| Name | PORT_IB_MODE_SEL [31:30] | | PORT_SLEW_CTL [29:28] | | PORT_HYST_TRIM | None | PORT_SLOW | PORT_VTRIP_SEL |

| Bits | Name | Description |
|---------|------------------|---|
| 31 : 30 | PORT_IB_MODE_SEL | <p>This field selects the input buffer reference. The size (1 or 2 bits) and functionality is dependent on the IO cell.</p> <p>For GPIO cells, bit PORT_IB_MODE_SEL[1] is not used</p> <p>"0"/"2": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1"/"3": vcchib. (VCC in Hibernate mode)</p> <p>For GPIO_OVT:</p> <p>"0": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1": vcchib.(VCC in Hibernate mode)</p> <p>"2": OVT.</p> <p>"3": Reference (possibly from reference generator cell).</p> <p>For SIO cell, this field is present but not used as the SIO cell does not provide input buffer mode select functionality</p> <p>Default Value: 0</p> |
| 29 : 28 | PORT_SLEW_CTL | <p>This field is used to vary slew rate in I2C mode. It comes into picture only when slow=1 and DM=4 (strong pull down, open drain). Following modes are supported and the corresponding fall time specs are mentioned:</p> <p>Default Value: 0</p> |

11.1.57 GPIO_PRT6_PC (continued)

| | | |
|---------|----------------|---|
| | | 0x0: PORT_SLEW_CTL_0: HS mode (100pf < Cb < 400pF, 1.71<5.5, Vext>3.0) FS mode (10pf<400pf, 1.71<5.5) (20-160ns) |
| | | 0x1: PORT_SLEW_CTL_1: HS mode (Cb<100pf, 1.71<5.5, Vext>2.8, F=1.7MHz) (10-80ns) FS+ Mode (Vext>2.8, 1.71<5.5) (20-120ns) |
| | | 0x2: PORT_SLEW_CTL_2: HS mode (100pf<400pf, 1.71<5.5, Vext<3.3) (20-160ns) |
| | | 0x3: PORT_SLEW_CTL_3: HS mode (Cb<100pf, 1.71<5.5, Vext<=2.8, F=1.7MHz) (10-80ns) FS+ mode (Vext<=2.8, 1.71<5.5) (20-120ns) |
| 27 | PORT_HYST_TRIM | This field is used to improve the hysteresis (to 10% of vddio) of the selectable trip point input buffer. The voltage reference comes from the VREFGEN block and is only available when using the VREFGEN block: '0': <= 2.2 V input signaling Voltage. '1': > 2.2 V input signaling Voltage. Default Value: 0 |
| 25 | PORT_SLOW | This field controls the output edge rate of all pins on the port: '0': fast. '1': slow. Default Value: 0 |
| 24 | PORT_VTRIP_SEL | The GPIO cells include a VTRIP_SEL signal to alter the input buffer voltage. Note: this bit is ignored for SIO ports, the VTRIP_SEL settings in the SIO register are used instead (a separate VTRIP_SEL is provided for each pin pair). 0: input buffer functions as a CMOS input buffer. 1: input buffer functions as a LVTTTL input buffer. Default Value: 0 |
| 17 : 15 | DM5 | The GPIO drive mode for pin 5. Default Value: 0 |
| 14 : 12 | DM4 | The GPIO drive mode for pin 4. Default Value: 0 |
| 11 : 9 | DM3 | The GPIO drive mode for pin 3. Default Value: 0 |
| 8 : 6 | DM2 | The GPIO drive mode for pin 2. Default Value: 0 |
| 5 : 3 | DM1 | The GPIO drive mode for pin 1. Default Value: 0 |
| 2 : 0 | DM0 | The GPIO drive mode for pin 0. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the HSIOM is properly configured (HSIOM_PRT_SELx) before turning the IO on here to avoid producing glitches on the bus. Default Value: 0 |
| | | 0x0: OFF: Mode 0 (analog mode): Output buffer off (high Z). Input buffer off. |
| | | 0x1: INPUT: Mode 1: Output buffer off (high Z). Input buffer on. |
| | | 0x2: 0_PU: Mode 2: Strong pull down ('0'), weak/resistive pull up (PU). Input buffer on. |

11.1.57 GPIO_PRT6_PC (continued)

0x3: PD_1:

Mode 3: Weak/resistive pull down (PD), strong pull up ('1'). Input buffer on.

0x4: 0_Z:

Mode 4: Strong pull down ('0'), open drain (pull up off). Input buffer on.

0x5: Z_1:

Mode 5: Open drain (pull down off), strong pull up ('1'). Input buffer on.

0x6: 0_1:

Mode 6: Strong pull down ('0'), strong pull up ('1'). Input buffer on.

0x7: PD_PU:

Mode 7: Weak/resistive pull down (PD), weak/resistive pull up (PU). Input buffer on.

| Name | PORT_IB_MODE_SEL [31:30] | | None [29:26] | | | PORT_SLOW | | PORT_VTRIP_SEL |

| Bits | Name | Description |
|---------|------------------|--|
| 31 : 30 | PORT_IB_MODE_SEL | This field selects the input buffer reference. The size (1 or 2 bits) and functionality is dependent on the IO cell. For GPIO cells, bit PORT_IB_MODE_SEL[1] is not used "0"/"2": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1') "1"/"3": vcchib. (VCC in Hibernate mode) For GPIO_OVT: "0": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1') "1": vcchib.(VCC in Hibernate mode) "2": OVT. "3": Reference (possibly from reference generator cell). For SIO cell, this field is present but not used as the SIO cell does not provide input buffer mode select functionality Default Value: 0 |
| 25 | PORT_SLOW | This field controls the output edge rate of all pins on the port: '0': fast. '1': slow. Default Value: 0 |

11.1.66 GPIO_PRT7_PC (continued)

| | | |
|---------|----------------|--|
| 24 | PORT_VTRIP_SEL | <p>The GPIO cells include a VTRIP_SEL signal to alter the input buffer voltage. Note: this bit is ignored for SIO ports, the VTRIP_SEL settings in the SIO register are used instead (a separate VTRIP_SEL is provided for each pin pair).</p> <p>0: input buffer functions as a CMOS input buffer.</p> <p>1: input buffer functions as a LVTTTL input buffer.</p> <p>Default Value: 0</p> |
| 23 : 21 | DM7 | <p>The GPIO drive mode for pin 7.</p> <p>Default Value: 0</p> |
| 20 : 18 | DM6 | <p>The GPIO drive mode for pin 6.</p> <p>Default Value: 0</p> |
| 17 : 15 | DM5 | <p>The GPIO drive mode for pin 5.</p> <p>Default Value: 0</p> |

| Name | PORT_IB_MODE_SEL [31:30] | | PORT_SLEW_CTL [29:28] | | PORT_HYST_TRIM | None | PORT_SLOW | PORT_VTRIP_SEL |

| Bits | Name | Description |
|---------|------------------|---|
| 31 : 30 | PORT_IB_MODE_SEL | <p>This field selects the input buffer reference. The size (1 or 2 bits) and functionality is dependent on the IO cell.</p> <p>For GPIO cells, bit PORT_IB_MODE_SEL[1] is not used</p> <p>"0"/"2": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1"/"3": vcchib. (VCC in Hibernate mode)</p> <p>For GPIO_OVT:</p> <p>"0": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1": vcchib.(VCC in Hibernate mode)</p> <p>"2": OVT.</p> <p>"3": Reference (possibly from reference generator cell).</p> <p>For SIO cell, this field is present but not used as the SIO cell does not provide input buffer mode select functionality</p> <p>Default Value: 0</p> |
| 29 : 28 | PORT_SLEW_CTL | <p>This field is used to vary slew rate in I2C mode. It comes into picture only when slow=1 and DM=4 (strong pull down, open drain). Following modes are supported and the corresponding fall time specs are mentioned:</p> <p>Default Value: 0</p> |

11.1.84 GPIO_PRT9_PC (continued)

| | | |
|---------|----------------|---|
| | | 0x0: PORT_SLEW_CTL_0: HS mode (100pf < Cb < 400pF, 1.71<5.5, Vext>3.0) FS mode (10pf<400pf,1.71<5.5) (20-160ns) |
| | | 0x1: PORT_SLEW_CTL_1: HS mode (Cb<100pf,1.71<5.5,Vext>2.8,F=1.7MHz) (10-80ns) FS+ Mode (Vext>2.8,1.71<5.5) (20-120ns) |
| | | 0x2: PORT_SLEW_CTL_2: HS mode (100pf<400pf, 1.71<5.5,Vext<3.3) (20-160ns) |
| | | 0x3: PORT_SLEW_CTL_3: HS mode (Cb<100pf,1.71<5.5,Vext<=2.8,F=1.7MHz) (10-80ns) FS+ mode (Vext<=2.8,1.71<5.5) (20-120ns) |
| 27 | PORT_HYST_TRIM | This field is used to improve the hysteresis (to 10% of vddio) of the selectable trip point input buffer. The voltage reference comes from the VREFGEN block and is only available when using the VREFGEN block: '0': <= 2.2 V input signaling Voltage. '1': > 2.2 V input signaling Voltage. Default Value: 0 |
| 25 | PORT_SLOW | This field controls the output edge rate of all pins on the port: '0': fast. '1': slow. Default Value: 0 |
| 24 | PORT_VTRIP_SEL | The GPIO cells include a VTRIP_SEL signal to alter the input buffer voltage. Note: this bit is ignored for SIO ports, the VTRIP_SEL settings in the SIO register are used instead (a separate VTRIP_SEL is provided for each pin pair). 0: input buffer functions as a CMOS input buffer. 1: input buffer functions as a LVTTTL input buffer. Default Value: 0 |
| 23 : 21 | DM7 | The GPIO drive mode for pin 7. Default Value: 0 |
| 20 : 18 | DM6 | The GPIO drive mode for pin 6. Default Value: 0 |
| 17 : 15 | DM5 | The GPIO drive mode for pin 5. Default Value: 0 |
| 14 : 12 | DM4 | The GPIO drive mode for pin 4. Default Value: 0 |
| 11 : 9 | DM3 | The GPIO drive mode for pin 3. Default Value: 0 |
| 8 : 6 | DM2 | The GPIO drive mode for pin 2. Default Value: 0 |
| 5 : 3 | DM1 | The GPIO drive mode for pin 1. Default Value: 0 |
| 2 : 0 | DM0 | The GPIO drive mode for pin 0. Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the HSIOM is properly configured (HSIOM_PRT_SELx) before turning the IO on here to avoid producing glitches on the bus. Default Value: 0 0x0: OFF: Mode 0 (analog mode): Output buffer off (high Z). Input buffer off. |

11.1.84 GPIO_PRT9_PC (continued)

0x1: INPUT:

Mode 1: Output buffer off (high Z). Input buffer on.

0x2: 0_PU:

Mode 2: Strong pull down ('0'), weak/resistive pull up (PU). Input buffer on.

0x3: PD_1:

Mode 3: Weak/resistive pull down (PD), strong pull up ('1'). Input buffer on.

0x4: 0_Z:

Mode 4: Strong pull down ('0'), open drain (pull up off). Input buffer on.

0x5: Z_1:

Mode 5: Open drain (pull down off), strong pull up ('1'). Input buffer on.

0x6: 0_1:

Mode 6: Strong pull down ('0'), strong pull up ('1'). Input buffer on.

