

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

## General Description

PSoC® 6 MCU is a high-performance, ultra-low-power and secured MCU platform, purpose-built for IoT applications. Based on the PSoC 6 MCU platform, this product line is a combination of a dual CPU microcontroller with low-power flash technology, digital programmable logic, high-performance analog-to-digital conversion and standard communication and timing peripherals.

## Features

### 32-bit Dual CPU Subsystem

- 150-MHz Arm® Cortex®-M4F (CM4) CPU with single-cycle multiply, floating point, and memory protection unit (MPU)
- 100-MHz Cortex-M0+ (CM0+) CPU with single-cycle multiply and MPU
- User-selectable core logic operation at either 1.1 V or 0.9 V
- Active CPU current slope with 1.1-V core operation
  - Cortex-M4: 40  $\mu$ A/MHz
  - Cortex-M0+: 20  $\mu$ A/MHz
- Active CPU current slope with 0.9-V core operation
  - Cortex-M4: 22  $\mu$ A/MHz
  - Cortex-M0+: 15  $\mu$ A/MHz
- Three DMA controllers

### Memory Subsystem

- 512-KB application flash, 32-KB auxiliary flash (AUXflash), and 32-KB supervisory flash (SFlash); read-while-write (RWW) support. Two 8-KB flash caches, one for each CPU.
- 256-KB SRAM with programmable power control and retention granularity
- One-time-programmable (OTP) 1-Kb eFuse array

### Low-Power 1.7-V to 3.6-V Operation

- Six power modes for fine-grained power management
- Deep Sleep mode current of 7  $\mu$ A with 64-KB SRAM retention
- On-chip DC-DC buck converter, <1  $\mu$ A quiescent current
- Backup domain with 64 bytes of memory and real-time clock

### Flexible Clocking Options

- 8-MHz internal main oscillator (IMO) with  $\pm 2\%$  accuracy
- Ultra-low-power 32-kHz internal low-speed oscillator (ILO)
- On-chip crystal oscillators (16 to 35 MHz, and 32 kHz)
- Phase-locked loop (PLL) for multiplying clock frequencies
- Frequency-locked loop (FLL) for multiplying IMO frequency
- Integer and fractional peripheral clock dividers

### Quad-SPI (QSPI)/Serial Memory Interface (SMIF)

- Execute-In-Place (XIP) from external quad SPI flash
- On-the-fly encryption and decryption
- 4-KB cache for greater XIP performance with lower power
- Supports single, dual, and quad interfaces with throughput up to 320 Mbps

### Segment LCD Drive

- Supports up to 63 segments and up to 8 commons.
- Operates in system Deep Sleep mode

### Serial Communication

- Seven run-time configurable serial communication blocks (SCBs)
  - Six SCBs: configurable as SPI, I<sup>2</sup>C, or UART
  - One Deep Sleep SCB: configurable as SPI or I<sup>2</sup>C
- USB Full-Speed device interface
- One SD Host Controller/eMMC/SD controller
- One CAN FD block

### Timing and Pulse-Width Modulation

- Twelve timer/counter/pulse-width modulators (TCPWMs)
- Center-aligned, edge, and pseudo-random modes
- Comparator-based triggering of kill signals

### Programmable Analog

- 12-bit 2-Msps SAR ADC with differential and single-ended modes and 16-channel sequencer with result averaging
- Two low-power comparators available in system Deep Sleep and Hibernate modes
- Built-in temperature sensor connected to ADC

### Up to 64 Programmable GPIOs

- Two Smart I/O™ ports (8 I/Os) enable Boolean operations on GPIO pins; available during system Deep Sleep
- Programmable drive modes, strengths, and slew rates
- Two overvoltage-tolerant (OVT) pins

### Capacitive Sensing

- Cypress CapSense® sigma-delta (CSD) provides best-in-class signal-to-noise ratio (SNR), liquid tolerance, and proximity sensing
- Enables dynamic usage of both self and mutual sensing
- Automatic hardware tuning (SmartSense™)

**Security Built into Platform Architecture**

- ROM-based root of trust via uninterruptible “Secure Boot”
- Authentication during boot using hardware hashing
- Step-wise authentication of execution images
- Secured execution of code in execute-only mode for protected routines
- All debug and test ingress paths can be disabled
- Up to eight protection contexts

**Cryptography Accelerator**

- Hardware acceleration for symmetric and asymmetric cryptographic methods and hash functions
- True random number generation (TRNG) function

**Packages**

- 100 TQFP, 68 QFN, 49 WLCSP

**Device Identification and Revisions**

- Product line ID (12-bit): 0x105
- Major/Minor die revision ID: 1/2
- Firmware revisions: ROM Boot: 7.1, Flash Boot: 3.1.0.378 (see [Boot Code](#) section)

This product line has a JTAG ID which is available through the SWJ interface. It is a 32-bit ID, where:

- The most significant digit is the device revision, based on the Major Die Revision
- The next four digits correspond to the part number, for example "E4B0" as a hexadecimal number
- The three least significant digits are the manufacturer ID, in this case "069" as a hexadecimal number

The Silicon ID system call can be used by firmware to get Silicon ID and ROM Boot data. For more information, see the [technical reference manual \(TRM\)](#).

The Flash Boot version can be read directly from designated addresses 0x1600 2004 and 0x1600 2018. For more information, see the [technical reference manual \(TRM\)](#).

## Development Ecosystem

### PSoC 6 MCU Resources

Cypress provides a wealth of data at [www.cypress.com](http://www.cypress.com) to help you select the right PSoC device and quickly and effectively integrate it into your design. The following is an abbreviated list of resources for PSoC 6 MCU:

- **Overview:** [PSoC Portfolio](#), [PSoC Roadmap](#)
- **Product Selectors:** [PSoC 6 MCU](#)
- **Application Notes** cover a broad range of topics, from basic to advanced level, and include the following:
  - [AN221774](#): Getting Started with PSoC 6 MCU
  - [AN218241](#): PSoC 6 MCU Hardware Design Guide
  - [AN213924](#): PSoC 6 MCU Device Firmware Update Guide
  - [AN215656](#): PSoC 6 MCU Dual-CPU System Design
  - [AN219528](#): PSoC 6 MCU Power Reduction Techniques
  - [AN221111](#): PSoC 6 MCU Creating a Secure System
  - [AN85951](#): PSoC 4, PSoC 6 MCU CapSense Design Guide
- **Code Examples** demonstrate product features and usage, and are also available on [Cypress GitHub repositories](#).
- **Technical Reference Manuals (TRMs)** provide detailed descriptions of PSoC 6 MCU architecture and registers.
- **PSoC 6 MCU Programming Specification** provides the information necessary to program PSoC 6 MCU nonvolatile memory
- **Development Tools**
  - [ModusToolbox®](#) software enables cross platform code development with a robust suite of tools and software libraries
  - [CY8CPROTO-062S3-4343W](#) PSoC 6 Wi-Fi-BT Prototyping Kit : a low-cost hardware platform that enables design and debug of the PSoC 62 CY8C62x5 product line.
  - [PSoC 6 CAD libraries](#) provide footprint and schematic support for common tools. [BSDL files](#) and [IBIS models](#) are also available.
- **Training Videos** are available on a wide range of topics including the [PSoC 6 MCU 101 series](#)
- **Cypress Developer Community** enables connection with fellow PSoC developers around the world, 24 hours a day, 7 days a week, and hosts a dedicated [PSoC 6 MCU Community](#)

### ModusToolbox™ IDE and the PSoC 6 SDK

[ModusToolbox Software](#) is Cypress' comprehensive collection of multi-platform tools and software libraries that enable an immersive development experience for creating converged MCU and wireless systems. It is:

- Comprehensive - it has the resources you need
- Flexible - you can use the resources in your own workflow
- Atomic - you can get just the resources you want

Cypress provides a large collection of code [repositories on GitHub](#). This includes:

- Board Support Packages (BSPs) aligned with Cypress kits
- Low-level resources, including a hardware abstraction layer (HAL) and peripheral driver library (PDL)
- Middleware enabling industry-leading features such as CapSense, Bluetooth Low Energy, and mesh networks
- An extensive set of thoroughly tested [code example applications](#)

**Note:** The HAL provides a high-level, simplified interface to configure and use the hardware blocks on Cypress MCUs. It is a generic interface that can be used across multiple product families. For example, it wraps the PSoC 6 PDL with a simplified API, but the PDL exposes all low-level peripheral functionality. You can leverage the HAL's simpler and more generic interface for most of an application, even if one portion requires finer-grained control.

ModusToolbox Software is IDE-neutral and easily adaptable to your workflow and preferred development environment. It includes a project creator, peripheral and library configurators, a library manager, as well as the optional Eclipse IDE for ModusToolbox. For information on using Cypress tools, refer to the documentation delivered with ModusToolbox software, and [AN228571: Getting Started with PSoC 6 MCU on ModusToolbox](#).

Figure 1. ModusToolbox Software Tools

## Blocks and Functionality

Figure 2 shows the major subsystems and a simplified view of their interconnections. The color coding shows the lowest power mode where the particular block is still functional (for example, the SRAM is functional down to system Deep Sleep mode).

Figure 2. Block Diagram

There are three debug access ports, one each for CM4 and CM0+, and a system port.

PSoC 6 MCU devices include extensive support for programming, testing, debugging, and tracing both hardware and firmware. All device interfaces can be permanently disabled for applications concerned about a reprogrammed device or starting and interrupting flash programming sequences. All programming, debug, and test interfaces can be disabled.

Complete debug-on-chip functionality enables full device debugging in the final system using the standard production device. It does not require special interfaces, debugging pods, simulators, or emulators. Only the standard programming connections are required to fully support debug.

The Eclipse IDE for ModusToolbox provides fully integrated programming and debug support for these devices. The SWJ (SWD and JTAG) interface is fully compatible with industry-standard third party probes. With the ability to disable debug features, with very robust flash protection, and by allowing customer-proprietary functionality to be implemented in on-chip programmable blocks, PSoC 6 provides multiple levels of device security.

## Functional Description

The following sections provide an overview of the features, capabilities and operation of each functional block identified in the block diagram in [Figure 2](#). For more detailed information, refer to the following documentation:

### ■ Board Support Package (BSP) Documentation

BSPs are available on [GitHub](#). They are aligned with Cypress kits and provide files for basic device functionality such as hardware configuration files, startup code, and linker files. The BSP also includes other libraries that are required to support a kit. Each BSP has its own documentation, but typically includes an API reference such as the example [here](#). This [search link](#) finds all currently available BSPs on the Cypress GitHub site.

