

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

# PSoC 3 Registers TRM

## **PSoC<sup>®</sup> 3 Registers TRM** (Technical Reference Manual)

Document No. 001-50581 Rev. \*K

March 25, 2020

Cypress Semiconductor  
198 Champion Court  
San Jose, CA 95134-1709

## Copyrights

© Cypress Semiconductor Corporation, 2009-2020. This document is the property of Cypress Semiconductor Corporation and its subsidiaries ("Cypress"). This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. No computing device can be absolutely secure. Therefore, despite security measures implemented in Cypress hardware or software products, Cypress shall have no liability arising out of any security breach, such as unauthorized access to or use of a Cypress product. CYPRESS DOES NOT REPRESENT, WARRANT, OR GUARANTEE THAT CYPRESS PRODUCTS, OR SYSTEMS CREATED USING CYPRESS PRODUCTS, WILL BE FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (collectively, "Security Breach"). Cypress disclaims any liability relating to any Security Breach, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any Security Breach. In addition, the products described in these materials may contain design defects or errors known as errata which may cause the product to deviate from published specifications. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. "High-Risk Device" means any device or system whose failure could cause personal injury, death, or property damage. Examples of High-Risk Devices are weapons, nuclear installations, surgical implants, and other medical devices. "Critical Component" means any component of a High-Risk Device whose failure to perform can be reasonably expected to cause, directly or indirectly, the failure of the High-Risk Device, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any use of a Cypress product as a Critical Component in a High-Risk Device. You shall indemnify and hold Cypress, its directors, officers, employees, agents, affiliates, distributors, and assigns harmless from and against all claims, costs, damages, and expenses, arising out of any claim, including claims for product liability, personal injury or death, or property damage arising from any use of a Cypress product as a Critical Component in a High-Risk Device. Cypress products are not intended or authorized for use as a Critical Component in any High-Risk Device except to the limited extent that (i) Cypress's published data sheet for the product explicitly states Cypress has qualified the product for use in a specific High-Risk Device, or (ii) Cypress has given you advance written authorization to use the product as a Critical Component in the specific High-Risk Device and you have signed a separate indemnification agreement.

Cypress, the Cypress logo, Spansion, the Spansion logo, and combinations thereof, WICED, PSoC, CapSense, EZ-USB, F-RAM, and Traveo are trademarks or registered trademarks of Cypress in the United States and other countries. For a more complete list of Cypress trademarks, visit [cypress.com](http://cypress.com). Other names and brands may be claimed as property of their respective owners.

## Revision History

**1701**

# Register Mapping

Register Mapping discusses the registers of the PSoC 3 device. It lists all the registers in mapping tables, in address order.

See the *PSoC 3, PSoC 5 Architecture TRM (Technical Reference Manual)*, 001-50235, for complete functionality.

## 1.1 Maneuvering Around the Registers

For ease-of-use, this chapter is formatted so that there is one register per page, although some registers use two pages. On each page, from top to bottom, there are four sections:

1. Register name and address (from lowest to highest).
2. Register table showing the bit organization, with reserved bits grayed out.
3. Written description of register specifics or links to additional register information.
4. Detailed register bit descriptions.

## 1.2 Register Conventions

The following table lists the register conventions.

Convention	Example	Description
'x' in a register name	ACBxxCR1	Multiple instances/address ranges of the same register
R	R : 00	Read register or bit(s)
W	W : 00	Write register or bit(s)
WOC	WOC:0	Write one to clear
WZC	WZC:0	Write zero to clear
RC	RC:0	Read to clear
WC	WC:0	Write to clear
NA	NA:000	Reserved
U	R:U	Undefined
00	RW : 00	Reset value is 0x00
XX	RW : XX	Register is not reset
Empty, grayed out table cell		Reserved bit or group of bits, unless otherwise stated. Write reserved bits to zero. Software cannot make any assumptions about return values.

## 1.3 PSoC 3 Register Map

The PSoC 3 device has a total register address space of 64 kbytes.

Register Name	Purpose	Address
SRAM_MAP_SYSMEM0_DATA[0..1023]	System Memory - CPU Region	[0..1023 * 0x4]
SRAM_MAP_SYSMEM1_DATA[0..1023]	System Memory - PHUB Region	0x1000 + [0..1023 * 0x4]
SRAM_MAP_TRACEMEM_DATA[0..1023]	Trace Memory	0x2000 + [0..1023 * 0x4]
CLKDIST_CR	Configuration Register CR	0x4000
CLKDIST_LD	LOAD Register	0x4001
CLKDIST_WRK0	LSB Shadow Divider Value Register	0x4002
CLKDIST_WRK1	MSB Shadow Divider Value Register	0x4003
CLKDIST_MSTR0	Master clock (clk_sync_d) Divider Value Register	0x4004
CLKDIST_MSTR1	Master (clk_sync_d) Configuration Register/CPU Divider Value	0x4005
CLKDIST_BCFG0	CLK_BUS LSB Divider Value Register	0x4006
CLKDIST_BCFG1	CLK_BUS MSB Divider Value Register	0x4007
CLKDIST_BCFG2	CLK_BUS Configuration Register	0x4008
CLKDIST_UCFG	USB Configuration Register	0x4009
CLKDIST_DLY0	Delay block Configuration Register	0x400a
CLKDIST_DLY1	Delay block Configuration Register	0x400b
CLKDIST_DMASK	Digital Clock Mask Register	0x4010
CLKDIST_AMASK	Analog Clock Mask Register	0x4014
CLKDIST_DCFG[0..7]_CFG0	LSB Divider Value Register	0x4080 + [0..7 * 0x4]
CLKDIST_DCFG[0..7]_CFG1	MSB Divider Value Register	0x4080 + [0..7 * 0x4] + 0x1
CLKDIST_DCFG[0..7]_CFG2	Configuration Register	0x4080 + [0..7 * 0x4] + 0x2
CLKDIST_ACFG[0..3]_CFG0	LSB Divider Value Register	0x4100 + [0..3 * 0x4]
CLKDIST_ACFG[0..3]_CFG1	MSB Divider Value Register	0x4100 + [0..3 * 0x4] + 0x1
CLKDIST_ACFG[0..3]_CFG2	Configuration Register	0x4100 + [0..3 * 0x4] + 0x2
CLKDIST_ACFG[0..3]_CFG3	Analog clocks Configuration Register	0x4100 + [0..3 * 0x4] + 0x3
FASTCLK_IMO_CR	Internal Main Oscillator Control Register	0x4200
FASTCLK_XMHZ_CSR	External 4-25 MHz Crystal Oscillator Status and Control Register	0x4210
FASTCLK_XMHZ_CFG0	External 4-25 MHz Crystal Oscillator Configuration Register 0	0x4212
FASTCLK_XMHZ_CFG1	External 4-25 MHz Crystal Oscillator Configuration Register 1	0x4213
FASTCLK_PLL_CFG0	PLL Configuration Register	0x4220
FASTCLK_PLL_CFG1	PLL Control Register	0x4221
FASTCLK_PLL_P	PLL P-Counter Configuration Register	0x4222
FASTCLK_PLL_Q	PLL Q-Counter Configuration Register	0x4223
FASTCLK_PLL_SR	PLL Status Register	0x4225
SLOWCLK_ILO_CR0	Internal Low-speed Oscillator Control Register 0	0x4300

Register Name	Purpose	Address
SLOWCLK_ILO_CR1	Internal Low-speed Oscillator Control Register 1	0x4301
SLOWCLK_X32_CR	External 32kHz Crystal Oscillator Control Register	0x4308
BOOST_CR0	Boost Control 0	0x4320
BOOST_CR1	Boost Control 1	0x4321

### 1.3.4 CLKDIST\_CR

#### Configuration Register CR

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_CR: 0x4000

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:00		R/W:00		R/W:00	
HW Access	NA	R	R		R		R	
Retention	NA	RET	RET		RET		RET	
Name	RSVD	IMO2X_SRC C	IMO_OUT		ILO_OUT		PLL_SRC	

This register is used to configure the 4 main CLK sources. PLL\_SRC - The source to the PLL reference clock input. ILO\_OUT - ILO source to the clock distribution block. IMO\_OUT - The source from IMO to clock distribution block. IMO2X\_SRC - Source to IMO doubler. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
6	IMO2X_SRC	This bit selects if the external clock input (dsi) or XTAL CLK is input to the internal oscillator. The internal oscillator itself contains another mux allowing control if the dsi/XTAL clock or the internal oscillator itself is the source clock to the system clock called IMO and to the IMO frequency doubling circuit. The clock selection in the internal oscillator is controlled by FASTCLK_IMO_CR.XCLKEN. Because this bit can induce clock glitches, it should only be changed when no downstream clock tree is configured to use the IMO clock source, or FASTCLK_IMO_CR.XCLKEN is low at the time it is changed. <a href="#">See Table 1-2.</a>
5:4	IMO_OUT[1:0]	Select the IMO output source to clock distribution. This clock configuration feature is primarily intended for internal use only. Changing this field can cause clock glitches. This needs either to be expected or avoided. To avoid glitches all downstream clock trees will need to be configured to a different clock source when this field is written. <a href="#">See Table 1-3.</a>
3:2	ILO_OUT[1:0]	Select the ILO output source to clock distribution. Any clock tree using this clock as its source must be disabled before writing this register bit to avoid potential glitches. <a href="#">See Table 1-1.</a>
1:0	PLL_SRC[1:0]	Select the PLL reference clock input. Do not change the value in this field while the PLL is the currently selected clock source for the Master Mux or USB clock (if enabled) <a href="#">See Table 1-4.</a>

Table 1-1. Bit field encoding: ILO\_OUTPUT\_SEL\_ENUM

Value	Name	Description
2'h0	ILO100K	100KHz output is selected
2'h1	ILO33K	33KHz output is selected
2'h2	ILO1K	1KHz output is selected
2'h3	RSVD	Reserved

(continued)

Table 1-2. Bit field encoding: IMO2X\_INPUT\_SEL\_ENUM

Value	Name	Description
1'b0	DSI	Digital System Interconnect is used as a source to IMO doubler
1'b1	XTAL	External clock source is used as a source to IMO doubler

Table 1-3. Bit field encoding: IMO\_OUTPUT\_SEL\_ENUM

Value	Name	Description
2'h0	IMO	IMO is selected
2'h1	IMO2X	IMO Doubler output is selected
2'h2	IMO36	IMO 36MHz output is selected
2'h3	RSVD	Reserved

Table 1-4. Bit field encoding: PLL\_INPUT\_SEL\_ENUM

Value	Name	Description
2'h0	IMO	IMO is selected
2'h1	XTAL	4 to 25MHz XTAL is selected
2'h2	DSI	Digital System Interconnect is selected
2'h3	RSVD	Reserved

## 1.3.5 CLKDIST\_LD

### LOAD Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_LD: 0x4001

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R/W	R/W	R/W
Retention	NA					RET	RET	RET
Name	RSVD					DISABLE	SYNC_EN	LOAD

This register provides control of clock parameters while the clocks are running and does so without compromising the integrity of the clocks (glitch-free). In groups defined by the DMASK and AMASK registers, clocks can be loaded with new count values or loaded with new divide counts and started aligned together using this feature. Setting the LOAD bit immediately copies the values of the WRK0 and WRK1 registers into all divider divide registers (DCFG0/1 and ACFG0/1, BCFG0/1), which are not masked off. Setting the SYNC\_EN bit forces a load and restart of all the dividers which are not masked off (excluding BUS\_CLK). Using SYNC\_EN restarts all affected dividers phase aligned. In order for the dividers to start phase aligned all the divide values must be integer multiples of one another. Upon setting the DISABLE register bit all dividers which are not masked off are disabled (Excluding BUS\_CLK). This allows for local control of the clock trees. The SYNC\_EN and LOAD bits, bits 1 and 0 respectively, in this register are cleared upon completion of loading and/or restarting. When changing configuration of any of the ACLK/DCLKs a value of 0x00 needs to be written to both WRK0 and WRK1 registers. Next a value of 0x07 has to be written to this register, LD. One has to poll this register, LD, for bits 1 and 0 (SYNC\_EN and LOAD) to be cleared in order to start modifying clock tree configuration. This applies to all ACLK/DCLK configuration bits. The WRK0/1 and DMASK/AMASK register can be written in any order but both must be written before LOAD or SYNC\_EN are written. The DMASK/AMASK register must be written before the DISABLE bit is written.

Bits	Name	Description
2	DISABLE	Locally disable all unmasked divders (Excluding BUS_CLK).  <a href="#">See Table 1-5.</a>
1	SYNC_EN	Load all unmasked dividers with a common shadow divider value and restart all unmasked dividers in phase.  <a href="#">See Table 1-7.</a>
0	LOAD	Load all unmasked dividers with a common shadow divider value. (does not restart them in phase)  <a href="#">See Table 1-6.</a>

Table 1-5. Bit field encoding: DISABLE\_ENUM

Value	Name	Description
1'b0	DISABLE_0	Enable
1'b1	DISABLE_1	Disable

Table 1-6. Bit field encoding: LOAD\_ENUM

Value	Name	Description
1'b0	LOAD_0	Do nothing
1'b1	LOAD_1	Copy shadow value defined in CLKDIST_WRK0 and CLKDIST_WRK1 registers to all dividers selected in CLKDIST_MSK0 and CLKDIST_MSK1 registers

(continued)

Table 1-7. Bit field encoding: SYNC\_SHADOW\_ENUM

Value	Name	Description
1'b0	SYNC_0	Do nothing
1'b1	SYNC_1	Enable all dividers selected in CLKDIST_MSK register (Excluding BUS_CLK) to start (or restart) in phase. NOTE: does not load the WRK register values. This bit only phase aligns all the selected dividers with their existing divide values.

## 1.3.6 CLKDIST\_WRK0

### LSB Shadow Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_WRK0: 0x4002

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register is the low byte of a count value to be loaded in specified clock dividers defined by the A/DMASK registers. This register (with WRK1) holds a new count value to be atomically loaded, so that the 16 bits dividers can safely be updated dynamically. For information on how this feature is used, see the description in the LD register.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including WRK1: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xfffe source / 65535 0xffff source / 65536

## 1.3.7 CLKDIST\_WRK1

### MSB Shadow Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_WRK1: 0x4003

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register is the high byte of a count value to be loaded in specified clock dividers defined by the A/DMASK registers. This register (with WRK0) holds a new count value to be atomically loaded, so that the 16 bits dividers can safely be updated dynamically. For information on how this feature is used, see the description in the LD register.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including WRK0: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xfffe source / 65535 0xffff source / 65536

## 1.3.8 CLKDIST\_MSTR0

### Master clock (clk\_sync\_d) Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_MSTR0: 0x4004

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the master source clock 8-bit divide value. This register can be written at any time, including while the divider is running. Due to a sampling anomaly in the HW, there is a small probability that the Master divider will divide by an incorrect value (not the past or new value) for one period before stabilizing on the divide value written. If this is undesirable, the workaround is to gray-code walk the divide value to that desired with multiple CSR writes. Also due to a defect in the HW, the Master clock divide value can not be changed from divide-by-n ( $n > 1$ ) to divide-by-1 when divide-by-1 produces an output frequency higher than 50MHz. If a frequency higher than 50MHz is desired a slower clock source must be configured during the switch to divide-by-1.

Bits	Name	Description
7:0	DIV_VAL[7:0]	0x00 source 0x01 source / 2 0x02 source / 3 ... .. 0xfe source / 255 0xff source / 256

### 1.3.9 CLKDIST\_MSTR1

#### Master (clk\_sync\_d) Configuration Register/CPU Divider Value

**Reset:** Reset Signals Listed Below

Register : Address

CLKDIST\_MSTR1: 0x4005

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0000				NA:00		R/W:00	
HW Access	R				NA		R	
Retention	RET				NA		NONRET	
Name	CPUDIV				RSVD		SRC_SEL	

This register holds the master clock source configuration and CPU clock divide value. Both fields in this register can be altered at any time without compromising clock integrity.

Bits	Name	Description
7:4	CPUDIV[3:0]	0x0 source 0x1 source / 2 0x2 source / 3 ... 0xe source / 15 0xf source / 16
1:0	SRC_SEL[1:0]	Master clock source selection.

[See Table 1-8.](#)

#### Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	CPUDIV[3:0]
Domain reset for non-retention flops [reset_all_nonretention]	SRC_SEL[1:0]

Table 1-8. Bit field encoding: MASTER\_SRC\_SEL\_ENUM

Value	Name	Description
2'h0	IMO	imo output is selected
2'h1	PLL	pll output is selected
2'h2	XTAL	xtal_mhz output is selected
2'h3	DSI	dsi_c output is selected

### 1.3.10 CLKDIST\_BCFG0

#### CLK\_BUS LSB Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_BCFG0: 0x4006

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the LSB of the 16-bit divide value. It should only be written when the clock tree is disabled to avoid clock glitches. If the clock divider needs changed when the clock is running, this can be accomplished using the atomic load feature described in the LD register description.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG1: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xfffe source / 65535 0xffff source / 65536

### 1.3.11 CLKDIST\_BCFG1

#### CLK\_BUS MSB Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_BCFG1: 0x4007

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the MSB of the 16-bit divide value. It should only be written when the clock tree is disabled to avoid clock glitches. If the clock divider needs changed when the clock is running, this can be accomplished using the atomic load feature described in the LD register description.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG0: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xfffe source / 65535 0xffff source / 65536

## 1.3.12 CLKDIST\_BCFG2

### CLK\_BUS Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_BCFG2: 0x4008

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:000		
HW Access	R	R	R	R	R	NA		
Retention	RET	RET	RET	RET	RET	NA		
Name	MASK	SSS	EARLY	DUTY	SYNC	RSVD		

This register holds the configuraton values for the Bus Clock. The EARLY bit should never be used and should never be set HIGH. The DUTY bit should never be written when the divider is in use to avoid clock glitches. The SSS and SYNC\_EN bits can only be safely written when clk\_sync (output of MasterMux) is running at 12MHz or lower and a duty-cycle between 30/70 and 50/50 to avoid clock glitches. The MASK bit is used for inclusion/exclusion from atomic load operations. See the description of this feature in the LD register description. SSS takes precedence over SYNC\_EN. Do not set SYNC\_EN high with SSS low when the divider is dividing by 1, this halts BUSCLK and is non-recoverable. BUSCLK is phase-aligned (balanced) with the ACLs/DCLKs only when SSS or SYNC\_EN is set HIGH.

Bits	Name	Description
7	MASK	Mask bits to enable shadow loads--0 disable, 1 enable. See LD register description.
6	SSS	Sync source same as output frequency. Used to bypass synchronization with delay matched path. Set this bit high when not dividing and balanced system clocks are desired. Only change when clk_sync is below 12MHz to avoid clock glitches. <a href="#">See Table 1-11.</a>
5	EARLY	RESERVED - Do not set HIGH in any application. <a href="#">See Table 1-10.</a>
4	DUTY	Force duty cycle to 50%. Only change this bit when divider is not in use to avoid clock glitches. <a href="#">See Table 1-9.</a>
3	SYNC	Select output synchronization to master clock. Use to balance system clocks only when the divider is dividing by 2 or higher. Do not set this bit high when the divider is set to divide by 1 if SSS is low - this will halt BUSCLK. Otherwise, to avoid clock glitches, first set the SSS bit high when making changes, then set the SSS bit low when changes are complete. (SSS takes precedence over SYNC so doing this will protect the clock from any glitches related to changing SYNC). <a href="#">See Table 1-12.</a>

Table 1-9. Bit field encoding: DUTY\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable 50% duty cycle. Pulse train.
1'b1	ENABLE	Enable 50% duty cycle clock output

Table 1-10. Bit field encoding: EARLY\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable early phase mode
1'b1	ENABLE	Enable early phase mode

(continued)

Table 1-11. Bit field encoding: SSS\_ENUM

Value	Name	Description
1'b0	DISABLE	Sync source not same frequency
1'b1	ENABLE	Sync source is same frequency

Table 1-12. Bit field encoding: SYNC\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable synchronization
1'b1	ENABLE	Enable synchronization

### 1.3.13 CLKDIST\_UCFG

#### USB Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_UCFG: 0x4009

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:00	
HW Access	NA			R	R	R	R	
Retention	NA			RET	RET	RET	RET	
Name	RSVD			TMODE	GPIPE	DIV2	SRC_SEL	

This register holds the USB clock configuration parameters. Only change values in this register when the USB clock is disabled to avoid clock glitches.

Bits	Name	Description
4	TMODE	Enable monitoring of clk_usb through DSI routing <a href="#">See Table 1-16.</a>
3	GPIPE	Global DSI input pipeline configuration <a href="#">See Table 1-13.</a>
2	DIV2	USB clock divide source by two <a href="#">See Table 1-14.</a>
1:0	SRC_SEL[1:0]	USB clock source selection. <a href="#">See Table 1-15.</a>

Table 1-13. Bit field encoding: CDSI\_ENUM

Value	Name	Description
1'b0	BYPASS	Bypass pipeline stages
1'b1	ENABLE	Use pipeline stages

Table 1-14. Bit field encoding: DIV2\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable divide by two
1'b1	ENABLE	Enable divide by two

Table 1-15. Bit field encoding: SRC\_SEL\_ENUM

Value	Name	Description
2'h0	IMO2X	imo2x output is selected
2'h1	IMO	imo output is selected
2'h2	PLL	pll output is selected
2'h3	DSI	dsi_glb_div output is selected

Table 1-16. Bit field encoding: TMODE\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable clk_usb_test output to DSI
1'b1	ENABLE	Enable clk_usb_test output to DSI

### 1.3.14 CLKDIST\_DLY0

#### Delay block Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_DLY0: 0x400A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:00		R/W:00000				
HW Access	NA	R		R				
Retention	NA	RET		RET				
Name	RSVD	CTRIM		FTRIM				

This register is used to trim the delay cell tap duration. This register should only be used when the delay cell is in trim mode (see DLY1 MODE bit). This register can also be accessed via it's alias, the DLY register in the MFGCFG address space.

Bits	Name	Description
6:5	CTRIM[1:0]	Course trim bits for delay block <a href="#">See Table 1-17.</a>
4:0	FTRIM[4:0]	Fine trim bits for delay block 5'b00000 Lowest bias ... .. 5'bffff Highest bias

Table 1-17. Bit field encoding: CTRIM\_ENUM

Value	Name	Description
2'b00	ZERO	Highest bias setting
2'b10	TWO	Second highest bias setting
2'b01	ONE	Third highest bias setting
2'b11	THREE	Fourth highest bias setting

### 1.3.15 CLKDIST\_DLY1

#### Delay block Configuration Register

**Reset:** Reset Signals Listed Below

Register : Address

CLKDIST\_DLY1: 0x400B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					NONRET	NA	RET
Name	RSVD					EN	RSVD	MODE

This register holds the configuration control for the clock delay cell. This cell is used to program delays between the system bus clock and each of the 4 individual analog clocks (ACLK). This is used to unalign analog and digital domain clock edges to reduce noise when the analog domain clocks. Normally the 5 domains are phase aligned for applications that need clock-edge-aligned interfaces. If clock-edge-aligned interfaces aren't needed and system noise is an issue, clock tree domains can be programmably skewed away from each other.

Bits	Name	Description
2	EN	The clk_sync_d reference clock is sourced by the clk0 output of the delay cell. This output can either be sourced from a 10-tap delay element or muxed directly (bypassed) from the delay cell's clock input (clk_sync). When bypassed (EN=0), the bus clock and all 4 analog clocks (clk_a[]) are balanced (clock-edge-aligned) if their skew delay registers are programmed to 0x0001. (see CLKDIST_ACFGx_CFG3) If EN=1 this enables the delay element on clk0 and allows the system to program delays on clk_sync_d. The delay amount is identical to the ACLK channels but is not controlled with a register, but rather with customer controlled non-volatile bits that are loaded at system POR. In this mode the clk0 has a inherent ~4ns delay, meaning BUSCLK lags the 4 ACLKs by ~4ns when all tap are programmed to 0x0001. Thus, any values programmed into the PHASE_DLY fields of the CLKDIST_ACFGx_CFG3 registers will skew the clocks relative to this ~4ns skew, as will changing the clk0 delay via CNVL setting. Note that it is not allowed that the system be configured such that clk_sync_d lag any clk_a[] by less than ~4ns for any values of the programmable delay values. The HW will fail in these cases and SW should avoid doing this. See ACFG3 register description for further details. This bit is cleared on wakeup from low power modes(sleep, hibernate, hibernate timer modes), user is expected to configure this bit to the required state.
0	MODE	Clock mode. Used to put the delay cell in normal more or trim mode.

[See Table 1-19.](#)

#### Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	MODE, ISEL
Domain reset for non-retention flops [reset_all_nonretention]	EN

Table 1-18. Bit field encoding: ISEL\_ENUM

Value	Name	Description
1'b0	BANDGAP	Use bandgap reference
1'b1	INTERNAL	Use internal reference, this selection is for engineering purposes only

(continued)

Table 1-19. Bit field encoding: MODE\_ENUM

Value	Name	Description
1'b0	DELAY	Puts the cell in normal clock delay mode. This is mission mode and allows for programming of delays on the clock trees. See CLKDIST_ACFGx_CFG3
1'b1	RING	This mode is used only for trimming. While in this mode the output of a ring oscillator is monitored and tuned to 40MHz.

## 1.3.16 CLKDIST\_DMASK

### Digital Clock Mask Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_DMASK: 0x4010

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DMASK							

Mask picking which digital clocks are enabled for shadow loads. See LD register description for usage information.

Bits	Name	Description
7:0	DMASK[7:0]	Mask bits to enable shadow loads -- 0 = Disabled, 1 = Enabled MSK0 = DCLK0 MSK1 = DCLK1 : MSK7 = DCLK7

### 1.3.17 CLKDIST\_AMASK

#### Analog Clock Mask Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_AMASK: 0x4014

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				AMASK			

Mask picking which analog clocks are enabled for shadow loads. See LD register description for usage information.

Bits	Name	Description
3:0	AMASK[3:0]	Mask bits to enable shadow loads -- 0 = Disabled, 1 = Enabled MSK0 = ACLK0 : MSK3 = ACLK3

### 1.3.18 CLKDIST\_DCFG[0..7]\_CFG0

#### LSB Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_DCFG0\_CFG0: 0x4080

CLKDIST\_DCFG1\_CFG0: 0x4084

CLKDIST\_DCFG2\_CFG0: 0x4088

CLKDIST\_DCFG3\_CFG0: 0x408C

CLKDIST\_DCFG4\_CFG0: 0x4090

CLKDIST\_DCFG5\_CFG0: 0x4094

CLKDIST\_DCFG6\_CFG0: 0x4098

CLKDIST\_DCFG7\_CFG0: 0x409C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the LSB of the 16-bit divide value. Change this register only when the associated clock is disabled. See LD register for details.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG1: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xffff source / 65535 0xffff source / 65536

## 1.3.19 CLKDIST\_DCFG[0..7]\_CFG1

### MSB Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_DCFG0\_CFG1: 0x4081

CLKDIST\_DCFG1\_CFG1: 0x4085

CLKDIST\_DCFG2\_CFG1: 0x4089

CLKDIST\_DCFG3\_CFG1: 0x408D

CLKDIST\_DCFG4\_CFG1: 0x4091

CLKDIST\_DCFG5\_CFG1: 0x4095

CLKDIST\_DCFG6\_CFG1: 0x4099

CLKDIST\_DCFG7\_CFG1: 0x409D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the MSB of the 16-bit divide value. Change this register only when the associated clock is disabled. See LD register for details.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG0: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xfffe source / 65535 0xffff source / 65536

## 1.3.20 CLKDIST\_DCFG[0..7]\_CFG2

### Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_DCFG0\_CFG2: 0x4082

CLKDIST\_DCFG1\_CFG2: 0x4086

CLKDIST\_DCFG2\_CFG2: 0x408A

CLKDIST\_DCFG3\_CFG2: 0x408E

CLKDIST\_DCFG4\_CFG2: 0x4092

CLKDIST\_DCFG5\_CFG2: 0x4096

CLKDIST\_DCFG6\_CFG2: 0x409A

CLKDIST\_DCFG7\_CFG2: 0x409E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	R	R	R	R	R	R		
Retention	RET	RET	RET	RET	RET	RET		
Name	PIPE	SSS	EARLY	DUTY	SYNC	SRC_SEL		

This register holds the 8-bit DCLK configuraton values. Only change these values when the associated clock is disabled to avoid clock glitches (See LD register for details). Clock is phase-aligned with BUSCLK only when clk\_sync\_d is the source and SSS or SYNC\_EN are set HIGH. SSS takes presedence over SYNC\_EN. Never set SYNC\_EN=1 with SSS=0 when dividing by 1, as this halts the clock.

Bits	Name	Description
7	PIPE	DSI input pipeline configuration <a href="#">See Table 1-22.</a>
6	SSS	Sync source same as output frequency. Used to bypass synchronization with delay matched path. <a href="#">See Table 1-24.</a>
5	EARLY	This bit in the configuration register can be used to set the early phase mode, with rising edge near the half-count of the divider. <a href="#">See Table 1-21.</a>
4	DUTY	Force duty cycle to 50% <a href="#">See Table 1-20.</a>
3	SYNC	Select output synchronization to master clock <a href="#">See Table 1-25.</a>
2:0	SRC_SEL[2:0]	Clock source selection. <a href="#">See Table 1-23.</a>

Table 1-20. Bit field encoding: DUTY\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable 50% duty cycle
1'b1	ENABLE	Enable 50% duty cycle clock output

Table 1-21. Bit field encoding: EARLY\_ENUM

Value	Name	Description
-------	------	-------------

(continued)

1'b0	DISABLE	Disable early phase mode
1'b1	ENABLE	Enable early phase mode

Table 1-22. Bit field encoding: PIPE\_ENUM

Value	Name	Description
1'b0	BYPASS	Bypass pipeline stages
1'b1	ENABLE	Use pipeline stages

Table 1-23. Bit field encoding: SRC\_SEL\_ENUM

Value	Name	Description
3'h0	clk_sync_d	clk_sync_d output is selected
3'h1	imo	imo output is selected
3'h2	xtal_mhz	xtal_mhz output is selected
3'h3	ilo	ilo output is selected
3'h4	pll	pll output is selected
3'h5	xtal_khz	xtal_khz output is selected
3'h6	dsi_g	dsi_global[0] output is selected
3'h7	dsi_d	dsi_d output is selected

Table 1-24. Bit field encoding: SSS\_ENUM

Value	Name	Description
1'b0	DISABLE	Sync source not same frequency
1'b1	ENABLE	Sync source is same frequency

Table 1-25. Bit field encoding: SYNC\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable synchronization
1'b1	ENABLE	Enable synchronization

## 1.3.21 CLKDIST\_ACFG[0..3]\_CFG0

### LSB Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_ACFG0\_CFG0: 0x4100

CLKDIST\_ACFG1\_CFG0: 0x4104

CLKDIST\_ACFG2\_CFG0: 0x4108

CLKDIST\_ACFG3\_CFG0: 0x410C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the LSB of the 16-bit divide value. Change this register only when the associated clock is disabled. See LD register for details.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG1: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xfffe source / 65535 0xffff source / 65536

## 1.3.22 CLKDIST\_ACFG[0..3]\_CFG1

### MSB Divider Value Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_ACFG0\_CFG1: 0x4101

CLKDIST\_ACFG1\_CFG1: 0x4105

CLKDIST\_ACFG2\_CFG1: 0x4109

CLKDIST\_ACFG3\_CFG1: 0x410D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the MSB of the 16-bit divide value. Change this register only when the associated clock is disabled. See LD register for details.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG0: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... .. 0xfffe source / 65535 0xffff source / 65536

### 1.3.23 CLKDIST\_ACFG[0..3]\_CFG2

#### Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_ACFG0\_CFG2: 0x4102

CLKDIST\_ACFG1\_CFG2: 0x4106

CLKDIST\_ACFG2\_CFG2: 0x410A

CLKDIST\_ACFG3\_CFG2: 0x410E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	R	R	R	R	R	R		
Retention	RET	RET	RET	RET	RET	RET		
Name	PIPE	SSS	EARLY	DUTY	SYNC	SRC_SEL		

This register holds the 8-bit ACLK configuraton values. Only change these values when the associated clock is disabled to avoid clock glitches (See LD register for details). Clock is phase-aligned with BUSCLK only when clk\_sync\_a/d is the source and SSS or SYNC\_EN are set HIGH. SSS takes presedence over SYNC\_EN. Never set SYNC\_EN=1 when dividing by 1, this halts the clock.

Bits	Name	Description
7	PIPE	DSI input pipeline configuration <a href="#">See Table 1-28.</a>
6	SSS	Sync source same as output frequency. Used to bypass synchronization with delay matched path. <a href="#">See Table 1-30.</a>
5	EARLY	This bit in the configuration register can be used to set the early phase mode, with rising edge near the half-count of the divider. <a href="#">See Table 1-27.</a>
4	DUTY	Force duty cycle to 50% <a href="#">See Table 1-26.</a>
3	SYNC	Select output synchronization to master clock <a href="#">See Table 1-31.</a>
2:0	SRC_SEL[2:0]	Clock source selection. <a href="#">See Table 1-29.</a>

Table 1-26. Bit field encoding: DUTY\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable 50% duty cycle
1'b1	ENABLE	Enable 50% duty cycle clock output

Table 1-27. Bit field encoding: EARLY\_ENUM

Value	Name	Description
1'b0	DISABLE	Disable early phase mode
1'b1	ENABLE	Enable early phase mode

(continued)

Table 1-28. Bit field encoding: PIPE\_ENUM

Value	Name	Description
1'b0	BYPASS	Bypass pipeline stages
1'b1	ENABLE	Use pipeline stages

Table 1-29. Bit field encoding: SRC\_SEL\_ENUM

Value	Name	Description
3'h0	clk_sync_a	clk_sync_a output is selected
3'h1	imo	imo output is selected

Value	Name	Description
1'b0	DISABLE	Disable synchronization
1'b1	ENABLE	Enable synchronization

## 1.3.24 CLKDIST\_ACFG[0..3]\_CFG3

### Analog clocks Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CLKDIST\_ACFG0\_CFG3: 0x4103

CLKDIST\_ACFG1\_CFG3: 0x4107

CLKDIST\_ACFG2\_CFG3: 0x410B

CLKDIST\_ACFG3\_CFG3: 0x410F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				PHASE_DLY			

This register holds the analog clocks delay configuration. This register should not be written when the associated clock tree is enabled to avoid clock glitches. See DLY1 for more information how to use this register. Note that due to a clock balancing problem in the HW that some delay values can produce jitter in the ACLKs.

Bits	Name	Description
3:0	PHASE_DLY[3:0]	Phase delay selection (1.0ns increments): 0x00 Clock Disabled 0x01 0 ns delay 0x02 1 ns delay ... 0x0a 9 ns delay 0x0b 10 ns delay 0x0c Clock Disabled 0x0d Clock Disabled 0x0e Clock Disabled 0x0f Clock Disabled

## 1.3.25 FASTCLK\_IMO\_CR

### Internal Main Oscillator Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FASTCLK\_IMO\_CR: 0x4200

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	R	R	R	R	R	R		
Retention	RET	RET	RET	RET	RET	RET		
Name	sel_fast_bias s	usbclk_on	xclken	f2xon	en_fast_bias s	f_range		

This register controls operation of the IMO.

Bits	Name	Description
7	sel_fast_bias	Select IMO reference source, possible frequency selections are 12,24 and 48MHz <a href="#">See Table 1-35.</a>
6	usbclk_on	Configures IMO for higher precision for when the internal USB clock-locking function is being used. <a href="#">See Table 1-36.</a>
5	xclken	External clock enable for the IMO and the IMO doubler. This bit selects if the Internal Oscillator or an external clock is the source of IMO and the input to the IMO Doubler. There are two choices for the external clock source, dsi and XTAL (see CLKDIST.CR.IMO2X_SRC). <a href="#">See Table 1-37.</a>
4	f2xon	IMO Doubler enable <a href="#">See Table 1-33.</a>
3	en_fast_bias	Enables fast wake bias circuitry. This must be set before selecting the fast wake bias as the IMO reference using sel_fast_bias. <a href="#">See Table 1-32.</a>
2:0	f_range[2:0]	Frequency range setting for the IMO. Note that if sel_fast_bias and en_fast_bias are set OR the device is in boot OR wake from sleep/hibernate/hibernate-timer modes IMO will be forced to FIMO mode. During boot, device wakeup from sleep/hibernate/hibernate-timers mode frequency setting is overridden by the value in PWRSYS_WAKE_TR1.wake_imofreq. During other times if sel_fast_bias and en_fast_bias are set then IMO frequency setting is controlled by f_range configuration bits only. See PWRSYS_WAKE_TR1 for FIMO frequency table. <a href="#">See Table 1-34.</a>

Table 1-32. Bit field encoding: EN\_FAST\_BIAS

Value	Name	Description
1'b0	EN_FAST_BIAS_DISAB LE	Disable fast wake bias circuit
1'b1	EN_FAST_BIAS_ENABL E	Enable fast wake bias circuit

(continued)

Table 1-33. Bit field encoding: F2XON\_ENUM

Value	Name	Description
1'b0	F2XON_0	Doubler disabled (IMOCLK2X = 0)
1'b1	F2XON_1	Doubler enabled. Note: input freq range limited to 24 MHz max.

Table 1-34. Bit field encoding: F\_RANGE\_ENUM

Value	Name	Description
3'h0	F_RANGE_0	12 MHz (normal)
3'h1	F_RANGE_1	6 MHz (12MHz if sel_fast_bias=1)
3'h2	F_RANGE_2	24 MHz
3'h3	F_RANGE_3	3 MHz ( RESERVED in FIMO mode)
3'h4	F_RANGE_4	48 MHz
3'h5	F_RANGE_5	62 MHz center, 67 MHz peak (48MHz if sel_fast_bias=1)
3'h6	F_RANGE_6	72 MHz center, 80 Mhz peak (48MHz if sel_fast_bias=1)
3'h7	F_RANGE_7	Reserved (48MHz if sel_fast_bias=1)

Table 1-35. Bit field encoding: SEL\_FAST\_BIAS\_ENUM

Value	Name	Description
1'b0	SEL_FAST_BIAS_NOR MAL	Select LVBG as IMO reference
1'b1	SEL_FAST_BIAS_FAST	Select fast wake bias as IMO reference

Table 1-36. Bit field encoding: USBCLK\_ON\_ENUM

Value	Name	Description
1'b0	USBCLK_ON_0	Normally used for non-USB modes, for lower IMO power
1'b1	USBCLK_ON_1	USB clock-locking used; IMO runs at higher power for highest USB clock precision.

Table 1-37. Bit field encoding: XCLKEN\_ENUM

Value	Name	Description
1'b0	XCLKEN_0	IMO doubler runs from the IMOCLK
1'b1	XCLKEN_1	IMO doubler runs from the selected 'external' clock.

### 1.3.26 FASTCLK\_XMHZ\_CSR

#### External 4-25 MHz Crystal Oscillator Status and Control Register

**Reset:** Reset Signals Listed Below

Register : Address

FASTCLK\_XMHZ\_CSR: 0x4210

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	RC:0	R/W:0	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	W	R	NA	R	R	R	R	R
Retention	NONRET	RET	NA	RET	RET	RET	RET	RET
Name	xerr	xprot	RSVD	xstart	xpump_dis	xfb_dis	xto_dis	en

This register is used to enable and configure modes of the XMHZ oscillator, and to read error status. In the table above, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
7	xerr	High output indicates oscillator failure. Only use this after start-up interval is completed. This can be used for status and failure recovery.
6	xprot	Enable External Crystal Oscillator (XMHZ) fault recovery circuitry <a href="#">See Table 1-40.</a>
4	xstart	This INTERNAL bit selects the start-up mode for the oscillator. By default, the output is pulsed to initiate start-up. If a system clock is available at approximately the same frequency as the crystal, this signal can be selected to provide a faster start-up time. <a href="#">See Table 1-42.</a>
3	xpump_dis	This bit disables the crystal oscillator voltage pumps. Recommended settings: 1 when VDDA > 2*VCCD (pump disabled) 0 when VDDA <= 2*VCCD (pump enabled) <a href="#">See Table 1-41.</a>
2	xfb_dis	This bit disables an amplitude monitor on the oscillator signal. If the oscillator amplitude is too low, the XERR bit will be high. <a href="#">See Table 1-39.</a>
1	xto_dis	This bit disables a watchdog monitor on the oscillator signal. Error output bit is asserted immediately after the oscillator is enabled and is de-asserted as soon as the output clock toggles <a href="#">See Table 1-43.</a>
0	en	This bit enables the 4 - 25 MHz crystal oscillator circuit when set high. <a href="#">See Table 1-38.</a>

#### Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	en, xto_dis, xfb_dis, xpump_dis, xstart, xprot
Domain reset for non-retention flops [reset_all_nonretention]	xerr

(continued)

Table 1-38. Bit field encoding: EN\_ENUM

Value	Name	Description
1'b0	EN_0	disabled
1'b1	EN_1	enabled. Note that the oscillator amplitude takes time to reach stable amplitude. This can be monitored with the XERR bit.

Table 1-39. Bit field encoding: XFB\_DIS\_ENUM

Value	Name	Description
1'b0	XFB_DIS_0	Feedback enabled - If oscillator has insufficient amplitude, XERR bit will be high.
1'b1	XFB_DIS_1	Feedback disabled

Table 1-40. Bit field encoding: XPROT\_ENUM

Value	Name	Description
1'b0	XPROT_0	Fault Recovery not enabled
1'b1	XPROT_1	Fault Recovery enabled

Table 1-41. Bit field encoding: XPUMP\_DIS\_ENUM

Value	Name	Description
1'b0	XPUMP_DIS_0	Pumps enabled - Use this setting if Vdd can be <3V.
1'b1	XPUMP_DIS_1	Pumps disabled - Only use this if Vdd will be >3V when oscillator is enabled.

Table 1-42. Bit field encoding: XSTART\_ENUM

Value	Name	Description
1'b0	XSTART_0	Use internal single pulse
1'b1	XSTART_1	Use a clock close to the target frequency to improve start-up time.

Table 1-43. Bit field encoding: XTO\_DIS\_ENUM

Value	Name	Description
1'b0	XTO_DIS_0	Watchdog enabled - Oscillator must achieve proper switching within the internal time window, or XERR will be set high.
1'b1	XTO_DIS_1	Watchdog disabled

### 1.3.27 FASTCLK\_XMHZ\_CFG0

#### External 4-25 MHz Crystal Oscillator Configuration Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FASTCLK\_XMHZ\_CFG0: 0x4212

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:00000				
HW Access	NA			R/W				
Retention	NA			RET				
Name	RSVD			xcfg				

Bits	Name	Description
4:0	xcfg[4:0]	<p>Selects amplifier transconductance setting, which impacts -R for crystal oscillator startup; Settings are based on the external crystal's parallel resonant load capacitance specification (CL) and its shunt capacitance (C0);</p> <p>CL &gt;= 15pF:  C0 &gt;= 3.5pF:  Frequency &lt;= 7.3MHz : xcfg = 5'h0E  7.3MHz &lt; Frequency &lt;= 13.2MHz : xcfg = 5'h13  Frequency &gt; 13.2MHz : xcfg = 5'h19  C0 &lt; 3.5pF:  Frequency &lt;= 6.9MHz : xcfg = 5'h13  Frequency &gt; 6.9MHz : xcfg = 5'h17  CL &lt; 15pF:  Frequency &lt;= 7.3MHz : xcfg = 5'h0A  7.3MHz &lt; Frequency &lt;= 12.9MHz : xcfg = 5'h0E  Frequency &gt; 12.9MHz : xcfg = 5'h13</p>

## 1.3.28 FASTCLK\_XMHZ\_CFG1

### External 4-25 MHz Crystal Oscillator Configuration Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FASTCLK\_XMHZ\_CFG1: 0x4213

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			R/W:0000			
HW Access	NA	R/W			R/W			
Retention	NA	RET			RET			
Name	RSVD	vref_sel_wd			vref_sel_fb			

Bits	Name	Description
6:4	vref_sel_wd[2:0]	Selects reference level for watchdog (vrefout_wd); NOTE: vref_sel_fb must be greater than or equal to the binary value of vref_sel_wd. Valid settings are: 5 for XOSC freq < 16 MHz 3 for 16 MHz <= XOSC freq <= 25 MHz <a href="#">See Table 1-45.</a>
3:0	vref_sel_fb[3:0]	Selects reference level for feedback (vrefout_fb); NOTE: vref_sel_fb must be greater than or equal to the binary value of vref_sel_wd <a href="#">See Table 1-44.</a>

Table 1-44. Bit field encoding: VREF\_SEL\_FB\_ENUM

Value	Name	Description
4'h0	VREF_SEL_FB_0	139 mV
4'h1	VREF_SEL_FB_1	185 mV
4'h2	VREF_SEL_FB_2	231 mV
4'h3	VREF_SEL_FB_3	277 mV
4'h4	VREF_SEL_FB_4	323 mV
4'h5	VREF_SEL_FB_5	370 mV
4'h6	VREF_SEL_FB_6	416 mV
4'h7	VREF_SEL_FB_7	462 mV
4'h8	VREF_SEL_FB_8	508 mV
4'h9	VREF_SEL_FB_9	554 mV
4'ha	VREF_SEL_FB_10	601 mV
4'hb	VREF_SEL_FB_11	647 mV
4'hc	VREF_SEL_FB_12	693 mV
4'hd	VREF_SEL_FB_13	739 mV
4'he	VREF_SEL_FB_14	786 mV
4'hf	VREF_SEL_FB_15	832 mV

Table 1-45. Bit field encoding: VREF\_SEL\_WD\_ENUM

Value	Name	Description
3'h0	VREF_SEL_WD_0	46 mV
3'h1	VREF_SEL_WD_1	92 mV
3'h2	VREF_SEL_WD_2	139 mV
3'h3	VREF_SEL_WD_3	185 mV
3'h4	VREF_SEL_WD_4	231 mV

(continued)

Table 1-45. Bit field encoding: VREF\_SEL\_WD\_ENUM

3'h5	VREF_SEL_WD_5	277 mV
3'h6	VREF_SEL_WD_6	323 mV
3'h7	VREF_SEL_WD_7	370 mV

## 1.3.29 FASTCLK\_PLL\_CFG0

### PLL Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FASTCLK\_PLL\_CFG0: 0x4220

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:01		R/W:01		NA:000			R/W:0
HW Access	R		R		NA			R
Retention	RET		RET		NA			RET
Name	wait		delay		RSVD			en

This register provides status and control for the PLL.

Bits	Name	Description
7:6	wait[1:0]	Lock detect wait time before declaring lock. The PLL's high phase error indicator must remain low for this number of PFD clock periods before the raw lock detect signal asserts. The PFD clock must be within 1MHz to 3MHz, and is determined by the PLL reference clock (FREF) divided by Q. The PFD clock period TPF <sub>D</sub> is determined by the equation $TPFD = Q / FREF$ <a href="#">See Table 1-48.</a>
5:4	delay[1:0]	Lock detect delay time. This is approximate phase error time allowed before the high phase error indicator asserts and clears the raw lock detect status bit. <a href="#">See Table 1-46.</a>
0	en	Enable PLL <a href="#">See Table 1-47.</a>

Table 1-46. Bit field encoding: DELAY\_ENUM

Value	Name	Description
2'h0	DELAY_0	19ns delay
2'h1	DELAY_1	23ns delay (default)
2'h2	DELAY_2	28ns delay
2'h3	DELAY_3	33ns delay

Table 1-47. Bit field encoding: PLL\_EN\_ENUM

Value	Name	Description
1'b0	PLL_EN_DISABLE	PLL Disabled
1'b1	PLL_EN_ENABLE	PLL Enabled

Table 1-48. Bit field encoding: WAIT\_ENUM

Value	Name	Description
2'h0	WAIT_0	7 * TPF <sub>D</sub>
2'h1	WAIT_1	15 * TPF <sub>D</sub> (default)
2'h2	WAIT_2	23 * TPF <sub>D</sub>
2'h3	WAIT_3	31 * TPF <sub>D</sub>

### 1.3.30 FASTCLK\_PLL\_CFG1

#### PLL Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FASTCLK\_PLL\_CFG1: 0x4221

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:100			NA:00		R/W:10	
HW Access	NA	R			NA		R	
Retention	NA	RET			NA		RET	
Name	RSVD	icpsel			RSVD		vco_gain	

This register sets trim levels and test modes in the PLL.

Bits	Name	Description
6:4	icpsel[2:0]	Charge Pump current select. This bit-field should be set to 0x01 for all configurations. <a href="#">See Table 1-49.</a>
1:0	vco_gain[1:0]	VCO loop gain. Gain doesn't begin effect the VCO frequency characteristics untill freq>60MHz. Effect of gain setting is provided at 25C, Vctrl=0.925V. <a href="#">See Table 1-50.</a>

Table 1-49. Bit field encoding: PLL\_ICPSEL\_ENUM

Value	Name	Description
3'h0	PLL_ICPSEL_0	1uA
3'h1	PLL_ICPSEL_1	2uA
3'h2	PLL_ICPSEL_2	3uA
3'h3	PLL_ICPSEL_3	4uA
3'h4	PLL_ICPSEL_4	5uA
3'h5	PLL_ICPSEL_5	6uA
3'h6	PLL_ICPSEL_6	7uA
3'h7	PLL_ICPSEL_7	1uA

Table 1-50. Bit field encoding: PLL\_VCO\_GAIN\_ENUM

Value	Name	Description
2'h0	PLL_VCO_GAIN_0	RESERVED
2'h1	PLL_VCO_GAIN_1	RESERVED
2'h2	PLL_VCO_GAIN_2	456 MHz/V
2'h3	PLL_VCO_GAIN_3	RESERVED

## 1.3.31 FASTCLK\_PLL\_P

### PLL P-Counter Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FASTCLK\_PLL\_P: 0x4222

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000100							
HW Access	R							
Retention	RET							
Name	P							

This register sets the P-Counter value, an 8-bit feedback divider

Bits	Name	Description
7:0	p[7:0]	<p>P-Counter divide value. Settings less than 8 do not give valid outputs. Valid range is 8 - 255, but this must still give a divided frequency of 1 - 3 MHz (PLLOUT / P); this is the limit of the implementation.</p> <p>Set the P-Counter to legal value before enabling PLL. <math>f_{out} = f_{in} \cdot (P/Q)</math></p> <p><a href="#">See Table 1-51.</a></p>

Table 1-51. Bit field encoding: P\_ENUM

Value	Name	Description
8'h08	P_DIV8	Divide by 8 (minimum valid value)
8'h09	P_DIV9	Divide by 9
8'h0A	P_DIV10	Divide by 10
8'h0f	P_DIV15	Divide by 15
8'hfe	P_DIV254	Divide by 254
8'hff	P_DIV255	Divide by 255

### 1.3.32 FASTCLK\_PLL\_Q

#### PLL Q-Counter Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FASTCLK\_PLL\_Q: 0x4223

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0011			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				q			

This register sets the Q-Counter value, a 4-bit divider on the input clock to the PLL.

Bits	Name	Description
3:0	q[3:0]	Q-Counter divide value. qrt-The Q divider (Reference) input Freq range is: 1-48MHz. The Q divider output Freq (and PFD input Freq) must be between 1-3MHz. $f_{out} = f_{in} * (P/Q)$ <a href="#">See Table 1-52.</a>

Table 1-52. Bit field encoding: Q\_ENUM

Value	Name	Description
4'h0	Q_DIV1	Divide by 1
4'h1	Q_DIV2	Divide by 2
4'h2	Q_DIV3	Divide by 3
4'h3	Q_DIV4	Divide by 4
4'h4	Q_DIV5	Divide by 5
4'h5	Q_DIV6	Divide by 6
4'h6	Q_DIV7	Divide by 7
4'h7	Q_DIV8	Divide by 8
4'h8	Q_DIV9	Divide by 9
4'h9	Q_DIV10	Divide by 10
4'ha	Q_DIV11	Divide by 11
4'hb	Q_DIV12	Divide by 12
4'hc	Q_DIV13	Divide by 13
4'hd	Q_DIV14	Divide by 14
4'he	Q_DIV15	Divide by 15
4'hf	Q_DIV16	Divide by 16

### 1.3.33 FASTCLK\_PLL\_SR

#### PLL Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

FASTCLK\_PLL\_SR: 0x4225

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						NA:0	RC:0
HW Access	NA						NA	W
Retention	NA						NA	NONRET
Name	RSVD						RSVD	lockdet

Bits	Name	Description
0	lockdet	Lock Status Flag. If lock is acquired this flag will stay set (regardless of whether lock is subsequently lost) until it is read. Upon reading it will clear. If lock is still true then the bit will simply set again. If lock happens to be false when the clear on read occurs then the bit will stay cleared until the next lock event. This output is only valid if the PLL is enabled. If the PLL is disabled, this bit may be high and won't be cleared by a read. In this scenario, this bit will remain high after enabling the PLL until after the PLL clock output begins running. As a safeguard, the lock bit should not be polled for 50us after the PLL is enabled. The bit should be ignored altogether when the PLL is disabled.

### 1.3.34 SLOWCLK\_ILO\_CR0

#### Internal Low-speed Oscillator Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SLOWCLK\_ILO\_CR0: 0x4300

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:1	NA:0	R/W:1	R/W:1	NA:0
HW Access	NA		R	R	NA	R	R	NA
Retention	NA		RET	RET	NA	RET	RET	NA
Name	RSVD		div3en	pd_mode	RSVD	en_100k	en_1k	RSVD

This register controls operation of the ILO output clocks.

Bits	Name	Description
5	div3en	Divide-by-3 enable for 100 kHz output <a href="#">See Table 1-53.</a>
4	pd_mode	Power down mode for ILO <a href="#">See Table 1-54.</a>
2	en_100k	Enables 100kHz ILO clock output when set. When clear, clock output is low.
1	en_1k	Enables 1kHz ILO clock output when set. This bit is forced on when PM.WDT_CFG.wdr_en bit is set. When clear, clock output is low.

Table 1-53. Bit field encoding: DIV3EN\_ENUM

Value	Name	Description
1'b0	DIV3EN_0	CLK33K disabled
1'b1	DIV3EN_1	CLK33K enabled, divides CLK100K by 3

Table 1-54. Bit field encoding: PD\_MODE\_ENUM

Value	Name	Description
1'b0	PD_MODE_0	Faster start-up, internal bias left on
1'b1	PD_MODE_1	Slower start-up, internal bias off

### 1.3.35 SLOWCLK\_ILO\_CR1

#### Internal Low-speed Oscillator Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SLOWCLK\_ILO\_CR1: 0x4301

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R/W	R	R
Retention	NA					RET	RET	RET
Name	RSVD					freq_sel	bias_opt	dis_turbo

This register controls non-standard features of the ILO.

Bits	Name	Description
2	freq_sel	Frequency select for CLK100K <a href="#">See Table 1-57.</a>
1	bias_opt	Alternate bias for ILO <a href="#">See Table 1-55.</a>
0	dis_turbo	Start-up speed control <a href="#">See Table 1-56.</a>

Table 1-55. Bit field encoding: BIAS\_OPT\_ENUM

Value	Name	Description
1'b0	BIAS_OPT_0	sub-threshold bias (default)
1'b1	BIAS_OPT_1	Use saturated bias

Table 1-56. Bit field encoding: DIS\_TURBO\_ENUM

Value	Name	Description
1'b0	DIS_TURBO_0	Turbo enabled (recommended)
1'b1	DIS_TURBO_1	Turbo disabled

Table 1-57. Bit field encoding: FREQ\_SEL\_ENUM

Value	Name	Description
1'b0	FREQ_SEL_0	CLK100K defaults to 100 kHz
1'b1	FREQ_SEL_1	CLK100K defaults to 32 kHz

### 1.3.36 SLOWCLK\_X32\_CR

#### External 32kHz Crystal Oscillator Control Register

**Reset:** Reset Signals Listed Below

Register : Address

SLOWCLK\_X32\_CR: 0x4308

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R:U	R:U	NA:0	R/W:1	R/W:0	R/W:0
HW Access	NA		W	W	NA	R	R	R
Retention	NA		NONRET	NONRET	NA	RET	RET	RET
Name	RSVD		ana_stat	dig_stat	RSVD	pdb	lpm	x32en

This register controls operation of the 32K Crystal Oscillator, and provides status on the oscillator's stability.

Bits	Name	Description
5	ana_stat	Indicates oscillator status, using internal analog measurement. <a href="#">See Table 1-58.</a>
4	dig_stat	Indicates oscillator status, using test against a reference clock. The ILO's CLK33K must be enabled for this function to operate. <a href="#">See Table 1-59.</a>
2	pdb	Power switch enable (active-low powerdown) for 32K crystal oscillator. When enabling the X32, it is recommended to set this bit first, then set en=1 in a separate bus cycle. The X32 is automatically powered down during hibernate modes.
1	lpm	Power setting for 32K crystal oscillator. This setting only takes effect in sleep modes. During active modes, the oscillator always runs in high power mode. <a href="#">See Table 1-60.</a>
0	x32en	32K Crystal Oscillator Enable <a href="#">See Table 1-61.</a>

#### Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	dig_stat, ana_stat
System reset for retention flops [reset_all_retention]	x32en, lpm, pdb

Table 1-58. Bit field encoding: ANA\_STAT\_ENUM

Value	Name	Description
1'b0	ANA_STAT_0	oscillator not stable
1'b1	ANA_STAT_1	oscillator stable

Table 1-59. Bit field encoding: DIG\_STAT\_ENUM

Value	Name	Description
1'b0	DIG_STAT_0	oscillator not stable
1'b1	DIG_STAT_1	oscillator stable

(continued)

Table 1-60. Bit field encoding: LPM\_ENUM

Value	Name	Description
1'b0	LPM_0	High Power Mode
1'b1	LPM_1	Low Power Mode (Only applies in chip sleep mode)

Table 1-61. Bit field encoding: X32EN\_ENUM

Value	Name	Description
1'b0	X32_EN_0	Oscillator disabled, power down
1'b1	X32_EN_1	Oscillator enabled

## 1.3.37 BOOST\_CR0

### Boost Control 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BOOST\_CR0: 0x4320

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:11		R/W:00100				
HW Access	R/W	R/W		R/W				
Retention	RET	RET		RET				
Name	thump	mode		vsel				

Boost output voltage and mode control register.

Bits	Name	Description
7	thump	Generates a 1 microsecond pulse on 0->1 transition. Must be cleared by firmware before another pulse can be generated. Used for discrete switch control in Boost Standby Mode.
6:5	mode[1:0]	Boost mode select. <a href="#">See Table 1-62.</a>
4:0	vsel[4:0]	Boost voltage selection <a href="#">See Table 1-63.</a>

Table 1-62. Bit field encoding: mode\_enum

Value	Name	Description
2'b00	MODE_00	Standby Mode (low power state)
2'b01	MODE_01	Reserved
2'b10	MODE_10	Reserved
2'b11	MODE_11	Active Mode (regulating)

Table 1-63. Bit field encoding: vsel\_enum

Value	Name	Description
5'b00000	VSEL_OFF	Off (0V)
5'b00001	VSEL_0x01	Reserved
5'b00010	VSEL_0x02	Reserved
5'b00011	VSEL_1P80V	1.80V
5'b00100	VSEL_1P90V	1.90V (Power Up Setting)
5'b00101	VSEL_2P00V	2.00V
5'b00110	VSEL_2P10V	2.10V
5'b00111	VSEL_2P20V	2.20V
5'b01000	VSEL_2P30V	2.30V
5'b01001	VSEL_2P40V	2.40V
5'b01010	VSEL_2P50V	2.50V
5'b01011	VSEL_2P60V	2.60V
5'b01100	VSEL_2P70V	2.70V
5'b01101	VSEL_2P80V	2.80V
5'b01110	VSEL_2P90V	2.90V
5'b01111	VSEL_3P00V	3.00V
5'b10000	VSEL_3P10V	3.10V
5'b10001	VSEL_3P20V	3.20V
5'b10010	VSEL_3P30V	3.30V

(continued)

Table 1-63. Bit field encoding: vsel\_enum

5'b10011	VSEL_3P40V	3.40V
5'b10100	VSEL_3P50V	3.50V
5'b10101	VSEL_3P60V	3.60V
5'b10110	VSEL_4P00V	4.00V
5'b10111	VSEL_4P25V	4.25V
5'b11000	VSEL_4P50V	4.50V
5'b11001	VSEL_4P75V	4.75V
5'b11010	VSEL_5P00V	5.00V
5'b11011	VSEL_0x1B	Reserved
5'b11100	VSEL_0x1C	Reserved
5'b11101	VSEL_0x1D	Reserved
5'b11110	VSEL_0x1E	Reserved
5'b11111	VSEL_0x1F	Reserved

## 1.3.38 BOOST\_CR1

### Boost Control 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BOOST\_CR1: 0x4321

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	NA:0	NA:0	NA:0	R/W:1	NA:0	R/W:01	
HW Access	NA	NA	NA	NA	R/W	NA	R/W	
Retention	NA	NA	NA	NA	RET	NA	RET	
Name	RSVD	RSVD	RSVD	RSVD	boosten	RSVD	clk	

Boost test, clock, and mode control register.

Bits	Name	Description
3	boosten	When set, enables boost operation
1:0	clk[1:0]	Boost active mode internal PWM clock frequency selection

[See Table 1-64.](#)

Table 1-64. Bit field encoding: clk\_enum

Value	Name	Description
2'b00	CLK_RSVD0	Reserved
2'b01	CLK_ON	PWM Clock On at 400kHz. Use this setting in Boost Active Mode. PWM is off in Boost Standby Mode.
2'b10	CLK_RSVD2	Reserved
2'b11	CLK_OFF	PWM Clock Off. Use this setting in Boost Standby Mode for lowest current, or for selecting the External Clock in Automatic Thump Mode.

## 1.3.39 BOOST\_CR2

### Boost Control 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BOOST\_CR2: 0x4322

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:1	R:0	R:0	R/W:0	R/W:0	NA:0	R/W:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	NA	R/W
Retention	RET	RET	RET	RET	RET	RET	NA	RET
Name	disc	boosting	equal	limdet	erefsel	limoff	RSVD	enatm

Boost configuration and status register. The lower 4 bits are advanced configuration and the upper 4 bits are status.

Bits	Name	Description
7	disc	When set, boost converter is operating in discontinuous mode
6	boosting	When set, converter is boosting (VBOOST < vsel)
5	equal	When set, converter is bypassed (VBAT >= vsel). VBOOST shorted to VBAT.
4	limdet	When set, the IND was not fully pulled low during the full duration that the NMOS switch to ground was enabled. This is a debug flag only. The circuit takes no action based on this status bit.
3	erefsel	When set, selects external reference <a href="#">See Table 1-65.</a>
2	limoff	When set, turns off skip cycle current limiter
0	enatm	When set, enables Automatic Thump Mode in Boost Standby Mode

Table 1-65. Bit field encoding: BOOST\_EREFSSEL\_ENUM

Value	Name	Description
1'b0	BOOST_EREFSSEL_INT ERNAL	Select internal reference
1'b1	BOOST_EREFSSEL_EXT ERNAL	Select external 800mv precision reference (vref_800mv)

## 1.3.40 BOOST\_CR3

### Boost Control 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BOOST\_CR3: 0x4323

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R/W	
Retention	NA						RET	
Name	RSVD						pwm	

Boost PWM value (not written during normal operation).

Bits	Name	Description
1:0	pwm[1:0]	Current state of the internal pulse width modulator. The PWM value should not be written during normal operation - it should be treated as read-only. 2'h3 means maximum duty cycle. 2'h0 means minimum duty cycle.

## 1.3.41 BOOST\_SR

### Boost Status

**Reset:** N/A

Register : Address

BOOST\_SR: 0x4324

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:U	R:U	NA:0	R:U	R:U	R:U	R:U	R:U
HW Access	R/W	R/W	NA	R/W	R/W	R/W	R/W	R/W
Retention	RET	RET	NA	RET	RET	RET	RET	RET
Name	ready	start	RSVD	ov	vhi	vnom	vlo	uv

Boost status, including window comparator results.

Bits	Name	Description
7	ready	When set, internal circuits have been initialized
6	start	When set, converter is in startup mode
4	ov	Output above overvoltage limit when 1, below limit when 0
3	vhi	Output is above vhigh limit when 1, below limit when 0
2	vnom	Output is above nominal when 1, below nominal when 0
1	vlo	Output is above vlow limit when 1, below limit when 0
0	uv	Output is above undervoltage limit when 1, below limit when 0

## 1.3.42 BOOST\_CR4

### Boost Control Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BOOST\_CR4: 0x4325

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							boost_ie

Boost interrupt control register.

Bits	Name	Description
0	boost_ie	When set, a boost undervoltage condition is propagated to the interrupt controller via the PM interrupt line. When clear, the interrupt condition is masked.

## 1.3.43 BOOST\_SR2

### Boost Status Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BOOST\_SR2: 0x4326

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							RC:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							boost_int

Boost interrupt status register.

Bits	Name	Description
0	boost_int	When set, a boost undervoltage event has occurred. The setting of boost_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)

## 1.3.44 PWRSYS\_CR0

### Power System Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_CR0: 0x4330

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:000			R/W:0
HW Access	NA		R	R	NA			R
Retention	NA		RET	RET	NA			RET
Name	RSVD		ext_vccd	ext_vcca	RSVD			rbbnw_dis

This register controls the voltage regulators.

Bits	Name	Description
5	ext_vccd	When set, the core digital (vccd) pin is driven with an externally regulated voltage. This disables the internal LDO-D regulator. If both LDO's are disabled, the BREF will be automatically disabled, too. The BREF must be manually enabled before re-enabling either LDO.
4	ext_vcca	When set, the core analog (vcca) pin is driven with an externally regulated voltage. This disables the internal LDO-A regulator. If both LDO's are disabled, the BREF will be automatically disabled, too. The BREF must be manually enabled before re-enabling either LDO.
0	rbbnw_dis	When set, disables the nwell reverse biasing during low power modes. Nwell reverse biasing is always disabled during active/standby modes.

## 1.3.45 PWRSYS\_CR1

### Power System Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_CR1: 0x4331

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					i2creg_backup	Idoa_dis	Idoa_iso

This register controls the voltage regulators.

Bits	Name	Description
2	i2creg_backup	When set, enables the I2C regulator backup. The I2C backup regulator enables the I2C logic to wake the chip from sleep mode on an I2C address match.
1	Idoa_dis	When set, disables the analog LDO regulator. This bit will not be set unless the Idoa_iso field is already set. Attempts to set this field while simultaneously clearing Idoa_iso will be ignored.
0	Idoa_iso	When set, prepares the system to disable the LDO-A. In this mode, the LV reference (bandgap) is supplied by the digital LDO. Also, outputs of vcca are isolated from the rest of the system. Note that this mode can result in degraded accuracy, as described in the Power Modes chapter. Once set, cannot be cleared unless Idoa_dis is already clear.

## 1.3.46 PM\_TW\_CFG0

### Timewheel Configuration Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_TW\_CFG0: 0x4380

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ftw_interval							

This register controls settings for the fast timewheel. If using low power active (LPA) mode, the fast timewheel must be used to program the burst period.

Bits	Name	Description
7:0	ftw_interval[7:0]	Sets the fast timewheel interval. The fast timewheel is programmed using a 8-bit terminal count (N-1) and is clocked by the ILO at 100 kHz. When the terminal count is reached, the timewheel automatically resets and begins counting again. This value can only be changed when {PM.TW_CFG2}.ftw_en is clear. After enabling, the duration before the first event is between 1 and 2 additional cycles, depending on synchronization with the ILO clock. Additional events occur periodically with a period of (1+ftw_interval).

## 1.3.47 PM\_TW\_CFG1

### Timewheel Configuration Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_TW\_CFG1: 0x4381

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1001			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				ctw_interval			

This register controls settings for the central timewheel.

Bits	Name	Description
3:0	ctw_interval[3:0]	Sets the central timewheel interval. The period is based on the ILO running at 1 kHz. When the interval is reached, it is automatically restarted. The first interval can range from 1 to (period + 1) ms. Additional intervals occur at the nominal period. This value can only be changed when {TW_CFG2}.ctw_en is clear.

[See Table 1-66.](#)

Table 1-66. Bit field encoding: ctw\_interval\_enum

Value	Name	Description
4'b0000	CTW_1_TICK	not presently supported ==> is same as CTW_2_TICKS
4'b0001	CTW_2_TICKS	2 CTW ticks ==> 2ms (nominal)
4'b0010	CTW_4_TICKS	4 CTW ticks ==> 4ms (nominal)
4'b0011	CTW_8_TICKS	8 CTW ticks ==> 8ms (nominal)
4'b0100	CTW_16_TICKS	16 CTW ticks ==> 16ms (nominal)
4'b0101	CTW_32_TICKS	32 CTW ticks ==> 32ms (nominal)
4'b0110	CTW_64_TICKS	64 CTW ticks ==> 64ms (nominal)
4'b0111	CTW_128_TICKS	128 CTW ticks ==> 128ms (nominal)
4'b1000	CTW_256_TICKS	256 CTW ticks ==> 256ms (nominal)
4'b1001	CTW_512_TICKS	512 CTW ticks ==> 512ms (nominal)
4'b1010	CTW_1024_TICKS	1024 CTW ticks ==> 1024ms (nominal)
4'b1011	CTW_2048_TICKS	2048 CTW ticks ==> 2048ms (nominal)
4'b1100	CTW_4096_TICKS	4096 CTW ticks ==> 4096ms (nominal)

## 1.3.48 PM\_TW\_CFG2

### Timewheel Configuration Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_TW\_CFG2: 0x4382

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA		R	R	R	R	R	R
Retention	NA		RET	RET	RET	RET	RET	RET
Name	RSVD		onepps_ie	onepps_en	ctw_ie	ctw_en	ftw_ie	ftw_en

This register controls settings for the central and fast timewheels.

Bits	Name	Description
5	onepps_ie	When set and one pulse-per-second is enabled, an interrupt is issued when the pulse occurs. If onepps_en is not enabled, no interrupt is generated.
4	onepps_en	When set, the system returns to the active global power mode once every second. The 32 kHz external crystal oscillator must be enabled to use the one pulse-per-second function.
3	ctw_ie	When set and the central timewheel is enabled, an interrupt is issued when the central timewheel reaches the selected interval. If ctw_en is not enabled, no interrupt is generated.
2	ctw_en	When set, the system returns to the active global power mode when the central timewheel reaches the interval selected in {PM.TW_CFG1}.ctw_interval. The ILO 1 kHz clock source must be enabled to use the central timewheel.
1	ftw_ie	When set and the fast timewheel is enabled, an interrupt is issued when it reaches the terminal count. If ftw_en is not enabled, no interrupt is generated. This bit is ignored when LPA is enabled, and no interrupts are issued.
0	ftw_en	When set, the system returns to the active global power mode when the fast timewheel reaches the terminal count selected in {PM.TW_CFG0}.ftw_interval. This bit should be set when using Low Power Active (lpa) mode, since the fast timewheel is usually used to control the LPA burst period. The ILO 100 kHz clock source must be enabled to use the fast timewheel.

## 1.3.49 PM\_WDT\_CFG

### Watchdog Timer Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_WDT\_CFG: 0x4383

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:01		R/W:0	NA:00		R/W:01	
HW Access	R	R		R	NA		R	
Retention	RET	RET		RET	NA		RET	
Name	ctw_reset	wdt_lpmode		wdr_en	RSVD		wdt_interval	

This register controls the watchdog timer (WDT) settings.

Bits	Name	Description
7	ctw_reset	When a one is written to this field, the free-running central timewheel counter is reset to 0 and held there. Firmware must then write a zero to exit the reset state. Since the central timewheel is used for many timing tasks (including buzz timing and WDT), care must be taken when resetting it. It is generally recommended to reset it only once when the watchdog is enabled, to ensure that first watchdog period is full. Cannot be changed after the watchdog is enabled.
6:5	wdt_lpmode[1:0]	If the Watchdog-Timer (WDT) is enabled, these 2 bits are used to define how the WDT behaves when the part enters Sleep/Idle/Hibtimers (low power) mode. By default (wdt_lpmode is left 01), the system will automatically use the longest WDT interval when Sleep/Idle/Hibtimers mode is entered - so SW isn't burdened with waking just to feed the WDT. This is true regardless of the value programmed in the wdt_interval register. Upon wakeup, the interval will remain at the highest setting until the WDT is fed the first time by the user. A feeding at this point will cause the interval to automatically return to the normal setting (value in wdt_interval). If this field is set to NOCHANGE ('00'), the system does not change the interval and does not feed the WDT when entering Sleep/Idle/Hibtimers mode. If DISABLED (wdt_lpmode=11), the WDT is turned off when Sleep/Idle/Hibtimers mode is entered and remains disabled until the first feeding by the user after Active mode is reentered. This field cannot be changed once {PM.WDT_CFG}.wdr_en is set.
4	wdr_en	When set, enables the watchdog reset (WDR) using the current WDT settings. Once enabled, the WDT cannot be disabled except by a reset. Setting this bit automatically enables the ILO 1 kHz clock source.
1:0	wdt_interval[1:0]	Selects the central timewheel taps that control the WDT period. The accuracy of the intervals are dependent upon the accuracy of the oscillator used. A watchdog reset (WDR) may be issued at any time within the selected interval, so software should be programmed to service the WDT before the lower bound is reached (two tap periods). A WDR is always issued within three tap periods. Once {PM.WDT_CFG}.wdr_en is set, the watchdog interval cannot be changed.

