active source 0 connection.

0x9: ACT_1:

Chip specific Active source 1 connection.

0xa: ACT_2:

Chip specific Active source 2 connection.

0xb: ACT_3:

Chip specific Active source 3 connection.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

Chip specific DeepSleep source 0 connection.

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

Chip specific DeepSleep source 1 connection.

0xe: DS_2:

Chip specific DeepSleep source 2 connection.

0xf: DS_3:

Chip specific DeepSleep source 3 connection.

6.1.4 HSIOM_PORT_SEL3

Port selection register

Address: 0x40020300

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	RW				RW			
Name	IO1_SEL [7:4]				IO0_SEL [3:0]			

Bits	15	14	13	12	11	10	9	8

Bits	Name	Description
11 : 8	IO2_SEL	Selects connection for IO pad 2 route. Default Value: 0
7 : 4	IO1_SEL	Selects connection for IO pad 1 route. Default Value: 0
3 : 0	IO0_SEL	Selects connection for IO pad 0 route. Default Value: 0
0x0: GPIO: SW controlled GPIO.		
0x1: GPIO_DSI: SW controlled "out", DSI controlled "oe_n".		
0x2: DSI_DSI: DSI controlled "out" and "oe_n".		
0x3: DSI_GPIO: DSI controlled "out", SW controlled "oe_n".		
0x4: CSD_SENSE: CSD sense connection (analog mode)		

6.1.4 HSIOM_PORT_SEL3 (continued)

0x5: CSD_SHIELD:

CSD shield connection (analog mode)

0x6: AMUXA:

AMUXBUS A connection.

0x7: AMUXB:

AMUXBUS B connection. This mode is also used for CSD GPIO charging. When CSD GPIO charging is enabled in CSD_CONTROL, "oe_n" is connected to "lcsd_charge" signal (and IO pad is also still connected to AMUXBUS B).

0x8: ACT_0:

Chip specific Active source 0 connection.

0x9: ACT_1:

Chip specific Active source 1 connection.

0xa: ACT_2:

Chip specific Active source 2 connection.

0xb: ACT_3:

Chip specific Active source 3 connection.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

Chip specific DeepSleep source 0 connection.

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

Chip specific DeepSleep source 1 connection.

0xe: DS_2:

Chip specific DeepSleep source 2 connection.

0xf: DS_3:

Chip specific DeepSleep source 3 connection.

6.1.5 HSIOM_PORT_SEL4

Port selection register

Address: 0x40020400

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	RW				RW			
Name	IO1_SEL [7:4]				IO0_SEL [3:0]

Name	None [31:24]							

Bits	Name	Description
7 : 4	IO1_SEL	Selects connection for IO pad 1 route. Default Value: 0
3 : 0	IO0_SEL	Selects connection for IO pad 0 route. Default Value: 0
	0x0: GPIO:	SW controlled GPIO.
	0x1: GPIO_DSI:	SW controlled "out", DSI controlled "oe_n".
	0x2: DSI_DSI:	DSI controlled "out" and "oe_n".
	0x3: DSI_GPIO:	DSI controlled "out", SW controlled "oe_n".
	0x4: CSD_SENSE:	CSD sense connection (analog mode)
	0x5: CSD_SHIELD:	CSD shield connection (analog mode)

6.1.5 HSIOM_PORT_SEL4 (continued)

0x6: AMUXA:

AMUXBUS A connection.

0x7: AMUXB:

AMUXBUS B connection. This mode is also used for CSD GPIO charging. When CSD GPIO charging is enabled in CSD_CONTROL, "oe_n" is connected to "!csd_charge" signal (and IO pad is also still connected to AMUXBUS B).

0x8: ACT_0:

Chip specific Active source 0 connection.

0x9: ACT_1:

Chip specific Active source 1 connection.

0xa: ACT_2:

Chip specific Active source 2 connection.

0xb: ACT_3:

Chip specific Active source 3 connection.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

Chip specific DeepSleep source 0 connection.

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

Chip specific DeepSleep source 1 connection.

0xe: DS_2:

Chip specific DeepSleep source 2 connection.

0xf: DS_3:

Chip specific DeepSleep source 3 connection.

6.1.6 HSIOM_PORT_SEL5

Port selection register

Address: 0x40020500

Retention: Retained

7 Peripheral Interconnect (PERI) Registers

This section discusses the PERI registers. It lists all the registers in mapping tables, in address order.

7.1 Register Details

Register Name	Address
PERI_DIV_CMD	0x40010000
PERI_PCLK_CTL0	0x40010100
PERI_PCLK_CTL1	0x40010104
PERI_PCLK_CTL2	0x40010108
PERI_PCLK_CTL3	0x4001010C
PERI_PCLK_CTL4	0x40010110
PERI_PCLK_CTL5	0x40010114
PERI_PCLK_CTL6	0x40010118
PERI_PCLK_CTL7	0x4001011C
PERI_PCLK_CTL8	0x40010120
PERI_PCLK_CTL9	0x40010124
PERI_PCLK_CTL10	0x40010128
PERI_PCLK_CTL11	0x4001012C
PERI_PCLK_CTL12	0x40010130
PERI_PCLK_CTL13	0x40010134
PERI_PCLK_CTL14	0x40010138
PERI_DIV_8_CTL0	0x40010200
PERI_DIV_8_CTL1	0x40010204
PERI_DIV_8_CTL2	0x40010208
PERI_DIV_8_CTL3	0x4001020C
PERI_DIV_8_CTL4	0x40010210
PERI_DIV_8_CTL5	0x40010214
PERI_DIV_16_CTL0	0x40010300
PERI_DIV_16_CTL1	0x40010304
PERI_DIV_16_CTL2	0x40010308
PERI_DIV_16_CTL3	0x4001030C
PERI_DIV_16_5_CTL0	0x40010400

Register Name	Address
PERI_DIV_16_5_CTL1	0x40010404
PERI_DIV_16_5_CTL2	0x40010408
PERI_DIV_16_5_CTL3	0x4001040C

7.1.1 PERI_DIV_CMD

Divider command register

Address: 0x40010000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW					
HW Access	R		R					
Name	SEL_TYPE [7:6]		SEL_DIV [5:0]					

Bits	15	14	13	12	11	10	9	8
SW Access	RW		RW					
HW Access	R		R					
Name	PA_SEL_TYPE [15:14]		PA_SEL_DIV [13:8]					

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	None					
HW Access	RW1C	RW1C	None					
Name	ENABLE	DISABLE	None [29:24]					

Bits	Name	Description
31	ENABLE	<p>Clock divider enable command (mutually exclusive with DISABLE). Typically, SW sets this field to '1' to enable a divider and HW sets this field to '0' to indicate that divider enabling has completed. When a divider is enabled, its integer and fractional (if present) counters are initialized to "0". If a divider is to be re-enabled using different integer and fractional divider values, the SW should follow these steps:</p> <p>0: Disable the divider using the DIV_CMD.DISABLE field.</p> <p>1: Configure the divider's DIV_XXX_CTL register.</p> <p>2: Enable the divider using the DIV_CMD_ENABLE field.</p> <p>The SEL_DIV and SEL_TYPE fields specify which divider is to be enabled. The enabled divider may be phase aligned to either "clk_hf" (typical usage) or to ANY enabled divider.</p> <p>The PA_SEL_DIV and P_SEL_TYPE fields specify the reference divider.</p> <p>The HW sets the ENABLE field to '0' when the enabling is performed and the HW set the DIV_XXX_CTL.EN field of the divider to '1' when the enabling is performed. Note that enabling with phase alignment to a low frequency divider takes time. E.g. To align to a divider that generates a clock of "clk_hf"/n (with n being the integer divider value INT_DIV+1), up to n cycles may be required to perform alignment. Phase alignment to "clk_hf" takes affect immediately. SW can set this field to '0' during phase alignment to abort the enabling process.</p> <p>Default Value: 0</p>

7.1.1 PERI_DIV_CMD (continued)

30	DISABLE	<p>Clock divider disable command (mutually exclusive with ENABLE). SW sets this field to '1' and HW sets this field to '0'.</p> <p>The SEL_DIV and SEL_TYPE fields specify which divider is to be disabled.</p> <p>The HW sets the DISABLE field to '0' immediately and the HW sets the DIV_XXX_CTL.EN field of the divider to '0' immediately. Default Value: 0</p>
15 : 14	PA_SEL_TYPE	<p>Specifies the divider type of the divider to which phase alignment is performed for the clock enable command:</p> <p>0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3</p>
13 : 8	PA_SEL_DIV	<p>(PA_SEL_TYPE, PA_SEL_DIV) specifies the divider to which phase alignment is performed for the clock enable command. Any enabled divider can be used as reference. This allows all dividers to be aligned with each other, even when they are enabled at different times.</p> <p>If PA_SEL_DIV is "63" and "PA_SEL_TYPE" is "3", "clk_hf" is used as reference. Default Value: 63</p>
7 : 6	SEL_TYPE	<p>Specifies the divider type of the divider on which the command is performed:</p> <p>0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3</p>
5 : 0	SEL_DIV	<p>(SEL_TYPE, SEL_DIV) specifies the divider on which the command (DISABLE/ENABLE) is performed.</p> <p>If SEL_DIV is "63" and "SEL_TYPE" is "3" (default/reset value), no divider is specified and no clock signal(s) are generated. Default Value: 63</p>

7.1.2 PERI_PCLK_CTL0

Programmable clock control register

Address: 0x40010100

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		None			RW		
HW Access	R		None			R		
Name	SEL_TYPE [7:6]		None [5:3]			SEL_DIV [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 6	SEL_TYPE	Specifies divider type: 0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3
2 : 0	SEL_DIV	Specifies one of the dividers of the divider type specified by SEL_TYPE. If SEL_DIV is "63" and "SEL_TYPE" is "3" (default/reset value), no divider is specified and no clock control signal(s) are generated. When transitioning a clock between two out of phase dividers, spurious clock control signals may be generated for one "clk_hf" cycle during this transition. These clock control signals may cause a single clock period that is smaller than any of the two divider periods. To prevent these spurious clock signals, the clock multiplexer can be disconnected (SEL_DIV is "63" and "SEL_TYPE" is "3") for a transition time that is larger than the smaller of the two divider periods. Default Value: 7

7.1.3 PERI_PCLK_CTL1

Programmable clock control register

Address: 0x40010104

Retention: Retained

Bits	7	6	5	4	3	2	1	0

7.1.11 PERI_PCLK_CTL9

Programmable clock control register

Address: 0x40010124

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		None			RW		
HW Access	R		None			R		
Name	SEL_TYPE [7:6]		None [5:3]			SEL_DIV [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 6	SEL_TYPE	Specifies divider type: 0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3
2 : 0	SEL_DIV	Specifies one of the dividers of the divider type specified by SEL_TYPE. If SEL_DIV is "63" and "SEL_TYPE" is "3" (default/reset value), no divider is specified and no clock control signal(s) are generated. When transitioning a clock between two out of phase dividers, spurious clock control signals may be generated for one "clk_hf" cycle during this transition. These clock control signals may cause a single clock period that is smaller than any of the two divider periods. To prevent these spurious clock signals, the clock multiplexer can be disconnected (SEL_DIV is "63" and "SEL_TYPE" is "3") for a transition time that is larger than the smaller of the two divider periods. Default Value: 7

Name	None [31:24]							

Bits	Name	Description
23 : 8	INT16_DIV	<p>Integer division by (1+INT16_DIV). Allows for integer divisions in the range [1, 65,536]. Note: this type of divider does NOT allow for a fractional division.</p> <p>For the generation of a divided clock, the integer division range is restricted to [2, 65,536].</p> <p>For the generation of a 50/50% duty cycle digital divided clock, the integer division range is restricted to even numbers in the range [2, 65,536]. The generation of a 50/50 % duty cycle analog divided clock has no restrictions.</p> <p>Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode. Default Value: 0</p>
0	EN	<p>Divider enabled. HW sets this field to '1' as a result of an ENABLE command. HW sets this field to '0' as a result on a DISABLE command.</p> <p>Note that this field is retained. As a result, the divider does NOT have to be re-enabled after transitioning from DeepSleep to Active power mode. Default Value: 0</p>

7.1.26 PERI_DIV_16_CTL3

Divider control register (for 16.0 divider)

Address: 0x4001030C

Retention: Retained

8 ROM Table Registers

This section discusses the ROM Table registers. It lists all the registers in mapping tables, in address order.

8.1 Register Details

Register Name	Address
ROMTABLE_ADDR	0xF0000000
ROMTABLE_DID	0xF0000FCC
ROMTABLE_PID4	0xF0000FD0
ROMTABLE_PID5	0xF0000FD4
ROMTABLE_PID6	0xF0000FD8
ROMTABLE_PID7	0xF0000FDC
ROMTABLE_PID0	0xF0000FE0
ROMTABLE_PID1	0xF0000FE4
ROMTABLE_PID2	0xF0000FE8
ROMTABLE_PID3	0xF0000FEC
ROMTABLE_CID0	0xF0000FF0
ROMTABLE_CID1	0xF0000FF4
ROMTABLE_CID2	0xF0000FF8
ROMTABLE_CID3	0xF0000FFC

8.1.1 ROMTABLE_ADDR

Link to Cortex M0 ROM Table.