### ■ Hardware Abstraction Layer API Reference Manual

The Cypress Hardware Abstraction Layer (HAL) provides a high-level interface to configure and use hardware blocks on Cypress MCUs. It is a generic interface that can be used across multiple product families. You can leverage the HAL's simpler and more generic interface for most of an application, even if one portion requires finer-grained control. The [HAL API Reference](#) provides complete details. Example applications that use the HAL download it automatically from the GitHub repository.

### ■ Peripheral Driver Library (PDL) Application Programming Interface (API) Reference Manual

The Peripheral Driver Library (PDL) integrates device header files and peripheral drivers into a single package and supports all PSoC 6 MCU product lines. The drivers abstract the hardware functions into a set of easy-to-use APIs. These are fully documented in the [PDL API Reference](#). Example applications that use the PSoC 6 PDL download it automatically from the GitHub repository.

### ■ Architecture Technical Reference Manual (TRM)

The architecture TRM provides a detailed description of each resource in the device. This is the next reference to use if it is necessary to understand the operation of the hardware below the software provided by PDL. It describes the architecture and functionality of each resource and explains the operation of each resource in all modes. It provides specific guidance regarding the use of associated registers.

### ■ Register Technical Reference Manual

The register TRM provides a complete list of all registers in the device. It includes the breakdown of all register fields, their possible settings, read/write accessibility, and default states. All registers that have a reasonable use in typical applications have functions to access them from within PDL. Note that ModusToolbox and PDL may provide software default conditions for some registers that are different from and override the hardware defaults.

## CPU and Memory Subsystem

PSoC 6 has multiple bus masters, as [Figure 2](#) shows. They are: CPUs, DMA controllers, QSPI, USB, SD Host controller, and a Crypto block. Generally, all memory and peripherals can be accessed and shared by all bus masters through multi-layer Arm AMBA high-performance bus (AHB) arbitration. Accesses between CPUs can be synchronized using an inter-processor communication (IPC) block.

### CPUs

There are two Arm Cortex CPUs:

The Cortex-M4 (CM4) has single-cycle multiply, a floating-point unit (FPU), and a memory protection unit (MPU). It can run at up to 150 MHz. This is the main CPU, designed for a short interrupt response time, high code density, and high throughput.

CM4 implements a version of the Thumb instruction set based on Thumb-2 technology (defined in the [Armv7-M Architecture Reference Manual](#)).

The Cortex-M0+ (CM0+) has single-cycle multiply, and an MPU. It can run at up to 100 MHz; however, for CM4 speeds above 100 MHz, CM0+ and bus peripherals are limited to half the speed of CM4. Thus, for CM4 running at 150 MHz, CM0+ and peripherals are limited to 75 MHz.

In PSoC 64, the initial CM0+ frequency is set according to a provisioned security policy (see PSoC 64 Security). The frequency ranges from 8 MHz to 50 MHz. For more information, see the Register and Architectu TRM. .

CM0+ is the secondary CPU; it is used to implement system calls and device-level security, safety, and protection features. CM0+ provides a secured, uninterruptible boot function. This helps ensure that post boot, system integrity is checked and memory and peripheral access privileges are enforced.

CM0+ implements the Armv6-M Thumb instruction set (defined in the [Armv6-M Architecture Reference Manual](#)).

The CPUs have the following power draw, at  $V_{DD} = 3.3$  V and using the internal buck regulator:

**Table 1. Active Current Slope at  $V_{DD} = 3.3$  V Using the Internal Buck Regulator**

|     |            | System Power Mode |                |
|-----|------------|-------------------|----------------|
|     |            | ULP               | LP             |
| CPU | Cortex-M0+ | 15 $\mu$ A/MHz    | 20 $\mu$ A/MHz |
|     | Cortex-M4  | 22 $\mu$ A/MHz    | 40 $\mu$ A/MHz |

The CPUs can be selectively placed in their Sleep and Deep Sleep power modes as defined by Arm.

Both CPUs have nested vectored interrupt controllers (NVIC) for rapid and deterministic interrupt response, and wakeup interrupt controllers (WIC) for CPU wakeup from Deep Sleep power mode.

The CPUs have extensive debug support. PSoC 6 has a debug access port (DAP) that acts as the interface for device programming and debug. An external programmer or debugger (the "host") communicates with the DAP through the device serial wire debug (SWD) or Joint Test Action Group (JTAG) interface pins. Through the DAP (and subject to device security

restrictions), the host can access the device memory and peripherals as well as the registers in both CPUs.

Each CPU offers debug and trace features as follows:

- CM4 supports six hardware breakpoints and four watchpoints, 4-bit embedded trace macrocell (ETM), serial wire viewer (SWV), and printf()-style debugging through the single wire output (SWO) pin.
- CM0+ supports four hardware breakpoints and two watchpoints, and a micro trace buffer (MTB) with 4-KB dedicated RAM.

PSoC 6 also has an Embedded Cross Trigger for synchronized debugging and tracing of both CPUs.

## Interrupts

This product line has 174 system and peripheral interrupt sources, and supports interrupts and system exceptions on both CPUs. CM4 has 174 interrupt request lines (IRQ), with the interrupt source 'n' directly connected to IRQn. CM0+ has eight interrupts IRQ[7:0] with configurable mapping of one or more interrupt sources to any of the IRQ[7:0]. CM0+ also supports eight internal (software only) interrupts.

Each interrupt supports configurable priority levels (eight levels for CM4 and four levels for CM0+). Up to four system interrupts can be mapped to each of the CPUs' non-maskable interrupts (NMI). Up to 39 interrupt sources are capable of waking the device from Deep Sleep power mode using the WIC. Refer to the [technical reference manual \(TRM\)](#).

## InterProcessor Communication (IPC)

In addition to the Arm SEV and WFE instructions, a hardware InterProcessor Communication (IPC) block is included. It includes 16 IPC channels and 16 IPC interrupt structures. The IPC channels can be used to implement data communication between the processors. Each IPC channel also implements a locking scheme which can be used to manage shared resources. The IPC interrupts let one processor interrupt the other, signaling an event. This is used to trigger events such as notify and release of the corresponding IPC channels. Some IPC channels and other resources are reserved, as [Table 2](#) shows:

**Table 2. Distribution of IPC Channels and Other Resources**

| Resources Available                                    | Resources Consumed   |
|--------------------------------------------------------|----------------------|
| IPC channels,<br>16 available                          | 8 reserved           |
| IPC interrupts,<br>16 available                        | 8 reserved           |
| Other interrupts                                       | 1 reserved           |
| CM0+ NMI                                               | Reserved             |
| Other resources:<br>clock dividers, DMA channels, etc. | 1 CM0+ interrupt mux |

## Direct Memory Access (DMA) Controllers

This product line has three DMA controllers, with 32, 29, and 2 channels, which support CPU-independent accesses to memory and peripherals. The descriptors for DMA channels can be in SRAM or flash. Therefore, the number of descriptors is limited only by the size of the memory. Each descriptor can transfer data in two nested loops with configurable address increments to the source and destination. The size of data transfer per descriptor varies based on the type of DMA channel. Refer to the [technical reference manual \(TRM\)](#) for detail.

## Cryptography Accelerator (Crypto)

This subsystem consists of hardware implementation and acceleration of cryptographic functions and random number generators.

The Crypto subsystem supports the following:

- Encryption/Decryption Functions
  - Data Encryption Standard (DES)
  - Triple DES (3DES)
  - Advanced Encryption Standard (AES) (128-, 192-, 256-bit)
  - Elliptic Curve Cryptography (ECC)
  - RSA cryptography functions
- Hashing functions
  - Secure Hash Algorithm (SHA)
  - SHA-1
  - SHA-224/-256/-384/-512
- Message authentication functions (MAC)
  - Hashed message authentication code (HMAC)
  - Cipher-based message authentication code (CMAC)
- 32-bit cyclic redundancy code (CRC) generator
- Random number generators
  - Pseudo random number generator (PRNG)
  - True random number generator (TRNG)

## Protection Units

This product line has multiple types of protection units to control erroneous or unauthorized access to memory and peripheral registers. CM4 and CM0+ have Arm MPUs for protection at the bus master level. Other bus masters use additional MPUs. Shared memory protection units (SMPUs) help implement protection for memory resources that are shared among multiple bus masters. Peripheral protection units (PPU) are similar to SMPUs but are designed for protecting the peripheral register space.

Protection units support memory and peripheral access attributes including address range, read/write, code/data, privilege level, secured/non-secured, and protection context. Some protection unit resources are reserved for system usage; see the [technical reference manual](#) for details.

## Memory

PSoC 6 contains flash, SRAM, ROM, and eFuse memory blocks.

### ■ Flash

There is up to 512 KB of application flash, organized in 256-KB sectors.

There are also two 32-KB flash sectors:

- AUXflash, typically used for EEPROM emulation
- Supervisory flash (SFlash). Data stored in SFlash includes device trim values, [Flash Boot](#) code, and encryption keys. After the device transitions into the “Secure” lifecycle stage, SFlash can no longer be changed.

The flash uses 128-bit-wide accesses to reduce power. Write operations can be performed at the row level. A row is 512 bytes. Read operations are supported in both Low Power and Ultra-Low Power modes, however write operations may not be performed in Ultra-Low Power mode.

The flash controller has two caches, one for each CPU. Each cache is 8 KB, with 4-way set associativity.

### ■ SRAM

Up to 256 KB of SRAM is provided.. Power control and retention granularity is implemented in 32-KB blocks allowing the user to control the amount of memory retained in Deep Sleep. Memory is not retained in Hibernate mode.

### ■ ROM

The 64-KB ROM, also referred to as the supervisory ROM (SROM), provides code ([ROM Boot](#)) for several system functions. The ROM contains device initialization, flash write, security, eFuse programming, and other system-level routines. ROM code is executed only by the CM0+ CPU, in protection context 0. A system function can be initiated by either CPU, or through the DAP. This causes an NMI in CM0+, which causes CM0+ to execute the system function.

### ■ eFuse

A one-time-programmable (OTP) eFuse array consists of 1024 bits, of which 648 are reserved for system use such as die ID, device ID, initial trim settings, device life cycle, and security settings. The remaining bits are available for storing security key information, hash values, unique IDs or similar custom content.

Each fuse is individually programmed; once programmed (or “blown”), its state cannot be changed. Blowing a fuse transitions it from the default state of 0 to 1. To program an eFuse,  $V_{DDIO0}$  must be at  $2.5\text{ V} \pm 5\%$ , at 14 mA.