[See Table 1-68.](#)

[See Table 1-67.](#)

Table 1-67. Bit field encoding: wdt\_interval\_enum

Value	Name	Description
2'b00	WDT_2_TICKS	2 CTW ticks ==> 4ms - 6ms
2'b01	WDT_16_TICKS	16 CTW ticks ==> 32ms - 48ms
2'b10	WDT_128_TICKS	128 CTW ticks ==> 256ms - 384ms
2'b11	WDT_1024_TICKS	1024 CTW ticks ==> 2.048s - 3.072s

(continued)

Table 1-68. Bit field encoding: wdt\_lpmode\_enum

Value	Name	Description
2'b00	WDT_LPMODE_NOCHANGE	WDT does not change behavior when Sleep/Idle Mode/Hibtimers is entered
2'b01	WDT_LPMODE_MAXINTER	WDT automatically switches to max interval when Sleep/Idle/Hibtimers Mode is entered
2'b10	WDT_LPMODE_RESERVED	Reserved (acts the same as NOCHANGE)
2'b11	WDT_LPMODE_DISABLED	WDT is disabled when Sleep/Idle/Hibtimers Mode is entered

### 1.3.50 PM\_WDT\_CR

#### Watchdog Timer Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_WDT\_CR: 0x4384

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOC:00000000							
HW Access	NA							
Retention	RET							
Name	wdt_clear							

This register is used to feed the watchdog timer (WDT).

Bits	Name	Description
7:0	wdt_clear[7:0]	Any write to this field feeds the WDT. After each feeding, there are at least two entire watchdog timer tap periods before a WDR occurs. Always reads as zero.

### 1.3.51 PM\_INT\_SR

#### Power Manager Interrupt Status Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_INT\_SR: 0x4390

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				RC:0	RC:0	RC:0	RC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				RET	RET	RET	RET
Name	RSVD				limact_int	onepps_int	ctw_int	ftw_int

This register indicates which interrupts occurred since the last read of the register. All bits are automatically cleared on read. If an interrupt gets generated at the same time as a clear, the bit will remain set (which causes another interrupt).

Bits	Name	Description
3	limact_int	When set, a limited active ready event has occurred. The setting of limact_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)
2	onepps_int	When set, a onepps event has occurred. The setting of onepps_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)
1	ctw_int	When set, a central timewheel event has occurred. The setting of ctw_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)
0	ftw_int	When set, a fast timewheel event has occurred. The setting of ftw_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)

## 1.3.52 PM\_MODE\_CFG0

### Power Mode Configuration Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_MODE\_CFG0: 0x4391

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	lpa_cycles							

This register controls settings for the low power modes.

Bits	Name	Description
7:0	lpa_cycles[7:0]	A setting of N causes (N+1) cycles to execute during each burst

### 1.3.53 PM\_MODE\_CFG1

#### Power Mode Configuration Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_MODE\_CFG1: 0x4392

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	R/W:0
HW Access	NA				R	NA	R	R
Retention	NA				RET	NA	RET	RET
Name	RSVD				limact_ie	RSVD	lpa_fie	lpa_en

This register controls settings for the low power modes.

Bits	Name	Description
3	limact_ie	Setting this bit will issue an interrupt when the system can return from limited active to fully active mode. To reliably generate the interrupt, this bit should be set prior to entering idle mode.
1	lpa_fie	When clear, interrupts are held off until next burst. This increases average interrupt latency, as compared to an active mode baseline design with identical throughput. When set, interrupts return the system to active mode, the on-time counter is reset, and the system will execute at least N cycles.
0	lpa_en	When set, LPA mode is enabled. LPA mode is compatible with all global power modes. If standby mode is specified, it is interpreted as an early return to standby, and the LPA scheduler will wake the system on the original schedule. If idle, sleep, or hibernate modes are specified, LPA is temporarily paused and resumed upon wakeup. Clearing this bit immediately disables LPA.

## 1.3.54 PM\_MODE\_CSR

### Power Mode Control/Status Register

**Reset:** Reset Signals Listed Below

Register : Address

PM\_MODE\_CSR: 0x4393

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WC:1	R:0	NA:0	R/WOC:0	R:1	R/W:000		
HW Access	W	W	NA	R	W	R/W		
Retention	NONRET	RET	NA	RET	RET	RET		
Name	nonret_rst	limact_mode	RSVD	reactivate	pwrup_pulse_q	lp_mode		

This register controls settings for the global power mode.

Bits	Name	Description
7	nonret_rst	Persistent status bit that indicates a non-retention reset occurred for some chip registers. This bit is preset high by any chip reset, and it is cleared whenever the register is written. When the system automatically resets non-retention registers (such as when returning from low power modes or a reactivation), this field is set high to indicate some register state has changed. Sticky (whole field)
6	limact_mode	When set, the chip is in limited active mode. Some subsystems and domains are unavailable in this mode. A reactivation is required to return the chip to active mode.
4	reactivate	Setting this bit reactivates subsystems with pending availability. This is used to transition from limited active to active mode or to initiate the delayed activation procedure after change(s) to PM_AVAIL* register(s). The reactivation process simulates a transition from sleep to active mode. During the simulated transition, user clocks are stopped. After completion, the system is in active mode regardless of the LP_MODE setting. This bit always reads as zero.
3	pwrup_pulse_q	When set, indicates that the chip is internally waiting for the hibernate/sleep regulator to stabilize. The chip will ignore LP requests for idle, sleep, and hibernate modes until the regulator is stable.
2:0	lp_mode[2:0]	Sets the global power mode.

[See Table 1-69.](#)

### Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	lp_mode[2:0], pwrup_pulse_q, reactivate, test_domains, limact_mode
Domain reset for non-retention flops [reset_all_nonretention]	nonret_rst

Table 1-69. Bit field encoding: mode\_enum

Value	Name	Description
3'b000	MODE_ACTIVE	Active mode
3'b001	MODE_STANDBY	Standby mode
3'b010	MODE_IDLE	Idle mode
3'b011	MODE_SLEEP	Sleep mode
3'b100	MODE_HIBERNATE	Hibernate mode
3'b110	MODE_HIBTIMERS	Hibernate+timewheels

### 1.3.55 PM\_USB\_CR0

#### USB Power Mode Control Register 0

**Reset:** Reset Signals Listed Below

Register : Address

PM\_USB\_CR0: 0x4394

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:1	R/W:0
HW Access	NA					R	R	R
Retention	NA					NONRET	RET	RET
Name	RSVD					fsusbio_pd_pullup_n	fsusbio_pd_n	fsusbio_ref_en

This register controls settings for USB low power mode.

Bits	Name	Description
2	fsusbio_pd_pullup_n	USB IO pad pullup enable. When set, the USBIO pad pullups can be used. When clear, the pullups are forced off. The pullups cannot be enabled until the appropriate supply is available. For example, if the USB regulator is configured, it must be stable before enabling the pullup or it may result in output glitches. The general guideline is to wait at least 2us after setting fsusbio_pd_n=1 before setting this field. This requirement is in addition to the reference settling time (if applicable).
1	fsusbio_pd_n	USB IO pad enable. When set, the USBIO pads can be used. When clear, the USBIO pads latch their previous settings and powerdown. This field must be high to use the pads for USB or GPIO modes. If USB is unavailable (wounded) the pads will ignore this setting and will remain disabled.
0	fsusbio_ref_en	USB IO pad receiver and regulator reference enable. The reference is required when using the USBIO pins for USB signaling. It is used by the differential receiver and USB regulator. The reference is NOT required when using the USBIO pins for GPIO signaling. Before enabling USB signaling in {USB_CR0}, enable this bit and allow the reference to settle. Settling time is max(1us after enabling, 40us after power restored). Power loss occurs during reset or when entering a deep low power mode (idle, sleep, or hibernate). Power is considered restored when reset deasserts or when the core supply reaches the PRES threshold after a wakeup. This field is retained so that if the core supply is kept up (eg. idle or sleep), the delay can be measured from the wakeup event.

#### Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	fsusbio_ref_en, fsusbio_pd_n
Domain reset for non-retention flops [reset_all_nonretention]	fsusbio_pd_pullup_n

### 1.3.56 PM\_WAKEUP\_CFG0

#### Power Mode Wakeup Mask Configuration Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_WAKEUP\_CFG0: 0x4398

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	mask_sleep	mask_clkp m	mask_boost	mask_cpu	mask_i2c	mask_picu	mask_tc	mask_int

This register masks the power mode wakeup sources.

Bits	Name	Description
7	mask_sleep	When set, the PM CTW and PM 1PPS (RTC) can return the chip to active mode.
6	mask_clkpm	When set, the PM FTW, LVI or HVI can return the chip to active mode.
5	mask_boost	When set, boost undervoltage can return the chip to active mode.
4	mask_cpu	When set, a CPU bus transaction can return the chip to active mode.
3	mask_i2c	When set, I2C can return the chip to active mode.
2	mask_picu	When set, the PICU can return the chip to active mode.
1	mask_tc	When set, the Test Controller can return the chip to active mode.
0	mask_int	When set, on-chip interrupts can return the chip to active mode.

## 1.3.57 PM\_WAKEUP\_CFG1

### Power Mode Wakeup Mask Configuration Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_WAKEUP\_CFG1: 0x4399

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	mask_cmp7	mask_cmp6	mask_cmp5	mask_cmp4	mask_cmp3	mask_cmp2	mask_cmp1	mask_cmp0

This register masks the power mode wakeup sources.

Bits	Name	Description
7	mask_cmp7	Reserved for comparator 7
6	mask_cmp6	Reserved for comparator 6
5	mask_cmp5	Reserved for comparator 5
4	mask_cmp4	Reserved for comparator 4
3	mask_cmp3	When set, comparator 3 can return the chip to active mode.
2	mask_cmp2	When set, comparator 2 can return the chip to active mode.
1	mask_cmp1	When set, comparator 1 can return the chip to active mode.
0	mask_cmp0	When set, comparator 0 can return the chip to active mode.

## 1.3.58 PM\_WAKEUP\_CFG2

### Power Mode Wakeup Mask Configuration Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_WAKEUP\_CFG2: 0x439A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:1
HW Access	NA							R
Retention	NA							RET
Name	RSVD							mask_lcd

This register masks the power mode wakeup sources.

Bits	Name	Description
0	mask_lcd	When set, LCD can return the chip to active mode.

## 1.3.59 PM\_ACT\_CFG0

### Active Power Mode Configuration Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG0: 0x43A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:1	R/W:0	R/W:1	R/W:1	R/W:1
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	en_delay	en_udbarra y	en_imo36m	en_imo	en_clk_spc	en_clk_bus	en_cpu	en_ic

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7	en_delay	Global enable for clkdist delay line. For analog clocks (ACLKs) to be running this bit must be set, When this bit is LOW the ACLKs can't toggle.
6	en_udbarray	Global enable for UDB array.
5	en_imo36m	Enable IMO SPC clock source. This also internally enables the IMO, since it is required for the 36MHz IMO to function.
4	en_imo	Enable IMO clock source. Any wakeup event will set this bit.
3	en_clk_spc	Enable clk_spc. This also internally enables the 36MHz IMO (similar to en_imo36m), since this is required for the SPC to function.
2	en_clk_bus	Enable clk_bus. Any wakeup event (including bus access from the CPU) will automatically set this bit.
1	en_cpu	Enable CPU. This also enables the flash, since the CPU requires the flash to function. Any wake-up event will set this bit.
0	en_ic	Enable interrupt controller

## 1.3.60 PM\_ACT\_CFG1

### Active Power Mode Configuration Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG1: 0x43A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_clk_a			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_clk_a[3:0]	Enable clk_a[3:0]

### 1.3.61 PM\_ACT\_CFG2

#### Active Power Mode Configuration Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG2: 0x43A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	en_clk_d							

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7:0	en_clk_d[7:0]	Enable clk_d[7:0]

## 1.3.62 PM\_ACT\_CFG3

### Active Power Mode Configuration Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG3: 0x43A3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_timer			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_timer[3:0]	Enable timer/counters.

### 1.3.63 PM\_ACT\_CFG4

#### Active Power Mode Configuration Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG4: 0x43A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_opamp			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_opamp[3:0]	Enable analog linear output buffer.

### 1.3.64 PM\_ACT\_CFG5

#### Active Power Mode Configuration Register 5

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG5: 0x43A5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	en_emif	RSVD	en_lcd	RSVD	en_i2c	RSVD	en_fsusb

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
6	en_emif	Enable EMIF
4	en_lcd	Enable LCD.
2	en_i2c	Enable I2C block(s). Populated subsystems are counted from the LSB.
0	en_fsusb	Enable FS-USB.

### 1.3.65 PM\_ACT\_CFG6

#### Active Power Mode Configuration Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG6: 0x43A6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_dfb	RSVD			en_can

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dfb	Enable DFB(s). Populated subsystems are counted from the LSB.
0	en_can	Enable CAN block(s). Populated subsystems are counted from the LSB.

## 1.3.66 PM\_ACT\_CFG7

### Active Power Mode Configuration Register 7

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG7: 0x43A7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_cmp			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_cmp[3:0]	Enable comparator(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to comparator 0.

## 1.3.67 PM\_ACT\_CFG8

### Active Power Mode Configuration Register 8

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG8: 0x43A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_dac			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_dac[3:0]	Enable DAC block(s). Populated subsystems are counted from the LSB.

## 1.3.68 PM\_ACT\_CFG9

### Active Power Mode Configuration Register 9

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG9: 0x43A9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_swcap			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_swcap[3:0]	Enable switchcap block(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to switchcap block 0.

## 1.3.69 PM\_ACT\_CFG10

### Active Power Mode Configuration Register 10

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG10: 0x43AA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_dsm_channel	RSVD			en_dec

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dsm_channel	Enable delta-sigma modulator ADC channel. Note: set the appropriate enables in the analog interface prior to setting this global enable for the channel.
0	en_dec	Enable decimator(s). Populated subsystems are counted from the LSB.

### 1.3.70 PM\_ACT\_CFG11

#### Active Power Mode Configuration Register 11

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG11: 0x43AB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		en_refbufr	en_refbufl	RSVD			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
5	en_refbufr	Enable RIGHT analog reference buffer (refbufr)
4	en_refbufl	Enable LEFT analog reference buffer (refbufl)

## 1.3.71 PM\_ACT\_CFG12

### Active Power Mode Configuration Register 12

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG12: 0x43AC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:1
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_ee	RSVD			en_fm

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_ee	Enable EEPROM. Re-enabling an EEPROM macro takes 5us. During this time, the EE will not acknowledge a PHUB request.
0	en_fm	Enable flash. Active flash macros consume current, but re-enabling a disabled flash macro takes 5us. If the CPU attempts to fetch out of the macro during that time, it will be stalled. This bit allows the flash to be enabled even if the CPU is disabled, which allows a quicker return to code execution. To avoid a deadlock where the CPU attempts to fetch out of a disabled macro, the flash macro will ignore this bit if the CPU is enabled in user mode. During test mode, the flash CAN be turned off independently from the CPU.

## 1.3.72 PM\_ACT\_CFG13

### Active Power Mode Configuration Register 13

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_ACT\_CFG13: 0x43AD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1	R/W:1	R/W:1	R/W:1
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				en_ports	en_picu	en_sysmem	en_anaif

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3	en_ports	Enable ports. This must be enabled to read/write registers in the port logic.
2	en_picu	Enable PICU. This must be enabled to read/write registers in the PICU. Configured wakeups will continue to function if the PICU is disabled, but the interface must be enabled to clear the interrupt condition.
1	en_sysmem	Enable SYSMEM. This must be enabled to read/write the SYSMEM.
0	en_anaif	Enable analog interface. This must be enabled to read/write registers in the analog interface.

### 1.3.73 PM\_STBY\_CFG0

#### Standby Power Mode Configuration Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG0: 0x43B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	en_delay	en_udbarray	en_imo36m	en_imo	en_clk_spc	en_clk_bus	en_cpu	en_ic

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7	en_delay	Global enable for clkdist delay line. For analog clocks (ACLKs) to be running this bit must be set, When this bit is LOW the ACLKs can't toggle.
6	en_udbarray	Global enable for UDB array.
5	en_imo36m	Enable IMO SPC clock source. This also internally enables the IMO, since it is required for the 36MHz IMO to function.
4	en_imo	Enable IMO clock source. Any wakeup event will set this bit.
3	en_clk_spc	Enable clk_spc. This also internally enables the 36MHz IMO (similar to en_imo36m), since this is required for the SPC to function.
2	en_clk_bus	Enable clk_bus. Any wakeup event (including bus access from the CPU) will automatically set this bit.
1	en_cpu	Enable CPU. This also enables the flash, since the CPU requires the flash to function. Any wake-up event will set this bit.
0	en_ic	Enable interrupt controller

## 1.3.74 PM\_STBY\_CFG1

### Standby Power Mode Configuration Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG1: 0x43B1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_clk_a			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_clk_a[3:0]	Enable clk_a[3:0]

### 1.3.75 PM\_STBY\_CFG2

#### Standby Power Mode Configuration Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG2: 0x43B2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	en_clk_d							

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7:0	en_clk_d[7:0]	Enable clk_d[7:0]

## 1.3.76 PM\_STBY\_CFG3

### Standby Power Mode Configuration Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG3: 0x43B3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_timer			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_timer[3:0]	Enable timer/counters.

### 1.3.77 PM\_STBY\_CFG4

#### Standby Power Mode Configuration Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG4: 0x43B4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_opamp			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_opamp[3:0]	Enable analog linear output buffer.

## 1.3.78 PM\_STBY\_CFG5

### Standby Power Mode Configuration Register 5

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG5: 0x43B5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	en_emif	RSVD	en_lcd	RSVD	en_i2c	RSVD	en_fsusb

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
6	en_emif	Enable EMIF
4	en_lcd	Enable LCD.
2	en_i2c	Enable I2C block(s). Populated subsystems are counted from the LSB.
0	en_fsusb	Enable FS-USB.

### 1.3.79 PM\_STBY\_CFG6

#### Standby Power Mode Configuration Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG6: 0x43B6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_dfb	RSVD			en_can

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dfb	Enable DFB(s). Populated subsystems are counted from the LSB.
0	en_can	Enable CAN block(s). Populated subsystems are counted from the LSB.

### 1.3.80 PM\_STBY\_CFG7

#### Standby Power Mode Configuration Register 7

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG7: 0x43B7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_cmp			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_cmp[3:0]	Enable comparator(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to comparator 0.

### 1.3.81 PM\_STBY\_CFG8

#### Standby Power Mode Configuration Register 8

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG8: 0x43B8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_dac			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_dac[3:0]	Enable DAC block(s). Populated subsystems are counted from the LSB.

## 1.3.82 PM\_STBY\_CFG9

### Standby Power Mode Configuration Register 9

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG9: 0x43B9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_swcap			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_swcap[3:0]	Enable switchcap block(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to switchcap block 0.

### 1.3.83 PM\_STBY\_CFG10

#### Standby Power Mode Configuration Register 10

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG10: 0x43BA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_dsm_channel	RSVD			en_dec

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dsm_channel	Enable delta-sigma modulator ADC channel. Note: set the appropriate enables in the analog interface prior to setting this global enable for the channel.
0	en_dec	Enable decimator(s). Populated subsystems are counted from the LSB.

### 1.3.84 PM\_STBY\_CFG11

#### Standby Power Mode Configuration Register 11

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG11: 0x43BB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		en_refbufr	en_refbufl	RSVD			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
5	en_refbufr	Enable RIGHT analog reference buffer (refbufr)
4	en_refbufl	Enable LEFT analog reference buffer (refbufl)

### 1.3.85 PM\_STBY\_CFG12

#### Standby Power Mode Configuration Register 12

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG12: 0x43BC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_ee	RSVD			en_fm

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_ee	Enable EEPROM. Re-enabling an EEPROM macro takes 5us. During this time, the EE will not acknowledge a PHUB request.
0	en_fm	Enable flash. Active flash macros consume current, but re-enabling a disabled flash macro takes 5us. If the CPU attempts to fetch out of the macro during that time, it will be stalled. This bit allows the flash to be enabled even if the CPU is disabled, which allows a quicker return to code execution. To avoid a deadlock where the CPU attempts to fetch out of a disabled macro, the flash macro will ignore this bit if the CPU is enabled in user mode. During test mode, the flash CAN be turned off independently from the CPU.

## 1.3.86 PM\_STBY\_CFG13

### Standby Power Mode Configuration Register 13

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_STBY\_CFG13: 0x43BD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				en_ports	en_picu	en_sysmem	en_anaif

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3	en_ports	Enable ports. This must be enabled to read/write registers in the port logic.
2	en_picu	Enable PICU. This must be enabled to read/write registers in the PICU. Configured wakeups will continue to function if the PICU is disabled, but the interface must be enabled to clear the interrupt condition.
1	en_sysmem	Enable SYSMEM. This must be enabled to read/write the SYSMEM.
0	en_anaif	Enable analog interface. This must be enabled to read/write registers in the analog interface.

### 1.3.87 PM\_AVAIL\_CR0

#### Power Mode Available Subsystem Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_CR0: 0x43C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:1
HW Access	NA							R
Retention	NA							RET
Name	RSVD							avail_fm

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
0	avail_fm	Each set bit requests a flash macro be available. Reactivation is delayed. Macro 0 can only be disabled during test_mode.

## 1.3.88 PM\_AVAIL\_CR1

### Power Mode Available Subsystem Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_CR1: 0x43C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:11	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						avail_sysmem	

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
1:0	avail_sysmem[1:0]	Each set bit requests a sysmem macro be available. Reactivation is delayed. Populated subsystems are counted from the LSB.

### 1.3.89 PM\_AVAIL\_CR2

#### Power Mode Available Subsystem Control Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_CR2: 0x43C2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:000			R/W:1
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			avail_udb	RSVD			avail_ee

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_udb	Each set bit requests a UDB bank be available. Reactivation is delayed. This bit should never be cleared if the the UDB is enabled. If this bit is cleared, then the application must reconfigure the UDB.
0	avail_ee	Each set bit requests a EEPROM macro be available. Reactivation is delayed.

### 1.3.90 PM\_AVAIL\_CR3

#### Power Mode Available Subsystem Control Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_CR3: 0x43C3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:000			R/W:1
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			avail_sysmemtrace	RSVD			avail_dfb

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_sysmemtrace	Each set bit requests a trace memory be available. Reactivation is delayed.
0	avail_dfb	Each set bit requests a DFB be available. Reactivation is delayed.

### 1.3.91 PM\_AVAIL\_CR4

#### Power Mode Available Subsystem Control Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_CR4: 0x43C4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:0	R/W:1	NA:0	R/W:1
HW Access	NA			R	NA	R	NA	R
Retention	NA			RET	NA	RET	NA	RET
Name	RSVD			avail_i2c	RSVD	avail_main	RSVD	avail_spc

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_i2c	When set, requests I2C be available. Reactivation is delayed.
2	avail_main	When set, requests main domain be available (default and necessary for most functionality). The main domain can only be disabled in test mode. There is no isolation in the UDB, DSM or the pumps, so also set avail_udb, avail_dsm_channel and avail_anapump low to avoid static current. Reactivation is delayed.
0	avail_spc	When set, requests SPC be available. Reactivation is delayed.

## 1.3.92 PM\_AVAIL\_CR5

### Power Mode Available Subsystem Control Register 5

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_CR5: 0x43C5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:1
HW Access	NA							R
Retention	NA							RET
Name	RSVD							avail_dsm_channel

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
0	avail_dsm_channel	Each set bit requests a delsig channel be available. Reactivation is immediate.

### 1.3.93 PM\_AVAIL\_CR6

#### Power Mode Available Subsystem Control Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_CR6: 0x43C6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:00		R/W:1	R/W:1
HW Access	NA			R	NA		R	R
Retention	NA			RET	NA		RET	RET
Name	RSVD			avail_anamisc2	RSVD		avail_anapump	avail_anamisc

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_anamisc2	When set, requests miscellaneous analog (group 2) be available. This register is a placeholder and presently has no fanout. Reactivation is immediate.
1	avail_anapump	When set, requests analog pump be available. Reactivation is immediate.
0	avail_anamisc	When set, requests miscellaneous analog be available. Reactivation is immediate.

### 1.3.94 PM\_AVAIL\_SR0

#### Power Mode Available Subsystem Status Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_SR0: 0x43D0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:1
HW Access	NA							W
Retention	NA							RET
Name	RSVD							avail_fm

This register indicates whether a subsystem is available or not.

Bits	Name	Description
0	avail_fm	Each set bit indicates an available flash macro.

### 1.3.95 PM\_AVAIL\_SR1

#### Power Mode Available Subsystem Status Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_SR1: 0x43D1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R:11	
HW Access	NA						W	
Retention	NA						RET	
Name	RSVD						avail_sysmem	

This register indicates whether a subsystem is available or not.

Bits	Name	Description
1:0	avail_sysmem[1:0]	Each set bit requests a sysmem macro be available. Reactivation is delayed. Populated subsystems are counted from the LSB.

## 1.3.96 PM\_AVAIL\_SR2

### Power Mode Available Subsystem Status Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_SR2: 0x43D2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:1	NA:000			R:1
HW Access	NA			W	NA			W
Retention	NA			RET	NA			RET
Name	RSVD			avail_udb	RSVD			avail_ee

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_udb	Each set bit indicates an available UDB bank.
0	avail_ee	Each set bit indicates an available EEPROM macro.

### 1.3.97 PM\_AVAIL\_SR3

#### Power Mode Available Subsystem Status Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_SR3: 0x43D3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:1	NA:000			R:1
HW Access	NA			W	NA			W
Retention	NA			RET	NA			RET
Name	RSVD			avail_sysmemtrace	RSVD			avail_dfb

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_sysmemtrace	Each set bit indicates an available trace memory.
0	avail_dfb	Each set bit indicates an available DFB.

## 1.3.98 PM\_AVAIL\_SR4

### Power Mode Available Subsystem Status Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_SR4: 0x43D4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:1	NA:0	R:1	NA:0	R:1
HW Access	NA			W	NA	W	NA	W
Retention	NA			RET	NA	RET	NA	RET
Name	RSVD			avail_i2c	RSVD	avail_main	RSVD	avail_spc

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_i2c	When set, I2C is available.
2	avail_main	When set, main domain is available.
0	avail_spc	When set, SPC is available.

### 1.3.99 PM\_AVAIL\_SR5

#### Power Mode Available Subsystem Status Register 5

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_SR5: 0x43D5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:1
HW Access	NA							W
Retention	NA							RET
Name	RSVD							avail_dsm_channel

This register indicates whether a subsystem is available or not.

Bits	Name	Description
0	avail_dsm_channel	Each set bit indicates an available delsig channel.

### 1.3.100 PM\_AVAIL\_SR6

#### Power Mode Available Subsystem Status Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PM\_AVAIL\_SR6: 0x43D6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:1	NA:00		R:1	R:1
HW Access	NA			W	NA		W	W
Retention	NA			RET	NA		RET	RET
Name	RSVD			avail_anamisc2	RSVD		avail_anapump	avail_anamisc

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_anamisc2	When set, miscellaneous analog (group 2) is available.
1	avail_anapump	When set, analog pump is available.
0	avail_anamisc	When set, miscellaneous analog is available.

### 1.3.101 INTC\_VECT[0..31]

#### Interrupt Address Vector registers

**Reset:** N/A

Register : Address

INTC\_VECT: 0x4400-0x443F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	IAV_LSB							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	IAV_MSB							

These registers contain the user programmed interrupt address vectors (iav[15:0]) for corresponding interrupts. S8DPARAM\_RAM8x16 is used for storing the interrupt address vectors. The registers access is such that the write/read happens to/from the LSB first and then the MSB. The addresses shown below are corresponds to LSB addresses. For corresponding MSB, add 1 to corresponding LSB address. Note: On reset, these registers contain X's and need to initialize prior to use them in IC. PHUB can written/read to/from either 8-bits or 16-bits of these registers.

Bits	Name	Description
15:8	IAV_MSB[7:0]	These bits contain the Higher byte of user programmed interrupt address vector (iav[15:8])
7:0	IAV_LSB[7:0]	These bits contain the Lower byte of user programmed interrupt address vector (iav[7:0])

### 1.3.102 INTC\_PRIOR[0..31]

#### Interrupt Controller Priority Registers

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

INTC_PRIOR0: 0x4480	INTC_PRIOR1: 0x4481
INTC_PRIOR2: 0x4482	INTC_PRIOR3: 0x4483
INTC_PRIOR4: 0x4484	INTC_PRIOR5: 0x4485
INTC_PRIOR6: 0x4486	INTC_PRIOR7: 0x4487
INTC_PRIOR8: 0x4488	INTC_PRIOR9: 0x4489
INTC_PRIOR10: 0x448A	INTC_PRIOR11: 0x448B
INTC_PRIOR12: 0x448C	INTC_PRIOR13: 0x448D
INTC_PRIOR14: 0x448E	INTC_PRIOR15: 0x448F
INTC_PRIOR16: 0x4490	INTC_PRIOR17: 0x4491
INTC_PRIOR18: 0x4492	INTC_PRIOR19: 0x4493
INTC_PRIOR20: 0x4494	INTC_PRIOR21: 0x4495
INTC_PRIOR22: 0x4496	INTC_PRIOR23: 0x4497
INTC_PRIOR24: 0x4498	INTC_PRIOR25: 0x4499
INTC_PRIOR26: 0x449A	INTC_PRIOR27: 0x449B
INTC_PRIOR28: 0x449C	INTC_PRIOR29: 0x449D
INTC_PRIOR30: 0x449E	INTC_PRIOR31: 0x449F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:000			NA:00000				
HW Access	R/W			NA				
Retention	RET			NA				
Name	PRIOR			RSVD				

These registers assign a priority value from 0 to 7 to each of the available interrupts. The highest priority is 0 and the lowest priority is 7. The priority registers are stored with the most significant bit (MSB) first. This means that for the three bit priority scheme used in the current design, the priority value will be stored in bits [7:5], the remaining bits will always be zero's. If it is a 3 bit priority scheme, then the most significant 3 bits are used. While Reading from these registers, the most 3 bits (7:5) are valid bits. Note: While writing/reading into/from Priority registers through PHUB interface, the priority value will be expected/available on phub\_spkn\_hwdt [7:5] for Byte access and phub\_spkn\_hwdt [15:13], phub\_spkn\_hwdt [7:5] for word access (16 bits).

Bits	Name	Description
7:5	PRIOR[2:0]	The priority value of corresponding interrupt input can be programmed into this register.

### 1.3.103 INTC\_SET\_EN[0..3]

#### Interrupt Controller Set Enable Registers

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

INTC\_SET\_EN0: 0x44C0

INTC\_SET\_EN1: 0x44C1

INTC\_SET\_EN2: 0x44C2

INTC\_SET\_EN3: 0x44C3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	SET_EN							

These registers enable and mask interrupts, and determine which interrupts are currently enabled. Each bit in the register corresponds to one of 8 among 32 interrupts. Setting a bit in the Interrupt Set-Enable Register enables the corresponding interrupt. When the enable bit of a pending interrupt is set, the interrupt controller activates the interrupt based on its priority. When the enable bit is clear, asserting its interrupt signal pends the interrupt, but it is not possible to activate the interrupt, regardless of its priority. Note: There exists only one physical flop for both INTC\_SET\_EN[0] and INTC\_CLR\_EN[0] registers. so effectively, N flops are required for both INTC\_SET\_EN and INTC\_CL\_EN registers instead of 2N where N is the No. of interrupts/8

Bits	Name	Description
7:0	SET_EN[7:0]	Interrupt set-enable bits For write operations: '1' - enable interrupt '0' - no effect For read operations: '1' - indicates that the interrupt is enabled '0' - indicates that the interrupt is disabled Writing '0' to a bit has no effect. Reading the bit, returns its current state.

### 1.3.104 INTC\_CLR\_EN[0..3]

#### Interrupt Controller Clear Enable Registers

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

INTC\_CLR\_EN0: 0x44C8

INTC\_CLR\_EN1: 0x44C9

INTC\_CLR\_EN2: 0x44CA

INTC\_CLR\_EN3: 0x44CB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	CLR_EN							

These registers disable the interrupts and determines which interrupts are currently disabled ('0' indicates that the interrupt is disabled). Each bit in the register corresponds to one of 8 among 32 interrupts. Setting an Interrupt Clear-Enable Register bit disables the corresponding interrupt. .

Bits	Name	Description
7:0	CLR_EN[7:0]	Interrupt clear-enable bits For write operations: '1' - Disable the interrupt '0' - Nothing to do on corresponding interrupt For read operations: '1' - indicates the enabled interrupts '0' - indicates the disabled interrupts Writing '0' to a bit has no effect. Reading the bit, returns its current state.

### 1.3.105 INTC\_SET\_PD[0..3]

#### Interrupt Controller Set Pend Registers

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

INTC\_SET\_PD0: 0x44D0

INTC\_SET\_PD1: 0x44D1

INTC\_SET\_PD2: 0x44D2

INTC\_SET\_PD3: 0x44D3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	SET_PD							

These registers force the interrupts into the pending state and determines which interrupts are currently pending. Each bit in the register corresponds to one of 8 among 32 interrupts. Setting an interrupt set-pending register bit pends the corresponding interrupt, that is, it puts the corresponding interrupt in the pending state. Note: writing '0' to the interrupt set-pending register has no affect on an interrupt that is already pending or that is disabled.

Bits	Name	Description
7:0	SET_PD[7:0]	Interrupt set-pending bits For write operations: '1' - pend the corresponding interrupt '0' - not pend the corresponding interrupt For read operations: '1' - indicates that currently pended interrupts '0' - corresponding interrupt is not in pending state Writing '0' to a bit has no effect. Reading the bit returns its current state.

### 1.3.106 INTC\_CLR\_PD[0..3]

#### Interrupt Controller Clear Pend Registers

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

INTC\_CLR\_PD0: 0x44D8

INTC\_CLR\_PD1: 0x44D9

INTC\_CLR\_PD2: 0x44DA

INTC\_CLR\_PD3: 0x44DB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	CLR_PD							

These registers clear the pending interrupts and determines which interrupts are currently pending. Each bit in the register corresponds to one of 8 among 32 interrupts. Setting an Interrupt clear pending register bit puts the corresponding pending interrupt in the inactive state. Note: There exists only one physical flop for both INTC\_SET\_PD[0] and INTC\_CLR\_PD[0] registers. so effectively, N flops are required for both INTC\_SET\_PD and INTC\_CLR\_PD registers instead of 2N where N is the No. of interrupts/8

Bits	Name	Description
7:0	CLR_PD[7:0]	Interrupt clear-pending bits For write operations: '1' - To clear pending interrupt '0' - Nothing to do on interrupt For read operations: '1' - indicates that currently pended interrupts '0' - corresponding interrupt is not in pend state Writing '0' to a bit has no effect. Reading the bit returns its current state.

## 1.3.107 INTC\_NUM\_LINES

### Interrupt Controller Number Of Lines Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

INTC\_NUM\_LINES: 0x44F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R:011		
HW Access	NA					R		
Retention	NA					NONRET		
Name	RSVD					INT_LINES		

This register reports the number of interrupt lines that the interrupt controller supports.

Bits	Name	Description
2:0	INT_LINES[2:0]	Total number of interrupt lines with the least equal to 8. 3'b000 = up to 8 interrupts 3'b001 = up to 16 interrupts 3'b010 = up to 24 interrupts 3'b011 = up to 32 interrupts 3'b100 = up to 40 interrupts 3'b101 = up to 48 interrupts 3'b110 = up to 56 interrupts 3'b111 = up to 64 interrupts

### 1.3.108 INTC\_ACT\_INT\_NUM

#### Interrupt Controller Active Interrupt Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

INTC\_ACT\_INT\_NUM: 0x44F1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:00000				
HW Access	NA			R/W				
Retention	NA			NONRET				
Name	RSVD			ACT_INT_NUM				

This register provides information on the recently posted interrupt, that is corresponding to the interrupt for which the IRQ was sent to the 8051. The value on this register is valid for corresponding posted interrupt only between duration of irq and corresponding ira. Otherwise the value on this register is not corresponding to the posted interrupt.

Bits	Name	Description
4:0	ACT_INT_NUM[4:0]	Interrupt Number of the recently posted interrupt.

## 1.3.109 INTC\_ACT\_VECT

### Interrupt Controller Active Vector Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

INTC\_ACT\_VECT: 0x44F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ACT_VECT_LSB							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ACT_VECT_MSB							

This register provides information on the interrupt address vector (iav) of the recently posted interrupt, i.e. the active interrupt. This register is read only. The value on this register is valid for corresponding posted interrupt only between irq and corresponding ira.

Bits	Name	Description
15:8	ACT_VECT_MSB[7:0]	The Higher byte of interrupt address vector (iav[15:8]) of the active interrupt is stored in this 8-bit register
7:0	ACT_VECT_LSB[7:0]	The Lower byte of interrupt address vector (iav[7:0]) of the active interrupt is stored in this 8-bit register

### 1.3.110 INTC\_CSR\_EN

#### Interrupt Controller Configuration and Status Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

INTC\_CSR\_EN: 0x44F4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R/W	R
Retention	NA						RET	RET
Name	RSVD						DISABLE_I RQ	CLOCK_EN

The register bit '0'(CLOCK\_EN) is used to enable the clock signal for internal core logic. This register bit is used along with external input 'intc\_clk\_en' which is driven from Power Manager to generate the clock signal for internal core logic. This register should not be accessed through DMA. The register bit '1'(DIS\_IRQ) is used to disable IRQ generation to CPU when written with 1'b1. This write is mandatory before disabling the IE bit in 8051.

Bits	Name	Description
1	DISABLE_IRQ	1'b0: Enables the IRQ generation to CPU 1'b1: Disables the IRQ generation to CPU.
0	CLOCK_EN	1'b0: Disables the clock signal for internal core logic 1'b1: Enables the clock signal for internal core logic.

### 1.3.111 PICU[0..15]\_INTTYPE[0..7]

#### Port Interrupt Control Type Register

**Reset:** System reset for always on flops [reset\_all\_alwayson]

Register : Address

PICU0_INTTYPE0: 0x4500	PICU0_INTTYPE1: 0x4501
PICU0_INTTYPE2: 0x4502	PICU0_INTTYPE3: 0x4503

PICU12_INTTYPE6: 0x4566	PICU12_INTTYPE7: 0x4567
PICU15_INTTYPE0: 0x4578	PICU15_INTTYPE1: 0x4579

$(0x4500 + [0..15 * 0x8]) + [0..7 * 0x1]$

(continued)

Register : Address

PICU15\_INTTYPE2: 0x457A

PICU15\_INTTYPE3: 0x457B

PICU15\_INTTYPE4: 0x457C

PICU15\_INTTYPE5: 0x457D

PICU15\_INTTYPE6: 0x457E

PICU15\_INTTYPE7: 0x457F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						INTTYPE	

This register configures the type of interrupt for a pin. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
1:0	INTTYPE[1:0]	This field configures the type of interrupt type enabled.

[See Table 1-70.](#)

Table 1-70. Bit field encoding: INTTYPE\_ENUM

Value	Name	Description
2'b00	DISABLE	Disable Interrupts for pin.
2'b01	RISING_EDGE	Enable Rising Edge Interrupts for pin.
2'b10	FALLING_EDGE	Enable Falling Edge Interrupts for pin.
2'b11	CHANGE_MODE	Enable Both Edge Interrupts for pin.

### 1.3.112 PICU[0..15]\_INTSTAT

#### Port Interrupt Control Status Register

**Reset:** System reset for always on flops [reset\_all\_alwayson]

Register : Address

PICU0\_INTSTAT: 0x4580

PICU1\_INTSTAT: 0x4581

PICU2\_INTSTAT: 0x4582

PICU3\_INTSTAT: 0x4583

PICU4\_INTSTAT: 0x4584

PICU5\_INTSTAT: 0x4585

PICU6\_INTSTAT: 0x4586

PICU12\_INTSTAT: 0x458C

PICU15\_INTSTAT: 0x458F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	RC:0	RC:0	RC:0	RC:0	RC:0	RC:0	RC:0	RC:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	STAT7	STAT6	STAT5	STAT4	STAT3	STAT2	STAT1	STAT0

This register provides information on the recently posted interrupts.

Bits	Name	Description
7	Interrupt Status {STAT7}	Pin 7 Interrupt Status <a href="#">See Table 1-71.</a>
6	Interrupt Status {STAT6}	Pin 6 Interrupt Status <a href="#">See Table 1-71.</a>
5	Interrupt Status {STAT5}	Pin 5 Interrupt Status <a href="#">See Table 1-71.</a>
4	Interrupt Status {STAT4}	Pin 4 Interrupt Status <a href="#">See Table 1-71.</a>
3	Interrupt Status {STAT3}	Pin 3 Interrupt Status <a href="#">See Table 1-71.</a>
2	Interrupt Status {STAT2}	Pin 2 Interrupt Status <a href="#">See Table 1-71.</a>
1	Interrupt Status {STAT1}	Pin 1 Interrupt Status <a href="#">See Table 1-71.</a>
0	Interrupt Status {STAT0}	Pin 0 Interrupt Status <a href="#">See Table 1-71.</a>

Table 1-71. Bit field encoding: INTSTAT\_ENUM

Value	Name	Description
1'b1	INT_PENDING	Indicates an interrupt is pending.
1'b0	NO_INT	Indicates no interrupt is pending.

### 1.3.113 PICU[0..15]\_SNAP

#### Port Interrupt Control Snap Shot Register

**Reset:** System reset for always on flops [reset\_all\_alwayson]

Register : Address

PICU0\_SNAP: 0x4590

PICU1\_SNAP: 0x4591

PICU2\_SNAP: 0x4592

PICU3\_SNAP: 0x4593

PICU4\_SNAP: 0x4594

PICU5\_SNAP: 0x4595

PICU6\_SNAP: 0x4596

PICU12\_SNAP: 0x459C

PICU15\_SNAP: 0x459F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	SNAPSHOT							

This register provides information on the state of input pins at recent read to Status register. An exception is this register will not be updated when status register is read with DISABLE\_COR or CORD bit in MLOGIC.DEBUG register set

Bits	Name	Description
7:0	SNAPSHOT[7:0]	Contains input pin values at recent read to status register

### 1.3.114 PICU[0..15]\_DISABLE\_COR

#### Disable Status Register Clear on Read Feature

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

PICU0\_DISABLE\_COR: 0x45A0

PICU1\_DISABLE\_COR: 0x45A1

PICU2\_DISABLE\_COR: 0x45A2

PICU3\_DISABLE\_COR: 0x45A3

PICU4\_DISABLE\_COR: 0x45A4

PICU5\_DISABLE\_COR: 0x45A5

PICU6\_DISABLE\_COR: 0x45A6

PICU12\_DISABLE\_COR: 0x45AC

PICU15\_DISABLE\_COR: 0x45AF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							DISABLE_C OR

This register is provided to disable the clear on read feature of Status Register. Either this register bit or CORD bit in MLOGIC.DEBUG register can disable the clear on read feature of status register. The interrupt will be cleared when both DISABLE\_COR is 1'b0, CORD bit in MLOGIC.DEBUG register is 1'b0 and there is a status register read. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
0	DISABLE_COR	1'b0: Status Register is Clear On Read. 1'b1: Disable the Clear on Read feature of Status Register.

### 1.3.115 DAC[0..3]\_TR

#### DAC Block Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_TR: 0x4608

DAC1\_TR: 0x4609

DAC2\_TR: 0x460A

DAC3\_TR: 0x460B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	tr							

Bits	Name	Description
7:0	tr[7:0]	8 Calibration bits

### 1.3.116 NPUMP\_DSM\_TR0

#### Delta Sigma Modulator (DSM) Negative Pump Trim Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

NPUMP\_DSM\_TR0: 0x4610

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						npump_dsm_trim	

Bits	Name	Description
1:0	npump_dsm_trim[1:0]	Delta Sigma Modulator (DSM) Negative Pump Trim

### 1.3.117 NPUMP\_SC\_TR0

#### Switched Cap Negative Pump Trim Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

NPUMP\_SC\_TR0: 0x4611

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						npump_sc_trim	

Bits	Name	Description
1:0	npump_sc_trim[1:0]	Switched Cap Negative Pump Trim

[See Table 1-72.](#)

Table 1-72. Bit field encoding: NPUMP\_SC\_TR0\_ENUM

Value	Name	Description
2'b00	one_sc_block	1 SC block
2'b01	two_sc_blocks	2 SC blocks
2'b10	four_sc_blocks	4 SC blocks
2'b11	turbo_mode	Turbo mode for risk mitigation, 4 SC blocks

### 1.3.118 NPUMP\_OPAMP\_TR0

#### Analog Linear Output Buffer (OPAMP) Negative Pump Trim Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

NPUMP\_OPAMP\_TR0: 0x4612

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						npump_opamp_trim	

Bits	Name	Description
1:0	npump_opamp_trim[1:0]	Analog Linear Output Buffer (OPAMP) Negative Pump Trim

### 1.3.119 OPAMP[0..3]\_TR0

#### Analog Output Buffer Trim Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP0\_TR0: 0x4620

OPAMP1\_TR0: 0x4622

OPAMP2\_TR0: 0x4624

OPAMP3\_TR0: 0x4626

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:00000				
HW Access	NA			R				
Retention	NA			RET				
Name	RSVD			offset_trim				

Bits	Name	Description
4:0	offset_trim[4:0]	Offset Trim: 420uV typical step size; +/- 6.8mV offset trimmable range

## 1.3.120 OPAMP[0..3]\_TR1

### Analog Output Buffer Trim Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP0\_TR1: 0x4621

OPAMP1\_TR1: 0x4623

OPAMP2\_TR1: 0x4625

OPAMP3\_TR1: 0x4627

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved for OPAMP expansion

### 1.3.121 CMP[0..3]\_TR0

#### Comparator Trim Register for PMOS Load

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_TR0: 0x4630

CMP1\_TR0: 0x4632

CMP2\_TR0: 0x4634

CMP3\_TR0: 0x4636

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0000			
HW Access	NA			R	R			
Retention	NA			RET	RET			
Name	RSVD			trim_pmos_sel	trim_pmos_mag			

Bits	Name	Description
4	trim_pmos_sel	Selects the side of the pmos load to which the trim magnitude is applied <a href="#">See Table 1-74.</a>
3:0	trim_pmos_mag[3:0]	Sets the trim magnitude of the pmos load for offset calibration <a href="#">See Table 1-73.</a>

Table 1-73. Bit field encoding: TRIM\_PMAG\_ENUM

Value	Name	Description
4'h0	TRIM_PMAG_0	Does not add any offset.
4'h1	TRIM_PMAG_1	Adds offset of ~1mV to side selected by trim_pmos_sel bit
4'h2	TRIM_PMAG_2	Adds offset of ~2mV to side selected by trim_pmos_sel bit
4'h3	TRIM_PMAG_3	Adds offset of ~3mV to side selected by trim_pmos_sel bit
4'h4	TRIM_PMAG_4	Adds offset of ~4mV to side selected by trim_pmos_sel bit
4'h5	TRIM_PMAG_5	Adds offset of ~5mV to side selected by trim_pmos_sel bit
4'h6	TRIM_PMAG_6	Adds offset of ~6mV to side selected by trim_pmos_sel bit
4'h7	TRIM_PMAG_7	Adds offset of ~7mV to side selected by trim_pmos_sel bit
4'h8	TRIM_PMAG_8	Adds offset of ~8mV to side selected by trim_pmos_sel bit
4'h9	TRIM_PMAG_9	Adds offset of ~9mV to side selected by trim_pmos_sel bit
4'ha	TRIM_PMAG_A	Adds offset of ~10mV to side selected by trim_pmos_sel bit
4'hb	TRIM_PMAG_B	Adds offset of ~11mV to side selected by trim_pmos_sel bit
4'hc	TRIM_PMAG_C	Adds offset of ~12mV to side selected by trim_pmos_sel bit
4'hd	TRIM_PMAG_D	Adds offset of ~13mV to side selected by trim_pmos_sel bit
4'he	TRIM_PMAG_E	Adds offset of ~14mV to side selected by trim_pmos_sel bit
4'hf	TRIM_PMAG_F	Adds offset of ~15mV to side selected by trim_pmos_sel bit

Table 1-74. Bit field encoding: TRIM\_PSEL\_ENUM

Value	Name	Description
1'b0	TRIM_PSEL_0	Trim the positive side of the pmos load
1'b1	TRIM_PSEL_1	Trim the negative side of the pmos load

### 1.3.122 CMP[0..3]\_TR1

#### Comparator Trim Register for NMOS Load

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_TR1: 0x4631

CMP1\_TR1: 0x4633

CMP2\_TR1: 0x4635

CMP3\_TR1: 0x4637

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:0	R/W:000		
HW Access	NA			R	NA	R		
Retention	NA			RET	NA	RET		
Name	RSVD			trim_nmos_sel	RSVD	trim_nmos_mag		

Bits	Name	Description
4	trim_nmos_sel	Selects the side of the nmos load to which the trim magnitude is applied <a href="#">See Table 1-76.</a>
2:0	trim_nmos_mag[2:0]	Sets the trim magnitude of the nmos load for offset calibration <a href="#">See Table 1-75.</a>

Table 1-75. Bit field encoding: TRIM\_NMAG\_ENUM

Value	Name	Description
3'h0	TRIM_NMAG_0	Does not add any offset.
3'h1	TRIM_NMAG_1	Adds offset of ~1mV to side selected by trim_nmos_sel bit
3'h2	TRIM_NMAG_2	Adds offset of ~2mV to side selected by trim_nmos_sel bit
3'h3	TRIM_NMAG_3	Adds offset of ~3mV to side selected by trim_nmos_sel bit
3'h4	TRIM_NMAG_4	Adds offset of ~4mV to side selected by trim_nmos_sel bit
3'h5	TRIM_NMAG_5	Adds offset of ~5mV to side selected by trim_nmos_sel bit
3'h6	TRIM_NMAG_6	Adds offset of ~6mV to side selected by trim_nmos_sel bit
3'h7	TRIM_NMAG_7	Adds offset of ~7mV to side selected by trim_nmos_sel bit

Table 1-76. Bit field encoding: TRIM\_NSEL\_ENUM

Value	Name	Description
1'b0	TRIM_NSEL_0	Trim the negative side of the nmos load
1'b1	TRIM_NSEL_1	Trim the positive side of the nmos load

### 1.3.123 PWRSYS\_HIB\_TR0

#### Hibernate Trim Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_HIB\_TR0: 0x4680

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1111				R/W:0000			
HW Access	R				R			
Retention	RET				RET			
Name	trim				biasg			

This register trims the hibernate regulator, which generates the vpwk supply.

Bits	Name	Description
7:4	trim[3:0]	Hibernate regulator trim.
3:0	biasg[3:0]	Hibernate regulator biasg tweak trim. During powerup hib/slp holdoff specified in PWRSYS_SLP_TR, this trim is internally forced to 4'b0001 until the hib/slp powerup holdoff is finished. This register can be written and will readback normally during the force condition (ie the force condition will not be seen during readback). After the force condition ends, the contents of this register will be applied to the hib/slp regulator.

### 1.3.124 PWRSYS\_HIB\_TR1

#### Hibernate Trim Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_HIB\_TR1: 0x4681

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:000			R/W:1011			
HW Access	R	R			R			
Retention	RET	RET			RET			
Name	dis_hibernate	rbb_trim			enleg			

This register trims the hibernate regulator and reverse body bias generator.

Bits	Name	Description
7	dis_hibernate	Setting this bit will disable hibernate mode.
6:4	rbb_trim[2:0]	Reverse body bias generator trim.
3:0	enleg[3:0]	Each set bit enables a current leg of the hibernate regulator for the keepalive supply.

## 1.3.125 PWRSYS\_I2C\_TR

### I2C Regulator Trim Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_I2C\_TR: 0x4682

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			NA:00		R/W:11	
HW Access	NA	R			NA		R	
Retention	NA	RET			NA		RET	
Name	RSVD	restrim			RSVD		trim	

This register trims the I2C regulator.

Bits	Name	Description
6:4	restrim[2:0]	I2C regulator series resistor trim.
1:0	trim[1:0]	I2C regulator trim.

### 1.3.126 PWRSYS\_SLP\_TR

#### Sleep Regulator Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_SLP\_TR: 0x4683

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:111			R/W:0	R/W:0011			
HW Access	R			R	R			
Retention	RET			RET	RET			
Name	hibslp_holdoff			bypass	trim			

This register trims the sleep regulator.

Bits	Name	Description
7:5	hibslp_holdoff[2:0]	Number of 1kHz ILO clocks before the hibernate/sleep regulator is ready after a chip reset. Before it is ready, the system will ignore power mode requests except active and standby. It also overrides trim settings for the hibernate/sleep regulator. <a href="#">See Table 1-77.</a>
4	bypass	When set, disables the sleep regulator and shorts vccd to vpwrslp. The bypass is internally shorted until hibslp_holdoff expires.
3:0	trim[3:0]	Sleep regulator trim.

Table 1-77. Bit field encoding: holdoff\_enum

Value	Name	Description
3'b000	HOLDOFF0	0 clocks => disables holdoff
3'b001	HOLDOFF1	1 clocks => 0-1ms
3'b010	HOLDOFF2	2 clocks => 1-2ms
3'b011	HOLDOFF3	3 clocks => 2-3ms
3'b100	HOLDOFF4	4 clocks => 3-4ms
3'b101	HOLDOFF5	5 clocks => 4-5ms
3'b110	HOLDOFF6	6 clocks => 5-6ms
3'b111	HOLDOFF7	7 clocks => 6-7ms

## 1.3.127 PWRSYS\_BUZZ\_TR

### Power Mode Buzz Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_BUZZ\_TR: 0x4684

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0011				R/W:0011			
HW Access	R				R			
Retention	RET				RET			
Name	idle_buzz				slp_buzz			

This register trims the settings for system sampling (buzzing).

Bits	Name	Description
7:4	idle_buzz[3:0]	Sets the buzz rate for digital and analog LDOs during idle mode <a href="#">See Table 1-78.</a>
3:0	slp_buzz[3:0]	Sets the buzz rate for digital and analog LDOs during sleep mode <a href="#">See Table 1-78.</a>

Table 1-78. Bit field encoding: psoc3pwrmgr\_pwrsys\_trim\_buzz\_enum

Value	Name	Description
4'b0000	BUZZ_2_TICKS	2 CTW ticks ==> 2ms
4'b0001	BUZZ_4_TICKS	4 CTW ticks ==> 4ms
4'b0010	BUZZ_8_TICKS	8 CTW ticks ==> 8ms
4'b0011	BUZZ_16_TICKS	16 CTW ticks ==> 16ms
4'b0100	BUZZ_32_TICKS	32 CTW ticks ==> 32ms
4'b0101	BUZZ_64_TICKS	64 CTW ticks ==> 64ms
4'b0110	BUZZ_128_TICKS	128 CTW ticks ==> 128ms
4'b0111	BUZZ_256_TICKS	256 CTW ticks ==> 256ms
4'b1000	BUZZ_512_TICKS	512 CTW ticks ==> 512ms

### 1.3.128 PWRSYS\_WAKE\_TR0

#### Power Mode Wakeup Trim Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_WAKE\_TR0: 0x4685

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:01111111							
HW Access	R							
Retention	RET							
Name	wake_to_interval							

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
7:0	wake_to_interval[7:0]	Sets the timeout time to wait until allowing a reset from the PRES-A or PRES-D propagates to the hard reset logic. Prior to this timeout, the power manager prevents PRES output signals from resetting the device. After this timeout, a reset indication from either PRES circuit will cause a system hard reset. The timeout time is (wake_precent+1)*wake_to_interval IMO cycles running at wake_imofreq. To avoid reset on wake from hibernate, this register must be set to 0xFF prior to hibernate entry. The register may be restored to 0x7F upon wake from hibernate to return to the wakeup default for subsequent sleep wakeups. It is safe to leave the register at 0xFF for all wakeups, but it must be written to 0xFF prior to the first hibernate entry.

### 1.3.129 PWRSYS\_WAKE\_TR1

#### Power Mode Wakeup Trim Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_WAKE\_TR1: 0x4686

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:1	NA:0	R/W:000			R/W:000		
HW Access	NA	NA	R			R		
Retention	NA	NA	RET			RET		
Name	RSVD	RSVD	wake_precent			wake_imofreq		

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
5:3	wake_precent[2:0]	Sets the wakeup precount value for the timeout counter {PWRSYS.WAKE_TR0} and holdoff counter {PWRSYS.WAKE_TR3}. Thus precount value also scales the timing of the wakeup sequencer that enables internal power domains. Wakeup timing is specified at 12MHz. If a different wake_imofreq is used, wake_precent is used to adjust the wakeup timing back to 12MHz. A larger precount value may also be used to allow for longer PRES timeout intervals (controlled by wake_ho_interval as well). Note that the actual precount value is wake_precent + 1. To avoid reset on wake from hibernate, wake_precent must be written to 4 (divide by 5) prior to hibernate entry. To preserve datasheet wakeup time from sleep, wake_precent must be restored to the default value of 0 (divide by 1) upon wakeup from hibernate.

[See Table 1-80.](#)

2:0	wake_imofreq[2:0]	Sets the IMO frequency used during chip wakeup from a low power mode.
-----	-------------------	---

[See Table 1-79.](#)

Table 1-79. Bit field encoding: fimo\_freq\_enum

Value	Name	Description
3'b000	FIMO_12MHZ	12 MHz
3'b001	FIMO_RSVD001	RESERVED
3'b010	FIMO_RSVD010	RESERVED
3'b011	FIMO_RSVD011	RESERVED
3'b100	FIMO_RSVD100	RESERVED
3'b101	FIMO_RSVD101	RESERVED
3'b110	FIMO_RSVD110	RESERVED
3'b111	FIMO_RSVD111	RESERVED

Table 1-80. Bit field encoding: wake\_precent\_enum

Value	Name	Description
3'b000	WPC1	Wakeup sequencer and counters run at FIMO frequency divided by 1 (sleep wakeup)
3'b001	WPC2	Wakeup sequencer and counters run at FIMO frequency divided by 2
3'b010	WPC3	Wakeup sequencer and counters run at FIMO frequency divided by 3
3'b011	WPC4	Wakeup sequencer and counters run at FIMO frequency divided by 4
3'b100	WPC5	Wakeup sequencer and counters run at FIMO frequency divided by 5 (hibernate wakeup)
3'b101	WPC6	Wakeup sequencer and counters run at FIMO frequency divided by 6
3'b110	WPC7	Wakeup sequencer and counters run at FIMO frequency divided by 7
3'b111	WPC8	Wakeup sequencer and counters run at FIMO frequency divided by 8

### 1.3.130 PWRSYS\_BREF\_TR

#### Boot Reference Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_BREF\_TR: 0x4687

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	NA:00		R/W:1	R/W:0	R/W:1	R/W:1	R/W:0
HW Access	R	NA		R	R	R	R	R
Retention	RET	NA		RET	RET	RET	RET	RET
Name	bref_manua l	RSVD		bref_force_t urbo	bref_testmo de_reg	bref_en_reg	bref_outen_ reg	bref_refsw_ reg

This registers configures the power system boot reference..

Bits	Name	Description
7	bref_manual	This bit must be written low in the manufacturing trim portion of the test program. When set the other fields in this register allow manual bootref control, which is for RMP and char purposes only. When clear, the power manager will automatically switch the bootref output between the bootref voltage itself and the LVBG after resets and wakeups. When clear, at power up and wakeup, the power manager forces the LDO and LPCOMP references to be the boot reference until device wakes up (meaning until CPU starts running on wakeup). bootref is disabled while device wakeup when this bit is set, the device is in externally regulated VCCA and VCCD mode, AND PWRSYS_WAKE_TR2[2] is set. At the above configuration regular LPCOMPs are used to detect power good during Hibernate and Hibernate timers mode. Since reference is disabled, device can't wakeup from hibernate and hibernate timer modes. Make sure PWRSYS_WAKE_TR2[2] is cleared during Hibertnate, Hibernate Timers mode
4	bref_force_turbo	reserved
3	bref_testmode_reg	When bref_manual is set, this puts the bootref in testmode.
2	bref_en_reg	When bref_manual is set, this fields enables the internal boot reference. This field must be set whenever either LDO is on.
1	bref_outen_reg	When bref_manual is set, this fields enables the output stage of the LDO reference selector. This field must be set prior to selecting the BREF source using bref_refsw_reg.
0	bref_refsw_reg	When bref_manual is set, this fields controls the power system reference source. Using the LVBG reference improves PSRR.

[See Table 1-81.](#)

Table 1-81. Bit field encoding: bref\_refsw\_enum

Value	Name	Description
1'b0	BREF	BREF (boot reference)
1'b1	LVBG	LVBG (low voltage band gap)

### 1.3.131 PWRSYS\_BG\_TR

#### Bandgap Trim

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_BG\_TR: 0x4688

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:00000				
HW Access	NA	R	NA	R				
Retention	NA	RET	NA	RET				
Name	RSVD	trimbuf_fine	RSVD	inl_ctl				

#### Bandgap Trim

Bits	Name	Description
6	trimbuf_fine	Current Bandgap - nonlinear current control (fine tuning)
4:0	inl_ctl[4:0]	Current Bandgap - nonlinear current control

### 1.3.132 PWRSYS\_WAKE\_TR2

#### Power Mode Wakeup Trim Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_WAKE\_TR2: 0x4689

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	NA		R	R	R	R	R	R
Retention	NA		RET	RET	RET	RET	RET	RET
Name	RSVD		use_early_s hort	use_vccd_b ackup	use_vcca_b ackup	use_vccdc lk_det	use_bgwku p_fast	en_buzz

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
5	use_early_short	Enable early shorting between vccd/vnwell/vpwrso/vpwrka. When set, the shorts will be applied at the wakeup event for sleep and idle modes. If clear or a wakeup from hibernate mode, shorts will be applied at the powergood event. Note that if early shorting is used, it is critical that vccd be at a valid voltage (>1.2V) for proper logic retention. If it is not, then state loss can occur including WDT failure. If using internal regulation, it is recommended to set use_vccd_backup and use_vcca_backup to ensure that the supply is valid. This bit is in a protected register segment to avoid accidental corruption. This bit must be set to achieve the wake time specs when using internal regulation for vccd.
4	use_vccd_backup	Enable replica regulated vccd supply. When using internal regulation for vccd, this bit enables a backup regulator that keeps vccd during sleep and idle modes. When clear, buzzing should be enabled to ensure that vccd remains high enough to meet the wake time requirement. If the buzzing approach is used, it is highly recommended to use the LPCOMP powergood detection scheme (use_vccdc_lk_det=0), since it is robust if vccd droops. This bit must be set to achieve the wake time specs when using the internal regulation for vccd. If the chip is configured for external vccd supply using {PWRSYS_CR0}.ext_vccd, then this bit is ignored.
3	use_vcca_backup	Enable replica regulated vcca supply. When using internal regulation for vcca, this bit enables a backup regulator that keeps vcca during sleep and idle modes. When clear, buzzing should be enabled to ensure that vcca remains high enough to meet the wake time requirement. If the buzzing approach is used, it is highly recommended to use the LPCOMP powergood detection scheme (use_vccdc_lk_det=0), since it is robust if vcca droops. This bit must be set to achieve the wake time specs when using the internal regulation for vcca. If the chip is configured for external vcca supply using {PWRSYS_CR0}.ext_vcca, then this bit is ignored.
2	use_vccdc_lk_det	Enable alternate powergood detector. When set, an alternate powergood detector is used during wakeup from hibernate and sleep. When clear, the LPCOMPs are used. The alternate powergood detector relies on valid vccd and vcca supplies. It is recommended to use it with the replica regulators (use_vccd_backup and use_vcca_backup) or external supplies. The LPCOMP detector is more robust to droops on vcca and vccd. The alternate powergood detector is slower and should not be used. This bit must be cleared to achieve the wake time specs.
1	use_bgwkup_fast	Enable fast BG wakeup. This bit must be set to achieve the wake time specs.
0	en_buzz	Enable buzz wakeups. Buzzing wakes the regulators (if configured) and performs periodic voltage supervision.

### 1.3.133 PWRSYS\_WAKE\_TR3

#### Power Mode Wakeup Trim Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PWRSYS\_WAKE\_TR3: 0x468A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:01011111							
HW Access	R							
Retention	RET							
Name	wake_ho_interval							

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
7:0	wake_ho_interval[7:0]	Sets the holdoff time to wait until sampling PRES-A/D. The holdoff time is (wake_precht+1)*wake_ho_interval IMO cycles running at wake_imofreq.

### 1.3.134 ILO\_TR0

#### Internal Low-speed Oscillator Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

ILO\_TR0: 0x4690

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1000				R/W:1000			
HW Access	R				R			
Retention	RET				RET			
Name	tr_100k				tr_1k			

This register is used to trim the frequency of the ILO output clocks.

Bits	Name	Description
7:4	tr_100k[3:0]	Trim setting for 100 kHz output <a href="#">See Table 1-82.</a>
3:0	tr_1k[3:0]	Trim setting for 1 kHz output <a href="#">See Table 1-83.</a>

Table 1-82. Bit field encoding: TR\_100K\_ENUM

Value	Name	Description
4'b0000	TR_100K_MIN	Minimum Frequency
4'b1111	TR_100K_MAX	Maximum Frequency

Table 1-83. Bit field encoding: TR\_1K\_ENUM

Value	Name	Description
4'b0000	TR_1K_MIN	Minimum Frequency
4'b1111	TR_1K_MAX	Maximum Frequency

### 1.3.135 ILO\_TR1

#### Internal Low-speed Oscillator Coarse Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

ILO\_TR1: 0x4691

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:10	
HW Access	NA					R	R	
Retention	NA					RET	RET	
Name	RSVD					ct_range	ctrim	

This register is used to trim the frequency of the ILO output clocks.

Bits	Name	Description
2	ct_range	Coarse Trim Range select for ILO <a href="#">See Table 1-85.</a>
1:0	ctrim[1:0]	Coarse Trim Setting for ILO <a href="#">See Table 1-84.</a>

Table 1-84. Bit field encoding: CTRIM\_ENUM

Value	Name	Description
2'h0	CTRIM_0	Full Resistor (lowest current, lowest frequency)
2'h1	CTRIM_1	3/4 * R
2'h2	CTRIM_2	1/2 * R
2'h3	CTRIM_3	1/4 * R (highest current, highest frequency)

Table 1-85. Bit field encoding: CT\_RANGE\_ENUM

Value	Name	Description
1'b0	CT_RANGE_0	Normal range
1'b1	CT_RANGE_1	Lower current range

### 1.3.136 X32\_TR

#### 32 kHz Watch Crystal Oscillator Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

X32\_TR: 0x4698

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:101		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					xgm		

Bits	Name	Description
2:0	xgm[2:0]	Amplifier GM setting, applies to both High and Low power modes <a href="#">See Table 1-86.</a>

Table 1-86. Bit field encoding: XGM\_ENUM

Value	Name	Description
3'b000	XGM_MAX	Highest current setting
3'b101	XGM_DEFAULT	Default setting
3'b111	XGM_MIN	Lowest current setting

### 1.3.137 IMO\_TR0

#### Internal Main Oscillator Trim Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

IMO\_TR0: 0x46A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:111			NA:00000				
HW Access	R/W			NA				
Retention	RET			NA				
Name	imo_lsb			RSVD				

This register contains the frequency trim for the IMO. For each frequency range, a separate factory trim should be loaded into this register. It is recommended that the user not change the value of this register. When changing frequency ranges, the new trim value should be applied at the lowest frequency range. For example, when switching to a high range, first apply the trim value of the higher range, then switch the IMO to that range. If switching to a lower range, change the range first and then apply the new trim value.

Bits	Name	Description
7:5	imo_lsb[2:0]	These are the 3 LSB of the IMO frequency trim. Normally these are not changed by the user, and are only modified by the hardware during USB clock-locking. These bits are locked from user write when USB Oscillator locking is enabled.

[See Table 1-87.](#)

Table 1-87. Bit field encoding: IMO\_LSB\_ENUM

Value	Name	Description
3'b000	IMO_LSB_MIN	minimum value
3'b111	IMO_LSB_MAX	maximum value

### 1.3.138 IMO\_TR1

#### Internal Main Oscillator Trim Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

IMO\_TR1: 0x46A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:10011101							
HW Access	R/W							
Retention	RET							
Name	imo_trim							

IMO Trim for 48 MHz frequency setting

Bits	Name	Description
7:0	imo_trim[7:0]	Frequency trim (8 MSbits) for the IMO. 8 MSbits of the trim. The factory trim only uses these 8 bits; the 3 LSbits (IMO_LSB[2:0]) are normally only used during USB operation. These bits are locked from user write when USB Oscillator locking is enabled.

[See Table 1-88.](#)

Table 1-88. Bit field encoding: IMO\_TRIM\_ENUM

Value	Name	Description
8'h00	IMO_TRIM_MIN	Minimum frequency
8'hff	IMO_TRIM_MAX	Maximum frequency

## 1.3.139 IMO\_GAIN

### Internal Main Oscillator Gain Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

IMO\_GAIN: 0x46A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:001111					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		gain					

This register contains the gain trim for the IMO. This is normally set with a factory trim and not modified by the user.

Bits	Name	Description
5:0	gain[5:0]	Gain trim for the IMO. This controls the kHz/step of the trim setting in the IMO_TR register. <a href="#">See Table 1-89.</a>

Table 1-89. Bit field encoding: GAIN\_ENUM

Value	Name	Description
6'h00	GAIN_MAX	Maximum Gain
6'h3F	GAIN_MIN	Minimum Gain

### 1.3.140 IMO\_C36M

#### Internal Main Oscillator 36 MHz clock control register {INTERNAL}

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

IMO\_C36M: 0x46A3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				tr36			

This register controls operation of the 36 Mhz output of the IMO.

Bits	Name	Description
3:0	tr36[3:0]	Frequency trim for the 36 MHz SPC clock. This value should not be changed by the user. <a href="#">See Table 1-90.</a>

Table 1-90. Bit field encoding: TR36\_ENUM

Value	Name	Description
4'h0	TR36_MIN	Minimum frequency
4'hf	TR36_MAX	Maximum frequency

### 1.3.141 IMO\_TR2

#### Internal Main Oscillator Trim Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

IMO\_TR2: 0x46A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:000110					
HW Access	R	NA	R					
Retention	RET	NA	RET					
Name	pll_trim	RSVD	fimo_trim					

This register contains the frequency trim for the IMO during fastwake mode.

Bits	Name	Description
7	pll_trim	PLL trim for VCO duty cycle. Must be set to 1'b0 in production test and firmware.
5:0	fimo_trim[5:0]	Frequency trim for the IMO in fastwake mode (FIMO). This value should not be changed by the user. Reset default value for bits 5:4 will be overwritten by NVLatch bits during boot

[See Table 1-91.](#)

Table 1-91. Bit field encoding: FIMO\_TRIM\_ENUM

Value	Name	Description
6'h00	FIMO_TRIM_MIN	Minimum frequency
6'h3f	FIMO_TRIM_MAX	Maximum frequency

### 1.3.142 XMHZ\_TR

#### External 4-25 MHz Crystal Oscillator Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

XMHZ\_TR: 0x46A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				iref			

Bits	Name	Description
3:0	iref[3:0]	This bit adjusts the output current of the oscillator circuit. The value is selected to match the output external crystal characteristics.

[See Table 1-92.](#)

Table 1-92. Bit field encoding: IREF\_ENUM

Value	Name	Description
4'h0	IREF_0	13 unit resistors
4'h1	IREF_1	14 unit resistors
4'h2	IREF_2	15 unit resistors
4'h3	IREF_3	16 unit resistors
4'h4	IREF_4	17 unit resistors
4'h5	IREF_5	18 unit resistors
4'h6	IREF_6	19 unit resistors
4'h7	IREF_7	20 unit resistors
4'h8	IREF_8	21 unit resistors
4'h9	IREF_9	22 unit resistors
4'ha	IREF_A	23 unit resistors
4'hb	IREF_B	24 unit resistors
4'hc	IREF_C	25 unit resistors
4'hd	IREF_D	26 unit resistors
4'he	IREF_E	27 unit resistors
4'hf	IREF_F	28 unit resistors

### 1.3.143 DLY

#### Delay block Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DLY: 0x46C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:00		R/W:00000				
HW Access	NA	R		R				
Retention	NA	RET		RET				
Name	RSVD	CTRIM		FTRIM				

This register is used to trim the delay cell tap duration. This register should only be used when the delay cell is in trim mode (see CLKDIST\_DLY1 MODE bit). This register can also be accessed via it's alias, the CLKDIST\_DLY0 register **User Defined**

**Properties:** unique\_name\_space=1

Bits	Name	Description
6:5	CTRIM[1:0]	Course trim bits for delay block  <a href="#">See Table 1-93.</a>
4:0	FTRIM[4:0]	Fine trim bits for delay block 5'b00000 Lowest bias ... .. 5'bffff Highest bias

Table 1-93. Bit field encoding: CTRIM\_ENUM

Value	Name	Description
2'b00	ZERO	Highest bias setting
2'b10	TWO	Second highest bias setting
2'b01	ONE	Third highest bias setting
2'b11	THREE	Fourth highest bias setting

### 1.3.144 MLOGIC\_DMPSTR

#### Dumpster Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

MLOGIC\_DMPSTR: 0x46E2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	RET							
Name	dumpster							

Bits	Name	Description
7:0	dumpster[7:0]	Dummy register used to pad the manufacturing configuration table. If the MFGCFG table has less than 63 data/address pairs, the remaining pairs write to this register to ensure nothing configured incorrectly

### 1.3.145 MLOGIC\_SEG\_CR

#### Segment Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

MLOGIC\_SEG\_CR: 0x46E4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:10110100							
HW Access	R							
Retention	RET							
Name	segment_control							

Bits	Name	Description
7:0	segment_control[7:0]	Segment Control, controls write access to the segment register. When 0xB5 is written the lock on the Segment Configuration is removed. When 0xB4 is written, the Segment Configuration bits are locked and may only be read. Writing any other value triggers a reset.