0x7: PD_PU:

Mode 7: Weak/resistive pull down (PD), weak/resistive pull up (PU). Input buffer on.

| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 2 | DATA2 | Pin 2 output data. Default Value: 0 |
| 1 | DATA1 | Pin 1 output data. Default Value: 0 |
| 0 | DATA0 | Pin 0 output data. Default Value: 0 |

11.1.120 GPIO_PRT13_PS

Port IO pad state register

Address: 0x40040D04

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|-------|-------|-------|
| SW Access | None | | | | | R | R | R |
| HW Access | None | | | | | W | W | W |
| Name | None [7:3] | | | | | DATA2 | DATA1 | DATA0 |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|----------|
| SW Access | None | | | | | | | R |
| HW Access | None | | | | | | | W |
| Name | None [15:9] | | | | | | | FLT_DATA |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|----------|---|
| 8 | FLT_DATA | Reads of this register return the logical state of the filtered pin. Default Value: 0 |
| 2 | DATA2 | Pin 2 state. Default Value: 0 |
| 1 | DATA1 | Pin 1 state. Default Value: 0 |
| 0 | DATA0 | Pin 0 state: 1: Logic high, if the pin voltage is above the input buffer threshold, logic high. 0: Logic low, if the pin voltage is below that threshold, logic low. If the drive mode for the pin is set to high Z Analog, the pin state will read 0 independent of the voltage on the pin. Default Value: 0 |

11.1.121 GPIO_PRT13_INTR_CFG

Port interrupt configuration register

Address: 0x40040D0C

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|-----------------|---|-----------------|---|-----------------|---|
| SW Access | None | | RW | | RW | | RW | |
| HW Access | None | | R | | R | | R | |
| Name | None [7:6] | | EDGE2_SEL [5:4] | | EDGE1_SEL [3:2] | | EDGE0_SEL [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|--|
| 20 : 18 | FLT_SEL | Selects which pin is routed through the 50ns glitch filter to provide a glitch-safe interrupt. Default Value: 0 |
| 17 : 16 | FLT_EDGE_SEL | Same for the glitch filtered pin (selected by FLT_SELECT). Default Value: 0 0x0: DISABLE: Disabled 0x1: RISING: Rising edge 0x2: FALLING: Falling edge 0x3: BOTH: Both rising and falling edges |
| 5 : 4 | EDGE2_SEL | Sets which edge will trigger an IRQ for pin 2. Default Value: 0 |
| 3 : 2 | EDGE1_SEL | Sets which edge will trigger an IRQ for pin 1. Default Value: 0 |

11.1.121 GPIO_PRT13_INTR_CFG (continued)

| | | |
|-------|-----------|--|
| 1 : 0 | EDGE0_SEL | Sets which edge will trigger an IRQ for pin 0. Default Value: 0 |
| | | 0x0: DISABLE: Disabled |
| | | 0x1: RISING: Rising edge |
| | | 0x2: FALLING: Falling edge |
| | | 0x3: BOTH: Both rising and falling edges |

11.1.122 GPIO_PRT13_INTR

Port interrupt status register

Address: 0x40040D10

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|-------|-------|-------|
| SW Access | None | | | | | RW1C | RW1C | RW1C |

|-------|------|---|
| 7 : 0 | DATA | pin i: '0': Output state DR.DATA[i] not affected. '1': Output state DR.DATA[i] inverted ('0' => '1', '1' => '0'). Default Value: 0 |

12 High Speed I/O Matrix Registers

This section discusses the High-Speed I/O Matrix registers. It lists all the registers in mapping tables, in address order.

12.1 Register Details

| Register Name | Address |
|---------------------------------------|------------|
| HSIOM_AMUX_SPLIT_CTL0 | 0x40022100 |
| HSIOM_AMUX_SPLIT_CTL1 | 0x40022104 |
| HSIOM_AMUX_SPLIT_CTL2 | 0x40022108 |

12.1.1 HSIOM_AMUX_SPLIT_CTL0

AMUX splitter cell control

Address: 0x40022100

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------|--------------|--------------|--------------|------|--------------|--------------|--------------|
| SW Access | None | RW | RW | RW | None | RW | RW | RW |
| HW Access | None | R | R | R | None | R | R | R |
| Name | None | SWITCH_BB_S0 | SWITCH_BB_SR | SWITCH_BB_SL | None | SWITCH_AA_S0 | SWITCH_AA_SR | SWITCH_AA_SL |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|--------------|---|
| 6 | SWITCH_BB_S0 | T-switch control for AMUXBUSB vssa/ground switch. Default Value: 0 |
| 5 | SWITCH_BB_SR | T-switch control for Right AMUXBUSB switch. Default Value: 0 |
| 4 | SWITCH_BB_SL | T-switch control for Left AMUXBUSB switch. Default Value: 0 |
| 2 | SWITCH_AA_S0 | T-switch control for AMUXBUSA vssa/ground switch: '0': switch open. '1': switch closed. Default Value: 0 |
| 1 | SWITCH_AA_SR | T-switch control for Right AMUXBUSA switch: '0': switch open. '1': switch closed. Default Value: 0 |

12.1.1 HSIOM_AMUX_SPLIT_CTL0 (continued)

| | | |
|---|--------------|---|
| 0 | SWITCH_AA_SL | T-switch control for Left AMUXBUS switch: '0': switch open. '1': switch closed. Default Value: 0 |
|---|--------------|---|

12.1.2 HSIOM_AMUX_SPLIT_CTL1

AMUX splitter cell control

Address: 0x40022104

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------|--------------|--------------|--------------|------|--------------|--------------|--------------|

| 5 | SWITCH_BB_SR | T-switch control for Right AMUXBUSB switch. Default Value: 0 |
| 4 | SWITCH_BB_SL | T-switch control for Left AMUXBUSB switch. Default Value: 0 |
| 2 | SWITCH_AA_S0 | T-switch control for AMUXBUSA vssa/ground switch: '0': switch open. '1': switch closed. Default Value: 0 |
| 1 | SWITCH_AA_SR | T-switch control for Right AMUXBUSA switch: '0': switch open. '1': switch closed. Default Value: 0 |

12.1.3 HSIOM_AMUX_SPLIT_CTL2 (continued)

| | | |
|---|--------------|---|
| 0 | SWITCH_AA_SL | T-switch control for Left AMUXBUS switch: '0': switch open. '1': switch closed. Default Value: 0 |
|---|--------------|---|

13 High-Speed I/O Matrix Port Registers

This section discusses the High-Speed I/O Matrix Port registers. It lists all the registers in mapping tables, in address order.

13.1 Register Details

| Register Name | Address |
|------------------|------------|
| HSIOM_PORT_SEL0 | 0x40020000 |
| HSIOM_PORT_SEL1 | 0x40020100 |
| HSIOM_PORT_SEL2 | 0x40020200 |
| HSIOM_PORT_SEL3 | 0x40020300 |
| HSIOM_PORT_SEL4 | 0x40020400 |
| HSIOM_PORT_SEL5 | 0x40020500 |
| HSIOM_PORT_SEL6 | 0x40020600 |
| HSIOM_PORT_SEL7 | 0x40020700 |
| HSIOM_PORT_SEL8 | 0x40020800 |
| HSIOM_PORT_SEL9 | 0x40020900 |
| HSIOM_PORT_SEL10 | 0x40020A00 |
| HSIOM_PORT_SEL11 | 0x40020B00 |
| HSIOM_PORT_SEL12 | 0x40020C00 |
| HSIOM_PORT_SEL13 | 0x40020D00 |

13.1.1 HSIOM_PORT_SEL0

Port selection register

Address: 0x40020000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|---------------|---|---|---|---------------|---|---|---|
| SW Access | RW | | | | RW | | | |
| HW Access | RW | | | | RW | | | |
| Name | IO1_SEL [7:4] | | | | IO0_SEL [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------------|----|----|----|----------------|----|---|---|
| SW Access | RW | | | | RW | | | |
| HW Access | RW | | | | RW | | | |
| Name | IO3_SEL [15:12] | | | | IO2_SEL [11:8] | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|-----------------|----|----|----|-----------------|----|----|----|
| SW Access | RW | | | | RW | | | |
| HW Access | RW | | | | RW | | | |
| Name | IO5_SEL [23:20] | | | | IO4_SEL [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|-----------------|----|----|----|-----------------|----|----|----|
| SW Access | RW | | | | RW | | | |
| HW Access | RW | | | | RW | | | |
| Name | IO7_SEL [31:28] | | | | IO6_SEL [27:24] | | | |

| Bits | Name | Description |
|---------|---------|---|
| 31 : 28 | IO7_SEL | Selects connection for Pin 7. Default Value: 0 |
| 27 : 24 | IO6_SEL | Selects connection for Pin 6. Default Value: 0 |
| 23 : 20 | IO5_SEL | Selects connection for Pin 5. Default Value: 0 |
| 19 : 16 | IO4_SEL | Selects connection for Pin 4. Default Value: 0 |
| 15 : 12 | IO3_SEL | Selects connection for Pin 3. Default Value: 0 |
| 11 : 8 | IO2_SEL | Selects connection for Pin 2. Default Value: 0 |
| 7 : 4 | IO1_SEL | Selects connection for Pin 1. Default Value: 0 |

13.1.1 HSIOM_PORT_SELO (continued)

3 : 0 IO0_SEL

Selects connection for Pin 0.

Note that the availability of Active and Deep Sleep sources depends on the pin. See the I/O System Chapter in Architecture TRM and Pin Outs section of the device datasheet to know the functions available for each pin.

Default Value: 0

0x0: GPIO:

Pin is regular firmware-controlled I/O or connected to dedicated hardware block.

0x1: GPIO_DSI:

Output is firmware controlled, but OE is controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x2: DSI_DSI:

Both output and OE are controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x3: DSI_GPIO:

Output is controlled from DSI, but OE is firmware controlled. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x4: CSD_SENSE:

Pin is a CSD sense pin (analog mode)

0x5: CSD_SHIELD:

Pin is a CSD shield pin (analog mode).

0x6: AMUXA:

Pin is connected to AMUXBUS-A.

0x7: AMUXB:

Pin is connected to AMUXBUS-B. This mode is also used for CSD I/O charging. When CSD I/O charging is enabled in CSD_CONTROL, digital I/O driver is connected to csd_charge signal (pin is still connected to AMUXBUS-B).

0x8: ACT_0:

Pin-specific Active source #0 (TCPWM, EXT CLOCK). See the device datasheet for details.

0x9: ACT_1:

Pin-specific Active source #1 (SCB-UART). See the device datasheet for details.

0xa: ACT_2:

Pin-specific Active source #2 (CAN) See the device datasheet for details.

0xb: ACT_3:

Reserved.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

13.1.1 HSIOM_PORT_SELO (continued)

0xe: DS_2:

Chip specific DeepSleep source 2 connection(SCB-I2C, SWD, LPComp, Wakeup, USB.VBUS_VALID). See the device datasheet for details.

0xf: DS_3:

Chip specific DeepSleep source 3 connection(SCB-SPI). See the device datasheet for details.

13.1.2 HSIOM_PORT_SEL1

Port selection register

Address: 0x40020100

Retention: Retained

| Bits | Name | Description |
|---------|---------|---|
| 31 : 28 | IO7_SEL | Selects connection for Pin 7. Default Value: 0 |
| 27 : 24 | IO6_SEL | Selects connection for Pin 6. Default Value: 0 |
| 23 : 20 | IO5_SEL | Selects connection for Pin 5. Default Value: 0 |
| 19 : 16 | IO4_SEL | Selects connection for Pin 4. Default Value: 0 |
| 15 : 12 | IO3_SEL | Selects connection for Pin 3. Default Value: 0 |
| 11 : 8 | IO2_SEL | Selects connection for Pin 2. Default Value: 0 |
| 7 : 4 | IO1_SEL | Selects connection for Pin 1. Default Value: 0 |

13.1.2 HSIOM_PORT_SEL1 (continued)

3 : 0 IO0_SEL

Selects connection for Pin 0.

Note that the availability of Active and Deep Sleep sources depends on the pin. See the I/O System Chapter in Architecture TRM and Pin Outs section of the device datasheet to know the functions available for each pin.