Because blowing an eFuse is an irreversible process, programming is recommended only in mass production under controlled factory conditions. For more information, see [PSoC 6 MCU Programming Specifications](#).

### Boot Code

Two blocks of code, [ROM Boot](#) and [Flash Boot](#), are pre-programmed into the device and work together to provide device startup and configuration, basic security features, life-cycle stage management and other system functions.

### ■ ROM Boot

On a device reset, the boot code in ROM is the first code to execute. This code performs the following:

- Integrity checks of flash boot code
  - Device trim setting (calibration)
  - Setting the device protection units
  - Setting device access restrictions for “Secure” lifecycle states
- ROM cannot be changed and acts as the root of trust in a secured system.

### ■ Flash Boot

Flash boot is firmware stored in SFlash that ensures that only a validated application may run on the device. It also ensures that the firmware image has not been modified, such as by a malicious third party.

Flash boot:

- Is validated by ROM Boot
- Runs after ROM Boot and before the user application
- Enables system calls
- Configures the Debug Access Port
- Launches the user application in the CM0+ (CM4 for single-CPU devices).

If the user application cannot be validated, then flash boot ensures that the device is transitioned into a safe state.

## Memory Map

Both CPUs have a fixed address map, with shared access to memory and peripherals. The 32-bit (4 GB) address space is divided into the Arm-defined regions shown in [Table 8](#). Note that code can be executed from the Code and External RAM regions.

**Table 3. Address Map for CM4 and CM0+**

| Address Range              | Name                   | Use                                                                                                                                        |
|----------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 0x0000 0000 – 0x1FFF FFFF  | Code                   | Program code region. Data can also be placed here. It includes the exception vector table, which starts at address 0.                      |
| 0x2000 0000 – 0x3FFF FFFF  | SRAM                   | Data region. This region is not supported in PSoC 6.                                                                                       |
| 0x4000 0000 – 0x5FFF FFFF  | Peripheral             | All peripheral registers. Code cannot be executed from this region. CM4 bit-band in this region is not supported in PSoC 6.                |
| 0x6000 0000 – 0x9FFF FFFF  | External RAM           | SMIF or Quad SPI, (see the <a href="#">Quad-SPI (QSPI)/Serial Memory Interface (SMIF)</a> section). Code can be executed from this region. |
| 0xA000 0000 – 0xDFFF FFFF  | External Device        | Not used.                                                                                                                                  |
| 0xE000 0000 – 0xE00F FFFF  | Private Peripheral Bus | Provides access to peripheral registers within the CPU core.                                                                               |
| 0xE010 0A000 – 0xFFFF FFFF | Device                 | Device-specific system registers.                                                                                                          |

The device memory map shown in [Table 4](#) applies to both CPUs. That is, the CPUs share access to all PSoC 6 MCU memory and peripheral registers.

**Table 4. Internal Memory Address Map for CM4 and CM0+**

| Address Range             | Memory Type                                       | Size         |
|---------------------------|---------------------------------------------------|--------------|
| 0x0000 0000 – 0x0000 FFFF | ROM                                               | 64 KB        |
| 0x0800 0000 – 0x0803 FFFF | SRAM                                              | Up to 256 KB |
| 0x1000 0000 – 0x1007 FFFF | Application flash                                 | Up to 512 KB |
| 0x1400 0000 – 0x1400 7FFF | Auxiliary flash, can be used for EEPROM emulation | 32 KB        |
| 0x1600 0000 – 0x1600 7FFF | Supervisory flash                                 | 32 KB        |

Note that PSoC 6 SRAM is located in the Arm Code region for both CPUs (see [Table 8](#)). There is no physical memory located in the CPUs' Arm SRAM regions.

## System Resources

### Power System

The power system provides assurance that voltage levels are as required for each respective mode and will either delay mode entry (on power-on reset (POR), for example) until voltage levels are as required for proper function or generate resets (brown-out detect (BOD)) when the power supply drops below specified levels. The design guarantees safe chip operation between power supply voltage dropping below specified levels (for example, below 1.7 V) and the reset occurring. There are no voltage sequencing requirements.

The  $V_{DD}$  supply (1.7 to 3.6 V) powers an on-chip buck regulator or a low-dropout regulator (LDO), selectable by the user. In addition, both the buck and the LDO offer a selectable (0.9 or 1.1 V) core operating voltage ( $V_{CCD}$ ). The selection lets users choose between two system power modes:

- System Low Power (LP) operates  $V_{CCD}$  at 1.1 V and offers high performance, with no restrictions on device configuration.
- System Ultra Low Power (ULP) operates  $V_{CCD}$  at 0.9 V for exceptional low power, but imposes limitations on clock speeds.

In addition, a backup domain adds an “always on” functionality using a separate power domain supplied by a backup supply ( $V_{BACKUP}$ ) such as a battery or supercapacitor.

It includes a real-time clock (RTC) with alarm feature, supported by a 32.768-kHz watch crystal oscillator (WCO), and power-management IC (PMIC) control. Refer to [Power Supply Considerations](#) for more details.

### Power Modes

PSoC 6 MCU can operate in four system and three CPU power modes. These modes are intended to minimize the average power consumption in an application. For more details on power modes and other power-saving configuration options, see the application note, [AN219528: PSoC 6 MCU Low-Power Modes and Power Reduction Techniques](#) and the [Architecture TRM](#), [Power Modes](#) chapter.

Power modes supported by PSoC 6 MCUs, in order of decreasing power consumption, are:

- System Low Power (LP) – All peripherals and CPU power modes are available at maximum speed
- System Ultra Low Power (ULP) – All peripherals and CPU power modes are available, but with limited speed
- CPU Active – CPU is executing code in system LP or ULP mode

- CPU Sleep – CPU code execution is halted in system LP or ULP mode
- CPU Deep Sleep – CPU code execution is halted and system Deep Sleep is requested in system LP or ULP mode
- System Deep Sleep – Only low-frequency peripherals are available after both CPUs enter CPU Deep Sleep mode
- System Hibernate – Device and I/O states are frozen and the device resets on wakeup

CPU Active, Sleep, and Deep Sleep are standard Arm-defined power modes supported by the Arm CPU instruction set architecture (ISA). System LP, ULP, Deep Sleep and Hibernate modes are additional low-power modes supported by PSoC 6 MCU.

### Clock System

[Figure 15](#) shows that the clock system of this product line consists of the following:

- Internal main oscillator (IMO)
- Internal low-speed oscillator (ILO)
- Watch crystal oscillator (WCO)
- External MHz crystal oscillator (ECO)
- External clock input
- One phase locked-loop (PLL)
- One frequency-locked loop (FLL)

Clocks may be buffered and brought out to a pin on a Smart I/O port.

The default clocking when the application starts is CLK\_HF[0] being driven by the IMO and the FLL. CLK\_HF[0], clk\_fast, clk\_peri, and clk\_slow are all either 50 MHz (LP mode) or 25 MHz (ULP mode). All other clocks, including all peripheral clocks, are off.

#### Internal Main Oscillator (IMO)

The IMO is the primary source of internal clocking. It is trimmed at the factory to achieve the specified accuracy. The IMO frequency is 8 MHz and tolerance is  $\pm 2\%$ .

The IMO can operate in system Deep Sleep mode to drive the LCD block for better contrast (and higher power) than is possible with the 32-kHz mode.

#### Internal Low-Speed Oscillator (ILO)

The ILO is a very low power oscillator, nominally 32 kHz, which operates in all power modes. The ILO can be calibrated against a higher accuracy clock for better accuracy.

**Figure 3. Clocking Diagram**

#### External Crystal Oscillators

Figure 4 shows all of the external crystal oscillator circuits for this product line. The component values shown are typical; check the [ECO Specifications](#) for the crystal values, and the crystal datasheet for the load capacitor values. The ECO and WCO require balanced external load capacitors. For more information, see the TRM and [AN218241, PSoC 6 MCU Hardware Design Considerations](#).

**Figure 4. Oscillator Circuits**

If the ECO is used, note that its performance is affected by GPIO switching noise. GPIO ports should be used as [Table 5](#) shows. See also [Table 6](#) for additional restrictions for general analog subsystem use.

**Table 5. ECO Usage Guidelines**

| Ports           | Max Frequency          | Drive Strength for $V_{DD} \leq 2.7$ V | Drive Strength for $V_{DD} \leq 2.7$ V |
|-----------------|------------------------|----------------------------------------|----------------------------------------|
| Port 11         | 60 MHz for SMIF (QSPI) | DRIVE_SEL 2                            | DRIVE_SEL 3                            |
| Ports 12 and 13 | Slow slew rate setting | No restrictions                        | No restrictions                        |

#### Watchdog Timers (WDT, MCWDT)

PSoC 6 MCU has one WDT and two multi-counter WDTs (MCWDT). The WDT has a 16-bit free-running counter. Each MCWDT has two 16-bit counters and one 32-bit counter, with multiple operating modes. All of the 16-bit counters can generate a watchdog device reset. All of the counters can generate an interrupt on a match event.

The WDT is clocked by the ILO. It can generate interrupt/wakeup in system LP/ULP, Deep Sleep, and Hibernate power modes. The MCWDTs are clocked by LFCLK (ILO or WCO). It can generate periodic interrupt/wakeup in system LP/ULP and Deep Sleep power modes.

#### Clock Dividers

Integer and fractional clock dividers are provided for peripheral use and timing purposes. There are:

- Four 8-bit clock dividers
- Eight 16-bit integer clock dividers
- Two 16.5-bit fractional clock dividers
- One 24.5-bit fractional clock divider

## Trigger Routing

PSoC 6 MCU contains a trigger multiplexer block. This is a collection of digital multiplexers and switches that are used for routing trigger signals between peripheral blocks and between GPIOs and peripheral blocks.

There are two types of trigger routing. Trigger multiplexers have reconfigurability in the source and destination. There are also hardwired switches called “one-to-one triggers”, which connect a specific source to a destination. The user can enable or disable the route.

## Reset

PSoC 6 MCU can be reset from a variety of sources:

- Power-on reset (POR) to hold the device in reset while the power supply ramps up to the level required for the device to function properly. POR activates automatically at power-up.
- Brown-out detect (BOD) reset to monitor the digital voltage supply  $V_{DD}$  and generate a reset if  $V_{DD}$  falls below the minimum required logic operating voltage.
- External reset dedicated pin (XRES) to reset the device using an external source. The XRES pin is active low. It can be connected either to a pull-up resistor to  $V_{DD}$ , or to an active drive circuit, as Figure 5 shows. If a pull-up resistor is used, select its value to minimize current draw when the pin is pulled low; 4.7 k $\Omega$  is typical.