## 1.3.146 MLOGIC\_SEG\_CFG0

### Segment Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

MLOGIC\_SEG\_CFG0: 0x46E5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOSET:0	R/W:0	R/WOSET:0	R/W:0	R/WOSET:0	R/W:0	R/WOSET:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	lock_protect_3	lock_3	lock_protect_2	lock_2	lock_protect_1	lock_1	lock_protect_0	lock_0

Bits	Name	Description
7	lock_protect_3	Segment Lock Protect
6	lock_3	Segment Lock
5	lock_protect_2	Segment Lock Protect
4	lock_2	Segment Lock
3	lock_protect_1	Segment Lock Protect
2	lock_1	Segment Lock
1	lock_protect_0	Segment Lock Protect
0	lock_0	Segment Lock

## 1.3.147 MLOGIC\_DEBUG

### MLOGIC Debug Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

MLOGIC\_DEBUG: 0x46E8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	NA:00	
HW Access	NA			R	R	R	NA	
Retention	NA			RET	RET	RET	NA	
Name	RSVD			CORD	swv_clk_sel	swv_clk_en	RSVD	

Bits	Name	Description
4	CORD	0x0: Reading RC registers clears the values in them. 0x1: Clear on Read Disabled. Values in RC registers are not cleared when read.
3	swv_clk_sel	Serial Wire Viewer (SWV) trace clock select. When set to '0' SWD clock is used for trace clock. When set to '1' clk_cpu/2 is used for trace clock
2	swv_clk_en	Serial Wire View (SWV) clock enable. When set to '1' the clocks for SWV are enabled. This bit must be set to '1' to use SWV

### 1.3.148 MLOGIC\_CPU\_SCR\_CPU\_SCR

#### System Status and Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

MLOGIC\_CPU\_SCR\_CPU\_SCR: 0x46EA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:0	R:1	R:0	R/W:0
HW Access	NA				R/W	R/W	R/W	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				wol	boot	tmode	stop

Bits	Name	Description
3	wol	Write Once Latch Status
2	boot	Boot. Cleared by the Checksum block upon completion of the boot process. Can also be cleared in Test Mode setting the boot bit in the Test Controller CR1 register to bypass the boot process.
1	tmode	Test Mode Status
0	stop	Halt the CPU. Halts the CPU in any mode when written to. Requires a reset, DMA or DOC write to start the CPU again.

## 1.3.149 RESET\_IPOR\_CR0

### Imprecise Power On Reset Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_IPOR\_CR0: 0x46F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0xD4 to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

### 1.3.150 RESET\_IPOR\_CR1

#### Imprecise Power On Reset Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_IPOR\_CR1: 0x46F1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0xAA to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

## 1.3.151 RESET\_IPOR\_CR2

### Imprecise Power On Reset Control Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_IPOR\_CR2: 0x46F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0x56 to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

## 1.3.152 RESET\_IPOR\_CR3

### Imprecise Power On Reset Control Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_IPOR\_CR3: 0x46F3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0xC9 to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

## 1.3.153 RESET\_CR0

### LVI Set Point Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_CR0: 0x46F4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0000				R/W:0000			
HW Access	R				R			
Retention	RET				RET			
Name	lvia				lvid			

Bits	Name	Description
7:4	lvia[3:0]	When LVI-A is enabled, these 4 bits select the trip point of the detector. <a href="#">See Table 1-94.</a>
3:0	lvid[3:0]	When LVI-D is enabled, these 4 bits select the trip point of the detector. <a href="#">See Table 1-95.</a>

Table 1-94. Bit field encoding: lvia\_sel

Value	Name	Description
4'b0000	LVIA_0	1.73V
4'b0001	LVIA_1	1.95v
4'b0010	LVIA_2	2.20V
4'b0011	LVIA_3	2.45V
4'b0100	LVIA_4	2.71V
4'b0101	LVIA_5	2.95V
4'b0110	LVIA_6	3.21V
4'b0111	LVIA_7	3.46V
4'b1000	LVIA_8	3.70V
4'b1001	LVIA_9	3.95V
4'b1010	LVIA_A	4.20V
4'b1011	LVIA_B	4.45V
4'b1100	LVIA_C	4.70V
4'b1101	LVIA_D	4.98V
4'b1110	LVIA_E	5.21V
4'b1111	LVIA_F	5.47V

Table 1-95. Bit field encoding: lvid\_sel

Value	Name	Description
4'b0000	LVID_0	1.73V
4'b0001	LVID_1	1.95v
4'b0010	LVID_2	2.20V
4'b0011	LVID_3	2.45V
4'b0100	LVID_4	2.71V
4'b0101	LVID_5	2.95V
4'b0110	LVID_6	3.21V
4'b0111	LVID_7	3.46V
4'b1000	LVID_8	3.70V

(continued)

Table 1-95. Bit field encoding: lvid\_sel

4'b1001	LVID_9	3.95V
4'b1010	LVID_A	4.20V
4'b1011	LVID_B	4.45V
4'b1100	LVID_C	4.70V
4'b1101	LVID_D	4.98V
4'b1110	LVID_E	5.21V
4'b1111	LVID_F	5.47V

## 1.3.154 RESET\_CR1

### Reset System Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_CR1: 0x46F5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				vmon_hvi_sel	en_hvia	en_lvia	en_lvid

This register enables circuits in the reset subsystem.

Bits	Name	Description
3	vmon_hvi_sel	When set to 1, this bit enables the vmon to look at the VDDD. When this bit is cleared to 0, the vmon looks at the VDDB.
2	en_hvia	When set to 1, enables the high-voltage-interrupt feature on the external analog supply. When this bit is set, there is a possible glitch on the output. To account for this glitch the user must mask the interrupt prior to setting this bit, then clear the status register immediately after this bit is set. Only then this circuit is ready for use.
1	en_lvia	Enables the low-voltage-interrupt or reset feature on the external analog supply. When this bit is set to 1 along with the en_presa bit (RESET_CR3 bit 7) set to 1, the lvia becomes an additional reset source through the presa reset path. When this bit is set to 1 along with the en_presa bit (RESET_CR3 bit 7) cleared to 0, the lvia becomes an interrupt source. When this bit is cleared to 0, the bit state (either a zero or a one) of the en_presa bit (RESET_CR3 bit 7) has no impact on the reset or interrupt functionality. When this bit is set, there is a possible glitch on the output. To account for this glitch the user must mask the interrupt prior to setting this bit, then clear the status register immediately after this bit is set. Only then this circuit is ready for use.
0	en_lvid	Enables the low-voltage-interrupt or reset feature on the external digital supply. When this bit is set to 1 along with the en_presd bit (RESET_CR3 bit 6) set to 1, the lvid becomes an additional reset source through the presd reset path. When this bit is set to 1 along with the en_presd bit (RESET_CR3 bit 6) cleared to 0, the lvid becomes an interrupt source. When this bit is cleared to 0, the bit state (either a zero or a one) of the en_presd bit (RESET_CR3 bit 6) has no impact on the reset or interrupt functionality. When this bit is set, there is a possible glitch on the output. To account for this glitch the user must mask the interrupt prior to setting this bit, then clear the status register immediately after this bit is set. Only then this circuit is ready for use.

### 1.3.155 RESET\_CR2

#### Software Reset Control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

RESET\_CR2: 0x46F6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							swr

This register control the software reset (SWR).

Bits	Name	Description
0	swr	Setting this bit will cause a system reset.

## 1.3.156 RESET\_CR3

### LVI Mode Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_CR3: 0x46F7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	NA:000			NA:000		
HW Access	R	R	NA			NA		
Retention	RET	RET	NA			NA		
Name	en_presa	en_presd	RSVD			RSVD		

This register controls mode settings for the LVI detector.

Bits	Name	Description
7	en_presa	When this bit is set to 1 along with the en_lvia bit (RESET_CR1 bit 1) set to 1, the lvia becomes an additional reset source through the presa reset path. When this bit is cleared to 0 along with the en_lvia bit (RESET_CR1 bit 1) set to 1, the lvia is only used as an interrupt source. If the en_lvia bit (RESET_CR1 bit 1) is cleared to 0, the bit state (either a zero or a one) has no impact on the reset or interrupt functionality. This bit is in segment 0.
6	en_presd	When this bit is set to 1 along with the en_lvid bit (RESET_CR1 bit 0) set to 1, the lvid becomes an additional reset source through the presd reset path. When this bit is cleared to 0 along with the en_lvid bit (RESET_CR1 bit 0) set to 1, the lvid is only used as an interrupt source. If the en_lvid bit (RESET_CR1 bit 0) is cleared to 0, the bit state (either a zero or a one) has no impact on the reset or interrupt functionality. This bit is in segment 0.

Table 1-96. Bit field encoding: tmux\_sel

Value	Name	Description
3'b000	TMODE_000	Normal mode (output driven to vgnd)
3'b001	TMODE_001	PRES-D
3'b010	TMODE_010	PRES-A
3'b011	TMODE_011	LVI-D
3'b100	TMODE_100	LVI-A
3'b101	TMODE_101	HVI-A
3'b110	TMODE_110	LPCOMP-D (set => powergood)
3'b111	TMODE_111	LPCOMP-A (set => powergood)

## 1.3.157 RESET\_CR4

### Reset Ignore Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_CR4: 0x46F8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:1	R/W:1	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			ignore_hbr1	ignore_lpcompa1	ignore_lpcompd1	ignore_presa1	ignore_presd1

This register configures the system to ignore certain reset sources.

Bits	Name	Description
4	ignore_hbr1	When both this bit and ignore_hbr2 are set to 1, the HBR circuit is disabled.
3	ignore_lpcompa1	When both this bit and ignore_lpcompa2 are set to 1, the LPCOMP-A circuits is disabled. Before entering Low Power Modes (LPM), this bit must be high.
2	ignore_lpcompd1	When both this bit and ignore_lpcompd2 are set to 1, the LPCOMP-D circuit is disabled. Before entering Low Power Modes (LPM), this bit must be high.
1	ignore_presa1	When both this bit and ignore_presa2 are set to 1, the PRES-A circuits is disabled.
0	ignore_presd1	When both this bit and ignore_presd2 are set to 1, the PRES-D circuit is disabled.

## 1.3.158 RESET\_CR5

### Reset Ignore Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_CR5: 0x46F9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:1	R/W:1	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			ignore_hbr2	ignore_lpcompa2	ignore_lpcompd2	ignore_presa2	ignore_presd2

This register configures the system to ignore certain reset sources.

Bits	Name	Description
4	ignore_hbr2	When both this bit and ignore_hbr1 are set to 1, the HBR circuit is disabled.
3	ignore_lpcompa2	When both this bit and ignore_lpcompa1 are set to 1, the LPCOMP-A circuits is disabled. Before entering Low Power Modes (LPM), this bit must be high.
2	ignore_lpcompd2	When both this bit and ignore_lpcompd1 are set to 1, the LPCOMP-D circuit is disabled. Before entering Low Power Modes (LPM), this bit must be high.
1	ignore_presa2	When both this bit and ignore_presa1 are set to 1, the PRES-A circuits is disabled.
0	ignore_presd2	When both this bit and ignore_presd1 are set to 1, the PRES-D circuit is disabled.

## 1.3.159 RESET\_SR0

### Reset and Voltage Detection Status Register 0

**Reset:** Reset Signals Listed Below

Register : Address

RESET\_SR0: 0x46FA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		RC:0	NA:0	RC:0	RC:0	RC:0	RC:0
HW Access	NA		R/W	NA	R/W	R/W	R/W	R/W
Retention	RET		RET	NA	RET	NONRET	NONRET	NONRET
Name	gpsw_s		swr_s	RSVD	wdr_s	hvia_s	lvia_s	lvid_s

This register gives persistent status for the reset and voltage detection systems.

Bits	Name	Description
7:6	gpsw_s[1:0]	General purpose status for user software. These bits can be set to 1 or cleared to 0 by software and only reset by hard reset sources. They can be used to hold user defined status that persists through many resets.
5	swr_s	Persistent status of the software reset. This bit will be set to 1 when a software reset occurs and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
3	wdr_s	Persistent status of the watchdog reset. This bit will be set to 1 when a watchdog reset occurs and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
2	hvia_s	Persistent status of analog HVI. This bit will be set to 1 when the analog supply goes below the trip point for the HVI detector and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
1	lvia_s	Persistent status of analog LVI. This bit will be set to 1 when the analog supply goes below the trip point for the LVI detector and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
0	lvid_s	Persistent status of digital LVI. This bit will be set to 1 when the digital supply goes below the trip point for the LVI detector and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)

### Reset Table

Reset Signal	Applicable Register Bit(s)
IPOR/PRES/HBR for retention flops [reset_hard_retention]	wdr_s, swr_s, gpsw_s[1:0]
IPOR/PRES/HBR for non-retention flops [reset_hard_nonretention]	lvid_s, lvia_s, hvia_s

## 1.3.160 RESET\_SR1

### Reset and Voltage Detection Status Register 1

**Reset:** IPOR/PRES/HBR for non-retention flops [reset\_hard\_nonretention]

Register : Address

RESET\_SR1: 0x46FB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	RC:0	RC:0	RC:0	RC:0	NA:00		RC:0
HW Access	NA	R/W	R/W	R/W	R/W	NA		R/W
Retention	NA	NONRET	NONRET	NONRET	NONRET	NA		NONRET
Name	RSVD	lpcompa_s	lpcompd_s	presa_s	presd_s	RSVD		sgr_s

This register gives persistent status for the reset and voltage detection systems.

Bits	Name	Description
6	lpcompa_s	Persistent status of analog LPCOMP. This bit will be set to 1 when the analog supply goes below the trip point for the LPCOMP circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the LPCOMP-A circuit does not cause a system reset. Sticky (whole field)
5	lpcompd_s	Persistent status of digital LPCOMP. This bit will be set to 1 when the digital supply goes below the trip point for the LPCOMP circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the LPCOMP-D circuit does not cause a system reset. Sticky (whole field)
4	presa_s	Persistent status of analog PRES. This bit will be set to 1 when the analog supply goes below the trip point for the PRES circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the PRES-A circuit does not cause a system reset. Sticky (whole field)
3	presd_s	Persistent status of digital PRES. This bit will be set to 1 when the digital supply goes below the trip point for the PRES circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the PRES-D circuit does not cause a system reset. Sticky (whole field)
0	sgr_s	Persistent status of the segment reset. This bit will be set to 1 when the segment reset occurs circuit and will stay set to 1 until cleared to 0 by the user or reset. Note a segment reset occurs when a value other than 0xB4 or 0xB5 is written to the Segment Control Register. Sticky (whole field)

### 1.3.161 RESET\_SR2

#### Reset and Voltage Detection Status Register 2

**Reset:** IPOR/PRES/HBR for non-retention flops [reset\_hard\_nonretention]

Register : Address

RESET\_SR2: 0x46FC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:0	R:0	R:0	R:0	R:0	R:0	R:0
HW Access	W	W	W	W	W	W	W	W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	hbrs_r	lpcompa_r	lpcompd_r	presa_r	presd_r	hvia_r	lvia_r	lvid_r

This register gives real-time status for the reset and voltage detection systems.

Bits	Name	Description
7	hbrs_r	Real-time status of HBR. This is only useful when the HBR does not cause a system level reset.
6	lpcompa_r	Real-time status of analog LPCOMP. This is only useful when the LPCOMP-A output is ignored.
5	lpcompd_r	Real-time status of digital LPCOMP. This is only useful when the LPCOMP-D output is ignored.
4	presa_r	Real-time status of analog PRES. This is only useful when the PRES-A output is ignored.
3	presd_r	Real-time status of digital PRES. This is only useful when the PRES-D output is ignored.
2	hvia_r	Real-time status of analog HVI.
1	lvia_r	Real-time status of analog LVI.
0	lvid_r	Real-time status of digital LVI.

## 1.3.162 RESET\_SR3

### Reset and Voltage Detection Status Register 3

**Reset:** IPOR/PRES/HBR for retention flops [reset\_hard\_retention]

Register : Address

RESET\_SR3: 0x46FD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0000				R:1	NA:000		
HW Access	R/W				W	NA		
Retention	RET				RET	NA		
Name	cksm_fail_cnts				ipor_key_n	RSVD		

This register gives persistent status for the reset and voltage detection systems.

Bits	Name	Description
7:4	cksm_fail_cnts[3:0]	Count of the number of times the Checksum process has failed, causing a reset. These 4 bits will hold the count value and it will stay until cleared to 0 by a reset.
3	ipor_key_n	IPOR key status. When low, the IPOR key has been properly written using the IPOR_CR registers.

## 1.3.163 RESET\_TR

### PRES Trim Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

RESET\_TR: 0x46FE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0111				R/W:0111			
HW Access	R				R			
Retention	RET				RET			
Name	presa				presd			

This register sets the trim for the precision voltage detectors (PRES).

Bits	Name	Description
7:4	presa[3:0]	Trim for PRES-A. Default value sets the trip to 1.6V
3:0	presd[3:0]	Trim for PRES-D. Default value sets the trip to 1.6V

## 1.3.164 SPC\_FM\_EE\_CR

### FM\_EE\_CR

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SPC\_FM\_EE\_CR: 0x4700

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R:0	NA:000			R/W:0	R/W:0
HW Access	NA		R/W	NA			R	R
Retention	NA		RET	NA			RET	RET
Name	RSVD		EE_AWAKE	RSVD			EE_Priority	FM_Priority

This register contains control bits for the flash and eeprom arrays

Bits	Name	Description
5	EE_AWAKE	Status signal to denote that the EEPROM array is awake & powered, when set equal to 1. On reset, this value is 0. When the EEPROM is enabled, after the 5 us startup time has elapsed, the bit will be set to a 1.
1	EE_Priority	Sets priority between the PHUB and the SPC for who gets control of the EEPROM array upon simultaneous access requests. 1-> SPC has priority. 0-> PHUB has priority.
0	FM_Priority	Sets priority between the cache controller and the SPC for who gets control of the flash array upon simultaneous access requests. 1-> SPC has priority. 0-> Cache controller has priority.

### 1.3.165 SPC\_FM\_EE\_WAKE\_CNT

#### FM\_EE\_WAKE\_CNT

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SPC\_FM\_EE\_WAKE\_CNT: 0x4701

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00011110							
HW Access	R							
Retention	RET							
Name	Wake_Count							

Flash/EEPROM Wake Count Register

Bits	Name	Description
7:0	Wake_Count[7:0]	The wake count defines the number of Bus Clock cycles it takes for the flash or eeprom to wake up from being in a put into a low power mode independent of the chip power mode (while the rest of the chip remained in active or standby). Wake up time for these blocks is 5 us. The granularity of this register is 2 Bus Clock cycles, so a value of 0x1E (30d) defines the wake up time as 60 cycles of the Bus Clock. This register needs to be written with a value dependent on the Bus Clock frequency so that the duration of the cycles is equal to or greater than the 5 us delay required. The reset value of this register (0x1E) is for a Bus Clock frequency of 12 MHz.

### 1.3.166 SPC\_EE\_SCR

#### EEPROM Status & Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SPC\_EE\_SCR: 0x4702

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R:0	R/W:0
HW Access	NA						R/W	R
Retention	NA						RET	RET
Name	RSVD						EE_AHB_A CK	AHB_EE_R EQ

This register contains status and control bits for the EEPROM array.

Bits	Name	Description
1	EE_AHB_ACK	Once the AHB_EE_REQ bit is set, this bit is set high once the EEPROM is available to be read across the PHUB interface.
0	AHB_EE_REQ	This bit is set high when a read access of the EEPROM, through the PHUB interface, is desired. This is a request bit and is part of a two bit interface with the EE_AHB_ACK bit.

### 1.3.167 SPC\_EE\_ERR

#### EEPROM Error Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SPC\_EE\_ERR: 0x4703

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							RC:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							EEPROM_error

This register has an error bit for the EEPROM array on the chip. The error bit indicates whether or not the array has had a collision error where two masters (the SPC and the PHUB interface) attempted to access the array simultaneously. The bits are cleared upon a read of this register.

Bits	Name	Description
0	EEPROM_error	Error bit for EEPROM array 0

## 1.3.168 SPC\_CPU\_DATA

### SPC CPU Data Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

SPC\_CPU\_DATA: 0x4720

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	CPU_Data							

This register is the command interface to the SPC that allows SPC instructions to be executed by the host CPU writing a sequential series of parameters to this location. This register is meant only for the CPU and not the DMA controller to prevent collisions between the CPU and the DMAC when both attempt to call a function in the SPC

Bits	Name	Description
7:0	CPU_Data[7:0]	CPU Data.

### 1.3.169 SPC\_DMA\_DATA

#### SPC DMA Data Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

SPC\_DMA\_DATA: 0x4721

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	DMA_Data							

This register is the command interface to the SPC that allows SPC instructions to be executed by the DMA controller writing a sequential series of parameters to this location. This register is meant only for the DMA Controller and not the CPU to prevent collisions between the CPU and the DMAC when both attempt to call a function in the SPC

Bits	Name	Description
7:0	DMA_Data[7:0]	DMA Data.

### 1.3.170 SPC\_SR

#### SPC Status Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SPC\_SR: 0x4722

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:000000						R:1	R:0
HW Access	R/W						R/W	R/W
Retention	RET						RET	RET
Name	Status_Code						SPC_Idle	Data_Ready

This register returns the current status of the SPC and the exit status of the last complete SPC instruction.

Bits	Name	Description
7:2	Status_Code[5:0]	The Status Code represents the exit status of the last executed SPC instruction. <a href="#">See Table 1-99.</a>
1	SPC_Idle	This bit indicates whether or not the SPC is currently executing an instruction. The bit transitions low as soon as the 1st byte of the 2-byte command key (0xB6) is written into the SPC CPU or DMA Data Register. The bit transitions high as soon as an instruction completes or if the 2nd byte of the command key is invalid. <a href="#">See Table 1-98.</a>
0	Data_Ready	This bit indicates whether or not the SPC has data that is ready to be read from the SPC CPU or DMA Data Register. <a href="#">See Table 1-97.</a>

Table 1-97. Bit field encoding: DATA\_RDY\_ENUM

Value	Name	Description
1'h0	DATA_IS_NOT_RDY	The SPC isn't ready for the next byte to be written
1'h1	DATA_IS_RDY	The SPC is read for the next byte to be written

Table 1-98. Bit field encoding: INSTR\_IDLE\_ENUM

Value	Name	Description
1'h0	INSTR_IS_NOT_IDLE	SPC is currently executing an SPC instruction.
1'h1	INSTR_IS_IDLE	SPC is idle and not busy executing an instruction.

Table 1-99. Bit field encoding: SPC\_SR\_STATUS\_CODE\_ENUM

Value	Name	Description
6'h0	SPC_SR_OPERATION_SUCCESS	Operation Successful
6'h1	SPC_SR_INVALID_ARR_AY_ID	Invalid Array ID for given command
6'h2	SPC_SR_INVALID_2_BYTE_KEY	Invalid 2-byte key
6'h3	SPC_SR_ADDR_ARRAY_IS_ASLEEP	Addressed Array is Asleep
6'h4	SPC_SR_EXTERNAL_ACCESS_FAILURE	External Access Failure (SPC is not in external access mode)

(continued)

Table 1-99. Bit field encoding: SPC\_SR\_STATUS\_CODE\_ENUM

6'h5	SPC_SR_INVALID_N_V	Invalid N Value for given command
	ALUE	
6'h6	SPC_SR_TEST_MODE	Test Mode Failure (SPC is not in test mode)
	_FAILURE	
6'h7	SPC_SR_SMART_WRIT	Smart Write Algorithm Checksum Failure
	E_ALGO_CHKSUM	
6'h8	SPC_SR_SMART_WRIT	Smart Write Parameter Checksum Failure
	E_PARAM_CHKSUM	
6'h9	SPC_SR_PROTECTION	Protection Check Failure: protection settings are in a state which prevents the given
	_CHK_FAILURE	command from executing
6'hA	SPC_SR_INVALID_ADD	Invalid Address parameter for the given command
	R_PARAM	
6'hB	SPC_SR_INVALID_CM	Invalid Command Code
	D_CODE	
6'hC	SPC_SR_INVALID_RO	Invalid Row ID parameter for given command
	W_ID	
6'hD	SPC_SR_INVALID_INP	Invalid input value for Get Temp & Get ADC commands
	UT_GET_TEMP_ADC	
6'hE	SPC_SR_TMP_SENDO	Tempsensor Vbe is currently driven to an external device
	R_VBR_DRIVEN_EXT_	
	DEV	
6'hF	SPC_SR_INVALID_SPC	Invalid SPC state (M8G's PC value out of range. Manual SPC Reset required)
	_STATE	
6'h10	SPC_SR_START_RAN	START RANGE: Smart Write return codes (only when using Smart Write algorithm)
	GE_SMART_WRITE	SWU-016.1 for exact definitions
6'h3F	SPC_SR_END_RANGE	END RANGE: Smart Write return codes (only when using Smart Write algorithm) SWU-
	_SMART_WRITE	016.1 for exact definitions
6'h20	SPC_SR_PEP_PROGR	PEP Program Failure (only when using PEP algorithm): Data Verification Failure (row
	AM_FAILURE	latch checksum != programmed row checksum)

## 1.3.171 SPC\_CR

### SPC Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SPC\_CR: 0x4723

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:0	NA:0	NA:0	R/W:0
HW Access	NA				R/W	NA	NA	R/W
Retention	NA				RET	NA	NA	RET
Name	RSVD				SPC_CTRL	RSVD	RSVD	SPC_Manual_Reset

This register contains control bits for the SPC. This register is reset upon assertion of the SPC\_Manual\_Reset bit.

Bits	Name	Description
3	SPC_CTRL	This is a status bit that defines which SPC data register (SPC.CPU_DATA or SPC.DMA_DATA) was or is currently being used to send a command to the SPC. When one of the two data registers has the first byte of the SPC 2-byte command key written to it, that register now has temporary control of the SPC. Upon this register write, this bit is set accordingly. All subsequent register writes to the other data register are ignored until the command completes.
0	SPC_Manual_Reset	Setting this bit manually resets the SPC. The SPC hardware automatically clears the bit after being held high for 2 cycles of the AHB Bus Clock.

[See Table 1-101.](#)

Table 1-100. Bit field encoding: SPC\_BUSFREQ\_ENUM

Value	Name	Description
1'h0	SPC_BUSFREQ_LOW	Tells the SPC that the Bus Clock Frequency is: 50 < Frequency <= 100.
1'h1	SPC_BUSFREQ_HIGH	Tells the SPC that the Bus Clock Frequency is: Frequency <= 50.

Table 1-101. Bit field encoding: SPC\_RESET\_ENUM

Value	Name	Description
1'h0	SPC_RST_LOW	SPC is in normal execution mode.
1'h1	SPC_RST_HIGH	SPC is in a reset state.

### 1.3.172 SPC\_DMM\_MAP\_SRAM[0..127]

#### SPC Direct Memory Mapping

**Reset:** N/A

Register : Address

SPC\_DMM\_MAP\_SRAM: 0x4780-0x47FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	spcsramdata							

Maps one of 5 possible 128-byte pages from the 128-Data Store SRAM or 512-byte Code Store SRAM

Bits	Name	Description
7:0	spcsramdata[7:0]	(no description)

## 1.3.173 CACHE\_CR

### Cache Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CACHE\_CR: 0x4800

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:11		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R		R	R	R/W	R/W	R/W	R
Retention	RET		RET	RET	RET	RET	RET	RET
Name	FLASH_CYCLES		BFILL_EN	CACHE_EN	UNLOCK	CACHE_INV	PHUB_INV	SRAM_EN

CACHE\_CR is used to configure the behavior of the cache

Bits	Name	Description
7:6	FLASH_CYCLES[1:0]	Specifies the number of clock cycles the cache will wait before it samples data coming back from Flash. 0x1: 1 cycle. -> 0-22 MHz 0x2: 2 cycles. -> >22-44 MHz 0x3: 3 cycles. -> >44-67 MHz 0x0: 4 cycles. -> RESERVED / Extra Margin (not expected to be used) If EN_CPU=0 then 'cycles' is in terms of bus clock cycles and MHz refers to bus clock frequency. If EN_CPU=1 then 'cycles' is in terms of cpu clock cycles and MHz refers to cpu clock frequency. See PM.ACT/ST-BY.CFG0.1 for an explanation of EN_CPU. If the cpu clock frequency is not equal to the bus clock frequency, then it's imperative to adjust FLASH_CYCLES when changing EN_CPU.
5	BFILL_EN	0x0: Disables background fill mechanism; allows for some minor power savings 0x1: Enables background fill mechanism to improve CPU performance; requires CACHE_EN=1 and SRAM_EN=1 otherwise this bit is ignored and background fill is disabled
4	CACHE_EN	0x0: Disables HW ability to write data coming from the flash to the cache SRAM. 0x1: Enables HW ability to write data coming from the flash to the cache SRAM.
3	UNLOCK	This is a 'virtual flop' that clears immediately. Reading this bit will always return 0. 0x1: Writing 1 will cause all lock bits in the tags and itself to be cleared the following cycle.
2	CACHE_INV	This is a 'virtual flop' that clears immediately. Reading this bit will always return 0. 0x1: Writing 1 will cause all valid bits in the tags, the valid bit for the 8 byte CPU interface and itself to be cleared the following cycle.
1	PHUB_INV	This is a 'virtual flop' that clears immediately. Reading this bit will always return 0. 0x1: Writing 1 will cause the valid bit for the 8 byte PHUB interface read buffer and itself to be cleared the following cycle.
0	SRAM_EN	This bit enables the use of SRAM memory. If bit is 0, SRAM clock is gated. This SRAM clock is also used for the tag registers. Gating this clock will prevent the tag registers from being written.

## 1.3.174 CACHE\_LP\_MODE

### LP\_MODE Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CACHE\_LP\_MODE: 0x4801

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:11111111							
HW Access	R/W							
Retention	RET							
Name	LP_MODE							

CACHE\_LP\_MODE is used to configure the FLASH Low Power Mode feature

Bits	Name	Description
7:0	LP_MODE[7:0]	0x0 - 0xfe: Specifies the number of cache hits after which the cache controller will assert SLEEP_REQ. 0xff: Low Power Mode disabled.; this register is on segment 1 and must be unlocked before writing is allowed

## 1.3.175 CACHE\_SR

### Cache Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_SR: 0x4808

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R:0	NA:0
HW Access	NA						R/W	NA
Retention	NA						NONRET	NA
Name	RSVD						FLUSH_DONE	RSVD

CACHE\_SR contains the Cache status

Bits	Name	Description
1	FLUSH_DONE	0x0: Flush was not performed since the last assertion of reset, or since CACHE.CR.CACHE_EN got set. 0x1: Flush is done. This bit clears automatically when : 1. a new Flush sequence has started; test_mode signal goes from 0 to 1. 2. CACHE.CR.CACHE_EN bit is set.

## 1.3.176 CACHE\_TAG\_SR

### Tag Status Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CACHE\_TAG\_SR: 0x4810

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TAG_VALID							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TAG_LOCK							

This is a virtual register that is a collection of the individual valid bits of the corresponding Tag registers.

Bits	Name	Description
15:8	TAG_LOCK[7:0]	Bit vector of lock bits from the Tag registers.
7:0	TAG_VALID[7:0]	Bit vector of valid bits from the Tag registers.

### 1.3.177 CACHE\_TAG[0..7]

#### Tag Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CACHE\_TAG0: 0x4818

CACHE\_TAG1: 0x4820

CACHE\_TAG2: 0x4828

CACHE\_TAG3: 0x4830

CACHE\_TAG4: 0x4838

CACHE\_TAG5: 0x4840

CACHE\_TAG6: 0x4848

CACHE\_TAG7: 0x4850

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		NA:0000				R/W:0	R/W:0
HW Access	R/W		NA				R/W	R/W
Retention	RET		NA				RET	RET
Name	TAG_ADDR		RSVD				TAG_LOCK	TAG_VALID

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	TAG_ADDR							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	VALID_VECTOR							

Contains Cache Line Tag information. The SRAM\_EN bit must be set to write these registers in User Mode.

Bits	Name	Description
31:24	VALID_VECTOR[7:0]	Each bit corresponds to a word within the cache line. Each cache line has 8, 64-bit words. 0x0: Corresponding word is invalid. The fill state machine should attempt to fill this word if the tag is valid. 0x1: This word is valid and can be used to satisfy the cpu with a hit.
15:6	TAG_ADDR[9:0]	Tag address bits [15:6] of the requested instruction fetch.
1	TAG_LOCK	0x0: The line is not locked and may be evicted by the replacement algorithm to make room for a new line. 0x1: The line is locked into the cache and cannot be chosen for eviction.

(continued)

0	TAG_VALID	0x0: The line is invalid. All valid bits for the words within the line should be invalid as well. 0x1: The line is valid. The instruction fetch will get a hit if the corresponding word is valid as well.
---	-----------	--

## 1.3.178 CACHE\_INT\_MSK

### Cache controller Interrupt Mask

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_MSK: 0x4858

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		NONRET					
Name	RSVD		VECTOR_MASK					

#### Interrupt Mask Register

Bits	Name	Description
5:0	VECTOR_MASK[5:0]	Bit vector of mask bits applied to corresponding interrupt

## 1.3.179 CACHE\_INT\_SR

### Cache controller Interrupt Status

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_SR: 0x4860

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R:000000					
HW Access	NA		R/W					
Retention	NA		NONRET					
Name	RSVD		VECTOR_VALID					

Interrupt Status Register

Bits	Name	Description
5:0	VECTOR_VALID[5:0]	Bit vector of valid bits from Interrupt_log registers

## 1.3.180 CACHE\_INT\_LOG0

### Interrupt Log 0

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_LOG0: 0x4868

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:000			RC:0
HW Access	NA				R/W			R/W
Retention	NA				NONRET			NONRET
Name	RSVD				INT_LINE			INT_VALID

#### ISR Loading Violation Interrupt

Bits	Name	Description
3:1	INT_LINE[2:0]	Cache Line number where the ISR loading violation occurred.
0	INT_VALID	0x0: Interrupt log is invalid. 0x1: Interrupt log is valid. Log will be frozen until read

## 1.3.181 CACHE\_INT\_LOG1

### Interrupt Log 1

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_LOG1: 0x4870

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:000			RC:0
HW Access	NA				R/W			R/W
Retention	NA				NONRET			NONRET
Name	RSVD				INT_LINE			INT_VALID

#### Coherency Violation Interrupt

Bits	Name	Description
3:1	INT_LINE[2:0]	Cache Line number where the Coherency violation occurred.
0	INT_VALID	0x0: Interrupt log is invalid. 0x1: Interrupt log is valid. Log will be frozen until read

## 1.3.182 CACHE\_INT\_LOG2

### Interrupt Log 2

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_LOG2: 0x4878

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00		NA:00000					RC:0
HW Access	R/W		NA					R/W
Retention	NONRET		NA					NONRET
Name	TAG_ADDR		RSVD					INT_VALID

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	TAG_ADDR							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00		R:000			R:000		
HW Access	NA		R/W			R/W		
Retention	NA		NONRET			NONRET		
Name	RSVD		TAG_LINE2			TAG_LINE1		

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

#### Duplicate Tag Violation Interrupt

Bits	Name	Description
21:19	TAG_LINE2[2:0]	Line number of the second tag that matched
18:16	TAG_LINE1[2:0]	Line number of the first tag that matched
15:6	TAG_ADDR[9:0]	Tag address that produced the multiple hits
0	INT_VALID	0x0: Interrupt log is invalid. 0x1: Interrupt log is valid. Log will be frozen until read

### 1.3.183 CACHE\_INT\_LOG3

#### Interrupt Log 3

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_LOG3: 0x4880

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000					NA:00		RC:0
HW Access	R/W					NA		R/W
Retention	NONRET					NA		NONRET
Name	FLASH_ADDR					RSVD		INT_VALID

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	FLASH_ADDR							

ECC-Single Bit error detected and corrected

Bits	Name	Description
15:3	FLASH_ADDR[12:0]	Flash address where error was detected and corrected
0	INT_VALID	0x0: Interrupt log is invalid. 0x1: Interrupt log is valid. Log will be frozen until read

## 1.3.184 CACHE\_INT\_LOG4

### Interrupt Log 4

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_LOG4: 0x4888

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000					NA:00		RC:0
HW Access	R/W					NA		R/W
Retention	NONRET					NA		NONRET
Name	FLASH_ADDR					RSVD		INT_VALID

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	FLASH_ADDR							

ECC-Multiple Bit error detected--uncorrectable

Bits	Name	Description
15:3	FLASH_ADDR[12:0]	Flash address where error was detected; error cannot be corrected
0	INT_VALID	0x0: Interrupt log is invalid. 0x1: Interrupt log is valid. Log will be frozen until read

## 1.3.185 CACHE\_INT\_LOG5

### Interrupt Log 5

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CACHE\_INT\_LOG5: 0x4890

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000					NA:00		RC:0
HW Access	R/W					NA		R/W
Retention	NONRET					NA		NONRET
Name	FLASH_ADDR					RSVD		INT_VALID

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	FLASH_ADDR							

Attempted write to Flash error

Bits	Name	Description
15:3	FLASH_ADDR[12:0]	Flash address where write was attempted
0	INT_VALID	0x0: Interrupt log is invalid. 0x1: Interrupt log is valid. Log will be frozen until read

## 1.3.186 I2C\_XCFG

### I2C Extended Configuration Register

**Reset:** Reset Signals Listed Below

Register : Address

I2C\_XCFG: 0x49C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R:0	R/W:0	NA:000			R/W:0
HW Access	R	R	R/W	R/W	NA			R
Retention	NONRET	NONRET	RET	RET	NA			NONRET
Name	csr_clk_en	i2c_on	ready_to_sleep	force_nack	RSVD			hw_addr_en

This register configures enhanced features. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Always write reserved bits with a value of '0'.

Bits	Name	Description
7	csr_clk_en	This bit is used for gating system clock for the blocks core logic that is not associated with AHB interface. Clock is made available to the core logic only when this bit is set to 1 and the input pin ext_clk_en is also active. If either of them is not active, the blocks core logic does not receive the system clock.  <a href="#">See Table 1-102.</a>
6	i2c_on	This bit should be set by the user during initial block configuration if the user wants to use the I2C block as wake-up source. Only when this bit set along with other bits mentioned in the sleep mode section, the I2C wakes up system from sleep on address match.
5	ready_to_sleep	Once the user sets the force_nack bit, the I2C block sets this bit if I2C is not busy or it waits for ongoing transaction to be completed and then sets this bit. As long as this bit is set, the I2C block is going to nack all the transactions. Clearing force_nack bit automatically clears this bit. HW clears this bit automatically on assertion of PD (Power Down)
4	force_nack	This bit must be set by the user before putting the device to sleep and wait for ready_to_sleep status bit to be set. This can be cleared by user by writing '0' and the HW clears it automatically on assertion of PD(Power Down)
0	hw_addr_en	When hw_addr_en = 1, on addr match: interrupt is generated, CSR[3] bit is set, clk is stalled, device will ACK automatically; When hw_addr_en = 1, on addr mismatch: no interrupt is generated, CSR[3] bit is set, clk not stalled, device will NACK automatically; You must configure the compare address in the ADR register; When hw_addr_en = 0, on addr match: interrupt is generated, CSR[3] bit is set, clk is stalled; When hw_addr_en = 0, on addr mismatch: interrupt is generated, CSR[3] bit is set, clk is stalled; and the received address is available in the Data register, to enable the CPU to do a firmware address compare; The functionality of this bit is independent of the data buffering mode  <a href="#">See Table 1-103.</a>

### Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	force_nack, ready_to_sleep
Domain reset for non-retention flops [reset_all_nonretention]	hw_addr_en, i2c_on, csr_clk_en

(continued)

Table 1-102. Bit field encoding: csr\_clk\_en\_enum

Value	Name	Description
1'b1	CSR_CLK_EN	CLK gating for block core logic is enabled
1'b0	CSR_CLK_DIS	CLK gating for block core logic is disabled

Table 1-103. Bit field encoding: hw\_addr\_en\_enum

Value	Name	Description
1'b1	HW_ADDR_EN	HW Address comparison is enabled
1'b0	HW_ADDR_DIS	HW Address comparison is disabled

## 1.3.187 I2C\_ADR

### I2C Slave Address Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

I2C\_ADR: 0x49CA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0000000						
HW Access	NA	R						
Retention	NA	NONRET						
Name	RSVD	slave_address						

This register holds the slave's 7-bit address. When hardware address compare mode is not enabled in the XCFG register, this register is not in use. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Always write reserved bits with a value of '0'.

Bits	Name	Description
6:0	slave_address[6:0]	These seven bits hold the slave's own device address. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

## 1.3.188 I2C\_CFG

### I2C Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

I2C\_CFG: 0x49D6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	NA:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	NA	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NA	NONRET	NONRET	NONRET
Name	sio_select	pselect	bus_error_ie	stop_ie	RSVD	clock_rate	en_mstr	en_slave

This register is used to set the basic operating modes, baud rate, and interrupt selection. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Always write reserved bits with a value of '0'.

Bits	Name	Description
7	sio_select	I2C Pin Select for SCL/SDA lines from SIO1/SIO2, 0 = SCL and SDA lines get their inputs from SIO1 module.sclk_str1 and sda_ack1 are driven to SIO1 module and they get asserted once device wakes up from sleep. 1 = SCL and SDA lines get their inputs from SIO2 module. sclk_str2 and sda_ack2 are driven to SIO2 module and they get asserted once device wakes up from sleep. This bit is valid only when I2C.CFG[6] is asserted. <a href="#">See Table 1-109.</a>
6	pselect	I2C Pin Select for SCL/SDA lines from GPIO/SIO, 0 = SCL and SDA lines get their inputs from GPIO module.sclk_str0 and sda_ack0 are driven to GPIO module and they get asserted once device wakes up from sleep. 1 = SCL and SDA lines get their inputs from one of the SIO Blocks that is chosen based on the configuration of bit I2C.CFG[7] <a href="#">See Table 1-108.</a>
5	bus_error_ie	Bus Error Interrupt Enable 0 disabled 1 enabled. An interrupt is generated on the detection of a Bus error condition. <a href="#">See Table 1-104.</a>
4	stop_ie	Stop Interrupt Enable 0 disabled 1 enabled. An interrupt is generated on the detection of a Stop condition. <a href="#">See Table 1-110.</a>
2	clock_rate	0 Samples/bit is 16, 1 Samples/bit is 32 <a href="#">See Table 1-105.</a>
1	en_mstr	0 Disabled 1 enabled <a href="#">See Table 1-106.</a>
0	en_slave	0 Disabled 1 enabled <a href="#">See Table 1-107.</a>

Table 1-104. Bit field encoding: bus\_error\_ie\_enum

Value	Name	Description
-------	------	-------------

(continued)

Table 1-104. Bit field encoding: bus\_error\_ie\_enum

1'b1	BUS_ERROR_IE_EN	Bus Error Interrupt is enabled
1'b0	BUS_ERROR_IE_DIS	Bus Error Interrupt is disabled

Table 1-105. Bit field encoding: clock\_rate\_enum

Value	Name	Description
1'b0	RATE_1	Samples/bit is 16. For 100K Standard mode OR 400K Fast mode.
1'b1	RATE_2	Samples/bit is 32. For 50K Standard mode.

Table 1-106. Bit field encoding: en\_mstr\_enum

Value	Name	Description
1'b1	MASTER_EN	Master mode is enabled for the device
1'b0	MASTER_DIS	Master mode is disabled for the device

Table 1-107. Bit field encoding: en\_slave\_enum

Value	Name	Description
1'b1	SLAVE_EN	Slave mode is enabled for the device
1'b0	SLAVE_DIS	Slave mode is disabled for the device

Table 1-108. Bit field encoding: pselect\_enum

Value	Name	Description
1'b1	PSELECT_EN	SCL/SDA lines get their inputs from SIO blocks
1'b0	PSELECT_DIS	SCL/SDA lines get their inputs from GPIO blocks

Table 1-109. Bit field encoding: sio\_select\_enum

Value	Name	Description
1'b1	SIO_SELECT_EN	SCL/SDA lines get their inputs from SIO2 block
1'b0	SIO_SELECT_DIS	SCL/SDA lines get their inputs from SIO1 block

Table 1-110. Bit field encoding: stop\_ie\_enum

Value	Name	Description
1'b1	STOP_IE_EN	Stop Interrupt is enabled
1'b0	STOP_IE_DIS	Stop Interrupt is disabled

## 1.3.189 I2C\_CSR

### I2C Control and Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

I2C\_CSR: 0x49D7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WZC:0	R/W:0	R/WZC:0	R/W:0	R/WZC:0	R/W:0	R/WZC:0	R/WZC:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	bus_error	lost_arb	stop_status	ack	address	transmit	lrb	byte_complete

This register is used by the slave to control the flow of data bytes and to keep track of the bus state during a transfer. Bits in this register are held in reset until one of the enable bits in CFG is set. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
7	bus_error	0 Status bit. It must be cleared by firmware by writing a '0' to the bit position. It is never cleared by the hardware. 1 a misplaced Start or Stop condition was detected. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
6	lost_arb	0 This bit is set immediately on lost arbitration; however, it does not cause an interrupt. This status may be checked after the following Byte Complete interrupt. Any Start detect or a write to the Start or Restart generate bits (MCSR register), when operating in Master mode, will also clear the bit. 1 lost Arbitration. This bit is held zero if I2C_CFG.en_mstr is zero.
5	stop_status	0 Status bit. It must be cleared by firmware with write of '0' to the bit position. It is never cleared by the hardware. 1 a Stop condition was detected. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
4	ack	Acknowledge Out. Bit is automatically cleared by hardware on a Byte Complete event. 0 nack the last received byte. 1 ack the last received byte
3	address	0 Status bit. It must be cleared by firmware with write of '0' to the bit position. 1 the received byte is a slave address. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
2	transmit	Bit is set by firmware to define the direction of the byte transfer. Any Start detect will clear the bit. 0 receive mode 1 transmit mode. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
		<a href="#">See Table 1-111.</a>
1	lrb	Last Received Bit. The value of the 9th bit in a Transmit sequence, which is the acknowledge bit from the receiver. Any Start detect or a write to the Start or Restart generate bits, when operating in Master mode, will also clear the bit. 0 last transmitted byte was ACK'ed by the receiver. 1 last transmitted byte was NACK'ed by the receiver. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

(continued)

0	byte_complete	Transmit/Receive Mode: 0 no completed transmit/receive since last cleared by firmware. Any Start detect or a write to the start or Restart generate bits, when operating in Master mode, will also clear the bit. Transmit mode: 1 eight bits of data have been transmitted and an ACK or NACK has been received. Receive mode: 1 eight bits of data have been received. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
---	---------------	---

Table 1-111. Bit field encoding: transmit\_enum

Value	Name	Description
1'b1	TRANSMIT_EN	Bytes are transferred from the device
1'b0	TRANSMIT_DIS	Bytes are received from the device

## 1.3.190 I2C\_D

### I2C Data Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

I2C\_D: 0x49D8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	data							

This register provides read/write access to the Shift register. This register is read only for received data and write only for transmitted data.

Bits	Name	Description
7:0	data[7:0]	Read received data or write data to transmit. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

### 1.3.191 I2C\_MCSR

#### I2C Master Control and Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

I2C\_MCSR: 0x49D9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R:0	R:0	R/W:0	R/W:0
HW Access	NA			R/W	R/W	R/W	R/W	R/W
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			stop_gen	bus_busy	master_mode	restart_gen	start_gen

This register implements I2C framing controls and provides Bus Busy status. Bits in this register are held in reset until one of the enable bits in CFG is set. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
4	stop_gen	This bit is set only for master transmitter and used at the end of byte transfer. After byte complete status is set, if this bit is set followed by the Transmit bit in I2C.CSR register, Stop condition is generated after byte complete. This bit is automatically reset to 0 after the Stop, start or Restart has been generated. During data phase, if Stop Gen bit is set to 0, clearing the Transmit bit in I2C.CSR register will also generate a Stop condition. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
3	bus_busy	This bit is set to the following. 0 when a Stop condition is detected (from any bus master). 1 when a Start condition is detected (from any bus master). This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
2	master_mode	This bit is set/cleared by hardware when the device is operating as a master. 0 stop condition detected, generated by this device. 1 start condition detected, generated by this device. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
1	restart_gen	This bit is cleared by hardware when the Restart generation is complete. 0 restart generation complete. 1 generate a Restart condition. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
0	start_gen	This bit is cleared by hardware when the Start generation is complete. 0 start generation complete. 1 generate a Start condition and send a byte (address) to the I2C bus, if bus is not busy. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

### 1.3.192 I2C\_CLK\_DIV1

#### I2C Clock Divide Factor Register-1

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

I2C\_CLK\_DIV1: 0x49DB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	divide_factor_1							

This register has the 8 LSB bits of the 10-bit Clock Divider.

Bits	Name	Description
7:0	divide_factor_1[7:0]	The configuration of this register along with that in register CLK_DIV2 defines the factor by which the SYSCLK will be divided in the I2C block. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

### 1.3.193 I2C\_CLK\_DIV2

#### I2C Clock Divide Factor Register-2

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

I2C\_CLK\_DIV2: 0x49DC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						NONRET	
Name	RSVD						divide_factor_2	

This register has the 2 MSB bits of the 10-bit Clock Divider.

Bits	Name	Description
1:0	divide_factor_2[1:0]	The configuration of this register along with that in register CLK_DIV1 defines the factor by which the SYSCLK will be divided in the I2C block. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

## 1.3.194 DEC\_CR

### Decimator Control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DEC\_CR: 0x4E00

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:00		R/W:0	R/W:0
HW Access	R	R	R	R	R		R	R/W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET		NONRET	NONRET
Name	sat_en	fir_en	ocor_en	gcor_en	conv_mode		xstart_en	start_conv

This register provides information about start, stop, mode, and feature enables. A read of this register produces the last value written to this register with the exception of bit 0. If a 1 is read from bit 0 and conv\_mode doesn't = 00 this indicates the filter is running. If a 0 is read and conv\_mode doesn't = 00 the block is in the standby state. If conv\_mode = 00 bit 0 has no meaning and could be 1 or 0.

Bits	Name	Description
7	sat_en	Controls saturation logic in the Post Processing filter. When enabled, the resulting outputs of the Post Processing filter are held to the most positive or negative values, rather than wrapping around. Conversion results are unpredictable if this bit is changed while the Post Processing filter is running. This bit is ignored if FIR_EN, OCOR_EN and GCOR_EN are all 0. This feature is used to prevent wrap-around if the Decimator is mis-configured when using the Post Processor. NOTE: This is different from the Overflow Correction described in DR2H. <a href="#">See Table 1-116.</a>
6	fir_en	Controls whether or not Post Processing filter implements a FIR filter. If this bit is set it enables the Post Processing filter. Conversion results are unpredictable if this bit is changed while the filter is running. The decimation period of this filter is controlled by the DR2 bits in register DR2 and DR2H. <a href="#">See Table 1-113.</a>
5	ocor_en	This bit controls the offset correction feature of the Post Processing filter. If this bit is set it enables the Post Processing filter. The offset value is programmed in the OCOR bits of registers OCOR, OCORM and OCORH. Conversion results are unpredictable if this bit is changed while the filter is running. <a href="#">See Table 1-115.</a>
4	gcor_en	This bit controls the gain correction feature of the Post Processing filter. If this bit is set it enables the Post Processing filter. The gain coefficient is programmed in the GCOR bits of registers GCOR and GCORH. Which bits in this 16-bit field that are valid is set in GVAL. Conversion results are unpredictable if this bit is changed while the filter is running. When this feature is enabled, the DR1 register field must be set to a value higher than 32 (worst case) for proper operation. See the DR1 register definition of cases where values less than 32 are allowed. <a href="#">See Table 1-114.</a>

(continued)

3:2	conv_mode[1:0]	The value in these two bits controls the sampling mode the Decimator runs in. Single Sample mode resets all values in the ADC path, captures one sample (4 decimation cycles) and returns to the Standby state. Fast Filter mode is a continuous running Single Sample mode - the ADC path being reset between each sample. Continuous mode resets the ADC path, generates a sample and then without resetting the ADC path, generates a new sample every decimation cycle thereafter. Fast FIR mode is the same as the Continuous mode except it resets the ADC channel and starts again at the termination of the DR2 (FIR Filter) period. If Fast FIR mode is selected and FIR Enable is not set in bit 6, Fast FIR and Continuous mode function the same. Conversion results are unpredictable if these bits are changed while the filter is running.  <a href="#">See Table 1-112.</a>
1	xstart_en	Controls whether DSI signal ext_start is active. If XSTART_EN is high, it allows the ext_start input to start a conversion just as START_CONV does. Regardless of the state of this bit, writing to START_CONV will start a conversion.  <a href="#">See Table 1-118.</a>
0	start_conv	A write of 1 to this bit starts a conversion (regardless of the state of XSTART_EN) according to the CONV_MODE set in bits 2, 3. If read, a 1 indicates the filter is running when not in Single Sample mode. If a 0 is read the block is in the standby state when not in Single Sample mode. When in Single Sample more this bit is cleared shortly after it is written and does not reflect the running state of the Decimator. If the Decimator is running in Single Sample Mode and this bit is written with a 1 the conversion start is queued, and will start then the previous one completes. If a 1 is read from this bit when in Single Sample Mode it indicates a conversion start is queued. Note that the other bits of this CSR are not queued so queued SS Mode starts must set the same bits in this register as the conversion running. If 0 is written to this bit, it forces the block into the Standby start via a soft-reset. This soft-reset works in any mode and at any time and takes a minimum of 1 and maximum of 2 adc_clk cycles to complete. If a 1 is written before the soft-reset has completed, the start is queued and the conversion will start when the soft-reset is complete.  <a href="#">See Table 1-117.</a>

Table 1-112. Bit field encoding: conv\_modes\_enum

Value	Name	Description
2'b00	SINGLE_SAMPLE	Single Sample Mode.
2'b01	FAST_FILTER	Fast Filter Mode.
2'b10	CONTINUOUS	Continuous Mode.
2'b11	FAST_FIR	Fast FIR.

Table 1-113. Bit field encoding: fir\_en\_enum

Value	Name	Description
1'b1	FIR_EN	FIR filter function is on.
1'b0	FIR_DIS	FIR filter function disabled.

Table 1-114. Bit field encoding: gcor\_en\_enum

Value	Name	Description
1'b1	GCOR_EN	Gain correction enabled.
1'b0	GCOR_DIS	Default: no gain correction.

Table 1-115. Bit field encoding: ocor\_en\_enum

Value	Name	Description
1'b1	OCOR_EN	Offset correction enabled.
1'b0	OCOR_DIS	No offset correction.

Table 1-116. Bit field encoding: sat\_en\_enum

Value	Name	Description
1'b1	SAT_EN	Saturation Control Enabled.
1'b0	SAT_DIS	No saturation control.

(continued)

Table 1-117. Bit field encoding: start\_conv\_enum

Value	Name	Description
1'b1	DEC_START	Initiate a conversion.
1'b0	DEC_STOP	Kill current conversion (if running) and enter Standby state (SW reset).

Table 1-118. Bit field encoding: xstart\_en\_enum

Value	Name	Description
1'b1	XSTART_EN	Enable the DSI input signal ext_start to start a conversion.
1'b0	XSTART_DIS	Default: DSI signal ext_start is disabled.

### 1.3.195 DEC\_SR

#### Decimator Status Register

**Reset:** Reset Signals Listed Below

Register : Address

DEC\_SR: 0x4E01

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	W:0	R/W:0	R:0
HW Access	NA		R	R	R	R	R	R/W
Retention	NA		RET	RET	RET	NONRET	RET	NONRET
Name	RSVD		coreclk_disable	intr_pulse	out_align	intr_clr	intr_mask	conv_done

This register provides information about interrupt, polling, status, and control features.

Bits	Name	Description
5	coreclk_disable	<p>This bit when set high disables (gates off) the clock to the entire core of the block (adc_clk). This includes all FFs except those used for the AHB interface and CSRs. When disabled (set high) the AHB interface to the CSR is still fully functional. This bit is ANDed with the primary input signal cic_clk_en to control the clock gate. cic_clk_en must be high and CoreCLK_Disable must be low for the clock to run.</p> <p><a href="#">See Table 1-120.</a></p>
4	intr_pulse	<p>This read/write bit selects if cic_intr is pulse or level sensed. If level, a sample completion sets cic_intr high where it remains until bit 2 is written, a soft-reset if performed or if OUTSAMP/M/H is read. If pulse, a single cycle (pclk) strobe is generated on cic_intr to be used as an edge sensed interrupt or a DMAREQ. Regardless of which is selected, the interrupt output is still subject to masking by bit 1.</p> <p><a href="#">See Table 1-123.</a></p>
3	out_align	<p>This bit when set high causes a read of OUTSAMP to produce the contents of OUTSAMP and OUTSAMP to produce the contents of OUTSAMP. Effectively, this is an 8-bit right shift of the result. Note that the setting of this bit does not alter the content of the OUTSAMP registers. Setting this bit simply realigns the byte lanes when the register is read. If this bit is set low, the OUTSAMP registers are read normally. This feature is added to allow the SW to read 9 to 16 bit samples from the Decimator in one cycle on bits 15:0. Note also that when using Coherency checking in conjunction with this alignment feature that the Key Coherency Byte selected in the COHER register is referenced based on the address of the register being read, not the content delivered on the bus. This means that if this bit is set high with the intent to read sample data 23:8 on 15:0 that they Key Coherency Byte should be set to either OUTSAMP or OUTSAMP, not OUTSAMP.</p> <p><a href="#">See Table 1-124.</a></p>
2	intr_clr	<p>INTR_CLR is a write-only bit that clears bit0 and cic_intr. A read always produces a 0.</p> <p><a href="#">See Table 1-121.</a></p>
1	intr_mask	<p>INTR_MASK is a RD/WR bit that controls the generation of the conversion completion interrupt. A read produces that last value written to this bit. This bit functions as a mask regardless of the value of bit 4 (INTR PULSE).</p> <p><a href="#">See Table 1-122.</a></p>

(continued)

0	conv_done	CONV_DONE is a read-only bit indicating that the most recently started conversion has completed if it has been cleared since the last sample read. This same bit is the interrupt signal cic_intr when bit 4 is low, if not masked by bit 1. This bit is intended to provide a polling mechanism should this be preferred to receiving interrupts. It is cleared by writing a 1 to bit 2, a soft-reset or a read of register OUTSAMP, OUTSAMP or OUTSAMP (regardless of Coherency settings).
---	-----------	--

[See Table 1-119.](#)

## Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	intr_mask, out_align, intr_pulse, coreclk_disable
Domain reset for non-retention flops [reset_all_nonretention]	conv_done, intr_clr

Table 1-119. Bit field encoding: conv\_done\_enum

Value	Name	Description
1'b1	CONV_COMP	Most recently started conversion completed.
1'b0	CONV_NOTCOMP	Conversion not completed since last clear.

Table 1-120. Bit field encoding: coreclk\_disable\_enum

Value	Name	Description
1'b1	CORECLK_DISABLE_HI	Core Clock is Disabled
1'b0	CORECLK_DISABLE_L	Core Clock is Enabled
	OW	

Table 1-121. Bit field encoding: intr\_clr\_enum

Value	Name	Description
1'b1	INTR_CLEAR	Clears CONV_DONE and the interrupt on cic_intr (if enabled).
1'b0	INTR_NOP	No affect.

Table 1-122. Bit field encoding: intr\_mask\_enum

Value	Name	Description
1'b1	INTR_MASKED	Masks the interrupt generation on cic_intr.
1'b0	INTR_ENABLED	Allows CONV_DONE to generate an interrupt.

Table 1-123. Bit field encoding: intr\_pulse\_enum

Value	Name	Description
1'b1	INTR_PULSE	Selects a pulse interrupt on cic_intr.
1'b0	INTR_LEVEL	Selects a level interrupt on cic_intr.

Table 1-124. Bit field encoding: out\_align\_enum

Value	Name	Description
1'b1	OUT_ALIGN_HIGH	Shifts SAMP registers right by 8-bits
1'b0	OUT_ALIGN_LOW	No affect on SAMP Registers

## 1.3.196 DEC\_SHIFT1

### Decimator Shifter 1 (Input)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_SHIFT1: 0x4E02

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:00000				
HW Access	NA			R				
Retention	NA			RET				
Name	RSVD			shift1				

This register provides control information to the input (left) shifter. SHIFT1 is a 5-bit field that sets the amount of left shift that the Modulator input will be shifted. Disturbing this field during a conversion will disturb the output value. This register should only be updated while the CIC filter is in the Standby state. Conversion results are unpredictable if these bits are changed while the filter is running. Not all values from 0 to 31 make computational sense. A read of this register produces the last value written to this register.

Bits	Name	Description
4:0	shift1[4:0]	Value for left shift amount of modulator input data. 0 = no shift, 1 = left shift by 1 bit, .... up to the max supported 31.

## 1.3.197 DEC\_SHIFT2

### Decimator Shifter 2 (Output)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_SHIFT2: 0x4E03

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				shift2			

This register provides control of the post CIC (output) shifter. This shifter sits at the input of the Post Processor and is only functional on the CIC output sample when the Post Processor is in use. SHIFT2 is a 4-bit field that sets the amount of right shift on the output of the CIC filter as it enters the Post Processor. Changing this field during a conversion will disrupt the output value. Conversion results are unpredictable if these bits are changed while the filter is running. Shift2 shifts right by the amount held in this register. Not all values from 0 to 15 make computational sense. A read of this register produces the last value written to this register.

Bits	Name	Description
3:0	shift2[3:0]	Value for the amount of right shift for the output of the CIC filter prior to entering the Post Processor. Functional values range from 0 to 15, 0 = no shift.

### 1.3.198 DEC\_DR2

#### Decimator Decimation Rate (2)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_DR2: 0x4E04

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dr2_low							

This register provides information to the Post Processor about the decimation rate of the FIR filter. This is a 10-bit field that sets the decimation ratio in the Post Processing filter. The upper 2 bits are found in register DR2H. The decimation ratio minus 1 in binary is the number to program in this 10-bit field. Valid decimation ratios are 2 to 1024. Changing this field during a conversion will disrupt the output value. Conversion results are unpredictable if these bits are changed while the filter is running. A read of this register produces the last value written to this register.

Bits	Name	Description
7:0	dr2_low[7:0]	FIR Filter decimation ratio bits [7:0] (of [9:0]).

### 1.3.199 DEC\_DR2H

#### Decimator Decimation Rate (2) and Overflow Correction

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_DR2H: 0x4E05

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000					NA:0	R/W:00	
HW Access	R					NA	R	
Retention	RET					NA	RET	
Name	of_width					RSVD	dr2_high	

This register provides information to the Post Processor about the decimation rate of the FIR filter. This is a 10-bit field that sets the decimation ratio in the Post Processing filter. The lower 8 bits are found in register DR2. The decimation ratio minus 1 in binary is the number to program in this 10-bit field. Valid decimation ratios are 2 to 1024. The OverFlow Correction Width field is used to correct for 2's compliment overflow in output results. For n bit results the CIC filter will create a maximum number of  $+2^n$  (for positive ranges) or  $+2^{(n-1)}$  (for signed ranges) which both need (n+1) bits to represent. When read truncated to n bits this produces errors in the output range. This field allows SW to program a reference to the size of n and where the n bits are in the output register and it controls correction HW that clamps the output value to  $+2^{n-1}$  and  $+2^{(n-1)}-1$ , respectively. Changing either of the fields in this register during a conversion will disrupt the output value. Conversion results are unpredictable if this register is changed while the Decimator is running. A read of this register produces the last value written to this register.

Bits	Name	Description
7:3	of_width[4:0]	Occupying the top 5 bits of this register is the Overflow Correction Bit-Width field (it is unrelated to the DR2). This field both enables and sets the bit width of the Overflow Correction logic in the CIC core. With n = number of bits in the sample SW will read from OUTSAMP, the following formula gives the value to program into OF_WIDTH: $OF\_WIDTH = n-1+s$ (for signed ranges), $OF\_WIDTH = n+s$ (for positive ranges) -- where s = the number of bit positions the result field is left-shifted from the lsb of the OUTSAMP register. Examples: For an 8-bit result that is lsb aligned in OUTSAMP and is signed, n=8, s=0 so: $OF\_WIDTH = 8-1+0 = 7$ . For an 8-bit result that is lsb aligned in OUTSAMP and is a positive range: $OF\_WIDTH = 8+0 = 8$ . For a signed 12-bit result that is shifted into the high two bytes: $OF\_WIDTH = 12-1+8 = 19$ . Functional values of OF_WIDTH are 5 to 22 (6 to 23-bit numbers). Any other value in this field disables the Overflow Correction feature and data is not altered when passing through the Overflow Correction logic. Overflow Correction only works on positive numbers. Example: If OF_WIDTH is set to 7 (for an 8-bit signed value) and given a range of -144 to 144, the 144 will get truncated to 127 but the -144 will not get truncated.
1:0	dr2_high[1:0]	FIR Filter decimation ratio bits [9:8] (of [9:0]). See description in DR2 register

## 1.3.200 DEC\_DR1

### Decimator Decimation Rate (1) of CIC Filter

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_DR1: 0x4E06

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dr1							

DR1 is an 8-bit field that sets the decimation ratio in the CIC filter. The decimation ratio minus 1 in binary is the number to program in this register. Valid decimation ratios are any value in the range 2 to 256 (program 1-255) for all modes where the Post Processor is not in use. Note this does not mean the results will be valid. For higher levels of input data (moddat), higher DR1 values will saturate the CIC filter and give meaningless results. This is true for any of the 4 modes Single Sample, Continuous, Fast Filter or Fast FIR. Because the Post Processor needs time to perform its enabled calculations, the minimum DR1 for cases where the Post Process is enabled are greater and are a function of what Post Processing features are enabled. These restrictions also apply to SS Mode if started back-to-back or queued. Minimum DR1 values for each are given as: Offset Correction: DR1  $\geq$  4, FIR (Sync1): DR1  $\geq$  4, Both Offset and FIR: DR1  $\geq$  5, Gain Correction: DR1  $\geq$  GVAL + 5, Gain and Offset: DR1  $\geq$  GVAL + 6, Gain and FIR: DR1  $\geq$  GVAL + 6, Gain and Offset and FIR: DR1  $\geq$  GVAL + 7, (where GVAL is the 0-based value programmed into the register). Changing this field during a conversion will disrupt the output value. Conversion results are unpredictable if these bits are changed while the filter is running.

Bits	Name	Description
7:0	dr1[7:0]	CIC Filter decimation rate.

### 1.3.201 DEC\_OCOR

#### Decimator Offset Correction Coefficient (Low Byte)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_OCOR: 0x4E08

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ocor_low							

OCOR / OCORM / OCORH is a 24-bit 2's compliment signed field that is the offset correction value used if the Post Processor Offset feature is enabled. The field is specified in registers OCOR, OCORM, and OCORH. This register may be written while the filter is running. OCOR, OCORM and OCORH can be coherency interlocked (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the Offset field is written the field is flagged incoherent until the Key Coherency Byte is written. Once the Key Coherency Byte is written the field is flagged coherent again. When not coherent, the HW will not pass any portion of the 24-bit number to the Post Processor. When incoherent, the previous Offset value is used. A new Offset value is accepted when a write to the Key Coherency Byte is seen - as defined in the COHER register. The 3 bytes of the Offset field may be written in any order but the Key Coherency Byte must be written last.

Bits	Name	Description
7:0	ocor_low[7:0]	Offset correction coefficient bits [7:0] (of [23:0]).

### 1.3.202 DEC\_OCORM

#### Decimator Offset Correction Coefficient (Middle Byte)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_OCORM: 0x4E09

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ocor_mid							

See description in OCOR register above.

Bits	Name	Description
7:0	ocor_mid[7:0]	Offset correction coefficient bits [15:8] (of [23:0]).

### 1.3.203 DEC\_OCORH

#### Decimator Offset Correction Coefficient (High Byte)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_OCORH: 0x4E0A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ocor_high							

See description in OCOR register above.

Bits	Name	Description
7:0	ocor_high[7:0]	Offset correction coefficient bits [23:16] (of [23:0]).

### 1.3.204 DEC\_GCOR

#### Decimator Gain Correction Coefficient (Low Byte)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_GCOR: 0x4E0C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	gcor_low							

GCOR / GCORH is a 16-bit field that is the gain correction value for the Post Processor. The field is specified in registers GCOR and GCORH. This register may be written while the filter is running. If a multiply is in progress, updates to the gain correction value will be ignored until the start of the next multiply. Which bits that are valid in the 16 bit field is signified in the GVAL register. The implementation in HW is a shift\_add multiply which consumes a clock cycle (adc\_clk) for each valid bit in the GCOR field as defined by GVAL. GCOR, GCORH and GVAL can be coherency interlocked (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the Gain/Gain\_Value field is written the field is flagged incoherent until the Key Coherency Byte is written. Once the Key Coherency Byte is written the field is flagged coherent again. When not coherent, the HW will not pass any portion of the 16-bit Gain number or 8-bit Gain Value to the Post Processor. When incoherent, the previous written values are used. A new Gain/Gain\_Value is accepted when a write to the Key Coherency Byte is seen - as defined in the COHER register. The 3 bytes of the Gain/Gain\_Value field may be written in any order but the Key Coherency Byte must be written last. READ: A read of this register produces the last value written to this register. Reads have no affect on coherency flags.

Bits	Name	Description
7:0	gcor_low[7:0]	Gain correction coefficient bits [7:0] (of [15:0]).

### 1.3.205 DEC\_GCORH

#### Decimator Gain Correction Coefficient (High Byte)

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_GCORH: 0x4E0D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	gcor_high							

Seed description of GCOR register above.

Bits	Name	Description
7:0	gcor_high[7:0]	Gain correction coefficient bits [15:8] (of [15:0]).

### 1.3.206 DEC\_GVAL

#### Decimator Gain Correction Size Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_GVAL: 0x4E0E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				gval			

GVAL is a 4-bit field that signifies to the HW how many bits of GCOR field are valid. The number of valid bits minus one should be written (0000b = 1 bit, 1111b = all 16 bits). Updates to this register will be ignored until the start of the next multiply. This register may be written while the filter is running. The valid field is measured from LSB (bit 0) up. Note that the HW always assumes the field specified by GVAL is left justified (starts at bit 0 of GCOR) and has a binary-point after the left-most digit. For example, if GVAL is programmed with a 7d, this means there are 8 valid bits in GCOR and they have the format x.xxxxxxb. If GCOR (GCORH, GCOR) holds the value 00000000 10100000b and GVAL is 7, only the low-order 8 bits are considered (10100000b) and the binary point is assumed after the left-most digit (1.0100000b). The multiply coefficient in the example would be 1.25d. Although a good explanation example, this isn't the most efficient way to multiply by 1.25d. Better would be GCOR (GCORH, GCOR) holds the value 00000000 00000101b and GVAL is 2, which gives (1.01b). Another example: If it is desired to multiply by a gain coefficient of 0.125d (0.001b) then GCOR would be programmed with a value of 00000001b, GCORH with 00000000b and GVAL (GVAL) with 0011b - meaning there are 4 valid bits x.xxb. The multiplier thus has a coefficient range of  $1/(2^{15})$  to  $2.0 - (1/(2^{15}))$  in steps of  $1/(2^{15})$ . GCOR, GCORH and GVAL can be coherency interlocked (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the Gain/Gain\_Value field is written the field is flagged incoherent until the Key Coherency Byte is written. Once the Key Coherency Byte is written the field is flagged coherent again. When not coherent, the HW will not pass any portion of the 16-bit Gain number or 8-bit Gain Value to the Post Processor. When incoherent, the previous written values are used. A new Gain/Gain\_Value is accepted when a write to the Key Coherency Byte is seen - as defined in the COHER register. The 3 bytes of the Gain/Gain\_Value field may be written in any order but the Key Coherency Byte must be written last. READ: A read of this register produces the last value written to this register. Reads have no affect on coherency flags.

Bits	Name	Description
3:0	gval[3:0]	Number of valid bits minus one in Gain Coefficient registers GCORH and GCOR.

## 1.3.207 DEC\_OUTSAMP

### Decimator Output Data Sample (Low Byte)

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DEC\_OUTSAMP: 0x4E10

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	samp_low							

This register is read-only and contains the low order byte of the conversion result. In some configurations of the block the output results of interest are placed in bits 23:8 of the output sample field. To allow reading such values in one bus cycle an alignment feature is added to shift the result right by 8-bits. This feature is enabled by the OUTPUT\_ALIGN bit of the SR register. This register can be coherency interlock protected (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the OUTSAMP / OUTSAMPM / OUTSAMPH field is read the field is flagged incoherent until the Key Coherency Byte is read. Once the Key Coherency Byte is read the field is flagged coherent again. When the Decimator generates a new sample and the output sample field is coherent, the output sample field is over-written with the new value - regardless of whether it had been read prior or not. If the output sample field is flagged incoherent when the new sample is generated, the new sample is lost and the output sample field is left untouched. There is no warning given when either a new sample is lost or an unread output sample is overwritten. WRITE: This register is read-only - writes to this address complete but have no affect.

Bits	Name	Description
7:0	samp_low[7:0]	Low order byte of the filter conversion result, bits [7:0] (of [23:0]) --- Or if the out_align bit is set it contains bits [15:8] (of [23:0]).

### 1.3.208 DEC\_OUTSAMP

#### Decimator Output Data Sample (Middle Byte)

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DEC\_OUTSAMP: 0x4E11

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	samp_middle							

This register is read-only and contains the middle order byte of the conversion result. In some configurations of the block the output results of interest are placed in bits 23:8 of the output sample field. To allow reading such values in one bus cycle an alignment feature is added to shift the result right by 8-bits. This feature is enabled by the OUTPUT\_ALIGN bit of the SR register. This register can be coherency interlock protected (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the OUTSAMP / OUTSAMP / OUTSAMP field is read the field is flagged incoherent until the Key Coherency Byte is read. Once the Key Coherency Byte is read the field is flagged coherent again. When the Decimator generates a new sample and the output sample field is coherent, the output sample field is over-written with the new value - regardless of whether it had been read prior or not. If the output sample field is flagged incoherent when the new sample is generated, the new sample is lost and the output sample field is left untouched. There is no warning given when either a new sample is lost or an unread output sample is overwritten. WRITE: This register is read-only - writes to this address complete but have no affect.