Address: 0xF0000000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						R	R
HW Access	None						R	R
Name	None [7:2]						FORMAT_3 2BIT	PRESENT

Bits	15	14	13	12	11	10	9	8
SW Access	R				None			
HW Access	R				None			
Name	ADDR_OFFSET [15:12]				None [11:8]			

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	ADDR_OFFSET [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	ADDR_OFFSET [31:24]							

Bits	Name	Description
31 : 12	ADDR_OFFSET	Address offset of the Cortex-M0 ROM Table base address (0xe00f:f000) wrt. Cypress chip specific ROM Table base address (0xf000:0000). ADDR_OFFSET[19:0] = 0xe00f:f - 0xf000:0 = 0xf00f:f. Default Value: 983295
1	FORMAT_32BIT	ROM Table format: '0': 8-bit format. '1': 32-bit format. Default Value: 1
0	PRESENT	Entry present. Default Value: 1

8.1.2 ROMTABLE_DID

Device Type Identifier register.

Address: 0xF0000FCC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	. Default Value: 1

8.1.3 ROMTABLE_PID4

Peripheral Identification Register 4.

Address: 0xF000FD0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	R				R			
Name	COUNT [7:4]				JEP_CONTINUATION [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 4	COUNT	Size of ROM Table is $2^{\text{COUNT}} \times 4$ KByte. Default Value: 0
3 : 0	JEP_CONTINUATION	JEP106 continuation code. This value is product specific and specified as part of the product definition in the CPUSS.JEPCONTINUATION parameter. Default Value: Undefined

8.1.4 ROMTABLE_PID5

Peripheral Identification Register 5.

Address: 0xF0000FD4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	. Default Value: 0

8.1.5 ROMTABLE_PID6

Peripheral Identification Register 6.

Address: 0xF0000FD8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	. Default Value: 0

8.1.6 ROMTABLE_PID7

Peripheral Identification Register 7.

Address: 0xF0000FDC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	. Default Value: 0

8.1.7 ROMTABLE_PID0

Peripheral Identification Register 0.

Address: 0xF000FE0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	PN_MIN [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 0	PN_MIN	JEP106 part number. 4 lsbs of CPUSS.PARTNUMBER parameter. These part numbers are maintained in spec 40-9500. Default Value: Undefined

8.1.8 ROMTABLE_PID1

Peripheral Identification Register 1.

Address: 0xF0000FE4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	R				R			
Name	JEPID_MIN [7:4]				PN_MAJ [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 4	JEPID_MIN	JEP106 vendor id. 4 lsbs of CPUSS.JEPID parameter. This number is maintained in spec 40-9500. Default Value: Undefined
3 : 0	PN_MAJ	JEP106 part number. 4 msbs of CPUSS.PARTNUMBER parameter. These part numbers are maintained in spec 40-9500. Default Value: Undefined

8.1.9 ROMTABLE_PID2

Peripheral Identification Register 2.

Address: 0xF0000FE8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				None	R		
HW Access	R				None	R		
Name	REV [7:4]				None	JEPID_MAJ [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 4	REV	Major REVision number (chip specific). Identifies the design iteration of the component. For first tape out: 0x1. This field is implemented in RTL by an ECO-able tie-off structure and is incremented on subsequent tape outs. Default Value: Undefined
2 : 0	JEPID_MAJ	JEP106 vendor id. 4 msbs of CPUSS.JEPID parameter. This number is maintained in spec 40-9500. Default Value: Undefined

8.1.10 ROMTABLE_PID3

Peripheral Identification Register 3.

Address: 0xF0000FEC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R				R			
HW Access	R				R			
Name	REV_AND [7:4]				CM [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 4	REV_AND	Minor REVersion number (chip specific). For first tape out: 0x1. This field is implemented in RTL by an ECO-able tie-off structure and is incremented on subsequent tape outs. Default Value: Undefined
3 : 0	CM	Customer modified field. This field is used to track modifications to the original component design as a result of component IP reuse. Default Value: 0

8.1.11 ROMTABLE_CID0

Component Identification Register 0.

Address: 0xF000FF0

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component identification byte 0 of 4-byte component identification 0xB105:100D. Default Value: 13

8.1.12 ROMTABLE_CID1

Component Identification Register 1.

Address: 0xF000FF4

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component identification byte 1 of 4-byte component identification 0xB105:100D. Component class: "ROM Table". Default Value: 16

8.1.13 ROMTABLE_CID2

Component Identification Register 2.

Address: 0xF000FF8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component identification byte 2 of 4-byte component identification 0xB105:100D. Default Value: 5

8.1.14 ROMTABLE_CID3

Component Identification Register 3.

Address: 0xF0000FFC

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	R							
Name	VALUE [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	R							
Name	VALUE [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	R							
HW Access	R							
Name	VALUE [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	R							
HW Access	R							
Name	VALUE [31:24]							

Bits	Name	Description
31 : 0	VALUE	Component identification byte 3 of 4-byte component identification 0xB105:100D. Default Value: 177

9 SCB Registers

This section discusses the SCB registers. It lists all the registers in mapping tables, in address order.

9.1 Register Details

Register Name	Address
SCB0_CTRL	0x40050000
SCB0_STATUS	0x40050004
SCB0_CMD_RESP_CTRL	0x40050008
SCB0_CMD_RESP_STATUS	0x4005000C
SCB0_SPI_CTRL	0x40050020
SCB0_SPI_STATUS	0x40050024
SCB0_UART_CTRL	0x40050040
SCB0_UART_TX_CTRL	0x40050044
SCB0_UART_RX_CTRL	0x40050048
SCB0_UART_RX_STATUS	0x4005004C
SCB0_UART_FLOW_CTRL	0x40050050
SCB0_I2C_CTRL	0x40050060
SCB0_I2C_STATUS	0x40050064
SCB0_I2C_M_CMD	0x40050068
SCB0_I2C_S_CMD	0x4005006C
SCB0_I2C_CFG	0x40050070
SCB0_TX_CTRL	0x40050200
SCB0_TX_FIFO_CTRL	0x40050204
SCB0_TX_FIFO_STATUS	0x40050208
SCB0_TX_FIFO_WR	0x40050240
SCB0_RX_CTRL	0x40050300
SCB0_RX_FIFO_CTRL	0x40050304
SCB0_RX_FIFO_STATUS	0x40050308
SCB0_RX_MATCH	0x40050310
SCB0_RX_FIFO_RD	0x40050340
SCB0_RX_FIFO_RD_SILENT	0x40050344
SCB0_EZ_DATA0	0x40050400

Register Name	Address
SCB0_EZ_DATA1	0x40050404
SCB0_EZ_DATA2	0x40050408
SCB0_EZ_DATA3	0x4005040C

Bits	Name	Description
31	ENABLED	<p>IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows:</p> <ul style="list-style-type: none"> - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. <p>When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0</p>
25 : 24	MODE	<p>Mode of operation (3: Reserved) Default Value: 3</p> <p>0x0: I2C: Inter-Integrated Circuits (I2C) mode.</p>

9.1.1 SCB0_CTRL (continued)

		0x1: SPI: Serial Peripheral Interface (SPI) mode.
		0x2: UART: Universal Asynchronous Receiver/Transmitter (UART) mode.
17	BLOCK	Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK is '1') or not ('BLOCK is '0'). If BLOCK is '0' and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX. Default Value: 0
16	ADDR_ACCEPT	Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0'). In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers. In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO. Default Value: 0
12	CMD_RESP_MODE	Determines CMD_RESP mode of operation: '0': CMD_RESP mode disabled. '1': CMD_RESP mode enabled (also requires EC_AM_MODE and EC_OP_MODE to be set to '1'). Default Value: 0
11	BYTE_MODE	Determines the number of bits per FIFO data element: '0': 16-bit FIFO data elements. '1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7]. Default Value: 0
10	EZ_MODE	Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first. In UART mode this field should be '0'. Default Value: 0
9	EC_OP_MODE	Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate). In UART mode this field should be '0'. Default Value: 0

9.1.1 SCB0_CTRL (continued)

8	EC_AM_MODE	<p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p>
---	------------	---

9.1.1 SCB0_CTRL (continued)

3 : 0 OVS

Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.

In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):

- MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps.
- MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps.
- MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps.
- MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps.

The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].

In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

Low power mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
- 1: 32 times oversampling.
 - IP clock frequency of 32*57.6 KHz for 57.6 Kbps.
- 2: 48 times oversampling.
 - IP clock frequency of 48*38.4 KHz for 38.4 Kbps.
- 3: 96 times oversampling.
 - IP clock frequency of 96*19.2 KHz for 19.2 Kbps.
- 4: 192 times oversampling.
 - IP clock frequency of 192*9.6 KHz for 9.6 Kbps.
- 5: 768 times oversampling.
 - IP clock frequency of 768*2.4 KHz for 2.4 Kbps.
- 6: 1536 times oversampling.
 - IP clock frequency of 1536*1.2 KHz for 1.2 Kbps.
- all other values are not used in low power mode.

Default Value: 15

9.1.2 SCB0_STATUS

Generic status register.

Address: 0x40050004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							R
HW Access	None							W
Name	None [7:1]							EC_BUSY

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined

9.1.3 SCB0_CMD_RESP_CTRL

Command/response control register.

Address: 0x40050008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			RW				
HW Access	None			R				
Name	None [7:5]			BASE_RD_ADDR [4:0]				

Bits	15	14	13	12	11	10	9	8

SW Access	RW	None			RW		RW	
HW Access	R	None			R		R	
Name	MASTER_MODE	None [30:28]			SLAVE_SELECT [27:26]		MODE [25:24]	

Bits	Name	Description
31	MASTER_MODE	Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0
27 : 26	SLAVE_SELECT	Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. only SPI_SELECT[0] is used in slave mode. Default Value: 0
25 : 24	MODE	Submode of SPI operation (3: Reserved). Default Value: 3

9.1.5 SCB0_SPI_CTRL (continued)

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0
11	SSEL_POLARITY3	Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0
10	SSEL_POLARITY2	Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0
9	SSEL_POLARITY1	Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0
8	SSEL_POLARITY0	Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). only SPI_SELECT[0] is used in slave mode. For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0
5	SCLK_CONTINUOUS	Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0

9.1.5 SCB0_SPI_CTRL (continued)

4	LATE_MISO_SAMPLE	<p>Changes the SCLK edge on which MISO is captured. Only used in master mode.</p> <p>When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK).</p> <p>When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master.</p> <p>Default Value: 0</p>
3	CPOL	<p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is '0': SCLK is '0' when not transmitting data. - CPOL is '1': SCLK is '1' when not transmitting data. <p>Default Value: 0</p>
2	CPHA	<p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is '0', CPHA is '0': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is '0', CPHA is '1': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is '1', CPHA is '0': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is '1', CPHA is '1': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p>
1	SELECT_PRECEDE	<p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p>
0	CONTINUOUS	<p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data frames are send out with slave deselection.</p> <p>Default Value: 0</p>

9.1.6 SCB0_SPI_STATUS

SPI status register.

Address: 0x40050024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						R	R
HW Access	None						W	W
Name	None [7:2]						SPI_EC_BUSY	BUS_BUSY

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	SPI base EZ address. Address as provided by a SPI write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	SPI current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when SPI_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
1	SPI_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	SPI bus is busy. The bus is considered busy ('1') during an ongoing transaction. For Motorola and National submodes, the busy bit is '1', when the slave selection (low active) is activated. For TI submode, the busy bit is '1' from the time the preceding/coinciding slave select (high active) is activated for the first transmitted data frame, till the last MOSI/MISO bit of the last data frame is transmitted. Default Value: Undefined

9.1.7 SCB0_UART_CTRL

UART control register.

Address: 0x40050040

Retention: Retained

Name	None [31:26]						MODE [25:24]	

Bits	Name	Description
25 : 24	MODE	<p>Submode of UART operation (3: Reserved) Default Value: 3</p> <p>0x0: UART_STD: Standard UART submode.</p> <p>0x1: UART_SMARTCARD: SmartCard (ISO7816) submode. Support for negative acknowledgement (NACK) on the receiver side and retransmission on the transmitter side.</p> <p>0x2: UART_IRDA: Infrared Data Association (IrDA) submode. Return to Zero modulation scheme. In this mode, the oversampling factor should be 16, that is OVS is 15.</p>
16	LOOPBACK	<p>Local loopback control (does NOT affect the information on the pins). When '0', the transmitter TX line "uart_tx_out" is connected to the TX pin and the receiver RX line "uart_rx_in" is connected to the RX pin. When '1', the transmitter TX line "uart_tx_out" is connected to the receiver RX line "uart_rx_in". A similar connections scheme is followed for "uart_rts_out" and "uart_cts_in".</p> <p>This allows a SCB UART transmitter to communicate with its receiver counterpart. Default Value: 0</p>

9.1.8 SCB0_UART_TX_CTRL

UART transmitter control register.