**Figure 5. XRES Connection Diagram**

- Watchdog timer (WDT or MCWDT) to reset the device if firmware fails to service it within a specified timeout period.
- Software-initiated reset to reset the device on demand using firmware.
- Logic-protection fault can trigger an interrupt or reset the device if unauthorized operating conditions occur; for example, reaching a debug breakpoint while executing privileged code.
- Hibernate wakeup reset to bring the device out of the system Hibernate power mode.

Reset events are asynchronous and guarantee reversion to a known state. Some of the reset sources are recorded in a register, which is retained through reset and allows software to determine the cause of the reset.

## Programmable Analog Subsystems

### 12-bit SAR ADC

The 12-bit, 2-Msps SAR ADC can operate at a maximum clock rate of 36 MHz and requires a minimum of 18 clocks at that frequency to do a 12-bit conversion. One of three internal reference voltages may be used for the ADC reference voltage. The references are,  $V_{DD}$ ,  $V_{DD}/2$ , and  $V_{REF}$  (nominally 1.2 V and trimmed to  $\pm 1\%$ ). An external reference may also be used, by either driving the VREF pin or routing an external reference to GPIO pin P9.3. These reference options allow ratio-metric readings or absolute readings at the accuracy of the reference used. The input range of the ADC is the full supply voltage between  $V_{SS}$  and  $V_{DDA}/V_{DDIOA}$ . The SAR ADC may be configured with a mix of single-ended and differential signals in the same configuration.

The SAR ADC's sample-and-hold (S/H) aperture is programmable to allow sufficient time for signals with a high impedance to settle sufficiently, if required. System performance is 65 dB for true 12-bit precision provided appropriate references are used and system noise levels permit it. To improve performance in noisy conditions, an external bypass capacitor for the internal reference amplifier (through the fixed “VREF” pin), may be added.

The SAR is connected to a fixed set of pins through an input multiplexer. The multiplexer cycles through the selected channels autonomously (sequencer scan) and does so with zero switching overhead (that is, the aggregate sampling bandwidth is equal to 2 Msps whether it is for a single channel or distributed over several channels). The result of each channel is buffered, so that an interrupt may be triggered only when a full scan of all channels is complete. Also, a pair of range registers can be set to detect and cause an interrupt if an input exceeds a minimum and/or maximum value. This allows fast detection of out-of-range values without having to wait for a sequencer scan to be completed and the CPU to read the values and check for out-of-range values in software. The SAR can also be connected, under firmware control, to most other GPIO pins via the Analog Multiplexer Bus (AMUXBUS). The SAR is not available in system Deep Sleep and Hibernate modes as it requires a high-speed clock (up to 36 MHz). The SAR operating range is 1.71 to 3.6 V.

### Temperature Sensor

An on-chip temperature sensor is part of the SAR and may be scanned by the SAR ADC. It consists of a diode, which is biased by a current source that can be disabled to save power. The temperature sensor may be connected directly to the SAR ADC as one of the measurement channels. The ADC digitizes the temperature sensor's output and a Cypress-supplied software function may be used to convert the reading to temperature which includes calibration and linearization.

### Low-Power Comparators

Two low-power comparators are provided, which can operate in all power modes. This allows other analog system resources to be disabled while retaining the ability to monitor external voltage levels during system Deep Sleep and Hibernate modes. The comparator outputs are normally synchronized to avoid metastability unless operating in an asynchronous power mode (Hibernate) where the system wake-up circuit is activated by a comparator-switch event.

Figure 6 shows an overview of the analog subsystem. This diagram is a high-level abstraction. See the [TRM](#) for detailed connectivity information.

**Figure 6. Analog Subsystem**

## Programmable Digital

### Smart I/O

Smart I/O is a programmable logic fabric that enables Boolean operations on signals traveling from device internal resources to the GPIO pins or on signals traveling into the device from external sources. A Smart I/O block sits between the GPIO pins and the high-speed I/O matrix (HSIOM) and is dedicated to a single port.

There are two Smart I/O blocks: one on Port 8 and one on Port 9. When Smart I/O is not enabled, all signals on Port 8 and Port 9 bypass the Smart I/O hardware.

Smart I/O supports:

- System Deep Sleep operation
- Boolean operations without CPU intervention
- Asynchronous or synchronous (clocked) operation

Each Smart I/O block contains a data unit (DU) and eight lookup tables (LUTs).

The DU:

- Performs unique functions based on a selectable opcode.
- Can source input signals from internal resources, the GPIO port, or a value in the DU register.

Each LUT:

- Has three selectable input sources. The input signals may be sourced from another LUT, an internal resource, an external signal from a GPIO pin, or from the DU.
- Acts as a programmable Boolean logic table.
- Can be synchronous or asynchronous.

## Fixed-Function Digital

### Timer/Counter/Pulse-width Modulator (TCPWM)

- The TCPWM supports the following operational modes:
  - Timer-counter with compare
  - Timer-counter with capture
  - Quadrature decoding
  - Pulse width modulation (PWM)
  - Pseudo-random PWM
  - PWM with dead time
- Up, down, and up/down counting modes.
- Clock prescaling (division by 1, 2, 4, ... 64, 128)
- Double buffering of compare/capture and period values
- Underflow, overflow, and capture/compare output signals
- Supports interrupt on:
  - Terminal count – Depends on the mode; typically occurs on overflow or underflow
  - Capture/compare – The count is captured to the capture register or the counter value equals the value in the compare register
- Complementary output for PWMs
- Selectable start, reload, stop, count, and capture event signals for each TCPWM; with rising edge, falling edge, both edges, and level trigger options. The TCPWM has a Kill input to force outputs to a predetermined state.

In this device there are:

- Four 32-bit TCPWMs
- Eight 16-bit TCPWMs

### Serial Communication Blocks (SCB)

This product line has seven SCBs:

- Six can implement either I<sup>2</sup>C, UART, or SPI.
- One SCB (SCB #6) can operate in system Deep Sleep mode with an external clock; this SCB can be either SPI slave or I<sup>2</sup>C slave.

**I<sup>2</sup>C Mode:** The SCB can implement a full multi-master and slave interface (it is capable of multimaster arbitration). This block can operate at speeds of up to 1 Mbps (Fast Mode Plus). It also supports EZI<sup>2</sup>C, which creates a mailbox address range and effectively reduces I<sup>2</sup>C communication to reading from and writing to an array in memory. The SCB supports a 256-byte FIFO for receive and transmit.

The I<sup>2</sup>C peripheral is compatible with I<sup>2</sup>C standard-mode, Fast Mode, and Fast Mode Plus devices as defined in the NXP I<sup>2</sup>C-bus specification and user manual (UM10204). The I<sup>2</sup>C bus I/O is implemented with GPIO in open-drain modes.

**UART Mode:** This is a full-feature UART operating at up to 8 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows the addressing of peripherals connected over common RX and TX lines. Common UART functions such as parity error, break detect, and frame error are supported. A 256-byte FIFO allows much greater CPU service latencies to be tolerated.

**SPI Mode:** The SPI mode supports full Motorola SPI, TI Secure Simple Pairing (SSP) (essentially adds a start pulse that is used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block supports an EZSPI mode in which the data interchange is reduced to reading and writing an array in memory. The SPI interface operates with a 25-MHz clock.

### USB Full-Speed Device Interface

This product line incorporates a full-speed USB device interface. The device can have up to eight endpoints. A 512-byte SRAM buffer is provided and DMA is supported.

**Note:** If the USB pins are not used, connect V<sub>DDUSB</sub> to ground and leave the P14.0/USBDP and P14.1/USBDM pins unconnected.

### Quad-SPI/Serial Memory Interface (SMIF)

A serial memory interface is provided, running at up to 80 MHz. It supports single, dual, and quad SPI configurations, and supports up to four external memory devices. It supports two modes of operation:

- Memory-mapped I/O (MMIO), a command mode interface that provides data access via registers and FIFOs
- Execute in Place (XIP), in which AHB reads and writes are directly translated to SPI read and write transfers.

In XIP mode, the external memory is mapped into the PSoC 6 MCU internal address space, enabling code execution directly from the external memory. To improve performance, a 4-KB cache is included. XIP mode also supports AES-128 on-the-fly encryption and decryption, enabling secured storage and access of code and data in the external memory.

### LCD

This block drives LCD commons and segments; routing is available to most of the GPIOs. One to eight of the GPIOs must be used for commons, the rest can be used for segments.

The LCD block has two modes of operation: high speed (8 MHz) and low speed (32 kHz). Both modes operate in system LP, ULP, and Deep Sleep modes, however the low-speed mode operates with reduced contrast in system Deep Sleep mode. The 8-MHz IMO is available in system Deep Sleep mode, and can be used to generate a clock for the LCD block. Review the number of common and segment lines, viewing angle requirements, and prototype performance, and then select the appropriate LCD clock frequency before using system Deep Sleep mode.

### SD Host Controller

This product line contains one Secure Digital (SD) host controller. It provides communication with IoT connectivity devices such as Bluetooth, Bluetooth Low-Energy and WiFi radios, as well as combination devices. The controller also supports embedded MultiMediaCards (eMMC) and Secure Digital (SD) cards.

Several bus speed modes under the SD specification are supported:

- DS (default speed)
- HS (high speed)
- SDR12 (single data rate)
- SDR25

## ■ SDR50

## ■ DDR50 (double data rate)

For eMMC, the supported modes are:

## ■ BWC (backward compatibility)

## ■ SDR

Maximum clock restrictions and capacitive loads apply to some modes, and are also dependent on system power mode (LP/ULP). Refer to the [SD Host Controller and eMMC Specifications](#) for details.

The SD Host Controller complies with the following standards. Refer to the specifications documents for more information on the protocol and operations.

## ■ SD Specifications Part 1 Physical Layer Specification Version 6.00, supporting card capacities for SDSC (up to 2 GB), SDHC (up to 32 GB) and SDXC (up to 2 TB).

## ■ SD Specifications Part A2 SD Host Controller Standard Specification Version 4.20

## ■ SD Specifications Part E1 SDIO Specifications Version 4.10

## ■ Embedded Multi-Media Card (eMMC) Electrical Standard 5.1

The SD host controller is configured as a master. To be fully compatible with features provided in the driver software for speed and efficiency, it supports advanced DMA version 3 (ADMA3), defined by the SDIO standard, and has a 1 KB RX/TX FIFO allowing double buffering of 512-byte blocks.