Bits	Name	Description
7:0	samp_middle[7:0]	Middle order byte of the filter conversion result, bits [15:8] (of [23:0]) --- Or if the out_align bit is set it contains bits [23:16] (of [23:0]).

### 1.3.209 DEC\_OUTSAMP\_H

#### Decimator Output Data Sample (High Byte)

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DEC\_OUTSAMP\_H: 0x4E12

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	samp_high							

This register is read-only and contains the high order byte of the conversion result. This register can be coherency interlock protected (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the OUTSAMP / OUTSAMP\_M / OUTSAMP\_H field is read the field is flagged incoherent until the Key Coherency Byte is read. Once the Key Coherency Byte is read the field is flagged coherent again. When the Decimator generates a new sample and the output sample field is coherent, the output sample field is over-written with the new value - regardless of whether it had been read prior or not. If the output sample field is flagged incoherent when the new sample is generated, the new sample is lost and the output sample field is left untouched. There is no warning given when either a new sample is lost or an unread output sample is overwritten. Note that even though there is no register defined for the high byte (address xx13) of this register, if this register is read as a 16-bit access the top byte will contain the sign extension. WRITE: This register is read-only - writes to this address complete but have no affect.

Bits	Name	Description
7:0	samp_high[7:0]	High order byte of the filter conversion result, bits [23:16] (of [23:0]).

### 1.3.210 DEC\_OUTSAMPS

#### Decimator Output Data Sample (Sign Extension)

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DEC\_OUTSAMPS: 0x4E13

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	samp_signext							

\* This is a pseudo register. There are no FFs or even an address decode for this pseudo register. If read or written as a byte it acts the same as all other unused byte addresses in the block's address space - writes are ignored and reads produce 0 on the bus. However, if OUTSAMP is read as a 16-bit value, it is sign extended onto the bus on these 8 bits. This pseudo register definition is here simply to document this sign extension functionality. WRITE: This register is read-only - writes to this address complete but have no affect. If read as a byte, it always returns 0. If read as the high byte of a 16-bit read of OUTSAMP, it always returns the sign extension of the value in OUTSAMP/M/H.

Bits	Name	Description
7:0	samp_signext[7:0]	Sign extension of the value held in OUTSAMP.

## 1.3.211 DEC\_COHER

### Decimator Coherency Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DEC\_COHER: 0x4E14

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:00		R/W:00		R/W:00	
HW Access	NA		R		R		R	
Retention	NA		RET		RET		RET	
Name	RSVD		gcor_key		ocor_key		samp_key	

The three 2-bit fields of this register are used to select which of the 3 bytes (of the OCOR, GCOR/GVAL and OUTSAMP fields) will be used as the Key Coherency Byte (KCB). Or, if no coherency checking is desired, to turn it off. The KCB selected is SW's way of tell the HW which byte of the 3-byte field it will access to signify the completion of a coherent operation. For the OCOR and GCOR/GVAL 3-byte fields, selecting the key byte tells the HW which of the bytes it will write last to note that all of the bytes it wants to update have been written. When any non-Key byte is written, the coherency HW locks the underlying ALU hardware from seeing the potentially incoherent value. While incoherent the ALU uses a shadow copy of the last coherent value received. The SW lastly writes the KCB and the HW flags the field as coherent and the next ALU operation needing that coefficient will get a copy of the newly written value. The OUTSAMP field is basically the same other than it's a read only register and the coherency protects the output sample from being overwritten by a subsequent sample if the present sample is in the process of being read (this is technically an overrun condition). If no byte of the previous sample has been read, a new sample will overwrite the last. If the previous sample is in the process of being read, a new sample will be dropped. Coherency doesn't protect against over/under flow, it only makes sure the sample read is coherent.

Bits	Name	Description
5:4	gcor_key[1:0]	Sets the Key Coherency Byte of the GCOR/GCORH/GVAL field <a href="#">See Table 1-125.</a>
3:2	ocor_key[1:0]	Sets the Key Coherency Byte of the OCOR/OCORM/OCORH field <a href="#">See Table 1-126.</a>
1:0	samp_key[1:0]	Sets the Key Coherency Byte of the OUTSAMP/OUTSAMP/OUTSAMP field <a href="#">See Table 1-127.</a>

Table 1-125. Bit field encoding: gcor\_key\_enum

Value	Name	Description
2'b00	GCOR_KEY_OFF	Gain Coefficient Coherency checking off.
2'b01	GCOR_KEY_LOW	Key Byte is low byte (GCOR).
2'b10	GCOR_KEY_MID	Key Byte is med byte (GCORH).
2'b11	GCOR_KEY_HIGH	Key Byte is high byte (GVAL).

Table 1-126. Bit field encoding: ocor\_key\_enum

Value	Name	Description
2'b00	OCOR_KEY_OFF	Offset Coefficient Coherency checking off.
2'b01	OCOR_KEY_LOW	Key Byte is low byte (OCOR).
2'b10	OCOR_KEY_MID	Key Byte is med byte (OCORM).
2'b11	OCOR_KEY_HIGH	Key Byte is high byte (OCORH).

(continued)

Table 1-127. Bit field encoding: samp\_key\_enum

Value	Name	Description
2'b00	SAMP_KEY_OFF	Output Sample Coherency checking off.
2'b01	SAMP_KEY_LOW	Key Byte is low byte (OUTSAMP).
2'b10	SAMP_KEY_MID	Key Byte is med byte (OUTSAMPM).
2'b11	SAMP_KEY_HIGH	Key Byte is high byte (OUTSAMPH).

## 1.3.212 TMR[0..3]\_CFG0

### Configuration Register CFG0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_CFG0: 0x4F00

TMR1\_CFG0: 0x4F0C

TMR2\_CFG0: 0x4F18

TMR3\_CFG0: 0x4F24

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R		R	R	R	R	R	R
Retention	RET		RET	RET	RET	RET	RET	RET
Name	DEADBAND_PERIOD		DB	INV	CMP_BUFF	ONESHOT	MODE	EN

This register is used to configure the timer block.

Bits	Name	Description
7:6	DEADBAND_PERIOD[1:0]	Deadband Period
5	DB	Deadband mode--Deadband phases phi1 and phi2 are outputted on CMP and TC output pins respectively. <a href="#">See Table 1-128.</a>
4	INV	Invert sense of TIMEREN signal
3	CMP_BUFF	Buffer compare register. Compare register updates only on timer terminal count.
2	ONESHOT	Timer stops upon reaching stop condition defined by TMR_CFG bits. Can be restarted by asserting TIMER RESET or disabling and re-enabling block.
1	MODE	Mode. (0 = Timer; 1 = Comparator) <a href="#">See Table 1-129.</a>
0	EN	Enables timer/comparator.

Table 1-128. Bit field encoding: db\_enum

Value	Name	Description
1'b0	Timer	CMP and TC are output.
1'b1	Deadband	PHI1 (instead of CMP) and PHI2 (instead of TC) are output.

Table 1-129. Bit field encoding: mode\_enum

Value	Name	Description
1'b0	Timer	Timer mode. CNT/CMP register holds timer count value.
1'b1	Comparator	Comparator mode. CNT/CMP register holds comparator threshold value.

### 1.3.213 TMR[0..3]\_CFG1

#### Configuration Register CFG1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_CFG1: 0x4F01

TMR1\_CFG1: 0x4F0D

TMR2\_CFG1: 0x4F19

TMR3\_CFG1: 0x4F25

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:000			R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R			R	R	R	R
Retention	RET	RET			RET	RET	RET	RET
Name	BUS_CLK_SEL	CLK_BUS_EN_SEL			DBMODE	DCOR	FTC	IRQ_SEL

This register is used to configure the timer block.

Bits	Name	Description
7	BUS_CLK_SEL	Bus Clock selection. <a href="#">See Table 1-130.</a>
6:4	CLK_BUS_EN_SEL[2:0]	Digital Global Clock selection. <a href="#">See Table 1-131.</a>
3	DBMODE	Deadband mode (asynchronous/synchronous). CMP output pin is also affected when not in deadband mode (CFG0.DEADBAND). <a href="#">See Table 1-132.</a>
2	DCOR	Disable Clear on Read (DCOR) of Status Register SR0. <a href="#">See Table 1-133.</a>
1	FTC	First Terminal Count (FTC). Setting this bit forces a single pulse on the TC pin when first enabled. <a href="#">See Table 1-134.</a>
0	IRQ_SEL	Irq selection. (0 = raw interrupts; 1 = status register interrupts) <a href="#">See Table 1-135.</a>

Table 1-130. Bit field encoding: bus\_sel\_enum

Value	Name	Description
1'b0	clk_d	Use the digital clocks, clk_d[*], as system clock.
1'b1	clk_bus	Use the system bus clock, clk_bus, as system clock.

Table 1-131. Bit field encoding: clk\_cfg\_enum

Value	Name	Description
3'b000	clk_d0	Select digital clock 0, clk_d[0], as clock enable.
3'b001	clk_d1	Select digital clock 1, clk_d[1], as clock enable.
3'b010	clk_d2	Select digital clock 2, clk_d[2], as clock enable.
3'b011	clk_d3	Select digital clock 3, clk_d[3], as clock enable.
3'b100	clk_d4	Select digital clock 4, clk_d[4], as clock enable.
3'b101	clk_d5	Select digital clock 5, clk_d[5], as clock enable.

(continued)

Table 1-131. Bit field encoding: clk\_cfg\_enum

3'b110	clk_d6	Select digital clock 6, clk_d[6], as clock enable.
3'b111	clk_d7	Select digital clock 7, clk_d[7], as clock enable.

Table 1-132. Bit field encoding: dbmode\_enum

Value	Name	Description
1'b0	Asynchronous	Asynchronous kill: Output is gated off immediately, and restored after a minimum of 1 application clock cycle.
1'b1	Synchronous	Synchronous kill: Output is gated off immediately, and restored after a minimum of one full counter period (at the terminal count).

Table 1-133. Bit field encoding: dcor\_enum

Value	Name	Description
1'b0	Enable clear on read	Clear status register, SR0, when read.
1'b1	Disable clear on read	Do not clear status register, SR0, when read.

Table 1-134. Bit field encoding: ftc\_enum

Value	Name	Description
1'b0	Disable FTC	Disable the single cycle pulse, which signifies the timer is starting.
1'b1	Enable FTC	Enable the single cycle pulse, which signifies the timer is starting.

Table 1-135. Bit field encoding: irq\_sel\_enum

Value	Name	Description
1'b0	Raw IRQ	IRQ from raw signals, maskable by corresponding mask bit in SR0 register.
1'b1	Status IRQ	IRQ from status signals, maskable by corresponding mask bit in SR0 register. Clear interrupt by writing '0' to corresponding status bit of SR0 register.

### 1.3.214 TMR[0..3]\_CFG2

#### Configuration Register CFG2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_CFG2: 0x4F02

TMR1\_CFG2: 0x4F0E

TMR2\_CFG2: 0x4F1A

TMR3\_CFG2: 0x4F26

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:000			R/W:0	R/W:0	NA:00	
HW Access	R	R			R	R	NA	
Retention	RET	RET			RET	RET	NA	
Name	HW_EN	CMP_CFG			ROD	COD	RSVD	

This register is used to configure the timer block.

Bits	Name	Description
7	HW_EN	When set Timer Enable controls counting.
6:4	CMP_CFG[2:0]	Comparator configuration: 000 = '=='; 001 = '<'; 010 = '<=' 011 = '>'; 100 = '>=' <a href="#">See Table 1-136.</a>
3	ROD	Reset On Disable (ROD). Resets internal state of output logic.
2	COD	Clear On Disable (COD). Clears or gates outputs to zero.

Table 1-136. Bit field encoding: cmp\_cfg\_enum

Value	Name	Description
3'b000	Equal	Compare Equal '=='
3'b001	Less than	Compare Less Than '<'.
3'b010	Less than or equal	Compare Less Than or Equal '<='.
3'b011	Greater	Compare Greater Than '>'.
3'b100	Greater than or equal	Compare Greater Than or Equal '>='.

Table 1-137. Bit field encoding: tmr\_cfg\_enum

Value	Name	Description
2'b00	Continuous	Timer runs while EN bit of CFG0 register is set to '1'.
2'b01	Pulsewidth	Timer runs from positive to negative edge of TIMEREN.
2'b10	Period	Timer runs from positive to positive edge of TIMEREN.
2'b11	Irq	Timer runs until IRQ.

## 1.3.215 TMR[0..3]\_SR0

### Status Register SR0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_SR0: 0x4F03

TMR1\_SR0: 0x4F0F

TMR2\_SR0: 0x4F1B

TMR3\_SR0: 0x4F27

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	RC:0	RC:0	RC:0	RC:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R/W	R/W	R/W	R/W	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	TC	CAP_CMP	TEN	TSTOP	MTC	MCAP_CMP	MTEN	MTSTOP

This register is used to configure interrupt masking and obtain status. Status bits 7-4 are cleared on read.

Bits	Name	Description
7	TC	Terminal count status. Interrupt, Sticky (individual bits)
6	CAP_CMP	Capture/Compare status (MODE = 0--Capture; MODE = 1--Compare). Interrupt, Sticky (individual bits)
5	TEN	Timer enable status. Interrupt, Sticky (individual bits)
4	TSTOP	Timer stop status. Interrupt, Sticky (individual bits)
3	MTC	Terminal count interrupt mask. (0 = Masked; 1 = Unmasked)
2	MCAP_CMP	Capture/Compare interrupt mask (MODE = 0--Capture; MODE = 1--Compare). (0 = Masked; 1 = Unmasked)
1	MTEN	Timer enable interrupt mask. (0 = Masked; 1 = Unmasked)
0	MTSTOP	Timer stop interrupt mask. (0 = Masked; 1 = Unmasked)

### 1.3.216 TMR[0..3]\_PER0

#### Timer Period Register PER0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_PER0: 0x4F04

TMR1\_PER0: 0x4F10

TMR2\_PER0: 0x4F1C

TMR3\_PER0: 0x4F28

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TIMER_PERIOD0							

This register contains the count value the timer is loaded with. When enabled the counter down counts from the value of this register to zero. NOTE: A period of 0 is not supported.

Bits	Name	Description
7:0	TIMER_PERIOD0[7:0]	Determines the high byte of the period for the timer.

## 1.3.217 TMR[0..3]\_PER1

### Timer Period Register PER1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_PER1: 0x4F05

TMR1\_PER1: 0x4F11

TMR2\_PER1: 0x4F1D

TMR3\_PER1: 0x4F29

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TIMER_PERIOD1							

This register contains the count value the timer is loaded with. When enabled the counter down counts from the value of this register to zero. NOTE: A period of 0 is not supported.

Bits	Name	Description
7:0	TIMER_PERIOD1[7:0]	Determines the low byte of the period for the timer.

### 1.3.218 TMR[0..3]\_CNT\_CMP0

#### Count/Comparator value CNT/CMP0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_CNT\_CMP0: 0x4F06

TMR1\_CNT\_CMP0: 0x4F12

TMR2\_CNT\_CMP0: 0x4F1E

TMR3\_CNT\_CMP0: 0x4F2A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COUNT_COMPARE0							

This register is a shared register. Its meaning depends upon the value of the MODE bit in the CFG0 register. (MODE = 0--Count value; MODE = 1--Comparator value).

Bits	Name	Description
7:0	COUNT_COMPARE0[7:0]	MODE = 0--LSB of current count value; MODE = 1--LSB of comparator threshold.

### 1.3.219 TMR[0..3]\_CNT\_CMP1

#### Count/Comparator value CNT/CMP1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_CNT\_CMP1: 0x4F07

TMR1\_CNT\_CMP1: 0x4F13

TMR2\_CNT\_CMP1: 0x4F1F

TMR3\_CNT\_CMP1: 0x4F2B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COUNT_COMPARE1							

This register is a shared register. Its meaning depends upon the value of the MODE bit in the CFG0 register. (MODE = 0--Count value; MODE = 1--Comparator value).

Bits	Name	Description
7:0	COUNT_COMPARE1[7:0]	MODE = 0--MSB of current count value; MODE = 1--MSB of comparator threshold.

## 1.3.220 TMR[0..3]\_CAP0

### Capture Value CAP0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_CAP0: 0x4F08

TMR1\_CAP0: 0x4F14

TMR2\_CAP0: 0x4F20

TMR3\_CAP0: 0x4F2C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CAPTURE_VALUE0							

This register holds the captured LSB of the timer count value. A 16-bit read of the CNT register returns the current timer value and captures. An 8-bit LSB read of the CNT register returns the LSB and captures both the LSB and MSB. This register only has meaning when MODE = 0 and is not to be used for any purpose when MODE = 1.

Bits	Name	Description
7:0	CAPTURE_VALUE0[7:0]	Captured LSB of the timer count value.

## 1.3.221 TMR[0..3]\_CAP1

### Capture Value CAP1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_CAP1: 0x4F09

TMR1\_CAP1: 0x4F15

TMR2\_CAP1: 0x4F21

TMR3\_CAP1: 0x4F2D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CAPTURE_VALUE1							

This register holds the captured MSB of the timer count value. A 16-bit read of the CNT register returns the current timer value and captures. An 8-bit LSB read of the CNT register returns the LSB and captures both the LSB and MSB. This register only has meaning when MODE = 0 and is not to be used for any purpose when MODE = 1.

Bits	Name	Description
7:0	CAPTURE_VALUE1[7:0]	Captured MSB of the timer count value.

0x4f00 + [0..3 \* 0xc] + 0xa

## 1.3.222 TMR[0..3]\_RT0

### Configuration Register RT0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_RT0: 0x4F0A

TMR1\_RT0: 0x4F16

TMR2\_RT0: 0x4F22

TMR3\_RT0: 0x4F2E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:00		R/W:00		R/W:00	
HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	TIMER_RST_SRC_SEL		TIMER_EN_SRC_SEL		CAPTURE_SRC_SEL		KILL_SRC_SEL	

This register is used to configure the dsi input routing to the timer block.

Bits	Name	Description
7:6	TIMER_RST_SRC_SEL[1:0]	Selects the driver for the timer reset signal <a href="#">See Table 1-138.</a>
5:4	TIMER_EN_SRC_SEL[1:0]	Selects the driver for the timer enable signal <a href="#">See Table 1-138.</a>
3:2	CAPTURE_SRC_SEL[1:0]	Selects the driver for the capture signal <a href="#">See Table 1-138.</a>
1:0	KILL_SRC_SEL[1:0]	Selects the driver for the kill signal <a href="#">See Table 1-138.</a>

Table 1-138. Bit field encoding: src\_enum

Value	Name	Description
2'b00	dsi_in0	dsi_in0 selected as source.
2'b01	dsi_in1	dsi_in1 selected as source.
2'b10	dsi_in2	dsi_in2 selected as source.
2'b11	dsi_in3	dsi_in3 selected as source.

### 1.3.223 TMR[0..3]\_RT1

#### Configuration Register RT1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

TMR0\_RT1: 0x4F0B

TMR1\_RT1: 0x4F17

TMR2\_RT1: 0x4F23

TMR3\_RT1: 0x4F2F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA		R	R	R	R	R	R
Retention	NA		RET	RET	RET	RET	RET	RET
Name	RSVD		SYNCTC	SYNCCMP	SYNCDSI3	SYNCDSI2	SYNCDSI1	SYNCDSI0

This register is used to configure the dsi input routing to the timer block. Input signals, dsi\_in0, dsi\_in1, dsi\_in2 and dsi\_in3, are double synchronized to the system/bus clock. Output signals, tc and cmp, are registered on the application clock.

Bits	Name	Description
5	SYNCTC	Register TC/TC-IRQ with selected clk_bus_en (0 = not registered; 1 = registered)
4	SYNCCMP	Register CMP/CMPB output with selected clk_bus_en (0 = not registered; 1 = registered)
3	SYNCDSI3	Synchronize DSI input, dsi_in3, to clk_bus (0 = no synchronization; 1 = synchronization)
2	SYNCDSI2	Synchronize DSI input, dsi_in2, to clk_bus (0 = no synchronization; 1 = synchronization)
1	SYNCDSI1	Synchronize DSI input, dsi_in1, to clk_bus (0 = no synchronization; 1 = synchronization)
0	SYNCDSI0	Synchronize DSI input, dsi_in0, to clk_bus (0 = no synchronization; 1 = synchronization)

### 1.3.227 PRT[0..14]\_DR\_ALIAS

#### Aliased Port Data Output Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_DR\_ALIAS: 0x5080

PRT1\_DR\_ALIAS: 0x5081

PRT2\_DR\_ALIAS: 0x5082

PRT3\_DR\_ALIAS: 0x5083

PRT4\_DR\_ALIAS: 0x5084

PRT5\_DR\_ALIAS: 0x5085

PRT6\_DR\_ALIAS: 0x5086

PRT12\_DR\_ALIAS: 0x508C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	DataReg_alias							

This register is used to set the output data output state for the corresponding GPIO port.

Bits	Name	Description
7:0	DataReg_alias[7:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port. This register is only accessible if the PRTxBIT_MASK register bits are set.

### 1.3.228 PRT15\_DR\_15\_ALIAS

#### Aliased Port Data Output Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_DR\_15\_ALIAS: 0x508F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:000000					
HW Access	R/W	R/W	R/W					
Retention	RET	RET	RET					
Name	DataReg_D M_alias	DataReg_D P_alias	DataReg_alias					

This register is used to set the output data output state for the corresponding GPIO port.

Bits	Name	Description
7	DataReg_DM_alias	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port. This register is only accessible if the PRTxBIT_MASK register bits are set.
6	DataReg_DP_alias	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port. This register is only accessible if the PRTxBIT_MASK register bits are set.
5:0	DataReg_alias[5:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port. This register is only accessible if the PRTxBIT_MASK register bits are set.

### 1.3.229 PRT[0..14]\_PS\_ALIAS

#### Aliased Port Pin State Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_PS\_ALIAS: 0x5090

PRT1\_PS\_ALIAS: 0x5091

PRT2\_PS\_ALIAS: 0x5092

PRT3\_PS\_ALIAS: 0x5093

PRT4\_PS\_ALIAS: 0x5094

PRT5\_PS\_ALIAS: 0x5095

PRT6\_PS\_ALIAS: 0x5096

PRT12\_PS\_ALIAS: 0x509C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	RET							
Name	PinState_alias							

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7:0	PinState_alias[7:0]	<p>Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin:</p> <p>1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high.</p> <p>0 Reads LOW if the pin voltage is below that threshold, logic low.</p>

### 1.3.230 PRT15\_PS15\_ALIAS

#### Aliased Port Pin State Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_PS15\_ALIAS: 0x509F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:0	R:000000					
HW Access	R/W	R/W	R/W					
Retention	RET	RET	RET					
Name	PinState_D M_alias	PinState_D P_alias	PinState_alias					

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7	PinState_DM_alias	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 0 Reads LOW if the pin voltage is below that threshold, logic low.
6	PinState_DP_alias	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 0 Reads LOW if the pin voltage is below that threshold, logic low.
5:0	PinState_alias[5:0]	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 0 Reads LOW if the pin voltage is below that threshold, logic low.

### 1.3.231 PRT[0..11]\_DR

#### Port Data Output Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_DR: 0x5100

PRT1\_DR: 0x5110

PRT2\_DR: 0x5120

PRT3\_DR: 0x5130

PRT4\_DR: 0x5140

PRT5\_DR: 0x5150

PRT6\_DR: 0x5160

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DataReg							

This register is used to set the output data state for the corresponding GPIO port.

Bits	Name	Description
7:0	DataReg[7:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port.

### 1.3.232 PRT[0..11]\_PS

#### Port Pin State Register1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_PS: 0x5101

PRT1\_PS: 0x5111

PRT2\_PS: 0x5121

PRT3\_PS: 0x5131

PRT4\_PS: 0x5141

PRT5\_PS: 0x5151

PRT6\_PS: 0x5161

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PinState							

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7:0	PinState[7:0]	<p>Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin:</p> <p>1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high.</p> <p>1'b0 Reads LOW if the pin voltage is below that threshold, logic low.</p>

### 1.3.233 PRT[0..11]\_DM[0..2]

#### Port Drive Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0_DM0: 0x5102	PRT0_DM1: 0x5103	PRT0_DM2: 0x5104

PRT6_DM0: 0x5162	PRT6_DM1: 0x5163	PRT6_DM2: 0x5164

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DriveMode							

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO section on IO drive modes for detailed information on the eight different drive mode configurations.

Bits	Name	Description
7:0	DriveMode[7:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high.

$$DM[2:0] = \{PRT\ X.DM2[y], PRT\ X.DM1[y], PRT\ X.DM0[y]\}$$

DM[2:0] : Complete drive mode setting for pin [y] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, strong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

### 1.3.234 PRT[0..11]\_SLW

#### Port slew rate control

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_SLW: 0x5105

PRT1\_SLW: 0x5115

PRT2\_SLW: 0x5125

PRT3\_SLW: 0x5135

PRT4\_SLW: 0x5145

PRT5\_SLW: 0x5155

PRT6\_SLW: 0x5165

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	SlwCtl							

The output drive on any I/O pin can be set to a fast edge rate mode (Slew=0) or slow edge rate mode (Slew=1) The slew rate only applies to strong output drive modes, not to resistive drive modes. Slower edge rates normally reduce EMI issues and are recommended when speed is not critical.

Bits	Name	Description
7:0	SlwCtl[7:0]	Each bit controls the output edge rate of the corresponding port pin. 1'b0 Fast edge rate mode 1'b1 Slow edge rate mode

### 1.3.235 PRT[0..11]\_BYP

#### Port Bypass enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_BYP: 0x5106

PRT1\_BYP: 0x5116

PRT2\_BYP: 0x5126

PRT3\_BYP: 0x5136

PRT4\_BYP: 0x5146

PRT5\_BYP: 0x5156

PRT6\_BYP: 0x5166

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Bypass							

The Port Bypass Registers select output data from either the data output register or internal sources such as digital global bus.

Bits	Name	Description
7:0	Bypass[7:0]	1'b1 Selected digital system interconnect (DSI) drives the corresponding port pin. 1'b0 Port logic data register drives the corresponding port pin. <i>The drive mode settings must configure the port to enable the output buffer or the DSI dynamic drive control must configure the output enable for the pad.</i>

### 1.3.236 PRT[0..11]\_BIE

#### Port Bidirectional enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_BIE: 0x5107

PRT1\_BIE: 0x5117

PRT2\_BIE: 0x5127

PRT3\_BIE: 0x5137

PRT4\_BIE: 0x5147

PRT5\_BIE: 0x5157

PRT6\_BIE: 0x5167

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	BidirectEn							

The Port Bidirectional Enable Registers are used to enable dynamic bidirectional mode at any pin.

Bits	Name	Description
7:0	BidirectEn[7:0]	Each bit controls the bidirectional mode of the corresponding port pin. 1'b0 Normal operation of pad. Drive mode setting configures output buffer 1'b1 Selected dynamic control DSI configures output buffer

### 1.3.237 PRT[0..11]\_INP\_DIS

#### Input buffer disable override

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_INP\_DIS: 0x5108

PRT1\_INP\_DIS: 0x5118

PRT2\_INP\_DIS: 0x5128

PRT3\_INP\_DIS: 0x5138

PRT4\_INP\_DIS: 0x5148

PRT5\_INP\_DIS: 0x5158

PRT6\_INP\_DIS: 0x5168

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Inp_dis							

The bits asserted force the input buffers off.

Bits	Name	Description
7:0	Inp_dis[7:0]	1'b1 Input buffers are disabled, overrides drive mode register settings. 1'b0 Input buffers are configured based on drive mode register settings.

### 1.3.238 PRT[0..11]\_CTL

#### Port wide control signals

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_CTL: 0x5109

PRT1\_CTL: 0x5119

PRT2\_CTL: 0x5129

PRT3\_CTL: 0x5139

PRT4\_CTL: 0x5149

PRT5\_CTL: 0x5159

PRT6\_CTL: 0x5169

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:000			R/W:0
HW Access	NA				R			R
Retention	NA				RET			RET
Name	RSVD				portEmifCfg			vtrip_sel

The port wide vtrip select register is used to select the input buffer trip point select. The emif configuration bits are used to configure the port for external memory access.

Bits	Name	Description
3:1	portEmifCfg[2:0]	GPIO emif selection option configures the port for External memory interface. <a href="#">See Table 1-144.</a>
0	vtrip_sel	The GPIO cells include a vtrip_sel signal to alter the input buffer voltage. <a href="#">See Table 1-145.</a>

Table 1-144. Bit field encoding: emif\_cfg\_enum

Value	Name	Description
3'b000	NOT_EMIF	Port not selected for EMIF control
3'b001	LSB_ADDR	Port selected as Address LS byte range
3'b010	UPR_ADDR	Port selected as Address upper byte range
3'b011	MSB_ADDR	Port selected as Address MS byte range
3'b101	LSB_DATA	Port selected as Data lower byte range
3'b110	MSB_DATA	Port selected as Data upper byte range

Table 1-145. Bit field encoding: vtrip\_sel\_enum

Value	Name	Description
1'b0	VTRIP_CMOS	Input buffer functions as a CMOS input buffer.
1'b1	VTRIP_LVTTL	Input buffer functions as a LVTTL input buffer.

### 1.3.239 PRT[0..11]\_PRT

#### Port wide configuration register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_PRT: 0x510A

PRT1\_PRT: 0x511A

PRT2\_PRT: 0x512A

PRT3\_PRT: 0x513A

PRT4\_PRT: 0x514A

PRT5\_PRT: 0x515A

PRT6\_PRT: 0x516A

Bits	7	6	5	4	3	2	1	0

HW Access	R	R	R	NA	R	R	R	NA
Retention	RET	RET	RET	NA	RET	RET	RET	NA
Name	byPass	slew	bidirectEn	RSVD	driveMode2	driveMode1	driveMode0	RSVD

The Port Configuration Register accesses several available configuration registers on a port-wide basis with a single bit write.

Bits	Name	Description
7	byPass	The Bypass bit sets all the bits for the port bypass register. <a href="#">See Table 1-147.</a>
6	slew	The slew bit is the same as the corresponding bit in the port slew register.
5	bidirectEn	The BiDir En bit sets all bits for the port bidirection enable register. <a href="#">See Table 1-146.</a>
3	driveMode2	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
2	driveMode1	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
1	driveMode0	A write to this bit sets all bits for the corresponding drive mode register of the entire port.

Table 1-146. Bit field encoding: bidir\_en\_enum

Value	Name	Description
1'b0	BIDIR_DIS	dynamic bidirectional mode disabled.
1'b1	BIDIR_EN	dynamic bidirectional mode enabled.

Table 1-147. Bit field encoding: bypass\_en\_enum

Value	Name	Description
1'b0	BYPASS_DIS	bypass function disabled.
1'b1	BYPASS_EN	bypass function enabled.

0x5100 + [0..11 \* 0x10] + 0xb

## 1.3.240 PRT[0..11]\_BIT\_MASK

### Bit-mask for Aliased Register access

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_BIT\_MASK: 0x510B

PRT1\_BIT\_MASK: 0x511B

PRT2\_BIT\_MASK: 0x512B

PRT3\_BIT\_MASK: 0x513B

PRT4\_BIT\_MASK: 0x514B

PRT5\_BIT\_MASK: 0x515B

PRT6\_BIT\_MASK: 0x516B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	bit_mask							

The bits asserted in the bit-mask register allow direct access to the data register or pin state register via the aliased registers.

Bits	Name	Description
7:0	bit_mask[7:0]	1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.

## 1.3.241 PRT[0..11]\_AMUX

### Port Analog global mux bus enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_AMUX: 0x510C

PRT1\_AMUX: 0x511C

PRT2\_AMUX: 0x512C

PRT3\_AMUX: 0x513C

PRT4\_AMUX: 0x514C

PRT5\_AMUX: 0x515C

PRT6\_AMUX: 0x516C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Amux							

Analog global mux switch.

Bits	Name	Description
7:0	Amux[7:0]	Connects analog mux bus to the pad when asserted.

## 1.3.242 PRT[0..11]\_AG

### Port Analog global enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_AG: 0x510D

PRT1\_AG: 0x511D

PRT2\_AG: 0x512D

PRT3\_AG: 0x513D

PRT4\_AG: 0x514D

PRT5\_AG: 0x515D

PRT6\_AG: 0x516D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	AnalogGlobal							

Analog global switch.

Bits	Name	Description
7:0	AnalogGlobal[7:0]	Connects analog global to the pad when asserted.

### 1.3.243 PRT[0..11]\_LCD\_COM\_SEG

#### Port LCD Com seg bits.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_LCD\_COM\_SEG: 0x510E

PRT1\_LCD\_COM\_SEG: 0x511E

PRT2\_LCD\_COM\_SEG: 0x512E

PRT3\_LCD\_COM\_SEG: 0x513E

PRT4\_LCD\_COM\_SEG: 0x514E

PRT5\_LCD\_COM\_SEG: 0x515E

PRT6\_LCD\_COM\_SEG: 0x516E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	com_seg							

Selects whether a pin is set as a common or segment drive pin.

Bits	Name	Description
7:0	com_seg[7:0]	Specify whether the pin will drive common or segment mode when LCD is enabled. 1'b0 Segment 1'b1 Common

### 1.3.244 PRT[0..11]\_LCD\_EN

#### Port LCD enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_LCD\_EN: 0x510F

PRT1\_LCD\_EN: 0x511F

PRT2\_LCD\_EN: 0x512F

PRT3\_LCD\_EN: 0x513F

PRT4\_LCD\_EN: 0x514F

PRT5\_LCD\_EN: 0x515F

PRT6\_LCD\_EN: 0x516F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Lcd_en							

Enables a given pin for LCD drive mode

Bits	Name	Description
7:0	Lcd_en[7:0]	Enable the pin for LCD mode. 1'b0 Disabled 1'b1 Enabled

## 1.3.245 PRT12\_DR

### Port Data Output Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_DR: 0x51C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DataReg							

This register is used to set the output data state for the corresponding GPIO port.

Bits	Name	Description
7:0	DataReg[7:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port.

## 1.3.246 PRT12\_PS

### Port Pin State Register1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_PS: 0x51C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PinState							

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7:0	PinState[7:0]	<p>Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin:</p> <p>1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high.</p> <p>1'b0 Reads LOW if the pin voltage is below that threshold, logic low.</p>

### 1.3.247 PRT12\_DM[0..2]

#### Port Drive Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_DM0: 0x51C2

PRT12\_DM1: 0x51C3

PRT12\_DM2: 0x51C4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DriveMode							

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO section on IO drive modes for detailed information on the eight different drive mode configurations.

Bits	Name	Description
7:0	DriveMode[7:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high.

$$DM[2:0] = \{PRT\ X.DM2[y], PRT\ X.DM1[y], PRT\ X.DM0[y]\}$$

DM[2:0] : Complete drive mode setting for pin [y] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, strong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

## 1.3.248 PRT12\_SLW

### Port slew rate control

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_SLW: 0x51C5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	SlwCtl							

The output drive on any I/O pin can be set to a fast edge rate mode (Slew=0) or slow edge rate mode (Slew=1) The slew rate only applies to strong output drive modes, not to resistive drive modes. Slower edge rates normally reduce EMI issues and are recommended when speed is not critical.

Bits	Name	Description
7:0	SlwCtl[7:0]	Each bit controls the output edge rate of the corresponding port pin. 1'b0 Fast edge rate mode 1'b1 Slow edge rate mode

### 1.3.249 PRT12\_BYP

#### Port Bypass enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_BYP: 0x51C6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Bypass							

The Port Bypass Registers select output data from either the data output register or internal sources such as digital global bus.

Bits	Name	Description
7:0	Bypass[7:0]	<p>1'b1 Selected digital system interconnect (DSI) drives the corresponding port pin.</p> <p>1'b0 Port logic data register drives the corresponding port pin.</p> <p><i>The drive mode settings must configure the port to enable the output buffer or the DSI dynamic drive control must configure the output enable for the pad.</i></p>

## 1.3.250 PRT12\_BIE

### Port Bidirectional enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_BIE: 0x51C7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	BidirectEn							

The Port Bidirectional Enable Registers are used to enable dynamic bidirectional mode at any pin.

Bits	Name	Description
7:0	BidirectEn[7:0]	Each bit controls the bidirectional mode of the corresponding port pin. 1'b0 Normal operation of pad. Drive mode setting configures output buffer 1'b1 Selected dynamic control DSI configures output buffer

### 1.3.251 PRT12\_INP\_DIS

#### Input buffer disable override

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_INP\_DIS: 0x51C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Inp_dis							

The bits asserted force the input buffers off.

Bits	Name	Description
7:0	Inp_dis[7:0]	1'b1 Input buffers are disabled, overrides drive mode register settings. 1'b0 Input buffers are configured based on drive mode register settings.

## 1.3.252 PRT12\_SIO\_HYST\_EN

### SIO Hysteresis enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_SIO\_HYST\_EN: 0x51C9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sio_diff_hyst_en							

The SIO hysteresis enable for the SIO differential input buffer.

Bits	Name	Description
7:0	sio_diff_hyst_en[7:0]	(no description)

### 1.3.253 PRT12\_PRT

#### Port wide configuration register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_PRT: 0x51CA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:0	W:0	W:0	NA:0	W:0	W:0	W:0	NA:0
HW Access	R	R	R	NA	R	R	R	NA
Retention	RET	RET	RET	NA	RET	RET	RET	NA
Name	byPass	slew	bidirectEn	RSVD	driveMode2	driveMode1	driveMode0	RSVD

The Port Configuration Register accesses several available configuration registers on a port-wide basis with a single bit write.

Bits	Name	Description
7	byPass	The Bypass bit sets all the bits for the port bypass register. <a href="#">See Table 1-149.</a>
6	slew	The slew bit is the same as the corresponding bit in the port slew register.
5	bidirectEn	The BiDir En bit sets all bits for the port bidirection enable register. <a href="#">See Table 1-148.</a>
3	driveMode2	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
2	driveMode1	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
1	driveMode0	A write to this bit sets all bits for the corresponding drive mode register of the entire port.

Table 1-148. Bit field encoding: bidir\_en\_enum

Value	Name	Description
1'b0	BIDIR_DIS	dynamic bidirectional mode disabled.
1'b1	BIDIR_EN	dynamic bidirectional mode enabled.

Table 1-149. Bit field encoding: bypass\_en\_enum

Value	Name	Description
1'b0	BYPASS_DIS	bypass function disabled.
1'b1	BYPASS_EN	bypass function enabled.

### 1.3.254 PRT12\_BIT\_MASK

#### Bit-mask for Aliased Register access

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_BIT\_MASK: 0x51CB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	bit_mask							

The bits asserted in the bit-mask register allow direct access to the data register or pin state register via the aliased registers.

Bits	Name	Description
7:0	bit_mask[7:0]	1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.

### 1.3.255 PRT12\_SIO\_REG\_HIFREQ

#### Regulated pull-up driver DC current setting

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_SIO\_REG\_HIFREQ: 0x51CC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	sio_reg_hifreq_7_6	RSVD	sio_reg_hifreq_5_4	RSVD	sio_reg_hifreq_3_2	RSVD	sio_reg_hifreq_1_0	RSVD

Sets each SIO pair's pull-up driver DC current. For output frequency  $\leq 10\text{MHz}$ , setting this low will lower the DC current on the SIO pin pair. For output frequency  $> 10\text{MHz} \leq 33\text{MHz}$ , set the bit high.

Bits	Name	Description
7	sio_reg_hifreq_7_6	pull-up driver DC current
5	sio_reg_hifreq_5_4	pull-up driver DC current
3	sio_reg_hifreq_3_2	pull-up driver DC current
1	sio_reg_hifreq_1_0	pull-up driver DC current

### 1.3.256 PRT12\_AG

#### Port Analog global enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_AG: 0x51CD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:00		R/W:00		R/W:00	
HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	AnalogGlobal_7_6		AnalogGlobal_5_4		AnalogGlobal_3_2		AnalogGlobal_1_0	

Analog global switch.

Bits	Name	Description
7:6	AnalogGlobal_7_6[1:0]	Connects analog global when asserted. <a href="#">See Table 1-150.</a>
5:4	AnalogGlobal_5_4[1:0]	Connects analog global when asserted. <a href="#">See Table 1-150.</a>
3:2	AnalogGlobal_3_2[1:0]	Connects analog global when asserted. <a href="#">See Table 1-150.</a>
1:0	AnalogGlobal_1_0[1:0]	Connects analog global when asserted. <a href="#">See Table 1-150.</a>

Table 1-150. Bit field encoding: pr12\_ag\_enum

Value	Name	Description
2'b00	NO_AG	No AG selected.
2'b01	AG0_SEL	low bit AG connection selected.
2'b10	AG1_SEL	high bit AG connection selected.
2'b11	VCCD_SEL	VCCD connection selected.

## 1.3.257 PRT12\_SIO\_CFG

### SIO Input Output Configuration

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_SIO\_CFG: 0x51CE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	ibuf_sel_7_6	vreg_en_7_6	ibuf_sel_5_4	vreg_en_5_4	ibuf_sel_3_2	vreg_en_3_2	ibuf_sel_1_0	vreg_en_1_0

Sets each SIO pair's input output Configuration. vreg\_en=0 & ibuf\_sel=0 sets the mode to Single Ended Input Buffer, Non-regulated Output Buffer. vreg\_en=0 & ibuf\_sel=1 sets the mode to Differential Input Buffer, Non-regulated Output Buffer. vreg\_en=1 & ibuf\_sel=0 sets the mode to Single Ended Input Buffer, Regulated Output Buffer. vreg\_en=1 & ibuf\_sel=1 sets the mode to Differential Input Buffer, Regulated Output Buffer.

Bits	Name	Description
7	ibuf_sel_7_6	sets the ibuf_sel for the corresponding SIO pair
6	vreg_en_7_6	sets the vreg_en for the corresponding SIO pair
5	ibuf_sel_5_4	sets the ibuf_sel for the corresponding SIO pair
4	vreg_en_5_4	sets the vreg_en for the corresponding SIO pair
3	ibuf_sel_3_2	sets the ibuf_sel for the corresponding SIO pair
2	vreg_en_3_2	sets the vreg_en for the corresponding SIO pair
1	ibuf_sel_1_0	sets the ibuf_sel for the corresponding SIO pair
0	vreg_en_1_0	sets the vreg_en for the corresponding SIO pair

### 1.3.258 PRT12\_SIO\_DIFF

#### Differential Input Buffer reference voltage selection

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_SIO\_DIFF: 0x51CF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vref_sel_7_6	vtrip_sel_7_6	vref_sel_5_4	vtrip_sel_5_4	vref_sel_3_2	vtrip_sel_3_2	vref_sel_1_0	vtrip_sel_1_0

Sets each SIO pair's input buffer switching threshold. If `ibuf_sel=0`, `vref_sel` has no impact as the single-ended receiver is used. In this case: `vtrip_sel=0` sets the single-ended input buffer threshold to CMOS levels. `vtrip_sel=1` sets the single-ended input buffer threshold to LVTTTL levels. If `ibuf_sel=1`, the differential receiver is used and `vref_sel` does have functional impact. In this case: `vref_sel=0` & `vtrip_sel=0` sets the differential input buffer threshold to  $0.5 \cdot v_{io}$ . `vref_sel=0` & `vtrip_sel=1` sets the differential input buffer threshold to  $0.4 \cdot v_{io}$ . `vref_sel=1` & `vtrip_sel=0` sets the differential input buffer threshold to  $0.5 \cdot v_{ohref}$ . `vref_sel=1` & `vtrip_sel=1` sets the differential input buffer threshold to `vohref`.

Bits	Name	Description
7	vref_sel_7_6	sets the vref_sel for the corresponding SIO pair
6	vtrip_sel_7_6	sets the vtrip_sel for the corresponding SIO pair
5	vref_sel_5_4	sets the vref_sel for the corresponding SIO pair
4	vtrip_sel_5_4	sets the vtrip_sel for the corresponding SIO pair
3	vref_sel_3_2	sets the vref_sel for the corresponding SIO pair
2	vtrip_sel_3_2	sets the vtrip_sel for the corresponding SIO pair
1	vref_sel_1_0	sets the vref_sel for the corresponding SIO pair
0	vtrip_sel_1_0	sets the vtrip_sel for the corresponding SIO pair

### 1.3.259 PRT15\_DR

#### Port Data Output Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_DR: 0x51f0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	DataReg_DM	DataReg_DP	DataReg					

This register is used to set the output data state for the corresponding GPIO port.

Bits	Name	Description
7	DataReg_DM	The data written to this register specifies the high (Data=1) or low (Data=0) state for the corresponding USB pin when GPIO mode is enabled by setting the USB.USBIO_CR1 iomode bit.
6	DataReg_DP	The data written to this register specifies the high (Data=1) or low (Data=0) state for the corresponding USB pin when GPIO mode is enabled by setting the USB.USBIO_CR1 iomode bit.
5:0	DataReg[5:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port.

## 1.3.260 PRT15\_PS

### Port Pin State Register1

**Reset:** Reset Signals Listed Below

Register : Address

PRT15\_PS: 0x51F1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:U	R:U	R:000000					
HW Access	R/W	R/W	R/W					
Retention	NONRET	NONRET	RET					
Name	PinState_DM	PinState_DP	PinState					

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7	PinState_DM	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 1'b0 Reads LOW if the pin voltage is below that threshold, logic low.
6	PinState_DP	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 1'b0 Reads LOW if the pin voltage is below that threshold, logic low.
5:0	PinState[5:0]	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 1'b0 Reads LOW if the pin voltage is below that threshold, logic low.

### Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	PinState_DP, PinState_DM
System reset for retention flops [reset_all_retention]	PinState[5:0]

### 1.3.261 PRT15\_DM0

#### Port Drive Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_DM0: 0x51F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	DriveMode_DM	DriveMode_DP	DriveMode					

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO section on IO drive modes for detailed information on the eight different drive mode configurations. The PRTx.DM0[7:6] select the drive mode setting for the limited GPIO functionality of the USBIO.

Bits	Name	Description
7	DriveMode_DM	If iomode is set to GPIO mode in USB_USBIO_CR1, driveMode_DM configures the D- pin drive mode. If IOMode is set to USB mode, driveMode_DM is ignored by the D-.
		1'b0: open drain mode. If dmi is high, DM is open drain, if dmi is low, DM forced low. 1'b1: drive out. The pin follows the Datareg_DM value
6	DriveMode_DP	Pull-up enable control for USBIO D+ pin. If iomode is set to GPIO mode in USB_USBIO_CR1, driveMode_DP configures the D+ pin drive mode. If IOMode is set to USB mode, driveMode_DP is ignored by the D+.
		1'b0: open drain mode. If dpi is high, DP is open drain, if dpi is low, DP forced low. 1'b1: drive out. The pin follows the Datareg_DP value
5:0	DriveMode[5:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high.

DM [ 2:0 ] = {PRT X .DM2 [ y ],PRT X .DM1 [ y ],PRT X .DM0 [ y ] }

DM [ 2:0 ] : Complete drive mode setting for pin [ y ] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, strong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

### 1.3.262 PRT15\_DM1

#### Port Drive Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_DM1: 0x51F3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	PullUp_en_DM	PullUp_en_DP	DriveMode					

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO section on IO drive modes for detailed information on the eight different drive mode configurations. The PRTx.DM1[7:6] enable the 5 kOhm pull-ups on the limited GPIO functionality USBIO pins.

Bits	Name	Description
7	PullUp_en_DM	<p>Pull-up enable control for USBIO D- pin.</p> <p>If iomode is set to GPIO mode in USB_USBIO_CR1, pullUp_en_DM configures the D- 5kOhm pull-up resistor. If IOMode is set to USB mode, pullUp_en_DM is ignored by the D-.</p> <p>1'b1: 5kOhm pull-up enabled on D- 1'b0: no pull-up</p>
6	PullUp_en_DP	<p>If iomode is set to GPIO mode in USB_USBIO_CR1, pullUp_en_DP configures the D+ 5kOhm pull-up resistor. If IOMode is set to USB mode, pullUp_en_DP is ignored by the D+.</p> <p>1'b1: 5kOhm pull-up enabled on D+ 1'b0: no pull-up</p>
5:0	DriveMode[5:0]	<p>1'b0 Corresponding drive mode register bit asserted low.</p> <p>1'b1 Corresponding drive mode register asserted high.</p>

$DM[2:0] = \{PRT\ X.DM2[y], PRT\ X.DM1[y], PRT\ X.DM0[y]\}$

DM[2:0] : Complete drive mode setting for pin [y] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, strong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

### 1.3.263 PRT15\_DM2

#### Port Drive Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_DM2: 0x51F4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		DriveMode					

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO section on IO drive modes for detailed information on the eight different drive mode configurations.

Bits	Name	Description
5:0	DriveMode[5:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high.

DM [ 2:0 ] = {PRT X .DM2 [ y ] ,PRT X .DM1 [ y ] ,PRT X .DM0 [ y ] }

DM [ 2:0 ] : Complete drive mode setting for pin [ y ] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, strong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

## 1.3.264 PRT15\_SLW

### Port slew rate control

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_SLW: 0x51F5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		SlwCtl					

The output drive on any I/O pin can be set to a fast edge rate mode (Slew=0) or slow edge rate mode (Slew=1) The slew rate only applies to strong output drive modes, not to resistive drive modes. Slower edge rates normally reduce EMI issues and are recommended when speed is not critical.

Bits	Name	Description
5:0	SlwCtl[5:0]	Each bit controls the output edge rate of the corresponding port pin. 1'b0 Fast edge rate mode 1'b1 Slow edge rate mode

### 1.3.265 PRT15\_BYP

#### Port Bypass enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_BYP: 0x51F6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:000000					
HW Access	R		R					
Retention	RET		RET					
Name	Bypass_usb		Bypass					

The Port Bypass Registers select output data from either the data output register or internal sources such as digital global bus. Shared USB pins must be set to GPIO mode.

Bits	Name	Description
7:6	Bypass_usb[1:0]	1'b1 Selected digital system interconnect (DSI) drives the corresponding port pin. 1'b0 DMI/DPI outputs from USB drives the corresponding port pin configured in IO mode. <i>GPIO mode must be enabled in order to bypass the shared function USB/IO pins.</i>
5:0	Bypass[5:0]	1'b1 Selected digital system interconnect (DSI) drives the corresponding port pin. 1'b0 Port logic data register drives the corresponding port pin. <i>The drive mode settings must configure the port to enable the output buffer or the DSI dynamic drive control must configure the output enable for the pad.</i>

## 1.3.266 PRT15\_BIE

### Port Bidirection enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_BIE: 0x51F7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		BidirectEn					

The Port Bidirectional Enable Registers are used to enable dynamic bidirectional mode at any pin.

Bits	Name	Description
5:0	BidirectEn[5:0]	Each bit controls the bidirectional mode of the corresponding port pin. 1'b0 Normal operation of pad. Drive mode setting configures output buffer 1'b1 Selected dynamic control DSI configures output buffer

### 1.3.267 PRT15\_INP\_DIS

#### Input buffer disable override

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_INP\_DIS: 0x51F8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	seinput_dis_dm	seinput_dis_dp	Inp_dis					

The bits asserted force the input buffers off.

Bits	Name	Description
7	seinput_dis_dm	1'b1 Single ended input disabled, IO mode disabled for USBIO. 1'b0 Single ended input enabled.
6	seinput_dis_dp	1'b1 Single ended input disabled, IO mode disabled for USBIO. 1'b0 Single ended input enabled.
5:0	Inp_dis[5:0]	1'b1 Input buffers are disabled, overrides drive mode register settings. 1'b0 Input buffers are configured based on drive mode register settings.

## 1.3.268 PRT15\_CTL

### Port wide control signals

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_CTL: 0x51F9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							vtrip_sel

The port wide vtrip select register is used to select the input buffer trip point select

Bits	Name	Description
0	vtrip_sel	The GPIO cells include a vtrip_sel signal to alter the input buffer voltage.

[See Table 1-151.](#)

Table 1-151. Bit field encoding: vtrip\_sel\_enum

Value	Name	Description
1'b0	VTRIP_CMOS	Input buffer functions as a CMOS input buffer.
1'b1	VTRIP_LVTTL	Input buffer functions as a LVTTL input buffer.

## 1.3.269 PRT15\_PRT

### Port wide configuration register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_PRT: 0x51FA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:0	W:0	W:0	NA:0	W:0	W:0	W:0	NA:0
HW Access	R	R	R	NA	R	R	R	NA
Retention	RET	RET	RET	NA	RET	RET	RET	NA
Name	byPass	slew	bidirectEn	RSVD	driveMode2	driveMode1	driveMode0	RSVD

The Port Configuration Register accesses several available configuration registers on a port-wide basis with a single bit write. The write will have no effect on reserved register bits. Please reference the applicable registers definitions.

Bits	Name	Description
7	byPass	The Bypass bit sets all the bits for the port bypass register. <a href="#">See Table 1-153.</a>
6	slew	The slew bit is the same as the corresponding bit in the port slew register.
5	bidirectEn	The BiDir En bit sets all bits for the port bidirection enable register. <a href="#">See Table 1-152.</a>
3	driveMode2	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
2	driveMode1	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
1	driveMode0	A write to this bit sets all bits for the corresponding drive mode register of the entire port.

Table 1-152. Bit field encoding: bidir\_en\_enum

Value	Name	Description
1'b0	BIDIR_DIS	dynamic bidirectional mode disabled.
1'b1	BIDIR_EN	dynamic bidirectional mode enabled.

Table 1-153. Bit field encoding: bypass\_en\_enum

Value	Name	Description
1'b0	BYPASS_DIS	bypass function disabled.
1'b1	BYPASS_EN	bypass function enabled.

### 1.3.270 PRT15\_BIT\_MASK

#### Bit-mask for Aliased Register access

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_BIT\_MASK: 0x51FB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	bit_mask_d m	bit_mask_d p	bit_mask					

The bits asserted in the bit-mask register allow direct access to the data register or pin state register via the aliased registers.

Bits	Name	Description
7	bit_mask_dm	Aliased register access of port 15[7:6] is for USB pins when configured to GPIO mode. 1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.
6	bit_mask_dp	Aliased register access of port 15[7:6] is for USB pins when configured to GPIO mode. 1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.
5:0	bit_mask[5:0]	1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.

### 1.3.271 PRT15\_AMUX

#### Port Analog global mux bus enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_AMUX: 0x51FC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		Amux					

Analog global mux switch.

Bits	Name	Description
5:0	Amux[5:0]	Connects analog mux bus to the pad when asserted.

## 1.3.272 PRT15\_AG

### Port Analog global enable

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_AG: 0x51FD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		AnalogGlobal					

Analog global switch.

Bits	Name	Description
5:0	AnalogGlobal[5:0]	Connects analog global to the pad when asserted.

### 1.3.273 PRT15\_LCD\_COM\_SEG

#### Port LCD Com seg bits.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_LCD\_COM\_SEG: 0x51FE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		com_seg					

Selects whether a pin is set as a common or segment drive pin.

Bits	Name	Description
5:0	com_seg[5:0]	Specify whether the pin will drive common or segment mode when LCD is enabled. 1'b0 Segment 1'b1 Common

### 1.3.274 PRT15\_LCD\_EN

#### Port LCD enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_LCD\_EN: 0x51FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		Lcd_en					

Enables a given pin for LCD drive mode

Bits	Name	Description
5:0	Lcd_en[5:0]	Enable the pin for LCD mode. 1'b0 Disabled 1'b1 Enabled

### 1.3.275 PRT0\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_OUT\_SEL0: 0x5200

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.276 PRT0\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_OUT\_SEL1: 0x5201

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.277 PRT0\_OE\_SEL0

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_OE\_SEL0: 0x5202

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.278 PRT0\_OE\_SEL1

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_OE\_SEL1: 0x5203

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ]}** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.279 PRT0\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_DBL\_SYNC\_IN: 0x5204

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

## 1.3.280 PRT0\_SYNC\_OUT

### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_SYNC\_OUT: 0x5205

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.281 PRT0\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT0\_CAPS\_SEL: 0x5206

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.282 PRT1\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT1\_OUT\_SEL0: 0x5208

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.283 PRT1\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT1\_OUT\_SEL1: 0x5209

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.284 PRT1\_OE\_SEL0

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT1\_OE\_SEL0: 0x520A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.285 PRT1\_OE\_SEL1

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT1\_OE\_SEL1: 0x520B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.286 PRT1\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT1\_DBL\_SYNC\_IN: 0x520C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.287 PRT1\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT1\_SYNC\_OUT: 0x520D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.288 PRT1\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT1\_CAPS\_SEL: 0x520E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.289 PRT2\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT2\_OUT\_SEL0: 0x5210

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.290 PRT2\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT2\_OUT\_SEL1: 0x5211

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.291 PRT2\_OE\_SEL0

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT2\_OE\_SEL0: 0x5212

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.292 PRT2\_OE\_SEL1

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT2\_OE\_SEL1: 0x5213

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ]}** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.293 PRT2\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT2\_DBL\_SYNC\_IN: 0x5214

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.294 PRT2\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT2\_SYNC\_OUT: 0x5215

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.295 PRT2\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT2\_CAPS\_SEL: 0x5216

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.296 PRT3\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT3\_OUT\_SEL0: 0x5218

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

## 1.3.297 PRT3\_OUT\_SEL1

### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT3\_OUT\_SEL1: 0x5219

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.298 PRT3\_OE\_SEL0

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT3\_OE\_SEL0: 0x521A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ]}** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.299 PRT3\_OE\_SEL1

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT3\_OE\_SEL1: 0x521B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.300 PRT3\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT3\_DBL\_SYNC\_IN: 0x521C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.301 PRT3\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT3\_SYNC\_OUT: 0x521D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.302 PRT3\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT3\_CAPS\_SEL: 0x521E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.303 PRT4\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT4\_OUT\_SEL0: 0x5220

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.304 PRT4\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT4\_OUT\_SEL1: 0x5221

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.305 PRT4\_OE\_SEL0

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT4\_OE\_SEL0: 0x5222

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.306 PRT4\_OE\_SEL1

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT4\_OE\_SEL1: 0x5223

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ]}** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.307 PRT4\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT4\_DBL\_SYNC\_IN: 0x5224

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.308 PRT4\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT4\_SYNC\_OUT: 0x5225

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.309 PRT4\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT4\_CAPS\_SEL: 0x5226

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.310 PRT5\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT5\_OUT\_SEL0: 0x5228

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.311 PRT5\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT5\_OUT\_SEL1: 0x5229

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.312 PRT5\_OE\_SEL0

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT5\_OE\_SEL0: 0x522A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ]}** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.313 PRT5\_OE\_SEL1

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT5\_OE\_SEL1: 0x522B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.314 PRT5\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT5\_DBL\_SYNC\_IN: 0x522C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.315 PRT5\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT5\_SYNC\_OUT: 0x522D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.316 PRT5\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT5\_CAPS\_SEL: 0x522E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.317 PRT6\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT6\_OUT\_SEL0: 0x5230

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ], PRT [ x ] OUT\_SEL0 [ y ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ], PRT [ x ] OUT\_SEL0 [ y ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.318 PRT6\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT6\_OUT\_SEL1: 0x5231

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.319 PRT6\_OE\_SEL0

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT6\_OE\_SEL0: 0x5232

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.320 PRT6\_OE\_SEL1

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT6\_OE\_SEL1: 0x5233

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ]}** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.321 PRT6\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT6\_DBL\_SYNC\_IN: 0x5234

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.322 PRT6\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT6\_SYNC\_OUT: 0x5235

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.323 PRT6\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT6\_CAPS\_SEL: 0x5236

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.324 PRT12\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_OUT\_SEL0: 0x5260

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.325 PRT12\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_OUT\_SEL1: 0x5261

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ] , PRT [ x ] OUT\_SEL0 [ y ] }** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.326 PRT12\_OE\_SEL0

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_OE\_SEL0: 0x5262

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.327 PRT12\_OE\_SEL1

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_OE\_SEL1: 0x5263

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.328 PRT12\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_DBL\_SYNC\_IN: 0x5264

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.329 PRT12\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT12\_SYNC\_OUT: 0x5265

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.330 PRT15\_OUT\_SEL0

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_OUT\_SEL0: 0x5278

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port  $x$  pin  $y$ , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [  $x$  ] OUT\_SEL1 [  $y$  ], PRT [  $x$  ] OUT\_SEL0 [  $y$  ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.331 PRT15\_OUT\_SEL1

#### Digital System Interconnect Port Pin Output Select Registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_OUT\_SEL1: 0x5279

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [ x ] OUT\_SEL1 [ y ], PRT [ x ] OUT\_SEL0 [ y ]}** TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [ x ] OUT\_SEL1 [ y ], PRT [ x ] OUT\_SEL0 [ y ]}** TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

### 1.3.332 PRT15\_OE\_SEL0

#### Dynamic Drive Strength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_OE\_SEL0: 0x527A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		portOEsel					

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ]}** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
5:0	portOEsel[5:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.333 PRT15\_OE\_SEL1

#### Dynamic Drive Stength of Port Output Enable Select registers.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_OE\_SEL1: 0x527B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		portOEsel					

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

**TAP == {PRT [ x ] OE\_SEL1 [ y ] , PRT [ x ] OE\_SEL0 [ y ] }** TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
5:0	portOEsel[5:0]	Selects which of the available taps are selected for the given I/O pin.

### 1.3.334 PRT15\_DBL\_SYNC\_IN

#### DSI double sync enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_DBL\_SYNC\_IN: 0x527C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

### 1.3.335 PRT15\_SYNC\_OUT

#### DSI sync out enable register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_SYNC\_OUT: 0x527D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

### 1.3.336 PRT15\_CAPS\_SEL

#### Global DSI select register.

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PRT15\_CAPS\_SEL: 0x527E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		sync_out					

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig\_glbl\_ctl.

Bits	Name	Description
5:0	sync_out[5:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

### 1.3.337 EMIF\_NO\_UDB

#### EMIF UDB/NO\_UDB Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

EMIF\_NO\_UDB: 0x5400

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							no_udb

This register indicates whether UDBs are generating external memory control signals or to enable EMIF to generate them for Flow Through Sync SRAM or Asynchronous SRAM. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
0	no_udb	1'b0: UDB Mode. In this mode EMIF bypasses the external memory transfer request to UDBs and UDBs should be configured to generate the control signals for external memory. 1'b1: NO_UDB Mode. In this mode, the EMIF generates the control signals for Flow through Sync SRAM or Async SRAM

### 1.3.338 EMIF\_RP\_WAIT\_STATES

#### External Memory Interface Read Path Wait States Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

EMIF\_RP\_WAIT\_STATES: 0x5401

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					rp_wait_states		

This register configures the additional wait states for read operation. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
2:0	rp_wait_states[2:0]	<p>In NO_UDB mode the following table determines the minimum number of additional clock cycles (wait states) required to complete the external read operation (this table assumes EMIF_MEMCLK_DIV is programmed correctly relative to f(HCLK)):</p> <p>0 &lt;= f(HCLK) &lt;= 19: RP_WAIT_STATES can be 0 or more</p> <p>19 &lt; f(HCLK) &lt;= 33: RP_WAIT_STATES must be &gt;= 1</p> <p>33 &lt; f(HCLK) &lt;= 41: RP_WAIT_STATES can be 0 or more</p> <p>41 &lt; f(HCLK) &lt;= 54: RP_WAIT_STATES must be &gt;= 1</p> <p>54 &lt; f(HCLK) &lt;= 67: RP_WAIT_STATES must be &gt;= 2</p> <p>67 &lt; f(HCLK) &lt;= 82: RP_WAIT_STATES must be &gt;= 2</p> <p>82 &lt; f(HCLK) &lt;= 95: RP_WAIT_STATES must be &gt;= 3</p> <p>95 &lt; f(HCLK) &lt;= 99: RP_WAIT_STATES must be &gt;= 4</p>

### 1.3.339 EMIF\_MEM\_DWN

#### External Memory Power Down Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

EMIF\_MEM\_DWN: 0x5402

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							mem_pd

This register puts the external memory into power down mode. This register is active only for Sync SRAM in NO\_UDB mode. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
0	mem_pd	1'b1: External Memory power down. 1'b0: External memory power up

### 1.3.340 EMIF\_MEMCLK\_DIV

#### External Memory Clock Divider Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

EMIF\_MEMCLK\_DIV: 0x5403

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						memclk_div	

This register sets the divider value for external memory clock frequency. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
1:0	memclk_div[1:0]	2'b00: $f(\text{EM\_clock}) = f(\text{HCLK})$ , when $f(\text{HCLK}) \leq 33\text{MHz}$ . 2'b01: $f(\text{EM\_clock}) = 1/2f(\text{HCLK})$ , when $33\text{MHz} \leq f(\text{HCLK}) \leq 67\text{MHz}$ . 2'b10: $f(\text{EM\_clock}) = 1/3f(\text{HCLK})$ , when $67\text{MHz} \leq f(\text{HCLK}) \leq 99\text{MHz}$ . 2'b11: $f(\text{EM\_clock}) = 1/4f(\text{HCLK})$ , Backup configuration.

### 1.3.341 EMIF\_CLOCK\_EN

#### EMIF Clock Enable Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

EMIF\_CLOCK\_EN: 0x5404

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							clock_en

This register enables the clock for EMIF core logic.

Bits	Name	Description
0	clock_en	<p>1'b0: Disable Clock for EMIF core logic.</p> <p>1'b1: Enable Clock for EMIF core. Along with this bit, the input 'emif_clk_en' to EMIF block should also be 1'b1 to enable the clock. This input can be made 1'b1 by setting corresponding bit in PM.ACT.CFG5 register in Power Manager.</p>

## 1.3.342 EMIF\_EM\_TYPE

### External Memory Type Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

EMIF\_EM\_TYPE: 0x5405

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							em_type

This register indicates whether to generate control signals for Sync or Async SRAM in NO\_UDB mode

Bits	Name	Description
0	em_type	1'b0: Generate control signals for Flow through Sync SRAM (CY7C1324H). 1'b1: Generate control signals for Async SRAM (CY7C1041D).