Address: 0x40050044

Retention: Retained

Bits	23	22	21	20	19	18	17	16
SW Access	None				RW			
HW Access	None				R			
Name	None [23:20]				BREAK_WIDTH [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	BREAK_WIDTH	<p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of 10+1 = 11 bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p>

9.1.9 SCB0_UART_RX_CTRL (continued)

13	SKIP_START	<p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p>
12	LIN_MODE	<p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p>
10	MP_MODE	<p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p>
9	DROP_ON_FRAME_ERR OR	<p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p>
8	DROP_ON_PARITY_ERR OR	<p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p>
6	POLARITY	<p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p>
5	PARITY_ENABLED	<p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p>
4	PARITY	<p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p>

9.1.9 SCB0_UART_RX_CTRL (continued)

2 : 0	STOP_BITS	<p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p>

SW Access	RW	RW	None					
HW Access	R	R	None					
Name	MASTER_MODE	SLAVE_MODE	None [29:24]					

Bits	Name	Description
31	MASTER_MODE	Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0
30	SLAVE_MODE	Slave mode enabled ('1') or not ('0'). Default Value: 0
16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0
15	S_NOT_READY_DATA_NACK	For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1

9.1.12 SCB0_I2C_CTRL (continued)

14	S_NOT_READY_ADDR_NACK	<p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p>
13	S_READY_DATA_ACK	<p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
12	S_READY_ADDR_ACK	<p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
11	S_GENERAL_IGNORE	<p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p>
9	M_NOT_READY_DATA_NACK	<p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p>
8	M_READY_DATA_ACK	<p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p>
7 : 4	LOW_PHASE_OVS	<p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>

9.1.12 SCB0_I2C_CTRL (continued)

3 : 0	HIGH_PHASE_OVS	<p>Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 peripheral clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be ≥ 6 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF high time should be ≥ 5 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>
-------	----------------	---

9.1.13 SCB0_I2C_STATUS

I2C status register.

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
5	M_READ	I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0
4	S_READ	I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0

9.1.13 SCB0_I2C_STATUS (continued)

1	I2C_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_EZ_ADDR or CURR_EZ_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_EZ_ADDR and CURR_EZ_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	<p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0</p>

9.1.14 SCB0_I2C_M_CMD

I2C master command register.

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
4	M_STOP	When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. I2C_M_CMD.M_START has a higher priority than this command: in situations where both a STOP and a REPEATED START could be transmitted, M_START takes precedence over M_STOP. Default Value: 0
3	M_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0
2	M_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0

9.1.14 SCB0_I2C_M_CMD (continued)

1	M_START_ON_IDLE	<p>When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>
0	M_START	<p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>

Bits	Name	Description
1	S_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). This command has a higher priority than I2C_S_CMD.S_ACK, I2C_CTRL.S_READY_ADDR_ACK or I2C_CTRL.S_READY_DATA_ACK. Default Value: 0
0	S_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). Default Value: 0

9.1.16 SCB0_I2C_CFG

I2C configuration register.

Address: 0x40050070

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
8	MSB_FIRST	Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1
3 : 0	DATA_WIDTH	Dataframe width. DATA_WIDTH + 1 is the amount of bits in a transmitted data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. Default Value: 7

9.1.18 SCB0_TX_FIFO_CTRL

Transmitter FIFO control register.

Address: 0x40050204

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None				RW			
HW Access	None				R			
Name	None [7:4]				TRIGGER_LEVEL [3:0]

SW Access	None						RW	RW
HW Access	None						R	R
Name	None [23:18]						FREEZE	CLEAR

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
17	FREEZE	When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0
16	CLEAR	When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0
3 : 0	TRIGGER_LEVEL	Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event INTR_TX.TRIGGER is generated. Default Value: 0

9.1.19 SCB0_TX_FIFO_STATUS

Transmitter FIFO status register.

Address: 0x40050208

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			R				
HW Access	None			W				
Name	None [7:5]			USED [4:0]				

Bits	15	14	13	12	11	10	9	8

Name	None [23:20]				RD_PTR [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	None				R			
HW Access	None				W			
Name	None [31:28]				WR_PTR [27:24]			

Bits	Name	Description
27 : 24	WR_PTR	FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0
19 : 16	RD_PTR	FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0
15	SR_VALID	Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0
4 : 0	USED	Amount of entries in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR (EZ_DATA_NR/2). Default Value: 0

9.1.20 SCB0_TX_FIFO_WR

Transmitter FIFO write register.

Address: 0x40050240

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9	MEDIAN	Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, it requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0
8	MSB_FIRST	Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1
3 : 0	DATA_WIDTH	Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7

9.1.22 SCB0_RX_FIFO_CTRL

Receiver FIFO control register.

Address: 0x40050304

Retention: Retained

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	DATA	<p>Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used.</p> <p>This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register.</p> <p>A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined</p>

9.1.26 SCB0_RX_FIFO_RD_SILENT

Receiver FIFO read register.

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11	SPI_BUS_ERROR	SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0
10	SPI_EZ_STOP	SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0
9	SPI_EZ_WRITE_STOP	SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0
8	I2C_BUS_ERROR	I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0

9.1.70 SCB0_INTR_S (continued)

7	I2C_GENERAL	<p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
6	I2C_ADDR_MATCH	<p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
5	I2C_START	<p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p>
4	I2C_STOP	<p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p>
3	I2C_WRITE_STOP	<p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p>
2	I2C_ACK	<p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
1	I2C_NACK	<p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
0	I2C_ARB_LOST	<p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p>

Bits	Name	Description
10	UART_ARB_LOST	UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
9	UART_DONE	UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
8	UART_NACK	UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
7	BLOCKED	AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0

9.1.74 SCB0_INTR_TX (continued)

6	UNDERFLOW	<p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p>
4	EMPTY	<p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p>
1	NOT_FULL	<p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2) BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p>
0	TRIGGER	<p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p>

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11	BREAK_DETECT	Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
10	BAUD_DETECT	LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0

9.1.78 SCB0_INTR_RX (continued)

9	PARITY_ERROR	<p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p>
8	FRAME_ERROR	<p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p>
7	BLOCKED	<p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p>
6	UNDERFLOW	<p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
3	FULL	<p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2)</p> <p>BYTE_MODE is '0': # entries == FF_DATA_NR/2.</p> <p>BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
2	NOT_EMPTY	<p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
0	TRIGGER	<p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>

Bits	31	30	29	28	27	26	25	24
SW Access	RW	None					RW	
HW Access	R	None					R	
Name	ENABLED	None [30:26]					MODE [25:24]	

Bits	Name	Description
31	ENABLED	<p>IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows:</p> <ul style="list-style-type: none"> - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. <p>When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0</p>
25 : 24	MODE	<p>Mode of operation (3: Reserved) Default Value: 3</p> <p>0x0: I2C: Inter-Integrated Circuits (I2C) mode.</p>

9.1.82 SCB1_CTRL (continued)

0x1: SPI:

Serial Peripheral Interface (SPI) mode.

0x2: UART:

Universal Asynchronous Receiver/Transmitter (UART) mode.

17	BLOCK	<p>Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK' is '1') or not ('BLOCK' is '0'). If 'BLOCK' is '0' and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX.</p> <p>Default Value: 0</p>
16	ADDR_ACCEPT	<p>Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0').</p> <p>In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers.</p> <p>In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO.</p> <p>Default Value: 0</p>
12	CMD_RESP_MODE	<p>Determines CMD_RESP mode of operation:</p> <p>'0': CMD_RESP mode disabled.</p> <p>'1': CMD_RESP mode enabled (also requires EC_AM_MODE and EC_OP_MODE to be set to '1').</p> <p>Default Value: 0</p>
11	BYTE_MODE	<p>Determines the number of bits per FIFO data element:</p> <p>'0': 16-bit FIFO data elements.</p> <p>'1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7].</p> <p>Default Value: 0</p>
10	EZ_MODE	<p>Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first.</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p>
9	EC_OP_MODE	<p>Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p>

9.1.82 SCB1_CTRL (continued)

8	EC_AM_MODE	<p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p>
---	------------	---

9.1.82 SCB1_CTRL (continued)

3 : 0 OVS

Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.

In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):

- MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps.
- MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps.
- MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps.
- MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps.

The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].

In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

Low power mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
- 1: 32 times oversampling.
 - IP clock frequency of 32*57.6 KHz for 57.6 Kbps.
- 2: 48 times oversampling.
 - IP clock frequency of 48*38.4 KHz for 38.4 Kbps.
- 3: 96 times oversampling.
 - IP clock frequency of 96*19.2 KHz for 19.2 Kbps.
- 4: 192 times oversampling.
 - IP clock frequency of 192*9.6 KHz for 9.6 Kbps.
- 5: 768 times oversampling.
 - IP clock frequency of 768*2.4 KHz for 2.4 Kbps.
- 6: 1536 times oversampling.
 - IP clock frequency of 1536*1.2 KHz for 1.2 Kbps.
- all other values are not used in low power mode.

Default Value: 15

9.1.83 SCB1_STATUS

Generic status register.

Address: 0x40060004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined

9.1.84 SCB1_CMD_RESP_CTRL

Command/response control register.

Address: 0x40060008

Retention: Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW	None			RW		RW	
HW Access	R	None			R		R	
Name	MASTER_MODE	None [30:28]			SLAVE_SELECT [27:26]		MODE [25:24]	

Bits	Name	Description
31	MASTER_MODE	Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0
27 : 26	SLAVE_SELECT	Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. only SPI_SELECT[0] is used in slave mode. Default Value: 0
25 : 24	MODE	Submode of SPI operation (3: Reserved). Default Value: 3

9.1.86 SCB1_SPI_CTRL (continued)

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0
11	SSEL_POLARITY3	Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0
10	SSEL_POLARITY2	Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0
9	SSEL_POLARITY1	Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0
8	SSEL_POLARITY0	Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). only SPI_SELECT[0] is used in slave mode. For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0
5	SCLK_CONTINUOUS	Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0

9.1.86 SCB1_SPI_CTRL (continued)

4	LATE_MISO_SAMPLE	<p>Changes the SCLK edge on which MISO is captured. Only used in master mode.</p> <p>When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK).</p> <p>When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master.</p> <p>Default Value: 0</p>
3	CPOL	<p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is '0': SCLK is '0' when not transmitting data. - CPOL is '1': SCLK is '1' when not transmitting data. <p>Default Value: 0</p>
2	CPHA	<p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is '0', CPHA is '0': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is '0', CPHA is '1': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is '1', CPHA is '0': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is '1', CPHA is '1': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p>
1	SELECT_PRECEDE	<p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p>
0	CONTINUOUS	<p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data frames are send out with slave deselection.</p> <p>Default Value: 0</p>

9.1.87 SCB1_SPI_STATUS

SPI status register.

Address: 0x40060024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	SPI base EZ address. Address as provided by a SPI write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	SPI current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when SPI_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
1	SPI_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	SPI bus is busy. The bus is considered busy ('1') during an ongoing transaction. For Motorola and National submodes, the busy bit is '1', when the slave selection (low active) is activated. For TI submode, the busy bit is '1' from the time the preceding/coinciding slave select (high active) is activated for the first transmitted data frame, till the last MOSI/MISO bit of the last data frame is transmitted. Default Value: Undefined

SW Access	None				RW			
HW Access	None				R			
Name	None [23:20]				BREAK_WIDTH [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	BREAK_WIDTH	<p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of 10+1 = 11 bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p>

9.1.90 SCB1_UART_RX_CTRL (continued)

13	SKIP_START	<p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p>
12	LIN_MODE	<p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p>
10	MP_MODE	<p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p>
9	DROP_ON_FRAME_ERR OR	<p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p>
8	DROP_ON_PARITY_ERR OR	<p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p>
6	POLARITY	<p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p>
5	PARITY_ENABLED	<p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p>
4	PARITY	<p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p>

9.1.90 SCB1_UART_RX_CTRL (continued)

2 : 0	STOP_BITS	<p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p>

HW Access	R	R	None					
Name	MASTER_MODE	SLAVE_MODE	None [29:24]					

Bits	Name	Description
31	MASTER_MODE	Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0
30	SLAVE_MODE	Slave mode enabled ('1') or not ('0'). Default Value: 0
16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0
15	S_NOT_READY_DATA_NACK	For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1

9.1.93 SCB1_I2C_CTRL (continued)

14	S_NOT_READY_ADDR_NACK	<p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p>
13	S_READY_DATA_ACK	<p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
12	S_READY_ADDR_ACK	<p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
11	S_GENERAL_IGNORE	<p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p>
9	M_NOT_READY_DATA_NACK	<p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p>
8	M_READY_DATA_ACK	<p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p>
7 : 4	LOW_PHASE_OVS	<p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>

9.1.93 SCB1_I2C_CTRL (continued)

3 : 0	HIGH_PHASE_OVS	<p>Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 peripheral clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be ≥ 6 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF high time should be ≥ 5 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>

Name	BASE_EZ_ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
5	M_READ	I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0
4	S_READ	I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0

9.1.94 SCB1_I2C_STATUS (continued)

1	I2C_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_EZ_ADDR or CURR_EZ_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_EZ_ADDR and CURR_EZ_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	<p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0</p>

9.1.95 SCB1_I2C_M_CMD

I2C master command register.