## CAN FD Block

This product line has one CAN FD block for industrial and automotive applications. The block includes Time-Stamp support and has a 4-KB message RAM. FD Data rates of up to 5 Mbps are supported. DMA transfers are supported.

## GPIO

This product line has up to 64 GPIOs, which implement the following:

## ■ Eight drive strength modes:

- Analog input mode (input and output buffers disabled)
- Input only
- Weak pull-up with strong pull-down
- Strong pull-up with weak pull-down

- Open drain with strong pull-down

- Open drain with strong pull-up

- Strong pull-up with strong pull-down

- Weak pull-up with weak pull-down

## ■ Input threshold select (CMOS or LVTTL)

## ■ Hold mode for latching previous state (used for retaining the I/O state in system Hibernation mode)

## ■ Selectable slew rates for dV/dt-related noise control to improve EMI

The pins are organized in logical entities called ports, which are up to 8 pins in width. Data output and pin state registers store, respectively, the values to be driven on the pins and the input states of the pins.

Every pin can generate an interrupt if enabled; each port has an interrupt request (IRQ) associated with it.

The port 3 pins are capable of overvoltage-tolerant (OVT) operation, where the input voltage may be higher than  $V_{DD}$ . OVT pins are commonly used with I<sup>2</sup>C, to allow powering the chip OFF while maintaining a physical connection to an operating I<sup>2</sup>C bus without affecting its functionality.

GPIO pins can be ganged to source or sink higher values of current. GPIO pins, including OVT pins, may not be pulled up higher than the absolute maximum; see [Electrical Specifications](#).

During power-on and reset, the pins are forced to the analog input drive mode, with input and output buffers disabled, so as not to crowbar any inputs and/or cause excess turn-on current.

A multiplexing network known as the high-speed I/O matrix (HSIOM) is used to multiplex between various peripheral and analog signals that may connect to an I/O pin.

Analog performance is affected by GPIO switching noise. In order to get the best analog performance, the following frequency and drive mode constraints must be applied. The DRIVE\_SEL values (see [Table 6](#)) represent drive strengths (please see the [Architecture and Register TRMs](#) for further detail).

See also [Table 5](#) for additional restrictions for ECO use.

**Table 6. DRIVE\_SEL Values**

| Ports          | Max Frequency                                                | Drive Strength for $V_{DD} \leq 2.7$ V | Drive Strength for $V_{DD} > 2.7$ V |
|----------------|--------------------------------------------------------------|----------------------------------------|-------------------------------------|
| Ports 0, 1     | 8 MHz                                                        | DRIVE_SEL 2                            | DRIVE_SEL 3                         |
| Port 2         | 50 MHz                                                       | DRIVE_SEL 1                            | DRIVE_SEL 2                         |
| Ports 3 to 10  | 16 MHz; 25 MHz for SPI                                       | DRIVE_SEL 2                            | DRIVE_SEL 3                         |
| Ports 11 to 12 | 80 MHz for SMIF (QSPI).                                      | DRIVE_SEL 1                            | DRIVE_SEL 2                         |
| Ports 9 and 10 | Slow slew rate setting for TQFP Packages for ADC performance | No restrictions                        | No restrictions                     |

## Special-Function Peripherals

### CapSense Subsystem

CapSense is supported in PSoC 6 MCU through a CapSense sigma-delta (CSD) hardware block. It is designed for high-sensitivity self-capacitance and mutual-capacitance measurements, and is specifically built for user interface solutions.

In addition to CapSense, the CSD hardware block supports three general-purpose functions. These are available when CapSense is not being used. Alternatively, two or more functions can be time-multiplexed in an application under firmware control. The four functions supported by the CSD hardware block are:

- CapSense
- 10-bit ADC
- Programmable current sources (IDAC)
- Comparator

### CapSense

Capacitive touch sensors are designed for user interfaces that rely on human body capacitance to detect the presence of a finger on or near a sensor. Cypress CapSense solutions bring elegant, reliable, and simple capacitive touch sensing functions to applications including IoT, industrial, automotive, and home appliances.

The Cypress-proprietary CapSense technology offers the following features:

- Best-in-class signal-to-noise ratio (SNR) and robust sensing under harsh and noisy conditions
- Self-capacitance (CSD) and mutual-capacitance (CSX) sensing methods
- Support for various widgets, including buttons, matrix buttons, sliders, touchpads, and proximity sensors
- High-performance sensing across a variety of materials
- Best-in-class liquid tolerance
- SmartSense™ auto-tuning technology that helps avoid complex manual tuning processes
- Superior immunity against external noise
- Spread-spectrum clocks for low radiated emissions
- Gesture and built-in self-test libraries
- Ultra-low power consumption
- An integrated graphical CapSense tuner for real-time tuning, testing, and debugging

### ADC

The CapSense subsystem slope ADC offers the following features:

- Selectable 8- or 10-bit resolution
- Selectable input range: GND to  $V_{REF}$  and GND to  $V_{DDA}$  on any GPIO input
- Measurement of  $V_{DDA}$  against an internal reference without the use of GPIO or external components

### IDAC

The CSD block has two programmable current sources, which offer the following features:

- 7-bit resolution
- Sink and source current modes
- A current source programmable from 37.5 nA to 609  $\mu$ A
- Two IDACs that can be used in parallel to form one 8-bit IDAC

### Comparator

The CapSense subsystem comparator operates in the system Low Power and Ultra-Low Power modes. The inverting input is connected to an internal programmable reference voltage and the non-inverting input can be connected to any GPIO via the AMUXBUS.

### CapSense Hardware Subsystem

Figure 7 shows the high-level hardware overview of the CapSense subsystem, which includes a delta sigma converter, internal clock dividers, a shield driver, and two programmable current sources.

The inputs are managed through analog multiplexed buses (AMUXBUS A/B). The input and output of all functions offered by the CSD block can be provided on any GPIO or on a group of GPIOs under software control, with the exception of the comparator output and external capacitors that use dedicated GPIOs.

Self-capacitance is supported by the CSD block using AMUXBUS A, an external modulator capacitor, and a GPIO for each sensor. There is a shield electrode (optional) for self-capacitance sensing. This is supported using AMUXBUS B and an optional external shield tank capacitor (to increase the drive capability of the shield driver) should this be required. Mutual-capacitance is supported by the CSD block using AMUXBUS A, two external integrated capacitors, and a GPIO for transmit and receive electrodes.

The ADC does not require an external component. Any GPIO that can be connected to AMUXBUS A can be an input to the ADC under software control. The ADC can accept  $V_{DDA}$  as an input without needing GPIOs (for applications such as battery voltage measurement).

The two programmable current sources (IDACs) in general-purpose mode can be connected to AMUXBUS A or B. They can therefore connect to any GPIO pin. The comparator resides in the delta-sigma converter. The comparator inverting input can be connected to the reference. Both comparator inputs can be connected to any GPIO using AMUXBUS B; see Figure 6. The reference has a direct connection to a dedicated GPIO; see Table 9.

The CSD block can operate in active and sleep CPU power modes, and seamlessly transition between system LP and ULP modes. It can be powered down in system Deep Sleep and Hibernate modes. Upon wakeup from Hibernate mode, the CSD block requires re-initialization. However, operation can be resumed without re-initialization upon exit from Deep Sleep mode, under firmware control.

**Figure 7. CapSense Hardware Subsystem**

Figure 18 shows the high-level software overview. Cypress provides middleware libraries for [CapSense](#), [ADC](#), and [IDAC](#) on GitHub to enable quick integration. The Board Support Package for any kit with CapSense capabilities automatically includes the CapSense library in any application that uses the BSP.

User applications interact only with middleware to implement functions of the CSD block. The middleware interacts with underlying drivers to access hardware as necessary. The CSD driver facilitates time-multiplexing of the CSD hardware if more than one piece of CSD-related middleware is present in a project. It prevents access conflicts in this case.

ModusToolbox Software provides a CapSense configurator to enable fast library configuration. It also provides a tuner for performance evaluation and real-time tuning of the system. The tuner requires an EZI2C communication interface in the application to enable real-time tuning capability. The tuner can update configuration parameters directly in the device as well as in the configurator.

CapSense and ADC middleware use the CSD interrupt to implement non-blocking sensing and A-to-D conversion. Therefore, interrupt service routines are a defined part of the middleware, which must be initialized by the application. Middleware and drivers can operate on either CPU. Cypress recommends using the middleware only in one CPU. If both CPUs must access the CSD driver, memory access should be managed in the application.

Refer to [AN85951: PSoC 4 and PSoC 6 MCU CapSense Design Guide](#) for more details on CSX sensing, CSD sensing, shield electrode usage and its benefits, and capacitive system design guidelines.

Refer to the API reference guides for [CapSense](#), [ADC](#), and [IDAC](#) available on GitHub.

**Figure 8. CapSense Software/Firmware Subsystem**

## Pinouts

**Note:** The CY8C62x5 [datasheet web page](#) contains a spreadsheet with a consolidated list of pinouts and pin alternate functions with HSIOM mapping.