Default Value: 0

0x0: GPIO:

Pin is regular firmware-controlled I/O or connected to dedicated hardware block.

0x1: GPIO_DSI:

Output is firmware controlled, but OE is controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x2: DSI_DSI:

Both output and OE are controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x3: DSI_GPIO:

Output is controlled from DSI, but OE is firmware controlled. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x4: CSD_SENSE:

Pin is a CSD sense pin (analog mode)

0x5: CSD_SHIELD:

Pin is a CSD shield pin (analog mode).

0x6: AMUXA:

Pin is connected to AMUXBUS-A.

0x7: AMUXB:

Pin is connected to AMUXBUS-B. This mode is also used for CSD I/O charging. When CSD I/O charging is enabled in CSD_CONTROL, digital I/O driver is connected to csd_charge signal (pin is still connected to AMUXBUS-B).

0x8: ACT_0:

Pin-specific Active source #0 (TCPWM, EXT CLOCK). See the device datasheet for details.

0x9: ACT_1:

Pin-specific Active source #1 (SCB-UART). See the device datasheet for details.

0xa: ACT_2:

Pin-specific Active source #2 (CAN) See the device datasheet for details.

0xb: ACT_3:

Reserved.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

13.1.2 HSIOM_PORT_SEL1 (continued)

0xe: DS_2:

Chip specific DeepSleep source 2 connection(SCB-I2C, SWD, LPComp, Wakeup, USB.VBUS_VALID). See the device datasheet for details.

0xf: DS_3:

Chip specific DeepSleep source 3 connection(SCB-SPI). See the device datasheet for details.

| 11 : 8 | IO2_SEL | Selects connection for Pin 2. Default Value: 0 |
| 7 : 4 | IO1_SEL | Selects connection for Pin 1. Default Value: 0 |
| 3 : 0 | IO0_SEL | Selects connection for Pin 0. Note that the availability of Active and Deep Sleep sources depends on the pin. See the I/O System Chapter in Architecture TRM and Pin Outs section of the device datasheet to know the functions available for each pin. Default Value: 0 |

0x0: GPIO:
Pin is regular firmware-controlled I/O or connected to dedicated hardware block.

13.1.7 HSIOM_PORT_SEL6 (continued)

0x1: GPIO_DSI:

Output is firmware controlled, but OE is controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x2: DSI_DSI:

Both output and OE are controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x3: DSI_GPIO:

Output is controlled from DSI, but OE is firmware controlled. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x4: CSD_SENSE:

Pin is a CSD sense pin (analog mode)

0x5: CSD_SHIELD:

Pin is a CSD shield pin (analog mode).

0x6: AMUXA:

Pin is connected to AMUXBUS-A.

0x7: AMUXB:

Pin is connected to AMUXBUS-B. This mode is also used for CSD I/O charging. When CSD I/O charging is enabled in CSD_CONTROL, digital I/O driver is connected to csd_charge signal (pin is still connected to AMUXBUS-B).

0x8: ACT_0:

Pin-specific Active source #0 (TCPWM, EXT CLOCK). See the device datasheet for details.

0x9: ACT_1:

Pin-specific Active source #1 (SCB-UART). See the device datasheet for details.

0xa: ACT_2:

Pin-specific Active source #2 (CAN) See the device datasheet for details.

0xb: ACT_3:

Reserved.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xe: DS_2:

Chip specific DeepSleep source 2 connection(SCB-I2C, SWD, LPComp, Wakeup, USB.VBUS_VALID). See the device datasheet for details.

0xf: DS_3:

Chip specific DeepSleep source 3 connection(SCB-SPI). See the device datasheet for details.

0xc: DS_0:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

13.1.12 HSIOM_PORT_SEL11 (continued)

0xe: DS_2:

Chip specific DeepSleep source 2 connection(SCB-I2C, SWD, LPComp, Wakeup, USB.VBUS_VALID). See the device datasheet for details.

0xf: DS_3:

Chip specific DeepSleep source 3 connection(SCB-SPI). See the device datasheet for details.

13.1.13 HSIOM_PORT_SEL12

Port selection register

Address: 0x40020C00

Retention: Retained

| Bits | Name | Description |
|-------|---------|--|
| 7 : 4 | IO1_SEL | Selects connection for Pin 1. Default Value: 0 |
| 3 : 0 | IO0_SEL | Selects connection for Pin 0. Note that the availability of Active and Deep Sleep sources depends on the pin. See the I/O System Chapter in Architecture TRM and Pin Outs section of the device datasheet to know the functions available for each pin. Default Value: 0 0x0: GPIO: Pin is regular firmware-controlled I/O or connected to dedicated hardware block. 0x1: GPIO_DSI: Output is firmware controlled, but OE is controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details. 0x2: DSI_DSI: Both output and OE are controlled from DSI. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details. |

13.1.13 HSIOM_PORT_SEL12 (continued)

0x3: DSI_GPIO:

Output is controlled from DSI, but OE is firmware controlled. Note that DSI may not be available on all ports. See the I/O System Chapter in Architecture TRM for details.

0x4: CSD_SENSE:

Pin is a CSD sense pin (analog mode)

0x5: CSD_SHIELD:

Pin is a CSD shield pin (analog mode).

0x6: AMUXA:

Pin is connected to AMUXBUS-A.

0x7: AMUXB:

Pin is connected to AMUXBUS-B. This mode is also used for CSD I/O charging. When CSD I/O charging is enabled in CSD_CONTROL, digital I/O driver is connected to csd_charge signal (pin is still connected to AMUXBUS-B).

0x8: ACT_0:

Pin-specific Active source #0 (TCPWM, EXT CLOCK). See the device datasheet for details.

0x9: ACT_1:

Pin-specific Active source #1 (SCB-UART). See the device datasheet for details.

0xa: ACT_2:

Pin-specific Active source #2 (CAN) See the device datasheet for details.

0xb: ACT_3:

Reserved.

0xc: LCD_COM:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xc: DS_0:

LCD common connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: LCD_SEG:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xd: DS_1:

LCD segment connection. This mode provides DeepSleep functionality (provided that the LCD block is enabled and properly configured).

0xe: DS_2:

Chip specific DeepSleep source 2 connection(SCB-I2C, SWD, LPComp, Wakeup, USB.VBUS_VALID). See the device datasheet for details.

0xf: DS_3:

Chip specific DeepSleep source 3 connection(SCB-SPI). See the device datasheet for details.

14 LCD Registers

This section discusses the LCD registers. It lists all the registers in mapping tables, in address order.

14.1 Register Details

| Register Name | Address |
|---------------|------------|
| LCD_ID | 0x402A0000 |
| LCD_DIVIDER | 0x402A0004 |
| LCD_CONTROL | 0x402A0008 |
| LCD_DATA00 | 0x402A0100 |
| LCD_DATA01 | 0x402A0104 |
| LCD_DATA02 | 0x402A0108 |
| LCD_DATA03 | 0x402A010C |
| LCD_DATA04 | 0x402A0110 |
| LCD_DATA05 | 0x402A0114 |
| LCD_DATA06 | 0x402A0118 |
| LCD_DATA07 | 0x402A011C |
| LCD_DATA10 | 0x402A0200 |
| LCD_DATA11 | 0x402A0204 |
| LCD_DATA12 | 0x402A0208 |
| LCD_DATA13 | 0x402A020C |
| LCD_DATA14 | 0x402A0210 |
| LCD_DATA15 | 0x402A0214 |
| LCD_DATA16 | 0x402A0218 |
| LCD_DATA17 | 0x402A021C |

14.1.1 LCD_ID

ID & Revision

Address: 0x402A0000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | ID [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------|----|----|----|----|----|---|---|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | ID [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | REVISION [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | REVISION [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|----------|---|
| 31 : 16 | REVISION | the version number is 0x0001 Default Value: 1 |
| 15 : 0 | ID | the ID of LCD controller peripheral is 0xF0F0 Default Value: 61680 |

14.1.2 LCD_DIVIDER

LCD Divider Register

Address: 0x402A0004

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | SUBFR_DIV [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | SUBFR_DIV [15:8] | | | | | | | |
| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DEAD_DIV [23:16] | | | | | | | |
| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DEAD_DIV [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|-----------|--|
| 31 : 16 | DEAD_DIV | Length of the dead time period in cycles. When set to zero, no dead time period exists. Default Value: 0 |
| 15 : 0 | SUBFR_DIV | Input clock frequency divide value, to generate the 1/4 sub-frame period. The sub-frame period is 4*(SUBFR_DIV+1) cycles long. Default Value: 0 |

14.1.3 LCD_CONTROL

LCD Configuration Register

Address: 0x402A0008

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------|------------|---|---------|------|----------|-------|-------|
| SW Access | None | RW | | RW | RW | RW | RW | RW |
| HW Access | None | R | | R | R | R | R | R |
| Name | None | BIAS [6:5] | | OP_MODE | TYPE | LCD_MODE | HS_EN | LS_EN |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|--------------|----|----|----|----------------|----|---|---|
| SW Access | None | | | | RW | | | |
| HW Access | None | | | | R | | | |
| Name | None [15:12] | | | | COM_NUM [11:8] | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------|--------------|----|----|----|----|----|----|
| SW Access | R | None | | | | | | |
| HW Access | W | None | | | | | | |
| Name | LS_EN_STAT | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|------------|---|
| 31 | LS_EN_STAT | <p>LS enable status bit. This bit is a copy of LS_EN that is synchronized to the low speed clock domain and back to the system clock domain. Firmware can use this bit to observe whether LS_EN has taken effect in the low speed clock domain. Firmware should never change the configuration for the LS generator without ensuring this bit is 0.</p> <p>The following procedure should be followed to disable the LS generator:</p> <ol style="list-style-type: none"> 1. If LS_EN=0 we are done. Exit the procedure. 2. Check that LS_EN_STAT=1. If not, wait until it is. This will catch the case of a recent enable (LS_EN=1) that has not taken effect yet. 3. Set LS_EN=0. 4. Wait until LS_EN_STAT=0. <p>Default Value: 0</p> |

14.1.3 LCD_CONTROL (continued)

| | | |
|--------|----------|---|
| 11 : 8 | COM_NUM | <p>The number of COM connections minus 2. So:</p> <p>0: 2 COM's</p> <p>1: 3 COM's</p> <p>...</p> <p>13: 15 COM's</p> <p>14: 16 COM's</p> <p>15: undefined</p> <p>Default Value: 0</p> |
| 6 : 5 | BIAS | <p>PWM bias selection</p> <p>Default Value: 0</p> <p>0x0: HALF: 1/2 Bias</p> <p>0x1: THIRD: 1/3 Bias</p> <p>0x2: FOURTH: 1/4 Bias (not supported by LS generator)</p> <p>0x3: FIFTH: 1/5 Bias (not supported by LS generator)</p> |
| 4 | OP_MODE | <p>Driving mode configuration</p> <p>Default Value: 0</p> <p>0x0: PWM: PWM Mode</p> <p>0x1: CORRELATION: Digital Correlation Mode</p> |
| 3 | TYPE | <p>LCD driving waveform type configuration.</p> <p>Default Value: 0</p> <p>0x0: TYPE_A: Type A - Each frame addresses each COM pin only once with a balanced (DC=0) waveform.</p> <p>0x1: TYPE_B: Type B - Each frame addresses each COM pin twice in sequence with a positive and negative waveform that together are balanced (DC=0).</p> |
| 2 | LCD_MODE | <p>HS/LS Mode selection</p> <p>Default Value: 0</p> <p>0x0: LS: Select Low Speed (32kHz) Generator (Works in Active, Sleep and DeepSleep power modes).</p> <p>0x1: HS: Select High Speed (system clock) Generator (Works in Active and Sleep power modes only).</p> |
| 1 | HS_EN | <p>High speed (HS) generator enable</p> <p>1: enable</p> <p>0: disable</p> <p>Default Value: 0</p> |
| 0 | LS_EN | <p>Low speed (LS) generator enable</p> <p>1: enable</p> <p>0: disable</p> <p>Default Value: 0</p> |

14.1.4 LCD_DATA00

LCD Pin Data Registers

Address: 0x402A0100

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|---|

15 Low Power Comparator Registers

This section discusses the Low Power Comparator registers. It lists all the registers in mapping tables, in address order.