Address: 0x40060068

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
4	M_STOP	When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. I2C_M_CMD.M_START has a higher priority than this command: in situations where both a STOP and a REPEATED START could be transmitted, M_START takes precedence over M_STOP. Default Value: 0
3	M_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0
2	M_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0

9.1.95 SCB1_I2C_M_CMD (continued)

1	M_START_ON_IDLE	<p>When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>
0	M_START	<p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>

9.1.96 SCB1_I2C_S_CMD

I2C slave command register.

Address: 0x4006006C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	RW
HW Access	None						RW1C	RW1C
Name	None [7:2]						S_NACK	S_ACK

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	S_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). This command has a higher priority than I2C_S_CMD.S_ACK, I2C_CTRL.S_READY_ADDR_ACK or I2C_CTRL.S_READY_DATA_ACK. Default Value: 0
0	S_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). Default Value: 0

9.1.97 SCB1_I2C_CFG

I2C configuration register.

Address: 0x40060070

Retention: Retained

Name	None [23:18]						FREEZE	CLEAR

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
17	FREEZE	When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0
16	CLEAR	When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0
3 : 0	TRIGGER_LEVEL	Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event INTR_TX.TRIGGER is generated. Default Value: 0

9.1.100 SCB1_TX_FIFO_STATUS

Transmitter FIFO status register.

Address: 0x40060208

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			R				
HW Access	None			W

SW Access	None				R			
HW Access	None				W			
Name	None [31:28]				WR_PTR [27:24]			

Bits	Name	Description
27 : 24	WR_PTR	FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0
19 : 16	RD_PTR	FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0
15	SR_VALID	Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0
4 : 0	USED	Amount of entries in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR (EZ_DATA_NR/2). Default Value: 0

9.1.101 SCB1_TX_FIFO_WR

Transmitter FIFO write register.

Address: 0x40060240

Retention: Not Retained

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9	MEDIAN	Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, it requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0
8	MSB_FIRST	Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1
3 : 0	DATA_WIDTH	Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7

9.1.103 SCB1_RX_FIFO_CTRL

Receiver FIFO control register.

Address: 0x40060304

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	DATA	<p>Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used.</p> <p>This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register.</p> <p>A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined</p>

9.1.107 SCB1_RX_FIFO_RD_SILENT

Bits	Name	Description
7 : 0	EZ_DATA	Data in buffer memory location. In case of a blocked discarded access, a read access returns 0xffff:ffff and a write access is dropped. Note that the 0xffff:ffff value is unique (not a legal EZ_DATA byte value) and can be detected by SW. Note that a discarded write access can be detected by reading back the written value. Default Value: Undefined

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11	SPI_BUS_ERROR	SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0
10	SPI_EZ_STOP	SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0
9	SPI_EZ_WRITE_STOP	SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0
8	I2C_BUS_ERROR	I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0

9.1.151 SCB1_INTR_S (continued)

7	I2C_GENERAL	<p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
6	I2C_ADDR_MATCH	<p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
5	I2C_START	<p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p>
4	I2C_STOP	<p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p>
3	I2C_WRITE_STOP	<p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p>
2	I2C_ACK	<p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
1	I2C_NACK	<p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
0	I2C_ARB_LOST	<p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p>

Name	None [31:24]							

Bits	Name	Description
10	UART_ARB_LOST	UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
9	UART_DONE	UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
8	UART_NACK	UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
7	BLOCKED	AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0

9.1.155 SCB1_INTR_TX (continued)

6	UNDERFLOW	<p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p>
4	EMPTY	<p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p>
1	NOT_FULL	<p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2) BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p>
0	TRIGGER	<p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p>

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11	BREAK_DETECT	Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
10	BAUD_DETECT	LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0

9.1.159 SCB1_INTR_RX (continued)

9	PARITY_ERROR	<p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p>
8	FRAME_ERROR	<p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p>
7	BLOCKED	<p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p>
6	UNDERFLOW	<p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
3	FULL	<p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2)</p> <p>BYTE_MODE is '0': # entries == FF_DATA_NR/2.</p> <p>BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
2	NOT_EMPTY	<p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
0	TRIGGER	<p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>

SW Access	RW	None					RW	
HW Access	R	None					R	
Name	ENABLED	None [30:26]					MODE [25:24]	

Bits	Name	Description
31	ENABLED	<p>IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows:</p> <ul style="list-style-type: none"> - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. <p>When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0</p>
25 : 24	MODE	<p>Mode of operation (3: Reserved) Default Value: 3</p> <p>0x0: I2C: Inter-Integrated Circuits (I2C) mode.</p>

9.1.163 SCB2_CTRL (continued)

		0x1: SPI: Serial Peripheral Interface (SPI) mode.
		0x2: UART: Universal Asynchronous Receiver/Transmitter (UART) mode.
17	BLOCK	Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK' is '1') or not ('BLOCK' is '0'). If BLOCK is '0' and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX. Default Value: 0
16	ADDR_ACCEPT	Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0'). In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers. In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO. Default Value: 0
12	CMD_RESP_MODE	Determines CMD_RESP mode of operation: '0': CMD_RESP mode disabled. '1': CMD_RESP mode enabled (also requires EC_AM_MODE and EC_OP_MODE to be set to '1'). Default Value: 0
11	BYTE_MODE	Determines the number of bits per FIFO data element: '0': 16-bit FIFO data elements. '1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7]. Default Value: 0
10	EZ_MODE	Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first.
		In UART mode this field should be '0'. Default Value: 0
9	EC_OP_MODE	Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).
		In UART mode this field should be '0'. Default Value: 0

9.1.163 SCB2_CTRL (continued)

8	EC_AM_MODE	<p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p>
---	------------	---

9.1.163 SCB2_CTRL (continued)

3 : 0 OVS

Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.

In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):

- MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps.
- MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps.
- MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps.
- MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps.

The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].

In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

Low power mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
- 1: 32 times oversampling.
 - IP clock frequency of 32*57.6 KHz for 57.6 Kbps.
- 2: 48 times oversampling.
 - IP clock frequency of 48*38.4 KHz for 38.4 Kbps.
- 3: 96 times oversampling.
 - IP clock frequency of 96*19.2 KHz for 19.2 Kbps.
- 4: 192 times oversampling.
 - IP clock frequency of 192*9.6 KHz for 9.6 Kbps.
- 5: 768 times oversampling.
 - IP clock frequency of 768*2.4 KHz for 2.4 Kbps.
- 6: 1536 times oversampling.
 - IP clock frequency of 1536*1.2 KHz for 1.2 Kbps.
- all other values are not used in low power mode.

Default Value: 15

9.1.164 SCB2_STATUS

Generic status register.

Address: 0x40070004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							R
HW Access	None							W
Name	None [7:1]							EC_BUSY

SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined

9.1.165 SCB2_CMD_RESP_CTRL

Command/response control register.

Address: 0x40070008

Retention: Retained

Bits	7	6	5	4	3	2	1	0

HW Access	R	None			R		R	
Name	MASTER_MODE	None [30:28]			SLAVE_SELECT [27:26]		MODE [25:24]	

Bits	Name	Description
31	MASTER_MODE	Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0
27 : 26	SLAVE_SELECT	Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. only SPI_SELECT[0] is used in slave mode. Default Value: 0
25 : 24	MODE	Submode of SPI operation (3: Reserved). Default Value: 3

9.1.167 SCB2_SPI_CTRL (continued)

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0
11	SSEL_POLARITY3	Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0
10	SSEL_POLARITY2	Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0
9	SSEL_POLARITY1	Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0
8	SSEL_POLARITY0	Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). only SPI_SELECT[0] is used in slave mode. For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0
5	SCLK_CONTINUOUS	Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0

9.1.167 SCB2_SPI_CTRL (continued)

4	LATE_MISO_SAMPLE	<p>Changes the SCLK edge on which MISO is captured. Only used in master mode.</p> <p>When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK).</p> <p>When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master.</p> <p>Default Value: 0</p>
3	CPOL	<p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is '0': SCLK is '0' when not transmitting data. - CPOL is '1': SCLK is '1' when not transmitting data. <p>Default Value: 0</p>
2	CPHA	<p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is '0', CPHA is '0': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is '0', CPHA is '1': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is '1', CPHA is '0': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is '1', CPHA is '1': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p>
1	SELECT_PRECEDE	<p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p>
0	CONTINUOUS	<p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data frames are send out with slave deselection.</p> <p>Default Value: 0</p>

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	SPI base EZ address. Address as provided by a SPI write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	SPI current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when SPI_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
1	SPI_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	SPI bus is busy. The bus is considered busy ('1') during an ongoing transaction. For Motorola and National submodes, the busy bit is '1', when the slave selection (low active) is activated. For TI submode, the busy bit is '1' from the time the preceding/coinciding slave select (high active) is activated for the first transmitted data frame, till the last MOSI/MISO bit of the last data frame is transmitted. Default Value: Undefined

SW Access	None				RW			
HW Access	None				R			
Name	None [23:20]				BREAK_WIDTH [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	BREAK_WIDTH	<p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of 10+1 = 11 bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p>

9.1.171 SCB2_UART_RX_CTRL (continued)

13	SKIP_START	<p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p>
12	LIN_MODE	<p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p>
10	MP_MODE	<p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p>
9	DROP_ON_FRAME_ERR OR	<p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p>
8	DROP_ON_PARITY_ERR OR	<p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p>
6	POLARITY	<p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p>
5	PARITY_ENABLED	<p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p>
4	PARITY	<p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p>

9.1.171 SCB2_UART_RX_CTRL (continued)

2 : 0	STOP_BITS	<p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p>

SW Access	RW	RW	None					
HW Access	R	R	None					
Name	MASTER_MODE	SLAVE_MODE	None [29:24]					

Bits	Name	Description
31	MASTER_MODE	Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0
30	SLAVE_MODE	Slave mode enabled ('1') or not ('0'). Default Value: 0
16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0
15	S_NOT_READY_DATA_NACK	For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1

9.1.174 SCB2_I2C_CTRL (continued)

14	S_NOT_READY_ADDR_NACK	<p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p>
13	S_READY_DATA_ACK	<p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
12	S_READY_ADDR_ACK	<p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
11	S_GENERAL_IGNORE	<p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p>
9	M_NOT_READY_DATA_NACK	<p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p>
8	M_READY_DATA_ACK	<p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p>
7 : 4	LOW_PHASE_OVS	<p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>

9.1.174 SCB2_I2C_CTRL (continued)

3 : 0	HIGH_PHASE_OVS	<p>Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 peripheral clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be ≥ 6 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF high time should be ≥ 5 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
5	M_READ	I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0
4	S_READ	I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0

9.1.175 SCB2_I2C_STATUS (continued)

1	I2C_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_EZ_ADDR or CURR_EZ_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_EZ_ADDR and CURR_EZ_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	<p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0</p>

9.1.176 SCB2_I2C_M_CMD

I2C master command register.

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
4	M_STOP	When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. I2C_M_CMD.M_START has a higher priority than this command: in situations where both a STOP and a REPEATED START could be transmitted, M_START takes precedence over M_STOP. Default Value: 0
3	M_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0
2	M_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0

9.1.176 SCB2_I2C_M_CMD (continued)

1	M_START_ON_IDLE	<p>When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>
0	M_START	<p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>

9.1.177 SCB2_I2C_S_CMD

I2C slave command register.

Address: 0x4007006C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	RW

SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	S_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). This command has a higher priority than I2C_S_CMD.S_ACK, I2C_CTRL.S_READY_ADDR_ACK or I2C_CTRL.S_READY_DATA_ACK. Default Value: 0
0	S_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. In EZ mode, this field should be set to '0' (it is only to be used in non EZ mode). Default Value: 0

9.1.178 SCB2_I2C_CFG

I2C configuration register.

Address: 0x40070070

Retention: Retained

Name	None [23:18]						FREEZE	CLEAR

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
17	FREEZE	When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0
16	CLEAR	When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0
3 : 0	TRIGGER_LEVEL	Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event INTR_TX.TRIGGER is generated. Default Value: 0

9.1.181 SCB2_TX_FIFO_STATUS

Transmitter FIFO status register.

Address: 0x40070208

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			R				
HW Access	None			W				
Name	None [7:5]			USED [4:0]				

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	None				R			
HW Access	None				W			
Name	None [31:28]				WR_PTR [27:24]			

Bits	Name	Description
27 : 24	WR_PTR	FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0
19 : 16	RD_PTR	FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0
15	SR_VALID	Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0
4 : 0	USED	Amount of entries in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR (EZ_DATA_NR/2). Default Value: 0

9.1.182 SCB2_TX_FIFO_WR

Transmitter FIFO write register.