GPIO ports are powered by  $V_{DDX}$  pins as follows:

- P0:  $V_{BACKUP}$
- P2, P3:  $V_{DDIO2}$
- P5, P6, P7, P8:  $V_{DDIO1}$
- P9, P10:  $V_{DDIOA}$ ,  $V_{DDA}$  ( $V_{DDIOA}$ , when present, and  $V_{DDA}$  must be connected together on the PCB)
- P11, P12:  $V_{DDIO0}$
- P14:  $V_{DDUSB}$

**Table 7. Packages and Pin Information**

| Pin          | Packages                                                    |         |          |
|--------------|-------------------------------------------------------------|---------|----------|
|              | 100-TQFP                                                    | 68-QFN  | 49-WLCSP |
| $V_{DDD}$    | 2                                                           | 68      | C11      |
| $V_{CCD}$    | 1, 100                                                      | 67      | A11      |
| $V_{DDA}$    | 73                                                          | 48      | B2       |
| $V_{DDIOA}$  | 53                                                          | 36      | –        |
| $V_{DDIO0}$  | 91, 92                                                      | 64      | A9       |
| $V_{DDIO1}$  | 51                                                          | 35      | G1       |
| $V_{DDIO2}$  | 31                                                          | 22      | J7       |
| $V_{BACKUP}$ | 6                                                           | 1       | –        |
| $V_{DDUSB}$  | 20                                                          | 11      | –        |
| $V_{SS}$     | 3, 4, 5, 13, 15, 18, 19, 33, 38, 49, 50, 54, 71, 72, 93, 94 | GND PAD | B6, H6   |
| $V_{DD\_NS}$ | 16                                                          | 9       | F10      |
| $V_{IND1}$   | 17                                                          | 10      | G11      |
| XRES         | 14                                                          | 8       | E11      |
| $V_{REF}$    | 74                                                          | 49      | C3       |
| P0.0         | 7                                                           | 2       | E9       |
| P0.1         | 8                                                           | 3       | D10      |
| P0.2         | 9                                                           | 4       | –        |
| P0.3         | 10                                                          | 5       | –        |
| P0.4         | 11                                                          | 6       | –        |
| P0.5         | 12                                                          | 7       | –        |
| P2.0         | 23                                                          | 14      | H10      |
| P2.1         | 24                                                          | 15      | F8       |
| P2.2         | 25                                                          | 16      | H8       |
| P2.3         | 26                                                          | 17      | G9       |
| P2.4         | 27                                                          | 18      | J11      |
| P2.5         | 28                                                          | 19      | J9       |
| P2.6         | 29                                                          | 20      | –        |
| P2.7         | 30                                                          | 21      | –        |
| P3.0         | 34                                                          | 23      | –        |

| NC            | 97       | –      | –        |

**Figure 9. Device Pinout for 100-TQFP Package**

**Figure 10. Device Pinout for 68-QFN Package<sup>[1]</sup>**

**Note:** If the USB pins are not used, connect V<sub>DDUSB</sub> to ground and leave the P14.0/USB DP and P14.1/USB DM pins unconnected.

**Note**

1. The center pad on the QFN package should be connected to PCB ground relative to device VDDx for best mechanical, thermal, and electrical performance. For more information, see [AN72845](#), Design Guidelines for QFN Devices.

Each port pin has multiple alternate functions. These are defined in Table 8. The columns ACT #x and DS #y denote active (System LP/ULP) and Deep Sleep mode signals respectively.

The notation for a signal is of the form IPName[x].signal\_name[u]:y.

IPName = Name of the block (such as tcpwm), x = Unique instance of the IP, Signal\_name = Name of the signal, u = Signal number where there is more than one signal for a particular signal name, y = Designates copies of the signal name.

For example, the name tcpwm[0].line\_compl[3]:4 indicates that this is instance 0 of a tcpwm block, the signal is line\_compl # 3 (complement of the line output) and this is the fourth occurrence (copy) of the signal. Signal copies are provided to allow flexibility in routing and to maximize use of on-chip resources.

**Table 8. Multiple Alternate Functions**

| Port/Pin | ACT #0                   | ACT #1                   | ACT #2        | ACT #3          | DS #2 | DS #3 | ACT #4         | ACT #5 | ACT #6            | ACT #7           | ACT #8               | ACT #9 | ACT #10 | ACT #12               | ACT #13                | ACT #14                 | ACT #15 | DS #5           | DS #6 | DS #7 |

## Power Supply Considerations

The following power system diagrams show typical connections for power pins for all supported packages, and with and without usage of the buck regulator.

In these diagrams, the package pin is shown with the pin name, for example "V<sub>DDA</sub>, 53". For V<sub>DDx</sub> pins, the I/O port that is powered by that pin is also shown, for example "V<sub>BACKUP</sub>, 6; I/O port P0".

**Figure 11. 100-TQFP Power Connection Diagram**

**Figure 12. 100-TQFP (No Buck) Power Connection Diagram**

In the QFN package, all internal grounds are routed to the metal pad (epad) in the package. This pad must be grounded on the PCB.

**Figure 13. 68-QFN Power Connection Diagram**

**Figure 14. 68-QFN (No Buck) Power Connection Diagram**

**Figure 15. 49-WLCSP Power Connection Diagram**

**Figure 16. 49-WLCSP (No Buck) Power Connection Diagram**

There are as many as eight  $V_{DDx}$  supply pins, depending on the package, and multiple  $V_{SS}$  ground pins. The power pins are:

- $V_{DDD}$ : the main digital supply. It powers the LDO and switching regulators. It also powers I/O port 0 on packages where  $V_{BACKUP}$  is not available.
- $V_{CCD}$ : the main LDO output. It requires a 4.7- $\mu$ F capacitor for regulation. The LDO can be turned off when  $V_{CCD}$  is driven from the switching regulator (see below). For more information, see the power system block diagram in the device [technical reference manual \(TRM\)](#).
- $V_{DDA}$ : the supply for the analog peripherals. Voltage must be applied to this pin for correct device initialization and boot up.
- $V_{DDIOA}$ : the supply for I/O ports 9 and 10. If it is present in the device package, it must be connected to  $V_{DDA}$ .
- $V_{DDIO0}$ : the supply for I/O ports 11 and 12.
- $V_{DDIO1}$ : the supply for I/O ports 5, 6, 7, and 8. Some of the ports are not available depending on package.
- $V_{DDIO2}$ : the supply for I/O ports 2 and 3.
- $V_{BACKUP}$ : the supply for the backup domain, which includes the 32-kHz WCO and the RTC. It can be a separate supply as low as 1.4 V, for battery or supercapacitor backup, as [Figure 17](#) shows, otherwise it is connected to  $V_{DDD}$ . It powers I/O port 0<sup>[2]</sup>.

**Figure 17. Separate Battery Connection to  $V_{BACKUP}$**

- $V_{DDUSB}$ : the supply for the USB peripheral and the USBDP and USBDM pins. It must be 2.85 V to 3.6 V for USB operation. If USB is not used, it can be 1.7 V to 3.6 V, and the USB pins can be used as limited-capability GPIOs on I/O port 14.

[Table 10](#) shows a summary of the I/O port supplies:

**Table 10. I/O Power Supplies**

| Port       | Supply       | Alternate Supply |
|------------|--------------|------------------|
| 0          | $V_{BACKUP}$ | $V_{DDD}$        |
| 2, 3       | $V_{DDIO2}$  | —                |
| 5, 6, 7, 8 | $V_{DDIO1}$  | —                |
| 9, 10      | $V_{DDIOA}$  | $V_{DDA}$        |
| 11, 12     | $V_{DDIO0}$  | —                |
| 14         | $V_{DDUSB}$  | —                |

**Note**

2. It is not available in the 49-WLCSP package.  $V_{DDD}$  powers port 0.

**Note:** If the USB pins are not used, connect  $V_{DDUSB}$  to ground and leave the P14.0/USBDP and P14.1/USBDM pins unconnected.

Voltage must be applied to the  $V_{DDD}$  pin, and the  $V_{DDA}$  pin as noted above, for correct device initialization and operation. If an I/O port is not being used, applying voltage to the corresponding  $V_{DDx}$  pin is optional.

- $V_{SS}$ : ground pins for the above supplies. All ground pins should be connected together to a common ground.

In addition to the LDO regulator, a switching regulator is included. The regulator pins are:

- $V_{DD\_NS}$ : the regulator supply.
- $V_{IND1}$ : the regulator output. It is typically used to drive  $V_{CCD}$  through an inductor.

The  $V_{DD}$  power pins are not connected on chip. They can be connected off chip, in one or more separate nets. If separate power nets are used, they can be isolated from noise from the other nets using optional ferrite beads, as indicated in the diagrams.

No external load should be placed on  $V_{CCD}$ , or  $V_{IND1}$ , whether or not these pins are used.

There are no power pin sequencing requirements; power supplies may be brought up in any order. The power management system holds the device in reset until all power pins are at the voltage levels required for proper operation.

**Note:** If a battery is installed on the PCB first,  $V_{DDD}$  must be cycled for at least 50  $\mu$ s. This prevents premature drain of the battery during product manufacture and storage.

Bypass capacitors must be connected to a common ground from the  $V_{DDx}$  and other pins, as indicated in the diagrams. Typical practice for systems in this frequency range is to use a 10- $\mu$ F or 1- $\mu$ F capacitor in parallel with a smaller capacitor (0.1  $\mu$ F, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and bypass capacitor parasitic should be simulated for optimal bypassing.

All capacitors and inductors should be  $\pm 20\%$  or better. The recommended inductor value is 2.2  $\mu$ H  $\pm 20\%$  (for example, TDK MLP2012H2R2MT0S1).

It is good practice to check the datasheets for your bypass capacitors, specifically the working voltage and the DC bias specifications. With some capacitors, the actual capacitance can decrease considerably when the applied voltage is a significant percentage of the rated working voltage.

For more information on pad layout, refer to [PSoC 6 CAD libraries](#).

## Electrical Specifications

All specifications are valid for  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$  and for 1.71 V to 3.6 V except where noted.

### Absolute Maximum Ratings

**Table 11. Absolute Maximum Ratings<sup>[3]</sup>**

| Spec ID# | Parameter                   | Description                                                                                    | Min  | Typ | Max                   | Units | Details / Conditions |
|----------|-----------------------------|------------------------------------------------------------------------------------------------|------|-----|-----------------------|-------|----------------------|
| SID1     | V <sub>DD_ABS</sub>         | Analog or digital supply relative to V <sub>SS</sub><br>(V <sub>SSD</sub> = V <sub>SSA</sub> ) | -0.5 | —   | 4                     | V     |                      |
| SID2     | V <sub>CCD_ABS</sub>        | Direct digital core voltage input relative to V <sub>SSD</sub>                                 | -0.5 | —   | 1.2                   | V     |                      |
| SID3     | V <sub>GPIO_ABS</sub>       | GPIO voltage; V <sub>DDD</sub> or V <sub>DDA</sub>                                             | -0.5 | —   | V <sub>DD</sub> + 0.5 | V     |                      |
| SID4     | I <sub>GPIO_ABS</sub>       | Current per GPIO                                                                               | -25  | —   | 25                    | mA    |                      |
| SID5     | I <sub>GPIO_injection</sub> | GPIO injection current per pin                                                                 | -0.5 | —   | 0.5                   | mA    |                      |
| SID3A    | ESD_HBM                     | Electrostatic discharge Human Body Model                                                       | 2200 | —   | —                     | V     |                      |
| SID4A    | ESD_CDM                     | Electrostatic discharge Charged Device Model                                                   | 500  | —   | —                     | V     |                      |
| SID5A    | LU                          | Pin current for latchup-free operation                                                         | -100 | —   | 100                   | mA    |                      |

### Device-Level Specifications

Table 14 provides detailed specifications of CPU current. Table 12 summarizes these specifications, for rapid review of CPU currents under common conditions. Note that the max frequency for CM4 is 150 MHz, and for CM0+ is 100 MHz. IMO and FLL are used to generate the CPU clocks; FLL is not used when the CPU clock frequency is 8 MHz.