15.1 Register Details

| Register Name | Address |
|--------------------|------------|
| LPCOMP_ID | 0x402B0000 |
| LPCOMP_CONFIG | 0x402B0004 |
| LPCOMP_INTR | 0x402B0010 |
| LPCOMP_INTR_SET | 0x402B0014 |
| LPCOMP_INTR_MASK | 0x402B0018 |
| LPCOMP_INTR_MASKED | 0x402B001C |
| LPCOMP_TRIM1 | 0x402BFF00 |
| LPCOMP_TRIM2 | 0x402BFF04 |
| LPCOMP_TRIM3 | 0x402BFF08 |
| LPCOMP_TRIM4 | 0x402BFF0C |

15.1.1 LPCOMP_ID

ID & Revision

Address: 0x402B0000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | ID [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------|----|----|----|----|----|---|---|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | ID [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | REVISION [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | REVISION [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|----------|---|
| 31 : 16 | REVISION | the version number is 0x0001 Default Value: 1 |
| 15 : 0 | ID | the ID of LPCOMP peripheral is 0xE0E0 Default Value: 57568 |

15.1.2 LPCOMP_CONFIG

LPCOMP Configuration Register

Address: 0x402B0004

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|---------|------|----------------|---|---------|-------|-------------|---|
| SW Access | RW | R | RW | | RW | RW | RW | |
| HW Access | R | RW | R | | R | R | R | |
| Name | ENABLE1 | OUT1 | INTTYPE1 [5:4] | | FILTER1 | HYST1 | MODE1 [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|---------|------|------------------|----|---------|-------|-------------|---|
| SW Access | RW | R | RW | | RW | RW | RW | |
| HW Access | R | RW | R | | R | R | R | |
| Name | ENABLE2 | OUT2 | INTTYPE2 [13:12] | | FILTER2 | HYST2 | MODE2 [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----------------|-----------------|--------------|----|----------------|-----------------|
| SW Access | None | | RW | RW | None | | RW | RW |
| HW Access | None | | R | R | None | | R | R |
| Name | None [23:22] | | DSI_LEVEL 2 | DSI_BYPAS S2 | None [19:18] | | DSI_LEVEL 1 | DSI_BYPAS S1 |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|-------------|---|
| 21 | DSI_LEVEL2 | Opamp2 comparator DSI (trigger) out level : 0=pulse, 1=level Default Value: 0 |
| 20 | DSI_BYPASS2 | Opamp2 bypass comparator output synchronization for DSI output: 0=synchronize (level or pulse), 1=bypass (output async) Default Value: 0 |
| 17 | DSI_LEVEL1 | Opamp1 comparator DSI (trigger) out level : 0=pulse, 1=level Default Value: 0 |
| 16 | DSI_BYPASS1 | Opamp1 bypass comparator output synchronization for DSI output: 0=synchronize (level or pulse), 1=bypass (output async) Default Value: 0 |
| 15 | ENABLE2 | Enable comparator #2 Default Value: 0 |
| 14 | OUT2 | Current output value of the comparator. Default Value: 0 |
| 13 : 12 | INTTYPE2 | Sets which edge will trigger an IRQ Default Value: 0 |

15.1.2 LPCOMP_CONFIG (continued)

| | | |
|-------|----------|--|
| | | 0x0: DISABLE: Disabled, no interrupts will be detected 0x1: RISING: Rising edge 0x2: FALLING: Falling edge 0x3: BOTH: Both rising and falling edges |
| 11 | FILTER2 | Deprecated, Reserved, must be written 0 Default Value: 0 |
| 10 | HYST2 | Add 10mV hysteresis to the comparator - 0: Enable Hysteresis - 1: Disable Hysteresis Default Value: 0 |
| 9 : 8 | MODE2 | Operating mode for the comparator Default Value: 0 0x0: SLOW: Slow operating mode (uses less power, <50uA) 0x1: FAST: Fast operating mode (uses more power, <400uA) 0x2: ULP: Ultra low power operating mode (uses ~2-4uA) |
| 7 | ENABLE1 | Enable comparator #1 Default Value: 0 |
| 6 | OUT1 | Current output value of the comparator. Default Value: 0 |
| 5 : 4 | INTTYPE1 | Sets which edge will trigger an IRQ Default Value: 0 0x0: DISABLE: Disabled, no interrupts will be detected 0x1: RISING: Rising edge 0x2: FALLING: Falling edge 0x3: BOTH: Both rising and falling edges |
| 3 | FILTER1 | Deprecated, Reserved, must be written 0 Default Value: 0 |
| 2 | HYST1 | Add 10mV hysteresis to the comparator - 0: Enable Hysteresis - 1: Disable Hysteresis Default Value: 0 |
| 1 : 0 | MODE1 | Operating mode for the comparator Default Value: 0 0x0: SLOW: Slow operating mode (uses less power, <50uA) |

15.1.2 LPCOMP_CONFIG (continued)

0x1: FAST:

Fast operating mode (uses more power, <400uA)

0x2: ULP:

Ultra low power operating mode (uses ~2-4uA)

15.1.3 LPCOMP_INTR

LPCOMP Interrupt request register

Address: 0x402B0010

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|-------|-------|
| SW Access | None | | | | | | RW1C | RW1C |
| HW Access | None | | | | | | RW1S | RW1S |
| Name | None [7:2] | | | | | | COMP2 | COMP1 |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------|---|
| 1 | COMP2 | Comparator 2 Interrupt: hardware sets this interrupt when comparator 0 triggers. Write with '1' to clear bit. Default Value: 0 |
| 0 | COMP1 | Comparator 1 Interrupt: hardware sets this interrupt when comparator 0 triggers. Write with '1' to clear bit. Default Value: 0 |

15.1.4 LPCOMP_INTR_SET

LPCOMP Interrupt set register

Address: 0x402B0014

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|-------|-------|

| SW Access | RW | None | | | | | | |
| HW Access | R | None | | | | | | |
| Name | ENABLED | None [30:24] | | | | | | |

| Bits | Name | Description |
|--------|-------------|---|
| 31 | ENABLED | - 0: DSAB IP disabled (put analog in power down, put all iref in bypass) - 1: DSAB IP enabled Default Value: 0 |
| 11 : 8 | SEL_OUT | selection for ibias_out and irefout_ptat_2pt4 0: bypass respectively irefin_0tc_2pt4 and bypass irefin_ptat_2pt4 1: drive respectively replicated dsab_ibias and 0. Default Value: 0 |
| 5 : 0 | CURRENT_SEL | current selection for dsab_ibias, dsab_ibias = CURRENT_SEL * 0.075 uA (+/-5%) Default Value: 0 |

17 ROM Table Registers

This section discusses the ROM Table registers. It lists all the registers in mapping tables, in address order.

17.1 Register Details

| Register Name | Address |
|-------------------------------|------------|
| ROMTABLE_ADDR | 0xF0000000 |
| ROMTABLE_DID | 0xF0000FCC |
| ROMTABLE_PID4 | 0xF0000FD0 |
| ROMTABLE_PID5 | 0xF0000FD4 |
| ROMTABLE_PID6 | 0xF0000FD8 |
| ROMTABLE_PID7 | 0xF0000FDC |
| ROMTABLE_PID0 | 0xF0000FE0 |
| ROMTABLE_PID1 | 0xF0000FE4 |
| ROMTABLE_PID2 | 0xF0000FE8 |
| ROMTABLE_PID3 | 0xF0000FEC |
| ROMTABLE_CID0 | 0xF0000FF0 |
| ROMTABLE_CID1 | 0xF0000FF4 |
| ROMTABLE_CID2 | 0xF0000FF8 |
| ROMTABLE_CID3 | 0xF0000FFC |

17.1.1 ROMTABLE_ADDR

Link to Cortex M0 ROM Table.

Address: 0xF0000000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|------------------|---------|
| SW Access | None | | | | | | R | R |
| HW Access | None | | | | | | R | R |
| Name | None [7:2] | | | | | | FORMAT_3 2BIT | PRESENT |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|---------------------|----|----|----|-------------|----|---|---|
| SW Access | R | | | | None | | | |
| HW Access | R | | | | None | | | |
| Name | ADDR_OFFSET [15:12] | | | | None [11:8] | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|---------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | R | | | | | | | |
| Name | ADDR_OFFSET [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|---------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | R | | | | | | | |
| Name | ADDR_OFFSET [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|--|
| 31 : 12 | ADDR_OFFSET | Address offset of the Cortex-M0 ROM Table base address (0xe00f:f000) wrt. Cypress chip specific ROM Table base address (0xf000:0000). ADDR_OFFSET[19:0] = 0xe00f:f - 0xf000:0 = 0xf00f:f. Default Value: 983295 |
| 1 | FORMAT_32BIT | ROM Table format: '0': 8-bit format. '1': 32-bit format. Default Value: 1 |
| 0 | PRESENT | Entry present. Default Value: 1 |

17.1.2 ROMTABLE_DID

Device Type Identifier register.

Address: 0xF0000FCC

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | R | | | | | | | |
| Name | VALUE [7:0] | | | | | | | |

18 SAR ADC Registers

This section discusses the SAR ADC registers. It lists all the registers in mapping tables, in address order.

18.1 Register Details

| Register Name | Address |
|-----------------------------------|------------|
| SAR_CTRL | 0x403A0000 |
| SAR_SAMPLE_CTRL | 0x403A0004 |
| SAR_SAMPLE_TIME01 | 0x403A0010 |
| SAR_SAMPLE_TIME23 | 0x403A0014 |
| SAR_RANGE_THRES | 0x403A0018 |
| SAR_RANGE_COND | 0x403A001C |
| SAR_CHAN_EN | 0x403A0020 |
| SAR_START_CTRL | 0x403A0024 |
| SAR_CHAN_CONFIG0 | 0x403A0080 |
| SAR_CHAN_CONFIG1 | 0x403A0084 |
| SAR_CHAN_CONFIG2 | 0x403A0088 |
| SAR_CHAN_CONFIG3 | 0x403A008C |
| SAR_CHAN_CONFIG4 | 0x403A0090 |
| SAR_CHAN_CONFIG5 | 0x403A0094 |
| SAR_CHAN_CONFIG6 | 0x403A0098 |
| SAR_CHAN_CONFIG7 | 0x403A009C |
| SAR_CHAN_CONFIG8 | 0x403A00A0 |
| SAR_CHAN_CONFIG9 | 0x403A00A4 |
| SAR_CHAN_CONFIG10 | 0x403A00A8 |
| SAR_CHAN_CONFIG11 | 0x403A00AC |
| SAR_CHAN_CONFIG12 | 0x403A00B0 |
| SAR_CHAN_CONFIG13 | 0x403A00B4 |
| SAR_CHAN_CONFIG14 | 0x403A00B8 |
| SAR_CHAN_CONFIG15 | 0x403A00BC |
| SAR_CHAN_WORK0 | 0x403A0100 |
| SAR_CHAN_WORK1 | 0x403A0104 |
| SAR_CHAN_WORK2 | 0x403A0108 |