### 1.3.343 EMIF\_WP\_WAIT\_STATES

#### External Memory Interface Write Path Wait States Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

EMIF\_WP\_WAIT\_STATES: 0x5406

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					wp_wait_states		

This register configures the additional wait states for write operation. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
2:0	wp_wait_states[2:0]	<p>In NO_UDB mode the following table determines the minimum number of additional clock cycles (wait states) required to complete the external write operation (this table assumes EMIF_MEMCLK_DIV is programmed correctly relative to f(HCLK)):</p> <p>0 &lt;= f(HCLK) &lt;= 28: WP_WAIT_STATES can be 0 or more</p> <p>28 &lt; f(HCLK) &lt;= 33: WP_WAIT_STATES must be &gt;= 1</p> <p>33 &lt; f(HCLK) &lt;= 61: WP_WAIT_STATES can be 0 or more</p> <p>61 &lt; f(HCLK) &lt;= 67: WP_WAIT_STATES must be &gt;= 1</p> <p>67 &lt; f(HCLK) &lt;= 81: WP_WAIT_STATES can be 0 or more</p> <p>81 &lt; f(HCLK) &lt;= 99: WP_WAIT_STATES must be &gt;= 1</p>

### 1.3.344 SC[0..3]\_CR0

#### Switched Capacitor Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_CR0: 0x5800

SC1\_CR0: 0x5804

SC2\_CR0: 0x5808

SC3\_CR0: 0x580C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		NA:00		R/W:000			NA:0
HW Access	NA		NA		R			NA
Retention	NA		NA		RET			NA
Name	RSVD		R		mode			RSVD

Bits	Name	Description
3:1	mode[2:0]	Configuration select for the SC block

[See Table 1-154.](#)

Table 1-154. Bit field encoding: SC\_MODE\_ENUM

Value	Name	Description
3'b000	SC_MODE_NAKED_OPAMP	Naked Op-Amp
3'b001	SC_MODE_TIA	Transimpedance Amplifier (TIA)
3'b010	SC_MODE_CTMIXER	Continuous Time Mixer
3'b011	SC_MODE_NRZ_SH	Discrete Time Mixer - NRZ S/H
3'b100	SC_MODE_UNITY	Unity Gain Buffer
3'b101	SC_MODE_1ST_MOD	First Order Modulator
3'b110	SC_MODE_PGA	Programmable Gain Amplifier (PGA)
3'b111	SC_MODE_TRACKANDHOLD	Track and Hold

### 1.3.345 SC[0..3]\_CR1

#### Switched Capacitor Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_CR1: 0x5801

SC1\_CR1: 0x5805

SC2\_CR1: 0x5809

SC3\_CR1: 0x580D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:00		R/W:00	
HW Access	NA		R	R	R		R	
Retention	NA		RET	RET	RET		RET	
Name	RSVD		gain	div2	comp		drive	

Bits	Name	Description
5	gain	Controls the ratio of the feedback cap for S/H Mixer mode and PGA mode <a href="#">See Table 1-158.</a>
4	div2	When 0, the sample clock only needs to be half the desired sample frequency for S/H Mixer mode <a href="#">See Table 1-156.</a>
3:2	comp[1:0]	Selects between various compensation capacitor sizes <a href="#">See Table 1-155.</a>
1:0	drive[1:0]	Selects between current settings (I_Load (uA)) in the output buffer <a href="#">See Table 1-157.</a>

Table 1-155. Bit field encoding: SC\_COMP\_ENUM

Value	Name	Description
2'b00	SC_COMP_3P0PF	3.0pF
2'b01	SC_COMP_3P6PF	3.6pF
2'b10	SC_COMP_4P35PF	4.35pF
2'b11	SC_COMP_5P1PF	5.1pF

Table 1-156. Bit field encoding: SC\_DIV2\_ENUM

Value	Name	Description
1'b0	SC_DIV2_DISABLE	no frequency division
1'b1	SC_DIV2_ENABLE	SC CLK is divided by two

Table 1-157. Bit field encoding: SC\_DRIVE\_ENUM

Value	Name	Description
2'b00	I_LOAD_175UA	175 uA
2'b01	I_LOAD_260UA	260 uA
2'b10	I_LOAD_330UA	330 uA
2'b11	I_LOAD_400UA	400 uA

Table 1-158. Bit field encoding: SC\_GAIN\_ENUM

Value	Name	Description
-------	------	-------------

(continued)

Table 1-158. Bit field encoding: SC\_GAIN\_ENUM

1'b0	GAIN_0DB	0 dB
1'b1	GAIN_6DB	6 dB

### 1.3.346 SC[0..3]\_CR2

#### Switched Capacitor Control Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_CR2: 0x5802

SC1\_CR2: 0x5806

SC2\_CR2: 0x580A

SC3\_CR2: 0x580E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:000			R/W:00		R/W:0	R/W:0
HW Access	R	R			R		R	R
Retention	RET	RET			RET		RET	RET
Name	pga_gndvref	rval			redc		r20_40b	bias_ctrl

Bits	Name	Description
7	pga_gndvref	Programmable Gain Amplifier Application - Ground VREF <a href="#">See Table 1-160.</a>
6:4	rval[2:0]	Programmable Gain Amplifier (PGA) and Transimpedance Amplifier (TIA): Feedback resistor (Rfb) <a href="#">See Table 1-163.</a>
3:2	redc[1:0]	Another stability control setting. Adjusts capacitance between amplifier output and first stage <a href="#">See Table 1-162.</a>
1	r20_40b	PGA Mode: input impedance (Rin), Mixer Mode: input and feedback impedance (Rmix) <a href="#">See Table 1-161.</a>
0	bias_ctrl	Toggles the bias current in the amplifier between normal and 1/2 <a href="#">See Table 1-159.</a>

Table 1-159. Bit field encoding: SC\_BIAS\_CONTROL\_ENUM

Value	Name	Description
1'b0	BIAS_1X	1x current reference reduces bandwidth to increase stability
1'b1	BIAS_2X	normal operation - 2x current reference to increase bandwidth

Table 1-160. Bit field encoding: SC\_PGA\_GNDVREF\_ENUM

Value	Name	Description
1'b0	SC_PGA_GNDVREF_DIS	VREF not grounded
1'b1	SC_PGA_GNDVREF_EN	VREF grounded

Table 1-161. Bit field encoding: SC\_R20\_40B\_ENUM

Value	Name	Description
1'b0	SC_R20_40B_40K	40kOhm
1'b1	SC_R20_40B_20K	20kOhm

(continued)

Table 1-162. Bit field encoding: SC\_REDC\_ENUM

Value	Name	Description
2'b00	SC_REDC_00	Varies depending on mode. See Switched Cap documentation
2'b01	SC_REDC_01	Varies depending on mode. See Switched Cap documentation
2'b10	SC_REDC_10	Varies depending on mode. See Switched Cap documentation
2'b11	SC_REDC_11	Varies depending on mode. See Switched Cap documentation

Table 1-163. Bit field encoding: SC\_RVAL\_ENUM

Value	Name	Description
3'b000	SC_RVAL_20	20 kOhm
3'b001	SC_RVAL_30	30 kOhm
3'b010	SC_RVAL_40	40 kOhm
3'b011	SC_RVAL_80	80 kOhm
3'b100	SC_RVAL_120	120 kOhm
3'b101	SC_RVAL_250	250 kOhm
3'b110	SC_RVAL_500	500 kOhm
3'b111	SC_RVAL_1000	1 MegaOhm

### 1.3.347 DAC[0..3]\_CR0

#### DAC Block Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_CR0: 0x5820

DAC1\_CR0: 0x5824

DAC2\_CR0: 0x5828

DAC3\_CR0: 0x582C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:00		R/W:0	NA:0
HW Access	NA			R	R		R	NA
Retention	NA			RET	RET		RET	NA
Name	RSVD			mode	range		hs	RSVD

Bits	Name	Description
4	mode	Mode Bit <a href="#">See Table 1-165.</a>
3:2	range[1:0]	Ranges for mode=0 (VDAC) and mode=1 (IDAC) <a href="#">See Table 1-166.</a>
1	hs	High Speed Bit <a href="#">See Table 1-164.</a>

Table 1-164. Bit field encoding: DAC\_HS\_ENUM

Value	Name	Description
1'b0	DAC_HS_LOWPOWER	regular (low power)
1'b1	DAC_HS_HIGHSPEED	high speed (higher power)

Table 1-165. Bit field encoding: DAC\_MODE\_ENUM

Value	Name	Description
1'b0	DAC_MODE_V	voltage DAC
1'b1	DAC_MODE_I	current DAC

Table 1-166. Bit field encoding: DAC\_RANGE\_ENUM

Value	Name	Description
2'b00	DAC_RANGE_0	x0=0V to 4*vref (1.024V); 0 to 31.875uA
2'b01	DAC_RANGE_1	x1=0V to 16*vref (4.096V); 0 to 255uA
2'b10	DAC_RANGE_2	x0=0V to 4*vref (1.024V); 0 to 2.040mA
2'b11	DAC_RANGE_3	x1=0V to 16*vref (4.096V); not used

### 1.3.348 DAC[0..3]\_CR1

#### DAC Block Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_CR1: 0x5821

DAC1\_CR1: 0x5825

DAC2\_CR1: 0x5829

DAC3\_CR1: 0x582D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA		R	R	R	R	R	R
Retention	NA		RET	RET	RET	RET	RET	RET
Name	RSVD		mx_data	reset_u db_ en	mx_idir	idirbit	mx_ioff	ioffbit

Bits	Name	Description
5	mx_data	Select DATA source <a href="#">See Table 1-168.</a>
4	reset_u db_ en	DAC reset enable <a href="#">See Table 1-171.</a>
3	mx_idir	Mux selection for DAC current direction control <a href="#">See Table 1-169.</a>
2	idirbit	register source for DAC current direction <a href="#">See Table 1-167.</a>
1	mx_ioff	Mux selection for DAC current off control <a href="#">See Table 1-170.</a>
0	ioffbit	register source for DAC current off

Table 1-167. Bit field encoding: IDIRBIT\_ENUM

Value	Name	Description
1'b1	IDIR_SNK	Current sink
1'b0	IDIR_SRC	Current source

Table 1-168. Bit field encoding: MX\_DATA\_ENUM

Value	Name	Description
1'b0	MX_DATA_REG	Select register source (DACxn_D)
1'b1	MX_DATA_UDB	Select UDB source

Table 1-169. Bit field encoding: MX\_IDIR\_ENUM

Value	Name	Description
1'b0	MX_IDIR_REG	Register source idirbit selected
1'b1	MX_IDIR_UDB	UDB ictrl selected

(continued)

Table 1-170. Bit field encoding: MX\_IOFF\_ENUM

Value	Name	Description
1'b0	MX_IOFF_REG	Register source ioffbit selected
1'b1	MX_IOFF_UDB	UDB ictrl selected

Table 1-171. Bit field encoding: RESET\_UDB\_EN\_ENUM

Value	Name	Description
1'b0	RESET_UDB_EN_DISA	Disable DAC Reset Source from UDB (System reset always resets)
	BLE	
1'b1	RESET_UDB_EN_ENA	Enable DAC Reset Source from UDB
	BLE	

### 1.3.349 CMP[0..3]\_CR

#### Comparator Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_CR: 0x5840

CMP1\_CR: 0x5841

CMP2\_CR: 0x5842

CMP3\_CR: 0x5843

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:00	
HW Access	NA	R	R	R	R	R	R	
Retention	NA	RET	RET	RET	RET	RET	RET	
Name	RSVD	filt	hyst	cal_en	mx_ao	pd_override	sel	

Bits	Name	Description
6	filt	enables a glitch filter at the output of the comparator <a href="#">See Table 1-173.</a>
5	hyst	enables a hysteresis of 10mV typ. <a href="#">See Table 1-174.</a>
4	cal_en	enables shorting of the two comparator inputs for trim calibration purposes <a href="#">See Table 1-172.</a>
3	mx_ao	comparator sleep always-on logic mux control <a href="#">See Table 1-175.</a>
2	pd_override	Power down override to allow comparator to continue operating during sleep. Note: if chip wants to wakeup using p3comp resource, this bit must be set to 1. <a href="#">See Table 1-176.</a>
1:0	sel[1:0]	Selects the mode of operation of the comparator <a href="#">See Table 1-177.</a>

Table 1-172. Bit field encoding: CMP\_CAL\_EN\_ENUM

Value	Name	Description
1'b0	CMP_CAL_EN_DISABLE	Disable calibration
1'b1	CMP_CAL_EN_ENABLE	Enable calibration

Table 1-173. Bit field encoding: CMP\_FILT\_ENUM

Value	Name	Description
1'b0	CMP_FILT_DISABLE	Disable glitch filter
1'b1	CMP_FILT_ENABLE	Enable glitch filter

Table 1-174. Bit field encoding: CMP\_HYST\_ENUM

Value	Name	Description
1'b1	CMP_HYST_DISABLE	Disable hysteresis

(continued)

Table 1-174. Bit field encoding: CMP\_HYST\_ENUM

1'b0	CMP_HYST_ENABLE	Enable hysteresis
------	-----------------	-------------------

Table 1-175. Bit field encoding: CMP\_MX\_AO\_ENUM

Value	Name	Description
1'b0	CMP_MX_AO_BYPASS	Bypass comparator sleep always-on logic
1'b1	CMP_MX_AO_ENABLE	Enable comparator sleep always-on logic

Table 1-176. Bit field encoding: CMP\_PD\_OVERRIDE\_ENUM

Value	Name	Description
1'b0	CMP_PD_OVERRIDE_DISABLE	Don't override power down
1'b1	CMP_PD_OVERRIDE_ENABLE	Override power down

Table 1-177. Bit field encoding: SEL\_ENUM

Value	Name	Description
2'b00	SEL_SLOW	slow mode
2'b01	SEL_FAST	fast mode
2'b10	SEL_LP	ultra low power mode. Note: if chip wants to wakeup using p3comp resource, p3comp shall be in ultra low power mode and pd_override bit must be set to 1
2'b11	SEL_ILLEGAL	Illegal Mode

## 1.3.350 LUT[0..3]\_CR

### LUT Config Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LUT0\_CR: 0x5848

LUT1\_CR: 0x584A

LUT2\_CR: 0x584C

LUT3\_CR: 0x584E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				q			

Bits	Name	Description
3:0	q[3:0]	LUT function

[See Table 1-178.](#)

Table 1-178. Bit field encoding: LUT\_Q\_ENUM

Value	Name	Description
4'h0	LUT_Q_0	FALSE (0)
4'h1	LUT_Q_A_AND_B	A AND B
4'h2	LUT_Q_A_AND_NOTB	A AND !B
4'h3	LUT_Q_A	A
4'h4	LUT_Q_NOTA_AND_B	!A AND B
4'h5	LUT_Q_B	B

### 1.3.351 LUT[0..3]\_MX

#### LUT Input Mux Config Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LUT0\_MX: 0x5849

LUT1\_MX: 0x584B

LUT2\_MX: 0x584D

LUT3\_MX: 0x584F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:00		NA:00		R/W:00	
HW Access	NA		R		NA		R	
Retention	NA		RET		NA		RET	
Name	RSVD		mx_b		RSVD		mx_a	

Bits	Name	Description
5:4	mx_b[1:0]	Mux Select for LUT Input B <a href="#">See Table 1-179.</a>
1:0	mx_a[1:0]	Mux Select for LUT Input A <a href="#">See Table 1-179.</a>

Table 1-179. Bit field encoding: LUT\_MUX\_ENUM

Value	Name	Description
2'h0	LUT_MUX_0	CMP0 output selected
2'h1	LUT_MUX_1	CMP1 output selected
2'h2	LUT_MUX_2	CMP2 output selected
2'h3	LUT_MUX_3	CMP3 output selected

### 1.3.352 OPAMP[0..3]\_CR

#### Analog Output Buffer Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP0\_CR: 0x5858

OPAMP1\_CR: 0x585A

OPAMP2\_CR: 0x585C

OPAMP3\_CR: 0x585E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						pwr_mode	

Bits	Name	Description
1:0	pwr_mode[1:0]	Power Mode

[See Table 1-180.](#)

Table 1-180. Bit field encoding: OPAMP\_PWR\_MODE\_ENUM

Value	Name	Description
2'h0	OPAMP_PWR_MODE_ TIA	TIA (default)
2'h1	OPAMP_PWR_MODE_ SLOW	Slow
2'h2	OPAMP_PWR_MODE_ MEDIUM	Medium
2'h3	OPAMP_PWR_MODE_ FAST	Fast

### 1.3.353 OPAMP[0..3]\_RSVD

#### OPAMP reserved

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP0\_RSVD: 0x5859

OPAMP1\_RSVD: 0x585B

OPAMP2\_RSVD: 0x585D

OPAMP3\_RSVD: 0x585F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved for OPAMP expansion

### 1.3.354 LCDDAC\_CR0

#### LCD Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDAC\_CR0: 0x5868

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:000			R/W:0	NA:0	R/W:00	
HW Access	R	NA			R	NA	R	
Retention	RET	NA			RET	NA	RET	
Name	lp_en	RSVD			continous_drive	RSVD	bias_sel	

Bits	Name	Description
7	lp_en	Setting this bit allows the UDB to gate the Low Power Ack for the LCD Subsystem (lcd_lp_ack_n); When set to 0, the LCD subsystem LP ack is directly driven by the lpreq from the power manager <a href="#">See Table 1-183.</a>
3	continous_drive	This bit allows the LCDDAC to remain active when the chip goes to sleep. In this mode, the LCD-DAC drives the LCD pins while the LCD Driver is in bypass mode <a href="#">See Table 1-182.</a>
1:0	bias_sel[1:0]	Selects the LCD bias/multiplex ratio <a href="#">See Table 1-181.</a>

Table 1-181. Bit field encoding: LCDDAC\_BIAS\_SELECT\_ENUM

Value	Name	Description
2'b00	LCDDAC_BIAS_SELECT_1DIV3	v0=2.0-supply; v1=0.666*v0; v2=0.333*v0; v3=0.666*v0; v4=0.333*v0; Multiplex ratio=2:1,3:1,4:1
2'b01	LCDDAC_BIAS_SELECT_1DIV4	v0=2.0-supply; v1=0.750*v0; v2=0.500*v0; v3=0.500*v0; v4=0.250*v0; Multiplex ratio=8:1
2'b10	LCDDAC_BIAS_SELECT_1DIV5	v0=2.0-supply; v1=0.800*v0; v2=0.600*v0; v3=0.400*v0; v4=0.200*v0; Multiplex ratio=16:1
2'b11	LCDDAC_BIAS_SELECT_1DIV5_ALSO	v0=2.0-supply; v1=0.800*v0; v2=0.600*v0; v3=0.400*v0; v4=0.200*v0; Multiplex ratio=16:1

Table 1-182. Bit field encoding: LCDDAC\_CONTINUOUS\_DRIVE\_ENUM

Value	Name	Description
1'b0	LCDDAC_CONTINUOUS_DRIVE_CANCATCHZ	LCDDAC is powered down when the chip is in sleep
1'b1	LCDDAC_CONTINUOUS_DRIVE_LIVINGDEAD	LCDDAC is active when the chip is in sleep

Table 1-183. Bit field encoding: LCD\_LP\_EN\_ENUM

Value	Name	Description
1'b0	LCD_LP_EN_DISABLE	LCD UDB LP Ack Disabled
	D	

(continued)

Table 1-183. Bit field encoding: LCD\_LP\_EN\_ENUM

1'b1	LCD_LP_EN_ENABLED	LCD UDB LP Ack Enabled
------	-------------------	------------------------

### 1.3.355 LCDDAC\_CR1

#### LCDDAC Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDAC\_CR1: 0x5869

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:000000					
HW Access	NA	R	R					
Retention	NA	RET	RET					
Name	RSVD	nc	contrast_ctl					

Bits	Name	Description
6	nc	Not connected
5:0	contrast_ctl[5:0]	LCD Contrast control setting. Bit6 Not Connected; Step size is 27.3 mV @ 3.0 V supply and 50 mV @ 5.5 V supply; Min V0 should be 2 V. To achieve this, use code value 6'h00 for 5.5 V supply and 6'h21 for 3 V supply. Max V0 is equal to supply level for code value 6'h3f

[See Table 1-184.](#)

Table 1-184. Bit field encoding: LCDDAC\_D\_ENUM

Value	Name	Description
6'h0	LCDDAC_D_MIN	Minimum
6'h3f	LCDDAC_D_MAX	Max

### 1.3.356 LCDDRV\_CR

#### LCD Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDRV\_CR: 0x586A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			bypass_en	pts	invert	mode_0	dispblnk

Bits	Name	Description
4	bypass_en	<p>This bit enables bypassing the LCD Driver, so that the LCDDAC is driving the LCD glass. The LCDDAC continuous_drive bit is also set to allow the LCDDAC to remain active when the chip goes to sleep.</p> <p><a href="#">See Table 1-185.</a></p>
3	pts	<p>pts (pull-to-supply) signal enables the LCD Driver to be able to drive to supply level. In normal operation, the output of the LCD Driver is limited to VIO-0.5V whereas when the pts mode is enabled, the output can reach to VIO.</p> <p><a href="#">See Table 1-189.</a></p>
2	invert	<p>Invert LCD Display (invert display data on all pins configured as segments)</p> <p><a href="#">See Table 1-187.</a></p>
1	mode_0	<p>LCD Driver mode[0]; mode[2:1] come from DSI</p> <p>HiDrive modes: HiDrive mode is used to refresh or to write new data to the LCD glass. Reason for different drive strengths is to save power and reduce AC coupling. There are cases where common drivers face more load than segment drivers. For these cases stronger commons should be selected. Also, to reduce AC coupling, the common drivers should be stronger than segment drivers (assuming number of common pins are less than segment pins). For cases where there is a big glass with number of common pins is close to or equal to segment pins, com=4x and seg=4x should be used to reduce charge times</p> <p>LoDrive modes: The purpose of this mode is to sustain the voltage on the LCD in the case of a leakage. In the case of higher leakage due to glass type, glass size or environment temperature; stronger LoDrive mode can be used.</p> <p>Control Bits Mode Drive Strength</p> <p>mode[2:0]</p> <p>000 HiDrive seg=1x, com=1x</p> <p>001 HiDrive seg=1x, com=2x</p> <p>010 HiDrive seg=1x, com=4x</p> <p>011 HiDrive seg=2x, com=2x</p> <p>100 HiDrive seg=2x, com=4x</p> <p>101 HiDrive seg=4x, com=4x</p> <p>110 LoDrive seg=1x, com=1x</p> <p>111 LoDrive seg=2x, com=2x</p> <p><a href="#">See Table 1-188.</a></p>

(continued)

0            dispblnk            LCD Display Blank

[See Table 1-186.](#)

Table 1-185. Bit field encoding: LCD\_BYPASS\_EN\_ENUM

Value	Name	Description
1'b0	LCD_BYPASS_EN_LCD	Normal mode
	DRV_DRIVES_GLASS	
1'b1	LCD_BYPASS_EN_LCD	Bypass mode
	DAC_DRIVES_GLASS	

Table 1-186. Bit field encoding: LCD\_DISPBLNK\_ENUM

Value	Name	Description
1'b0	LCD_DISPBLNK_HIZ	When in a low power mode, set output buffer in LCD Drivers to hi impedance. This leaves intact the last image driven to the LCD display (charge will slowly leak off and the image will fade unless updated).
1'b1	LCD_DISPBLNK_BLANK	When in a low power mode, set output buffer in LCD Drivers to ground. Blanks the LCD display.

Table 1-187. Bit field encoding: LCD\_INVERT\_ENUM

Value	Name	Description
1'b0	LCD_INVERT_DISABLE	Normal display
	D	
1'b1	LCD_INVERT_ENABLE	Inverted display
	D	

Table 1-188. Bit field encoding: LCD\_MODE\_0\_ENUM

Value	Name	Description
1'b0	LCD_MODE_0_0	Depends on other signals
1'b1	LCD_MODE_0_1	Depends on other signals

Table 1-189. Bit field encoding: LCD\_PTS\_ENUM

Value	Name	Description
1'b0	LCD_PTS_0	normal operation, VOUT = VIO-0.5V
1'b1	LCD_PTS_1	pts mode enabled, VOUT = VIO

### 1.3.357 LCDTMR\_CFG

#### LCD Timer Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDTMR\_CFG: 0x586B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:000000						R/W:0	R/W:0
HW Access	R						R	R
Retention	RET						RET	RET
Name	period						clk_sel	en_timer

Bits	Name	Description
7:2	period[5:0]	LCD timer period / lcd_int period; change only when LCD timer is disabled
1	clk_sel	LCD timer clock source selection bit; change only when LCD timer is disabled <a href="#">See Table 1-190.</a>
0	en_timer	LCD timer enable bit <a href="#">See Table 1-191.</a>

Table 1-190. Bit field encoding: LCD\_CLK\_SEL\_ENUM

Value	Name	Description
1'b0	LCD_CLK_SEL_ILO_1K	ILO 1kHz
	HZ	
1'b1	LCD_CLK_SEL_ECO_8	8kHz Tap of ONEPPS (One Pulse Per Second) from 32kHz External Watch Crystal Oscillator
	KHZ	

Table 1-191. Bit field encoding: LCD\_EN\_TIMER\_ENUM

Value	Name	Description
1'b0	LCD_EN_TIMER_DISAB	LCD Timer is disabled
	LED	
1'b1	LCD_EN_TIMER_ENAB	LCD Timer is enabled
	LED	

### 1.3.358 BG\_CR0

#### Bandgap Precision Reference Control 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BG\_CR0: 0x586C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:00	
HW Access	NA				R	R	R	
Retention	NA				RET	RET	RET	
Name	RSVD				bg_vda_res_en	bg_vda_sw_abusl0	cmp_mxvn	

Bits	Name	Description
3	bg_vda_res_en	Bandgap VDA <a href="#">See Table 1-192.</a>
2	bg_vda_swabusl0	Switch Control for VDA Bandgap output to abusl0 connection <a href="#">See Table 1-193.</a>
1:0	cmp_mxvn[1:0]	Mux for comparator reference cmp1_vref <a href="#">See Table 1-194.</a>

Table 1-192. Bit field encoding: BG\_VDA\_RES\_EN\_ENUM

Value	Name	Description
1'h0	BG_VDA_RES_EN_VD_A	VDA
1'h1	BG_VDA_RES_EN_HAL_FVDA	VDA/2

Table 1-193. Bit field encoding: BG\_VDA\_SWABUSL0\_ENUM

Value	Name	Description
1'h0	BG_VDA_SWABUSL0_DISCONNECT	not connected
1'h1	BG_VDA_SWABUSL0_CONNECT	Connect VDA Bandgap output to abusl0

Table 1-194. Bit field encoding: CMP\_MXVN\_ENUM

Value	Name	Description
2'h0	CMP_MXVN_NC	not connected (NC)
2'h1	CMP_MXVN_VDA	Bandgap VREF_VDA output selected
2'h2	CMP_MXVN_CMP1	Bandgap VREF_CMP1 output selected
2'h2	CMP_MXVN_RSVD	Reserved

### 1.3.359 BG\_RSVD

#### Bandgap Precision Reference Reserved Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BG\_RSVD: 0x586D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved

### 1.3.360 CAPSL\_CFG0

#### Capsense Reference Driver Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CAPSL\_CFG0: 0x5870

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	R/W:00		R/W:0	R/W:0
HW Access	R	NA		R	R		R	R
Retention	RET	NA		RET	RET		RET	RET
Name	mxcmp	RSVD		ch_cont	refsel		boost	out_en

Bits	Name	Description
7	mxcmp	Reference Buffer channel to comparator vp mux select <a href="#">See Table 1-197.</a>
4	ch_cont	Reference Buffer Channel Selection Control <a href="#">See Table 1-196.</a>
3:2	refsel[1:0]	Reference Selection <a href="#">See Table 1-199.</a>
1	boost	High power mode <a href="#">See Table 1-195.</a>
0	out_en	Reference Buffer Output enable <a href="#">See Table 1-198.</a>

Table 1-195. Bit field encoding: CS\_BOOST\_ENUM

Value	Name	Description
1'b0	CS_BOOST_NORMAL	Normal Drive (typically 10-60pF)
1'b1	CS_BOOST_HIGH	High Drive (typical load = 0.1 to 20nF)

Table 1-196. Bit field encoding: CS\_CH\_CONT\_ENUM

Value	Name	Description
1'b0	CS_CH_CONT_VS	Ch2: Vssa path
1'b1	CS_CH_CONT_AG	Ch1: Analog Global Path

Table 1-197. Bit field encoding: CS\_MXCMP\_ENUM

Value	Name	Description
1'b0	CS_MXCMP_AG	Analog Global path connected to comparator vp mux (ch1)
1'b1	CS_MXCMP_VS	Vssa path connected to comparator vp mux (ch2)

Table 1-198. Bit field encoding: CS\_OUT\_EN\_ENUM

Value	Name	Description
1'b0	CS_OUT_EN_HIZ	tristate
1'b1	CS_OUT_EN_ON	connected

Value	Name	Description
1'h0	LPF_SWOUT_NC	LPF output not connected
1'h1	LPF_SWOUT_ABUS0	LPF output connected to Analog local bus 0 LPF0 (left): ABUSL0 LPF1 (right): ABUSR0

### 1.3.369 LPF1\_RSVD

#### LPF Reserved

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LPF1\_RSVD: 0x587B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved

### 1.3.370 ANAIF\_CFG\_MISC\_CR0

#### MISC Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

ANAIF\_CFG\_MISC\_CR0: 0x587C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							enpdb

Bits	Name	Description
0	enpdb	Analog Switch Enable Pull Down Bar (active low enable) - if enabled, all unused/opened analog routing switches will have their center nodes pulled down

[See Table 1-220.](#)

Table 1-220. Bit field encoding: ENPDB\_ENUM

Value	Name	Description
1'b0	ENPDB_ENABLE	Enable analog switch pulldown
1'b1	ENPDB_DISABLE	Disable analog switch pulldown

### 1.3.371 DSM[0..0]\_CR0

#### Delta Sigma Modulator Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_CR0: 0x5880

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		R/W:00	
HW Access	NA				R		R	
Retention	NA				RET		RET	
Name	RSVD				nonov		qlev	

Bits	Name	Description
3:2	nonov[1:0]	Non overlap delay of clock phases <a href="#">See Table 1-221.</a>
1:0	qlev[1:0]	Quantization Level choice for modulator <a href="#">See Table 1-222.</a>

Table 1-221. Bit field encoding: NONOV\_ENUM

Value	Name	Description
2'h0	NONOV_LOW	low (1.57ns, typ)
2'h1	NONOV_MEDIUM	medium (3.54ns, typ)
2'h2	NONOV_HIGH	high (6.47ns, typ)
2'h3	NONOV_VERYHIGH	very high (9.91ns, typ)

Table 1-222. Bit field encoding: QLEV\_ENUM

Value	Name	Description
2'b00	QLEV_2	2 level quantization
2'b01	QLEV_3	3 level quantization
2'b10	QLEV_9	9 level quantization
2'b11	QLEV_9_ALSO	9 level quantization

### 1.3.372 DSM[0..0]\_CR1

#### Delta Sigma Modulator Control Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_CR1: 0x5881

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:00000				
HW Access	NA	R	R	R				
Retention	NA	RET	RET	RET				
Name	RSVD	dpmode	oden	odet_th				

Bits	Name	Description
6	dpmode	Datapath mode <a href="#">See Table 1-223.</a>
5	oden	Overload detect scheme enable
4:0	odet_th[4:0]	Overload detection threshold. If the number of continuous 1s or 0s coming out of quantizer exceeds this number overload detection flag is set

Table 1-223. Bit field encoding: DPMODE\_ENUM

Value	Name	Description
1'h0	DPMODE_NORMAL	normal
1'h1	DPMODE_LOWOFFSET	low offset

### 1.3.373 DSM[0..0]\_CR2

#### Delta Sigma Modulator Control Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_CR2: 0x5882

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	R	R	R	R	R	R		
Retention	RET	RET	RET	RET	RET	RET		
Name	mx_reset	reset3_en	reset2_en	reset1_en	mod_chop_en	fchop		

Bits	Name	Description
7	mx_reset	select DSM reset source <a href="#">See Table 1-225.</a>
6	reset3_en	allow third stage integrating capacitance to be reset <a href="#">See Table 1-228.</a>
5	reset2_en	allow second stage integrating capacitance to be reset <a href="#">See Table 1-227.</a>
4	reset1_en	Allow first stage integrating capacitance to be reset <a href="#">See Table 1-226.</a>
3	mod_chop_en	Enable Modulator Chopping
2:0	fchop[2:0]	Chopping Frequency Selection. The Fclock is samplpy frequency clock <a href="#">See Table 1-224.</a>

Table 1-224. Bit field encoding: FCHOP\_ENUM

Value	Name	Description
3'h0	FCHOP_DIV2	Fclock/2
3'h1	FCHOP_DIV4	Fclock/4
3'h2	FCHOP_DIV8	Fclock/8
3'h3	FCHOP_DIV16	Fclock/16
3'h4	FCHOP_DIV32	Fclock/32
3'h5	FCHOP_DIV64	Fclock/64
3'h6	FCHOP_DIV128	Fclock/128
3'h7	FCHOP_DIV256	Fclock/256

Table 1-225. Bit field encoding: MXSELRESET\_ENUM

Value	Name	Description
1'b0	MXSELRESET_0	Select Decimator for reset source
1'b1	MXSELRESET_1	Select UDB for reset source

(continued)

Table 1-226. Bit field encoding: RESET1\_EN\_ENUM

Value	Name	Description
1'b0	RESET1_EN_DISABLE	First stage integrating capacitance cannot be reset (use when in overload, to allow for first order operation)
1'b1	RESET1_EN_ENABLE	First stage integrating capacitance can be reset

Table 1-227. Bit field encoding: RESET2\_EN\_ENUM

Value	Name	Description
1'b0	RESET2_EN_DISABLE	second stage integrating capacitance cannot be reset (use when in overload, to allow for second order operation, assuming the reset1_en bit is also cleared)
1'b1	RESET2_EN_ENABLE	second stage integrating capacitance can be reset

Table 1-228. Bit field encoding: RESET3\_EN\_ENUM

Value	Name	Description
1'b0	RESET3_EN_DISABLE	third stage integrating capacitance cannot be reset (use only for debug purposes)
1'b1	RESET3_EN_ENABLE	third stage integrating capacitance can be reset

### 1.3.374 DSM[0..0]\_CR3

#### Delta Sigma Modulator Control Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_CR3: 0x5883

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	R/W:0	R/W:0000			
HW Access	R	NA	R	R	R			
Retention	RET	NA	RET	RET	RET			
Name	sign	RSVD	mx_dout	modbitin_en	mx_modbitin			

Bits	Name	Description
7	sign	Invert sign of input <a href="#">See Table 1-232.</a>
5	mx_dout	Select DSM dout routed to UDB <a href="#">See Table 1-230.</a>
4	modbitin_en	modbitin enable <a href="#">See Table 1-229.</a>
3:0	mx_modbitin[3:0]	Select modbitin input <a href="#">See Table 1-231.</a>

Table 1-229. Bit field encoding: MODBITIN\_EN\_ENUM

Value	Name	Description
1'b0	MODBITIN_EN_DISABL	Do not allow modbit input to be mixed with modulator input
1'b1	MODBITIN_EN_ENABL	Allow modbit input to be mixed with modulator input

Table 1-230. Bit field encoding: MX\_DOUT\_ENUM

Value	Name	Description
1'b0	MX_DOUT_8BIT	Select reg OUT0=dout[7:0] (synced; w/o post processing)
1'b1	MX_DOUT_2SCOMP	Select reg OUT1={2'b0,ovdcause,ovdflag,dout2scomp} (synced; overload cause, overload flag, dout 2s complement)

Table 1-231. Bit field encoding: MX\_MODBITIN\_ENUM

Value	Name	Description
4'h0	MX_MODBITIN_LUT0	lut0_out
4'h1	MX_MODBITIN_LUT1	lut1_out
4'h2	MX_MODBITIN_LUT2	lut2_out
4'h3	MX_MODBITIN_LUT3	lut3_out
4'h4	MX_MODBITIN_LUT4	lut4_out (doesn't exist on Leopard, tied to 0)
4'h5	MX_MODBITIN_LUT5	lut5_out (doesn't exist on Leopard, tied to 0)
4'h6	MX_MODBITIN_LUT6	lut6_out (doesn't exist on Leopard, tied to 0)
4'h7	MX_MODBITIN_LUT7	lut7_out (doesn't exist on Leopard, tied to 0)

(continued)

Table 1-231. Bit field encoding: MX\_MODBITIN\_ENUM

4'h8	MX_MODBITIN_UDB	UDB
4'h9	MX_MODBITIN_CONST	constant 1
		1
4'ha	MX_MODBITIN_CONST	constant 0
		0
4'hb	MX_MODBITIN_0xB_RS	Reserved
		VD
4'hc	MX_MODBITIN_0xC_R	Reserved
		SVD
4'hd	MX_MODBITIN_0xD_R	Reserved
		SVD
4'he	MX_MODBITIN_0xE_RS	Reserved
		VD
4'hf	MX_MODBITIN_0xF_RS	Reserved
		VD

Table 1-232. Bit field encoding: SIGN\_ENUM

Value	Name	Description
1'b0	SIGN_NONINVERT	keep original polarity for the input
1'b1	SIGN_INVERT	Invert sign of input (use when trying to chop once and then average the offset value out)

### 1.3.375 DSM[0..0]\_CR4

#### Delta Sigma Modulator Control Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_CR4: 0x5884

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0000000						
HW Access	R	R						
Retention	RET	RET						
Name	fcap1_en	fcap1						

Bits	Name	Description
7	fcap1_en	Enable/Disable Capacitance path meant for DFT (Design for Testability) of the first integrator's integrating capacitance path <a href="#">See Table 1-234.</a>
6:0	fcap1[6:0]	binary weighted first stage integrating capacitance <a href="#">See Table 1-233.</a>

Table 1-233. Bit field encoding: FCAP1\_ENUM

Value	Name	Description
7'b0	FCAP1_MIN	0 fF
7'b1111111	FCAP1_MAX	Max Value = 12.7 pF
7'b0000001	FCAP1_BIT0	fcap[0] set -> +100 fF
7'b0000010	FCAP1_BIT1	fcap[1] set -> +200 fF
7'b0000100	FCAP1_BIT2	fcap[2] set -> +400 fF
7'b0001000	FCAP1_BIT3	fcap[3] set -> +800 fF
7'b0010000	FCAP1_BIT4	fcap[4] set -> +1600 fF
7'b0100000	FCAP1_BIT5	fcap[5] set -> +3200 fF
7'b1000000	FCAP1_BIT6	fcap[6] set -> +6400 fF

Table 1-234. Bit field encoding: FCAP1\_EN\_ENUM

Value	Name	Description
1'h0	FCAP1_EN_DISABLE	Disable the DFT 100fF capacitance path
1'h1	FCAP1_EN_ENABLE	Enable the DFT 100fF capacitance path

### 1.3.376 DSM[0..0]\_CR5

#### Delta Sigma Modulator Control Register 5

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_CR5: 0x5885

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0000000

2'h0	PWR_CTRL_VREF_0	VREF Buffer is operating in Low Power (26 uA) mode
2'h1	PWR_CTRL_VREF_1	VREF Buffer is operating in Medium Power (32 uA) mode
2'h2	PWR_CTRL_VREF_2	VREF Buffer is operating in High Power (118 uA) mode
2'h3	PWR_CTRL_VREF_3	VREF Buffer is operating in Turbo Power (232 uA) mode

Table 1-269. Bit field encoding: PWR\_CTRL\_VREF\_INN\_ENUM

Value	Name	Description
2'h0	PWR_CTRL_VREF_INN_LOW	VREF Buffer (Input mux path) is operating in Low Power (26uA) mode
2'h1	PWR_CTRL_VREF_INN_MEDIUM	VREF Buffer (Input mux path) is operating in Medium Power (32uA) mode
2'h2	PWR_CTRL_VREF_INN_HIGH	VREF Buffer (Input mux path) is operating in High Power (118uA) mode
2'h3	PWR_CTRL_VREF_INN_TURBO	VREF Buffer (Input mux path) is operating in Turbo Power (232uA) mode

### 1.3.389 DSM[0..0]\_REF0

#### Delta Sigma Modulator Reference Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_REF0: 0x5892

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		NA:0	R/W:0	R/W:0	R/W:000		
HW Access	R		NA	R	R	R		
Retention	RET		NA	RET	RET	RET		
Name	vcmsel		RSVD	vref_res_div_en	en_buf_vref_inn	refmux		

Bits	Name	Description
7:6	vcmsel[1:0]	Output common mode selection for modulator <a href="#">See Table 1-271.</a>
4	vref_res_div_en	If enabled it allows the resistor divided value of (VDDA/3 or VDDA/4) to a selectable voltage for the RefMux
3	en_buf_vref_inn	Enable/Disable control for ADC (internal) REFBUF1 Buffer; This buffers the ADC reference before being sent to INN Mux; See DSM chapter
2:0	refmux[2:0]	Mux control that allows for selecting one among the various available internal reference values <a href="#">See Table 1-270.</a>

Table 1-270. Bit field encoding: REFMUX\_ENUM

Value	Name	Description
3'h0	REFMUX_0	No Selection made for VCM
3'h1	REFMUX_1	VDAC0 output is the reference for the DSM
3'h2	REFMUX_2	VDDA/4 is selected as the reference for the DSM (VDDA is the external voltage supply)
3'h3	REFMUX_3	VDDA/3 is selected as the reference for the DSM (VDDA is the external voltage supply)
3'h4	REFMUX_4	internal precision bandgap reference of 1.024 (typ) is selected as the DSM reference
3'h5	REFMUX_5	internal precision bandgap reference of 1.2V (typ) is selected as the DSM reference
3'h6	REFMUX_6	N/A
3'h7	REFMUX_7	N/A

Table 1-271. Bit field encoding: VCMSEL\_ENUM

Value	Name	Description
2'h0	VCMSEL_0	No selection is made for VCM
2'h1	VCMSEL_1	0.8V from bandgap trim buffer is being selected as VCM (output common mode) for the DSM opamps
2'h2	VCMSEL_2	0.7V from bandgap trim buffer is being selected as VCM (output common mode)
2'h3	VCMSEL_3	Vssd being selected as VCM (output common mode) for the DSM opamps

### 1.3.390 DSM[0..0]\_REF1

#### Delta Sigma Modulator Reference Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_REF1: 0x5893

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							dac_gnd_sel I

Bits	Name	Description
0	dac_gnd_sel	Selects DSM Reference DAC Capacitor Ground
<a href="#">See Table 1-272.</a>		

Table 1-272. Bit field encoding: DSM\_DAC\_GND\_SEL\_ENUM

Value	Name	Description
1'b0	DSM_DAC_GND_SEL_I	select DSM internal vssa
	NT	
1'b1	DSM_DAC_GND_SEL_EXT	select external ground (AGL6)
	EXT	

### 1.3.391 DSM[0..0]\_REF2

#### Delta Sigma Modulator Reference Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_REF2: 0x5894

Bits	7	6	5	4	3	2	1	0

0	s8_en	If Set, closes the S8 switch in figure Sigma Delta Channel Analog Reference Selection in the DSM chapter; See sub-section Analog Reference Options for the Sigma Delta Channel

### 1.3.393 DSM[0..0]\_DEM0

#### Delta Sigma Modulator Dynamic Element Matching Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_DEM0: 0x5896

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			demtest_src	adc_test_en	en_dem	en_scrambler1	en_scrambler0

Bits	Name	Description
4	demtest_src	Select demtest source <a href="#">See Table 1-274.</a>
3	adc_test_en	Enable/Disable All test modes in Sigma Delta Channel <a href="#">See Table 1-273.</a>
2	en_dem	Enable DEM <a href="#">See Table 1-275.</a>
1	en_scrambler1	Enable Scrambler 1 <a href="#">See Table 1-277.</a>
0	en_scrambler0	Enable Scrambler 0 <a href="#">See Table 1-276.</a>

Table 1-273. Bit field encoding: ADC\_TEST\_EN\_ENUM

Value	Name	Description
1'h0	ADC_TEST_EN_0	Disable all test modes for the sigma delta channel
1'h1	ADC_TEST_EN_1	Enable all test modes for the sigma delta channel

Table 1-274. Bit field encoding: DEMTEST\_SRC\_ENUM

Value	Name	Description
1'h0	DEMTEST_SRC_REG	ANAIF register source selected - DSM#_DEM1.demtest[7:0]
1'h1	DEMTEST_SRC_UDB	UDB array source selected - dsi_anaif_dft[7:0]

Table 1-275. Bit field encoding: EN\_DEM\_ENUM

Value	Name	Description
1'h0	EN_DEM_DISABLE	Disable DEM
1'h1	EN_DEM_ENABLE	Enable DEM

Table 1-276. Bit field encoding: EN\_SCRAMBLER0\_ENUM

Value	Name	Description
1'h0	EN_SCRAMBLER0_DISABLE	Disable Scrambler 0
1'h1	EN_SCRAMBLER0_ENABLE	Enable Scrambler 0

(continued)

Table 1-276. Bit field encoding: EN\_SCRAMBLER0\_ENUM

1'h1	EN_SCRAMBLER0_EN	Enable Scrambler 0
	ABLE	

Table 1-277. Bit field encoding: EN\_SCRAMBLER1\_ENUM

Value	Name	Description
1'h0	EN_SCRAMBLER1_DIS	Disable Scrambler 1
	ABLE	
1'h1	EN_SCRAMBLER1_EN	Enable Scrambler 1
	ABLE	

### 1.3.394 DSM[0..0]\_DEM1

#### Delta Sigma Modulator Dynamic Element Matching Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_DEM1: 0x5897

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	demtest							

Bits	Name	Description
7:0	demtest[7:0]	Register control for the DAC unit elements inside the first integrator. This can be used when bit DSM.DEM0[3], adc_test_en, is set. If the adc_test_en is not set the the control logic inside the modulator determines how the DAC unit elements are controlled. This is meant for static testing purposes

### 1.3.395 DSM[0..0]\_BUF0

#### Delta Sigma Modulator Buffer Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_BUF0: 0x589A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					rail_rail_en	bypass_p	enable_p

Bits	Name	Description
2	rail_rail_en	Selects Rail-to-Rail Mode <a href="#">See Table 1-280.</a>
1	bypass_p	Remove positive half of the buffer from signal path <a href="#">See Table 1-278.</a>
0	enable_p	Buffer Positive Half Enable <a href="#">See Table 1-279.</a>

Table 1-278. Bit field encoding: BYPASS\_P\_ENUM

Value	Name	Description
1'b0	BYPASS_P_0	The buffer in the positive half remains on the signal path (Refer Fig 33-2)
1'b1	BYPASS_P_1	bypass the buffer on the positive half of the signal path (Refer Fig 33-2)

Table 1-279. Bit field encoding: ENABLE\_P\_ENUM

Value	Name	Description
1'b0	ENABLE_P_0	power down buffer in positive half
1'b1	ENABLE_P_1	enable positive half of buffer

Table 1-280. Bit field encoding: RAIL\_RAIL\_EN\_ENUM

Value	Name	Description
1'h0	RAIL_RAIL_EN_DISABL E	Level shifted mode
1'h1	RAIL_RAIL_EN_ENABL E	Rail-to-Rail mode

### 1.3.396 DSM[0..0]\_BUF1

#### Delta Sigma Modulator Buffer Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_BUF1: 0x589B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		R/W:0	R/W:0
HW Access	NA				R		R	R
Retention	NA				RET		RET	RET
Name	RSVD				gain		bypass_n	enable_n

Bits	Name	Description
3:2	gain[1:0]	Gain settings of 1,2,4,8 are supported <a href="#">See Table 1-283.</a>
1	bypass_n	Remove negative half of the buffer from signal path <a href="#">See Table 1-281.</a>
0	enable_n	Buffer Negative Half Enable <a href="#">See Table 1-282.</a>

Table 1-281. Bit field encoding: BYPASS\_N\_ENUM

Value	Name	Description
1'b0	BYPASS_N_DISABLE_	The buffer in the negative half remains on the signal path (Refer Fig 33-2)
1'b1	BYPASS_N_ENABLE_BYPASS	bypass the buffer on the negative half of the signal path (Refer Fig 33-2)

Table 1-282. Bit field encoding: ENABLE\_N\_ENUM

Value	Name	Description
1'b0	ENABLE_N_0	power down buffer in negative half
1'b1	ENABLE_P_1	enable negative half of buffer

Table 1-283. Bit field encoding: GAIN\_ENUM

Value	Name	Description
2'h0	GAIN_1X	1x
2'h1	GAIN_2X	2x
2'h2	GAIN_4X	4x
2'h3	GAIN_8X	8x

### 1.3.397 DSM[0..0]\_BUF2

#### Delta Sigma Modulator Buffer Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_BUF2: 0x589C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						add_extra_rc	lowpower_en

Bits	Name	Description
1	add_extra_rc	If enabled an additional RC is included at the output of the buffer differentially, to lower noise at the expense of settling else normal settling.
0	lowpower_en	Enables the lower power mode of operation. The normal power mode implies 600uA typical current consumption per opamp in the buffer.

[See Table 1-284.](#)

Table 1-284. Bit field encoding: LOWPOWER\_EN\_ENUM

Value	Name	Description
1'h0	LOWPOWER_EN_NOR	Input buffer operated in normal power mode
	MAL	
1'h1	LOWPOWER_EN_LOW	Input buffer operated in low (1/4th of normal power) power mode

### 1.3.398 DSM[0..0]\_BUF3

#### Delta Sigma Modulator Buffer Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_BUF3: 0x589D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				buf_chop_en	buf_fchop		

Bits	Name	Description
3	buf_chop_en	Enable/ Disable Chopping of the input buffer (TYPE A or B as selected in DSM_BUF0 register) <a href="#">See Table 1-285.</a>
2:0	buf_fchop[2:0]	Input Buffer Chopping frequency control <a href="#">See Table 1-286.</a>

Table 1-285. Bit field encoding: BUF\_CHOP\_EN\_ENUM

Value	Name	Description
1'b0	BUF_CHOP_EN_0	Disable Chopping of the input buffer (type is as determined by
1'b1	BUF_CHOP_EN_1	Enable Chopping of the input buffer

Table 1-286. Bit field encoding: BUF\_FCHOP\_ENUM

Value	Name	Description
3'h0	BUF_FCHOP_0	chopping frequency is fs/2
3'h1	BUF_FCHOP_1	chopping frequency is fs/4
3'h2	BUF_FCHOP_2	chopping frequency is fs/8
3'h3	BUF_FCHOP_3	chopping frequency is fs/16
3'h4	BUF_FCHOP_4	chopping frequency is fs/32
3'h5	BUF_FCHOP_5	chopping frequency is fs/64
3'h6	BUF_FCHOP_6	chopping frequency is fs/128
3'h7	BUF_FCHOP_7	chopping frequency is fs/256

### 1.3.399 DSM[0..0]\_MISC

#### Delta Sigma Modulator Miscellaneous register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_MISC: 0x589E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:0	R/W:0
HW Access	NA				R	R	NA	R
Retention	NA				RET	RET	NA	RET
Name	RSVD				swvn_src	swvp_src	RSVD	sel_iclk_cp

Bits	Name	Description
3	swvn_src	negative input routing control source <a href="#">See Table 1-287.</a>
2	swvp_src	positive input routing control source <a href="#">See Table 1-288.</a>
0	sel_iclk_cp	Select Charge Pump Internal Clock <a href="#">See Table 1-289.</a>

Table 1-287. Bit field encoding: DSM\_SWVN\_SRC\_ENUM

Value	Name	Description
1'b0	DSM_SWVN_SRC_REG	ANAIF DSM routing registers
1'b1	DSM_SWVN_SRC_UDB	UDB

Table 1-288. Bit field encoding: DSM\_SWVP\_SRC\_ENUM

Value	Name	Description
1'b0	DSM_SWVP_SRC_REG	ANAIF DSM routing registers
1'b1	DSM_SWVP_SRC_UDB	UDB

Table 1-289. Bit field encoding: SEL\_ICLK\_CP\_ENUM

Value	Name	Description
1'b0	SEL_ICLK_CP_EXT	External (DSI) Charge Pump Clock selected
	NAL	
1'b1	SEL_ICLK_CP_INT	Internal Charge Pump Clock selected
	AL	

### 1.3.400 DSM[0..0]\_RSVD1

#### Delta Sigma Modulator RSVD 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_RSVD1: 0x589F

Bits	7	6	5	4	3	2	1	0

0	vref_ag0	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-294.</a>

Table 1-294. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.405 SC0\_SW6

#### Switched Capacitor Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_SW6: 0x5A06

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							vref_abus0

Bits	Name	Description
0	vref_abus0	Connect SC signal input VREF to analog (local) bus of the same side <a href="#">See Table 1-295.</a>

Table 1-295. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.406 SC0\_SW7

#### Switched Capacitor Analog Routing Register 7

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_SW7: 0x5A07

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:00	
HW Access	NA					R/W	NA	
Retention	NA					RET	NA	
Name	RSVD					vin_vo	RSVD	

Bits	Name	Description
2	vin_vo	Connect SC signal input VIN to VO of opposite SC
<a href="#">See Table 1-296.</a>		

Table 1-296. Bit field encoding: VIN\_VO\_ENUM

Value	Name	Description
1'b0	VIN_VO_0	not connected
1'b1	VIN_VO_1	Connect VIN to VO of opposite SC

### 1.3.407 SC0\_SW8

#### Switched Capacitor Analog Routing Register 8

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_SW8: 0x5A08

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vo_ag7	RSVD	vo_ag5	RSVD	vo_ag3	RSVD	vo_ag1	RSVD

Bits	Name	Description
7	vo_ag7	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-297.</a>
5	vo_ag5	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-297.</a>
3	vo_ag3	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-297.</a>
1	vo_ag1	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-297.</a>

Table 1-297. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.408 SC0\_SW10

#### Switched Capacitor Analog Routing Register 10

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_SW10: 0x5A0A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				vo_abus3	RSVD	vo_abus1	RSVD

Bits	Name	Description
3	vo_abus3	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-298.</a>
1	vo_abus1	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-298.</a>

Table 1-298. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.409 SC0\_CLK

#### Switched Capacitor Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_CLK: 0x5A0B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	NA		R/W	R	R	R		
Retention	NA		RET	RET	RET	RET		
Name	RSVD		dyn_cntl_en	bypass_sync	clk_en	mx_clk		

Bits	Name	Description
5	dyn_cntl_en	Enable Dynamic Control (UDB generated clock source drives dynamic control) <a href="#">See Table 1-301.</a>
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-299.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-300.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-302.</a>

Table 1-299. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-300. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-301. Bit field encoding: DYN\_CNTL\_ENUM

Value	Name	Description
1'b0	DYN_CNTL_DIS	Dynamic Control Disabled
1'b1	DYN_CNTL_EN	Dynamic Control Enabled

Table 1-302. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock

(continued)

Table 1-302. Bit field encoding: MX\_CLK\_ENUM

3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

### 1.3.410 SC0\_BST

#### Switched Capacitor Boost Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC0\_BST: 0x5A0C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				bst_clk_en	mx_bst_clk		

Bits	Name	Description
3	bst_clk_en	Clock gating control <a href="#">See Table 1-303.</a>
2:0	mx_bst_clk[2:0]	Clock Selection <a href="#">See Table 1-304.</a>

Table 1-303. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-304. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

## 1.3.411 SC1\_SW0

### Switched Capacitor Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW0: 0x5A10

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vin_ag7	vin_ag6	vin_ag5	vin_ag4	vin_ag3	vin_ag2	vin_ag1	vin_ag0

Bits	Name	Description
7	vin_ag7	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>
6	vin_ag6	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>
5	vin_ag5	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>
4	vin_ag4	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>
3	vin_ag3	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>
2	vin_ag2	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>
1	vin_ag1	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>
0	vin_ag0	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-305.</a>

Table 1-305. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.412 SC1\_SW2

#### Switched Capacitor Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW2: 0x5A12

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:0	R/W:0
HW Access	NA				R	R	NA	R
Retention	NA				RET	RET	NA	RET
Name	RSVD				vin_abus3	vin_abus2	RSVD	vin_abus0

Bits	Name	Description
3	vin_abus3	Connect SC signal input VIN to analog (local) bus of the same side <a href="#">See Table 1-306.</a>
2	vin_abus2	Connect SC signal input VIN to analog (local) bus of the same side <a href="#">See Table 1-306.</a>
0	vin_abus0	Connect SC signal input VIN to analog (local) bus of the same side <a href="#">See Table 1-306.</a>

Table 1-306. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.413 SC1\_SW3

#### Switched Capacitor Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW3: 0x5A13

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	NA:000			R/W:0	R/W:0
HW Access	NA		R	NA			R	R
Retention	NA		RET	NA			RET	RET
Name	RSVD		vref_bgvref	RSVD			vin_bgvref	vin_amx

Bits	Name	Description
5	vref_bgvref	Connect SC signal input VREF to Bandgap Voltage Reference <a href="#">See Table 1-308.</a>
1	vin_bgvref	Connect SC signal input VIN to Bandgap Voltage Reference <a href="#">See Table 1-308.</a>
0	vin_amx	Connect SC signal input VIN to Analog Mux Bus <a href="#">See Table 1-307.</a>

Table 1-307. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-308. Bit field encoding: VREF\_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

### 1.3.414 SC1\_SW4

#### Switched Capacitor Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW4: 0x5A14

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	vref_ag6	RSVD	vref_ag4	RSVD	vref_ag2	RSVD	vref_ag0

Bits	Name	Description
6	vref_ag6	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-309.</a>
4	vref_ag4	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-309.</a>
2	vref_ag2	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-309.</a>
0	vref_ag0	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-309.</a>

Table 1-309. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.415 SC1\_SW6

#### Switched Capacitor Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW6: 0x5A16

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							vref_abus0

Bits	Name	Description
0	vref_abus0	Connect SC signal input VREF to analog (local) bus of the same side
<a href="#">See Table 1-310.</a>		

Table 1-310. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.416 SC1\_SW7

#### Switched Capacitor Analog Routing Register 7

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW7: 0x5A17

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:00	
HW Access	NA					R/W	NA	
Retention	NA					RET	NA	
Name	RSVD					vin_vo	RSVD	

Bits	Name	Description
2	vin_vo	Connect SC signal input VIN to VO of opposite SC <a href="#">See Table 1-311.</a>

Table 1-311. Bit field encoding: VIN\_VO\_ENUM

Value	Name	Description
1'b0	VIN_VO_0	not connected
1'b1	VIN_VO_1	Connect VIN to VO of opposite SC

## 1.3.417 SC1\_SW8

### Switched Capacitor Analog Routing Register 8

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW8: 0x5A18

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vo_ag7	RSVD	vo_ag5	RSVD	vo_ag3	RSVD	vo_ag1	RSVD

Bits	Name	Description
7	vo_ag7	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-312.</a>
5	vo_ag5	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-312.</a>
3	vo_ag3	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-312.</a>
1	vo_ag1	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-312.</a>

Table 1-312. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.418 SC1\_SW10

#### Switched Capacitor Analog Routing Register 10

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_SW10: 0x5A1A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				vo_abus3	RSVD	vo_abus1	RSVD

Bits	Name	Description
3	vo_abus3	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-313.</a>
1	vo_abus1	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-313.</a>

Table 1-313. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.419 SC1\_CLK

### Switched Capacitor Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_CLK: 0x5A1B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	NA		R/W	R	R	R		
Retention	NA		RET	RET	RET	RET		
Name	RSVD		dyn_cntl_en	bypass_sync	clk_en	mx_clk		

Bits	Name	Description
5	dyn_cntl_en	Enable Dynamic Control (UDB generated clock source drives dynamic control) <a href="#">See Table 1-316.</a>
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-314.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-315.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-317.</a>

Table 1-314. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-315. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-316. Bit field encoding: DYN\_CNTL\_ENUM

Value	Name	Description
1'b0	DYN_CNTL_DIS	Dynamic Control Disabled
1'b1	DYN_CNTL_EN	Dynamic Control Enabled

Table 1-317. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock

(continued)

Table 1-317. Bit field encoding: MX\_CLK\_ENUM

3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

### 1.3.420 SC1\_BST

#### Switched Capacitor Boost Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC1\_BST: 0x5A1C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				bst_clk_en	mx_bst_clk		

Bits	Name	Description
3	bst_clk_en	Clock gating control <a href="#">See Table 1-318.</a>
2:0	mx_bst_clk[2:0]	Clock Selection <a href="#">See Table 1-319.</a>

Table 1-318. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-319. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

### 1.3.421 SC2\_SW0

#### Switched Capacitor Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC2\_SW0: 0x5A20

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0

## 1.3.426 SC2\_SW7

### Switched Capacitor Analog Routing Register 7

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC2\_SW7: 0x5A27

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:00	
HW Access	NA					R/W	NA	
Retention	NA					RET	NA	
Name	RSVD					vin_vo	RSVD	

Bits	Name	Description
2	vin_vo	Connect SC signal input VIN to VO of opposite SC
<a href="#">See Table 1-326.</a>		

Table 1-326. Bit field encoding: VIN\_VO\_ENUM

Value	Name	Description
1'b0	VIN_VO_0	not connected
1'b1	VIN_VO_1	Connect VIN to VO of opposite SC

### 1.3.427 SC2\_SW8

#### Switched Capacitor Analog Routing Register 8

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC2\_SW8: 0x5A28

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	vo_ag6	RSVD	vo_ag4	RSVD	vo_ag2	RSVD	vo_ag0

Bits	Name	Description
6	vo_ag6	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-327.</a>
4	vo_ag4	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-327.</a>
2	vo_ag2	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-327.</a>
0	vo_ag0	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-327.</a>

Table 1-327. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.428 SC2\_SW10

### Switched Capacitor Analog Routing Register 10

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC2\_SW10: 0x5A2A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					RET	NA	RET
Name	RSVD					vo_abus2	RSVD	vo_abus0

Bits	Name	Description
2	vo_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-328.</a>
0	vo_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-328.</a>

Table 1-328. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.429 SC2\_CLK

### Switched Capacitor Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC2\_CLK: 0x5A2B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	NA		R/W	R	R	R		
Retention	NA		RET	RET	RET	RET		
Name	RSVD		dyn_cntl_en	bypass_sync	clk_en	mx_clk		

Bits	Name	Description
5	dyn_cntl_en	Enable Dynamic Control (UDB generated clock source drives dynamic control) <a href="#">See Table 1-331.</a>
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-329.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-330.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-332.</a>

Table 1-329. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-330. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-331. Bit field encoding: DYN\_CNTL\_ENUM

Value	Name	Description
1'b0	DYN_CNTL_DIS	Dynamic Control Disabled
1'b1	DYN_CNTL_EN	Dynamic Control Enabled

Table 1-332. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock

(continued)

Table 1-332. Bit field encoding: MX\_CLK\_ENUM

3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

### 1.3.430 SC2\_BST

#### Switched Capacitor Boost Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC2\_BST: 0x5A2C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				bst_clk_en	mx_bst_clk		

Bits	Name	Description
3	bst_clk_en	Clock gating control <a href="#">See Table 1-333.</a>
2:0	mx_bst_clk[2:0]	Clock Selection <a href="#">See Table 1-334.</a>

Table 1-333. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-334. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

### 1.3.431 SC3\_SW0

#### Switched Capacitor Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW0: 0x5A30

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vin_ag7	vin_ag6	vin_ag5	vin_ag4	vin_ag3	vin_ag2	vin_ag1	vin_ag0

Bits	Name	Description
7	vin_ag7	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>
6	vin_ag6	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>
5	vin_ag5	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>
4	vin_ag4	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>
3	vin_ag3	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>
2	vin_ag2	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>
1	vin_ag1	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>
0	vin_ag0	Connect SC signal input VIN to analog global of same side <a href="#">See Table 1-335.</a>

Table 1-335. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.432 SC3\_SW2

#### Switched Capacitor Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW2: 0x5A32

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	NA:0
HW Access	NA				R	R	R	NA
Retention	NA				RET	RET	RET	NA
Name	RSVD				vin_abus3	vin_abus2	vin_abus1	RSVD

Bits	Name	Description
3	vin_abus3	Connect SC signal input VIN to analog (local) bus of the same side <a href="#">See Table 1-336.</a>
2	vin_abus2	Connect SC signal input VIN to analog (local) bus of the same side <a href="#">See Table 1-336.</a>
1	vin_abus1	Connect SC signal input VIN to analog (local) bus of the same side <a href="#">See Table 1-336.</a>

Table 1-336. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.433 SC3\_SW3

#### Switched Capacitor Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW3: 0x5A33

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	NA:000			R/W:0	R/W:0
HW Access	NA		R	NA			R	R
Retention	NA		RET	NA			RET	RET
Name	RSVD		vref_bgvref	RSVD			vin_bgvref	vin_amx

Bits	Name	Description
5	vref_bgvref	Connect SC signal input VREF to Bandgap Voltage Reference <a href="#">See Table 1-338.</a>
1	vin_bgvref	Connect SC signal input VIN to Bandgap Voltage Reference <a href="#">See Table 1-338.</a>
0	vin_amx	Connect SC signal input VIN to Analog Mux Bus <a href="#">See Table 1-337.</a>

Table 1-337. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-338. Bit field encoding: VREF\_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

### 1.3.434 SC3\_SW4

#### Switched Capacitor Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW4: 0x5A34

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vref_ag7	RSVD	vref_ag5	RSVD	vref_ag3	RSVD	vref_ag1	RSVD

Bits	Name	Description
7	vref_ag7	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-339.</a>
5	vref_ag5	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-339.</a>
3	vref_ag3	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-339.</a>
1	vref_ag1	Connect SC signal input VREF to analog global of same side <a href="#">See Table 1-339.</a>

Table 1-339. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.435 SC3\_SW6

#### Switched Capacitor Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW6: 0x5A36

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	NA:0
HW Access	NA						R	NA
Retention	NA						RET	NA
Name	RSVD						vref_abus1	RSVD

Bits	Name	Description
1	vref_abus1	Connect SC signal input VREF to analog (local) bus of the same side <a href="#">See Table 1-340.</a>

Table 1-340. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.436 SC3\_SW7

#### Switched Capacitor Analog Routing Register 7

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW7: 0x5A37

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:00	
HW Access	NA					R/W	NA	
Retention	NA					RET	NA	
Name	RSVD					vin_vo	RSVD	

Bits	Name	Description
2	vin_vo	Connect SC signal input VIN to VO of opposite SC <a href="#">See Table 1-341.</a>

Table 1-341. Bit field encoding: VIN\_VO\_ENUM

Value	Name	Description
1'b0	VIN_VO_0	not connected
1'b1	VIN_VO_1	Connect VIN to VO of opposite SC

### 1.3.437 SC3\_SW8

#### Switched Capacitor Analog Routing Register 8

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW8: 0x5A38

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	vo_ag6	RSVD	vo_ag4	RSVD	vo_ag2	RSVD	vo_ag0

Bits	Name	Description
6	vo_ag6	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-342.</a>
4	vo_ag4	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-342.</a>
2	vo_ag2	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-342.</a>
0	vo_ag0	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-342.</a>

Table 1-342. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.438 SC3\_SW10

#### Switched Capacitor Analog Routing Register 10

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_SW10: 0x5A3A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					RET	NA	RET
Name	RSVD					vo_abus2	RSVD	vo_abus0

Bits	Name	Description
2	vo_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-343.</a>
0	vo_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-343.</a>

Table 1-343. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.439 SC3\_CLK

#### Switched Capacitor Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_CLK: 0x5A3B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	NA		R/W	R	R	R		
Retention	NA		RET	RET	RET	RET		
Name	RSVD		dyn_cntl_en	bypass_sync	clk_en	mx_clk		

Bits	Name	Description
5	dyn_cntl_en	Enable Dynamic Control (UDB generated clock source drives dynamic control) <a href="#">See Table 1-346.</a>
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-344.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-345.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-347.</a>

Table 1-344. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-345. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-346. Bit field encoding: DYN\_CNTL\_ENUM

Value	Name	Description
1'b0	DYN_CNTL_DIS	Dynamic Control Disabled
1'b1	DYN_CNTL_EN	Dynamic Control Enabled

Table 1-347. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock

(continued)

Table 1-347. Bit field encoding: MX\_CLK\_ENUM

3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

### 1.3.440 SC3\_BST

#### Switched Capacitor Boost Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC3\_BST: 0x5A3C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				bst_clk_en	mx_bst_clk		

Bits	Name	Description
3	bst_clk_en	Clock gating control <a href="#">See Table 1-348.</a>
2:0	mx_bst_clk[2:0]	Clock Selection <a href="#">See Table 1-349.</a>

Table 1-348. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-349. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

## 1.3.441 DAC0\_SW0

### DAC Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_SW0: 0x5A80

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						v_ag1	v_ag0

Bits	Name	Description
1	v_ag1	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-350.</a>
0	v_ag0	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-350.</a>

Table 1-350. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.442 DAC0\_SW2

### DAC Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_SW2: 0x5A82

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				v_abus3	RSVD	v_abus1	RSVD

Bits	Name	Description
3	v_abus3	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-351.</a>
1	v_abus1	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-351.</a>

Table 1-351. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.443 DAC0\_SW3

#### DAC Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_SW3: 0x5A83

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad <a href="#">See Table 1-353.</a>
4	i_amx	Connect current output to Analog Mux Bus <a href="#">See Table 1-352.</a>
0	v_amx	Connect voltage output to Analog Mux Bus <a href="#">See Table 1-352.</a>

Table 1-352. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-353. Bit field encoding: IOUT\_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

### 1.3.444 DAC0\_SW4

#### DAC Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_SW4: 0x5A84

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						i_ag1	i_ag0

Bits	Name	Description
1	i_ag1	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-354.</a>
0	i_ag0	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-354.</a>

Table 1-354. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.445 DAC0\_STROBE

### DAC Strobe Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_STROBE: 0x5A87

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0) <a href="#">See Table 1-356.</a>
2:0	mx_strobe[2:0]	Strobe source selection <a href="#">See Table 1-355.</a>

Table 1-355. Bit field encoding: MX\_STROBE\_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRI TE	Select bus write strobe source (Enable gater regardless of strobe_en setting)
3'h1	MX_STROBE_UDB_SR C	Select UDB strobe source
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_ DIG	Select clk_a0_dig
3'h5	MX_STROBE_CLK_A1_ DIG	Select clk_a1_dig
3'h6	MX_STROBE_CLK_A2_ DIG	Select clk_a2_dig
3'h7	MX_STROBE_CLK_A3_ DIG	Select clk_a3_dig

Table 1-356. Bit field encoding: STROBE\_EN\_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

### 1.3.446 DAC1\_SW0

#### DAC Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC1\_SW0: 0x5A88

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						v_ag1	v_ag0

Bits	Name	Description
1	v_ag1	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-357.</a>
0	v_ag0	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-357.</a>

Table 1-357. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.447 DAC1\_SW2

### DAC Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC1\_SW2: 0x5A8A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				v_abus3	RSVD	v_abus1	RSVD

Bits	Name	Description
3	v_abus3	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-358.</a>
1	v_abus1	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-358.</a>

Table 1-358. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.448 DAC1\_SW3

### DAC Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC1\_SW3: 0x5A8B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad <a href="#">See Table 1-360.</a>
4	i_amx	Connect current output to Analog Mux Bus <a href="#">See Table 1-359.</a>
0	v_amx	Connect voltage output to Analog Mux Bus <a href="#">See Table 1-359.</a>

Table 1-359. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-360. Bit field encoding: IOUT\_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

## 1.3.449 DAC1\_SW4

### DAC Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC1\_SW4: 0x5A8C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						i_ag1	i_ag0

Bits	Name	Description
1	i_ag1	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-361.</a>
0	i_ag0	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-361.</a>

Table 1-361. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.450 DAC1\_STROBE

### DAC Strobe Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC1\_STROBE: 0x5A8F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0)

[See Table 1-363.](#)

2:0	mx_strobe[2:0]	Strobe source selection
-----	----------------	-------------------------

[See Table 1-362.](#)

Table 1-362. Bit field encoding: MX\_STROBE\_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRI	Select bus write strobe source (Enable gater regardless of strobe_en setting)
	TE	
3'h1	MX_STROBE_UDB_SR	Select UDB strobe source
	C	
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_	Select clk_a0_dig
	DIG	
3'h5	MX_STROBE_CLK_A1_	Select clk_a1_dig
	DIG	
3'h6	MX_STROBE_CLK_A2_	Select clk_a2_dig
	DIG	
3'h7	MX_STROBE_CLK_A3_	Select clk_a3_dig
	DIG	

Table 1-363. Bit field encoding: STROBE\_EN\_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

## 1.3.451 DAC2\_SW0

### DAC Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC2\_SW0: 0x5A90

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		v_ag5	v_ag4	RSVD			

Bits	Name	Description
5	v_ag5	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-364.</a>
4	v_ag4	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-364.</a>

Table 1-364. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.452 DAC2\_SW2

### DAC Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC2\_SW2: 0x5A92

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					RET	NA	RET
Name	RSVD					v_abus2	RSVD	v_abus0

Bits	Name	Description
2	v_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-365.</a>
0	v_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-365.</a>

Table 1-365. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.453 DAC2\_SW3

#### DAC Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC2\_SW3: 0x5A93

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad <a href="#">See Table 1-367.</a>
4	i_amx	Connect current output to Analog Mux Bus <a href="#">See Table 1-366.</a>
0	v_amx	Connect voltage output to Analog Mux Bus <a href="#">See Table 1-366.</a>

Table 1-366. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-367. Bit field encoding: IOUT\_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

### 1.3.454 DAC2\_SW4

#### DAC Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC2\_SW4: 0x5A94

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		i_ag5	i_ag4	RSVD			

Bits	Name	Description
5	i_ag5	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-368.</a>
4	i_ag4	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-368.</a>

Table 1-368. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.455 DAC2\_STROBE

### DAC Strobe Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC2\_STROBE: 0x5A97

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0) <a href="#">See Table 1-370.</a>
2:0	mx_strobe[2:0]	Strobe source selection <a href="#">See Table 1-369.</a>

Table 1-369. Bit field encoding: MX\_STROBE\_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRI TE	Select bus write strobe source (Enable gater regardless of strobe_en setting)
3'h1	MX_STROBE_UDB_SR C	Select UDB strobe source
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_ DIG	Select clk_a0_dig
3'h5	MX_STROBE_CLK_A1_ DIG	Select clk_a1_dig
3'h6	MX_STROBE_CLK_A2_ DIG	Select clk_a2_dig
3'h7	MX_STROBE_CLK_A3_ DIG	Select clk_a3_dig

Table 1-370. Bit field encoding: STROBE\_EN\_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

## 1.3.456 DAC3\_SW0

### DAC Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC3\_SW0: 0x5A98

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		v_ag5	v_ag4	RSVD			

Bits	Name	Description
5	v_ag5	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-371.</a>
4	v_ag4	Connect voltage output to analog global of same side (see field instance name) <a href="#">See Table 1-371.</a>

Table 1-371. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.457 DAC3\_SW2

### DAC Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC3\_SW2: 0x5A9A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					RET	NA	RET
Name	RSVD					v_abus2	RSVD	v_abus0

Bits	Name	Description
2	v_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-372.</a>
0	v_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-372.</a>

Table 1-372. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.458 DAC3\_SW3

### DAC Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC3\_SW3: 0x5A9B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad <a href="#">See Table 1-374.</a>
4	i_amx	Connect current output to Analog Mux Bus <a href="#">See Table 1-373.</a>
0	v_amx	Connect voltage output to Analog Mux Bus <a href="#">See Table 1-373.</a>

Table 1-373. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-374. Bit field encoding: IOUT\_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

## 1.3.459 DAC3\_SW4

### DAC Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC3\_SW4: 0x5A9C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		i_ag5	i_ag4	RSVD			

Bits	Name	Description
5	i_ag5	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-375.</a>
4	i_ag4	Connect current output to analog global of same side (see field instance name) <a href="#">See Table 1-375.</a>

Table 1-375. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.460 DAC3\_STROBE

### DAC Strobe Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC3\_STROBE: 0x5A9F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0)

[See Table 1-377.](#)

2:0	mx_strobe[2:0]	Strobe source selection
-----	----------------	-------------------------

[See Table 1-376.](#)

Table 1-376. Bit field encoding: MX\_STROBE\_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRI TE	Select bus write strobe source (Enable gater regardless of strobe_en setting)
3'h1	MX_STROBE_UDB_SR C	Select UDB strobe source
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_ DIG	Select clk_a0_dig
3'h5	MX_STROBE_CLK_A1_ DIG	Select clk_a1_dig
3'h6	MX_STROBE_CLK_A2_ DIG	Select clk_a2_dig
3'h7	MX_STROBE_CLK_A3_ DIG	Select clk_a3_dig

Table 1-377. Bit field encoding: STROBE\_EN\_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

## 1.3.461 CMP0\_SW0

### Comparator Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_SW0: 0x5AC0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-378.</a>

Table 1-378. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.462 CMP0\_SW2

### Comparator Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_SW2: 0x5AC2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						vp_abus1	vp_abus0

Bits	Name	Description
1	vp_abus1	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-379.</a>
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-379.</a>

Table 1-379. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.463 CMP0\_SW3

#### Comparator Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_SW3: 0x5AC3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:00		R/W:0
HW Access	NA	R	R	R	R	NA		R
Retention	NA	RET	RET	RET	RET	NA		RET
Name	RSVD	vn_vref1	vn_vref0	vn_amx	vp_refbuf	RSVD		vp_amx

Bits	Name	Description
6	vn_vref1	Connect negative voltage input to Voltage Reference 1 <a href="#">See Table 1-382.</a>
5	vn_vref0	Connect negative voltage input to Voltage Reference 0 <a href="#">See Table 1-382.</a>
4	vn_amx	Connect negative voltage input to Analog Mux Bus <a href="#">See Table 1-380.</a>
3	vp_refbuf	Connect positive voltage input to CapSense reference buffer channel <a href="#">See Table 1-381.</a>
0	vp_amx	Connect positive voltage input to Analog Mux Bus <a href="#">See Table 1-380.</a>

Table 1-380. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-381. Bit field encoding: VP\_REFBUF\_ENUM

Value	Name	Description
1'b0	VP_REFBUF_ENABLED	disable
1'b1	VP_REFBUF_DISABLE	enable
	D	

Table 1-382. Bit field encoding: VREF\_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

### 1.3.464 CMP0\_SW4

#### Comparator Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_SW4: 0x5AC4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	vn_ag6	RSVD	vn_ag4	RSVD	vn_ag2	RSVD	vn_ag0

Bits	Name	Description
6	vn_ag6	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-383.</a>
4	vn_ag4	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-383.</a>
2	vn_ag2	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-383.</a>
0	vn_ag0	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-383.</a>

Table 1-383. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.465 CMP0\_SW6

### Comparator Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_SW6: 0x5AC6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:00	
HW Access	NA				R	R	NA	
Retention	NA				RET	RET	NA	
Name	RSVD				vn_abus3	vn_abus2	RSVD	

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-384.</a>
2	vn_abus2	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-384.</a>

Table 1-384. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.466 CMP0\_CLK

### Comparator Clock Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP0\_CLK: 0x5AC7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_syn c	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-385.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-386.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-387.</a>

Table 1-385. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-386. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-387. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

## 1.3.467 CMP1\_SW0

### Comparator Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP1\_SW0: 0x5AC8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-388.</a>

Table 1-388. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.468 CMP1\_SW2

#### Comparator Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP1\_SW2: 0x5ACA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						vp_abus1	vp_abus0

Bits	Name	Description
1	vp_abus1	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-389.</a>
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-389.</a>

Table 1-389. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.469 CMP1\_SW3

#### Comparator Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP1\_SW3: 0x5ACB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:00		R/W:0
HW Access	NA	R	R	R	R	NA		R
Retention	NA	RET	RET	RET	RET	NA		RET
Name	RSVD	vn_vref1	vn_vref0	vn_amx	vp_refbuf	RSVD		vp_amx

Bits	Name	Description
6	vn_vref1	Connect negative voltage input to Voltage Reference 1 <a href="#">See Table 1-392.</a>
5	vn_vref0	Connect negative voltage input to Voltage Reference 0 <a href="#">See Table 1-392.</a>
4	vn_amx	Connect negative voltage input to Analog Mux Bus <a href="#">See Table 1-390.</a>
3	vp_refbuf	Connect positive voltage input to CapSense reference buffer channel <a href="#">See Table 1-391.</a>
0	vp_amx	Connect positive voltage input to Analog Mux Bus <a href="#">See Table 1-390.</a>

Table 1-390. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-391. Bit field encoding: VP\_REFBUF\_ENUM

Value	Name	Description
1'b0	VP_REFBUF_ENABLED	disable
1'b1	VP_REFBUF_DISABLE	enable

Table 1-392. Bit field encoding: VREF\_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

## 1.3.470 CMP1\_SW4

### Comparator Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP1\_SW4: 0x5ACC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	vn_ag6	RSVD	vn_ag4	RSVD	vn_ag2	RSVD	vn_ag0

Bits	Name	Description
6	vn_ag6	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-393.</a>
4	vn_ag4	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-393.</a>
2	vn_ag2	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-393.</a>
0	vn_ag0	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-393.</a>