**Table 12. CPU Current Specifications Summary**

| Condition                                                                        | Range                                                                       | Typ Range    | Max Range    |
|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------|--------------|--------------|
| LP Mode, V <sub>DD</sub> = 3.3 V, V <sub>CCD</sub> = 1.1 V, with buck regulator  |                                                                             |              |              |
| CM4 active, CM0+ sleep                                                           | Across CPUs clock ranges: 8–150/100 MHz; Dhrystone with flash cache enabled | 0.9–6.3 mA   | 1.5–7 mA     |
| CM0+ active, CM4 sleep                                                           |                                                                             | 0.8–3.8 mA   | 1.3–4.5 mA   |
| CM4 sleep, CM0+ sleep                                                            |                                                                             | 0.7–1.5 mA   | 1.3–2.2 mA   |
| CM0+ sleep, CM4 off                                                              |                                                                             | 0.7–1.3 mA   | 1.3–2 mA     |
| Minimum regulator current mode                                                   | Across CM4/CM0+ CPU active/sleep modes                                      | 0.6–0.7 mA   | 1.1–1.1 mA   |
| ULP Mode, V <sub>DD</sub> = 3.3 V, V <sub>CCD</sub> = 0.9 V, with buck regulator |                                                                             |              |              |
| CM4 active, CM0+ sleep                                                           | Across CPUs clock ranges: 8 – 50/25 MHz; Dhrystone with flash cache enabled | 0.65–1.6 mA  | 0.8–2.2mA    |
| CM0+ active, CM4 sleep                                                           |                                                                             | 0.51–0.91 mA | 0.72–1.25 mA |
| CM4 sleep, CM0+ sleep                                                            |                                                                             | 0.42–0.76 mA | 0.65–1.1 mA  |
| CM0+ sleep, CM4 off                                                              |                                                                             | 0.41–0.62 mA | 0.6–0.9 mA   |
| Minimum regulator current mode                                                   | Across CM4/CM0+ CPU active/sleep modes                                      | 0.39–0.54 mA | 0.6–0.76 mA  |
| Deep Sleep                                                                       | Across SRAM retention                                                       | 7–9 μA       | -            |
| Hibernate                                                                        | Across V <sub>DD</sub>                                                      | 300–800 nA   | -            |

#### Note

- Usage above the absolute maximum conditions listed in Table 11 may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods of time may affect device reliability. The maximum storage temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below absolute maximum conditions but above normal operating conditions, the device may not operate to specification.

**Figure 18. Typical Device Currents vs. CPU Frequency; System Low Power (LP) Mode**

#### Power Supplies

**Table 13. Power Supply DC Specifications**

| Spec ID# | Parameter    | Description                                                                         | Min  | Typ | Max  | Units   | Details / Conditions                                                          |
|----------|--------------|-------------------------------------------------------------------------------------|------|-----|------|---------|-------------------------------------------------------------------------------|
| SID6     | $V_{DD}$     | Internal regulator                                                                  | 1.7  | –   | 3.6  | V       | –                                                                             |
| SID7     | $V_{DDA}$    | Analog power supply voltage. Shorted to $V_{DDIOA}$ on PCB.                         | 1.7  | –   | 3.6  | V       | Internally unregulated supply                                                 |
| SID7A    | $V_{DDIO1}$  | GPIO supply for Ports 5 to 8 when present                                           | 1.7  | –   | 3.6  | V       | Must be $\geq V_{DDA}$ if the CapSense (CSD) block is used in the application |
| SID7B    | $V_{DDIO0}$  | GPIO supply for Ports 11 and 12                                                     | 1.7  | –   | 3.6  | V       | –                                                                             |
| SID7E    | $V_{DDIO0}$  | Supply for eFuse programming                                                        | 2.38 | 2.5 | 2.62 | V       | –                                                                             |
| SID7C    | $V_{DDIO2}$  | GPIO supply for Ports 2 and 3 when present                                          | 1.7  | –   | 3.6  | V       | –                                                                             |
| SID7D    | $V_{DDIOA}$  | GPIO supply for Ports 9 and 10 when present. Must be connected to $V_{DDA}$ on PCB. | 1.7  | –   | 3.6  | V       | –                                                                             |
| SID7F    | $V_{DDUSB}$  | Supply for Port 14 (USB or GPIO) when present                                       | 1.7  | –   | 3.6  | V       | Min supply is 2.85 V for USB                                                  |
| SID6B    | $V_{BACKUP}$ | Backup power and GPIO Port 0 supply when present                                    | 1.7  | –   | 3.6  | V       | Min. is 1.4 V when $V_{DD}$ is removed                                        |
| SID8     | $V_{CCD1}$   | Output voltage (for core logic bypass)                                              | –    | 1.1 | –    | V       | System LP mode                                                                |
| SID9     | $V_{CCD2}$   | Output voltage (for core logic bypass)                                              | –    | 0.9 | –    |         | ULP mode. Valid for $-20$ to $85$ °C.                                         |
| SID10    | $C_{EFC}$    | External regulator voltage ( $V_{CCD}$ ) bypass                                     | 3.8  | 4.7 | 5.6  | $\mu$ F | X5R ceramic or better. Value for 0.8 to 1.2 V                                 |
| SID11    | $C_{EXC}$    | Power supply decoupling capacitor                                                   | –    | 10  | –    | $\mu$ F | X5R ceramic or better                                                         |

**Note**

4. It can take as much as 16 milliseconds to write to flash. During this time, the device should not be reset, or flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

### External Clock Specifications

**Table 39. External Clock Specifications**

| Spec ID | Parameter              | Description                                | Min | Typ | Max | Units | Details/Conditions |
|---------|------------------------|--------------------------------------------|-----|-----|-----|-------|--------------------|
| SID305  | EXTCLK <sub>FREQ</sub> | External clock input frequency             | 0   | –   | 100 | MHz   | –                  |
| SID306  | EXTCLK <sub>DUTY</sub> | Duty cycle; measured at V <sub>DD</sub> /2 | 45  | –   | 55  | %     | –                  |

### PLL Specifications

**Table 40. PLL Specifications**

| Spec ID | Parameter | Description                     | Min    | Typ  | Max | Units | Details/Conditions       |
|---------|-----------|---------------------------------|--------|------|-----|-------|--------------------------|
| SID304P | PLL_IN    | Input frequency to PLL block    | 4      | –    | 64  | MHz   |                          |
| SID305P | PLL_LOCK  | Time to achieve PLL lock        | –      | 16   | 35  | μs    | –                        |
| SID306P | PLL_OUT   | Output frequency from PLL block | 10.625 | –    | 150 | MHz   | –                        |
| SID307P | PLL_IDD   | PLL current                     | –      | 0.55 | 1.1 | mA    | Typ. at 100 MHz out.     |
| SID308P | PLL_JTR   | Period jitter                   | –      | –    | 150 | ps    | 100-MHz output frequency |

**Table 41. Clock Source Switching Time**

| Spec ID | Parameter              | Description                                                                                                    | Min | Typ | Max             | Units   | Details/Conditions |
|---------|------------------------|----------------------------------------------------------------------------------------------------------------|-----|-----|-----------------|---------|--------------------|
| SID262  | TCLK <sub>SWITCH</sub> | Clock switching from clk1 to clk2 in clock periods; for example, from IMO (clk1) to FLL (clk2). <sup>[5]</sup> | –   | –   | 4 clk1 + 3 clk2 | periods | –                  |

**Note**

5. As an example, if the clk\_path[1] source is changed from the IMO to the FLL (see [Figure 3](#)) then clk1 is the IMO and clk2 is the FLL.

### FLL Specifications

**Table 42. Frequency Locked Loop (FLL) Specifications**

| Spec ID#                                   | Parameter     | Description                                                            | Min   | Typ | Max    | Units             | Details / Conditions                                                                                       |

## Packaging

This product line is offered in 100 TQFP, 68 QFN, and 49 WLCSP packages.

**Table 49. Package Dimensions**

| Spec ID# | Package  | Description      | Package Dwg # |
|----------|----------|------------------|---------------|
| PKG_1    | 100-TQFP | 100 TQFP package | 51-85048      |
| PKG_2    | 68 QFN   | 68 QFN package   | 001-96836     |
| PKG_3    | 49 WLCSP | 49 WLCSP package | 002-26627     |

**Table 50. Package Characteristics**

| Parameter       | Description                      | Conditions | Min | Typ  | Max | Units   |
|-----------------|----------------------------------|------------|-----|------|-----|---------|
| T <sub>A</sub>  | Operating ambient temperature    | —          | –40 | 25   | 85  | °C      |
| T <sub>J</sub>  | Operating junction temperature   | —          | –40 | —    | 100 | °C      |
| T <sub>JA</sub> | Package $\theta_{JA}$ (100 TQFP) | —          | —   | 37.2 | —   | °C/watt |
| T <sub>JC</sub> | Package $\theta_{JC}$ (100 TQFP) | —          | —   | 20.7 | —   | °C/watt |
| T <sub>JA</sub> | Package $\theta_{JA}$ (68 QFN)   | —          | —   | 15.4 | —   | °C/watt |
| T <sub>JC</sub> | Package $\theta_{JC}$ (68 QFN)   | —          | —   | 2    | —   | °C/watt |
| T <sub>JA</sub> | Package $\theta_{JA}$ (49 WLCSP) | —          | —   | 21.5 | —   | °C/watt |
| T <sub>JC</sub> | Package $\theta_{JC}$ (49 WLCSP) | —          | —   | 0.21 | —   | °C/watt |

**Table 51. Solder Reflow Peak Temperature**

| Package      | Maximum Peak Temperature | Maximum Time at Peak Temperature |
|--------------|--------------------------|----------------------------------|
| All packages | 260 °C                   | 30 seconds                       |

**Table 52. Package Moisture Sensitivity Level (MSL), IPC/JEDEC J-STD-2**

| Package             | MSL   |
|---------------------|-------|
| 100 TQFP and 68 QFN | MSL 3 |
| 49 WLCSP            | MSL 1 |

**Figure 19. 100-TQFP 14.0 × 14.0 × 1.4 mm**

NOTE:

1. JEDEC STD REF MS-026
2. BODY LENGTH DIMENSION DOES NOT INCLUDE MOLD PROTRUSION/END FLASH  
MOLD PROTRUSION/END FLASH SHALL NOT EXCEED 0.0098 in (0.25 mm) PER SIDE  
BODY LENGTH DIMENSIONS ARE MAX PLASTIC BODY SIZE INCLUDING MOLD MISMATCH
3. DIMENSIONS IN MILLIMETERS

NOTE: PKG. CAN HAVE

51-85048 \*K

**Figure 20. 68-QFN Package Diagram**

NOTES:

1.  HATCH AREA IS SOLDERABLE EXPOSED METAL.
2. REFERENCE JEDEC#: MO-220
3. ALL DIMENSIONS ARE IN MILLIMETERS

001-96836 \*A

| eS2    | 0.40 BSC   |       |       |
| SD     | 0.21 BSC   |       |       |
| SE     | 0.00 BSC   |       |       |

**NOTES:**

- ALL DIMENSIONS ARE IN MILLIMETERS.
- SOLDER BALL POSITION DESIGNATION PER JEP95, SECTION 3, SPP-020.
- "e" REPRESENTS THE SOLDER BALL GRID PITCH.
- SYMBOL "MD" IS THE BALL MATRIX SIZE IN THE "D" DIRECTION. SYMBOL "ME" IS THE BALL MATRIX SIZE IN THE "E" DIRECTION. N IS THE NUMBER OF POPULATED SOLDER BALL POSITIONS FOR MATRIX SIZE MD X ME.
- DIMENSION "b" IS MEASURED AT THE MAXIMUM BALL DIAMETER IN A PLANE PARALLEL TO DATUM C.
- "SD" AND "SE" ARE MEASURED WITH RESPECT TO DATUMS A AND B AND DEFINE THE POSITION OF THE CENTER SOLDER BALL IN THE OUTER ROW. WHEN THERE IS AN ODD NUMBER OF SOLDER BALLS IN THE OUTER ROW. "SD" OR "SE" = 0. WHEN THERE IS AN EVEN NUMBER OF SOLDER BALLS IN THE OUTER ROW. "SD" = eD/2 AND "SE" = eE/2.
- A1 CORNER TO BE IDENTIFIED BY CHAMFER, LASER OR INK MARK, METALIZED MARK, INDENTATION OR OTHER MEANS.
- "+" INDICATES THE THEORETICAL CENTER OF DEPOPULATED SOLDER BALLS.
- JEDEC SPECIFICATION NO. REF. : N/A.

002-26627 \*A

| AES     | advanced encryption standard                                                                    |
| AHB     | AMBA (advanced microcontroller bus architecture) high-performance bus, an Arm data transfer bus |
| AMUX    | analog multiplexer                                                                              |
| AMUXBUS | analog multiplexer bus                                                                          |
| API     | application programming interface                                                               |
| Arm®    | advanced RISC machine, a CPU architecture                                                       |
| BGA     | ball grid array                                                                                 |
| BOD     | brown-out detect                                                                                |
| BREG    | backup registers                                                                                |
| BWC     | backward compatibility (eMMC data transfer mode)                                                |
| CAD     | computer aided design                                                                           |
| CCO     | current controlled oscillator                                                                   |
| ChaCha  | a stream cipher                                                                                 |
| CM0+    | Cortex-M0+, an Arm CPU                                                                          |
| CM4     | Cortex-M4, an Arm CPU                                                                           |
| CMAC    | cypher-based message authentication code                                                        |
| CMOS    | complementary metal-oxide-semiconductor, a process technology for IC fabrication                |
| CMRR    | common-mode rejection ratio                                                                     |
| CPU     | central processing unit                                                                         |
| CRC     | cyclic redundancy check, an error-checking protocol                                             |
| CSD     | CapSense Sigma-Delta                                                                            |
| CSV     | clock supervisor                                                                                |
| CSX     | Cypress mutual capacitance sensing method. See also CSD                                         |
| CTI     | cross trigger interface                                                                         |
| DAC     | digital-to-analog converter, see also IDAC, VDAC                                                |
| DAP     | debug access port                                                                               |
| DDR     | double data rate                                                                                |
| DES     | data encryption standard                                                                        |
| DFT     | design for test                                                                                 |
| DMA     | direct memory access, see also TD                                                               |
| DNL     | differential nonlinearity, see also INL                                                         |
| DSI     | digital system interconnect                                                                     |
| DU      | data unit                                                                                       |
| DW      | data wire, a DMA implementation                                                                 |

| Acronym                  | Description                                           |
|--------------------------|-------------------------------------------------------|
| ECC                      | error correcting code                                 |
| ECC                      | elliptic curve cryptography                           |
| ECO                      | external crystal oscillator                           |
| EEPROM                   | electrically erasable programmable read-only memory   |
| EMI                      | electromagnetic interference                          |
| eMMC                     | embedded MultiMediaCard                               |
| ESD                      | electrostatic discharge                               |
| ETM                      | embedded trace macrocell                              |
| FIFO                     | first-in, first-out                                   |
| FLL                      | frequency locked loop                                 |
| FPU                      | floating-point unit                                   |
| FS                       | full-speed                                            |
| GND                      | Ground                                                |
| GPIO                     | general-purpose input/output, applies to a PSoC pin   |
| HMAC                     | Hash-based message authentication code                |
| HSIOM                    | high-speed I/O matrix                                 |
| I/O                      | input/output, see also GPIO, DIO, SIO, USBIO          |
| I <sup>2</sup> C, or IIC | Inter-Integrated Circuit, a communications protocol   |
| I <sup>2</sup> S         | inter-IC sound                                        |
| IC                       | integrated circuit                                    |
| IDAC                     | current DAC, see also DAC, VDAC                       |

| LIN                      | Local Interconnect Network, a communications protocol |
| LP                       | low power                                             |
| LS                       | low-speed                                             |
| LUT                      | lookup table                                          |
| LVD                      | low-voltage detect, see also LVI                      |
| LVI                      | low-voltage interrupt                                 |
| LVTTTL                   | low-voltage transistor-transistor logic               |

| Acronym | Description                                                |
|---------|------------------------------------------------------------|
| MAC     | multiply-accumulate                                        |
| MCU     | microcontroller unit                                       |
| MISO    | master-in slave-out                                        |
| MMIO    | memory-mapped input output                                 |
| MOSI    | master-out slave-in                                        |
| MPU     | memory protection unit                                     |
| MSL     | moisture sensitivity level                                 |
| Msp/s   | million samples per second                                 |
| MTB     | micro trace buffer                                         |
| MUL     | multiplier                                                 |
| NC      | no connect                                                 |
| NMI     | nonmaskable interrupt                                      |
| NVIC    | nested vectored interrupt controller                       |
| NVL     | nonvolatile latch, see also WOL                            |
| OTP     | one-time programmable                                      |
| OVP     | over voltage protection                                    |
| OVT     | overvoltage tolerant                                       |
| PASS    | programmable analog subsystem                              |
| PCB     | printed circuit board                                      |
| PCM     | pulse code modulation                                      |
| PDM     | pulse density modulation                                   |
| PHY     | physical layer                                             |
| PICU    | port interrupt control unit                                |
| PLL     | phase-locked loop                                          |
| PMIC    | power management integrated circuit                        |
| POR     | power-on reset                                             |
| PPU     | peripheral protection unit                                 |
| PRNG    | pseudo random number generator                             |
| PSoC®   | Programmable System-on-Chip™                               |
| PSRR    | power supply rejection ratio                               |
| PWM     | pulse-width modulator                                      |
| QD      | quadrature decoder                                         |
| QSPI    | quad serial peripheral interface                           |
| RAM     | random-access memory                                       |
| RISC    | reduced-instruction-set computing                          |
| RMS     | root-mean-square                                           |
| ROM     | read-only memory                                           |
| RSA     | Rivest–Shamir–Adleman, a public-key cryptography algorithm |
| RTC     | real-time clock                                            |
| RWW     | read-while-write                                           |
| RX      | receive                                                    |
| S/H     | sample and hold                                            |

| Acronym | Description                                                            |
|---------|------------------------------------------------------------------------|
| SAR     | successive approximation register                                      |
| SARMUX  | SAR ADC multiplexer bus                                                |
| SC/CT   | switched capacitor/continuous time                                     |
| SCB     | serial communication block                                             |
| SCL     | I <sup>2</sup> C serial clock                                          |
| SD      | Secure Digital                                                         |
| SDA     | I <sup>2</sup> C serial data                                           |
| SDHC    | Secure Digital host controller                                         |
| SDR     | single data rate                                                       |
| Sflash  | supervisory flash                                                      |
| SHA     | secure hash algorithm                                                  |
| SINAD   | signal to noise and distortion ratio                                   |
| SMPU    | shared memory protection unit                                          |
| SNR     | signal-to-noise ration                                                 |
| SOF     | start of frame                                                         |
| SONOS   | silicon-oxide-nitride-oxide-silicon, a flash memory technology         |

### Units of Measure

Table 53. Units of Measure

| Symbol | Unit of Measure        |
|--------|------------------------|
| °C     | degrees Celsius        |
| dB     | decibel                |
| fF     | femto farad            |
| Hz     | hertz                  |
| KB     | 1024 bytes             |
| kbps   | kilobits per second    |
| hr     | hour                   |
| kHz    | kilohertz              |
| kΩ     | kilo ohm               |
| ksps   | kilosamples per second |
| LSB    | least significant bit  |
| Mbps   | megabits per second    |
| MHz    | megahertz              |
| MΩ     | mega-ohm               |
| Msps   | megasamples per second |
| μA     | microampere            |
| μF     | microfarad             |

Table 53. Units of Measure (*continued*)

| Symbol | Unit of Measure      |
|--------|----------------------|
| μH     | microhenry           |
| μs     | microsecond          |
| μV     | microvolt            |
| μW     | microwatt            |
| mA     | milliampere          |
| ms     | millisecond          |
| mV     | millivolt            |
| nA     | nanoampere           |
| ns     | nanosecond           |
| nV     | nanovolt             |
| W      | ohm                  |
| pF     | picofarad            |
| ppm    | parts per million    |
| ps     | picosecond           |
| s      | second               |
| sps    | samples per second   |
| sqrtHz | square root of hertz |
| V      | volt                 |

This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. No computing device can be absolutely secure. Therefore, despite security measures implemented in Cypress hardware or software products, Cypress does not assume any liability arising out of any security breach, such as unauthorized access to or use of a Cypress product. In addition, the products described in these materials may contain design defects or errors known as errata which may cause the product to deviate from published specifications. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. You shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.