Address: 0x40070240

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9	MEDIAN	Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, it requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0
8	MSB_FIRST	Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1
3 : 0	DATA_WIDTH	Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7

9.1.184 SCB2_RX_FIFO_CTRL

Receiver FIFO control register.

Address: 0x40070304

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	MASK [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	MASK	Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0
7 : 0	ADDR	Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). Default Value: 0

9.1.187 SCB2_RX_FIFO_RD

Receiver FIFO read register.

Address: 0x40070340

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	DATA	<p>Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used.</p> <p>This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register.</p> <p>A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined</p>

9.1.188 SCB2_RX_FIFO_RD_SILENT

Name	None [31:24]							

Bits	Name	Description
7 : 0	EZ_DATA	Data in buffer memory location. In case of a blocked discarded access, a read access returns 0xffff:ffff and a write access is dropped. Note that the 0xffff:ffff value is unique (not a legal EZ_DATA byte value) and can be detected by SW. Note that a discarded write access can be detected by reading back the written value. Default Value: Undefined

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11	SPI_BUS_ERROR	SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0
10	SPI_EZ_STOP	SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0
9	SPI_EZ_WRITE_STOP	SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0
8	I2C_BUS_ERROR	I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0

9.1.232 SCB2_INTR_S (continued)

7	I2C_GENERAL	<p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
6	I2C_ADDR_MATCH	<p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
5	I2C_START	<p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p>
4	I2C_STOP	<p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p>
3	I2C_WRITE_STOP	<p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p>
2	I2C_ACK	<p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
1	I2C_NACK	<p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
0	I2C_ARB_LOST	<p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p>

Bits	Name	Description
10	UART_ARB_LOST	UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
9	UART_DONE	UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
8	UART_NACK	UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
7	BLOCKED	AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0

9.1.236 SCB2_INTR_TX (continued)

6	UNDERFLOW	<p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p>
4	EMPTY	<p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p>
1	NOT_FULL	<p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2) BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p>
0	TRIGGER	<p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p>

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11	BREAK_DETECT	Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
10	BAUD_DETECT	LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0

9.1.240 SCB2_INTR_RX (continued)

9	PARITY_ERROR	<p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p>
8	FRAME_ERROR	<p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p>
7	BLOCKED	<p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p>
6	UNDERFLOW	<p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
3	FULL	<p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2) BYTE_MODE is '0': # entries == FF_DATA_NR/2. BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
2	NOT_EMPTY	<p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
0	TRIGGER	<p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>

Name	ENABLED	None [30:26]					MODE [25:24]	

Bits	Name	Description
31	ENABLED	<p>IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows:</p> <ul style="list-style-type: none"> - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. <p>When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0</p>
25 : 24	MODE	<p>Mode of operation (3: Reserved) Default Value: 3</p> <p>0x0: I2C: Inter-Integrated Circuits (I2C) mode.</p>

9.1.244 SCB3_CTRL (continued)

0x1: SPI:

Serial Peripheral Interface (SPI) mode.

0x2: UART:

Universal Asynchronous Receiver/Transmitter (UART) mode.

17	BLOCK	<p>Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK' is '1') or not ('BLOCK' is '0'). If BLOCK is '0' and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX.</p> <p>Default Value: 0</p>
16	ADDR_ACCEPT	<p>Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0').</p> <p>In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers.</p> <p>In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO.</p> <p>Default Value: 0</p>
12	CMD_RESP_MODE	<p>Determines CMD_RESP mode of operation:</p> <p>'0': CMD_RESP mode disabled.</p> <p>'1': CMD_RESP mode enabled (also requires EC_AM_MODE and EC_OP_MODE to be set to '1').</p> <p>Default Value: 0</p>
11	BYTE_MODE	<p>Determines the number of bits per FIFO data element:</p> <p>'0': 16-bit FIFO data elements.</p> <p>'1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7].</p> <p>Default Value: 0</p>
10	EZ_MODE	<p>Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first.</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p>
9	EC_OP_MODE	<p>Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p>

9.1.244 SCB3_CTRL (continued)

8	EC_AM_MODE	<p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p>
---	------------	--

9.1.244 SCB3_CTRL (continued)

3 : 0 OVS

Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.

In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):

- MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps.
- MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps.
- MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps.
- MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps.

The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].

In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

Low power mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
- 1: 32 times oversampling.
 - IP clock frequency of 32*57.6 KHz for 57.6 Kbps.
- 2: 48 times oversampling.
 - IP clock frequency of 48*38.4 KHz for 38.4 Kbps.
- 3: 96 times oversampling.
 - IP clock frequency of 96*19.2 KHz for 19.2 Kbps.
- 4: 192 times oversampling.
 - IP clock frequency of 192*9.6 KHz for 9.6 Kbps.
- 5: 768 times oversampling.
 - IP clock frequency of 768*2.4 KHz for 2.4 Kbps.
- 6: 1536 times oversampling.
 - IP clock frequency of 1536*1.2 KHz for 1.2 Kbps.
- all other values are not used in low power mode.

Default Value: 15

9.1.245 SCB3_STATUS

Generic status register.

Address: 0x40080004

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							R
HW Access	None							W
Name	None [7:1]							EC_BUSY

Bits	15	14	13	12	11	10	9	8

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined

9.1.246 SCB3_CMD_RESP_CTRL

Command/response control register.

Address: 0x40080008

Retention: Retained

Bits	7	6	5	4	3	2	1	0

SW Access	RW	None			RW		RW	
HW Access	R	None			R		R	
Name	MASTER_MODE	None [30:28]			SLAVE_SELECT [27:26]		MODE [25:24]	

Bits	Name	Description
31	MASTER_MODE	Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0
27 : 26	SLAVE_SELECT	Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. only SPI_SELECT[0] is used in slave mode. Default Value: 0
25 : 24	MODE	Submode of SPI operation (3: Reserved). Default Value: 3

9.1.248 SCB3_SPI_CTRL (continued)

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0
11	SSEL_POLARITY3	Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0
10	SSEL_POLARITY2	Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0
9	SSEL_POLARITY1	Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0
8	SSEL_POLARITY0	Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). only SPI_SELECT[0] is used in slave mode. For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0
5	SCLK_CONTINUOUS	Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0

9.1.248 SCB3_SPI_CTRL (continued)

4	LATE_MISO_SAMPLE	<p>Changes the SCLK edge on which MISO is captured. Only used in master mode.</p> <p>When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK).</p> <p>When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master.</p> <p>Default Value: 0</p>
3	CPOL	<p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is '0': SCLK is '0' when not transmitting data. - CPOL is '1': SCLK is '1' when not transmitting data. <p>Default Value: 0</p>
2	CPHA	<p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is '0', CPHA is '0': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is '0', CPHA is '1': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is '1', CPHA is '0': MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is '1', CPHA is '1': MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p>
1	SELECT_PRECEDE	<p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p>
0	CONTINUOUS	<p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data frames are send out with slave deselection.</p> <p>Default Value: 0</p>

9.1.249 SCB3_SPI_STATUS

SPI status register.

Address: 0x40080024

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						R	R
HW Access	None						W	W
Name	None [7:2]						SPI_EC_BUSY	BUS_BUSY

Bits	15	14	13	12	11	10	9	8

Name	BASE_EZ_ADDR [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	SPI base EZ address. Address as provided by a SPI write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	SPI current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when SPI_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
1	SPI_EC_BUSY	Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	SPI bus is busy. The bus is considered busy ('1') during an ongoing transaction. For Motorola and National submodes, the busy bit is '1', when the slave selection (low active) is activated. For TI submode, the busy bit is '1' from the time the preceding/coinciding slave select (high active) is activated for the first transmitted data frame, till the last MOSI/MISO bit of the last data frame is transmitted. Default Value: Undefined

SW Access	None				RW			
HW Access	None				R			
Name	None [23:20]				BREAK_WIDTH [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	BREAK_WIDTH	<p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of 10+1 = 11 bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p>

9.1.252 SCB3_UART_RX_CTRL (continued)

13	SKIP_START	<p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p>
12	LIN_MODE	<p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p>
10	MP_MODE	<p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p>
9	DROP_ON_FRAME_ERR OR	<p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p>
8	DROP_ON_PARITY_ERR OR	<p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p>
6	POLARITY	<p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p>
5	PARITY_ENABLED	<p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p>
4	PARITY	<p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p>

9.1.252 SCB3_UART_RX_CTRL (continued)

2 : 0	STOP_BITS	<p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p>

HW Access	R	R	None					
Name	MASTER_MODE	SLAVE_MODE	None [29:24]					

Bits	Name	Description
31	MASTER_MODE	Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0
30	SLAVE_MODE	Slave mode enabled ('1') or not ('0'). Default Value: 0
16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0
15	S_NOT_READY_DATA_NACK	For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1

9.1.255 SCB3_I2C_CTRL (continued)

14	S_NOT_READY_ADDR_NACK	<p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p>
13	S_READY_DATA_ACK	<p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
12	S_READY_ADDR_ACK	<p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p>
11	S_GENERAL_IGNORE	<p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p>
9	M_NOT_READY_DATA_NACK	<p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p>
8	M_READY_DATA_ACK	<p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p>
7 : 4	LOW_PHASE_OVS	<p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>

9.1.255 SCB3_I2C_CTRL (continued)

3 : 0	HIGH_PHASE_OVS	<p>Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 peripheral clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be ≥ 6 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF high time should be ≥ 5 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p>

HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
5	M_READ	I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0
4	S_READ	I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0

9.1.256 SCB3_I2C_STATUS (continued)

1	I2C_EC_BUSY	<p>Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_EZ_ADDR or CURR_EZ_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_EZ_ADDR and CURR_EZ_ADDR are reliable.</p> <p>Default Value: Undefined</p>
0	BUS_BUSY	<p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions).</p> <p>Default Value: 0</p>

9.1.257 SCB3_I2C_M_CMD

I2C master command register.

Address: 0x40080068

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			RW	RW	RW	RW	RW
HW Access	None			RW1C	RW1C	RW1C	RW1C	RW1C
Name	None [7:5]			M_STOP	M_NACK	M_ACK	M_START_ON_IDLE	M_START

Bits	15	14	13	12	11	10	9	8

HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
4	M_STOP	When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. I2C_M_CMD.M_START has a higher priority than this command: in situations where both a STOP and a REPEATED START could be transmitted, M_START takes precedence over M_STOP. Default Value: 0
3	M_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0
2	M_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0

9.1.257 SCB3_I2C_M_CMD (continued)

1	M_START_ON_IDLE	<p>When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>
0	M_START	<p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p>

9.1.258 SCB3_I2C_S_CMD

I2C slave command register.

Address: 0x4008006C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	RW

Name	None [23:18]						FREEZE	CLEAR

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
17	FREEZE	When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0
16	CLEAR	When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0
3 : 0	TRIGGER_LEVEL	Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event INTR_TX.TRIGGER is generated. Default Value: 0

9.1.262 SCB3_TX_FIFO_STATUS

Transmitter FIFO status register.

Address: 0x40080208

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			R

SW Access	None				R			
HW Access	None				W			
Name	None [31:28]				WR_PTR [27:24]			

Bits	Name	Description
27 : 24	WR_PTR	FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0
19 : 16	RD_PTR	FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0
15	SR_VALID	Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0
4 : 0	USED	Amount of entries in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR (EZ_DATA_NR/2). Default Value: 0

9.1.263 SCB3_TX_FIFO_WR

Transmitter FIFO write register.

Address: 0x40080240

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9	MEDIAN	Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, it requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0
8	MSB_FIRST	Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1
3 : 0	DATA_WIDTH	Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7

9.1.265 SCB3_RX_FIFO_CTRL

Receiver FIFO control register.

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23 : 16	MASK	Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0
7 : 0	ADDR	Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). Default Value: 0

9.1.268 SCB3_RX_FIFO_RD

Receiver FIFO read register.