Table 1-393. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.471 CMP1\_SW6

#### Comparator Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP1\_SW6: 0x5ACE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:00	
HW Access	NA				R	R	NA	
Retention	NA				RET	RET	NA	
Name	RSVD				vn_abus3	vn_abus2	RSVD	

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-394.</a>
2	vn_abus2	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-394.</a>

Table 1-394. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.472 CMP1\_CLK

### Comparator Clock Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP1\_CLK: 0x5ACF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-395.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-396.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-397.</a>

Table 1-395. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-396. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-397. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

### 1.3.473 CMP2\_SW0

#### Comparator Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP2\_SW0: 0x5AD0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-398.</a>

Table 1-398. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.474 CMP2\_SW2

#### Comparator Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP2\_SW2: 0x5AD2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						vp_abus1	vp_abus0

Bits	Name	Description
1	vp_abus1	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-399.</a>
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-399.</a>

Table 1-399. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

### 1.3.475 CMP2\_SW3

#### Comparator Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP2\_SW3: 0x5AD3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:00		R/W:0
HW Access	NA	R	R	R	R	NA		R
Retention	NA	RET	RET	RET	RET	NA		RET
Name	RSVD	vn_vref1	vn_vref0	vn_amx	vp_refbuf	RSVD		vp_amx

Bits	Name	Description
6	vn_vref1	Connect negative voltage input to Voltage Reference 1 <a href="#">See Table 1-402.</a>
5	vn_vref0	Connect negative voltage input to Voltage Reference 0 <a href="#">See Table 1-402.</a>
4	vn_amx	Connect negative voltage input to Analog Mux Bus <a href="#">See Table 1-400.</a>
3	vp_refbuf	Connect positive voltage input to CapSense reference buffer channel <a href="#">See Table 1-401.</a>
0	vp_amx	Connect positive voltage input to Analog Mux Bus <a href="#">See Table 1-400.</a>

Table 1-400. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-401. Bit field encoding: VP\_REFBUF\_ENUM

Value	Name	Description
1'b0	VP_REFBUF_ENABLED	disable
1'b1	VP_REFBUF_DISABLE	enable

Table 1-402. Bit field encoding: VREF\_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

### 1.3.476 CMP2\_SW4

#### Comparator Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP2\_SW4: 0x5AD4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vn_ag7	RSVD	vn_ag5	RSVD	vn_ag3	RSVD	vn_ag1	RSVD

Bits	Name	Description
7	vn_ag7	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-403.</a>
5	vn_ag5	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-403.</a>
3	vn_ag3	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-403.</a>
1	vn_ag1	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-403.</a>

Table 1-403. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.477 CMP2\_SW6

#### Comparator Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP2\_SW6: 0x5AD6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:00	
HW Access	NA				R	R	NA	
Retention	NA				RET	RET	NA	
Name	RSVD				vn_abus3	vn_abus2	RSVD	

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-404.</a>
2	vn_abus2	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-404.</a>

Table 1-404. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.478 CMP2\_CLK

### Comparator Clock Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP2\_CLK: 0x5AD7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-405.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-406.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-407.</a>

Table 1-405. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-406. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-407. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

## 1.3.479 CMP3\_SW0

### Comparator Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP3\_SW0: 0x5AD8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-408.</a>

Table 1-408. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.480 CMP3\_SW2

### Comparator Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP3\_SW2: 0x5ADA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						vp_abus1	vp_abus0

Bits	Name	Description
1	vp_abus1	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-409.</a>
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-409.</a>

Table 1-409. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.481 CMP3\_SW3

### Comparator Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP3\_SW3: 0x5ADB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:00		R/W:0
HW Access	NA	R	R	R	R	NA		R
Retention	NA	RET	RET	RET	RET	NA		RET
Name	RSVD	vn_vref1	vn_vref0	vn_amx	vp_refbuf	RSVD		vp_amx

Bits	Name	Description
6	vn_vref1	Connect negative voltage input to Voltage Reference 1 <a href="#">See Table 1-412.</a>
5	vn_vref0	Connect negative voltage input to Voltage Reference 0 <a href="#">See Table 1-412.</a>
4	vn_amx	Connect negative voltage input to Analog Mux Bus <a href="#">See Table 1-410.</a>
3	vp_refbuf	Connect positive voltage input to CapSense reference buffer channel <a href="#">See Table 1-411.</a>
0	vp_amx	Connect positive voltage input to Analog Mux Bus <a href="#">See Table 1-410.</a>

Table 1-410. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-411. Bit field encoding: VP\_REFBUF\_ENUM

Value	Name	Description
1'b0	VP_REFBUF_ENABLED	disable
1'b1	VP_REFBUF_DISABLE	enable

Table 1-412. Bit field encoding: VREF\_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

## 1.3.482 CMP3\_SW4

### Comparator Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP3\_SW4: 0x5ADC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vn_ag7	RSVD	vn_ag5	RSVD	vn_ag3	RSVD	vn_ag1	RSVD

Bits	Name	Description
7	vn_ag7	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-413.</a>
5	vn_ag5	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-413.</a>
3	vn_ag3	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-413.</a>
1	vn_ag1	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-413.</a>

Table 1-413. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.483 CMP3\_SW6

#### Comparator Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP3\_SW6: 0x5ADE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:00	
HW Access	NA				R	R	NA	
Retention	NA				RET	RET	NA	
Name	RSVD				vn_abus3	vn_abus2	RSVD	

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-414.</a>
2	vn_abus2	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-414.</a>

Table 1-414. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.484 CMP3\_CLK

### Comparator Clock Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

CMP3\_CLK: 0x5ADF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-415.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-416.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-417.</a>

Table 1-415. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-416. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-417. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

## 1.3.485 DSM0\_SW0

### Delta Sigma Modulator Analog Routing Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_SW0: 0x5B00

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-418.</a>

Table 1-418. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

## 1.3.486 DSM0\_SW2

### Delta Sigma Modulator Analog Routing Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_SW2: 0x5B02

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					RET	NA	RET
Name	RSVD					vp_abus2	RSVD	vp_abus0

Bits	Name	Description
2	vp_abus2	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-419.</a>
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-419.</a>

Table 1-419. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.487 DSM0\_SW3

### Delta Sigma Modulator Analog Routing Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_SW3: 0x5B03

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	NA:00		R/W:0	NA:0	R/W:0
HW Access	NA	R	R	NA		R	NA	R
Retention	NA	RET	RET	NA		RET	NA	RET
Name	RSVD	vn_vssa	vn_vref	RSVD		vp_vssa	RSVD	vp_amx

Bits	Name	Description
6	vn_vssa	Connect negative voltage input to vssa <a href="#">See Table 1-422.</a>
5	vn_vref	Connect negative voltage input to Voltage Reference <a href="#">See Table 1-421.</a>
2	vp_vssa	Connect positive voltage input to vssa <a href="#">See Table 1-422.</a>
0	vp_amx	Connect positive voltage input to Analog Mux Bus <a href="#">See Table 1-420.</a>

Table 1-420. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-421. Bit field encoding: VREF\_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

Table 1-422. Bit field encoding: VSSA\_ENUM

Value	Name	Description
1'b0	VSSA_NC	not connected
1'b1	VSSA_CONNECTED	Connect to vssa

### 1.3.488 DSM0\_SW4

#### Delta Sigma Modulator Analog Routing Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_SW4: 0x5B04

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vn_ag7	RSVD	vn_ag5	RSVD	vn_ag3	RSVD	vn_ag1	RSVD

Bits	Name	Description
7	vn_ag7	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-423.</a>
5	vn_ag5	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-423.</a>
3	vn_ag3	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-423.</a>
1	vn_ag1	Connect negative voltage input to analog global of same side (see field instance name) <a href="#">See Table 1-423.</a>

Table 1-423. Bit field encoding: AG\_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

### 1.3.489 DSM0\_SW6

#### Delta Sigma Modulator Analog Routing Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_SW6: 0x5B06

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				vn_abus3	RSVD	vn_abus1	RSVD

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-424.</a>
1	vn_abus1	Connect negative voltage input to analog (local) bus of the same side (see field instance name) <a href="#">See Table 1-424.</a>

Table 1-424. Bit field encoding: ABUS\_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

## 1.3.490 DSM0\_CLK

### Delta Sigma Modulator Clock Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DSM0\_CLK: 0x5B07

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization <a href="#">See Table 1-425.</a>
3	clk_en	Clock gating control <a href="#">See Table 1-426.</a>
2:0	mx_clk[2:0]	Clock Selection <a href="#">See Table 1-427.</a>

Table 1-425. Bit field encoding: BYPASS\_SYNC\_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-426. Bit field encoding: CLK\_EN\_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-427. Bit field encoding: MX\_CLK\_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

## 1.3.491 OPAMP0\_MX

### Analog Buffer Input Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP0\_MX: 0x5B40

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:00		R/W:0000			
HW Access	NA		R		R			
Retention	NA		RET		RET			
Name	RSVD		mx_vn		mx_vp			

Bits	Name	Description
5:4	mx_vn[1:0]	Mux Select VN <a href="#">See Table 1-428.</a>
3:0	mx_vp[3:0]	Mux Select VP <a href="#">See Table 1-429.</a>

Table 1-428. Bit field encoding: OPAMP0\_MX\_VN\_ENUM

Value	Name	Description
2'h0	OPAMP0_MX_VN_DEF	Default - Not Connected (NC)
	AULT	
2'h1	OPAMP0_MX_VN_AG4	Mux Selection AGL[4]
2'h2	OPAMP0_MX_VN_AG6	Mux Selection AGL[6]
2'h3	OPAMP0_MX_VN_0x3	Reserved (NC)

Table 1-429. Bit field encoding: OPAMP0\_MX\_VP\_ENUM

Value	Name	Description
4'h0	OPAMP0_MX_VP_DEF	Default - Not Connected (NC)
	AULT	
4'h1	OPAMP0_MX_VP_AG4	Mux Selection: AGL[4]
4'h2	OPAMP0_MX_VP_AG5	Mux Selection: AGL[5]
4'h3	OPAMP0_MX_VP_AG6	Mux Selection: AGL[6]
4'h4	OPAMP0_MX_VP_AG7	Mux Selection: AGL[7]
4'h5	OPAMP0_MX_VP_ABU	Mux Selection: ABUSL[0]
	S0	
4'h6	OPAMP0_MX_VP_ABU	Mux Selection: ABUSL[1]
	S1	
4'h7	OPAMP0_MX_VP_ABU	Mux Selection: ABUSL[2]
	S2	
4'h8	OPAMP0_MX_VP_ABU	Mux Selection: ABUSL[3]
	S3	
4'h9	OPAMP0_MX_VP_VRE	Mux Selection: OPAMP Voltage Reference
	F	
4'ha	OPAMP0_MX_VP_H_0x	Reserved (NC)

## 1.3.492 OPAMP0\_SW

### Analog Buffer Routing Switch Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP0\_SW: 0x5B41

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					swinp	swinn	swfol

Bits	Name	Description
2	swinp	Switch Enable Positive Input
1	swinn	Switch Enable Negative Input
0	swfol	Switch Enable Follow

## 1.3.493 OPAMP1\_MX

### Analog Buffer Input Selection Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP1\_MX: 0x5B42

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:00		R/W:0000			
HW Access	NA		R		R			
Retention	NA		RET		RET			
Name	RSVD		mx_vn		mx_vp			

Bits	Name	Description
5:4	mx_vn[1:0]	Mux Select VN <a href="#">See Table 1-430.</a>
3:0	mx_vp[3:0]	Mux Select VP <a href="#">See Table 1-431.</a>

Table 1-430. Bit field encoding: OPAMP1\_MX\_VN\_ENUM

Value	Name	Description
2'h0	OPAMP1_MX_VN_DEF AULT	Default - Not Connected (NC)
2'h1	OPAMP1_MX_VN_AG4	Mux Selection AGR[4]
2'h2	OPAMP1_MX_VN_AG6	Mux Selection AGR[6]
2'h3	OPAMP1_MX_VN_0x3	Reserved (NC)

Table 1-431. Bit field encoding: OPAMP1\_MX\_VP\_ENUM

## 1.3.498 OPAMP3\_SW

### Analog Buffer Routing Switch Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

OPAMP3\_SW: 0x5B47

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					swinp	swinn	swfol

Bits	Name	Description
2	swinp	Switch Enable Positive Input
1	swinn	Switch Enable Negative Input
0	swfol	Switch Enable Follow

## 1.3.499 LCDDAC\_SW0

### LCDDAC Switch Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDAC\_SW0: 0x5B50

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw0		

Bits	Name	Description
2:0	sw0[2:0]	Switch Control for LCD_BIAS_BUS[0]

[See Table 1-436.](#)

Table 1-436. Bit field encoding: LCDDAC\_SW0\_ENUM

Value	Name	Description
3'h0	LCDDAC_SW0_NC	NC
3'h1	LCDDAC_SW0_LCDDA	LCDDAC_V0 connected to LCD_BIAS_BUS[0]
	C_V0	
3'h2	LCDDAC_SW0_ABUSR	ABUSR[0] connected to LCD_BIAS_BUS[0]
	0	
3'h3	LCDDAC_SW0_3	LCDDAC_V0 and ABUSR[0] connected to LCD_BIAS_BUS[0]
3'h4	LCDDAC_SW0_ABUSR	ABUSR[1] connected to LCD_BIAS_BUS[0]
	1	
3'h5	LCDDAC_SW0_5	LCDDAC_V0 and ABUSR[1] connected to LCD_BIAS_BUS[0]
3'h6	LCDDAC_SW0_6	ABUSR[0] and ABUSR[1] connected to LCD_BIAS_BUS[0]
3'h7	LCDDAC_SW0_7	LCDDAC_V0 and ABUSR[0] and ABUSR[1] connected to LCD_BIAS_BUS[0]

## 1.3.500 LCDDAC\_SW1

### LCDDAC Switch Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDAC\_SW1: 0x5B51

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw1		

Bits	Name	Description
2:0	sw1[2:0]	Switch Control for LCD_BIAS_BUS[1]

[See Table 1-437.](#)

Table 1-437. Bit field encoding: LCDDAC\_SW1\_ENUM

Value	Name	Description
3'h0	LCDDAC_SW1_NC	NC
3'h1	LCDDAC_SW1_LCDDA C_V1	LCDDAC_V1 connected to LCD_BIAS_BUS[1]
3'h2	LCDDAC_SW1_ABUSL 0	ABUSL[0] connected to LCD_BIAS_BUS[1]
3'h3	LCDDAC_SW1_3	LCDDAC_V1 and ABUSL[0] connected to LCD_BIAS_BUS[1]
3'h4	LCDDAC_SW1_ABUSL 1	ABUSL[1] connected to LCD_BIAS_BUS[1]
3'h5	LCDDAC_SW1_5	LCDDAC_V1 and ABUSL[1] connected to LCD_BIAS_BUS[1]
3'h6	LCDDAC_SW1_6	ABUSL[0] and ABUSL[1] connected to LCD_BIAS_BUS[1]
3'h7	LCDDAC_SW1_7	LCDDAC_V1 and ABUSL[0] and ABUSL[1] connected to LCD_BIAS_BUS[1]

## 1.3.501 LCDDAC\_SW2

### LCDDAC Switch Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDAC\_SW2: 0x5B52

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw2		

Bits	Name	Description
2:0	sw2[2:0]	Switch Control for LCD_BIAS_BUS[2] <a href="#">See Table 1-438.</a>

Table 1-438. Bit field encoding: LCDDAC\_SW2\_ENUM

Value	Name	Description
3'h0	LCDDAC_SW2_NC	NC
3'h1	LCDDAC_SW2_LCDDA	LCDDAC_V2 connected to LCD_BIAS_BUS[2]
	C_V2	
3'h2	LCDDAC_SW2_ABUSR	ABUSR[2] connected to LCD_BIAS_BUS[2]
	2	
3'h3	LCDDAC_SW2_3	LCDDAC_V2 and ABUSR[2] connected to LCD_BIAS_BUS[2]
3'h4	LCDDAC_SW2_ABUSR	ABUSR[3] connected to LCD_BIAS_BUS[2]
	3	
3'h5	LCDDAC_SW2_5	LCDDAC_V2 and ABUSR[3] connected to LCD_BIAS_BUS[2]
3'h6	LCDDAC_SW2_6	ABUSR[2] and ABUSR[3] connected to LCD_BIAS_BUS[2]
3'h7	LCDDAC_SW2_7	LCDDAC_V2 and ABUSR[2] and ABUSR[3] connected to LCD_BIAS_BUS[2]

## 1.3.502 LCDDAC\_SW3

### LCDDAC Switch Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDAC\_SW3: 0x5B53

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw3		

Bits	Name	Description
2:0	sw3[2:0]	Switch Control for LCD_BIAS_BUS[3]

[See Table 1-439.](#)

Table 1-439. Bit field encoding: LCDDAC\_SW3\_ENUM

Value	Name	Description
3'h0	LCDDAC_SW3_NC	NC
3'h1	LCDDAC_SW3_LCDDA C_V3	LCDDAC_V3 connected to LCD_BIAS_BUS[3]
3'h2	LCDDAC_SW3_ABUSL 2	ABUSL[2] connected to LCD_BIAS_BUS[3]
3'h3	LCDDAC_SW3_3	LCDDAC_V3 and ABUSL[2] connected to LCD_BIAS_BUS[3]
3'h4	LCDDAC_SW3_ABUSL 3	ABUSL[3] connected to LCD_BIAS_BUS[3]
3'h5	LCDDAC_SW3_5	LCDDAC_V3 and ABUSL[3] connected to LCD_BIAS_BUS[3]
3'h6	LCDDAC_SW3_6	ABUSL[2] and ABUSL[3] connected to LCD_BIAS_BUS[3]
3'h7	LCDDAC_SW3_7	LCDDAC_V3 and ABUSL[2] and ABUSL[3] connected to LCD_BIAS_BUS[3]

### 1.3.503 LCDDAC\_SW4

#### LCDDAC Switch Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LCDDAC\_SW4: 0x5B54

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw4		

Bits	Name	Description
2:0	sw4[2:0]	Switch Control for LCD_BIAS_BUS[4] <a href="#">See Table 1-440.</a>

Table 1-440. Bit field encoding: LCDDAC\_SW4\_ENUM

Value	Name	Description
3'h0	LCDDAC_SW4_NC	NC
3'h1	LCDDAC_SW4_LCDDA	LCDDAC_V4 connected to LCD_BIAS_BUS[4]
	C_V4	
3'h2	LCDDAC_SW4_AMUXB	AMUXBUSR connected to LCD_BIAS_BUS[4]
	USR	
3'h3	LCDDAC_SW4_3	LCDDAC_V4 and AMUXBUSR connected to LCD_BIAS_BUS[4]
3'h4	LCDDAC_SW4_AMUXB	AMUXBUSL connected to LCD_BIAS_BUS[4]
	USL	
3'h5	LCDDAC_SW4_5	LCDDAC_V4 and AMUXBUSL connected to LCD_BIAS_BUS[4]
3'h6	LCDDAC_SW4_6	AMUXBUSR and AMUXBUSL connected to LCD_BIAS_BUS[4]
3'h7	LCDDAC_SW4_7	LCDDAC_V4 and AMUXBUSR and AMUXBUSL connected to LCD_BIAS_BUS[4]

## 1.3.504 SC\_MISC

### Switched Cap Miscellaneous Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC\_MISC: 0x5B56

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:00		R/W:0	R/W:0
HW Access	NA		R	R	NA		R	R
Retention	NA		RET	RET	NA		RET	RET
Name	RSVD		sc_pump_force	sc_pump_auto	RSVD		diff_pga_1_3	diff_pga_0_2

Bits	Name	Description
5	sc_pump_force	force pumping - if block enabled enable pump regardless of voltage state
4	sc_pump_auto	enable autopumping - if block enabled pump when low voltage detected
1	diff_pga_1_3	Switched Cap Pair Connect for Differential Amplifier Applications <a href="#">See Table 1-441.</a>
0	diff_pga_0_2	Switched Cap Pair Connect for Differential Amplifier Applications <a href="#">See Table 1-441.</a>

Table 1-441. Bit field encoding: SC\_DIFF\_PGA\_ENUM

Value	Name	Description
1'h0	SC_DIFF_PGA_DISABLED	Differential PGA pair connect disabled
1'h1	SC_DIFF_PGA_ENABLED	Differential PGA pair connect enabled

## 1.3.505 BUS\_SW0

### Bus Switch Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BUS\_SW0: 0x5B58

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	ag7	ag6	ag5	ag4	ag3	ag2	ag1	ag0

Bits	Name	Description
7	ag7	Connect Left and Right Analog Globals <a href="#">See Table 1-449.</a>
6	ag6	Connect Left and Right Analog Globals <a href="#">See Table 1-448.</a>
5	ag5	Connect Left and Right Analog Globals <a href="#">See Table 1-447.</a>
4	ag4	Connect Left and Right Analog Globals <a href="#">See Table 1-446.</a>
3	ag3	Connect Left and Right Analog Globals <a href="#">See Table 1-445.</a>
2	ag2	Connect Left and Right Analog Globals <a href="#">See Table 1-444.</a>
1	ag1	Connect Left and Right Analog Globals <a href="#">See Table 1-443.</a>
0	ag0	Connect Left and Right Analog Globals <a href="#">See Table 1-442.</a>

Table 1-442. Bit field encoding: AG0\_ENUM

Value	Name	Description
1'b0	AG0_NC	Disconnect AGL[0] and AGR[0]
1'b1	AG0_CONNECT	Connect AGL[0] and AGR[0]

Table 1-443. Bit field encoding: AG1\_ENUM

Value	Name	Description
1'b0	AG1_NC	Disconnect AGL[1] and AGR[1]
1'b1	AG1_CONNECT	Connect AGL[1] and AGR[1]

(continued)

Table 1-444. Bit field encoding: AG2\_ENUM

Value	Name	Description
1'b0	AG2_NC	Disconnect AGL[2] and AGR[2]
1'b1	AG2_CONNECT	Connect AGL[2] and AGR[2]

Table 1-445. Bit field encoding: AG3\_ENUM

Value	Name	Description
1'b0	AG3_NC	Disconnect AGL[3] and AGR[3]
1'b1	AG3_CONNECT	Connect AGL[3] and AGR[3]

Table 1-446. Bit field encoding: AG4\_ENUM

Value	Name	Description
1'b0	AG4_NC	Disconnect AGL[4] and AGR[4]
1'b1	AG4_CONNECT	Connect AGL[4] and AGR[4]

Table 1-447. Bit field encoding: AG5\_ENUM

Value	Name	Description
1'b0	AG5_NC	Disconnect AGL[5] and AGR[5]
1'b1	AG5_CONNECT	Connect AGL[5] and AGR[5]

Table 1-448. Bit field encoding: AG6\_ENUM

Value	Name	Description
1'b0	AG6_NC	Disconnect AGL[6] and AGR[6]
1'b1	AG6_CONNECT	Connect AGL[6] and AGR[6]

Table 1-449. Bit field encoding: AG7\_ENUM

Value	Name	Description
1'b0	AG7_NC	Disconnect AGL[7] and AGR[7]
1'b1	AG7_CONNECT	Connect AGL[7] and AGR[7]

## 1.3.506 BUS\_SW2

### Bus Switch Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BUS\_SW2: 0x5B5A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				abus3	abus2	abus1	abus0

Bits	Name	Description
3	abus3	Connect Left and Right Analog (local) Buses <a href="#">See Table 1-453.</a>
2	abus2	Connect Left and Right Analog (local) Buses <a href="#">See Table 1-452.</a>
1	abus1	Connect Left and Right Analog (local) Buses <a href="#">See Table 1-451.</a>
0	abus0	Connect Left and Right Analog (local) Buses <a href="#">See Table 1-450.</a>

Table 1-450. Bit field encoding: ABUS0\_ENUM

Value	Name	Description
1'b0	ABUS0_NC	Disconnect ABUSL[0] and ABUSR[0]
1'b1	ABUS0_CONNECT	Connect ABUSL[0] and ABUSR[0]

Table 1-451. Bit field encoding: ABUS1\_ENUM

Value	Name	Description
1'b0	ABUS1_NC	Disconnect ABUSL[1] and ABUSR[1]
1'b1	ABUS1_CONNECT	Connect ABUSL[1] and ABUSR[1]

Table 1-452. Bit field encoding: ABUS2\_ENUM

Value	Name	Description
1'b0	ABUS2_NC	Disconnect ABUSL[2] and ABUSR[2]
1'b1	ABUS2_CONNECT	Connect ABUSL[2] and ABUSR[2]

Table 1-453. Bit field encoding: ABUS3\_ENUM

Value	Name	Description
1'b0	ABUS3_NC	Disconnect ABUSL[3] and ABUSR[3]
1'b1	ABUS3_CONNECT	Connect ABUSL[3] and ABUSR[3]

## 1.3.507 BUS\_SW3

### Bus Switch Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BUS\_SW3: 0x5B5B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		NA:0	R/W:0
HW Access	NA				R		NA	R
Retention	NA				RET		NA	RET
Name	RSVD				power2ag_sel		RSVD	amx

Bits	Name	Description
3:2	power2ag_sel[1:0]	Connect power pins to Analog Global <a href="#">See Table 1-455.</a>
0	amx	Connect Left and Righth Analog Mux Bus <a href="#">See Table 1-454.</a>

Table 1-454. Bit field encoding: AMX\_ENUM

Value	Name	Description
1'b0	AMX_NC	Disconnect AMXL and AMXR
1'b1	AMX_CONNECT	Connect AMXL and AMXR

Table 1-455. Bit field encoding: POWER2AG\_SEL\_ENUM

Value	Name	Description
2'h0	POWER2AG_SEL_NC	AGL[3] not connected to power pins
2'h1	POWER2AG_SEL_VDD	AGL[3] connected to vdda
	A	
2'h2	POWER2AG_SEL_VDD	AGL[3] connected to vddd
	D	
2'h3	POWER2AG_SEL_VBA	AGL[3] connected to vbat (RC filtered)
	T	

## 1.3.508 DAC[0..3]\_D

### DAC Data Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DAC0\_D: 0x5B80

DAC1\_D: 0x5B81

DAC2\_D: 0x5B82

DAC3\_D: 0x5B83

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	data							

This register stores the DAC output data. This register is retained during low power modes, however the internal registers inside the DAC are not. To drive out DAC data upon return from low power modes, this register must be rewritten or the DAC must be strobed once.

Bits	Name	Description
7:0	data[7:0]	8 DAC data bits. These bits are retained in low power modes, but internal DAC state is not. To drive DAC data out upon return from lower power modes, this register must be rewritten or a DAC strobe supplied.

## 1.3.509 DSM[0..0]\_OUT0

### DSM Output Register 0

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DSM0\_OUT0: 0x5B88

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	dout							

Bits	Name	Description
7:0	dout[7:0]	DSM output

## 1.3.510 DSM[0..0]\_OUT1

### DSM Output Register 1

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DSM0\_OUT1: 0x5B89

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R:0	R:0	R:0000			
HW Access	NA		W	W	W			
Retention	NA		NONRET	NONRET	NONRET			
Name	RSVD		ovdcause	ovdflag	dout2scomp			

Bits	Name	Description
5	ovdcause	Overload Cause <a href="#">See Table 1-457.</a>
4	ovdflag	Overload detected
3:0	dout2scomp[3:0]	DSM Output Register 1 <a href="#">See Table 1-456.</a>

Table 1-456. Bit field encoding: DSM\_DOUT2SCOMP\_ENUM

Value	Name	Description
4'h0	DSM_DOUT2SCOMP_0	NA (qlev=00); 0 (qlev=01); 0 (qlev=10)
4'h1	DSM_DOUT2SCOMP_1	+1 (qlev=00); +1 (qlev=01); +1 (qlev=10)
4'h2	DSM_DOUT2SCOMP_2	NA (qlev=00); NA (qlev=01); +2 (qlev=10)
4'h3	DSM_DOUT2SCOMP_3	NA (qlev=00); NA (qlev=01); +3 (qlev=10)
4'h4	DSM_DOUT2SCOMP_4	NA (qlev=00); NA (qlev=01); +4 (qlev=10)
4'h5	DSM_DOUT2SCOMP_5	NA (qlev=00); NA (qlev=01); NA (qlev=10)
4'h6	DSM_DOUT2SCOMP_6	NA (qlev=00); NA (qlev=01); NA (qlev=10)
4'h7	DSM_DOUT2SCOMP_7	NA (qlev=00); NA (qlev=01); NA (qlev=10)
4'h8	DSM_DOUT2SCOMP_8	NA (qlev=00); NA (qlev=01); NA (qlev=10)
4'h9	DSM_DOUT2SCOMP_9	NA (qlev=00); NA (qlev=01); NA (qlev=10)
4'ha	DSM_DOUT2SCOMP_10	NA (qlev=00); NA (qlev=01); NA (qlev=10)
4'hb	DSM_DOUT2SCOMP_11	NA (qlev=00); NA (qlev=01); NA (qlev=10)
4'hc	DSM_DOUT2SCOMP_12	NA (qlev=00); NA (qlev=01); -4 (qlev=10)
4'hd	DSM_DOUT2SCOMP_13	NA (qlev=00); NA (qlev=01); -3 (qlev=10)
4'he	DSM_DOUT2SCOMP_14	NA (qlev=00); NA (qlev=01); -2 (qlev=10)
4'hf	DSM_DOUT2SCOMP_15	-1 (qlev=00); -1 (qlev=01); -1 (qlev=10)

Table 1-457. Bit field encoding: OVDCAUSE\_ENUM

Value	Name	Description
1'b0	OVDCAUSE_0	0s overload
1'b1	OVDCAUSE_1	1s overload

## 1.3.511 LUT\_SR

### LUT Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

LUT\_SR: 0x5B90

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				RC:0	RC:0	RC:0	RC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				lut3_out	lut2_out	lut1_out	lut0_out

Clear-on-read sticky status register

Bits	Name	Description
3	lut3_out	LUT output
2	lut2_out	LUT output
1	lut1_out	LUT output
0	lut0_out	LUT output

## 1.3.512 LUT\_WRK1

### Reserved

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LUT\_WRK1: 0x5B91

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved

### 1.3.513 LUT\_MSK

#### LUT Interrupt ReQuest (IRQ) Mask Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LUT\_MSK: 0x5B92

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				lut3_msk	lut2_msk	lut1_msk	lut0_msk

Bits	Name	Description
3	lut3_msk	Enable LUT IRQ <a href="#">See Table 1-458.</a>
2	lut2_msk	Enable LUT IRQ <a href="#">See Table 1-458.</a>
1	lut1_msk	Enable LUT IRQ <a href="#">See Table 1-458.</a>
0	lut0_msk	Enable LUT IRQ <a href="#">See Table 1-458.</a>

Table 1-458. Bit field encoding: LUT\_MSK\_ENUM

Value	Name	Description
1'b1	LUT_MSK_ENABLE	enable LUT IRQ
1'b0	LUT_MSK_DISABLE	disable LUT IRQ

## 1.3.514 LUT\_CLK

### LUT CLK Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LUT\_CLK: 0x5B93

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				lut3_en_clk	lut2_en_clk	lut1_en_clk	lut0_en_clk

LUT status clk gater control

Bits	Name	Description
3	lut3_en_clk	LUT status clock gater control <a href="#">See Table 1-459.</a>
2	lut2_en_clk	LUT status clock gater control <a href="#">See Table 1-459.</a>
1	lut1_en_clk	LUT status clock gater control <a href="#">See Table 1-459.</a>
0	lut0_en_clk	LUT status clock gater control <a href="#">See Table 1-459.</a>

Table 1-459. Bit field encoding: LUT\_EN\_CLK\_ENUM

Value	Name	Description
1'b0	LUT_EN_CLK_DISABLE	LUT status clock disabled
1'b1	LUT_EN_CLK_ENABLE	LUT status clock enabled (must set this bit for LUT interrupts)

### 1.3.515 LUT\_CPTR

#### LUT Capture Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

LUT\_CPTR: 0x5B94

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				lut3_capture_mode	lut2_capture_mode	lut1_capture_mode	lut0_capture_mode

LUT status capture mode

Bits	Name	Description
3	lut3_capture_mode	LUT status capture mode <a href="#">See Table 1-460.</a>
2	lut2_capture_mode	LUT status capture mode <a href="#">See Table 1-460.</a>
1	lut1_capture_mode	LUT status capture mode <a href="#">See Table 1-460.</a>
0	lut0_capture_mode	LUT status capture mode <a href="#">See Table 1-460.</a>

Table 1-460. Bit field encoding: LUT\_CAPTURE\_MODE\_ENUM

Value	Name	Description
1'b0	LUT_CAPTURE_MODE_EDGE	LUT status edge capture mode
1'b1	LUT_CAPTURE_MODE_LEVEL	LUT status level capture mode

## 1.3.516 CMP\_WRK

### Comparator output working register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CMP\_WRK: 0x5B96

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:0	R:0	R:0	R:0
HW Access	NA				W	W	W	W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				cmp3_out	cmp2_out	cmp1_out	cmp0_out

Bits	Name	Description
3	cmp3_out	Comparator Output
2	cmp2_out	Comparator Output
1	cmp1_out	Comparator Output
0	cmp0_out	Comparator Output

## 1.3.517 SC\_SR

### Switched Capacitor Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

SC\_SR: 0x5B98

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				RC:0	RC:0	RC:0	RC:0
HW Access	NA				W	W	W	W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				sc3_modout	sc2_modout	sc1_modout	sc0_modout

Bits	Name	Description
3	sc3_modout	Switched Cap block modulator output
2	sc2_modout	Switched Cap block modulator output
1	sc1_modout	Switched Cap block modulator output
0	sc0_modout	Switched Cap block modulator output

## 1.3.518 SC\_WRK1

### Reserved

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC\_WRK1: 0x5B99

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved

## 1.3.519 SC\_MSK

### SC IRQ Mask Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC\_MSK: 0x5B9A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				sc3_msk	sc2_msk	sc1_msk	sc0_msk

Bits	Name	Description
3	sc3_msk	Enable SC IRQ <a href="#">See Table 1-461.</a>
2	sc2_msk	Enable SC IRQ <a href="#">See Table 1-461.</a>
1	sc1_msk	Enable SC IRQ <a href="#">See Table 1-461.</a>
0	sc0_msk	Enable SC IRQ <a href="#">See Table 1-461.</a>

Table 1-461. Bit field encoding: SC\_MSK\_ENUM

Value	Name	Description
1'b1	SC_MSK_ENABLE	enable SC IRQ
1'b0	SC_MSK_DISABLE	disable SC IRQ

## 1.3.520 SC\_CMPINV

### SC comparator inversion

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC\_CMPINV: 0x5B9B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				sc3_cmpinv	sc2_cmpinv	sc1_cmpinv	sc0_cmpinv

Bits	Name	Description
3	sc3_cmpinv	Switched Cap modulator comparator output inversion control <a href="#">See Table 1-462.</a>
2	sc2_cmpinv	Switched Cap modulator comparator output inversion control <a href="#">See Table 1-462.</a>
1	sc1_cmpinv	Switched Cap modulator comparator output inversion control <a href="#">See Table 1-462.</a>
0	sc0_cmpinv	Switched Cap modulator comparator output inversion control <a href="#">See Table 1-462.</a>

Table 1-462. Bit field encoding: SC\_CMPINV\_ENUM

Value	Name	Description
1'b0	SC_CMPINV_DISABLE	Switched Cap modulator comparator output not inverted
1'b1	SC_CMPINV_ENABLE	Switched Cap modulator comparator output inverted

## 1.3.521 SC\_CPTR

### SC Capture Mode Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SC\_CPTR: 0x5B9C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				sc3_capture_mode	sc2_capture_mode	sc1_capture_mode	sc0_capture_mode

SC status capture mode

Bits	Name	Description
3	sc3_capture_mode	SC status capture mode <a href="#">See Table 1-463.</a>
2	sc2_capture_mode	SC status capture mode <a href="#">See Table 1-463.</a>
1	sc1_capture_mode	SC status capture mode <a href="#">See Table 1-463.</a>
0	sc0_capture_mode	SC status capture mode <a href="#">See Table 1-463.</a>

Table 1-463. Bit field encoding: SC\_CAPTURE\_MODE\_ENUM

Value	Name	Description
1'b0	SC_CAPTURE_MODE_EDGE	SC status edge capture mode
1'b1	SC_CAPTURE_MODE_LEVEL	SC status level capture mode

### 1.3.522 USB\_EP0\_DR[0..7]

#### Control End point EP0 Data Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_EP0\_DR0: 0x6000

USB\_EP0\_DR1: 0x6001

USB\_EP0\_DR2: 0x6002

USB\_EP0\_DR3: 0x6003

USB\_EP0\_DR4: 0x6004

USB\_EP0\_DR5: 0x6005

USB\_EP0\_DR6: 0x6006

USB\_EP0\_DR7: 0x6007

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_byte							

The Endpoint 0 Data Register (EP0\_DR) is used to read and write data to the USB control endpoint. The EP0\_DR register has a hardware-locking feature that prevents the CPU write when SETUP is active. The registers are locked as soon as the SETUP token is decoded and remain locked throughout the SETUP transaction and until the EP0\_CR register have been read. This is to prevent over-writing new SETUP data before firmware knows it has arrived. All other endpoint data buffers do not have this locking feature. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_byte[7:0]	This register is shared for both transmit and receive. The count in the EP0_CNT register determines the number of bytes received or to be transferred.

### 1.3.523 USB\_CR0

#### USB control 0 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

USB\_CR0: 0x6008

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0000000						
HW Access	R	R						
Retention	RET	RET						
Name	usb_enable	device_address						

The USB Control Register 0 (CR0) is used to set the PSoC3's USB address and enable the USB system resource. All bits in this register are reset to zero when a USB bus reset interrupt occurs. The IMO frequency should be set to 24MHz before USB is enabled. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	usb_enable	This bit enables the PSoC device to respond to USB traffic. 0 - USB disabled. 1 - USB enabled.
6:0	device_address[6:0]	These bits specify the USB device address to which the SIE will respond. This address must be set by firmware and is specified by the USB Host with a SET ADDRESS command during USB enumeration. This value must be programmed by firmware when assigned during enumeration. It is not set automatically by the hardware.

## 1.3.524 USB\_CR1

### USB control 1 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

USB\_CR1: 0x6009

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/WZC:0	R/W:0	R/W:0
HW Access	NA				R	W	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				trim_offset_msb	bus_activity	enable_lock	reg_enable

The USB Control Register 1 (CR1) is used to configure the internal regulator and the oscillator tuning capability. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
3	trim_offset_msb	This bit is enabled/disabled for using trim bit[7]. 0-enabled. 1-disabled.
2	bus_activity	The Bus Activity bit is a stickybit that detects any non-idle USB event that has occurred on the USB bus. Once set to High by the SIE to indicate the bus activity this bit retains its logical High value until firmware clears it. Writing a '0' to this bit clears it; writing a '1' preserves its value. 0 No activity. 1 Non-idle activity (D+ = Low) was detected since the last time the bit was cleared. Sticky (individual bits)
1	enable_lock	This bit is set to turn on the automatic frequency locking of the internal oscillator to USB traffic. Unless an external clock is being provided this bit should remain set for proper USB operation. 0 Locking disabled. 1 Locking enabled.
0	reg_enable	This bit controls the operation of the internal USB regulator. For applications with PSoC supply voltages in the 5V range this bit is set high to enable the internal regulator. For device supply voltage in the 3.3V range this bit is cleared to connect the transceiver directly to the supply. 0- Pass-through mode. Use for Vdd = 3.3V range. 1- Regulating mode. Use for Vdd = 5V range.

## 1.3.525 USB\_SIE\_EP\_INT\_EN

### USB SIE Data Endpoints Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP\_INT\_EN: 0x600A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_intr_en	ep7_intr_en	ep6_intr_en	ep5_intr_en	ep4_intr_en	ep3_intr_en	ep2_intr_en	ep1_intr_en

The USB SIE Data Endpoints Interrupt Enable Register (SIE\_EP\_INT\_EN) is used to enable/ mask the Data Endpoint Interrupts This register is clocked with the AHB Bus Clock

Bits	Name	Description
7	ep8_intr_en	EP8 Interrupt Enable. 0: Do not raise EP8 Interrupt. 1: Raise EP8 Interrupt
6	ep7_intr_en	EP7 Interrupt Enable. 0: Do not raise EP7 Interrupt. 1: Raise EP7 Interrupt
5	ep6_intr_en	EP6 Interrupt Enable. 0: Do not raise EP6 Interrupt. 1: Raise EP6 Interrupt
4	ep5_intr_en	EP5 Interrupt Enable. 0: Do not raise EP5 Interrupt. 1: Raise EP5 Interrupt
3	ep4_intr_en	EP4 Interrupt Enable. 0: Do not raise EP4 Interrupt. 1: Raise EP4 Interrupt
2	ep3_intr_en	EP3 Interrupt Enable. 0: Do not raise EP3 Interrupt. 1: Raise EP3 Interrupt
1	ep2_intr_en	EP2 Interrupt Enable. 0: Do not raise EP2 Interrupt. 1: Raise EP2 Interrupt
0	ep1_intr_en	EP1 Interrupt Enable. 0: Do not raise EP1 Interrupt. 1: Raise EP1 Interrupt

## 1.3.526 USB\_SIE\_EP\_INT\_SR

### SIE Data Endpoint Interrupt Status

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP\_INT\_SR: 0x600B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_intr	ep7_intr	ep6_intr	ep5_intr	ep4_intr	ep3_intr	ep2_intr	ep1_intr

SIE Data Endpoint Status Register. This is an Interrupt Status Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_intr	EP8 Interrupt Status. 0: EP8 Interrupt not raised. 1: EP8 Interrupt Present
6	ep7_intr	EP7 Interrupt Status. 0: EP7 Interrupt not raised. 1: EP7 Interrupt Present
5	ep6_intr	EP6 Interrupt Status. 0: EP6 Interrupt not raised. 1: EP6 Interrupt Present
4	ep5_intr	EP5 Interrupt Status. 0: EP5 Interrupt not raised. 1: EP5 Interrupt Present
3	ep4_intr	EP4 Interrupt Status. 0: EP4 Interrupt not raised. 1: EP4 Interrupt Present
2	ep3_intr	EP3 Interrupt Status. 0: EP3 Interrupt not raised. 1: EP3 Interrupt Present
1	ep2_intr	EP2 Interrupt Status. 0: EP2 Interrupt not raised. 1: EP2 Interrupt Present
0	ep1_intr	EP1 Interrupt Status. 0: EP1 Interrupt not raised. 1: EP1 Interrupt Present

### 1.3.527 USB\_SIE\_EP1\_CNT0

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP1\_CNT0: 0x600C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

## 1.3.528 USB\_SIE\_EP1\_CNT1

### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP1\_CNT1: 0x600D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

## 1.3.529 USB\_SIE\_EP1\_CR0

### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP1\_CR0: 0x600E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

## 1.3.530 USB\_USBIO\_CR0

### USBIO Control 0 Register

**Reset:** Reset Signals Listed Below

Register : Address

USB\_USBIO\_CR0: 0x6010

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	NA:0000				R:U
HW Access	R	R	R	NA				W
Retention	RET	RET	RET	NA				NONRET
Name	ten	tse0	td	RSVD				rd

The USB IO Control Register 0 (USBIO\_CR0) is used for manually transmitting on the USB D+ and D- pins or reading the differential receiver. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	ten	USB Transmit Enable. This is used to manually transmit on the D+ and D- pins. Normally this bit should be cleared to allow the internal SIE to drive the pins. The most common reason for manually transmitting is to force a resume state on the bus. 0- Manual Transmission Off (TSE0 and TD have no effect). 1- Manual Transmission Enabled (TSE0 and TD determine the state of the D+ and Dpins).
6	tse0	Transmit Single-Ended Zero. SE0: both D+ and D- low. No effect if TEN=0. 0- Do not force SE0. 1- Force SE0 on D+ and D-.
5	td	Transmit Data. Transmit a USB J or K state on the USB bus. No effect if TEN=0 or TSE0=1. 0- Force USB K state (D+ is low D- is high). 1- Force USB J state (D+ is high D- is low)
0	rd	Received Data. This read only bit gives the state of the USB differential receiver. 0- D+ < D- or D+ = D- = 0.

### Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	rd
System reset for retention flops [reset_all_retention]	td, tse0, ten

### 1.3.531 USB\_USBIO\_CR1

#### USBIO control 1 Register

**Reset:** Reset Signals Listed Below

Register : Address

USB\_USBIO\_CR1: 0x6012

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:1	NA:00		R/W:0	R:U	R:U
HW Access	NA		R	NA		R	W	W
Retention	NA		RET	NA		RET	NONRET	NONRET
Name	RSVD		iomode	RSVD		usbpuen	dpo	dmo

The USB IO Control Register 1 (USBIO\_CR1) is used to manually read or write the D+ and D- pins and to configure internal pull-up resistors on those pins. This register is clocked with AHB (BUS) Clock

Bits	Name	Description
5	iomode	This bit allows the D+ and D- pins to be configured for either USB mode or bit banded modes. If this bit is set the DMI and DPI bits are used to drive the D- and D+ pins. 0- USB Mode. Drive Mode has no effect. 1- Drive Mode DMI and DPI determine state of the D+ and D- pins.
2	usbpuen	This bit controls the connection of the internal 1.5 k pull up resistor on the D+ pin. 0- No effect. 1- Apply internal USB pull-up resistor to D+ pad.
1	dpo	This read only bit gives the state of the D+ pin.
0	dmo	This read only bit gives the state of the D- pin.

#### Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	dmo, dpo
System reset for retention flops [reset_all_retention]	usbpuen, iomode

### 1.3.532 USB\_DYN\_RECONFIG

#### USB Dynamic reconfiguration register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_DYN\_RECONFIG: 0x6014

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:0	R/W:000			R/W:0
HW Access	NA			W	R			R
Retention	NA			NONRET	NONRET			NONRET
Name	RSVD			dyn_reconfi g_rdy_sts	dyn_reconfig_epno			dyn_config_ en

This register is used for dynamically configuring the data EPs. This register is clocked with AHB Clock

Bits	Name	Description
4	dyn_reconfig_rdy_sts	This bit indicates the ready status for the dynamic reconfiguration, when set to 1 , indicates the block is ready for reconfiguration .
3:1	dyn_reconfig_epno[2:0]	These bits indicates the EP number for which reconfiguration is required when dyn_config_en bit is set to 1.
0	dyn_config_en	This bit is used to enable the dynamic re-configuration for the selected EP. If set to 1 , indicates the reconfiguration required for selected EP.

### 1.3.533 USB\_SOF0

#### Start Of Frame Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SOF0: 0x6018

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	frame_number							

The USB Start of Frame Registers (SOF0 and SOF1) provide access to the 11-bit SOF frame number. Start of frame packets are sent from the host every one ms. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	frame_number[7:0]	It has the lower 8 bits [7:0] of the SOF frame number.

### 1.3.534 USB\_SOF1

#### Start Of Frame Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SOF1: 0x6019

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R:000		
HW Access	NA					R/W		
Retention	NA					NONRET		
Name	RSVD					frame_number		

The USB Start of Frame Registers (SOF0 and SOF1) provide access to the 11-bit SOF frame number. Start of frame packets are sent from the host every one ms. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
2:0	frame_number[2:0]	It has the upper 3 bits [10:8] of the SOF frame number.

### 1.3.535 USB\_SIE\_EP2\_CNT0

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP2\_CNT0: 0x601C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

### 1.3.536 USB\_SIE\_EP2\_CNT1

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP2\_CNT1: 0x601D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

## 1.3.537 USB\_SIE\_EP2\_CR0

### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP2\_CR0: 0x601E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

## 1.3.538 USB\_EP0\_CR

### Endpoint0 control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_EP0\_CR: 0x6028

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WC:0	R/WC:0	R/WC:0	R/WC:0	R/W:0000			
HW Access	W	W	W	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	setup_rcvd	in_rcvd	out_rcvd	acked_txn	mode			

The Endpoint Control Register (EP0\_CR) is used to configure endpoint 0. Because both firmware and the SIE are allowed to write to the Endpoint 0 Control and Count registers the SIE provides an interlocking mechanism to prevent accidental overwriting of data. When the SIE writes to these registers they are locked and the processor cannot write to them until after reading the EP0\_CR register. Writing to this register clears the upper four bits regardless of the value written. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	setup_rcvd	When set this bit indicates a valid SETUP packet was received and ACKed. This bit is forced HIGH from the start of the data packet phase of the SETUP transaction until the start of the ACK packet returned by the SIE. The CPU is prevented from clearing this bit during this interval. After this interval the bit will remain set until cleared by firmware. While this bit is set to '1' the CPU cannot write to the EP0_DRx registers. This prevents firmware from overwriting an incoming SETUP transaction before firmware has a chance to read the SETUP data. This bit is cleared by any non-locked writes to the register. Sticky (individual bits)
6	in_rcvd	When set this bit indicates a valid IN packet has been received. This bit is updated to '1' after the host acknowledges an IN data packet. When clear this bit indicates either no IN has been received or that the host did not acknowledge the IN data by sending ACK handshake. It is cleared by any non-locked writes to the register. Sticky (individual bits)
5	out_rcvd	When set this bit indicates a valid OUT packet has been received and ACKed. This bit is updated to '1' after the last received packet in an OUT transaction. When clear this bit indicates no OUT received. It is cleared by any non-locked writes to the register. Sticky (individual bits)
4	acked_txn	This bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with a ACK packet. This bit is cleared by any nonlocked writes to the register. Sticky (individual bits)
3:0	mode[3:0]	The mode bits control how the USB SIE responds to traffic and how the USB SIE will change the mode of that endpoint as a result of host packets to the endpoint.

## 1.3.539 USB\_EP0\_CNT

### Endpoint0 count Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_EP0\_CNT: 0x6029

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:00		R/W:0000			
HW Access	R/W	W	NA		R/W			
Retention	NONRET	NONRET	NA		NONRET			
Name	data_toggle	data_valid	RSVD		byte_count			

The Endpoint 0 Count Register (EP0\_CNT) is used to configure endpoint 0. Whenever the count updates from a SETUP or OUT transaction this register locks and can not be written by the CPU. Reading the EP0\_CR register unlocks this register. This prevents firmware from overwriting a status update on incoming SETUP or OUT transactions before firmware has a chance to read the data. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit. For OUT or SETUP transactions the SIE hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit indicates whether there were errors in OUT or SETUP transactions. It is cleared to '0' if CRC bit stuff or PID errors have occurred. This bit does not update for some endpoint mode settings. This bit may be cleared by writing a zero to it when the register is not locked. 0- Error in data received. 1- No Errors Sticky (individual bits)
3:0	byte_count[3:0]	These bits indicate the number of data bytes in a transaction. For IN transactions firmware loads the count with the number of bytes to be transmitted to the host from the endpoint FIFO. Valid values are 0 to 8. For OUT or SETUP transactions the count is updated by hardware to the number of data bytes received plus two for the CRC bytes. Valid values are 2 to 10.

## 1.3.540 USB\_SIE\_EP3\_CNT0

### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP3\_CNT0: 0x602C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

### 1.3.541 USB\_SIE\_EP3\_CNT1

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP3\_CNT1: 0x602D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

## 1.3.542 USB\_SIE\_EP3\_CR0

### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP3\_CR0: 0x602E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

### 1.3.543 USB\_SIE\_EP4\_CNT0

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP4\_CNT0: 0x603C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

## 1.3.544 USB\_SIE\_EP4\_CNT1

### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP4\_CNT1: 0x603D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

### 1.3.545 USB\_SIE\_EP4\_CR0

#### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP4\_CR0: 0x603E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

## 1.3.546 USB\_SIE\_EP5\_CNT0

### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP5\_CNT0: 0x604C

Bits	7	6	5	4	3	2	1	0

HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

## 1.3.547 USB\_SIE\_EP5\_CNT1

### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP5\_CNT1: 0x604D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

## 1.3.548 USB\_SIE\_EP5\_CR0

### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP5\_CR0: 0x604E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

### 1.3.549 USB\_SIE\_EP6\_CNT0

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP6\_CNT0: 0x605C

SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

### 1.3.550 USB\_SIE\_EP6\_CNT1

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP6\_CNT1: 0x605D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

## 1.3.551 USB\_SIE\_EP6\_CR0

### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP6\_CR0: 0x605E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

## 1.3.552 USB\_SIE\_EP7\_CNT0

### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP7\_CNT0: 0x606C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

### 1.3.553 USB\_SIE\_EP7\_CNT1

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP7\_CNT1: 0x606D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

## 1.3.554 USB\_SIE\_EP7\_CR0

### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP7\_CR0: 0x606E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

## 1.3.555 USB\_SIE\_EP8\_CNT0

### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP8\_CNT0: 0x607C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

### 1.3.556 USB\_SIE\_EP8\_CNT1

#### Non-control endpoint count register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP8\_CNT1: 0x607D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control endpoints. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater than the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter. The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

## 1.3.557 USB\_SIE\_EP8\_CR0

### Non-control endpoint's control Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_SIE\_EP8\_CR0: 0x607E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

## 1.3.558 USB\_ARB\_EP1\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP1\_CFG: 0x6080

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sen-sitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.559 USB\_ARB\_EP1\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP1\_INT\_EN: 0x6081

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

## 1.3.560 USB\_ARB\_EP1\_SR

### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP1\_SR: 0x6082

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

## 1.3.561 USB\_ARB\_RW1\_WA

### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW1\_WA: 0x6084

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

### 1.3.562 USB\_ARB\_RW1\_WA\_MSB

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW1\_WA\_MSB: 0x6085

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

## 1.3.563 USB\_ARB\_RW1\_RA

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW1\_RA: 0x6086

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

### 1.3.564 USB\_ARB\_RW1\_RA\_MSB

#### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW1\_RA\_MSB: 0x6087

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

## 1.3.565 USB\_ARB\_RW1\_DR

### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW1\_DR: 0x6088

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

## 1.3.566 USB\_BUF\_SIZE

### Dedicated Endpoint Buffer Size Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_BUF\_SIZE: 0x608C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0000				R/W:0000			
HW Access	R				R			
Retention	NONRET				NONRET			
Name	out_buf				in_buf			

Dedicated buffer size for IN and OUT type Endpoints; Encoded power of 2 value; Eg: 1 => 2 bytes; 2 => 4 bytes; 9 => 512 bytes This register is clocked with AHB Bus Clock

Bits	Name	Description
7:4	out_buf[3:0]	Buffer size for OUT Endpoints.
3:0	in_buf[3:0]	Buffer size for IN Endpoints.

## 1.3.567 USB\_EP\_ACTIVE

### Endpoint Active Indication Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_EP\_ACTIVE: 0x608E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_act	ep7_act	ep6_act	ep5_act	ep4_act	ep3_act	ep2_act	ep1_act

Endpoint Active Register; Indicates if an Endpoint is active or not; Required to be programmed only in the case of Automatic Memory Management mode of operation. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_act	Endpoint 8 Active Indication. 0: Inactive. 1: Active
6	ep7_act	Endpoint 7 Active Indication. 0: Inactive. 1: Active
5	ep6_act	Endpoint 6 Active Indication. 0: Inactive. 1: Active
4	ep5_act	Endpoint 5 Active Indication. 0: Inactive. 1: Active
3	ep4_act	Endpoint 4 Active Indication. 0: Inactive. 1: Active
2	ep3_act	Endpoint 3 Active Indication. 0: Inactive. 1: Active
1	ep2_act	Endpoint 2 Active Indication. 0: Inactive. 1: Active
0	ep1_act	Endpoint 1 Active Indication. 0: Inactive. 1: Active

## 1.3.568 USB\_EP\_TYPE

### Endpoint Type (IN/OUT) Indication

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_EP\_TYPE: 0x608F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_typ	ep7_typ	ep6_typ	ep5_typ	ep4_typ	ep3_typ	ep2_typ	ep1_typ

Endpoint Type Register; Indicates the Endpoint Type as IN / OUT. Value is valid if EP\_ACTIVE bit is set for the corresponding Endpoint. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_typ	Endpoint 8 Type Indication. 0: IN. 1: OUT
6	ep7_typ	Endpoint 7 Type Indication. 0: IN. 1: OUT
5	ep6_typ	Endpoint 6 Type Indication. 0: IN. 1: OUT
4	ep5_typ	Endpoint 5 Type Indication. 0: IN. 1: OUT
3	ep4_typ	Endpoint 4 Type Indication. 0: IN. 1: OUT
2	ep3_typ	Endpoint 3 Type Indication. 0: IN. 1: OUT
1	ep2_typ	Endpoint 2 Type Indication. 0: IN. 1: OUT
0	ep1_typ	Endpoint 1 Type Indication. 0: IN. 1: OUT

## 1.3.569 USB\_ARB\_EP2\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP2\_CFG: 0x6090

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.570 USB\_ARB\_EP2\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP2\_INT\_EN: 0x6091

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

## 1.3.571 USB\_ARB\_EP2\_SR

### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP2\_SR: 0x6092

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

### 1.3.572 USB\_ARB\_RW2\_WA

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW2\_WA: 0x6094

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

### 1.3.573 USB\_ARB\_RW2\_WA\_MSB

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW2\_WA\_MSB: 0x6095

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

## 1.3.574 USB\_ARB\_RW2\_RA

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW2\_RA: 0x6096

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

## 1.3.575 USB\_ARB\_RW2\_RA\_MSB

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW2\_RA\_MSB: 0x6097

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

## 1.3.576 USB\_ARB\_RW2\_DR

### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW2\_DR: 0x6098

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

## 1.3.577 USB\_ARB\_CFG

### Arbiter Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_CFG: 0x609C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:00		R/W:0	NA:0000			
HW Access	R	R		R	NA			
Retention	NONRET	NONRET		NONRET	NA			
Name	cfg_cmp	dma_cfg		auto_mem	RSVD			

Arbiter Configuration Register. For MODE I Operation: This register can be left in its default state. For MODE II and MODE III Operation: This register should be programmed. Cfg\_cmp bit set to 0 during configuration of PFSUSB Registers. Cfg\_cmp bit set to 1 once configuration is complete. This should then be held at 1 during functional mode. Similarly auto\_mem and dma\_cfg settings are static and should not be modified during block operation. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	cfg_cmp	Register Configuration Complete Indication. Posedge is detected on this bit. Hence a 0 to 1 transition is required. 0: Configuration in progress. 1: Configuration complete.
6:5	dma_cfg[1:0]	DMA Access Configuration. 00: No DMA. 01: Manual DMA. 10: Auto DMA and Manual DMA. 11: Reserved.
4	auto_mem	Auto / Manual Memory Configuration. 0: Manual Memory Config (CPU). 1: Auto Memory Config

## 1.3.578 USB\_USB\_CLK\_EN

### USB Block Clock Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_USB\_CLK\_EN: 0x609D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							csr_clk_en

USB Block Clock Enable Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	csr_clk_en	Clock Enable for Core Logic clocked by AHB bus clock

## 1.3.579 USB\_ARB\_INT\_EN

### Arbiter Interrupt Enable

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_INT\_EN: 0x609E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_intr_en	ep7_intr_en	ep6_intr_en	ep5_intr_en	ep4_intr_en	ep3_intr_en	ep2_intr_en	ep1_intr_en

Arbiter Interrupt Enable Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_intr_en	EP8 Interrupt Enable. 0: Do not raise EP8 Interrupt. 1: Raise EP8 Interrupt
6	ep7_intr_en	EP7 Interrupt Enable. 0: Do not raise EP7 Interrupt. 1: Raise EP7 Interrupt
5	ep6_intr_en	EP6 Interrupt Enable. 0: Do not raise EP6 Interrupt. 1: Raise EP6 Interrupt
4	ep5_intr_en	EP5 Interrupt Enable. 0: Do not raise EP5 Interrupt. 1: Raise EP5 Interrupt
3	ep4_intr_en	EP4 Interrupt Enable. 0: Do not raise EP4 Interrupt. 1: Raise EP4 Interrupt
2	ep3_intr_en	EP3 Interrupt Enable. 0: Do not raise EP3 Interrupt. 1: Raise EP3 Interrupt
1	ep2_intr_en	EP2 Interrupt Enable. 0: Do not raise EP2 Interrupt. 1: Raise EP2 Interrupt
0	ep1_intr_en	EP1 Interrupt Enable. 0: Do not raise EP1 Interrupt. 1: Raise EP1 Interrupt

## 1.3.580 USB\_ARB\_INT\_SR

### Arbiter Interrupt Status

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_INT\_SR: 0x609F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:0	R:0	R:0	R:0	R:0	R:0	R:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_intr	ep7_intr	ep6_intr	ep5_intr	ep4_intr	ep3_intr	ep2_intr	ep1_intr

Arbiter Status Register. This is an Interrupt Status Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_intr	EP8 Interrupt Status. 0: EP8 Interrupt not raised. 1: EP8 Interrupt Present
6	ep7_intr	EP7 Interrupt Status. 0: EP7 Interrupt not raised. 1: EP7 Interrupt Present
5	ep6_intr	EP6 Interrupt Status. 0: EP6 Interrupt not raised. 1: EP6 Interrupt Present
4	ep5_intr	EP5 Interrupt Status. 0: EP5 Interrupt not raised. 1: EP5 Interrupt Present
3	ep4_intr	EP4 Interrupt Status. 0: EP4 Interrupt not raised. 1: EP4 Interrupt Present
2	ep3_intr	EP3 Interrupt Status. 0: EP3 Interrupt not raised. 1: EP3 Interrupt Present
1	ep2_intr	EP2 Interrupt Status. 0: EP2 Interrupt not raised. 1: EP2 Interrupt Present
0	ep1_intr	EP1 Interrupt Status. 0: EP1 Interrupt not raised. 1: EP1 Interrupt Present

## 1.3.581 USB\_ARB\_EP3\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP3\_CFG: 0x60A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sen-sitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.582 USB\_ARB\_EP3\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP3\_INT\_EN: 0x60A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

## 1.3.583 USB\_ARB\_EP3\_SR

### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP3\_SR: 0x60A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

### 1.3.584 USB\_ARB\_RW3\_WA

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW3\_WA: 0x60A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

## 1.3.585 USB\_ARB\_RW3\_WA\_MSB

### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW3\_WA\_MSB: 0x60A5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

## 1.3.586 USB\_ARB\_RW3\_RA

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW3\_RA: 0x60A6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

## 1.3.587 USB\_ARB\_RW3\_RA\_MSB

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW3\_RA\_MSB: 0x60A7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

## 1.3.588 USB\_ARB\_RW3\_DR

### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW3\_DR: 0x60A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

## 1.3.589 USB\_CWA

### Common Area Write Address

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_CWA: 0x60AC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	cwa							

Write Address Pointer for Common Area; LSB 8 bits of the 9 bit pointer are stored in this register. This register is only valid in Mode3 operation. Although it is R/W register for CPU, all intended updates are performed by the block and CPU can access the value for debug purposes. This register will indicate the Common Area location in memory. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	cwa[7:0]	Write Address for Common Area

## 1.3.590 USB\_CWA\_MSB

### Common Area Write Address

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_CWA\_MSB: 0x60AD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							cwa_msb

Write Address Pointer for Common Area; MSB of the 9 bit pointer are stored in this register. This register is only valid in Mode3 operation. Although it is R/W register for CPU, all intended updates are performed by the block and CPU can access the value for debug purposes. This register will indicate the Common Area location in memory. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	cwa_msb	Write Address for Common Area

## 1.3.591 USB\_ARB\_EP4\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP4\_CFG: 0x60B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.592 USB\_ARB\_EP4\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP4\_INT\_EN: 0x60B1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

## 1.3.593 USB\_ARB\_EP4\_SR

### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP4\_SR: 0x60B2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

### 1.3.594 USB\_ARB\_RW4\_WA

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW4\_WA: 0x60B4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

## 1.3.595 USB\_ARB\_RW4\_WA\_MSB

### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW4\_WA\_MSB: 0x60B5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

## 1.3.596 USB\_ARB\_RW4\_RA

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW4\_RA: 0x60B6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

## 1.3.597 USB\_ARB\_RW4\_RA\_MSB

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW4\_RA\_MSB: 0x60B7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

## 1.3.598 USB\_ARB\_RW4\_DR

### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW4\_DR: 0x60B8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

## 1.3.599 USB\_DMA\_THRES

### DMA Burst / Threshold Configuration

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_DMA\_THRES: 0x60BC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	dma_ths							

It contains 8 LSB bits of DMA Threshold Register This register is only valid in Mode3 operation. This register should be programmed to the same value as the DMA Burst Count programmed in the corresponding Channel Basic Config Register in PHUB. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dma_ths[7:0]	8 Lsb bits of 9 bit DMA Threshold count.

## 1.3.600 USB\_DMA\_THRES\_MSB

### DMA Burst / Threshold Configuration

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_DMA\_THRES\_MSB: 0x60BD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							dma_ths_msb

It contains the MSB bit of DMA Threshold Register This register is clocked with AHB Bus Clock

Bits	Name	Description
0	dma_ths_msb	Msb bit of 9 bit DMA Threshold count.

## 1.3.601 USB\_ARB\_EP5\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP5\_CFG: 0x60C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.602 USB\_ARB\_EP5\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP5\_INT\_EN: 0x60C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

### 1.3.603 USB\_ARB\_EP5\_SR

#### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP5\_SR: 0x60C2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

### 1.3.604 USB\_ARB\_RW5\_WA

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW5\_WA: 0x60C4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

### 1.3.605 USB\_ARB\_RW5\_WA\_MSB

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW5\_WA\_MSB: 0x60C5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

## 1.3.606 USB\_ARB\_RW5\_RA

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW5\_RA: 0x60C6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

## 1.3.607 USB\_ARB\_RW5\_RA\_MSB

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW5\_RA\_MSB: 0x60C7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

## 1.3.608 USB\_ARB\_RW5\_DR

### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW5\_DR: 0x60C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

## 1.3.609 USB\_BUS\_RST\_CNT

### Bus Reset Count Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_BUS\_RST\_CNT: 0x60CC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1010			
HW Access	NA				R			
Retention	NA				NONRET			
Name	RSVD				bus_rst_cnt			

Bus Reset Count register ; For USB bus reset length; The value in this register determines the no. of pulses of the low freq. clock which will be counted to determine if an SE0 condition has been held for long enough to declare a USB Bus reset condition. In krypton, 3 pulses of a 32 KHz clock were counted to declare a usb bus reset condition. In leopard, a 100 KHz clock is used. Recommended is to count 10 pulses of this clock to remain equivalent to Krypton. This register is clocked with AHB Bus Clock

Bits	Name	Description
3:0	bus_rst_cnt[3:0]	Bus Reset Count Length

## 1.3.610 USB\_ARB\_EP6\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP6\_CFG: 0x60D0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sen-sitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.611 USB\_ARB\_EP6\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP6\_INT\_EN: 0x60D1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

## 1.3.612 USB\_ARB\_EP6\_SR

### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP6\_SR: 0x60D2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

### 1.3.613 USB\_ARB\_RW6\_WA

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW6\_WA: 0x60D4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

### 1.3.614 USB\_ARB\_RW6\_WA\_MSB

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW6\_WA\_MSB: 0x60D5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

## 1.3.615 USB\_ARB\_RW6\_RA

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW6\_RA: 0x60D6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

### 1.3.616 USB\_ARB\_RW6\_RA\_MSB

#### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW6\_RA\_MSB: 0x60D7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

## 1.3.617 USB\_ARB\_RW6\_DR

### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW6\_DR: 0x60D8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

## 1.3.618 USB\_ARB\_EP7\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP7\_CFG: 0x60E0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sen-sitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.619 USB\_ARB\_EP7\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP7\_INT\_EN: 0x60E1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

## 1.3.620 USB\_ARB\_EP7\_SR

### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP7\_SR: 0x60E2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

## 1.3.621 USB\_ARB\_RW7\_WA

### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW7\_WA: 0x60E4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

### 1.3.622 USB\_ARB\_RW7\_WA\_MSB

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW7\_WA\_MSB: 0x60E5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

### 1.3.623 USB\_ARB\_RW7\_RA

#### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW7\_RA: 0x60E6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

### 1.3.624 USB\_ARB\_RW7\_RA\_MSB

#### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW7\_RA\_MSB: 0x60E7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

## 1.3.625 USB\_ARB\_RW7\_DR

### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW7\_DR: 0x60E8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

## 1.3.626 USB\_ARB\_EP8\_CFG

### Endpoint Configuration Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP8\_CFG: 0x60F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firm-ware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sen-sitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

## 1.3.627 USB\_ARB\_EP8\_INT\_EN

### Endpoint Interrupt Enable Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP8\_INT\_EN: 0x60F1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

## 1.3.628 USB\_ARB\_EP8\_SR

### Endpoint Status Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_EP8\_SR: 0x60F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

## 1.3.629 USB\_ARB\_RW8\_WA

### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW8\_WA: 0x60F4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

### 1.3.630 USB\_ARB\_RW8\_WA\_MSB

#### Endpoint Write Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW8\_WA\_MSB: 0x60F5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

## 1.3.631 USB\_ARB\_RW8\_RA

### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW8\_RA: 0x60F6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

### 1.3.632 USB\_ARB\_RW8\_RA\_MSB

#### Endpoint Read Address value

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

USB\_ARB\_RW8\_RA\_MSB: 0x60F7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

### 1.3.633 USB\_ARB\_RW8\_DR

#### Endpoint Data Register

**Reset:** N/A

Register : Address

USB\_ARB\_RW8\_DR: 0x60F8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

### 1.3.634 B[0..3]\_UDB00\_A0

#### UDB00\_A0

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

B0\_UDB00\_A0: 0x6400

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	A0							

Accumulator 0

Bits	Name	Description
7:0	A0[7:0]	Generic field for 8 bit working registers

### 1.3.635 B[0..3]\_UDB01\_A0

#### UDB01\_A0

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

B0\_UDB01\_A0: 0x6401

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	A0							

Accumulator 0

Bits	Name	Description
7:0	A0[7:0]	Generic field for 8 bit working registers

### 1.3.636 B[0..3]\_UDB02\_A0

#### UDB02\_A0

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

B0\_UDB02\_A0: 0x6402

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	A0							

Accumulator 0

Bits	Name	Description
7:0	A0[7:0]	Generic field for 8 bit working registers

### 1.3.637 B[0..3]\_UDB03\_A0

#### UDB03\_A0

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

B0\_UDB03\_A0: 0x6403

## 1.3.1071 PHUB\_CFG

### PHUB Configuration

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

PHUB\_CFG: 0x7000

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1111111							R/W:0
HW Access	R							R
Retention	RET							RET
Name	spk_cpu_pri							cpu_clkdif

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:UUUUUUUU							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:0	R/W:0000000						
HW Access	R	R						
Retention	RET	RET						
Name	simple_pri	pri_int_en						

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:UUU			R:1	R/W:1	R/W:111		
HW Access	NA			R/W	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			dmac_idle	dmac_en	bus_timeout		

This is the general configuration register for the PHUB

Bits	Name	Description
28	dmac_idle	Indicates whether the DMAC is currently IDLE or not
27	dmac_en	Global DMAC enable
26:24	bus_timeout[2:0]	Specifies the number of wait states (!HREADY responses by an accessed peripheral) PHUB will allow before timing out the AHB transaction. On a bus timeout PHUB will act as if it received a positive HREADY from the peripheral then move onto the next natural transaction as it would normally. The BUS_TIMEOUT bit of the ERR register will be set upon detecting the timeout. <a href="#">See Table 1-652.</a>
23	simple_pri	0: Grant allocation fairness algorithm enabled 1: Grant allocation fairness algorithm disabled; simple priority utilized

(continued)

22:16	pri_int_en[6:0]	0: Priority can not interrupt lower priority channels 1: Priority can interrupt lower priority channels Bits 22:16 correspond to priorities 6:0. Priority 7 is the lowest priority and thus can not interrupt yet lower priorities and therefore there is no bit for it.
7:1	spk_cpu_pri[6:0]	0: DMA priority spoke 1: CPU priority spoke Bits 15:1 correspond to spokes 15:1 respectively. SPK0 is not accessible by the CPU and thus no bit exists for it. The number of valid SPKxx_CPU_PRI bits is determined by the cfg_num_of_spk[4:0] input to PHUB; non-configured bits are hardwired to 0.
0	cpu_clkdif	0: CPU_CLOCK_EN assumed tied to 1; Performance Mode 1: CPU_CLOCK_EN assumed to modulate; Mixed Frequency Mode

Table 1-652. Bit field encoding: BUS\_TIMEOUT\_ENUM

Value	Name	Description
3'b000	Timeout_0	Disable bus timeout detection
3'b001	Timeout_1	8 wait states
3'b010	Timeout_2	16 wait states
3'b011	Timeout_3	32 wait states
3'b100	Timeout_4	64 wait states
3'b101	Timeout_5	128 wait states
3'b110	Timeout_6	256 wait states
3'b111	Timeout_7	511 wait states (default)

## 1.3.1072 PHUB\_ERR

### PHUB Error Detection

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

PHUB\_ERR: 0x7004

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:UUUU				R/WOC:0	R/WOC:0	R/WOC:0	NA:U
HW Access	NA				R/W	R/W	R/W	NA
Retention	NA				NONRET	NONRET	NONRET	NA
Name	RSVD				periph_err	unpop_acc	bus_timeout	RSVD

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:UUUUUUUU							
HW Access	NA

Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:UUUUUUUU							
HW Access	NA							
Retention	NA							
Name	RSVD							

PHUB detects the following errors: 1. Bus Timeout 2. Unpopulated address access 3. Peripheral AHB ERROR response If the error was detected as a result of a CPU access then PHUB will send an AHB ERROR response to the CPU. If the error was detected as a result of either a CPU or DMA access then PHUB will set the corresponding bit in the following ERR register.

Bits	Name	Description
3	periph_err	Set to 1 when a peripheral responds to a bus transaction with an AHB ERROR response. Cleared by writing a 1.
2	unpop_acc	Set to 1 when an access is attempted to an address that does not decode to any spoke HSEL. Cleared by writing a 1.
1	bus_timeout	Set to 1 when a bus timeout occurs. Cleared by writing a 1. Timeout values are determined by the BUS_TIMEOUT field in the PHUBCFG register.