| Register Name | Address |
|--------------------------|------------|
| SAR_CHAN_WORK3 | 0x403A010C |
| SAR_CHAN_WORK4 | 0x403A0110 |
| SAR_CHAN_WORK5 | 0x403A0114 |
| SAR_CHAN_WORK6 | 0x403A0118 |
| SAR_CHAN_WORK7 | 0x403A011C |
| SAR_CHAN_WORK8 | 0x403A0120 |
| SAR_CHAN_WORK9 | 0x403A0124 |
| SAR_CHAN_WORK10 | 0x403A0128 |
| SAR_CHAN_WORK11 | 0x403A012C |
| SAR_CHAN_WORK12 | 0x403A0130 |
| SAR_CHAN_WORK13 | 0x403A0134 |
| SAR_CHAN_WORK14 | 0x403A0138 |
| SAR_CHAN_WORK15 | 0x403A013C |
| SAR_CHAN_RESULT0 | 0x403A0180 |
| SAR_CHAN_RESULT1 | 0x403A0184 |
| SAR_CHAN_RESULT2 | 0x403A0188 |
| SAR_CHAN_RESULT3 | 0x403A018C |
| SAR_CHAN_RESULT4 | 0x403A0190 |
| SAR_CHAN_RESULT5 | 0x403A0194 |
| SAR_CHAN_RESULT6 | 0x403A0198 |
| SAR_CHAN_RESULT7 | 0x403A019C |
| SAR_CHAN_RESULT8 | 0x403A01A0 |
| SAR_CHAN_RESULT9 | 0x403A01A4 |
| SAR_CHAN_RESULT10 | 0x403A01A8 |
| SAR_CHAN_RESULT11 | 0x403A01AC |
| SAR_CHAN_RESULT12 | 0x403A01B0 |
| SAR_CHAN_RESULT13 | 0x403A01B4 |
| SAR_CHAN_RESULT14 | 0x403A01B8 |
| SAR_CHAN_RESULT15 | 0x403A01BC |
| SAR_CHAN_WORK_VALID | 0x403A0200 |
| SAR_CHAN_RESULT_VALID | 0x403A0204 |
| SAR_STATUS | 0x403A0208 |
| SAR_AVG_STAT | 0x403A020C |
| SAR_INTR | 0x403A0210 |
| SAR_INTR_SET | 0x403A0214 |
| SAR_INTR_MASK | 0x403A0218 |
| SAR_INTR_MASKED | 0x403A021C |
| SAR_SATURATE_INTR | 0x403A0220 |
| SAR_SATURATE_INTR_SET | 0x403A0224 |
| SAR_SATURATE_INTR_MASK | 0x403A0228 |
| SAR_SATURATE_INTR_MASKED | 0x403A022C |
| SAR_RANGE_INTR | 0x403A0230 |

| Register Name | Address |
|------------------------|------------|
| SAR_RANGE_INTR_SET | 0x403A0234 |
| SAR_RANGE_INTR_MASK | 0x403A0238 |
| SAR_RANGE_INTR_MASKED | 0x403A023C |
| SAR_INTR_CAUSE | 0x403A0240 |
| SAR_INJ_CHAN_CONFIG | 0x403A0280 |
| SAR_INJ_RESULT | 0x403A0290 |
| SAR_MUX_SWITCH0 | 0x403A0300 |
| SAR_MUX_SWITCH_CLEAR0 | 0x403A0304 |
| SAR_MUX_SWITCH1 | 0x403A0308 |
| SAR_MUX_SWITCH_CLEAR1 | 0x403A030C |
| SAR_MUX_SWITCH_HW_CTRL | 0x403A0340 |
| SAR_MUX_SWITCH_STATUS | 0x403A0348 |
| SAR_PUMP_CTRL | 0x403A0380 |
| SAR_ANA_TRIM | 0x403A0F00 |

18.1.1 SAR_CTRL

Analog control register.

Address: 0x403A0000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|---------------------|----------------|---|---|------------|---|---|---|
| SW Access | RW | RW | | | None | | | |
| HW Access | R | R | | | None | | | |
| Name | VREF_BYP _CAP_EN | VREF_SEL [6:4] | | | None [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------------------|----|-----------------------------|------|----------------|----|---|------|
| SW Access | RW | | RW | None | RW | | | None |
| HW Access | R | | R | None | R | | | None |
| Name | PWR_CTRL_VREF [15:14] | | SAR_HW_ CTRL_NEG VREF | None | NEG_SEL [11:9] | | | None |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|------------------|---------------|----|----|----|
| SW Access | None | | | RW | RW | | | |
| HW Access | None | | | R | R | | | |
| Name | None [23:21] | | | BOOSTPU MP_EN | SPARE [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|---------|--------------------|----------|---------------------|------------------|------|------------------|----|
| SW Access | RW | RW | RW | RW | RW | None | RW | |
| HW Access | R | R | R | R | R | None | R | |
| Name | ENABLED | SWITCH_DI SABLE | DSI_MODE | DSI_SYNC _CONFIG | DEEPSLEE P_ON | None | ICONT_LV [25:24] | |

| Bits | Name | Description |
|------|----------------|--|
| 31 | ENABLED | Before enabling always make sure the SAR is idle (STATUS.BUSY==0) - 0: SAR IP disabled (put analog in power down and stop clocks), also can clear FW_TRIGGER and INJ_START_EN (if not tailgating) on write. - 1: SAR IP enabled. Default Value: 0 |
| 30 | SWITCH_DISABLE | Disable SAR sequencer from enabling routing switches (note DSI and firmware can always close switches independent of this control) - 0: Normal mode, SAR sequencer changes switches according to pin address in channel configurations - 1: Switches disabled, SAR sequencer does not enable any switches, it is the responsibility of the firmware or UDBs (through DSI) to set the switches to route the signal to be converted through the SARMUX Default Value: 0 |

18.1.1 SAR_CTRL (continued)

| | | |
|---------|---------------------|--|
| 29 | DSI_MODE | <p>SAR sequencer takes configuration from DSI signals (note this also has the same effect as SWITCH_DISABLE==1)</p> <ul style="list-style-type: none"> - 0: Normal mode, SAR sequencer operates according to CHAN_EN enables and CHAN_CONFIG channel configurations - 1: CHAN_EN, INJ_START_EN and channel configurations in CHAN_CONFIG and INJ_CHAN_CONFIG are ignored <p>Default Value: 0</p> |
| 28 | DSI_SYNC_CONFIG | <ul style="list-style-type: none"> - 0: bypass clock domain synchronisation of the DSI config signals. - 1: synchronize the DSI config signals to peripheral clock domain. <p>Default Value: 1</p> |
| 27 | DEEPSLEEP_ON | <ul style="list-style-type: none"> - 0: SARMUX IP disabled off during DeepSleep power mode - 1: SARMUX IP remains enabled during DeepSleep power mode (if ENABLED=1) <p>Default Value: 0</p> |
| 25 : 24 | ICONT_LV | <p>SARADC low power mode.</p> <p>Default Value: 0</p> <p>0x0: NORMAL_PWR: normal power (default), max clk_sar is 18MHz.</p> <p>0x1: HALF_PWR: 1/2 power mode, max clk_sar is 9MHz.</p> <p>0x2: MORE_PWR: 1.333 power mode, max clk_sar is 18MHz.</p> <p>0x3: QUARTER_PWR: 1/4 power mode, max clk_sar is 4.5MHz.</p> |
| 20 | BOOSTPUMP_EN | <p>SARADC internal pump: 0=disabled: pump output is VDDA, 1=enabled: pump output is boosted.</p> <p>Default Value: 0</p> |
| 19 : 16 | SPARE | <p>Spare controls, not yet designated, for late changes done with an ECO</p> <p>Default Value: 0</p> |
| 15 : 14 | PWR_CTRL_VREF | <p>VREF buffer low power mode.</p> <p>Default Value: 0</p> <p>0x0: NORMAL_PWR: normal power (default), bypass cap, max clk_sar is 18MHz.</p> <p>0x1: HALF_PWR: deprecated</p> <p>0x2: THIRD_PWR: Invalid for PSoC4A, otherwise 2X power, no bypass cap, max clk_sar is 1.8MHz</p> <p>0x3: QUARTER_PWR: deprecated</p> |
| 13 | SAR_HW_CTRL_NEGVREF | <p>Hardware control: 0=only firmware control, 1=hardware control masked by firmware setting for VREF to NEG switch.</p> <p>Default Value: 0</p> |
| 11 : 9 | NEG_SEL | <p>SARADC internal NEG selection for Single ended conversion</p> <p>Default Value: 0</p> <p>0x0: VSSA_KELVIN: NEG input of SARADC is connected to "vssa_kelvin", gives more precision around zero. Note this opens both SARADC internal switches, therefore use this value to insert a break-before-make cycle on those switches when SWITCH_DISABLE is high.</p> |

18.1.1 SAR_CTRL (continued)

| | | |
|-------|-----------------|---|
| | | 0x1: ART_VSSA: NEG input of SARADC is connected to VSSA in AROUTE close to the SARADC |
| | | 0x2: P1: NEG input of SARADC is connected to P1 pin of SARMUX |
| | | 0x3: P3: NEG input of SARADC is connected to P3 pin of SARMUX |
| | | 0x4: P5: NEG input of SARADC is connected to P5 pin of SARMUX |
| | | 0x5: P7: NEG input of SARADC is connected to P7 pin of SARMUX |
| | | 0x6: ACORE: NEG input of SARADC is connected to an ACORE in AROUTE |
| | | 0x7: VREF: NEG input of SARADC is shorted with VREF input of SARADC. |
| 7 | VREF_BYP_CAP_EN | VREF bypass cap enable for when VREF buffer is on Default Value: 0 |
| 6 : 4 | VREF_SEL | SARADC internal VREF selection. Default Value: 0 |
| | | 0x0: VREF0: VREF0 from PRB (VREF buffer on) |
| | | 0x1: VREF1: VREF1 from PRB (VREF buffer on) |
| | | 0x2: VREF2: VREF2 from PRB (VREF buffer on) |
| | | 0x3: VREF_AROUTE: VREF from AROUTE (VREF buffer on) |
| | | 0x4: VBGR: 1.024V from BandGap (VREF buffer on) |
| | | 0x5: VREF_EXT: External precision Vref direct from a pin (low impedance path). |
| | | 0x6: VDDA_DIV_2: Vdda/2 (VREF buffer on) |
| | | 0x7: VDDA: Vdda. |

18.1.2 SAR_SAMPLE_CTRL

Sample control register.