Bits	Name	Description
7 : 0	EZ_DATA	Data in buffer memory location. In case of a blocked discarded access, a read access returns 0xffff:ffff and a write access is dropped. Note that the 0xffff:ffff value is unique (not a legal EZ_DATA byte value) and can be detected by SW. Note that a discarded write access can be detected by reading back the written value. Default Value: Undefined

Bits	Name	Description
11	SPI_BUS_ERROR	SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0
10	SPI_EZ_STOP	SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0
9	SPI_EZ_WRITE_STOP	SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0
8	I2C_BUS_ERROR	I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0

9.1.313 SCB3_INTR_S (continued)

7	I2C_GENERAL	<p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
6	I2C_ADDR_MATCH	<p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p>
5	I2C_START	<p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p>
4	I2C_STOP	<p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p>
3	I2C_WRITE_STOP	<p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p>
2	I2C_ACK	<p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
1	I2C_NACK	<p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p>
0	I2C_ARB_LOST	<p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p>

Bits	Name	Description
10	UART_ARB_LOST	UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
9	UART_DONE	UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
8	UART_NACK	UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
7	BLOCKED	AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0

9.1.317 SCB3_INTR_TX (continued)

6	UNDERFLOW	<p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p>
4	EMPTY	<p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p>
1	NOT_FULL	<p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2) BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p>
0	TRIGGER	<p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p>

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
11	BREAK_DETECT	Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0
10	BAUD_DETECT	LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0

9.1.321 SCB3_INTR_RX (continued)

9	PARITY_ERROR	<p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p>
8	FRAME_ERROR	<p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p>
7	BLOCKED	<p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p>
6	UNDERFLOW	<p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
5	OVERFLOW	<p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
3	FULL	<p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODE: (FF_DATA_NR = EZ_DATA_NR/2)</p> <p>BYTE_MODE is '0': # entries == FF_DATA_NR/2.</p> <p>BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
2	NOT_EMPTY	<p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>
0	TRIGGER	<p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p>

7	BLOCKED	Write with '1' to set corresponding bit in interrupt status register. Default Value: 0
6	UNDERFLOW	Write with '1' to set corresponding bit in interrupt status register. Default Value: 0
5	OVERFLOW	Write with '1' to set corresponding bit in interrupt status register. Default Value: 0

9.1.322 SCB3_INTR_RX_SET (continued)

3	FULL	Write with '1' to set corresponding bit in interrupt status register. Default Value: 0
2	NOT_EMPTY	Write with '1' to set corresponding bit in interrupt status register. Default Value: 0
0	TRIGGER	Write with '1' to set corresponding bit in interrupt request register. Default Value: 0

9.1.323 SCB3_INTR_RX_MASK

Receiver interrupt mask register.

Address: 0x40080FC8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW	RW	RW	None	RW	RW	None	RW

Bits	Name	Description
11	BREAK_DETECT	Logical and of corresponding request and mask bits. Default Value: 0
10	BAUD_DETECT	Logical and of corresponding request and mask bits. Default Value: 0
9	PARITY_ERROR	Logical and of corresponding request and mask bits. Default Value: 0
8	FRAME_ERROR	Logical and of corresponding request and mask bits. Default Value: 0
7	BLOCKED	Logical and of corresponding request and mask bits. Default Value: 0
6	UNDERFLOW	Logical and of corresponding request and mask bits. Default Value: 0
5	OVERFLOW	Logical and of corresponding request and mask bits. Default Value: 0

9.1.324 SCB3_INTR_RX_MASKED (continued)

3	FULL	Logical and of corresponding request and mask bits. Default Value: 0
2	NOT_EMPTY	Logical and of corresponding request and mask bits. Default Value: 0
0	TRIGGER	Logical and of corresponding request and mask bits. Default Value: 0

10 Supervisory Flash (SFLASH) Registers

This section discusses the SFLASH registers. It lists all the registers in mapping tables, in address order.

10.1 Register Details

Register Name	Address
SFLASH_SILICON_ID	0xFFFFF244
SFLASH_HIB_KEY_DELAY	0xFFFFF250
SFLASH_DPSLP_KEY_DELAY	0xFFFFF252
SFLASH_SWD_CONFIG	0xFFFFF254
SFLASH_SWD_LISTEN	0xFFFFF258
SFLASH_FLASH_START	0xFFFFF25C
SFLASH_IMO_TRIM_USBMODE_24	0xFFFFF33E
SFLASH_IMO_TRIM_USBMODE_48	0xFFFFF33F
SFLASH_IMO_TCTRIM_LT0	0xFFFFF34C
SFLASH_IMO_TCTRIM_LT1	0xFFFFF34D
SFLASH_IMO_TCTRIM_LT2	0xFFFFF34E
SFLASH_IMO_TCTRIM_LT3	0xFFFFF34F
SFLASH_IMO_TCTRIM_LT4	0xFFFFF350
SFLASH_IMO_TCTRIM_LT5	0xFFFFF351
SFLASH_IMO_TCTRIM_LT6	0xFFFFF352
SFLASH_IMO_TCTRIM_LT7	0xFFFFF353
SFLASH_IMO_TCTRIM_LT8	0xFFFFF354
SFLASH_IMO_TCTRIM_LT9	0xFFFFF355
SFLASH_IMO_TCTRIM_LT10	0xFFFFF356
SFLASH_IMO_TCTRIM_LT11	0xFFFFF357
SFLASH_IMO_TCTRIM_LT12	0xFFFFF358
SFLASH_IMO_TCTRIM_LT13	0xFFFFF359
SFLASH_IMO_TCTRIM_LT14	0xFFFFF35A
SFLASH_IMO_TCTRIM_LT15	0xFFFFF35B
SFLASH_IMO_TCTRIM_LT16	0xFFFFF35C
SFLASH_IMO_TCTRIM_LT17	0xFFFFF35D
SFLASH_IMO_TCTRIM_LT18	0xFFFFF35E

Register Name	Address
SFLASH_IMO_TCTRIM_LT19	0x0FFF35F
SFLASH_IMO_TCTRIM_LT20	0x0FFF360
SFLASH_IMO_TCTRIM_LT21	0x0FFF361
SFLASH_IMO_TCTRIM_LT22	0x0FFF362
SFLASH_IMO_TCTRIM_LT23	0x0FFF363
SFLASH_IMO_TCTRIM_LT24	0x0FFF364
SFLASH_IMO_TRIM_LT0	0x0FFF365
SFLASH_IMO_TRIM_LT1	0x0FFF366
SFLASH_IMO_TRIM_LT2	0x0FFF367
SFLASH_IMO_TRIM_LT3	0x0FFF368
SFLASH_IMO_TRIM_LT4	0x0FFF369
SFLASH_IMO_TRIM_LT5	0x0FFF36A
SFLASH_IMO_TRIM_LT6	0x0FFF36B
SFLASH_IMO_TRIM_LT7	0x0FFF36C
SFLASH_IMO_TRIM_LT8	0x0FFF36D
SFLASH_IMO_TRIM_LT9	0x0FFF36E
SFLASH_IMO_TRIM_LT10	0x0FFF36F
SFLASH_IMO_TRIM_LT11	0x0FFF370
SFLASH_IMO_TRIM_LT12	0x0FFF371
SFLASH_IMO_TRIM_LT13	0x0FFF372
SFLASH_IMO_TRIM_LT14	0x0FFF373
SFLASH_IMO_TRIM_LT15	0x0FFF374
SFLASH_IMO_TRIM_LT16	0x0FFF375
SFLASH_IMO_TRIM_LT17	0x0FFF376
SFLASH_IMO_TRIM_LT18	0x0FFF377
SFLASH_IMO_TRIM_LT19	0x0FFF378
SFLASH_IMO_TRIM_LT20	0x0FFF379
SFLASH_IMO_TRIM_LT21	0x0FFF37A
SFLASH_IMO_TRIM_LT22	0x0FFF37B
SFLASH_IMO_TRIM_LT23	0x0FFF37C
SFLASH_IMO_TRIM_LT24	0x0FFF37D

10.1.1 SFLASH_SILICON_ID

Silicon ID

Address: 0x0FFFF244

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	ID [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	None							
Name	ID [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	ID	Silicon ID Default Value: X

10.1.2 SFLASH_HIB_KEY_DELAY

Hibernate wakeup value for PWR_KEY_DELAY

Address: 0x0FFFF250

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	WAKEUP_HOLDOFF [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None						RW	
HW Access	None						R	
Name	None [15:10]						WAKEUP_HOLDOFF [9:8]	

Bits	Name	Description
9 : 0	WAKEUP_HOLDOFF	Delay (in 12MHz IMO clock cycles) to wait for references to settle on wakeup from hibernate/deepsleep. PBOD is ignored and system does not resume until this delay expires. Note that the same delay on POR is hard-coded. Default Value: X

10.1.3 SFLASH_DPSLP_KEY_DELAY

DeepSleep wakeup value for PWR_KEY_DELAY

Address: 0x0FFFF252

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	WAKEUP_HOLDOFF [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None						RW	
HW Access	None						R	
Name	None [15:10]						WAKEUP_HOLDOFF [9:8]	

Bits	Name	Description
9 : 0	WAKEUP_HOLDOFF	Delay (in 12MHz IMO clock cycles) to wait for references to settle on wakeup from hibernate/deepsleep. PBOD is ignored and system does not resume until this delay expires. Note that the same delay on POR is hard-coded. Default Value: X

10.1.4 SFLASH_SWD_CONFIG

SWD pinout selector (not present in TSG4/TSG5-M)

Address: 0x0FFFF254

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							RW
HW Access	None							None
Name	None [7:1]							SWD_SELECT

Bits	Name	Description
0	SWD_SELECT	0: Use Primary SWD location 1: Use Alternate SWD location Default Value: X

10.1.5 SFLASH_SWD_LISTEN

Listen Window Length

Address: 0x0FFFF258

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	CYCLES [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	None							
Name	CYCLES [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	None							
Name	CYCLES [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	None							
Name	CYCLES [31:24]							

Bits	Name	Description
31 : 0	CYCLES	Number of clock cycles Default Value: X

10.1.6 SFLASH_FLASH_START

Flash Image Start Address

Address: 0x0FFFF25C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	ADDRESS [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	None							
Name	ADDRESS [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	None							
Name	ADDRESS [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	None							
Name	ADDRESS [31:24]							

Bits	Name	Description
31 : 0	ADDRESS	Start Address Default Value: X

10.1.7 SFLASH_IMO_TRIM_USBMODE_24

USB IMO TRIM 24MHz

Address: 0x0FFFF33E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	TRIM_24 [7:0]							

Bits	Name	Description
7 : 0	TRIM_24	TRIM value for IMO with USB at 24MHz Default Value: X

10.1.8 SFLASH_IMO_TRIM_USBMODE_48

USB IMO TRIM 48MHz

Address: 0x0FFFF33F

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	TRIM_24 [7:0]							

Bits	Name	Description
7 : 0	TRIM_24	TRIM value for IMO with USB at 24MHz Default Value: X

10.1.9 SFLASH_IMO_TCTRIM_LT0

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF34C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.10 SFLASH_IMO_TCTRIM_LT1

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF34D

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.11 SFLASH_IMO_TCTRIM_LT2

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF34E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.12 SFLASH_IMO_TCTRIM_LT3

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF34F

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.13 SFLASH_IMO_TCTRIM_LT4

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF350

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.14 SFLASH_IMO_TCTRIM_LT5

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF351

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.15 SFLASH_IMO_TCTRIM_LT6

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF352

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.16 SFLASH_IMO_TCTRIM_LT7

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF353

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.17 SFLASH_IMO_TCTRIM_LT8

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF354

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.18 SFLASH_IMO_TCTRIM_LT9

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF355

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.19 SFLASH_IMO_TCTRIM_LT10

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF356

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.20 SFLASH_IMO_TCTRIM_LT11

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF357

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.21 SFLASH_IMO_TCTRIM_LT12

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF358

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEPsize [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEPsize	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSoffset and OFFSET trims. Default Value: 16

10.1.22 SFLASH_IMO_TCTRIM_LT13

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF359

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.23 SFLASH_IMO_TCTRIM_LT14

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF35A

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.24 SFLASH_IMO_TCTRIM_LT15

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF35B

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.25 SFLASH_IMO_TCTRIM_LT16

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF35C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.26 SFLASH_IMO_TCTRIM_LT17

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF35D

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.27 SFLASH_IMO_TCTRIM_LT18

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF35E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.28 SFLASH_IMO_TCTRIM_LT19

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF35F

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.29 SFLASH_IMO_TCTRIM_LT20

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF360

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.30 SFLASH_IMO_TCTRIM_LT21

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF361

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.31 SFLASH_IMO_TCTRIM_LT22

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF362

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.32 SFLASH_IMO_TCTRIM_LT23

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF363

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FS_OFFSET and OFFSET trims. Default Value: 16

10.1.33 SFLASH_IMO_TCTRIM_LT24

IMO TempCo Trim Register (SRSS-Lite)

Address: 0x0FFFF364

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEP_SIZE [4:0]				

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. This bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEP_SIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10.1.34 SFLASH_IMO_TRIM_LT0

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF365

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.35 SFLASH_IMO_TRIM_LT1

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF366

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.36 SFLASH_IMO_TRIM_LT2

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF367

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.37 SFLASH_IMO_TRIM_LT3

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF368

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.38 SFLASH_IMO_TRIM_LT4

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF369

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.39 SFLASH_IMO_TRIM_LT5

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF36A

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.40 SFLASH_IMO_TRIM_LT6

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF36B

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.41 SFLASH_IMO_TRIM_LT7

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF36C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.42 SFLASH_IMO_TRIM_LT8

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF36D

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.43 SFLASH_IMO_TRIM_LT9

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF36E

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.44 SFLASH_IMO_TRIM_LT10

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF36F

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.45 SFLASH_IMO_TRIM_LT11

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF370

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.46 SFLASH_IMO_TRIM_LT12

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF371

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.47 SFLASH_IMO_TRIM_LT13

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF372

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.48 SFLASH_IMO_TRIM_LT14

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF373

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.49 SFLASH_IMO_TRIM_LT15

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF374

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.50 SFLASH_IMO_TRIM_LT16

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF375

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.51 SFLASH_IMO_TRIM_LT17

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF376

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.52 SFLASH_IMO_TRIM_LT18

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF377

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.53 SFLASH_IMO_TRIM_LT19

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF378

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.54 SFLASH_IMO_TRIM_LT20

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFFF379

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.55 SFLASH_IMO_TRIM_LT21

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF37A

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.56 SFLASH_IMO_TRIM_LT22

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF37B

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.57 SFLASH_IMO_TRIM_LT23

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF37C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

10.1.58 SFLASH_IMO_TRIM_LT24

IMO Frequency Trim Register (SRSS-Lite)

Address: 0x0FFF37D

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	None							
Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

11 SPC Interface (SPCIF) Registers

This section discusses the SPCIF registers. It lists all the registers in mapping tables, in address order.