## 1.3.1073 PHUB\_ERR\_ADR

### PHUB Error Address

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

PHUB\_ERR\_ADR: 0x7008

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	err_adr							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	err_adr							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	err_adr							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	err_adr							

Contains the address that caused an error to trigger

Bits	Name	Description
31:0	err_adr[31:0]	Contains the value of the address that caused the error (limited to the BUS_TIMEOUT, UNPOP_ACC and PERIPH_ERR errors). If there are a succession of errors that occur before the CPU is able to clear the ERR register to all zeros, ERR_ADR will latch the address of the first error only.

(continued)

Name	RSVD
------	------

Each channel will have the following basic configuration stored in gates inside PHUB.

Bits	Name	Description
5	work_sep	<p>If a TD requires multiple bursts DMAC must remember where it left off between bursts while allowing interleaving other channels' bus access. It can either store the intermediate TD states on top of the current CHn_ORIG_TD0/1 of the TD chain, OR it can store it separately in a working area called CHn_SEP_TD0/1. The latter allows the original TD chain to be preserved.</p> <p>0: Store the intermediate and final TD states on top of the original TD chain. Intermediate state storage allows the CPU to gauge progress of a particular TD. Final state storage allows the CPU to 'walk the chain' later and see what the final completion state of each TD was.</p> <p>1: Store the intermediate TD states separately in CHn_SEP_TD0/1 to preserve the original TD chain. Intermediate state storage allows the CPU to gauge progress of a particular TD. Note the final state of each TD is not stored anywhere in this case. CHn_SEP_TD0/1 is stored in TDMEM and the address is: {00, CH_NUM[5:0], 000}</p> <p>In other words the slot in TDMEM that equals the channel number becomes reserved for DMAC's private use. Instead of processing the original TDs in place, DMAC will copy the original TDs to this separate working area and process them there. Because of this the separate working area is considered reserved and no real TDs should be stored there.</p>
4	rr_en	<p>Round-Robin enable</p> <p>RR_EN is only valid if the cfg_ch_recent_cnt_size[2:0] input to PHUB is not zero; otherwise RR_EN is hardwired to zero.</p>
3:1	pri[2:0]	Channel priority; see DMA Arbiter section for description of channel priorities
0	en	<p>0: Channel is disabled from accepting requests. This is the default state of the channel and allows the channel to be fully configured before enabling. This can also be used to stall a chain.</p> <p>If TD_ACTIVE=0 then clearing this bit will prevent any further DMA requests from being accepted by the channel until ENABLE is set again.</p> <p>If TD_ACTIVE=1 then DMAC will allow the current burst to finish naturally. Then when DMAC returns to the IDLE state it will prevent any further DMA requests from being accepted by the channel until ENABLE is set again.</p> <p>If a TD chain finishes due to NEXT_TD_PTR=0xFE then the ENABLE bit will be cleared automatically (this is not the case if the TD chain finishes due to NEXT_TD_PTR=0xFF).</p> <p>1: Channel is enabled and will accept DMA requests for it. While the channel is enabled any other configuration information for the channel should NOT be altered to ensure graceful operation. This includes the channel's BASIC_CFG, BASIC_STATUS, CFG0/1, and associated TDs.</p>

Each channel will have the following action register associated with it:

Bits	Name	Description
2	cpu_term_chain	<p>Setting this bit causes the TD chain to terminate and the channel's ENABLE and CHAIN_ACTIVE bits to clear.</p> <p>If TD_ACTIVE=0 setting this bit will effectively create a request for the channel. When the request wins the DMAC will do some housekeeping associated with terminating a chain which includes clearing the channel's ENABLE, CHAIN_ACTIVE and CPU_TERM_CHAIN bits.</p> <p>If TD_ACTIVE=1 then DMAC will terminate the current burst as soon as any outstanding AHB requests are completed. The channel's ENABLE, CHAIN_ACTIVE and CPU_TERM_CHAIN bits will be cleared when the DMAC returns to the IDLE state.</p>
1	cpu_term_td	<p>Setting this bit causes the current TD to terminate regardless of the status of the XFRCNT associated with the TD.</p> <p>If TD_ACTIVE=0 the CPU_TERM_TD bit will just wait in the background. When the channel is eventually requested and serviced by DMAC the data burst will be preempted and the TD will complete just as if XFRCNT had expired. When the DMAC FSM returns to the IDLE state it will clear the CPU_TERM_TD bit.</p> <p>If TD_ACTIVE=1 then DMAC will terminate the current burst as soon as any outstanding AHB requests are completed. The TD will then complete just as if XFRCNT had expired. When the DMAC FSM returns to the IDLE state it will clear the CPU_TERM_TD bit.</p>
0	cpu_req	<p>Setting this bit creates a direct DMA request for the channel.</p> <p>If TD_ACTIVE=0 CPU_REQ will remain set until the request wins arbitration and is accepted by DMAC. This bit is cleared upon triggering the DMAC FSM from the IDLE state.</p> <p>If TD_ACTIVE=1 CPU_REQ will remain set and will apply to the next burst for the channel. The bit will essentially be ignored by DMAC and will be left alone so that it can trigger the next burst for the channel.</p>

Each channel will have the following status information stored in gates inside PHUB

Bits	Name	Description
14:8	td_ptr[6:0]	<p>Address pointer to the current CHn_ORIG_TD0/1 in the chain. The CPU initializes this to the location of the first TD in the chain before enabling the channel. DMAC updates TD_PTR with NEXT_TD when it completes the current TD. This gives status to the CPU of how far along the chain is and where it is.</p> <p>The CHn_ORIG_TD0/1 chain is stored in TDMEM and DMAC accesses the current TD at: {TD_PTR[7:0], 000}</p> <p>The number of valid TD_PTR bits is determined by the cfg_ch_td_ptr_size[3:0] input to PHUB; non-configured bits are hardwired to 0.</p> <p>br] TD_PTR resets to the same value as the channel number.</p>
7:4	rr_cnt[3:0]	<p>Current state of the channel's Round-Robin counter. The lower the value the more recently the channel has won a DMA grant with zero meaning it won the last grant.</p> <p>0: RR_CNT will be frozen on the terminal count (all ones) and therefore it will look as if the channel has never received a DMA grant which will give it an advantage over channels that do support Round-Robin. Put another way, when RR_EN=0 the channel is not subject to Round-Robin rules.</p> <p>1: RR_CNT will reset each time the channel wins a DMA grant. It will increment each time any other channel wins a DMA grant. It will stop incrementing when it hits the terminal count (all ones).</p> <p>The number of valid RR_CNT bits is determined by the cfg_ch_recent_cnt_size[2:0] input to PHUB; non-configured bits are hardwired to 0.</p>
1	td_active	<p>0: channel is not currently being serviced by DMAC</p> <p>1: channel is currently being serviced by DMAC</p>
0	chain_active	<p>0: TD chain is inactive; either no DMA requests have triggered a new chain or the previous chain has completed.</p> <p>1: TD chain has been triggered by a DMA request</p>

Each channel will have some configuration information stored in RAM, and this configuration information is called CHn\_CFG0/1. CHn\_CFG0/1 are stored in CFGMEM at {CH\_NUM[5:0], 000}. Chn\_CFG0/1 are described in detail below.

Bits	Name	Description
31:25	burstcount_remain[6:0]	These bits are reserved for use by the DMAC in storing the intermediate state of BURSTCNT in the event that the channel is interrupted mid-burst by a higher priority channel. These bits need to be preserved by SW only if the channel is active and interrupt-able. Otherwise SW can overwrite these bits without concern, for instance when initially setting up the configuration for the channel.
19:16	termin_sel[3:0]	Selects 1 of the 16 TERMIN[15:0] inputs to PHUB for use in terminating a TD. Any active high strobe on the TERMIN signal will be positive edge detected and will cause the TD to terminate if TERMIN_EN is set in the TD. The TD will complete just as if XFRCNT expired.
15:12	termout1_sel[3:0]	Selects 1 of the 16 TERMOUT1[15:0] outputs from PHUB to be toggled upon completion of the current TD if TERMOUT1_EN is set in the TD. Because the frequency of the receiving logic for the TERMOUT1 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT1 signal and interpret either as the completion of the current TD.
11:8	termout0_sel[3:0]	Selects 1 of the 16 TERMOUT0[15:0] outputs from PHUB to be toggled upon completion of the current TD if TERMOUT0_EN is set in the TD. Because the frequency of the receiving logic for the TERMOUT0 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT0 signal and interpret either as the completion of the current TD.
7	req_per_burst	0: A DMA request is required to activate each TD in the chain. If the TD requires multiple bursts to complete then all subsequent bursts after the first burst will be automatically requested and carried out. DMAC will set the AUTO_BURST_WHOLE_TD request after completing each burst except the last. 1: A DMA request is required to activate each TD in the chain. If the TD requires multiple bursts to complete then all subsequent bursts after the first burst must also be individually requested.
6:0	burstcnt[6:0]	The data block moved by a TD can be broken up into small bursts. BURSTCNT[6:0] specifies the length of the small burst from 1 to 127 bytes. If BURSTCNT=0 this means do not break the data block into small bursts and instead burst the whole XFRCNT in one burst. The number of valid BURSTCNT bits is determined by the cfg_burstcnt_size[2:0] input to PHUB; non-configured bits are ignored by the DMAC.

Each channel will have a TD chain (as short as one TD in length) that provides instructions to the DMAC for carrying out a DMA sequence for the channel. This is described in greater detail in the 'TD Chains' section to follow. The TD chain is comprised of one or more CHn\_ORIG\_TD0/1 TDs. DMAC accesses the CHn\_ORIG\_TD0/1 chain from TDMEM and the address in TDMEM of the current TD in the chain is {TD\_PTR[7:0], 000}. TD\_PTR for the first TD in a chain is initialized by the CPU. As the chain progresses through TDs the TD\_PTR will be automatically updated by DMAC to reflect the current TD being accessed in the chain. CHn\_ORIG\_TD0/1 are described in detail below.

Bits	Name	Description
31	swap_en	0: Do not perform endian swap 1: Perform endian swap. BURSTCNT and XFRCNT must be an integer multiple of SWAP_SIZE.
30	swap_size	Only valid if SWAP_EN=1. 0: Swap size = 2 bytes, meaning every 2 bytes are endian swapped during the DMA transfer. 1: Swap size = 4 bytes, meaning every 4 bytes are endian swapped during the DMA transfer.
29	auto_exec_next	0: The next TD in the chain requires a CPU_REQ or peripheral request in order to trigger 1: The next TD in the chain will trigger automatically when the current TD completes. The DMAC will create an AUTO_EXEC_NEXT_TD request for the channel when it completes the current TD.
28	termin_en	0: Do not terminate this TD based on a TERMIN signal. 1: Terminate this TD if a positive edge on the TERMIN signal selected by TERMIN_SEL is detected. Any ongoing burst will terminate as soon as any outstanding AHB requests have been completed. The TD will then complete just as if XFRCNT expired.
27	termout1_en	0: Do not toggle a TERMOUT1 signal when this TD completes 1: When this TD completes the TERMOUT1 signal selected by TERMOUT1_SEL will toggle. Because the frequency of the receiving logic for the TERMOUT1 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT1 signal and interpret either as the completion of the current TD.
26	termout0_en	0: Do not toggle a TERMOUT0 signal when the TD completes 1: When this TD completes the TERMOUT0 signal selected by TERMOUT0_SEL will toggle. Because the frequency of the receiving logic for the TERMOUT0 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT0 signal and interpret either as the completion of the current TD.
25	inc_dst_adr	0: Freeze DST_ADR throughout the burst 1: Increment DST_ADR according to the size of each data transaction in the burst
24	inc_src_adr	0: Freeze SRC_ADR throughout the burst 1: Increment SRC_ADR according to the size of each data transaction in the burst

(continued)

23:16	next_td_ptr[7:0]	<p>Specifies the next TD to be executed in the chain when this TD completes. When this TD completes the value of NEXT_TD_PTR is copied into the TD_PTR status register to allow the CPU to see where in the chain the channel is.</p> <p>If NEXT_TD_PTR=0xFE or 0xFF then this is the last TD in the chain. When the last TD in a chain completes DMAC will clear CHAIN_ACTIVE and if NEXT_TD_PTR=0xFE then ENABLE will clear as well.</p>
11:0	xfrcnt[11:0]	<p>Transfer count in bytes from 1 to 4KB-1, or indefinite transfer count if set to 0.</p> <p>1. Setting XFRCNT to 0:</p> <p>This means transfer count is not used to terminate the TD. An indefinite amount of data can be transferred in this mode. The TD must be terminated either by TERMIN, CPU_TERM_TD or CPU_TERM_CHAIN.</p> <p>Data movement is broken into bursts according to BURSTCNT. Note in the special case where both XFRCNT and BURSTCNT are 0 data will be transferred indefinitely and without interruption.</p> <p>2. Setting XFRCNT to non-0:</p> <p>This means the XFRCNT is used to determine how much data will be transferred (1 to 4KB-1). If BURSTCNT=0 then DMAC will transfer the entire XFRCNT worth of data in one burst. If BURSTCNT is not 0 and BURSTCNT represents a value that is greater than or equal to XFRCNT then DMAC will transfer the entire XFRCNT worth of data in one burst. If BURSTCNT is not 0 and BURSTCNT represents a value that is less than XFRCNT then DMAC will break the data movement into multiple bursts as dictated by BURSTCNT. See the description for the REQ_PER_BURST bit for how subsequent bursts are triggered.</p> <p>At any point the TD can terminate before exhausting the XFRCNT due to TERMIN, CPU_TERM_TD or CPU_TERM_CHAIN.</p> <p>When DMAC updates the TD (whether it's the CHn_ORIG_TD0/1 or CHn_SEP_TD0/1) at the end of a burst it will update the XFRCNT to reflect the newly decremented value based on the number of bytes that were transferred in the burst.</p> <p>The number of valid XFRCNT bits is determined by the cfg_xfrcnt_size[4:0] input to PHUB; non-configured bits are ignored by the DMAC.</p>

Each channel will have a TD chain (as short as one TD in length) that provides instructions to the DMAC for carrying out a DMA sequence for the channel. This is described in greater detail in the 'TD Chains' section to follow. The TD chain is comprised of one or more CHn\_ORIG\_TD0/1 TDs. DMAC accesses the CHn\_ORIG\_TD0/1 chain from TDMEM and the address in TDMEM of the current TD in the chain is {TD\_PTR[7:0], 000}. TD\_PTR for the first TD in a chain is initialized by the CPU. As the chain progresses through TDs the TD\_PTR will be automatically updated by DMAC to reflect the current TD being accessed in the chain. CHn\_ORIG\_TD0/1 are described in detail below.

Bits	Name	Description
31:16	dst_adr[15:0]	<p>Specifies the lower portion of the full destination address by concatenating with DST_BASE_ADR from CHn_CFG1.</p> <p>Can be incremented or not depending on the setting of INC_DST_ADR. Only DST_ADR will increment; DST_BASE_ADR will remain static. Therefore, separate TDs should be used to cross 64KB address boundaries.</p> <p>If INC_DST_ADR=1 then when DMAC updates the TD (whether it's the CHn_ORIG_TD0/1 or CHn_SEP_TD0/1) at the end of a burst it will update DST_ADR to reflect the newly incremented value based on the number of bytes that were transferred to the destination during the burst.</p>
15:0	src_adr[15:0]	<p>Specifies the lower portion of the full source address by concatenating with SRC_BASE_ADR from CHn_CFG1.</p> <p>Can be incremented or not depending on the setting of INC_SRC_ADR. Only SRC_ADR will increment; SRC_BASE_ADR will remain static. Therefore, separate TDs should be used to cross 64KB address boundaries.</p> <p>If INC_SRC_ADR=1 then when DMAC updates the TD (whether it's the CHn_ORIG_TD0/1 or CHn_SEP_TD0/1) at the end of a burst it will update SRC_ADR to reflect the newly incremented value based on the number of bytes that were transferred from the source during the burst.</p>

The interrupt status register stores internal interrupt events. Once a bit is set it remains set until it is cleared by writing a '1' to it. The interrupt enable register has no effect on the interrupt status register. A pending interrupt occurs when the flag is set to '1'. To acknowledge an interrupt, set the flag to '1'

Bits	Name	Description

HW Access	NA							
Retention	NA							
Name	RSVD							

Status indicators are provided to report the CAN controller error state, receive error count, and transmit error count. Special flags report error counter values equal to or in excess of 96 errors are available to indicate heavily disturbed bus situations. The transmitter error counter according to the CAN standard. When it is greater than 255 Decimal, it is fixed at 255 Decimal.

Bits	Name	Description
19	rxgte96	Rx Error Count is greater or equal to 96 Decimal
18	txgte96	Tx Error Count is greater or equal to 96 Decimal
17:16	err_state[1:0]	Error State of CAN node, 00 error active, 01 error passive, 1x bus off
15:8	rx_err_cnt[7:0]	Rx error Count. When in bus-off state, this counter is used to count 128 groups of 11 recessive bits
7:0	tx_err_cnt[7:0]	Tx error Count

## 1.3.1086 CAN[0..0]\_CSR\_CMD

### CMD

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Retention	NA							
Name	RSVD							

The CAN can be used in different operating mode,by disabling transmitting data,it is possible to use the CAN in listen only mode,enabling feature such as automatic bit rate detection,SRAM Test Mode

Bits	Name	Description
3	sram_test	SRAM test Mode. 0 Normal operation, 1 Enable SRAM test mode
1	listen	Listen only mode. 0 Active, 1 CAN listen only
0	run_stop	Run/Stop mode. 0 Sets the CAN controller to stop mode. Returns '1' when stopped, 1 Sets the CAN controller to run mode. Returns '1' when running

## 1.3.1087 CAN[0..0]\_CSR\_CFG

### CFG

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

CAN0\_CSR\_CFG: 0xA014

Bits	7	6	5	4	3	2	1	0

SW Access:Reset	NA:0	R/W:0000000						
HW Access	NA	R						
Retention	NA	NONRET						
Name	RSVD	cfg_bitrate						

CAN module has to be configured prior to use, this register defines the effective CAN data rate, CAN data synchronization, message buffer arbitration

Bits	Name	Description
30:16	cfg_bitrate[14:0]	CAN configuration Bit rate. 0 equals 1 clock cycle, 1 equals 2 clock cycles, ..., 32767 equals 32768 clock cycles
12	cfg_arbiter	Tx buffer Arbiter. 0 Round robin arbitration, 1 Fixed priority arbitration
11:8	cfg_tseg1[3:0]	Length of time segment1
7:5	cfg_tseg2[2:0]	Length of time segment2
4	auto_rst	auto_restart. 0 After bus-off, the CAN must be restarted 'by hand'. This is the recommended setting, 1 After bus-off, the CAN is restarting automatically after 128 groups of 11 recessive bits

(continued)

3:2	cfg_sjw[1:0]	Synchronization Jump Width
1	sampling_mode	CAN bus Bit sampling. 0 One sampling point is used in the receiver path, 1 Three sampling points with majority decision are used
0	edge_mode	CAN bus synchronization logic. 0 Edge from 'R' to 'D' is used for synchronization, 1 Both edges are used

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NA							
Name	RSVD2							

This is the Interrupt Enable bit. 0 interrupt disabled. 1 interrupt enables, successful message transmission sets the TxMsg flag in the Interrupt Controller.

Bits	Name	Description
31:24	RSVD2[7:0]	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
23	wpn2	Write protection for bits [21:16]. 0 = Bits [21:16] are write protected. 1 = Bits [21:16] are modified by writes. The wpn2 bit must always be set in the same write that is modifying bits [21:16] as these bit's states are not preserved. The readback value of the wpn2 bit is undefined.

(continued)

22	RSVD1	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
21	rtr	RTR Remote bit. 0 Standard message, 1 RTR message
20	ide	Extended identifier. 0 Standard format message, 1 Extended format message
19:16	dlc[3:0]	Data Length of the Tx Msg. Invalid values are transmitted as they are, but the number of data bytes is limited to eight. 0 Message has 0 data byte, data[63:0] is not used, 1 Message has 1 data byte, data[63:56] is used, ..., 8 Message has 8 data bytes, data [63:0] is used, 9-15 Message has 8 data bytes
15:8	RSVD0[7:0]	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
3	wpn1	Write protection for bit [2]. 0 = Bit [2] is write protected. 1 = Bit [2] is modified by writes. The wpn1 bit must always be set in the same write that is modifying bit [2] as this bit's state is not preserved. The wpn1 bit is always zero for readback.
2	txint_ebl	Transmit Interrupt Enable. 0 Interrupt disabled, 1 Interrupt enabled, succesful message transmission setst the TxMsg flag in the interrupt controller
1	txabort	Transmit Abort Request. 0 idle, 1 Requests removal of a pending message. The message is removed the next time an arbitration loss happened. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time
0	txreq	Transmit Request. For Write: 0 Idle, 1 Message Transmit request. For Read: 0 TxReq completed, 1 TxReq pending

## 1.3.1106 DFB[0..0]\_CR

### DFB Command Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_CR: 0xc780

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R	R	R
Retention	NA					NONRET	NONRET	NONRET
Name	RSVD					CORECLK_DISABLE	ADDR6	RUN

This register enables/disables DFB operation and sets FSM memory bank. Also, the internal core clock gater is controlled. A read of this register produces the last value written to this register.

Bits	Name	Description
2	CORECLK_DISABLE	This bit when set high disables (gates off) the clock to the entire core of the block. This includes all FFs except those used for the AHB interface and CSRs and all 6 RAMs. When disabled (set high) the AHB interface to the CSR is still fully functional. This bit is ANDed with the primary input signal dfb_clk_en to control the clock gate. dfb_clk_en must be high and CoreCLK_Disable must be low for the clock to run.  <a href="#">See Table 1-654.</a>
1	ADDR6	This bit is literally address bit 5 (6th bit) of the FSM RAM when addressed by the DFB Controller. It has no affect on the FSM RAM when addressed on the AHB interface. It controls the Banking feature of the FSM.  <a href="#">See Table 1-653.</a>
0	RUN	Setting this bit to 1 enables the DFB to run. Setting it to 0 forces the next state address of the FSM to zero of the active Bank, reinitializes the ACU's and PC's and clears the round flag, saturation flag, saturation detect flag and all 6 extended Enables in the Controller.  <a href="#">See Table 1-655.</a>

Table 1-653. Bit field encoding: addr6\_enum

Value	Name	Description
1'b1	ADDR6_HIGH	ADDR6 is High
1'b0	ADDR6_LOW	ADDR6 is Low

Table 1-654. Bit field encoding: coreclk\_disable\_enum

Value	Name	Description
1'b1	CORECLK_DISABLE_HI	Core Clock is Disabled (gated)
	GH	
1'b0	CORECLK_DISABLE_L	Core Clock is Enabled
	OW	

Table 1-655. Bit field encoding: run\_bit\_enum

Value	Name	Description
1'b1	RUN_EN	DFB is enabled to operate.
1'b0	RUN_DIS	DFB operation is halted.

## 1.3.1107 DFB[0..0]\_SR

### DFB Status Register

**Reset:** Reset Signals Listed Below

Register : Address

DFB0\_SR: 0xC784

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R:U	R:U	R:U
HW Access	W	W	W	W	W	W	W	W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	INTR_SEM 2	INTR_SEM 1	INTR_SEM 0	INTR_HOL DB	INTR_HOL DA	RND_MOD E	SAT_MODE	RAM_SEL

This register contains 5 bits indicating the status of block generated interrupts and 3 bits of status from the Datapath unit. Of the 5 sources of interrupts, only those configured in INT\_CTRL are activated. If not activated in INT\_CTRL they will never assert in this register. If an interrupt source bit (7:3) is set this indicates it is at least one of the sources of the currently driven interrupt on dfb\_intr. More than one of the 5 could be asserted. Note that if the system SW wishes to poll for an event and not have an interrupt generated, the interrupt must be enabled in the INT\_CTRL register so that it can be polled here and then disable the interrupt in the Interrupt Controller or not connect the dfb\_intr signal to the Interrupt Controller at all by not configuring the DSI path. Bits 2:0 are read-only - writes to these bits have no affect. Writes to bits 7:3 of '1' clear the bit, writes of 0 have no affect.

Bits	Name	Description
7	INTR_SEM2	If this bit is high, semaphore register bit 2 is a source of the current interrupt. Write a '1' to this bit to clear it.  <a href="#">See Table 1-660.</a>
6	INTR_SEM1	If this bit is high, semaphore register bit 1 is a source of the current interrupt. Write a '1' to this bit to clear it.  <a href="#">See Table 1-659.</a>
5	INTR_SEM0	If this bit is high, semaphore register bit 0 is a source of the current interrupt. Write a '1' to this bit to clear it.  <a href="#">See Table 1-658.</a>
4	INTR_HOLD B	If this bit is high, Holding register B is a source of the current interrupt. Write a '1' to this bit to clear it. Reading the Holding register B also clears this bit.  <a href="#">See Table 1-657.</a>
3	INTR_HOLD A	If this bit is high, Holding register A is a source of the current interrupt. Write a '1' to this bit to clear it. Reading the Holding register A also clears this bit.  <a href="#">See Table 1-656.</a>
2	RND_MODE	Indicates that the DP is in Round mode - meaning that any result passing out of the DP unit is being rounded to a 16-bit value.  <a href="#">See Table 1-662.</a>

(continued)

1	SAT_MODE	Indicates that the DP unit is in Saturation mode - meaning that any mathematic operation executed that produces a number outside the range of a 24-bit 2's complement number is clamped to the mode positive or negative number allowed. Saturation mode is set/unset under Assembly control in the DFB Controller.  <a href="#">See Table 1-663.</a>
0	RAM_SEL	This bit indicates which Control Store memory is in use, RAM A or RAM B.  <a href="#">See Table 1-661.</a>

## Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	RAM_SEL, SAT_MODE, RND_MODE
Domain reset for non-retention flops [reset_all_nonretention]	INTR_HOLD_A, INTR_HOLD_B, INTR_SEM0, INTR_SEM1, INTR_SEM2

Table 1-656. Bit field encoding: intr\_holda\_enum

Value	Name	Description
1'b0	HOLDA_OFF	Indicates no pending Holding A Register Interrupt.
1'b1	HOLDA_ON	Indicates a pending Holding A Register Interrupt.

Table 1-657. Bit field encoding: intr\_holdb\_enum

Value	Name	Description
1'b0	HOLDB_OFF	Indicates no pending Holding B Register Interrupt.
1'b1	HOLDB_ON	Indicates a pending Holding B Register Interrupt.

Table 1-658. Bit field encoding: intr\_sem0\_enum

Value	Name	Description
1'b0	SEM0_OFF	Indicates no pending Semaphore 0 Interrupt.
1'b1	SEM0_ON	Indicates a pending Semaphore 0 Interrupt.

Table 1-659. Bit field encoding: intr\_sem1\_enum

Value	Name	Description
1'b0	SEM1_OFF	Indicates no pending Semaphore 1 Interrupt.
1'b1	SEM1_ON	Indicates a pending Semaphore 1 Interrupt.

Table 1-660. Bit field encoding: intr\_sem2\_enum

Value	Name	Description
1'b0	SEM2_OFF	Indicates no pending Semaphore 2 Interrupt.
1'b1	SEM2_ON	Indicates a pending Semaphore 2 Interrupt.

Table 1-661. Bit field encoding: ram\_select\_bit\_enum

Value	Name	Description
1'b0	RAMSEL_LOW	Control Store memory A is in use.
1'b1	RAMSEL_HIGH	Control Store memory B is in use.

Table 1-662. Bit field encoding: rnd\_mode\_enum

Value	Name	Description
1'b0	RND_OFF	Indicates Round Mode is off.
1'b1	RND_ON	Indicates Round Mode is on.

Table 1-663. Bit field encoding: sat\_mode\_enum

Value	Name	Description
1'b0	SAT_OFF	Indicates Saturation mode is off.
1'b1	SAT_ON	Indicates Saturation mode is on.

## 1.3.1108 DFB[0..0]\_RAM\_EN

### DFB RAM Enable Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DFB0\_RAM\_EN: 0xC788

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R		R	R	R	R	R	R
Retention	RET		RET	RET	RET	RET	RET	RET
Name	RAMWR_ADDRRING		DPB_EN	DPA_EN	ACU_EN	CSB_EN	CSA_EN	FSM_EN

This register controls the DFB memory enables. These bits are tied directly to the enable pins of the RAMs in this block and should be used by System SW to power-down RAMs not in use. A read of this register produces the last value written to this register. The high two bits control the RAM overlay addressing.

Bits	Name	Description
7:6	RAMWR_ADDRRING[1:0]	These two bits control the write addressing of the 4 largest RAMs embedded in the DFB (CS-A, CS-B, Data-A, Data-B). The setting of these bits allows overlaid writes to occur to these memories when it is desired to fill them with like data. This feature is primarily intended to enhance SW BIST test time but may also have functional uses as well like filling both CS RAMs concurrently as they typically hold identical data. Setting these bits to 01, for example, configures the HW to write to both CS-A and CS-B for any write to the address space of either CS-A or CS-B. Reads are not affected by these bits. <a href="#">See Table 1-665.</a>
5	DPB_EN	Datapath RAM B RAM enable / disable. <a href="#">See Table 1-664.</a>
4	DPA_EN	Datapath RAM A RAM enable / disable. <a href="#">See Table 1-664.</a>
3	ACU_EN	ACU RAM RAM enable / disable. <a href="#">See Table 1-664.</a>
2	CSB_EN	Control Store RAM B RAM enable / disable. <a href="#">See Table 1-664.</a>
1	CSA_EN	Control Store RAM A RAM enable / disable. <a href="#">See Table 1-664.</a>
0	FSM_EN	FSM RAM RAM enable / disable. <a href="#">See Table 1-664.</a>

Table 1-664. Bit field encoding: ram\_enable\_bit\_enum

Value	Name	Description
1'b1	RAM_EN	RAM is enabled.
1'b0	RAM_DIS	RAM is disabled.

Table 1-665. Bit field encoding: ram\_write\_addressing\_bits\_enum

Value	Name	Description
2'b00	NO_OVERLAY	No overlay mapping.
2'b11	OVERLAY_CS_A_CS_B	Overlay CS A with CS B.
2'b10	OVERLAY_DATA_A_DA	Overlay Data A with Data B.
	TA_B	
2'b11	OVERLAY_CS_AB_DAT	Overlay CS A/B with Data A with DATA B.
	A_AB	

### 1.3.1109 DFB[0..0]\_RAM\_DIR

#### DFB RAM Direction Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DFB0\_RAM\_DIR: 0xC78C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	NA	R	R	R	R	R	R	R
Retention	NA	RET	RET	RET	RET	RET	RET	RET
Name	RSVD	SNP_DABLE	DPB_DIR	DPA_DIR	ACU_DIR	CSB_DIR	CSA_DIR	FSM_DIR

This register controls the DFB memory direction. These bits control if each RAM of this block is embedded to the DFB function or mapped in the system address space on the AHB bus. Mapping to the bus facilitates SW BIST, Configuration filling, and Block Mode transfers. A read to this register returns what was last written. When programming code into the CSA/B and FSM RAMs the RAM\_DIR bits should be set and unset together. When in normal operating mode and the CSA/B, ACU and FSM are being filled with assembly code/data, it is high recommended that all four RAMs DIR bits be set and cleared together.

Bits	Name	Description
6	SNP_DABLE	The CS and DP RAMs (optionally the FSM) have address snooping logic that watches for redundant back-to-back RD cycles and disables the RAM to conserve power. Writing a 1 to this bit disables this logic for all RAMs.  <a href="#">See Table 1-667.</a>
5	DPB_DIR	Datapath RAM B RAM Direction.  <a href="#">See Table 1-666.</a>
4	DPA_DIR	Datapath RAM A RAM Direction.  <a href="#">See Table 1-666.</a>
3	ACU_DIR	ACU RAM RAM Direction.  <a href="#">See Table 1-666.</a>
2	CSB_DIR	Control Store RAM B RAM Direction.  <a href="#">See Table 1-666.</a>
1	CSA_DIR	Control Store RAM A RAM Direction.  <a href="#">See Table 1-666.</a>
0	FSM_DIR	FSM RAM RAM Direction.  <a href="#">See Table 1-666.</a>

Table 1-666. Bit field encoding: ram\_direction\_bit\_enum

Value	Name	Description
1'b1	RAM_AHB	System Bus
1'b0	RAM_DFB	DFB

(continued)

Table 1-667. Bit field encoding: snoop\_disable\_bit\_enum

Value	Name	Description
1'b1	SNP_DISABLE	Disabled
1'b0	SNP_ENABLE	Enabled

## 1.3.1110 DFB[0..0]\_SEMA

### DFB Semaphore Register

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_SEMA: 0xC790

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	W:000			NA:0	R/W:000		
HW Access	NA	R			NA	R		
Retention	NA	NONRET			NA	NONRET		
Name	RSVD	SEMA_MASK			RSVD	SEMA		

This register controls the DFB Semaphore register. These bits are used to pass semaphores between the DFB Controller and the System SW. Their use and purpose is user defined. A read to this register returns what was last written by either System SW or the DFB Controller.

Bits	Name	Description
6:4	SEMA_MASK[2:0]	These bits are used to mask writes to bits 2-0. They are write-only. If bit 4 is a 1 then the value on bit 0 will be written to SEM0, otherwise SEM0 will not be altered. Likewise for MASK1 and SEM1, and MASK2 and SEM2.
2:0	SEMA[2:0]	These bits are used to pass semaphores between the DFB Controller and the System SW. Their definition is user defined. There is no HW implementing an arbitration methodology should both the System and Control access the same SEM bit at the same time. Coherency of the SEM bits is the responsibility of the SW running on the Controller and the System CPU. If the same SEM bit is written by the Controller and the System in the exact same cycle (a collision), the System write takes precedence over the Controller. In this manner, each of the 3 bits are treated individually.

### 1.3.1111 DFB[0..0]\_DSI\_CTRL

#### DFB Global Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DFB0\_DSI\_CTRL: 0xC794

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		R/W:00	
HW Access	NA				R		R	
Retention	NA				RET		RET	
Name	RSVD				GBL2_OUT		GBL1_OUT	

This register controls what internal signals are mapped to the two primary output global signals dfb\_globalo1 and dfb\_globalo2. A read of this register produces the last value written to this register. These two outputs are registered (pclk rising) just before leaving the block - giving them a 1 cycle delay and a full clock cycle to propagate to their DSI destinations.

Bits	Name	Description
3:2	GBL2_OUT[1:0]	These bits are used to control what internal signals are mapped to the primary output signal dfb_globalo2. <a href="#">See Table 1-669.</a>
1:0	GBL1_OUT[1:0]	These bits are used to control what internal signals are mapped to the primary output signal dfb_globalo1. <a href="#">See Table 1-668.</a>

Table 1-668. Bit field encoding: global\_output\_1\_encoding\_bits\_enum

Value	Name	Description
2'b00	DFB_RUN	DFB RUN Bit. This is the same bit as the RUN bit in the DFB0_CR register.
2'b01	SEM0	Semaphore Bit 0. This is the same signal described in the DFB0_SEMA_CSR.
2'b10	SEM1	Semaphore Bit 1. This is the same signal described in the DFB0_SEMA_CSR.
2'b11	DFB_INTR	DFB Interrupt. This is the same signal as the primary dfb_intr output signal.

Table 1-669. Bit field encoding: global\_output\_2\_encoding\_bits\_enum

Value	Name	Description
2'b00	SEM2	Semaphore Bit 2. This is the same signal described in the DFB0_SEMA_CSR.
2'b01	DPSIGN	Datapath Sign. This signal asserts anytime the output of the ALU in the Datapath unit is negative. It will remain high for each cycle this condition is true.
2'b10	DPTHREASH	Datapath Threshold Crossed. This signal asserts anytime the threshold of 0 is crossed in the ALU when one of the following instructions is executing: TDECA, TSUBA, TSUBB, TADDABSA, TADDABSB. It will remain high for each cycle this condition is true.
2'b11	DPEQ	Datapath ALU=0. This signal asserts high when the output of the ALU in the Datapath unit equals 0 and one of the following ALU commands is executing: TDECA, TSUBA, TSUBB, TADDABSA, TADDABSB. It will remain high for each cycle this condition is true.

### 1.3.1112 DFB[0..0]\_INT\_CTRL

#### DFB Interrupt Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DFB0\_INT\_CTRL: 0xC798

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			SEMA2_EN	SEMA1_EN	SEMA0_EN	HOLDB_EN	HOLDA_EN

This register allows control of what events generate an interrupt. Each of the events enabled by the bits in this register are ORed together to produce the dfb\_intr signal. A read to this register returns what was last written. System SW should see that a semaphore is never configured as both a DMA request and an interrupt (see DMA\_CTRL).

Bits	Name	Description
4	SEMA2_EN	If this bit is set high, an interrupt is generated each time a 1 is written into the semaphore register bit 2.  <a href="#">See Table 1-671.</a>
3	SEMA1_EN	If this bit is set high, an interrupt is generated each time a 1 is written into the semaphore register bit 1.  <a href="#">See Table 1-671.</a>
2	SEMA0_EN	If this bit is set high, an interrupt is generated each time a 1 is written into the semaphore register bit 0.  <a href="#">See Table 1-671.</a>
1	HOLDB_EN	If this bit is set high, an interrupt is generated each time new valid data is written into the output Holding register B.  <a href="#">See Table 1-670.</a>
0	HOLDA_EN	If this bit is set high, an interrupt is generated each time new valid data is written into the output Holding register A.  <a href="#">See Table 1-670.</a>

Table 1-670. Bit field encoding: enable\_holding\_reg\_bit\_enum

Value	Name	Description
1'b1	ENABLE_HOLDING_IRQ_EN	Interrupt is generated each time new valid data is written into the output Holding register.
1'b0	ENABLE_HOLDING_IRQ_DIS	Holding register interrupt masked.

Table 1-671. Bit field encoding: enable\_semaphore\_bit\_enum

Value	Name	Description
1'b1	ENABLE_SEMAPHORE_IRQ_EN	Interrupt is generated each time a 1 is written to the semaphore register.
1'b0	ENABLE_SEMAPHORE_IRQ_DIS	Semaphore register interrupt masked.

### 1.3.1113 DFB[0..0]\_DMA\_CTRL

#### DFB DMAREQ Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DFB0\_DMA\_CTRL: 0xC79C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		R/W:00	
HW Access	NA				R		R	
Retention	NA				RET		RET	
Name	RSVD				DMAREQ2		DMAREQ1	

This register allows control of what events generate DMAREQ events. Each field allows the user to configure what event drives each of the two DMAREQ primary output signals. Note that if a semaphore is configured as the DMAREQ the HW automatically clears the appropriate semaphore register after one pclk cycle - creating a single cycle pulse on the dmareq output as is required. Otherwise, the semaphores are sticky. If a Holding register is programmed as a DMAREQ, the DMAREQ is level sensed, instead of a pulse. The DMAREQ in this case will stay asserted until the Holding register is read. Level sensed is the preferred method of PHUB even though a strobe will work. System SW should see that a semaphore is never configured as both a DMA request and an interrupt (see INT\_CTRL). A read of this register returns the last value written.

Bits	Name	Description
3:2	DMAREQ2[1:0]	The value in these two bits selects which event drives dma_req2. <a href="#">See Table 1-673.</a>
1:0	DMAREQ1[1:0]	The value in these two bits selects which event drives dma_req1. <a href="#">See Table 1-672.</a>

Table 1-672. Bit field encoding: dma\_req\_1\_source\_bits\_enum

Value	Name	Description
2'b00	DMAREQ1_DISABLED	Disabled
2'b01	DMAREQ1_HOLDING_REG_A	New data in Holding Register A.
2'b10	DMAREQ1_SEMAPHO_RE_0	Semaphore 0.
2'b11	DMAREQ1_SEMAPHO_RE_1	Semaphore 1.

Table 1-673. Bit field encoding: dma\_req\_2\_source\_bits\_enum

Value	Name	Description
2'b00	DMAREQ2_DISABLED	Disabled
2'b01	DMAREQ2_HOLDING_REG_B	New data in Holding Register B.
2'b10	DMAREQ2_SEMAPHO_RE_0	Semaphore 0.
2'b11	DMAREQ2_SEMAPHO_RE_1	Semaphore 1.

### 1.3.1114 DFB[0..0]\_STAGEA

#### DFB Low Byte Staging Register A

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_STAGEA: 0xC7A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGA_LOW							

This is the low byte of the Streaming input Staging Register - Port A. If the Staging A Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 15:8 instead. Although the Staging A/B registers are shown here as 3 byte-wide registers, it is primarily intended that they be treated as 24-bit registers at a 32-bit offset. Due to the architecture of the DFB, any value written to the Staging A or B registers that is less than 24 bits in size must be msb aligned. For example, a 16-bit value written to the Staging A register must be written to STAGExM and STAGExH with STAGEx set to 0. The Staging registers support byte and half-word accesses as well. However, if byte and half-word accesses are used then the Key Coherency Byte feature must be used. Also see the COHER register description below. In some use models it is desirable to write 16-bit values on bus bits 15:0 and have them actually writing to bits 23:8 of the register. A System SW convenience feature to accomplish this is provided. If the Data Alignment bit for these registers is set in the DALIGN register the byte written is shifted up (left) to the next byte position. This is only true of the two lower bytes. READ: AHB: What was last written. The DFB Controller reads this register (and the other 2 bytes) by asserting busrd and setting the low-order ACU RAM address bit low. WRITE: Writes the low byte of the input Staging Register for Port A or the middle byte if the Data Alignment bit is set in the DALIGN register.

Bits	Name	Description
7:0	STGA_LOW[7:0]	A write to this register sets the low byte of the input Staging Register for Port A.

### 1.3.1115 DFB[0..0]\_STAGEAM

#### DFB Middle Byte Staging Register A

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_STAGEAM: 0xC7A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGA_MID							

This is the middle byte of the Streaming input Staging Register - Port A. If the Staging A Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 23:16 instead. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGA_MID[7:0]	A write to this register sets the middle byte of the input Staging Register for Port A.

### 1.3.1116 DFB[0..0]\_STAGEAH

#### DFB High Byte Staging Register A

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_STAGEAH: 0xC7A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGA_HIGH							

This is the high byte of the Streaming input Staging Register - Port A. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGA_HIGH[7:0]	A write to this register sets the high byte of the input Staging Register for Port A.

### 1.3.1117 DFB[0..0]\_STAGEB

#### DFB Low Byte Staging Register B

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_STAGEB: 0xC7A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGB_LOW							

This is the low byte of the Streaming input Staging Register - Port B. If the Staging B Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 15:8 instead. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGB_LOW[7:0]	A write to this register sets the low byte of the input Staging Register for Port B.

### 1.3.1118 DFB[0..0]\_STAGEBM

#### DFB Middle Byte Staging Register B

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_STAGEBM: 0xC7A5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGB_MID							

This is the middle byte of the Streaming input Staging Register - Port B. If the Staging B Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 23:16 instead. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGB_MID[7:0]	A write to this register sets the middle byte of the input Staging Register for Port B.

## 1.3.1119 DFB[0..0]\_STAGEBH

### DFB High Byte Staging Register B

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_STAGEBH: 0xC7A6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGB_HIGH							

This is the high byte of the Streaming input Staging Register - Port B. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGB_HIGH[7:0]	A write to this register sets the high byte of the input Staging Register for Port B.

### 1.3.1120 DFB[0..0]\_HOLDA

#### DFB Low Byte Holding Register A

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDA: 0xC7A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_LOW							

This is the low byte of the output Holding Register - Port A. If the Holding A Data Alignment bit is set in the DALIGN register then data read from this address will be bits 15:8 instead. Although the Holding A/B registers are shown here as 3 byte-wide registers, it is primarily intended that they be treated as 24-bit registers at a 32-bit offset. Due to the architecture of the DFB, any value read from the Holding A or B registers will be msb aligned unless shifted otherwise by the Datapath shifter. For example, if the resultant output samples are 16-bit values, a read of a Holding register will produce that data on bits 23:8, or HOLDxH and HOLDxM. The Holding registers support byte and half-word accesses as well. However, if byte and half-word accesses are used then the Key Coherency Byte feature must be used. Also see the COHER register description below. In some use models it is desirous to read 16-bit values on bus bits 15:0 and have them actually source from bits 23:8 of the register. A System SW convenience feature to accomplish this is provided. If the Data Alignment bit for these registers is set in the DALIGN register the byte read is shifted down (right) to the next byte position. This is only true of the two upper bytes. Also as a System SW convenience, reads of the Holding registers are sign extended up to bit 31 of the bus even though the top byte is not documented or implemented as a real register. If the DFB is configured (see INT\_CTRL) to generate an interrupt based on valid data in the Holding register, the interrupt status bit in the SR register will be cleared when any portion (byte, 16-bit or full 32-bit read) of the Holding register is read, by the CPU or the DMA Controller. READ: What was last written by the DFB Controller. WRITE: Read-only by AHB, DFB Controller writes to this register (including the other 2 bytes) with a buswr command and the low-order ACU RAM address bit set low.

Bits	Name	Description
7:0	HOLDA_LOW[7:0]	Low byte of the output Holding Register, Port A.

### 1.3.1121 DFB[0..0]\_HOLDAM

#### DFB Middle Byte Holding Register A

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDAM: 0xC7A9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_MID							

This is the middle byte of the output Holding Register - Port A. If the Holding A Data Alignment bit is set in the DALIGN register then data read from this address will be bits 23:16 instead. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDA_MID[7:0]	Middle byte of the output Holding Register, Port A.

### 1.3.1122 DFB[0..0]\_HOLDAH

#### DFB High Byte Holding Register A

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDAH: 0xC7AA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_HIGH							

This is the high byte of the output Holding Register - Port A. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDA_HIGH[7:0]	High byte of the output Holding Register, Port A.

### 1.3.1123 DFB[0..0]\_HOLDAS

#### DFB Holding Register A Sign Extension

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDAS: 0xC7AB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_SIGNEXT							

\* This is a pseudo register. There are no FFs or even an address decode for this pseudo register. If read or written as a byte it acts the same as all other unused byte addresses in the block's address space - writes are ignored and reads produce 0 on the bus. However, if HOLDA is read as a 32-bit value or HOLDAH is read as a 16-bit value, the sign is extended onto this byte lane. This pseudo register definition is here simply to document this sign extension functionality. See usage notes in HOLDA register description above. READ: Always 0 if read as a byte. Always the sign extension if HOLDA is read as a 32-bit value or HOLDAH is read as a 16-bit value. WRITE: Ignored.

Bits	Name	Description
7:0	HOLDA_SIGNEXT[7:0]	Output Holding Register Sign Extension, Port A.

### 1.3.1124 DFB[0..0]\_HOLDB

#### DFB Low Byte Holding Register B

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDB: 0xC7AC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDB_LOW							

This is the low byte of the output Holding Register - Port B. If the Holding B Data Alignment bit is set in the DALIGN register then data read from this address will be bits 15:8 instead. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDB_LOW[7:0]	Low byte of the output Holding Register, Port B.

### 1.3.1125 DFB[0..0]\_HOLDBM

#### DFB Middle Byte Holding Register B

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDBM: 0xC7AD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDB_MID							

This is the middle byte of the output Holding Register - Port B. If the Holding B Data Alignment bit is set in the DALIGN register then data read from this address will be bits 23:16 instead. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDB_MID[7:0]	Middle byte of the output Holding Register, Port B.

### 1.3.1126 DFB[0..0]\_HOLDBH

#### DFB High Byte Holding Register B

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDBH: 0xC7AE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDB_HIGH							

This is the high byte of the output Holding Register - Port B. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDB_HIGH[7:0]	High byte of the output Holding Register, Port B.

## 1.3.1127 DFB[0..0]\_HOLDBS

### DFB Holding Register B Sign Extension

**Reset:** Domain reset for non-retention flops [reset\_all\_nonretention]

Register : Address

DFB0\_HOLDBS: 0xC7AF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDB_SIGNEXT							

\* This is a pseudo register. There are no FFs or even an address decode for this pseudo register. If read or written as a byte it acts the same as all other unused byte addresses in the block's address space - writes are ignored and reads produce 0 on the bus. However, if HOLDB is read as a 32-bit value or HOLDBH is read as a 16-bit value, the sign is extended onto this byte lane. This pseudo register definition is here simply to document this sign extension functionality. See usage notes in HOLDA register description above. READ: Always 0 if read as a byte. Always the sign extension if HOLDB is read as a 32-bit value or HOLDBH is read as a 16-bit value. WRITE: Ignored.

Bits	Name	Description
7:0	HOLDB_SIGNEXT[7:0]	Output Holding Register Sign Extension, Port B.

## 1.3.1128 DFB[0..0]\_COHER

### DFB Coherency Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DFB0\_COHER: 0xC7B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:10		R/W:10		R/W:10		R/W:10	
HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	holdb_key		holda_key		stgb_key		stga_key	

The 4 2-bit fields of this register are used to select which of the 3 bytes of each of the STAGEA, STAGEB, HOLDA and HOLDB will be used as the Key Coherency Byte. Coherency refers to the HW added to this block to protect against malfunctions of the block in cases where register fields are wider than the bus access, leaving intervals in time when fields are partially written/read (incoherent). The Key Coherency Byte is the SW's way of telling the HW which byte of the field will be written/read last when an update to the field is desired. When the Key byte is written/read, the field is flagged coherent. If any other byte is written/read, the field is flagged incoherent.

Bits	Name	Description
7:6	holdb_key[1:0]	Sets the Key Coherency Byte of the Holding B register <a href="#">See Table 1-675.</a>
5:4	holda_key[1:0]	Sets the Key Coherency Byte of the Holding A register <a href="#">See Table 1-674.</a>
3:2	stgb_key[1:0]	Sets the Key Coherency Byte of the Staging B register <a href="#">See Table 1-677.</a>
1:0	stga_key[1:0]	Sets the Key Coherency Byte of the Staging A register <a href="#">See Table 1-676.</a>

Table 1-674. Bit field encoding: holda\_key\_enum

Value	Name	Description
2'b00	HOLDA_KEY_LOW	Key Byte is low byte.
2'b01	HOLDA_KEY_MID	Key Byte is med byte.
2'b10	HOLDA_KEY_HIGH	Key Byte is high byte.

Table 1-675. Bit field encoding: holdb\_key\_enum

Value	Name	Description
2'b00	HOLDB_KEY_LOW	Key Byte is low byte.
2'b01	HOLDB_KEY_MID	Key Byte is med byte.
2'b10	HOLDB_KEY_HIGH	Key Byte is high byte.

Table 1-677. Bit field encoding: stgb\_key\_enum

Value	Name	Description
2'b00	STGB_KEY_LOW	Key Byte is low byte.
2'b01	STGB_KEY_MID	Key Byte is med byte.
2'b10	STGB_KEY_HIGH	Key Byte is high byte.

## 1.3.1129 DFB[0..0]\_DALIGN

### DFB Data Alignment Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DFB0\_DALIGN: 0xC7B4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				holdb_dalign	holda_dalign	stgb_dalign	stga_dalign

These bits when set high causes an 8-bit shift in the data to all access of the corresponding Staging and Holding registers. The purpose of this feature is to allow 9 to 16 bit input and output samples to travel as 16-bit values on the AHB bus. Because the DFB datapath is inherently msb aligned, it is convenient to the System SW to align values on bits 23:8 of the Staging and Holding register to bits 15:0 of the bus. A read of this register produces the last value written to this register.

Bits	Name	Description
3	holdb_dalign	Shifts the read right by a byte. <a href="#">See Table 1-679.</a>
2	holda_dalign	Shifts the read right by a byte. <a href="#">See Table 1-678.</a>
1	stgb_dalign	Shifts the write left by a byte. <a href="#">See Table 1-681.</a>
0	stga_dalign	Shifts the write left by a byte. <a href="#">See Table 1-680.</a>

Table 1-678. Bit field encoding: holda\_dalign\_enum

Value	Name	Description
1'b0	HOLDA_DALIGN_LOW	Reads normally.
1'b1	HOLDA_DALIGN_HIGH	Reads shifted right by 8-bits.

Table 1-679. Bit field encoding: holdb\_dalign\_enum

Value	Name	Description
1'b0	HOLDB_DALIGN_LOW	Reads normally.
1'b1	HOLDB_DALIGN_HIGH	Reads shifted right by 8-bits.

Table 1-680. Bit field encoding: stga\_dalign\_enum

Value	Name	Description
1'b0	STGA_DALIGN_LOW	Writes normally.
1'b1	STGA_DALIGN_HIGH	Writes shifted left by 8-bits.

Table 1-681. Bit field encoding: stgb\_dalign\_enum

Value	Name	Description
1'b0	STGB_DALIGN_LOW	Writes normally.
1'b1	STGB_DALIGN_HIGH	Writes shifted left by 8-bits.

Retention	RET							
Name	SPR_BIT							

Each of the 32 stimulus ports is represented by a virtual address. A write to one of these locations causes data to be written into the FIFO if the corresponding bit in the Trace Enable Register is set and ITM is enabled. Reading from any of the stimulus ports returns the FIFO status (notFull(1) / Full(0)) only if the ITM is enabled.

Bits	Name	Description
31:0	SPR_BIT[31:0]	(no description)

## 1.3.1131 SWV\_ITM\_TER

### Trace Enable Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_ITM\_TER: 0xEE00

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TER_BIT							

  

Bits	15	14	13	12	11	10	9	8

SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TER_BIT							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TER_BIT							

Bit mask to enable tracing on ITM stimulus ports. Each bit location corresponds to a virtual stimulus register; when a bit is set, a write to the appropriate stimulus location results in a packet being generated, except when the FIFO is full. Reset to disable all locations is 0x00000000. The setting of the bits [31:16] is ignored if secure trace is disabled. Stimulus ports 16-31 are disabled when the ability to perform secure non-invasive debug is removed. The setting of the bits [31:0] is ignored if non-secure trace is disabled. Stimulus ports 0-31 are disabled when the ability to perform non-secure non-invasive debug is removed.

Bits	Name	Description
31:0	TER_BIT[31:0]	(no description)

## 1.3.1132 SWV\_ITM\_TTR

### Trace Triger Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_ITM\_TTR: 0xEE20

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TER_BIT

HW Access	R							
Retention	RET							
Name	TER_BIT							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TER_BIT							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TER_BIT							

Bit mask to enable trigger generation, TRIGOUT, on selected writes to the Stimulus Registers. Each bit in the register represents one of the virtual stimulus registers. When the bit is set, a pulse is sent on TRIGOUT when writing to the corresponding Stimulus Register. The pulse is held until TRIGOUTACK is returned, which can result in masking of multiple triggers with one acknowledgement. Triggers are not generated if trace is disabled. When secure non-invasive debug, or secure trace, is disabled, no triggers are generated for Stimulus Registers 16 to 31. If non-secure non-invasive debug, or trace, is disabled, no triggers are generated. The register is zero on reset, and the default is no triggers generated.

Bits	Name	Description
31:0	TER_BIT[31:0]	(no description)

## 1.3.1133 SWV\_ITM\_CR

### Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_ITM\_CR: 0xEE80

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:1	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				DWTEn	SYNCEn	TSSEn	ITMEn

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						TSPrescale	

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:0	R/W:0000000						
HW Access	R	R						
Retention	RET	RET						
Name	ITMBusy	TraceID						

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

This is the control word used to configure and control transfers through the APB interface.

Bits	Name	Description
23	ITMBusy	ITM is transmitting trace and FIFO is not empty <a href="#">See Table 1-683.</a>
22:16	TraceID[6:0]	ATIDM[6:0] value <a href="#">See Table 1-686.</a>
9:8	TSPrescale[1:0]	Timestamp Prescaler divide value <a href="#">See Table 1-687.</a>

(continued)

3	DWTEn	Enable DWT input port <a href="#">See Table 1-682.</a>
2	SYNCEn	Enable sync packets The SYNCEn bit is always 0x1 and is enabled. <a href="#">See Table 1-685.</a>
1	TSSEn	Enable timestamps, delta <a href="#">See Table 1-688.</a>
0	ITMEn	Enable ITM stimulus, also acts as a global enable It is recommended that the ITMEn bit is cleared and waits for the ITMBusy bit to be cleared, before changing any fields in the Control Register, otherwise the behavior can be unpredictable. See Overflow packet on page 13-4 for information about disabling the ITM overflow packets. <a href="#">See Table 1-684.</a>

Table 1-682. Bit field encoding: DWT\_ENUM

Value	Name	Description
1'd1	DWT_EN	Enable DWT input port Data Watchpoint and Trace (DWT) is not used in the CoreSight ITM, so the DWTEn bit is always 0x0.

Table 1-683. Bit field encoding: ITMBUSY\_ENUM

Value	Name	Description
1'b1	ITMBUSY	ITM is transmitting trace and FIFO is not empty

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Synchronization packets must be output on a regular basis to provide decompression tools markers in the trace stream. The first synchronization packet is output when the ITM is enabled by setting bit [0] in the Control Register. Subsequent packets are output when the counter reaches zero, that is, decrement on data entered into the FIFO. The Synchronization Control Register represents the reloaded count value when the counter reaches zero, not the current count. This register must only be changed when the ITM is disabled.

Bits	Name	Description
11:0	SyncCount[11:0]	Counter value for time between synchronization markers

[See Table 1-689.](#)

Table 1-689. Bit field encoding: SC\_ENUM

Value	Name	Description
12'h400	SYNC_COUNT	Counter value for time between synchronization markers

Retention	RET							
Name	CSPS							

The SWO does not support synchronous mode, so this register reads as zero.

Bits	Name	Description
31:0	CSPS[31:0]	(no description)
<a href="#">See Table 1-697.</a>		

Table 1-697. Bit field encoding: CSPS\_ENUM

Value	Name	Description
32'h0	CSPS	(no description)

## 1.3.1143 SWV\_SWO\_CAOSD

### Current Output Divisor Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_CAOSD: 0xF010

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	CASOD							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:000			R/W:00000				
HW Access	NA			R				
Retention	NA			RET				
Name	RSVD			CASOD				

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

With this register it is possible to scale the baud rate of the SWO output. It divides TRACECLKIN, enabling it when the counter reaches the programmed value and thus reducing the baud rate of the TRACESWO pin.

Bits	Name	Description
12:0	CASOD[12:0]	Prescaler

[See Table 1-698.](#)

Table 1-698. Bit field encoding: CAOSD\_ENUM

Value	Name	Description
13'h0	CAOSD	13 bit prescale counter.

## 1.3.1144 SWV\_SWO\_SPP

### Selected Pin Protocol Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_SPP: 0xF0F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:01	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						SPP	

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

This register selects which protocol to use for trace outputting. The register is defined in Table 12-9 on page 12-13, and the supported values allowed in the register are determined by bits [11:9] of the Device ID Register, Table 12-7 on page 12-9. When only one protocol is supported on a component, this device is read only and set as the appropriate protocol.

Bits	Name	Description
1:0	SPP[1:0]	Select the pin protocol where multiple types are supported. The selection of unsupported protocols can result in unpredictable behavior. <a href="#">See Table 1-699.</a>

Table 1-699. Bit field encoding: SPP\_ENUM

Value	Name	Description
2'h01	Manchester	Single Wire Output (Manchester). This is the reset value.
2'h10	NRZ	Single Wire Output (NRZ).

### 1.3.1145 SWV\_SWO\_STM

#### Supported Trigger Modes Registers

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_STM: 0xF100

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:00000				
HW Access	NA			R				
Retention	NA			RET				
Name	RSVD			Multipliers				

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:0000000							R:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							TCount8

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:000000						R:0	R:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						TrgRun	Triggered

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

This register indicates the implemented Trigger Counter multipliers and other supported features of the trigger system. Because no trigger options are implemented in the SWO, this register must read as zero.

Bits	Name	Description
17	TrgRun	Trigger Counter running. A trigger has occurred but the counter is not at zero. <a href="#">See Table 1-701.</a>
16	Triggered	A trigger has occurred and the counter has reached zero where implemented. <a href="#">See Table 1-701.</a>
8	TCount8	8-bit wide counter register implemented. <a href="#">See Table 1-701.</a>

(continued)

4:0      Multipliers[4:0]      (no description)

[See Table 1-700.](#)

Table 1-700. Bit field encoding: MULT\_ENUM

Value	Name	Description
5'h1	Mult2	Multiply the Trigger Counter by 2 supported.
5'h1	Mult4	Multiply the Trigger Counter by 4 supported.
5'h1	Mult16	Multiply the Trigger Counter by 16 supported.
5'h1	Mult256	Multiply the Trigger Counter by 256 supported.
5'h1	Mult64k	Multiply the Trigger Counter by 65536 supported.

Table 1-701. Bit field encoding: STM\_ENUM

Value	Name	Description
1'h1	TrgRun	(no description)

### 1.3.1146 SWV\_SWO\_STPM

#### Supported Test Pattern and Modes Registers

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_STPM: 0xF200

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				Pattern			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:0000000							R:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							PPat8

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:000000						R:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						Mode	

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	Name	Description
17:16	Mode[1:0]	(no description) <a href="#">See Table 1-702.</a>
8	PPat8	(no description) <a href="#">See Table 1-704.</a>
3:0	Pattern[3:0]	(no description) <a href="#">See Table 1-703.</a>

(continued)

Table 1-702. Bit field encoding: STPMM\_ENUM

Value	Name	Description
2'h2	PContEn	Continuous Mode
2'h1	PtimeEn	Timed Mode

Table 1-703. Bit field encoding: STPMP\_ENUM

Value	Name	Description
4'h8	FPatF0	FF/00 Pattern.
4'h4	FPatA5	AA/55 Pattern.
4'h2	FPatW1	Walking 0's Pattern.
4'h1	FPatW0	Walking 1's Pattern

Table 1-704. Bit field encoding: STPPP\_ENUM

Value	Name	Description
1'h1	PPat8	8-bit Programmable Test Pattern

### 1.3.1147 SWV\_SWO\_FFS

#### Formatter and Flush Status Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_FFS: 0xF300

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:1000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				FFS			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	Name	Description
3:0	FFS[3:0]	(no description) <a href="#">See Table 1-705.</a>

Table 1-705. Bit field encoding: FFS\_ENUM

Value	Name	Description
4'h8	FtNonStop	Formatter cannot be stopped. Settings can be altered without the requirement to stop the formatter, therefore this bit remains HIGH.
4'h4	TCPresent	TRACECTL is not present, therefore this bit is tied off to 0.
4'h2	FtStopped	Formatter stopped. Because the formatter is not present, this bit always reads 0.
4'h1	FIInProg	Flush In Progress. Because flushing is not supported, this bit always reads 0.

## 1.3.1148 SWV\_SWO\_FFC

### Formatter and Flush Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_FFC: 0xF304

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R:000			NA:00		R:00	
HW Access	NA	R			NA		R	
Retention	NA	RET			NA		RET	
Name	RSVD	FON			RSVD		ENF	

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:0	R:000			NA:0	R:000		
HW Access	NA	R			NA	R		
Retention	NA	RET			NA	RET		
Name	RSVD	STOP			RSVD	TRIG		

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	Name	Description
14:12	STOP[2:0]	Stop events <a href="#">See Table 1-708.</a>
10:8	TRIG[2:0]	Trigger mark <a href="#">See Table 1-709.</a>
6:4	FON[2:0]	FOn events <a href="#">See Table 1-707.</a>

(continued)

1:0      ENF[1:0]      EnF events

[See Table 1-706.](#)

Table 1-706. Bit field encoding: ENF\_ENUM

Value	Name	Description
2'h2	EnFCont	Continuous Formatting, that is, data is always present. Embed in trigger packets and indicate null cycles using sync packets.
2'h1	EnFTC	Enable Formatting. Do not embed triggers into the formatted stream. Trace disable cycles and triggers are indicated where possible in the selected pin protocol.

Table 1-707. Bit field encoding: FON\_ENUM

Value	Name	Description
3'h4	FOnMan	Manually generates a flush of the system. Setting this bit causes a flush to be generated. This is cleared when this flush has been serviced. This bit is clear on reset.
3'h2	FOnTrig	Generates flush using a trigger event. Set this bit to cause a flush of data in the system when a trigger event occurs.
3'h1	FOnFlIn	Generate Flush using the FLUSHIN interface. Set this bit to enable use of the FLUSHIN connection.

Table 1-708. Bit field encoding: ST\_ENUM

Value	Name	Description
3'h4	StopMan	Manually stop the output of trace.
3'h2	StopTrig	Stop the formatter when a Trigger Event is observed.
3'h1	StopFI	Stop the formatter when a flush has completed, that is, return of AFREADY. This forces the FIFO to drain of any part completed packets.

Table 1-709. Bit field encoding: TRIG\_ENUM

Value	Name	Description
3'h4	TrigFI	Indicate a trigger on Flush completion, that is, AFREADY is returned.
3'h2	TrigEvt	Indicates a trigger on a Trigger Event.
3'h1	TrigIn	Indicates a trigger on TRIGIN being asserted.

## 1.3.1149 SWV\_SWO\_ITDR0

### Integration Test ATB Data Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_ITDR0: 0xFEEC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						ATDATA	

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	Name	Description
1:0	ATDATA[1:0]	(no description)
<a href="#">See Table 1-710.</a>		

Table 1-710. Bit field encoding: ATDATA\_ENUM

Value	Name	Description
2'h2	ATDATA7	Reads the value of ATDATAS[7]
2'h1	ATDATA0	Reads the value of ATDATAS[0]

### 1.3.1150 SWV\_SWO\_ITCR2

#### Integration Test ATB Control Register 2

**Reset:** N/A

Register : Address

SWV\_SWO\_ITCR2: 0xFEFO

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							W:U
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							ATREADY-DATA

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	Name	Description
0	ATREADYDATA	(no description)
<a href="#">See Table 1-711.</a>		

Table 1-711. Bit field encoding: ATREADY\_ENUM

Value	Name	Description
1'h1	ATREADY	Sets the value of ATREADY. Topology detection register, always present

## 1.3.1151 SWV\_SWO\_ITCR0

### Integration Test ATB Control Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_ITCR0: 0xFEf8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							ATVALID

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	Name	Description
0	ATVALID	(no description) <a href="#">See Table 1-712.</a>

Table 1-712. Bit field encoding: ATVALID\_ENUM

Value	Name	Description
1'h1	ATVALID	Reads the value of ATVALIDS. Topology detection register, always present

### 1.3.1152 SWV\_SWO\_ITMCR

#### Integration Mode Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_ITMCR: 0xFF00

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							ITCTRL

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:0000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:0000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:0000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

This register enables the component to switch from a functional mode, the default behavior, to integration mode. The ITM must be disabled and be in the idle state before setting the Integration Mode.

Bits	Name	Description
0	ITCTRL	(no description)

[See Table 1-713.](#)

Table 1-713. Bit field encoding: ITCTRL\_ENUM

Value	Name	Description
1'h1	ITCTRL	If set, the component reverts to an integration mode to enable topology detection or to enable integration testing. When no integration functionality has been put into a component, because it is not required, writing a HIGH to this location must be ignored and must return a LOW on read. At reset integration functionality is disabled.

## 1.3.1153 SWV\_SWO\_CTS

### Claim Tag Set Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_CTS: 0xFFA0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:1111			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				CLAIMTAG			

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Claim Tag Set Register is used with the Claim Tag Clear Register. This register returns the number of bits that can be set on a read, and enables individual bits to be set on a write. All CoreSight components implement a minimum of a 4-bit claim tag (n=4). CoreSight ETMs implement an 8-bit claim tag field.

Bits	Name	Description
3:0	CLAIMTAG[3:0]	A bit-programmable register bank that reads the Claim Tag Value (CTV) Reads: A read returns 32'h0000000F indicating that this claim tag is eight bits wide. 32'h0000000F indicates that this claim tag is four bits wide. Logic 1 indicates that this bit can be set. Logic 0 indicates that this bit is unimplemented, that is, it cannot be set.

[See Table 1-714.](#)

Table 1-714. Bit field encoding: CLAIMTAG\_ENUM

Value	Name	Description
4'hF	CLAIMTAG	(no description)

## 1.3.1154 SWV\_SWO\_CTC

### Claim Tag Clear Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_CTC: 0xFFA4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				CLAIMTAG			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Claim Tag Clear Register is used in conjunction with the Claim Tag Set Register. See Claim Tag Set Register

Bits	Name	Description
3:0	CLAIMTAG[3:0]	A bit-programmable register bank that sets the CTV. Reads: A read returns a value indicating the current claim value. This is 0 on reset.
<a href="#">See Table 1-715.</a>		

Table 1-715. Bit field encoding: CLAIMTAGC\_ENUM

Value	Name	Description
4'h0	CLAIMTAGCLEAR	(no description)

## 1.3.1155 SWV\_SWO\_LA

### Lock Access Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_LA: 0xFFB0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LA							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LA							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LA							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LA							

The Lock Access Register enables a write access to component registers.

Bits	Name	Description
31:0	LA[31:0]	Write Access Code. A write of 0xC5ACCE55 enables further write access to this component. An invalid write has the effect of removing write access.

[See Table 1-716.](#)

Table 1-716. Bit field encoding: LA\_ENUM

Value	Name	Description
32'h0	LA	(no description)

## 1.3.1156 SWV\_SWO\_LS

### Lock Status Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_LS: 0xFFB4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R:0	R:0	R:0
HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					Bit	STATUS	IMP

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Lock Status Register indicates the status of the lock control mechanism. The Lock Status Register is used with the Lock Access Register.

Bits	Name	Description
2	Bit	Lock Register Width <a href="#">See Table 1-719.</a>
1	STATUS	Device Write Access Selection <a href="#">See Table 1-718.</a>
0	IMP	Lock Mechanism Selection <a href="#">See Table 1-717.</a>

(continued)

Table 1-717. Bit field encoding: IMP\_ENUM

Value	Name	Description
1'h0	IMP_DS	lock mechanism is not implemented.
1'h1	IMP_EN	lock mechanism is implemented.

Table 1-718. Bit field encoding: STATUS\_ENUM

Value	Name	Description
1'h0	STATUS_G	device write access is granted.
1'h1	STATUS_L	device write access is locked.

Table 1-719. Bit field encoding: WD\_ENUM

Value	Name	Description
1'h0	WD_32	device implements a 32-bit lock register.
1'h1	WD_8	device implements a 8-bit lock register..

## 1.3.1157 SWV\_SWO\_AS

### Authentication Status Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_AS: 0xFFB8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00		R:00		R:00		R:00	
HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	SNDS		SIDS		NNDS		NIDS	

Bits	15	14	13	12	11	10	9	8

HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Authentication Status Register reports the required security level and current status of the security enable bit pairs. Where functionality changes on a given security level, this change is reported in this register.

Bits	Name	Description
7:6	SNDS[1:0]	Secure noninvasive debug status <a href="#">See Table 1-720.</a>
5:4	SIDS[1:0]	Secure invasive debug status <a href="#">See Table 1-720.</a>
3:2	NNDS[1:0]	Nonsecure noninvasive debug status <a href="#">See Table 1-720.</a>

(continued)

1:0      NIDS[1:0]      Nonsecure invasive debug status

[See Table 1-720.](#)

Table 1-720. Bit field encoding: AS\_ENUM

Value	Name	Description
2'h0	FUNC_N	Functionality not implemented or controlled elsewhere.
2'h2	FUNC_DS	Functionality disabled.
2'h3	FUNC_EN	Functionality enabled.

## 1.3.1158 SWV\_SWO\_DID

### Device ID Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_DID: 0xFFC8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:10		R:1	R/W:0	R:0000			
HW Access	R		R	R/W	R			
Retention	RET		RET	RET	RET			
Name	DID3		DID2	DID1	DID0			

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:000			R:0	R:1	R:1	R:1	R:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			DID7	DID6	DID5	DID4	DID3

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

This register indicates the capabilities of the device.

Bits	Name	Description
12	DID7	STP fitted. SWO does not support this.
11	DID6	UART NRZ Serial Wire Output support. SWO supports this mode.
10	DID5	Manchester Serial Wire Output support. SWO supports this mode.
9	DID4	Synchronous trace port not supported. SWO does not support synchronous trace port.
8:6	DID3[2:0]	FIFO Size (Power of 2).
5	DID2	Indicates the relationship between ATCLK and TRACECLKIN. The SWO always assumes the relationship is asynchronous.

[See Table 1-721.](#)

(continued)

4	DID1	Enables Manual selection, so that bits [3:0] indicate the number of selectable inputs selectable on EXTCLKOUT[3:0]
3:0	DID0[3:0]	Hidden Level of input multiplexing. When non-zero this value indicates the type/number of ATB multiplexing present on the input to the ATB. This value is used to assist topology detection of the ATB structure.

[See Table 1-722.](#)

Table 1-721. Bit field encoding: ASYNCAATTRCLK\_ENUM

Value	Name	Description
1'b1	ASYNCA	ATCLK and TRACECLKIN are asynchronous clocks
1'b0	SYNC	ATCLK and TRACECLKIN are synchronous clocks

Table 1-722. Bit field encoding: HLIPMUX\_ENUM

Value	Name	Description
4'b0001	FIXP	Fixed priority done by port number, bit[4] must be 0
4'b0000	NIPMP	No invisible port multiplexing present, bit [4] must be 0

## 1.3.1159 SWV\_SWO\_DTI

### Device Type Identifier Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SWV\_SWO\_DTI: 0xFFCC

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Device Type Identifier Register enables devices to be identified by their CoreSight Class. The classifications are defined to enable any interrogating tools to obtain more information about the device in the absence of understanding the Part Number field. This information can then be reported back to the user of the debugger.