Address: 0x403A0004

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-----------|---------------|---|---|---------------------|---------------------|------------|----------------|
| SW Access | RW | RW | | | RW | RW | RW | RW |
| HW Access | R | R | | | R | R | R | R |
| Name | AVG_SHIFT | AVG_CNT [6:4] | | | DIFFERENTIAL_SIGNED | SINGLE_ENDED_SIGNED | LEFT_ALIGN | SUB_RESOLUTION |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

|-----------|--------------|----|----|----|------------------|-------------------|----------------|------------|
| SW Access | None | | | | RW | RW | RW | RW |
| HW Access | None | | | | R | R | R | R |
| Name | None [23:20] | | | | DSI_SYNC_TRIGGER | DSI_TRIGGER_LEVEL | DSI_TRIGGER_EN | CONTINUOUS |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|----------------|--------------|----|----|----|----|----|----|
| SW Access | RW | None | | | | | | |
| HW Access | R | None | | | | | | |
| Name | EOS_DSI_OUT_EN | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------------------|---|
| 31 | EOS_DSI_OUT_EN | Enable to output EOS_INTR to DSI. When enabled each time EOS_INTR is set by the hardware also a pulse is send on the dsi_eos signal. Default Value: 0 |
| 19 | DSI_SYNC_TRIGGER | - 0: bypass clock domain synchronisation of the DSI trigger signal. - 1: synchronize the DSI trigger signal to the SAR clock domain, if needed an edge detect is done in the peripheral clock domain. Default Value: 1 |
| 18 | DSI_TRIGGER_LEVEL | - 0: DSI trigger signal is a pulse input, a positive edge detected on the DSI trigger signal triggers a new scan. - 1: DSI trigger signal is a level input, as long as the DSI trigger signal remains high the SAR will do continuous scans. Default Value: 0 |
| 17 | DSI_TRIGGER_EN | - 0: firmware trigger only: disable hardware (DSI) trigger. - 1: enable hardware (DSI) trigger (e.g. from TCPWM, GPIO or UDB). Default Value: 0 |

18.1.2 SAR_SAMPLE_CTRL (continued)

| | | |
|-------|---------------------|---|
| 16 | CONTINUOUS | <p>- 0: Wait for next FW_TRIGGER (one shot) or hardware (DSI) trigger (e.g. from TPWM for periodic triggering) before scanning enabled channels.</p> <p>- 1: Continuously scan enabled channels, ignore triggers.</p> <p>Default Value: 0</p> |
| 7 | AVG_SHIFT | <p>Averaging shifting: after averaging the result is shifted right to fit in the sample resolution.</p> <p>Default Value: 0</p> |
| 6 : 4 | AVG_CNT | <p>Averaging Count for channels that have over sampling enabled (AVG_EN). A channel will be sampled back to back $(1 < (AVG_CNT + 1)) = [2..256]$ times before the result is stored and the next enabled channel is sampled (1st order accumulate and dump filter).</p> <p>If shifting is not enabled (AVG_SHIFT=0) then the result is forced to shift right so that it fits in 16 bits, so right shift is done by $\max(0, AVG_CNT - 3)$.</p> <p>Default Value: 0</p> |
| 3 | DIFFERENTIAL_SIGNED | <p>Output data from a differential conversion as a signed value</p> <p>Default Value: 1</p> <p>0x0: UNSIGNED: result data is unsigned (zero extended if needed)</p> <p>0x1: SIGNED: Default: result data is signed (sign extended if needed)</p> |
| 2 | SINGLE_ENDED_SIGNED | <p>Output data from a single ended conversion as a signed value</p> <p>Default Value: 0</p> <p>0x0: UNSIGNED: Default: result data is unsigned (zero extended if needed)</p> <p>0x1: SIGNED: result data is signed (sign extended if needed)</p> |
| 1 | LEFT_ALIGN | <p>Left align data in data[15:0], default data is right aligned in data[11:0], with sign extension to 16 bits if the channel is differential.</p> <p>Default Value: 0</p> |
| 0 | SUB_RESOLUTION | <p>Conversion resolution for channels that have sub-resolution enabled (RESOLUTION=1) (otherwise resolution is 12-bit).</p> <p>Default Value: 0</p> <p>0x0: 8B: 8-bit.</p> <p>0x1: 10B: 10-bit.</p> |

18.1.3 SAR_SAMPLE_TIME01

Sample time specification ST0 and ST1

Address: 0x403A0010

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------------|--|
| 0 | FW_TRIGGER | When firmware writes a 1 here it will trigger the next scan of enabled channels, hardware clears this bit when the scan started with this trigger is completed. If scanning continuously the trigger is ignored and hardware clears this bit after the next scan is done. This bit is also cleared when the SAR is disabled. Default Value: 0 |

18.1.9 SAR_CHAN_CONFIG0

Channel configuration register.

Address: 0x403A0080

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------|-----------------|---|---|------|----------------|---|---|
| SW Access | None | RW | | | None | RW | | |
| HW Access | None | R | | | None | R | | |
| Name | None | PORT_ADDR [6:4] | | | None | PIN_ADDR [2:0] | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|--------------|----|-------------------------|----|------|--------|------------|-----------------|
| SW Access | None | | RW | | None | RW | RW | RW |
| HW Access | None | | R | | None | R | R | R |
| Name | None [15:14] | | SAMPLE_TIME_SEL [13:12] | | None | AVG_EN | RESOLUTION | DIFFERENTIAL_EN |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------|--------------|----|----|----|----|----|----|
| SW Access | RW | None | | | | | | |
| HW Access | R | None | | | | | | |
| Name | DSI_OUT_EN | None [30:24] | | | | | | |

| Bits | Name | Description |
|---------|-----------------|---|
| 31 | DSI_OUT_EN | DSI data output enable for this channel. - 0: the conversion result for this channel is only stored in the channel data register and the corresponding CHAN_DATA_VALID bit is set. - 1: the conversion result for this channel is stored in the channel data register and the corresponding CHAN_DATA_VALID bit is set. The same data (same formatting), together with the channel number, is sent out on the DSI communication channel for processing in UDBs. Default Value: 0 |
| 13 : 12 | SAMPLE_TIME_SEL | Sample time select: select which of the 4 global sample times to use for this channel Default Value: 0 |
| 10 | AVG_EN | Averaging enable for this channel. If set the AVG_CNT and AVG_SHIFT settings are used for sampling the addressed pin(s) Default Value: 0 |
| 9 | RESOLUTION | Resolution for this channel. When AVG_EN is set this bit is ignored and always a 12-bit resolution is used for this channel. Default Value: 0 |

18.1.9 SAR_CHAN_CONFIG0 (continued)

| | | |
|-------|-----------------|---|
| | | 0x0: MAXRES: The maximum resolution is used for this channel . |
| | | 0x1: SUBRES: The resolution specified by SUB_RESOLUTION in the SAR_SAMPLE_CTRL register is used for this channel. |
| 8 | DIFFERENTIAL_EN | Differential enable for this channel. - 0: The voltage on the addressed pin is measured (Single-ended) and the resulting value is stored in the corresponding data register. - 1: The differential voltage on the addressed pin pair is measured and the resulting value is stored in the corresponding data register. (PIN_ADDR[0] is ignored). Default Value: 0 |
| 6 : 4 | PORT_ADDR | Address of the port that contains the pin to be sampled by this channel. Default Value: 0 0x0: SARMUX: SARMUX pins. 0x1: CTB0: CTB0 0x2: CTB1: CTB1 0x3: CTB2: CTB2 0x4: CTB3: CTB3 0x5: AROUTE_VIRT2: AROUTE virtual port2 (VPORT2) 0x6: AROUTE_VIRT1: AROUTE virtual port1 (VPORT1) 0x7: SARMUX_VIRT: SARMUX virtual port (VPORT0) |
| 2 : 0 | PIN_ADDR | Address of the pin to be sampled by this channel. If differential is enabled then PIN_ADDR[0] is ignored and considered to be 0, i.e. PIN_ADDR points to the even pin of a pin pair. For differential the even pin of the pair is connected to Vplus and the odd pin of the pair is connected to Vminus. Default Value: 0 |

18.1.10 SAR_CHAN_CONFIG1

Channel configuration register.

| Name | DSI_OUT_EN | None [30:24] | | | | | | |

| Bits | Name | Description |
|---------|-----------------|---|
| 31 | DSI_OUT_EN | DSI data output enable for this channel. - 0: the conversion result for this channel is only stored in the channel data register and the corresponding CHAN_DATA_VALID bit is set. - 1: the conversion result for this channel is stored in the channel data register and the corresponding CHAN_DATA_VALID bit is set. The same data (same formatting), together with the channel number, is sent out on the DSI communication channel for processing in UDBs. Default Value: 0 |
| 13 : 12 | SAMPLE_TIME_SEL | Sample time select: select which of the 4 global sample times to use for this channel Default Value: 0 |
| 10 | AVG_EN | Averaging enable for this channel. If set the AVG_CNT and AVG_SHIFT settings are used for sampling the addressed pin(s) Default Value: 0 |
| 9 | RESOLUTION | Resolution for this channel. When AVG_EN is set this bit is ignored and always a 12-bit resolution is used for this channel. Default Value: 0 |

18.1.11 SAR_CHAN_CONFIG2 (continued)

| | | |
|-------|-----------------|---|
| | | 0x0: MAXRES: The maximum resolution is used for this channel . |
| | | 0x1: SUBRES: The resolution specified by SUB_RESOLUTION in the SAR_SAMPLE_CTRL register is used for this channel. |
| 8 | DIFFERENTIAL_EN | Differential enable for this channel. - 0: The voltage on the addressed pin is measured (Single-ended) and the resulting value is stored in the corresponding data register. - 1: The differential voltage on the addressed pin pair is measured and the resulting value is stored in the corresponding data register. (PIN_ADDR[0] is ignored). Default Value: 0 |
| 6 : 4 | PORT_ADDR | Address of the port that contains the pin to be sampled by this channel. Default Value: 0 0x0: SARMUX: SARMUX pins. 0x1: CTB0: CTB0 0x2: CTB1: CTB1 0x3: CTB2: CTB2 0x4: CTB3: CTB3 0x5: AROUTE_VIRT2: AROUTE virtual port2 (VPORT2) 0x6: AROUTE_VIRT1: AROUTE virtual port1 (VPORT1) 0x7: SARMUX_VIRT: SARMUX virtual port (VPORT0) |
| 2 : 0 | PIN_ADDR | Address of the pin to be sampled by this channel. If differential is enabled then PIN_ADDR[0] is ignored and considered to be 0, i.e. PIN_ADDR points to the even pin of a pin pair. For differential the even pin of the pair is connected to Vplus and the odd pin of the pair is connected to Vminus. Default Value: 0 |

| Name | DSI_OUT_EN | None [30:24] | | | | | | |

| Bits | Name | Description |
|---------|-----------------|---|
| 31 | DSI_OUT_EN | DSI data output enable for this channel. - 0: the conversion result for this channel is only stored in the channel data register and the corresponding CHAN_DATA_VALID bit is set. - 1: the conversion result for this channel is stored in the channel data register and the corresponding CHAN_DATA_VALID bit is set. The same data (same formatting), together with the channel number, is sent out on the DSI communication channel for processing in UDBs. Default Value: 0 |
| 13 : 12 | SAMPLE_TIME_SEL | Sample time select: select which of the 4 global sample times to use for this channel Default Value: 0 |
| 10 | AVG_EN | Averaging enable for this channel. If set the AVG_CNT and AVG_SHIFT settings are used for sampling the addressed pin(s) Default Value: 0 |
| 9 | RESOLUTION | Resolution for this channel. When AVG_EN is set this bit is ignored and always a 12-bit resolution is used for this channel. Default Value: 0 |