11.1 Register Details

Register Name	Address
SPCIF_GEOMETRY	0x40110000
SPCIF_INTR	0x401107F0
SPCIF_INTR_SET	0x401107F4
SPCIF_INTR_MASK	0x401107F8
SPCIF_INTR_MASKED	0x401107FC

11.1.1 SPCIF_GEOMETRY

Flash/NVL geometry information

Address: 0x40110000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	W							
Name	FLASH [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	R		R					
HW Access	W		W					
Name	SFLASH [15:14]		FLASH [13:8]					

Bits	23	22	21	20	19	18	17	16
SW Access	R		R		R			
HW Access	W		W		W			
Name	FLASH_ROW [23:22]		NUM_FLASH [21:20]		SFLASH [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	RW	None						
HW Access	None	None						
Name	DE_CPD_LP	None [30:24]						

Bits	Name	Description
31	DE_CPD_LP	0': SRAM busy wait loop has not been copied. '1': Busy wait loop has been written into SRAM. Default Value: 0
23 : 22	FLASH_ROW	Page size in 64 Byte multiples (chip dependent): "0": 64 byte "1": 128 byte "2": 192 byte "3": 256 byte The page size is used to determine the number of Bytes in a page for Flash page based operations (e.g. PGM_PAGE). Note: the field name FLASH_ROW is misleading, as this field specifies the number of Bytes in a page, rather than the number of Bytes in a row. In a single plane flash macro architecture, a page consists of a single row. However, in a multi plane flash macro architecture, a page consists of multiple rows from different planes. Default Value: Undefined

11.1.1 SPCIF_GEOMETRY (continued)

21 : 20	NUM_FLASH	Number of flash macros (chip dependent): "0": 1 flash macro "1": 2 flash macros "2": 3 flash macros "3": 4 flash macros Default Value: Undefined
19 : 14	SFLASH	Supervisory flash capacity in 256 Byte multiples (chip dependent). If multiple flash macros are present, this field provides the supervisory flash capacity of all flash macros together: "0": 256 Bytes. "1": 2*256 Bytes. ... "63": 64*256 Bytes. Default Value: Undefined
13 : 0	FLASH	Regular flash capacity in 256 Byte multiples (chip dependent). If multiple flash macros are present, this field provides the flash capacity of all flash macros together: "0": 256 Bytes. "1": 2*256 Bytes. ... "16383": 16384*256 Bytes. Default Value: Undefined

11.1.2 SPCIF_INTR

SPCIF interrupt request register

Address: 0x401107F0

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							RW1C
HW Access	None							RW1S
Name	None [7:1]							TIMER

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	TIMER	Timer counter value reaches "0". Set to '1', when event is detected. Write INTR field with '1', to clear bit. Write INTR_SET field with '1', to set bit. Default Value: 0

11.1.3 SPCIF_INTR_SET

SPCIF interrupt set request register

Address: 0x401107F4

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							RW1S
HW Access	None							A
Name	None [7:1]							TIMER

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	TIMER	Write INTR_SET field with '1' to set corresponding INTR field. Default Value: 0

11.1.4 SPCIF_INTR_MASK

SPCIF interrupt mask register

Address: 0x401107F8

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							RW
HW Access	None							R
Name	None [7:1]							TIMER

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	TIMER	Mask for corresponding field in INTR register. Default Value: 0

11.1.5 SPCIF_INTR_MASKED

SPCIF interrupt masked request register

Address: 0x401107FC

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							R
HW Access	None							W
Name	None [7:1]							TIMER

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	TIMER	Logical and of corresponding request and mask fields. Default Value: 0

12 SRSSLT Registers

This section discusses the SRSSLT registers. It lists all the registers in mapping tables, in address order.

12.1 Register Details

Register Name	Address
PWR_CONTROL	0x40030000
PWR_KEY_DELAY	0x40030004
PWR_DDFT_SELECT	0x4003000C
TST_MODE	0x40030014
CLK_SELECT	0x40030028
CLK_ILO_CONFIG	0x4003002C
CLK_IMO_CONFIG	0x40030030
CLK_DFT_SELECT	0x40030034
WDT_DISABLE_KEY	0x40030038
WDT_COUNTER	0x4003003C
WDT_MATCH	0x40030040
SRSS_INTR	0x40030044
SRSS_INTR_SET	0x40030048
SRSS_INTR_MASK	0x4003004C
RES_CAUSE	0x40030054
CLK_IMO_SELECT	0x40030F08
CLK_IMO_TRIM1	0x40030F0C
CLK_IMO_TRIM2	0x40030F10
PWR_PWRSYS_TRIM1	0x40030F14
CLK_IMO_TRIM3	0x40030F18

12.1.1 PWR_CONTROL

Power Mode Control

Address: 0x40030000

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None		R	R	R			
HW Access	None		RW	RW	RW			
Name	None [7:6]		LPM_READ Y	DEBUG_SE SSION	POWER_MODE [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW	None			R		RW	RW
HW Access	A	None			RW		R	R
Name	EXT_VCCD	None [22:20]			SPARE [19:18]		OVER_TEM P_THRESH	OVER_TEM P_EN

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23	EXT_VCCD	Always write 0 except as noted below. PSoC4-S0 and Streetfighter CapSense products may set this bit if Vccd is provided externally (on Vccd pin). Setting this bit turns off the active regulator and will lead to system reset (BOD) unless both Vddd and Vccd pins are supplied externally. This register bit only resets for XRES, POR, or a detected BOD. Default Value: 0
19 : 18	SPARE	Spare AHB readback bits that are hooked to PWR_PWRSYS_TRIM1.SPARE_TRIM[1:0] through spare logic equivalent to bitwise inversion. Engineering only. Default Value: 0
17	OVER_TEMP_THRESH	Over-temperature threshold. 0: TEMP_HIGH condition occurs between 120C and 125C. 1: TEMP_HIGH condition occurs between 60C and 75C (used for testing). Default Value: 0
16	OVER_TEMP_EN	Enables the die over temperature sensor. Must be enabled when using the TEMP_HIGH interrupt. Default Value: 0

12.1.1 PWR_CONTROL (continued)

5	LPM_READY	<p>Indicates whether the low power mode regulator is ready to enter DEEPSLEEP mode.</p> <p>0: If DEEPSLEEP mode is requested, device will enter SLEEP mode. When low power regulators are ready, device will automatically enter the originally requested mode.</p> <p>1: Normal operation. DEEPSLEEP works as described.</p> <p>Default Value: 0</p>
4	DEBUG_SESSION	<p>Indicates whether a debug session is active (CDBGPWUPREQ signal is 1)</p> <p>Default Value: 0</p> <p>0x0: NO_SESSION: No debug session active</p> <p>0x1: SESSION_ACTIVE: Debug session is active</p>
3 : 0	POWER_MODE	<p>Current power mode of the device. Note that this field cannot be read in all power modes on actual silicon.</p> <p>Default Value: 0</p> <p>0x0: RESET: RESET state</p> <p>0x1: ACTIVE: ACTIVE state</p> <p>0x2: SLEEP: SLEEP state</p> <p>0x3: DEEP_SLEEP: DEEP_SLEEP state</p>

12.1.2 PWR_KEY_DELAY

Power System Key Register

Address: 0x40030004

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	WAKEUP_HOLDOFF [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None						RW	
HW Access	None						R	
Name	None [15:10]						WAKEUP_HOLDOFF [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9 : 0	WAKEUP_HOLDOFF	Delay to wait for references to settle on wakeup from deepsleep. BOD is ignored and system does not resume until this delay expires. Note that the same delay on POR is hard-coded. The default assumes the output of the predivider is 48MHz + 3%. Firmware may scale this setting according to the fastest actual clock frequency that can occur when waking from DEEPSLEEP. Default Value: 248

12.1.3 PWR_DDFT_SELECT

Power DDFT Mode Selection Register

Address: 0x4003000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	DDFT1_SEL [7:4]				DDFT0_SEL [3:0]			
Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							
Bits	23	22	21	20	19	18	17	16

12.1.3 PWR_DDFT_SELECT (continued)

0xc: ADFT_BUF_EN:

adft_buf_en

0xd: ATPG_OBSERVE:

ATPG observe point (no functional purpose)

0xe: GND:

1'b0

0xf: PWR:

1'b1

12.1.4 TST_MODE

Test Mode Control Register

Address: 0x40030014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None					R	None	
HW Access	None					RW	None	
Name	None [7:3]					SWD_CONNECTED	None [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	R	None	RW	None			
HW Access	R	RW	None	A	None			
Name	TEST_MODE	TEST_KEY_DFT_EN	None	BLOCK_ALTXRES	None [27:24]			

Bits	Name	Description
31	TEST_MODE	0: Normal operation mode 1: Test mode (any test mode) Setting this bit will prevent BootROM from yielding execution to Flash image. Default Value: 0
30	TEST_KEY_DFT_EN	This bit is set when a XRES test mode key is shifted in. It is the value of the test_key_dft_en signal. When this bit is set, the BootROM will not yield execution to the FLASH image (same function as setting TEST_MODE bit below). Default Value: 0
28	BLOCK_ALT_XRES	Relevant only for parts that have the alternate XRES mechanism of overloading a GPIO pin temporarily as alternate XRES during test. When set, this bit blocks the alternate XRES function, such that the pin can be used for normal I/O or for ddft/adft observation. See SAS Part-V and Part-IX for details. This register bit only resets for XRES, POR, or a detected BOD. Default Value: 0

12.1.4 TST_MODE (continued)

2	SWD_CONNECTED	0: SWD not active 1: SWD activated (Line Reset & Connect sequence passed) (Note: this bit replaces TST_CTRL.SWD_CONNECTED and is present in all M0S8 products except TSG4) Default Value: 0
---	---------------	--

12.1.5 CLK_SELECT

Clock Select Register

Address: 0x40030028

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW		RW		RW		RW	
HW Access	R		R		R		R	
Name	SYSCLK_DIV [7:6]		PUMP_SEL [5:4]		HFCLK_DIV [3:2]		HFCLK_SEL [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 6	SYSCLK_DIV	Select clk_sys prescaler value. Default Value: 0 0x0: NO_DIV: clk_sys= clk_hf/1 0x1: DIV_BY_2: clk_sys= clk_hf/2 0x2: DIV_BY_4: clk_sys= clk_hf/4 0x3: DIV_BY_8: clk_sys= clk_hf/8
5 : 4	PUMP_SEL	Selects clock source for charge pump clock. This clock is not guaranteed to be glitch free when changing any of its sources or settings. Default Value: 0 0x0: GND: No clock, connect to gnd

12.1.5 CLK_SELECT (continued)

		0x1: IMO: Use main IMO output
		0x2: HFCLK: Use clk_hf (using selected source after predivider but before prescaler)
3 : 2	HFCLK_DIV	Selects clk_hf predivider value. Default Value: 2
		0x0: NO_DIV: Transparent mode, feed through selected clock source w/o dividing.
		0x1: DIV_BY_2: Divide selected clock source by 2
		0x2: DIV_BY_4: Divide selected clock source by 4
		0x3: DIV_BY_8: Divide selected clock source by 8
1 : 0	HFCLK_SEL	Selects a source for clk_hf and dsi_in[0]. Note that not all products support all clock sources. Selecting a clock source that is not supported will result in undefined behavior. Default Value: 0
		0x0: IMO: IMO - Internal R/C Oscillator
		0x1: EXTCLK: EXTCLK - External Clock Pin
		0x2: ECO: ECO - External-Crystal Oscillator or PLL subsystem output

12.1.6 CLK_ILO_CONFIG

ILO Configuration

Address: 0x4003002C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							
HW Access	None							
Name	None [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	None						
HW Access	RW	None						
Name	ENABLE	None [30:24]						

Bits	Name	Description
31	ENABLE	Master enable for ILO oscillator. This bit is hardware set whenever the WDT_DISABLE_KEY is not set to the magic value. Default Value: 1

12.1.7 CLK_IMO_CONFIG

IMO Configuration

Address: 0x40030030

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None							
HW Access	None							
Name	None [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	None						
HW Access	R	None						
Name	ENABLE	None [30:24]						

Bits	Name	Description
31	ENABLE	Master enable for IMO oscillator. Clearing this bit will disable the IMO. Don't do this if the system is running off it. Default Value: 1