Bits	Name	Description
7:0	Device Type {TYPE[7:0]}	Bits [7:4] are assigned to Main type/class. Bits[3:0] are assigned as Sub type, for trace sources this is broken down into cores, DSPs or buses.  <a href="#">See Table 1-723.</a>

Table 1-723. Bit field encoding: MAINSUB\_ENUM

Value	Name	Description
8'h14	MAINSUB1	Main class= Debug Control, Sub type = Cross Trigger Matrix, CTI

(continued)

Table 1-723. Bit field encoding: MAINSUB\_ENUM

8'h13	MAINSUB2	Main class= Trace Source, Sub type = ETM, associated with processor or core
8'h43	MAINSUB3	Main class= Trace Source, Sub type = HTM, stimulus from bus activity
8'h12	MAINSUB4	Main class= Trace Link, Sub type = Trace Funnel
8'h21	MAINSUB5	Main class= Trace Sink, Sub type = ETB
8'h11	MAINSUB6	Main class= Trace Sink, Sub type = TPIU

$$(((0x10000 + [0..3 * 0x1000]) + [0..7 * 0x200]) + [0..1 *$$

Name	F1_CK_INV	F0_CK_INV	FIFO_FAST	FIFO_CAP	FIFO_EDGE	FIFO_ASYNC	EXT_CRCP_RS	WRK16_CONCAT

Datapath FIFO and register access configuration control

Bits	Name	Description
7	F1_CK_INV	FIFO Clock Invert. When this bit is set, the polarity of the clock for the given FIFO will be inverted, with respect to the polarity of the selected Datapath clock. <a href="#">See Table 1-756.</a>
6	F0_CK_INV	FIFO Clock Invert. When this bit is set, the polarity of the clock for the given FIFO will be inverted, with respect to the polarity of the selected Datapath clock. <a href="#">See Table 1-756.</a>
5	FIFO_FAST	FIFO Fast Mode. When this bit is set, the FIFO write logic is clocked by the application bus clock. Lowers the latency of capture timing, at the expense of additional power. <a href="#">See Table 1-758.</a>
4	FIFO_CAP	FIFO Software Capture Mode. When this bit is set, a read of A0 or A1 triggers a capture into F0 or F1 respectively. This function follows the chaining configuration. All accumulators in the chain from a given block to the MS block in the chain are captured. Captured data may be read immediately from the FIFO. Only applies to FIFOs configured in output mode. <a href="#">See Table 1-755.</a>

(continued)

3	FIFO_EDGE	Edge/level sensitive FIFO write control (Fx_LD). Only applies to FIFO configured in output mode <a href="#">See Table 1-757.</a>
2	FIFO_ASYNC	Asynchronous FIFO clocking support <a href="#">See Table 1-754.</a>
1	EXT_CRCPRS	External CRC/PRS mode <a href="#">See Table 1-753.</a>
0	WRK16_CONCAT	Datapath register access mode <a href="#">See Table 1-759.</a>

Table 1-753. Bit field encoding: EXT\_CRCPRS\_ENUM

Value	Name	Description
1'b0	INTERNAL	Internal CRC/PRS routing
1'b1	EXTERNAL	External CRC/PRS routing

Table 1-754. Bit field encoding: FIFO\_ASYNC\_ENUM

Value	Name	Description
1'b0	DISABLED	FIFO clocks are synchronous
1'b1	ENABLED	FIFO clocks are asynchronous

Table 1-755. Bit field encoding: FIFO\_CAP\_ENUM

Value	Name	Description
1'b0	DISABLED	FIFO capture is disabled.
1'b1	ENABLED	FIFO capture is enabled (FIFO must be in output mode). A read of A0 or A1 will write into F0 or F1.

Table 1-756. Bit field encoding: FIFO\_CK\_INV\_ENUM

Value	Name	Description
1'b0	NORMAL	FIFO clock is the same polarity as the Datapath clock.
1'b1	INVERTED	FIFO clock is inverted with respect to the Datapath clock.

Table 1-757. Bit field encoding: FIFO\_EDGE\_ENUM

Value	Name	Description
1'b0	LEVEL	FIFO write from accumulators/ALU is level sensitive. FIFO write occurs on a clock edge whenever the write control is sampled high on that edge.
1'b1	EDGE	FIFO write from accumulators/ALU is edge sensitive. FIFO write occurs on a clock edge following a 0 to 1 transition on the write control. The write control must be negated for at least one full cycle of the FIFO clock for a subsequent transition to be detected.

Table 1-758. Bit field encoding: FIFO\_FAST\_ENUM

Value	Name	Description
1'b0	DISABLED	FIFO is clocked with selected Datapath clock.
1'b1	ENABLED	FIFO is clocked with application bus clock. Master and quadrant bus clock gating must be enabled.

Table 1-759. Bit field encoding: WRK16\_SEL\_ENUM

Value	Name	Description
1'b0	DEFAULT	16-bit default access mode: selects registers in two consecutive UDBs in chaining order
1'b1	CONCATENATE	16-bit concat access mode: selects concatenated registers in a single UDB

$$((0x10000 + [0..3 * 0x1000]) + [0..7 * 0x200]) + [0..1 *$$

HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			FIFO_ADD_SYNC	NC1	NC0	F1_DYN	F0_DYN

Datapath FIFO control

Bits	Name	Description
4	FIFO_ADD_SYNC	Adds an additional sync flip-flop to FIFO block status. <a href="#">See Table 1-760.</a>
3	NC1	Spare register bit
2	NC0	Spare register bit
1	F1_DYN	When this bit is set, the associated FIFO configuration may be dynamically controlled. <a href="#">See Table 1-761.</a>
0	F0_DYN	When this bit is set, the associated FIFO configuration may be dynamically controlled. <a href="#">See Table 1-761.</a>

Table 1-760. Bit field encoding: FIFO\_ADD\_SYNC\_ENUM

Value	Name	Description
1'b0	DISABLED	Compatible Mode: FIFO block status sync configuration is 'none' (FIFO_ASYNC = 0) and 1 sync flip-flop (FIFO_ASYNC = 1)

(continued)

Table 1-760. Bit field encoding: FIFO\_ADD\_SYNC\_ENUM

1'b1	ENABLED	Add Sync Mode: FIFO block status sync configuration 1 sync flip-flop (FIFO_ASYNC = 0) and 2 sync flip-flops (FIFO_ASYNC = 1)
------	---------	--

Table 1-761. Bit field encoding: FIFO\_DYN\_ENUM

Value	Name	Description
1'b0	STATIC	Default. FIFO direction is static and controlled by the associated Fx_INSEL bits (CFG15).
1'b1	DYNAMIC	The associated FIFO direction is dynamically controlled by the associated 'dx_load' Datapath input signal. When the 'dx_load' signal is '0', the access is internal, where the FIFO is both a source for the Datapath, and a destination for the Datapath (destination path from Fx_INSEL bits). When the 'dx_load' signal is '1', the access is external, where the CPU can both write and read the FIFO. When dynamic mode is activated, the dx_load signals are disabled for use as Data Register load signals.

Name	CTL_MD0							

Control Register Mode 0 (used in conjunction with Control Register Mode 1)

Bits	Name	Description
7:0	CTL_MD0[7:0]	CTL_MD1 and CTL_MD0 are concatenated to form an encoding for the mode of each control bit in the control register. Value '00' is Direct Mode, where the value written to that bit drives directly in the the routing. Value '01' is Sync Mode, where the control bit input is resampled by the selected SC clock before it is driven into the routing. Value '11' is Pulse Mode. Similar to Sync Mode, the control bit is resampled, then driven into the routing for a duration of 1 SC clock period. In addition, the control bit accessible by the CPU is reset at the end of the pulse period. The control bit can be polled for feedback with regard to this timing.

HW Access	NA			R	R	R	R	
Retention	NA			RET	RET	RET	RET	
Name	RSVD			SC_EXT_RES	SC_SYNC_MD	SC_INT_MD	SC_OUT_CTL	

#### SC block configuration control

Bits	Name	Description
4	SC_EXT_RES	Control register external reset operation. This bit supports autonomous usage of the control register, where a routed reset should clear the writable input registers. By default this is off because the CPU writable register can be cleared in firmware. In other usage models, such as DMA data writing, an asynchronous routed reset may be needed. <a href="#">See Table 1-763.</a>
3	SC_SYNC_MD	SC Sync Mode - controls when the status register operates as a 4-bit double synchronizer module <a href="#">See Table 1-765.</a>
2	SC_INT_MD	SC Interrupt Mode - controls when the UDB driving an interrupt generated from the masked OR reduction of status bits 6 to 0 <a href="#">See Table 1-764.</a>
1:0	SC_OUT_CTL[1:0]	Selects the output source for the Status and Control routing connections <a href="#">See Table 1-762.</a>

(continued)

Table 1-762. Bit field encoding: OUT\_CTL\_ENUM

Value	Name	Description
2'b00	CONTROL	Control out, 8-bits of control are driven to the routing connections
2'b01	PARALLEL	Datapath parallel output, 8-bits of datapath parallel output data are driven to the routing connections
2'b10	COUNTER	Counter out, 7-bits of count and 1 bit (MSB) of terminal count are driven to the routing connections
2'b11	RESERVED	Reserved

Table 1-763. Bit field encoding: SC\_EXT\_RES\_ENUM

Value	Name	Description
1'b0	DISABLED	When a routed reset is applied to the control register, only embedded state (sampling registers) are cleared
1'b1	ENABLED	When a routed reset is applied to the control register, all state is cleared, including the CPU writable control bits.

Table 1-764. Bit field encoding: SC\_INT\_MD\_ENUM

Value	Name	Description
1'b0	NORMAL	Normal Mode - Routing connection sc_io[3] is a normal input to the status register
1'b1	INT_MODE	Interrupt Mode - Routing connection sc_io[3] operates as the UDB interrupt output

Table 1-765. Bit field encoding: SC\_SYNC\_MD\_ENUM

Value	Name	Description
1'b0	NORMAL	Normal Mode - Status register operation
1'b1	SYNC_MODE	Sync Mode - Routing inputs sc_in[3:0] are the 4 sync inputs, and connections sc_io[3:0] operate as the sync outputs

$$((0x10000 + [0..3 * 0x1000]) + [0..7 * 0x200]) + [0..1 *$$

Name	RC_RES_SEL1	RC_RES_SEL0_OR_FRES	RC_INV	RC_EN_INV	RC_EN_MODE		RC_EN_SEL	

PLD1 Clock and Reset control. Note: In alternate reset mode (ALT RES = 1), The PLD0 routed reset selection controls both PLD0 and PLD1, therefore the RC\_SEL bits for PLD1 are not used.

Bits	Name	Description
7	RC_RES_SEL1	Configures the routed reset for the associated UDB component block. The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES = '0' - This bit is not used. When ALT RES = '1' - The bits {RC_SEL1,RC_SEL0_OR_FRES} select the RC routing for routed reset control according to the following: 00 : rc_in [0] 01 : rc_in [1] 10 : rc_in [2] 11 : rc_in [3]
6	RC_RES_SEL0_OR_FRES	Configures the routed or firmware reset for the associated UDB component block. The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES = '0' - This bit is a firmware reset. When ALT RES = '1' - The bits {RC_SEL1,RC_SEL0_OR_FRES} select the RC routing for routed reset control according to the following: 00 : rc_in [0] 01 : rc_in [1] 10 : rc_in [2] 11 : rc_in [3]
5	RC_INV	Optionally inverts the clock selection for the associated UDB component block. <a href="#">See Table 1-778.</a>

(continued)

4	RC_EN_INV	Optionally inverts the clock enable selection for the associated UDB component blocks. <a href="#">See Table 1-775.</a>
3:2	RC_EN_MODE[1:0]	Selects the operating mode for the clock to the associated UDB component block. <a href="#">See Table 1-776.</a>
1:0	RC_EN_SEL[1:0]	Selects channel route for enable control to the associated UDB component block <a href="#">See Table 1-777.</a>

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	NA:0	R/W:0	R/W:0	R/W:0	R/W:00	
HW Access	R	R	NA	R	R	R	R	
Retention	RET	RET	NA	RET	RET	RET	RET	
Name	SC_RES_POL	DP_RES_POL	RSVD	GUDB_WR	EN_RES_CNTCTL	RES_POL	RES_SEL	

#### Reset control

Bits	Name	Description
7	SC_RES_POL	Only valid when ALT RES (CFG31) is '1'. This bit controls the polarity of the selected SC routed reset. <a href="#">See Table 1-794.</a>
6	DP_RES_POL	Only valid when ALT RES (CFG31) is '1'. This bit controls the polarity of the selected Datapath routed reset. <a href="#">See Table 1-789.</a>
4	GUDB_WR	Enable global write operation for the configuration and working registers in this UDB. When this bit is set, the UDB ID select decoding is bypassed. <a href="#">See Table 1-791.</a>
3	EN_RES_CNTCTL	This bit gates the routed reset to the counter/control register. By default, the operation is compatible, i.e., it only applies to the counter. However, if the updated control register modes are used (sync mode, pulse mode, or the ext res bit) then the routed reset applies to the control register also. <a href="#">See Table 1-790.</a>

(continued)

2 RES\_POL The meaning of this bit depends on the value of the ALT RES bit in CFG31. When ALT RES is '0' (compatible mode), this bit sets the polarity of the routed reset. When ALT RES is '1', this bit is unused.

[See Table 1-792.](#)

1:0 RES\_SEL[1:0] The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES is '0' (compatible mode), this 2 bit field selects the RC routing input for the compatible reset scheme. When the ALT RES bit is '1', these bits are not used.

[See Table 1-793.](#)

Table 1-789. Bit field encoding: RC\_DP\_RES\_POL\_ENUM

Value	Name	Description
1'b0	TRUE	Routed reset to the Datapath block is true polarity.
1'b1	INVERTED	Routed reset to the Datapath block is inverted polarity.

Table 1-790. Bit field encoding: RC\_EN\_RES\_CNTCTL\_ENUM

Value	Name	Description
1'b0	DISABLE	Routed reset is not applied to counter/control register
1'b1	ENABLE	Routed reset is applied to the counter/control register

Table 1-791. Bit field encoding: RC\_GUDB\_WR\_ENUM

Value	Name	Description
1'b0	DISABLE	Global UDB configuration/working register write is disabled
1'b1	ENABLE	Global UDB configuration/working register write is enabled

Table 1-792. Bit field encoding: RC\_RES\_POL\_ENUM

Value	Name	Description
1'b0	NEGATED	Polarity of the routed reset is true.
1'b1	ASSERTED	Polarity of the routed reset is inverted.

Table 1-793. Bit field encoding: RC\_RES\_SEL\_ENUM

Retention	RET	RET	RET		RET	RET	RET	RET
Name	PLD1_RES_POL	PLD0_RES_POL	EXT_CK_SEL		EN_RES_DP	EN_RES_STAT	EXT_SYNC	ALT_RES

#### Reset control

Bits	Name	Description
7	PLD1_RES_POL	Not connected. NOTE: There is only one routed reset available to both PLDs in the UDB. When ALT RES is '1', PLD0 RES SEL controls the polarity of the routed reset for both PLDs. <a href="#">See Table 1-801.</a>
6	PLD0_RES_POL	The meaning of this bit depends on the value of ALT RES. When ALT RES (CFG31) is '1', this bit controls the polarity of the selected PLD0 routed reset. NOTE: There is only one routed reset available in the PLD block for both PLDs, therefore this bit controls the reset polarity to both PLD0 and PLD1. When ALT RES is '0' this bit is not used. <a href="#">See Table 1-800.</a>
5:4	EXT_CK_SEL[1:0]	External clock selection <a href="#">See Table 1-798.</a>
3	EN_RES_DP	Only valid when ALT RES (CFG31) is '1'. This bit gates the routed reset to the Datapath block. <a href="#">See Table 1-796.</a>

(continued)

2	EN_RES_STAT	Only valid when ALT RES (CFG31) is '1'. This bit gates the routed reset to the status register. <a href="#">See Table 1-797.</a>
1	EXT_SYNC	Enable synchronization of selected external clock <a href="#">See Table 1-799.</a>
0	ALT_RES	This bit toggles between two reset configurations. When this bit is '0', one routed reset is shared by all components in this UDB (compatible mode). When this bit is a 1, each block can select a unique routed reset from the available RC inputs.; <a href="#">See Table 1-795.</a>

Table 1-795. Bit field encoding: RC\_ALT\_RES\_ENUM

Value	Name	Description
1'b0	COMPATIBLE	All UDB blocks share a common routed reset.
1'b1	ALTERNAT	Each UDB component block can select and control it's individual routed reset.

Table 1-796. Bit field encoding: RC\_EN\_RES\_DP\_ENUM

Value	Name	Description
1'b0	DISABLE	Routed reset to the Datapath block is gated off.
1'b1	ENABLE	Routed reset to the Datapath block is on. ALT RES must be '1' and routed reset must be selected in CFG26

Table 1-797. Bit field encoding: RC\_EN\_RES\_STAT\_ENUM

Value	Name	Description
1'b0	NEGATED	Status register routed reset is gated off
1'b1	ASSERTED	Status register routed reset is on

Table 1-798. Bit field encoding: RC\_EXT\_CK\_SEL\_ENUM

Value	Name	Description
2'b00	RC_IN0	rc_in[0]
2'b01	RC_IN1	rc_in[1]
2'b10	RC_IN2	rc_in[2]
2'b11	RC_IN3	rc_in[3]

Table 1-799. Bit field encoding: RC\_EXT\_SYNC\_ENUM

Value	Name	Description
1'b0	DISABLE	Selected external clock input is not synchronized
1'b1	ENABLE	Selected external clock input is synchronized

Table 1-800. Bit field encoding: RC\_PLD0\_RES\_POL\_ENUM

Value	Name	Description
1'b0	TRUE	Routed reset to the PLD0/PLD1 block is true polarity.
1'b1	INVERTED	Routed reset to the PLD0/PLD1 block is inverted polarity.

Table 1-801. Bit field encoding: RC\_PLD1\_RES\_POL\_ENUM

Value	Name	Description
1'b0	TRUE	NU
1'b1	INVERTED	NU

$$(((0x10000 + [0..3 * 0x1000]) + [0..7 * 0x200]) + [0..1 *$$

## 1.3.1253 BCTL[0..3]\_BANK\_CTL

### BANK\_CTL

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

BCTL0\_BANK\_CTL: 0x15003

BCTL1\_BANK\_CTL: 0x15013

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	NA:0	NA:0	NA:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA	NA	NA	NA	R	R	R	R
Retention	NA	NA	NA	NA	RET	RET	RET	RET
Name	RSVD	RSVD	RSVD	RSVD	GLBL_WR	DPARAM_T M	ROUTE_EN ABLE	DIS_COR

#### Bank Control Register

Bits	Name	Description
3	GLBL_WR	Global Write Test Mode: The purpose of this bit is to accelerate configuration and working register writing for test purposes. When this bit is set, the bank is in global write mode. In this mode a set of UDBs or UDB channels are selected for writing in parallel based on the setting of the GUDB WR bits and GCH WR bits in the individual UDB. <a href="#">See Table 1-827.</a>
2	DPARAM_TM	DPARAM Test Mode: The DP RAM (s8dparam_ram16x8) has two read ports, one connected to the system bus (for configuration of the RAM), and one port that drives the DP control bits. When this bit is set, the DP RAM control port is connected to the system bus for reading (the system bus read port is tri-stated) <a href="#">See Table 1-826.</a>
1	ROUTE_ENABLE	Route Enable: When this bit is a 0, all routing drivers are gated off to drive '0'. This results in nets either at 'Z' or '0' state and prevents driver conflicts with random configuration RAM on POR. This bit also controls gating of buffer inputs to prevent high current states in the case of 'Z' nets. After configuration, this bit may be enabled. <a href="#">See Table 1-828.</a>
0	DIS_COR	Disable Clear On Read: The status registers have an automatic clear on read function to maintain firmware synchronization with UDB processing. When the system is stopped in debug mode, this bit can be used to prevent the statu from clearing on a debug read. It also prevents a read pop from the FIFO blocks. Only the top of FIFO can be read when this bit is set. <a href="#">See Table 1-825.</a>

Table 1-825. Bit field encoding: COR\_ENUM

Value	Name	Description
1'b0	ENABLE	Status register clear on read enabled. (default)
1'b1	DISABLE	Status register clear on read disabled.

Table 1-826. Bit field encoding: DPARAM\_TM\_ENUM

Value	Name	Description
1'b0	DISABLE	DPARAM test mode is disabled. (default)
1'b1	ENABLE	DPARAM test mode is enabled.

(continued)

Table 1-827. Bit field encoding: GLBL\_WR\_ENUM

Value	Name	Description
1'b0	DISABLE	Global Write Test Mode is disabled. (default)
1'b1	ENABLE	Global Write Test Mode enabled.

Table 1-828. Bit field encoding: ROUTE\_ENABLE

Value	Name	Description
1'b0	DISABLE	Routing input drivers are gated off to '0' (default)
1'b1	ENABLE	Routing input drivers are enabled.

Table 1-829. Bit field encoding: USCAN\_CLK\_ENUM

Value	Name	Description
1'b0	DISABLE	UDB DSI scan clk is idle
1'b1	ENABLE	UDB DSI scan clk asserted for 1 clock pulse if USCAN_SE = 0 (capture mode) or for 32 clock pulses if USCAN_SE = 1 (shift mode). Register bit auto-clears after one clock.

Table 1-830. Bit field encoding: USCAN\_RES\_ENUM

Value	Name	Description
1'b0	DISABLE	RESET is not asserted to the UDB DSI scan registers.
1'b1	ENABLE	RESET is asserted to the UDB DSI scan registers.

Table 1-831. Bit field encoding: USCAN\_SET\_ENUM

Value	Name	Description
1'b0	DISABLE	SET is not asserted to the UDB DSI scan registers.
1'b1	ENABLE	SET is asserted to the UDB DSI scan registers.

Table 1-832. Bit field encoding: USCAN\_SE\_ENUM

Value	Name	Description
1'b0	DISABLE	UDB DSI scan chain is in capture mode.
1'b1	ENABLE	UDB DSI scan chain is in shift mode.

Name	RSVD	NC0	WR_CFG_OPT	GLB_DSI_WR	DISABLE_ROUTE	GCH_WR_HI	GCH_WR_LO	BCEN

#### Bus Clock Enable Register

Bits	Name	Description
6	NC0	Spare register bit
5	WR_CFG_OPT	Select 1/2 clock cycle or full clock cycle generation for bus_last_strobe used in generating write strobes for latches within the UDB. Only one BCLK_ENx register per bank has an active bit. BCTL0_BCLK_EN0 controls this bit for Bank 0. BCTL1_BCLK_EN1 controls this bit for Bank 1. The WR_CFG_OPT bits in the other BCTLx_BCLK_ENy registers are not used. <a href="#">See Table 1-840.</a>
4	GLB_DSI_WR	Enable global write operation for the DSI routing channels. When this bit is set, the DSI ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. Control is split top and bottom. BCTL0_BCLK_EN0 controls DSI blocks 0-3. BCTL0_BCLK_EN3 controls DSI blocks 4-7. BCTL1_BCLK_EN1 controls DSI blocks 8-9. BCTL1_BCLK_EN2 controls DSI blocks 12-13. The GLB_DSI_WR bits in the other BCTLx_BCLK_ENy registers are not used. <a href="#">See Table 1-838.</a>
3	DISABLE_ROUTE	By default, when this bit is set to '0', the quadrant routing (for 2 channels in the quadrant) are enabled when the global route enable for the bank is set. However, when this bit is set to '1', the routing in the associated quadrant is disabled and is not enabled by the global route enable bit. The routing will remain in a benign state until it is subsequently configured and then enabled by clearing this bit. <a href="#">See Table 1-835.</a>
2	GCH_WR_HI	Enable global write operation for the routing channel with the higher address in the associated quadrant. When enabled, the UDB ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. <a href="#">See Table 1-836.</a>
1	GCH_WR_LO	Enable global write operation for the routing channel with the lower address in the associated quadrant. When enabled, the UDB ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. <a href="#">See Table 1-837.</a>
0	BCEN	Bank Clock Enable Control <a href="#">See Table 1-834.</a>

IDMUX\_DRQ\_CTL2: 0x15112

IDMUX\_DRQ\_CTL3: 0x15113

IDMUX\_DRQ\_CTL4: 0x15114

IDMUX\_DRQ\_CTL5: 0x15115

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:00		R/W:00		R/W:00	
HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	DCTRL3		DCTRL2		DCTRL1		DCTRL0	

This register is used to select between DMA requests (fixed function or udb).

Bits	Name	Description
7:6	DCTRL3[1:0]	DMA input type. <a href="#">See Table 1-866.</a>
5:4	DCTRL2[1:0]	DMA input type. <a href="#">See Table 1-866.</a>
3:2	DCTRL1[1:0]	DMA input type. <a href="#">See Table 1-866.</a>
1:0	DCTRL0[1:0]	DMA input type. <a href="#">See Table 1-866.</a>

Table 1-866. Bit field encoding: drq\_enum

Value	Name	Description
2'b00	Fixed Function	Fixed Function DMA request.
2'b01	UDB	UDB Level DMA request
2'b10	UDB EDGE	UDB Edge Detect DMA request
2'b11	RESERVED	RESERVED

### 1.3.1264 IRAM\_IRAM\_L\_DATA\_RAM\_L[0..127]

#### Internal Data RAM

**Reset:** N/A

Register : Address

IRAM\_IRAM\_L\_DATA\_RAM\_L: 0x50000-0x5007F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	INT_RAM_REG							

This is internal data RAM space for DP8051.

Bits	Name	Description
7:0	INT_RAM_REG[7:0]	Internal data ram space

### 1.3.1265 IRAM\_IRAM\_H\_DATA\_RAM\_H[0..127]

#### Internal Data RAM

**Reset:** N/A

Register : Address

IRAM\_IRAM\_H\_DATA\_RAM\_H: 0x50080-0x500FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	INT_RAM_REG							

This is internal data RAM space for DP8051.

Bits	Name	Description
7:0	INT_RAM_REG[7:0]	Internal data ram space

### 1.3.1266 SFR\_REGS\_SP

#### Stack Pointer

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_SP: 0x50181

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000111							
HW Access	R/W							
Retention	RET							
Name	sp							

Stack Pointer Register of DP8051. It is incremented before data is stored during PUSH and CALL execution and decremented after data is popped during POP, RET and RETI execution.

Bits	Name	Description
7:0	sp[7:0]	Stack Pointer: It always points to last valid stack byte

## 1.3.1267 SFR\_REGS\_DPL

### Data Pointer 0 Low

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_DPL: 0x50182

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dpl							

Lower Byte of Data Pointer Register DPTR0. Data pointers are used to speed up data block copying.

Bits	Name	Description
7:0	dpl[7:0]	Lower Byte of DPTR0 register

## 1.3.1268 SFR\_REGS\_DPH

### Data Pointer 0 High

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_DPH: 0x50183

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dph							

Upper Byte of Data Pointer Register DPTR0. Data pointers are used to speed up data block copying.

Bits	Name	Description
7:0	dph[7:0]	Upper Byte of DPTR0 register

## 1.3.1269 SFR\_REGS\_DPL1

### Data Pointer 1 Low

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_DPL1: 0x50184

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dpl1							

Lower Byte of Data Pointer Register DPTR1. Data pointers are used to speed up data block copying.

Bits	Name	Description
7:0	dpl1[7:0]	Lower Byte of DPTR1 register

## 1.3.1270 SFR\_REGS\_DPH1

### Data Pointer 1 High

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_DPH1: 0x50185

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dph1							

Upper Byte of Data Pointer Register DPTR1. Data pointers are used to speed up data block copying.

Bits	Name	Description
7:0	dph1[7:0]	Upper Byte of DPTR1 register

## 1.3.1271 SFR\_REGS\_DPS

### Data pointer select register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_DPS: 0x50186

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							SEL

The SEL bit of DPS register is used to select one of data pointer DPTR0 or DPTR1

Bits	Name	Description
0	SEL	1'b0: Select DPTR0. 1'b1: Select DPTR1

## 1.3.1272 SFR\_REGS\_DPX

### Data Pointer Extended 0 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_DPX: 0x50193

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dpx							

Data pointer extended registers hold the most significant part of program memory during access to data located above 64KB

Bits	Name	Description
7:0	dpx[7:0]	During MOVX instruction using DPTR0 register, the most significant part of address XRAMADDR[23:16] is always equal to DPX0(0x93) contents.

## 1.3.1273 SFR\_REGS\_DPX1

### Data Pointer Extended 1 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_DPX1: 0x50195

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dpx1							

Data pointer extended registers hold the most significant part of program memory during access to data located above 64KB.

Bits	Name	Description
7:0	dpx1[7:0]	During MOVX instruction using DPTR1 register, the most significant part of address XRAMAD-DR[23:16] is always equal to DPX1(0x95) contents.

## 1.3.1274 SFR\_REGS\_P2

### P2 read-write Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_P2: 0x501A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	P2							

This register holds XRAMADDR[15:8] bits during MOVX using R0 or R1

Bits	Name	Description
7:0	P2[7:0]	During MOVX using R0 or R1 register, XRAMADDR[15:8] is always equal to P2(0xA0) contents.

## 1.3.1275 SFR\_REGS\_IE

### Interrupt Enable Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_IE: 0x501A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0000000						
HW Access	R	NA						
Retention	RET	NA						
Name	EA	RSVD						

The Interrupt system can be enabled/disabled using EA bit IE register

Bits	Name	Description
7	EA	Enable Interrupt Controller at logic high

### 1.3.1276 SFR\_REGS\_PSW

#### Program Status Word Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_PSW: 0x501D0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:00		R/W:0	R/W:0	R:0
HW Access	R/W	R/W	R	R		R/W	R	R/W
Retention	RET	RET	RET	RET		RET	RET	RET
Name	CY	AC	F0	RS		OV	F1	P

The PSW contains several bits that reflect the current state of the CPU.

Bits	Name	Description
7	CY	Carry Flag
6	AC	Auxilar Carry Flag
5	F0	General Purpose Flag 0
4:3	RS[1:0]	Register Bank Select. 2'b00: Bank 0 - data address 0x00-0x07. 2'b01: Bank 1 - data address 0x08-0x0F. 2'b10: Bank 2 - data address 0x10-0x17. 2'b11: Bank 3 - data address 0x18-0x1F
2	OV	Over Flow Flag
1	F1	General Purpose Flag 1
0	P	Parity Flag

## 1.3.1277 SFR\_REGS\_ACC

### Accumulator register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_ACC: 0x501E0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	ACC							

Accumulator Register of DP8051

Bits	Name	Description
7:0	ACC[7:0]	Accumulator

### 1.3.1278 SFR\_REGS\_MXAX

#### MOVX @Ri extended Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_MXAX: 0x501EA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	MXAX							

This register holds the most significant part of address XRAMADDR[23:16] during MOVX using R0 or R1.

Bits	Name	Description
7:0	MXAX[7:0]	During MOVX using R0 or R1 register, XRAMADDR[23:16] is always equal to MAXA(0xEA) contents.

## 1.3.1279 SFR\_REGS\_B

### B Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_REGS\_B: 0x501F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	B							

The B register is used during multiply and divide operations. In other cases may be used as normal SFR.

Bits	Name	Description
7:0	B[7:0]	B Register

## 1.3.1280 SFR\_USER\_GPIO0

### GPIO0 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO0: 0x50180

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO0							

This register is used to set the output data state for Port0

Bits	Name	Description
7:0	GPIO0[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO0_SEL register is set to high

## 1.3.1281 SFR\_USER\_GPIRD0

### GPIRD0 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD0: 0x50189

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD0							

This read only register contains pin state value of Port0

Bits	Name	Description
7:0	GPIRD0[7:0]	This register contains the pin state values of Port0 pins

## 1.3.1282 SFR\_USER\_GPIO0\_SEL

### GPIO0\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO0\_SEL: 0x5018A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO0_SEL							

This register is used to select the GPIO0 register to set the output data state for Port0

Bits	Name	Description
7:0	GPIO0_SEL[7:0]	This register is used to select each bit of the GPIO0 register to set the output data state for the corresponding pin of Port0.

## 1.3.1283 SFR\_USER\_GPIO1

### GPIO1 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO1: 0x50190

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO1							

This register is used to set the output data state for Port1

Bits	Name	Description
7:0	GPIO1[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO1_SEL register is set to high

## 1.3.1284 SFR\_USER\_GPIRD1

### GPIRD1 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD1: 0x50191

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD1							

This read only register contains pin state value of Port1

Bits	Name	Description
7:0	GPIRD1[7:0]	This register contains the pin state values of Port1 pins

## 1.3.1285 SFR\_USER\_GPIO2

### GPIO2 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO2: 0x50198

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO2							

This register is used to set the output data state for Port2

Bits	Name	Description
7:0	GPIO2[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO2_SEL register is set to high

## 1.3.1286 SFR\_USER\_GPIRD2

### GPIRD2 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD2: 0x50199

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD2							

This read only register contains pin state values of Port2

Bits	Name	Description
7:0	GPIRD2[7:0]	This register contains the pin state values of Port2 pins

## 1.3.1287 SFR\_USER\_GPIO2\_SEL

### GPIO2\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO2\_SEL: 0x5019A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO2_SEL							

This register is used to select the GPIO2 register to set the output data state for Port2

Bits	Name	Description
7:0	GPIO2_SEL[7:0]	This register is used to select each bit of the GPIO2 register to set the output data state for the corresponding pin of Port2.

## 1.3.1288 SFR\_USER\_GPIO1\_SEL

### GPIO1\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO1\_SEL: 0x501A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO1_SEL							

This register is used to select the GPIO1 register to set the output data state for Port1

Bits	Name	Description
7:0	GPIO1_SEL[7:0]	This register is used to select each bit of the GPIO1 register to set the output data state for the corresponding pin of Port1.

## 1.3.1289 SFR\_USER\_GPIO3

### GPIO3 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO3: 0x501B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO3							

This register is used to set the output data state for Port3

Bits	Name	Description
7:0	GPIO3[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO3_SEL register is set to high

## 1.3.1290 SFR\_USER\_GPIRD3

### GPIRD3 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD3: 0x501B1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD3							

This read only register contains pin state values of Port3

Bits	Name	Description
7:0	GPIRD3[7:0]	This register contains the pin state values of Port3 pins

## 1.3.1291 SFR\_USER\_GPIO3\_SEL

### GPIO3\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO3\_SEL: 0x501B2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO3_SEL							

This register is used to select the GPIO3 register to set the output data state for Port3

Bits	Name	Description
7:0	GPIO3_SEL[7:0]	This register is used to select each bit of the GPIO3 register to set the output data state for the corresponding pin of Port3.

## 1.3.1292 SFR\_USER\_GPIO4

### GPIO4 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO4: 0x501C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO4							

This register is used to set the output data state for Port4

Bits	Name	Description
7:0	GPIO4[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO4_SEL register is set to high

## 1.3.1293 SFR\_USER\_GPIRD4

### GPIRD4 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD4: 0x501C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD4							

This read only register contains pin state values of Port4

Bits	Name	Description
7:0	GPIRD4[7:0]	This register contains the pin state values of Port4 pins

## 1.3.1294 SFR\_USER\_GPIO4\_SEL

### GPIO4\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO4\_SEL: 0x501C2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO4_SEL							

This register is used to select the GPIO4 register to set the output data state for Port4

Bits	Name	Description
7:0	GPIO4_SEL[7:0]	This register is used to select each bit of the GPIO4 register to set the output data state for the corresponding pin of Port4.

## 1.3.1295 SFR\_USER\_GPIO5

### GPIO5 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO5: 0x501C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO5							

This register is used to set the output data state for Port5

Bits	Name	Description
7:0	GPIO5[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO5_SEL register is set to high

## 1.3.1296 SFR\_USER\_GPIRD5

### GPIRD5 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD5: 0x501C9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD5							

This read only register contains pin state values of Port5

Bits	Name	Description
7:0	GPIRD5[7:0]	This register contains the pin state values of Port5 pins

## 1.3.1297 SFR\_USER\_GPIO5\_SEL

### GPIO5\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO5\_SEL: 0x501CA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO5_SEL							

This register is used to select the GPIO5 register to set the output data state for Port5

Bits	Name	Description
7:0	GPIO5_SEL[7:0]	This register is used to select each bit of the GPIO5 register to set the output data state for the corresponding pin of Port5.

## 1.3.1298 SFR\_USER\_GPIO6

### GPIO6 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO6: 0x501D8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO6							

This register is used to set the output data state for Port6

Bits	Name	Description
7:0	GPIO6[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO6_SEL register is set to high

## 1.3.1299 SFR\_USER\_GPIRD6

### GPIRD6 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD6: 0x501D9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD6							

This read only register contains pin state values of Port6

Bits	Name	Description
7:0	GPIRD6[7:0]	This register contains the pin state values of Port6 pins

### 1.3.1300 SFR\_USER\_GPIO6\_SEL

#### GPIO6\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO6\_SEL: 0x501DA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO6_SEL							

This register is used to select the GPIO6 register to set the output data state for Port6

Bits	Name	Description
7:0	GPIO6_SEL[7:0]	This register is used to select each bit of the GPIO6 register to set the output data state for the corresponding pin of Port6.

## 1.3.1301 SFR\_USER\_GPIO12

### GPIO12 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO12: 0x501E8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO12							

This register is used to set the output data state for Port12

Bits	Name	Description
7:0	GPIO12[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO12_SEL register is set to high

## 1.3.1302 SFR\_USER\_GPIRD12

### GPIRD12 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIRD12: 0x501E9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIRD12							

This read only register contains pin state values of Port12

Bits	Name	Description
7:0	GPIRD12[7:0]	This register contains the pin state values of Port12 pins

### 1.3.1303 SFR\_USER\_GPIO12\_SEL

#### GPIO12\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO12\_SEL: 0x501F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO12_SEL							

This register is used to select the GPIO12 register to set the output data state for Port12

Bits	Name	Description
7:0	GPIO12_SEL[7:0]	This register is used to select each bit of the GPIO12 register to set the output data state for the corresponding pin of Port12.

## 1.3.1304 SFR\_USER\_GPIO15

### GPIO15 Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO15: 0x501F8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO15							

This register is used to set the output data state for Port15

Bits	Name	Description
7:0	GPIO15[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO15_SEL register is set to high

## 1.3.1305 SFR\_USER\_GPIRD15

### GPIRD15 Register

**Reset:** Reset Signals Listed Below

Register : Address

SFR\_USER\_GPIRD15: 0x501F9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UU		R:000000					
HW Access	R/W		R/W					
Retention	NONRET		RET					
Name	GPIRD15_7_6		GPIRD15_5_0					

This read only register contains pin state values of Port15

Bits	Name	Description
7:6	GPIRD15_7_6[1:0]	Contains the pin state values of Port15 pins 7 to 6
5:0	GPIRD15_5_0[5:0]	Contains the pin state values of Port15 pins 5 to 0

### Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	GPIRD15_7_6[1:0]
System reset for retention flops [reset_all_retention]	GPIRD15_5_0[5:0]

### 1.3.1306 SFR\_USER\_GPIO15\_SEL

#### GPIO15\_SEL Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_USER\_GPIO15\_SEL: 0x501FA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	GPIO15_SEL							

This register is used to select the GPIO15 register to set the output data state for Port15

Bits	Name	Description
7:0	GPIO15_SEL[7:0]	This register is used to select each bit of the GPIO15 register to set the output data state for the corresponding pin of Port15.

## 1.3.1307 SFR\_SPACE\_RSVD[0..255]

### Placeholder Memory Space

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

SFR\_SPACE\_RSVD: 0x50100-0x501FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	(no description)

### 1.3.1308 DOC\_DBG\_CTRL

#### Debug Control Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_DBG\_CTRL: 0x50220

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R/W				R/W	R/W	R/W	R/W
Retention	RET				RET	RET	RET	RET
Name	DBG_KEY				A_TMRS	STEP	HALT	DBG_ACT

The DBG\_CTRL Register (DGB\_CTRL) is used to enable debug, halt and single step the 8051 CPU.

Bits	Name	Description
7:4	DBG_KEY[3:0]	Every write to this register must contain the debug key value of 0b1011. Writes to this register are ignored if the correct key is not written.
3	A_TMRS	Allow Timers, is used to enable timers such as the WDT and CTW that are normally paused when the CPU is halted in debug mode. Setting A_TMRS to '1' allows the WDT and CTW to operate as if the part was not in debug mode.
2	STEP	The STEP bit steps one instruction on the 8051 CPU. The HALT bit must be set to 1 to write this bit. This bit is reset to 0 after the step operation is complete. Writing 0 to this bit has no effect.
1	HALT	Halts the 8051 CPU if written to 1, if the CPU is halted writing 0 to the HALT bits un-halts the CPU. A read of the HALT bit returns the current state of CPU: 1 - halted, 0 - running.
0	DBG_ACT	This bit activates debug. This bit must be set to 1 to halt, single step, break, trace or read and write memory address with the DoC

### 1.3.1309 DOC\_PA\_BKPT0

#### Program Address Breakpoint Register 0

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT0: 0x50224

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

### 1.3.1310 DOC\_PA\_BKPT1

#### Program Address Breakpoint Register 1

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT1: 0x50228

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

### 1.3.1311 DOC\_PA\_BKPT2

#### Program Address Breakpoint Register 2

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT2: 0x5022C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

### 1.3.1312 DOC\_PA\_BKPT3

#### Program Address Breakpoint Register 3

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT3: 0x50230

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

### 1.3.1313 DOC\_PA\_BKPT4

#### Program Address Breakpoint Register 4

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT4: 0x50234

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

### 1.3.1314 DOC\_PA\_BKPT5

#### Program Address Breakpoint Register 5

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT5: 0x50238

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

### 1.3.1315 DOC\_PA\_BKPT6

#### Program Address Breakpoint Register 6

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT6: 0x5023C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

### 1.3.1316 DOC\_PA\_BKPT7

#### Program Address Breakpoint Register 7

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PA\_BKPT7: 0x50240

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							ENA

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Program Address Breakpoint Register (PA\_BKPT) is used to set a Program address breakpoint

Bits	Name	Description
16	ENA	Enables breakpoint when set to 1, disables breakpoint when set to 0
15:0	COMP[15:0]	Halts the CPU if stored value matches the program counter when the breakpoint is enabled.

## 1.3.1317 DOC\_MEM\_BKPT

### Memory Breakpoint Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_MEM\_BKPT: 0x50244

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COMP							

  

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:0	R/W:00000					R/W:00	
HW Access	NA	R/W					R/W	
Retention	NA	RET					RET	
Name	RSVD	MASK					MB_CFG	

The Memory Breakpoint register is used (MEM\_BKPT) is used to set a memory breakpoint, this breakpoint is enabled in the BKPT\_CFG register. This register can be used to halt the CPU on any CPU accessible register with the execution of the 8051's internal memory.

Bits	Name	Description
30:26	MASK[4:0]	Mask, the MASK bits are used to allow the memory breakpoint to break on a range of values. The value entered as the MASK ignores that bit of the COMP value and every bit to its right. Example: If MASK = 4, COMP will ignore the least significant 4 bits when comparing the memory address. If the compare address was 0xDEAF only 0xDEA* would be compared.
25:24	MB_CFG[1:0]	Memory Breakpoint Configuration. <a href="#">See Table 1-867.</a>
23:0	COMP[23:0]	Halts the CPU if stored value matches address of current next address access.

(continued)

Table 1-867. Bit field encoding: MB\_CFG\_ENUM

Value	Name	Description
2'b00	MB_CFG_DIS	Memory Breakpoint disabled
2'b01	MB_CFG_R	Break on read only
2'b10	MB_CFG_W	Break on write only
2'b11	MB_CFG_RW	Break on read or write

### 1.3.1318 DOC\_BKPT\_CFG

#### Breakpoint Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_BKPT\_CFG: 0x50248

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	CBKPT_6	CBKPT_5	CBKPT_4	CBKPT_3	CBKPT_2	CBKPT_1	CBKPT_0	BC_ENA

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:0000				R:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				RET	RET	RET	RET
Name	RSVD				WDR_TRG	WDRBKPT	CBKPT_8	CBKPT_7

The breakpoint chaining register is used to enable the memory breakpoint, and to configure breakpoint chaining

Bits	Name	Description
11	WDR_TRG	Watch Dog Reset Triggered, this is a read-only bit that can be used to determine if the CPU was halted because a WDR occurred. This bit will be set to 1 if the CPU was halted due to WDR, otherwise it will be read as a 0.
10	WDRBKPT	Watch Dog Reset Breakpoint Disable, controls the halting of the CPU when a WDR is triggered when debugging. The WDR breakpoint is enabled by default, (WDRBKPT = 0) but can be disabled by writing this bit to 1.
9	CBKPT_8	Set to 1 to add the memory breakpoint to the breakpoint chain.
8	CBKPT_7	Set to 1 to add breakpoint 7 to the breakpoint chain.
7	CBKPT_6	Set to 1 to add breakpoint 6 to the breakpoint chain.
6	CBKPT_5	Set to 1 to add breakpoint 5 to the breakpoint chain.
5	CBKPT_4	Set to 1 to add breakpoint 4 to the breakpoint chain.
4	CBKPT_3	Set to 1 to add breakpoint 3 to the breakpoint chain.
3	CBKPT_2	Set to 1 to add breakpoint 2 to the breakpoint chain.
2	CBKPT_1	set to 1, to add breakpoint 1 to the breakpoint chain.
1	CBKPT_0	set to 1, to add breakpoint 0 to the breakpoint chain.
0	BC_ENA	Enables breakpoint chaining, writing to bits[9:1] of this register has no effect on breakpoint chaining unless this bit set to 1, but the bits [9:1] can always be set regardless of the state of this bit.

## 1.3.1319 DOC\_BKPTCS

### Breakpoint Chain Status

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_BKPTCS: 0x5024A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	RBIC							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							R:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							RBIC

The Breakpoint chain status register contains the current status of the breakpoint chain, which breakpoints have been triggered and which breakpoints remain in the chain

Bits	Name	Description
8:0	RBIC[8:0]	Remaining Breakpoints In Chain, the read value of 1 indicates that the corresponding breakpoint has not been triggered yet. Example: if bit[0] of BKPTCS reads as 1, this means that breakpoint chaining of breakpoint 0 is enabled and that the PC has not matched the value contained in register PA_BKPT0[15:0]

## 1.3.1320 DOC\_TRC\_CFG

### Trace Configuration Register

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_TRC\_CFG: 0x5024C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:00	
HW Access	NA				R/W	R/W	R/W	
Retention	NA				RET	RET	RET	
Name	RSVD				TRC_FULL	TRC_FLTR	TRC_CNTRL	

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	TRC_PMEM							

The Trace Configuration register configures instruction trace

Bits	Name	Description
15:8	TRC_PMEM[7:0]	Trace Private Memory, this register is used to trace a register in private memory. TRC_PMEM contains the address of private memory data value that will be stored in the trace buffer when the TRC_FLTR is set to 0. The default of this register is 0, which corresponds to trace register 0 (R0)
3	TRC_FULL	Trace Full, when set to 1 the CPU is halted when the trace buffer is full, otherwise the trace buffer data continuously overlaps.
2	TRC_FLTR	Trace Filter, Sets filterable data for trace buffer, when set to .0. the trace buffer records the PC, the accumulator and a specified SFR or Internal memory location. The location depends on the value stored in the TRC_PMEM register. When set to .1. the trace buffer only records the PC value.
1:0	TRC_CNTRL[1:0]	Trace Control, enables trace, and configures trace buffer mode <a href="#">See Table 1-868.</a>

Table 1-868. Bit field encoding: TRC\_CNTRL\_ENUM

Value	Name	Description
2'b00	trace_disabled	Trace Disabled
2'b01	run_cont	Run Continuously
2'b10	trig_point	Trigger point mode, when set 7th breakpoint comparator register is used as the trigger point
2'b11	win_mode	Window mode, when set the 7th and 8th breakpoint comparator register are used for window points

## 1.3.1321 DOC\_PC

### Program Counter

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_PC: 0x5024E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	PC							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	PC							

This program counter register acts as a place holder for the program counter so that reads and writes to the PC can be accessed through the DoC using this address

Bits	Name	Description
15:0	PC[15:0]	Current PC value on reads, new PC value for writes. The CPU must be halted to read or write the PC otherwise reads will return 0, and writes will have no effect

## 1.3.1322 DOC\_CPU\_RST

### CPU reset

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_CPU\_RST: 0x50250

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							RST

Virtual register for CPU reset

Bits	Name	Description
0	RST	Reset, when set to 1 the DoC holds the CPU in the reset state, when set to 0 the DoC releases the CPU from the reset state (does not override other reset signals).

## 1.3.1323 DOC\_ENTR\_TS

### Entry Timestamp

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_ENTR\_TS: 0x50254

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Holds the number of clock cycles from the point trace is enabled and the cpu is running to the entry of the trace window when window mode is enabled

Bits	Name	Description
31:0	TSTMP[31:0]	Holds the number of clock cycles from the point trace is enabled and the cpu is running to the entry point of the trace window when window mode is enabled

## 1.3.1324 DOC\_EXIT\_TS

### Exit Timestamp

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

DOC\_EXIT\_TS: 0x50258

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	TSTMP							

Holds the number of clock cycles from the time trace is enabled and the cpu is running to the exit of the window when window mode is enabled

Bits	Name	Description
31:0	TSTMP[31:0]	Holds the number of clock cycles from the time trace is enabled and the cpu is running to the exit of the window when window mode is enabled

### 1.3.1325 FLSHID\_RSVD[0..127]

#### RSVD

**Reset:** N/A

Register : Address

FLSHID\_RSVD: 0xC0000-0xC007F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	(no description)

### 1.3.1326 FLSHID\_CUST\_MDATA[0..127]

#### Customer Meta Data

**Reset:** N/A

Register : Address

FLSHID\_CUST\_MDATA: 0xC0080-0xC00FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cust_mdata							

Contains customer meta data such as information on the programmer used and the build number of the Cypress tool used. See Flash chapter for more information on the use of this field and a breakdown of the individual bytes

Bits	Name	Description
7:0	cust_mdata[7:0]	Customer Meta Data

## 1.3.1327 FLSHID\_CUST\_TABLES\_Y\_LOC

### Y location

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_Y\_LOC: 0xC0100

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	y_loc							

Y location of die on the wafer

Bits	Name	Description
7:0	y_loc[7:0]	Y location of die on the wafer (row number)

## 1.3.1328 FLSHID\_CUST\_TABLES\_X\_LOC

### X location

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_X\_LOC: 0xc0101

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	x_loc							

X location of die on the wafer

Bits	Name	Description
7:0	x_loc[7:0]	X location of die on the wafer (column number)

### 1.3.1329 FLSHID\_CUST\_TABLES\_WAFER\_NUM

#### Wafer Number

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_WAFER\_NUM: 0xC0102

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	wafer_num							

Wafer Number

Bits	Name	Description
7:0	wafer_num[7:0]	Wafer Number: 1 to 24

## 1.3.1330 FLSHID\_CUST\_TABLES\_LOT\_LSB

### Lot Number LSB

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_LOT\_LSB: 0xC0103

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	lot_lsb							

### Lot Number LSB

Bits	Name	Description
7:0	lot_lsb[7:0]	LSB of lot number/wafer start

### 1.3.1331 FLSHID\_CUST\_TABLES\_LOT\_MSB

#### Lot Number MSB

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_LOT\_MSB: 0xC0104

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	lot_msb							

#### Lot Number MSB

Bits	Name	Description
7:0	lot_msb[7:0]	MSB of lot number/wafer start

## 1.3.1332 FLSHID\_CUST\_TABLES\_WRK\_WK

### Work Week

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_WRK\_WK: 0xC0105

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	work_week							

Work week

Bits	Name	Description
7:0	work_week[7:0]	Work week: 1 to 53

### 1.3.1333 FLSHID\_CUST\_TABLES\_FAB\_YR

#### Fab/Yr

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FLSHID\_CUST\_TABLES\_FAB\_YR: 0xC0106

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0000				R:0000			
HW Access	R/W				R/W			
Retention	RET				RET			
Name	year				fab			

Fab ID and Year Produced

Bits	Name	Description
7:4	year[3:0]	Year: 0 to 9
3:0	fab[3:0]	Fab Number: 4 or 5

## 1.3.1334 FLSHID\_CUST\_TABLES\_MINOR

### Minor Part Number

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_MINOR: 0xc0107

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	minor							

Marketing part number - minor

Bits	Name	Description
7:0	minor[7:0]	Marketing part number - minor: 000 to 999

### 1.3.1335 FLSHID\_CUST\_TABLES\_IMO\_3MHZ

#### IMO Trim - 3 MHz

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_3MHZ: 0xC0108

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_3mhz							

#### IMO Frequency Trim - 3 MHz

Bits	Name	Description
7:0	imo_3mhz[7:0]	IMO Frequency Trim - 3 MHz: trim value to write to register IMO.TR1 to trim for 3 MHz setting

## 1.3.1336 FLSHID\_CUST\_TABLES\_IMO\_6MHZ

### IMO Trim - 6 MHz

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_6MHZ: 0xC0109

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_6mhz							

IMO Frequency Trim - 6 MHz

Bits	Name	Description
7:0	imo_6mhz[7:0]	IMO Frequency Trim - 6 MHz: trim value to write to register IMO.TR1 to trim for 6 MHz setting

## 1.3.1337 FLSHID\_CUST\_TABLES\_IMO\_12MHZ

### IMO Trim - 12 MHz

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_12MHZ: 0xC010A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_12mhz							

### IMO Frequency Trim - 12 MHz

Bits	Name	Description
7:0	imo_12mhz[7:0]	IMO Frequency Trim - 12 MHz: trim value to write to register IMO.TR1 to trim for 12 MHz setting

## 1.3.1338 FLSHID\_CUST\_TABLES\_IMO\_24MHZ

### IMO Trim - 24 MHz

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_24MHZ: 0xC010B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_24mhz							

#### IMO Frequency Trim - 24 MHz

Bits	Name	Description
7:0	imo_24mhz[7:0]	IMO Frequency Trim - 24 MHz: trim value to write to register IMO.TR1 to trim for 24 MHz setting

### 1.3.1339 FLSHID\_CUST\_TABLES\_IMO\_67MHZ

#### IMO Trim - 67 MHz

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_67MHZ: 0xC010C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_67mhz							

#### IMO Frequency Trim - 67 MHz

Bits	Name	Description
7:0	imo_67mhz[7:0]	IMO Frequency Trim - 67 MHz: trim value to write to register IMO.TR1 to trim for 67 MHz setting

### 1.3.1340 FLSHID\_CUST\_TABLES\_IMO\_80MHZ

#### IMO Trim - 80 MHz

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_80MHZ: 0xC010D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_80mhz							

IMO Frequency Trim - 80 MHz

Bits	Name	Description
7:0	imo_80mhz[7:0]	IMO Frequency Trim - 80 MHz: trim value to write to register IMO.TR1 to trim for 80 MHz setting

## 1.3.1341 FLSHID\_CUST\_TABLES\_IMO\_92MHZ

### IMO Trim - 92 MHz

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_92MHZ: 0xC010E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_92mhz							

### IMO Frequency Trim - 92 MHz

Bits	Name	Description
7:0	imo_92mhz[7:0]	IMO Frequency Trim - 92 MHz: trim value to write to register IMO.TR1 to trim for 92 MHz setting

## 1.3.1342 FLSHID\_CUST\_TABLES\_IMO\_USB

### IMO Trim - USB Mode

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_IMO\_USB: 0xC010F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	imo_usb							

### IMO Frequency Trim - USB Mode

Bits	Name	Description
7:0	imo_usb[7:0]	IMO Frequency Trim - USB Mode: trim value to write to register IMO.TR1 to trim for USB mode setting

### 1.3.1343 FLSHID\_CUST\_TABLES\_CMP0\_TR0\_HS

#### CMP0\_TR0 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP0\_TR0\_HS: 0xC0110

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp0_tr0_hs							

Trim for CMP0\_TR0 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp0_tr0_hs[7:0]	Trim for CMP0_TR0 for offset high speed mode (mode 1)

### 1.3.1344 FLSHID\_CUST\_TABLES\_CMP1\_TR0\_HS

#### CMP1\_TR0 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP1\_TR0\_HS: 0xC0111

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp1_tr0_hs							

Trim for CMP1\_TR0 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp1_tr0_hs[7:0]	Trim for CMP1_TR0 for offset high speed mode (mode 1)

### 1.3.1345 FLSHID\_CUST\_TABLES\_CMP2\_TR0\_HS

#### CMP2\_TR0 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP2\_TR0\_HS: 0xC0112

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp2_tr0_hs							

Trim for CMP2\_TR0 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp2_tr0_hs[7:0]	Trim for CMP2_TR0 for offset high speed mode (mode 1)

## 1.3.1346 FLSHID\_CUST\_TABLES\_CMP3\_TR0\_HS

### CMP3\_TR0 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP3\_TR0\_HS: 0xC0113

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp3_tr0_hs							

Trim for CMP3\_TR0 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp3_tr0_hs[7:0]	Trim for CMP3_TR0 for offset high speed mode (mode 1)

## 1.3.1347 FLSHID\_CUST\_TABLES\_CMP0\_TR1\_HS

### CMP0\_TR1 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP0\_TR1\_HS: 0xC0114

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp0_tr1_hs							

Trim for CMP0\_TR1 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp0_tr1_hs[7:0]	Trim for CMP0_TR1 for offset high speed mode (mode 1)

### 1.3.1348 FLSHID\_CUST\_TABLES\_CMP1\_TR1\_HS

#### CMP1\_TR1 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP1\_TR1\_HS: 0xC0115

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp1_tr1_hs							

Trim for CMP1\_TR1 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp1_tr1_hs[7:0]	Trim for CMP1_TR1 for offset high speed mode (mode 1)

## 1.3.1349 FLSHID\_CUST\_TABLES\_CMP2\_TR1\_HS

### CMP2\_TR1 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP2\_TR1\_HS: 0xC0116

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp2_tr1_hs							

Trim for CMP2\_TR1 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp2_tr1_hs[7:0]	Trim for CMP2_TR1 for offset high speed mode (mode 1)

### 1.3.1350 FLSHID\_CUST\_TABLES\_CMP3\_TR1\_HS

#### CMP3\_TR1 High Speed

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_CMP3\_TR1\_HS: 0xC0117

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cmp3_tr1_hs							

Trim for CMP3\_TR1 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp3_tr1_hs[7:0]	Trim for CMP3_TR1 for offset high speed mode (mode 1)

## 1.3.1351 FLSHID\_CUST\_TABLES\_DEC\_M1

### Decimator Trim - Mode 1

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M1: 0xC0118

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m1							

#### Decimator Trim - Mode 1

Bits	Name	Description
7:0	dec_tr_m1[7:0]	Decimator Trim - Mode 1: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

## 1.3.1352 FLSHID\_CUST\_TABLES\_DEC\_M2

### Decimator Trim - mode 2

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M2: 0xC0119

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m2							

#### Decimator Trim - mode 2

Bits	Name	Description
7:0	dec_tr_m2[7:0]	Decimator Trim - mode 2: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

### 1.3.1353 FLSHID\_CUST\_TABLES\_DEC\_M3

#### Decimator Trim - mode 3

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M3: 0xC011A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m3							

#### Decimator Trim - mode 3

Bits	Name	Description
7:0	dec_tr_m3[7:0]	Decimator Trim - mode 3: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

## 1.3.1354 FLSHID\_CUST\_TABLES\_DEC\_M4

### Decimator Trim - mode 4

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M4: 0xC011B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m4							

Decimator Trim - mode 4

Bits	Name	Description
7:0	dec_tr_m4[7:0]	Decimator Trim - mode 4: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

### 1.3.1355 FLSHID\_CUST\_TABLES\_DEC\_M5

#### Decimator Trim - mode 5

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M5: 0xC011C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m5							

#### Decimator Trim - mode 5

Bits	Name	Description
7:0	dec_tr_m5[7:0]	Decimator Trim - mode 5: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

### 1.3.1356 FLSHID\_CUST\_TABLES\_DEC\_M6

#### Decimator Trim - mode 6

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M6: 0xC011D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m6							

#### Decimator Trim - mode 6

Bits	Name	Description
7:0	dec_tr_m6[7:0]	Decimator Trim - mode 6: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

### 1.3.1357 FLSHID\_CUST\_TABLES\_DEC\_M7

#### Decimator Trim - Mode 7

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M7: 0xC011E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m7							

#### Decimator Trim - Mode 7

Bits	Name	Description
7:0	dec_tr_m7[7:0]	Decimator Trim - Mode 7: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

## 1.3.1358 FLSHID\_CUST\_TABLES\_DEC\_M8

### Decimator Trim - Mode 8

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DEC\_M8: 0xC011F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dec_tr_m8							

#### Decimator Trim - Mode 8

Bits	Name	Description
7:0	dec_tr_m8[7:0]	Decimator Trim - Mode 8: Offset value to add to base decimator gain correction coefficient (GCOR). Value is 8-bit signed.

### 1.3.1359 FLSHID\_CUST\_TABLES\_DAC0\_M1

#### DAC0\_TR Trim - Mode 1

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M1: 0xC0120

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m1							

#### DAC0\_TR Trim - Mode 1

Bits	Name	Description
7:0	dac0_m1[7:0]	DAC0_TR Trim - Mode 1

## 1.3.1360 FLSHID\_CUST\_TABLES\_DAC0\_M2

### DAC0\_TR Trim - mode 2

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M2: 0xC0121

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m2							

DAC0\_TR Trim - mode 2

Bits	Name	Description
7:0	dac0_m2[7:0]	DAC0_TR Trim - mode 2

### 1.3.1361 FLSHID\_CUST\_TABLES\_DAC0\_M3

#### DAC0\_TR Trim - mode 3

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M3: 0xc0122

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m3							

#### DAC0\_TR Trim - mode 3

Bits	Name	Description
7:0	dac0_m3[7:0]	DAC0_TR Trim - mode 3

## 1.3.1362 FLSHID\_CUST\_TABLES\_DAC0\_M4

### DAC0\_TR Trim - mode 4

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M4: 0xC0123

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m4							

DAC0\_TR Trim - mode 4

Bits	Name	Description
7:0	dac0_m4[7:0]	DAC0_TR Trim - mode 4

### 1.3.1363 FLSHID\_CUST\_TABLES\_DAC0\_M5

#### DAC0\_TR Trim - mode 5

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M5: 0xc0124

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m5							

DAC0\_TR Trim - mode 5

Bits	Name	Description
7:0	dac0_m5[7:0]	DAC0_TR Trim - mode 5

## 1.3.1364 FLSHID\_CUST\_TABLES\_DAC0\_M6

### DAC0\_TR Trim - mode 6

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M6: 0xC0125

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m6							

DAC0\_TR Trim - mode 6

Bits	Name	Description
7:0	dac0_m6[7:0]	DAC0_TR Trim - mode 6

### 1.3.1365 FLSHID\_CUST\_TABLES\_DAC0\_M7

#### DAC0\_TR Trim - mode 7

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M7: 0xC0126

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m7							

DAC0\_TR Trim - mode 7

Bits	Name	Description
7:0	dac0_m7[7:0]	DAC0_TR Trim - mode 7

## 1.3.1366 FLSHID\_CUST\_TABLES\_DAC0\_M8

### DAC0\_TR Trim - mode 8

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC0\_M8: 0xC0127

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac0_m8							

DAC0\_TR Trim - mode 8

Bits	Name	Description
7:0	dac0_m8[7:0]	DAC0_TR Trim - mode 8

### 1.3.1367 FLSHID\_CUST\_TABLES\_DAC2\_M1

#### DAC2\_TR Trim - Mode 1

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M1: 0xC0128

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m1							

#### DAC2\_TR Trim - Mode 1

Bits	Name	Description
7:0	dac2_m1[7:0]	DAC2_TR Trim - Mode 1

## 1.3.1368 FLSHID\_CUST\_TABLES\_DAC2\_M2

### DAC2\_TR Trim - mode 2

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M2: 0xC0129

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m2							

DAC2\_TR Trim - mode 2

Bits	Name	Description
7:0	dac2_m2[7:0]	DAC2_TR Trim - mode 2

### 1.3.1369 FLSHID\_CUST\_TABLES\_DAC2\_M3

#### DAC2\_TR Trim - mode 3

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M3: 0xC012A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m3							

#### DAC2\_TR Trim - mode 3

Bits	Name	Description
7:0	dac2_m3[7:0]	DAC2_TR Trim - mode 3

## 1.3.1370 FLSHID\_CUST\_TABLES\_DAC2\_M4

### DAC2\_TR Trim - mode 4

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M4: 0xC012B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m4							

DAC2\_TR Trim - mode 4

Bits	Name	Description
7:0	dac2_m4[7:0]	DAC2_TR Trim - mode 4

### 1.3.1371 FLSHID\_CUST\_TABLES\_DAC2\_M5

#### DAC2\_TR Trim - mode 5

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M5: 0xC012C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m5							

DAC2\_TR Trim - mode 5

Bits	Name	Description
7:0	dac2_m5[7:0]	DAC2_TR Trim - mode 5

## 1.3.1372 FLSHID\_CUST\_TABLES\_DAC2\_M6

### DAC2\_TR Trim - mode 6

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M6: 0xC012D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m6							

DAC2\_TR Trim - mode 6

Bits	Name	Description
7:0	dac2_m6[7:0]	DAC2_TR Trim - mode 6

### 1.3.1373 FLSHID\_CUST\_TABLES\_DAC2\_M7

#### DAC2\_TR Trim - mode 7

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M7: 0xC012E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m7							

#### DAC2\_TR Trim - mode 7

Bits	Name	Description
7:0	dac2_m7[7:0]	DAC2_TR Trim - mode 7

## 1.3.1374 FLSHID\_CUST\_TABLES\_DAC2\_M8

### DAC2\_TR Trim - mode 8

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC2\_M8: 0xC012F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac2_m8							

DAC2\_TR Trim - mode 8

Bits	Name	Description
7:0	dac2_m8[7:0]	DAC2_TR Trim - mode 8

### 1.3.1375 FLSHID\_CUST\_TABLES\_DAC1\_M1

#### DAC1\_TR Trim - Mode 1

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M1: 0xC0130

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m1							

#### DAC1\_TR Trim - Mode 1

Bits	Name	Description
7:0	dac1_m1[7:0]	DAC1_TR Trim - Mode 1

## 1.3.1376 FLSHID\_CUST\_TABLES\_DAC1\_M2

### DAC1\_TR Trim - mode 2

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M2: 0xC0131

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m2							

DAC1\_TR Trim - mode 2

Bits	Name	Description
7:0	dac1_m2[7:0]	DAC1_TR Trim - mode 2

## 1.3.1377 FLSHID\_CUST\_TABLES\_DAC1\_M3

### DAC1\_TR Trim - mode 3

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M3: 0xC0132

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m3							

### DAC1\_TR Trim - mode 3

Bits	Name	Description
7:0	dac1_m3[7:0]	DAC1_TR Trim - mode 3

## 1.3.1378 FLSHID\_CUST\_TABLES\_DAC1\_M4

### DAC1\_TR Trim - mode 4

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M4: 0xC0133

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m4							

DAC1\_TR Trim - mode 4

Bits	Name	Description
7:0	dac1_m4[7:0]	DAC1_TR Trim - mode 4

### 1.3.1379 FLSHID\_CUST\_TABLES\_DAC1\_M5

#### DAC1\_TR Trim - mode 5

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M5: 0xC0134

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m5							

#### DAC1\_TR Trim - mode 5

Bits	Name	Description
7:0	dac1_m5[7:0]	DAC1_TR Trim - mode 5

## 1.3.1380 FLSHID\_CUST\_TABLES\_DAC1\_M6

### DAC1\_TR Trim - mode 6

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M6: 0xC0135

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m6							

DAC1\_TR Trim - mode 6

Bits	Name	Description
7:0	dac1_m6[7:0]	DAC1_TR Trim - mode 6

### 1.3.1381 FLSHID\_CUST\_TABLES\_DAC1\_M7

#### DAC1\_TR Trim - mode 7

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M7: 0xC0136

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m7							

#### DAC1\_TR Trim - mode 7

Bits	Name	Description
7:0	dac1_m7[7:0]	DAC1_TR Trim - mode 7

## 1.3.1382 FLSHID\_CUST\_TABLES\_DAC1\_M8

### DAC1\_TR Trim - mode 8

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC1\_M8: 0xC0137

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac1_m8							

DAC1\_TR Trim - mode 8

Bits	Name	Description
7:0	dac1_m8[7:0]	DAC1_TR Trim - mode 8

### 1.3.1383 FLSHID\_CUST\_TABLES\_DAC3\_M1

#### DAC3\_TR Trim - Mode 1

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M1: 0xC0138

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m1							

#### DAC3\_TR Trim - Mode 1

Bits	Name	Description
7:0	dac3_m1[7:0]	DAC3_TR Trim - Mode 1

## 1.3.1384 FLSHID\_CUST\_TABLES\_DAC3\_M2

### DAC3\_TR Trim - mode 2

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M2: 0xC0139

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m2							

DAC3\_TR Trim - mode 2

Bits	Name	Description
7:0	dac3_m2[7:0]	DAC3_TR Trim - mode 2

### 1.3.1385 FLSHID\_CUST\_TABLES\_DAC3\_M3

#### DAC3\_TR Trim - mode 3

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M3: 0xC013A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m3							

#### DAC3\_TR Trim - mode 3

Bits	Name	Description
7:0	dac3_m3[7:0]	DAC3_TR Trim - mode 3

## 1.3.1386 FLSHID\_CUST\_TABLES\_DAC3\_M4

### DAC3\_TR Trim - mode 4

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M4: 0xC013B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m4							

DAC3\_TR Trim - mode 4

Bits	Name	Description
7:0	dac3_m4[7:0]	DAC3_TR Trim - mode 4

## 1.3.1387 FLSHID\_CUST\_TABLES\_DAC3\_M5

### DAC3\_TR Trim - mode 5

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M5: 0xC013C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m5							

DAC3\_TR Trim - mode 5

Bits	Name	Description
7:0	dac3_m5[7:0]	DAC3_TR Trim - mode 5

## 1.3.1388 FLSHID\_CUST\_TABLES\_DAC3\_M6

### DAC3\_TR Trim - mode 6

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M6: 0xC013D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m6							

DAC3\_TR Trim - mode 6

Bits	Name	Description
7:0	dac3_m6[7:0]	DAC3_TR Trim - mode 6

### 1.3.1389 FLSHID\_CUST\_TABLES\_DAC3\_M7

#### DAC3\_TR Trim - mode 7

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M7: 0xC013E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m7							

#### DAC3\_TR Trim - mode 7

Bits	Name	Description
7:0	dac3_m7[7:0]	DAC3_TR Trim - mode 7

## 1.3.1390 FLSHID\_CUST\_TABLES\_DAC3\_M8

### DAC3\_TR Trim - mode 8

**Reset:** N/A

Register : Address

FLSHID\_CUST\_TABLES\_DAC3\_M8: 0xC013F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	dac3_m8							

DAC3\_TR Trim - mode 8

Bits	Name	Description
7:0	dac3_m8[7:0]	DAC3_TR Trim - mode 8

## 1.3.1391 FLSHID\_MFG\_CFG\_IMO\_TR1

### IMO\_TR1 Trim

**Reset:** System reset for retention flops [reset\_all\_retention]

Register : Address

FLSHID\_MFG\_CFG\_IMO\_TR1: 0xC0188

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:10100001							
HW Access	R/W							
Retention	RET							
Name	addr							

  

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	data							

IMO Trim for 48 MHz frequency setting

Bits	Name	Description
15:8	data[7:0]	Data byte to write to address
7:0	addr[7:0]	Address offset to add to 0x4600

### 1.3.1392 FLS\_DATA[0..65535]

#### FLASH Data

**Reset:** N/A

Register : Address

FLS\_DATA: 0x100000-0x10FFFF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	data							

FLASH data. 8051 may access only through extended data space.

Bits	Name	Description
7:0	data[7:0]	FLASH data

### 1.3.1393 EXTMEM\_DATA[0..8388607]

#### DATA

**Reset:** N/A

Register : Address

EXTMEM\_DATA: 0x800000-0xFFFFFFFF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	data							

Bits	Name	Description
7:0	data[7:0]	(no description)

# Revision History

## Revision History

Document Title: PSoC® 3 REGISTERS TRM (TECHNICAL REFERENCE MANUAL)			
Document Number: 001-50581			
Revision	ECN#	Issue Date	Description of Change
**	2658937	01/05/2009	Initial internal publication.
*A	2622249	02/17/2009	ES10 update.
*B	2738258	07/14/2009	Initial external publication, non NDA.
*C	2762360	09/10/2009	Incorporated updates through 09/09/2009.
*D	3117373	12/23/2010	Incremental Edit
*E	3634126	06/01/2012	Incorporated updates through 05/31/2012.
*F	4136831	09/26/2013	Incorporated updates through 09/25/2013
*G	4247592	01/15/2014	Incorporated updates through 01/15/2014
*H	4446627	07/17/2014	Incorporated updates through 07/16/2014
*I	4813026	06/30/2015	Updated avail_main in PM_AVAIL_CR4 Register Updated vsel_enum (vsel[4:0]) in BOOST_CR0 Register Updated nobat in BOOST_SR Register Updated CMP[0..3]_TR0 and CMP[0..3]_TR1 Registers Updated wait[1:0], delay[1:0], lockdet ilock changed to high_phase_error for FASTCLK_PLL_CFG0 and FASTCLK_PLL_SR Registers Updated extmode, clk_ilo, and clk_eco for BOOST_CR1 and BOOST_CR4 Registers Updated bitfield description in CAN_TX_CMD and CAN_RX_CMD registers.
*J	5758771	01/06/2017	Updated logo and copyright information
*K	6836882	03/25/2020	Updated 1.3.344 SC[0..3]_CR0 register. Completing the Sunset review.