18.1.18 SAR_CHAN_CONFIG9 (continued)

| | | |
|-------|-----------------|---|
| | | 0x0: MAXRES: The maximum resolution is used for this channel . |
| | | 0x1: SUBRES: The resolution specified by SUB_RESOLUTION in the SAR_SAMPLE_CTRL register is used for this channel. |
| 8 | DIFFERENTIAL_EN | Differential enable for this channel. - 0: The voltage on the addressed pin is measured (Single-ended) and the resulting value is stored in the corresponding data register. - 1: The differential voltage on the addressed pin pair is measured and the resulting value is stored in the corresponding data register. (PIN_ADDR[0] is ignored). Default Value: 0 |
| 6 : 4 | PORT_ADDR | Address of the port that contains the pin to be sampled by this channel. Default Value: 0 0x0: SARMUX: SARMUX pins. 0x1: CTB0: CTB0 0x2: CTB1: CTB1 0x3: CTB2: CTB2 0x4: CTB3: CTB3 0x5: AROUTE_VIRT2: AROUTE virtual port2 (VPORT2) 0x6: AROUTE_VIRT1: AROUTE virtual port1 (VPORT1) 0x7: SARMUX_VIRT: SARMUX virtual port (VPORT0) |
| 2 : 0 | PIN_ADDR | Address of the pin to be sampled by this channel. If differential is enabled then PIN_ADDR[0] is ignored and considered to be 0, i.e. PIN_ADDR points to the even pin of a pin pair. For differential the even pin of the pair is connected to Vplus and the odd pin of the pair is connected to Vminus. Default Value: 0 |

| | | 0x0: MAXRES: The maximum resolution is used for this channel . |
| | | 0x1: SUBRES: The resolution specified by SUB_RESOLUTION in the SAR_SAMPLE_CTRL register is used for this channel. |
| 8 | DIFFERENTIAL_EN | Differential enable for this channel. - 0: The voltage on the addressed pin is measured (Single-ended) and the resulting value is stored in the corresponding data register. - 1: The differential voltage on the addressed pin pair is measured and the resulting value is stored in the corresponding data register. (PIN_ADDR[0] is ignored). Default Value: 0 |
| 6 : 4 | PORT_ADDR | Address of the port that contains the pin to be sampled by this channel. Default Value: 0 0x0: SARMUX: SARMUX pins. 0x1: CTB0: CTB0 0x2: CTB1: CTB1 0x3: CTB2: CTB2 0x4: CTB3: CTB3 0x5: AROUTE_VIRT2: AROUTE virtual port2 (VPORT2) 0x6: AROUTE_VIRT1: AROUTE virtual port1 (VPORT1) 0x7: SARMUX_VIRT: SARMUX virtual port (VPORT0) |
| 2 : 0 | PIN_ADDR | Address of the pin to be sampled by this channel. If differential is enabled then PIN_ADDR[0] is ignored and considered to be 0, i.e. PIN_ADDR points to the even pin of a pin pair. For differential the even pin of the pair is connected to Vplus and the odd pin of the pair is connected to Vminus. Default Value: 0 |

| SW Access | R | | | | | | | |
| HW Access | RW | | | | | | | |
| Name | CHAN_RESULT_VALID [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|-------------------|---|
| 15 : 0 | CHAN_RESULT_VALID | If set the corresponding RESULT data is valid, i.e. was sampled during the last scan. Default Value: 0 |

18.1.59 SAR_STATUS

Current status of internal SAR registers (mostly for debug)

Address: 0x403A0208

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|----------------|---|---|---|---|
| SW Access | None | | | R | | | | |
| HW Access | None | | | W | | | | |
| Name | None [7:5] | | | CUR_CHAN [4:0] | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------|-------------|--------------|----|----|----|----|----|
| SW Access | R | R | None | | | | | |
| HW Access | W | W | None | | | | | |
| Name | BUSY | SW_VREF_NEG | None [29:24] | | | | | |

| Bits | Name | Description |
|-------|-------------|---|
| 31 | BUSY | If high then the SAR is busy with a conversion. This bit is always high when CONTINUOUS is set. Firmware should wait for this bit to be low before putting the SAR in power down. Default Value: 0 |
| 30 | SW_VREF_NEG | the current switch status, including DSI and sequencer controls, of the switch in the SARADC that shorts NEG with VREF input (see NEG_SEL). Default Value: 0 |
| 4 : 0 | CUR_CHAN | current channel being sampled (channel 16 indicates the injection channel), only valid if BUSY. Default Value: 0 |

18.1.60 SAR_AVG_STAT

Current averaging status (for debug)

Address: 0x403A020C

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | CUR_AVG_ACCU [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|---------------------|----|----|----|----|----|---|---|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | CUR_AVG_ACCU [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----------------------|----|----|----|
| SW Access | None | | | | R | | | |
| HW Access | None | | | | W | | | |
| Name | None [23:20] | | | | CUR_AVG_ACCU [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|---------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | CUR_AVG_CNT [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|--|
| 31 : 24 | CUR_AVG_CNT | the current value of the averaging counter. Note that the value shown is updated after the sampling time and therefore runs ahead of the accumulator update. Default Value: 0 |
| 19 : 0 | CUR_AVG_ACCU | the current value of the averaging accumulator Default Value: 0 |

18.1.61 SAR_INTR

Interrupt request register.

Address: 0x403A0210

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------------|----------------|-------------------|--------------|--------------------|-------------------|---------------|----------|
| SW Access | RW1C | RW1C | RW1C | RW1C | RW1C | RW1C | RW1C | RW1C |
| HW Access | RW1S | RW1S | RW1S | RW1S | RW1S | RW1S | RW1S | RW1S |
| Name | INJ_COLLISION_INTR | INJ_RANGE_INTR | INJ_SATURATE_INTR | INJ_EOC_INTR | DSI_COLLISION_INTR | FW_COLLISION_INTR | OVERFLOW_INTR | EOS_INTR |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|--------------------|---|
| 7 | INJ_COLLISION_INTR | Injection Collision Interrupt: hardware sets this interrupt when the injection trigger signal is asserted (INJ_START_EN==1 && INJ_TAILGATING==0) while the SAR is BUSY. Raising this interrupt is delayed to when the sampling of the injection channel has been completed, i.e. not when the preceeding scan with which this trigger collided is completed. When this interrupt is set it implies that the injection channel was sampled later than was intended. Write with '1' to clear bit. Default Value: 0 |
| 6 | INJ_RANGE_INTR | Injection Range detect Interrupt: hardware sets this interrupt if the injection conversion result (after averaging) met the condition specified by the SAR_RANGE registers. Write with '1' to clear bit. Default Value: 0 |
| 5 | INJ_SATURATE_INTR | Injection Saturation Interrupt: hardware sets this interrupt if an injection conversion result (before averaging) is either 0x000 or 0xFFFF (for 12-bit resolution), this is an indication that the ADC likely saturated. Write with '1' to clear bit. Default Value: 0 |
| 4 | INJ_EOC_INTR | Injection End of Conversion Interrupt: hardware sets this interrupt after completing the conversion for the injection channel (irrespective of if tailgating was used). Write with '1' to clear bit. Default Value: 0 |

18.1.61 SAR_INTR (continued)

| | | |
|---|--------------------|--|
| 3 | DSI_COLLISION_INTR | DSI Collision Interrupt: hardware sets this interrupt when the DSI trigger signal is asserted while the SAR is BUSY. Raising this interrupt is delayed to when the scan caused by the DSI trigger has been completed, i.e. not when the preceeding scan with which this trigger collided is completed. When this interrupt is set it implies that the channels were sampled later than was intended (jitter). Write with '1' to clear bit. Default Value: 0 |
| 2 | FW_COLLISION_INTR | Firmware Collision Interrupt: hardware sets this interrupt when FW_TRIGGER is asserted while the SAR is BUSY. Raising this interrupt is delayed to when the scan caused by the FW_TRIGGER has been completed, i.e. not when the preceeding scan with which this trigger collided is completed. When this interrupt is set it implies that the channels were sampled later than was intended (jitter). Write with '1' to clear bit. Default Value: 0 |
| 1 | OVERFLOW_INTR | Overflow Interrupt: hardware sets this interrupt when it sets a new EOS_INTR while that bit was not yet cleared by the firmware. Write with '1' to clear bit. Default Value: 0 |
| 0 | EOS_INTR | End Of Scan Interrupt: hardware sets this interrupt after completing a scan of all the enabled channels. Write with '1' to clear bit. Default Value: 0 |

18.1.62 SAR_INTR_SET

Interrupt set request register

Address: 0x403A0214

Retention: Not Retained

|-----------|--------------|----------------|--------------|----|----|----|----|----|
| SW Access | RW1S | RW | None | | | | | |
| HW Access | RW1C | R | None | | | | | |
| Name | INJ_START_EN | INJ_TAILGATING | None [29:24] | | | | | |

| Bits | Name | Description |
|---------|---------------------|--|
| 31 | INJ_START_EN | Set by firmware to enable the injection channel. If INJ_TAILGATING is not set this bit also functions as trigger for this channel. Cleared by hardware after this channel has been sampled (i.e. this channel is always one shot even if CONTINUOUS is set). Also cleared if the SAR is disabled. Default Value: 0 |
| 30 | INJ_TAILGATING | Injection channel tailgating. - 0: no tailgating for this channel, SAR is immediately triggered when the INJ_START_EN bit is set. - 1: injection channel tailgating. The addressed pin is sampled after the next trigger and after all enabled channels have been scanned. Default Value: 0 |
| 13 : 12 | INJ_SAMPLE_TIME_SEL | Injection sample time select: select which of the 4 global sample times to use for this channel Default Value: 0 |
| 10 | INJ_AVG_EN | Averaging enable for this channel. If set the AVG_CNT and AVG_SHIFT settings are used for sampling the addressed pin(s) Default Value: 0 |

18.1.74 SAR_INJ_CHAN_CONFIG (continued)

| | | |
|-------|---------------------|--|
| 9 | INJ_RESOLUTION | <p>Resolution for this channel. Default Value: 0</p> <p>0x0: 12B: 12-bit resolution is used for this channel.</p> <p>0x1: SUBRES: The resolution specified by SUB_RESOLUTION in the SAR_SAMPLE_CTRL register is used for this channel.</p> |
| 8 | INJ_DIFFERENTIAL_EN | <p>Differential enable for this channel.</p> <ul style="list-style-type: none"> - 0: The voltage on the addressed pin is measured (Single-ended) and the resulting value is stored in the corresponding data register. - 1: The differential voltage on the addressed pin pair is measured and the resulting value is stored in the corresponding data register. (INJ_PIN_ADDR[0] is ignored). <p>Default Value: 0</p> |
| 6 : 4 | INJ_PORT_ADDR | <p>Address of the port that contains the pin to be sampled by this channel. Default Value: 0</p> <p>0x0: SARMUX: SARMUX pins.</p> <p>0x1: CTB0: CTB0</p> <p>0x2: CTB1: CTB1</p> <p>0x3: CTB2: CTB2</p> <p>0x4: CTB3: CTB3</p> <p>0x6: AROUTE_VIRT: AROUTE virtual port</p> <p>0x7: SARMUX_VIRT: SARMUX virtual port</p> |
| 2 : 0 | INJ_PIN_ADDR | <p>Address of the pin to be sampled by this injection channel. If differential is enabled then PIN_ADDR[0] is ignored and considered to be 0, i.e. PIN_ADDR points to the even pin of a pin pair. Default Value: 0</p> |

18.1.75 SAR_INJ_RESULT

Injection channel result register

Address: 0x403A0290

Retention: Not Retained

19 SCB Registers

This section discusses the SCB registers. It lists all the registers in mapping tables, in address order.