12.1.8 CLK_DFT_SELECT

Clock DFT Mode Selection Register

Address: 0x40030034

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW	RW		RW			
HW Access	None	R	R		R			
Name	None	DFT_EDGE 0	DFT_DIV0 [5:4]		DFT_SEL0 [3:0]

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
14	DFT_EDGE1	Edge sensitivity for in-line divider on output #1 (only relevant when DIV1>0). Default Value: 0 0x0: POSEDGE: Use posedge for divider 0x1: NEGEDGE: Use negedge for divider
13 : 12	DFT_DIV1	DFT Output Divide Down. Default Value: 0 0x0: NO_DIV: Direct Output 0x1: DIV_BY_2: Divide by 2 0x2: DIV_BY_4: Divide by 4

12.1.8 CLK_DFT_SELECT (continued)

11 : 8	DFT_SEL1	0x3: DIV_BY_8: Divide by 8
		Select signal for DFT output #1 Default Value: 0
		0x0: NC: Disabled - output is 0
		0x1: ILO: clk_ilo: ILO output
		0x2: IMO: clk_imo: IMO primary output
		0x3: ECO: clk_eco: ECO output
		0x4: EXTCLK: clk_ext: external clock input
		0x5: HFCLK: clk_hf: root of the high-speed clock tree
		0x6: LFCLK: clk_lf: root of the low-speed clock tree
		0x7: SYSCLK: clk_sys: root of the CPU/AHB clock tree (gated version of clk_hf)
6	DFT_EDGE0	0x8: PUMPCLK: clk_pump: clock provided to charge pumps in FLASH and PA
		0x9: SLPCTRLCLK: clk_slpctrl: clock provided to SleepController
		Edge sensitivity for in-line divider on output #0 (only relevant when DIV0>0). Default Value: 0
5 : 4	DFT_DIV0	0x0: POSEDGE: Use posedge for divider
		0x1: NEGEDGE: Use negedge for divider
		DFT Output Divide Down. Default Value: 0
		0x0: NO_DIV: Direct Output
		0x1: DIV_BY_2: Divide by 2
		0x2: DIV_BY_4: Divide by 4
		0x3: DIV_BY_8: Divide by 8
		Select signal for DFT output #0 Default Value: 0
		0x0: NC: Disabled - output is 0
3 : 0	DFT_SEL0	Select signal for DFT output #0 Default Value: 0
		0x0: NC: Disabled - output is 0

12.1.8 CLK_DFT_SELECT (continued)

0x1: ILO:

clk_ilo: ILO output

0x2: IMO:

clk_imo: IMO primary output

0x3: ECO:

clk_eco: ECO output

0x4: EXTCLK:

clk_ext: external clock input

0x5: HFCLK:

clk_hf: root of the high-speed clock tree

0x6: LFCLK:

clk_lf: root of the low-speed clock tree

0x7: SYSCLK:

clk_sys: root of the CPU/AHB clock tree (gated version of clk_hf)

0x8: PUMPCLK:

clk_pump: clock provided to charge pumps in FLASH and PA

0x9: SLPCTRLCLK:

clk_slpctrl: clock provided to SleepController

12.1.9 WDT_DISABLE_KEY

Watchdog Disable Key Register

Address: 0x40030038

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	KEY [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	KEY [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	RW							
HW Access	R							
Name	KEY [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access	R							
Name	KEY [31:24]							

Bits	Name	Description
31 : 0	KEY	Disables WDT reset when equal to 0xACED8865. The WDT reset functions normally for any other setting. Default Value: 0

12.1.10 WDT_COUNTER

Watchdog Counter Register

Address: 0x4003003C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	R							
HW Access	RW							
Name	COUNTER [7:0]							
Bits	15	14	13	12	11	10	9	8
SW Access	R							
HW Access	RW							
Name	COUNTER [15:8]							
Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							
Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
15 : 0	COUNTER	Current value of WDT Counter Default Value: 0

12.1.11 WDT_MATCH

Watchdog Match Register

Address: 0x40030040

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	MATCH [7:0]							

Bits	15	14	13	12	11	10	9	8
SW Access	RW							
HW Access	R							
Name	MATCH [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None				RW			
HW Access	None				R			
Name	None [23:20]				IGNORE_BITS [19:16]			

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	IGNORE_BITS	The number of MSB bits of the watchdog timer that are NOT checked against MATCH. This value provides control over the time-to-reset of the watchdog (which happens after 3 successive matches). Note that certain products may enforce a minimum value for this register through design time configuration. Default Value: 0
15 : 0	MATCH	Match value for Watchdog counter. Every time WDT_COUNTER reaches MATCH an interrupt is generated. Two unserviced interrupts will lead to a system reset (i.e. at the third match). Default Value: 4096

12.1.12 SRSS_INTR

SRSS Interrupt Register

Address: 0x40030044

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW1C	RW1C
HW Access	None						A	A
Name	None [7:2]						TEMP_HIGH	WDT_MATCH

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	TEMP_HIGH	Regulator over-temp interrupt. This interrupt can occur when a short circuit exists on the vccd pin or when extreme loads are applied on IO-cells causing the die to overheat. Firmware is encourage to shutdown all IO cells and then go to DeepSleep mode when this interrupt occurs if protection against such conditions is desired. Default Value: 0
0	WDT_MATCH	WDT Interrupt Request. This bit is set each time WDT_COUNT==WDT_MATCH. Clearing this bit also feeds the watch dog. Missing 2 interrupts in a row will generate brown-out reset. Due to internal synchronization, it takes 2 SYSCLK cycles to update after a W1C. Default Value: 0

12.1.13 SRSS_INTR_SET

SRSS Interrupt Set Register

Address: 0x40030048

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW1S	None
HW Access	None						A	None
Name	None [7:2]						TEMP_HIGH	None

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	TEMP_HIGH	Writing 1 to this bit internally sets the overtemp interrupt. This can be observed by reading SRSS_INTR.TEMP_HIGH. This bit always reads back as zero. Default Value: 0

12.1.14 SRSS_INTR_MASK

SRSS Interrupt Mask Register

Address: 0x4003004C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	RW
HW Access	None						R	R
Name	None [7:2]						TEMP_HIGH	WDT_MATCH

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	TEMP_HIGH	Masks REG_OVERTEMP interrupt Default Value: 0
0	WDT_MATCH	Clearing this bit will not forward the interrupt to the CPU. It will not, however, disable the WDT reset generation on 2 missed interrupts. Default Value: 0

12.1.15 RES_CAUSE

Reset Cause Observation Register

Address: 0x40030054

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None			RW1C	RW1C	None		RW1C
HW Access	None			A	A	None		A
Name	None [7:5]			RESET_SOFT	RESET_PROT_FAULT	None [2:1]		RESET_WDT

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]

HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
4	RESET_SOFT	Cortex-M0 requested a system reset through it's SYSRESETREQ. This can be done via a debugger probe or in firmware. Default Value: 0
3	RESET_PROT_FAULT	A protection violation occurred that requires a RESET. This includes, but is not limited to, hitting a debug breakpoint while in Privileged Mode. Default Value: 0
0	RESET_WDT	A WatchDog Timer reset has occurred since last power cycle. Default Value: 0

12.1.16 CLK_IMO_SELECT

IMO Frequency Select Register

Address: 0x40030F08

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None					RW		
HW Access	None					R		
Name	None [7:3]					FREQ [2:0]

HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. This field is hardware updated during USB osclock mode. This field is mapped to the most significant bits of the IMO trim imo_clk_trim[10:3]. The step size of 1 LSB on this field is approximately 120 kHz. Default Value: 128

12.1.18 CLK_IMO_TRIM2

IMO Trim Register

Address: 0x40030F10

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None					RW		
HW Access	None					RW		
Name	None [7:3]					FSOFFSET [2:0]		

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
2 : 0	FSOFFSET	Frequency trim bits. These bits are not trimmed during manufacturing and kept at 0 under normal operation. This field is hardware updated during USB osclock mode. This field is mapped to the least significant bits of the IMO trim imo_clk_trim[2:0]. The step size of 1 LSB on this field is approximately 15 kHz. Default Value: 0

12.1.19 PWR_PWRSYS_TRIM1

Power System Trim Register

Address: 0x40030F14

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW				RW			
HW Access	R				R			
Name	SPARE_TRIM [7:4]				DPSLP_REF_TRIM [3:0]			

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 4	SPARE_TRIM	Active-Reference temperature compensation trim (repurposed from spare bits). Bits [7:6] - trim the Active-Reference IREF temperature coefficient (TC). 00: TC = 0 (unchanged) 01: TC = +80ppm/C 10: TC = -80ppm/C 11: TC = -150ppm/C Bits [5:4] - trim the Active-Reference VREF temperature coefficient (TC). 00: TC = 0 (unchanged) 01: TC = -50ppm/C 10: TC = -80ppm/C 11: TC = +150ppm/C Default Value: 0
3 : 0	DPSLP_REF_TRIM	Trims the DeepSleep reference that is used by the DeepSleep regulator and DeepSleep power comparator. Default Value: 0

12.1.20 CLK_IMO_TRIM3

IMO Trim Register

Address: 0x40030F18

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None	RW		RW				
HW Access	None	R		R				
Name	None	TCTRIM [6:5]		STEPsize [4:0]				

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
6 : 5	TCTRIM	IMO temperature compensation trim. These bits are determined at manufacturing time to adjust for temperature dependence. These bits are dependent on frequency and need to be changed using the Cypress provided frequency change algorithm. Default Value: 2
4 : 0	STEPsize	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

12.1.20 CLK_IMO_TRIM3 (continued)

13 TCPWM Registers

This section discusses the TCPWM registers. It lists all the registers in mapping tables, in address order.

13.1 Register Details

Register Name	Address
TCPWM_CTRL	0x40090000
TCPWM_CMD	0x40090008
TCPWM_INTR_CAUSE	0x4009000C

13.1.1 TCPWM_CTRL

TCPWM control register 0.

Address: 0x40090000

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW	
HW Access	None						R	
Name	None [7:2]						COUNTER_ENABLED [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1 : 0	COUNTER_ENABLED	<p>Counter enables for counters 0 up to CNT_NR-1.</p> <p>'0': counter disabled.</p> <p>'1': counter enabled.</p> <p>Counter static configuration information (e.g. CTRL.MODE, all TR_CTRL0, TR_CTRL1, and TR_CTRL2 register fields) should only be modified when the counter is disabled. When a counter is disabled, command and status information associated to the counter is cleared by HW, this includes:</p> <ul style="list-style-type: none"> - the associated counter triggers in the CMD register are set to '0'. - the counter's interrupt cause fields in counter's INTR register. - the counter's status fields in counter's STATUS register.. - the counter's trigger outputs ("tr_overflow", "tr_underflow" and "tr_compare_match"). - the counter's line outputs ("line_out" and "line_compl_out"). <p>Default Value: 0</p>

13.1.2 TCPWM_CMD

TCPWM command register.

Address: 0x40090008

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						RW1S	
HW Access	None						RW1C	
Name	None [7:2]						COUNTER_CAPTURE [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None						RW1S	
HW Access	None						RW1C	
Name	None [15:10]						COUNTER_RELOAD [9:8]	

Bits	23	22	21	20	19	18	17	16
SW Access	None						RW1S	
HW Access	None						RW1C	
Name	None [23:18]						COUNTER_STOP [17:16]	

Bits	31	30	29	28	27	26	25	24
SW Access	None						RW1S	
HW Access	None						RW1C	
Name	None [31:26]						COUNTER_START [25:24]	

Bits	Name	Description
25 : 24	COUNTER_START	Counters SW start trigger. For HW behavior, see COUNTER_CAPTURE field. Default Value: 0
17 : 16	COUNTER_STOP	Counters SW stop trigger. For HW behavior, see COUNTER_CAPTURE field. Default Value: 0
9 : 8	COUNTER_RELOAD	Counters SW reload trigger. For HW behavior, see COUNTER_CAPTURE field. Default Value: 0
1 : 0	COUNTER_CAPTURE	Counters SW capture trigger. When written with '1', a capture trigger is generated and the HW sets the field to '0' when the SW trigger has taken effect. It should be noted that the HW operates on the counter frequency. If the counter is disabled through CTRL.COUNTER_ENABLED, the field is immediately set to '0'. Default Value: 0

13.1.3 TCPWM_INTR_CAUSE

TCPWM Counter interrupt cause register.

Address: 0x4009000C

Retention: Not Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None						R	
HW Access	None						W	
Name	None [7:2]						COUNTER_INT [1:0]	

Bits	15	14	13	12	11	10	9	8
SW Access	None							
HW Access	None							
Name	None [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1 : 0	COUNTER_INT	Counters interrupt signal active. If the counter is disabled through CTRL.COUNTER_ENABLED, the associated interrupt field is immediately set to '0'. Default Value: 0

13.1.3 TCPWM_INTR_CAUSE (continued)

14 USBPD Registers

To configure the USB PD registers, use the USB PD component provided by the ModusToolbox™ (MTB) IDE. See [Getting Started with EZ-PD™ PMG1 on ModusToolbox](#) application note for more details.