19.1 Register Details

| Register Name | Address |
|------------------------|------------|
| SCB0_CTRL | 0x40240000 |
| SCB0_STATUS | 0x40240004 |
| SCB0_SPI_CTRL | 0x40240020 |
| SCB0_SPI_STATUS | 0x40240024 |
| SCB0_UART_CTRL | 0x40240040 |
| SCB0_UART_TX_CTRL | 0x40240044 |
| SCB0_UART_RX_CTRL | 0x40240048 |
| SCB0_UART_RX_STATUS | 0x4024004C |
| SCB0_UART_FLOW_CTRL | 0x40240050 |
| SCB0_I2C_CTRL | 0x40240060 |
| SCB0_I2C_STATUS | 0x40240064 |
| SCB0_I2C_M_CMD | 0x40240068 |
| SCB0_I2C_S_CMD | 0x4024006C |
| SCB0_I2C_CFG | 0x40240070 |
| SCB0_TX_CTRL | 0x40240200 |
| SCB0_TX_FIFO_CTRL | 0x40240204 |
| SCB0_TX_FIFO_STATUS | 0x40240208 |
| SCB0_TX_FIFO_WR | 0x40240240 |
| SCB0_RX_CTRL | 0x40240300 |
| SCB0_RX_FIFO_CTRL | 0x40240304 |
| SCB0_RX_FIFO_STATUS | 0x40240308 |
| SCB0_RX_MATCH | 0x40240310 |
| SCB0_RX_FIFO_RD | 0x40240340 |
| SCB0_RX_FIFO_RD_SILENT | 0x40240344 |
| SCB0_EZ_DATA0 | 0x40240400 |
| SCB0_EZ_DATA1 | 0x40240404 |
| SCB0_EZ_DATA2 | 0x40240408 |

| Register Name | Address |
|-------------------------|------------|
| SCB0_EZ_DATA3 | 0x4024040C |
| SCB0_EZ_DATA4 | 0x40240410 |
| SCB0_EZ_DATA5 | 0x40240414 |
| SCB0_EZ_DATA6 | 0x40240418 |
| SCB0_EZ_DATA7 | 0x4024041C |
| SCB0_EZ_DATA8 | 0x40240420 |
| SCB0_EZ_DATA9 | 0x40240424 |
| SCB0_EZ_DATA10 | 0x40240428 |
| SCB0_EZ_DATA11 | 0x4024042C |
| SCB0_EZ_DATA12 | 0x40240430 |
| SCB0_EZ_DATA13 | 0x40240434 |
| SCB0_EZ_DATA14 | 0x40240438 |
| SCB0_EZ_DATA15 | 0x4024043C |
| SCB0_EZ_DATA16 | 0x40240440 |
| SCB0_EZ_DATA17 | 0x40240444 |
| SCB0_EZ_DATA18 | 0x40240448 |
| SCB0_EZ_DATA19 | 0x4024044C |
| SCB0_EZ_DATA20 | 0x40240450 |
| SCB0_EZ_DATA21 | 0x40240454 |
| SCB0_EZ_DATA22 | 0x40240458 |
| SCB0_EZ_DATA23 | 0x4024045C |
| SCB0_EZ_DATA24 | 0x40240460 |
| SCB0_EZ_DATA25 | 0x40240464 |
| SCB0_EZ_DATA26 | 0x40240468 |
| SCB0_EZ_DATA27 | 0x4024046C |
| SCB0_EZ_DATA28 | 0x40240470 |
| SCB0_EZ_DATA29 | 0x40240474 |
| SCB0_EZ_DATA30 | 0x40240478 |
| SCB0_EZ_DATA31 | 0x4024047C |
| SCB0_INTR_CAUSE | 0x40240E00 |
| SCB0_INTR_I2C_EC | 0x40240E80 |
| SCB0_INTR_I2C_EC_MASK | 0x40240E88 |
| SCB0_INTR_I2C_EC_MASKED | 0x40240E8C |

19.1.1 SCB0_CTRL

Generic control register.

Address: 0x40240000

Retention: Retained

|---------|---------|--|
| 31 | ENABLED | <p>IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows:</p> <ul style="list-style-type: none"> - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. <p>When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0</p> |
| 25 : 24 | MODE | <p>Mode of operation (3: Reserved) Default Value: 3</p> <p>0x0: I2C: Inter-Integrated Circuits (I2C) mode.</p> |

19.1.1 SCB0_CTRL (continued)

0x1: SPI:

Serial Peripheral Interface (SPI) mode.

0x2: UART:

Universal Asynchronous Receiver/Transmitter (UART) mode.

| | | |
|----|-------------|---|
| 17 | BLOCK | <p>Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK is 1') or not ('BLOCK is 0'). IF BLOCK is 0 and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX.</p> <p>Default Value: 0</p> |
| 16 | ADDR_ACCEPT | <p>Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0').</p> <p>In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers.</p> <p>In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO.</p> <p>Default Value: 0</p> |
| 11 | BYTE_MODE | <p>Determines the number of bits per FIFO data element:</p> <p>'0': 16-bit FIFO data elements.</p> <p>'1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7].</p> <p>Default Value: 0</p> |
| 10 | EZ_MODE | <p>Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first.</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |
| 9 | EC_OP_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |

19.1.1 SCB0_CTRL (continued)

| | | |
|---|------------|---|
| 8 | EC_AM_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p> |
|---|------------|---|

19.1.1 SCB0_CTRL (continued)

3 : 0 OVS

Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.

In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):

- MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps.
- MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps.
- MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps.
- MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps.

The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].

In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 - IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 - IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 - IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 - IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 - IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 - IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

Low power mode, OVS field values (with the required IP clock frequency):

- 0: 16 times oversampling.
 - IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
- 1: 32 times oversampling.
 - IP clock frequency of 32*57.6 KHz for 57.6 Kbps.
- 2: 48 times oversampling.
 - IP clock frequency of 48*38.4 KHz for 38.4 Kbps.
- 3: 96 times oversampling.
 - IP clock frequency of 96*19.2 KHz for 19.2 Kbps.
- 4: 192 times oversampling.
 - IP clock frequency of 192*9.6 KHz for 9.6 Kbps.
- 5: 768 times oversampling.
 - IP clock frequency of 768*2.4 KHz for 2.4 Kbps.
- 6: 1536 times oversampling.
 - IP clock frequency of 1536*1.2 KHz for 1.2 Kbps.
- all other values are not used in low power mode.

Default Value: 15

19.1.2 SCB0_STATUS

Generic status register.

Address: 0x40240004

| Bits | Name | Description |
|---------|--------------|---|
| 31 | MASTER_MODE | Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0 |
| 27 : 26 | SLAVE_SELECT | Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. Default Value: 0 |
| 25 : 24 | MODE | Submode of SPI operation (3: Reserved). Default Value: 3 |

19.1.3 SCB0_SPI_CTRL (continued)

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

| | | |
|----|-----------------|--|
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0 |
| 11 | SSEL_POLARITY3 | Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0 |
| 10 | SSEL_POLARITY2 | Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0 |
| 9 | SSEL_POLARITY1 | Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0 |
| 8 | SSEL_POLARITY0 | Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0 |
| 5 | SCLK_CONTINUOUS | Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0 |

19.1.3 SCB0_SPI_CTRL (continued)

| | | |
|---|------------------|---|
| 4 | LATE_MISO_SAMPLE | <p>Changes the SCLK edge on which MISO is captured. Only used in master mode.</p> <p>When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK).</p> <p>When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master.</p> <p>Default Value: 0</p> |
| 3 | CPOL | <p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is 0: SCLK is 0 when not transmitting data. - CPOL is 1: SCLK is 1 when not transmitting data. <p>Default Value: 0</p> |
| 2 | CPHA | <p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is 0, CPHA is 0: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is 0, CPHA is 1: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is 1, CPHA is 0: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is 1, CPHA is 1: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p> |
| 1 | SELECT_PRECEDE | <p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p> |
| 0 | CONTINUOUS | <p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are sent out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data+G65 frames are sent out with slave deselection.</p> <p>Default Value: 0</p> |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|---|
| 23 : 16 | BASE_EZ_ADDR | SPI base EZ address. Address as provided by a SPI write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 15 : 8 | CURR_EZ_ADDR | SPI current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when SPI_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 1 | SPI_EC_BUSY | Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined |
| 0 | BUS_BUSY | SPI bus is busy. The bus is considered busy ('1') during an ongoing transaction. For Motorola and National submodes, the busy bit is '1', when the slave selection (low active) is activated. For TI submode, the busy bit is '1' from the time the preceding/coinciding slave select (high active) is activated for the first transmitted data frame, till the last MOSI/MISO bit of the last data frame is transmitted. Default Value: Undefined |

| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|-------------|--|
| 19 : 16 | BREAK_WIDTH | <p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of $10+1 = 11$ bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p> |

19.1.7 SCB0_UART_RX_CTRL (continued)

| | | |
|----|-----------------------|--|
| 13 | SKIP_START | <p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p> |
| 12 | LIN_MODE | <p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p> |
| 10 | MP_MODE | <p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p> |
| 9 | DROP_ON_FRAME_ERR OR | <p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p> |
| 8 | DROP_ON_PARITY_ERR OR | <p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p> |
| 6 | POLARITY | <p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p> |
| 5 | PARITY_ENABLED | <p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p> |
| 4 | PARITY | <p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p> |

19.1.7 SCB0_UART_RX_CTRL (continued)

| | | |
|-------|-----------|--|
| 2 : 0 | STOP_BITS | <p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p> |

| Name | MASTER_MODE | SLAVE_MODE | None [29:24] | | | | | |

| Bits | Name | Description |
|------|-----------------------|--|
| 31 | MASTER_MODE | Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0 |
| 30 | SLAVE_MODE | Slave mode enabled ('1') or not ('0'). Default Value: 0 |
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0 |
| 15 | S_NOT_READY_DATA_NACK | For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1 |

19.1.10 SCB0_I2C_CTRL (continued)

| | | |
|-------|-----------------------|--|
| 14 | S_NOT_READY_ADDR_NACK | <p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p> |
| 13 | S_READY_DATA_ACK | <p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 12 | S_READY_ADDR_ACK | <p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 11 | S_GENERAL_IGNORE | <p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p> |
| 9 | M_NOT_READY_DATA_NACK | <p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p> |
| 8 | M_READY_DATA_ACK | <p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p> |
| 7 : 4 | LOW_PHASE_OVS | <p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p> |

19.1.10 SCB0_I2C_CTRL (continued)

| | | |
|-------|----------------|---|
| 3 : 0 | HIGH_PHASE_OVS | <p>Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 peripheral clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be ≥ 6 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF high time should be ≥ 5 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p> |
|-------|----------------|---|

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|---|
| 23 : 16 | BASE_EZ_ADDR | I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 15 : 8 | CURR_EZ_ADDR | I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 5 | M_READ | I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |
| 4 | S_READ | I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |

19.1.11 SCB0_I2C_STATUS (continued)

| | | |
|---|-------------|---|
| 1 | I2C_EC_BUSY | Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined |
| 0 | BUS_BUSY | <p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0</p> |

19.1.12 SCB0_I2C_M_CMD

I2C master command register.

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-----------------|---|
| 4 | M_STOP | When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. This command has a higher priority than I2C_M_CMD.M_START: in situations where both a STOP and a REPEATED START could be transmitted, M_STOP takes precedence over M_START. Default Value: 0 |
| 3 | M_NACK | When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 2 | M_ACK | When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 1 | M_START_ON_IDLE | When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'. Default Value: 0 |

19.1.12 SCB0_I2C_M_CMD (continued)

| | | |
|---|---------|---|
| 0 | M_START | <p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p> |
|---|---------|---|

19.1.13 SCB0_I2C_S_CMD

I2C slave command register.

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|---------------|---|
| 17 | FREEZE | When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0 |
| 16 | CLEAR | When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0 |
| 3 : 0 | TRIGGER_LEVEL | Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event is generated. Default Value: 0 |

19.1.17 SCB0_TX_FIFO_STATUS

Transmitter FIFO status register.

Address: 0x40240208

Retention: Not Retained

| HW Access | None | | | | W | | | |
| Name | None [31:28] | | | | WR_PTR [27:24] | | | |

| Bits | Name | Description |
|---------|----------|--|
| 27 : 24 | WR_PTR | FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0 |
| 19 : 16 | RD_PTR | FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0 |
| 15 | SR_VALID | Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0 |
| 4 : 0 | USED | Amount of enties in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR. Default Value: 0 |

19.1.18 SCB0_TX_FIFO_WR

Transmitter FIFO write register.

Address: 0x40240240

Retention: Not Retained

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|------------|--|
| 9 | MEDIAN | Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, its requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0 |
| 8 | MSB_FIRST | Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1 |
| 3 : 0 | DATA_WIDTH | Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7 |

19.1.20 SCB0_RX_FIFO_CTRL

Receiver FIFO control register.

Address: 0x40240304

Retention: Retained

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|------|--|
| 23 : 16 | MASK | Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0 |
| 7 : 0 | ADDR | Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). Default Value: 0 |

19.1.23 SCB0_RX_FIFO_RD

Receiver FIFO read register.

Address: 0x40240340

Retention: Not Retained

| Bits | Name | Description |
|--------|------|---|
| 15 : 0 | DATA | <p>Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used.</p> <p>This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register.</p> <p>A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined</p> |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------------------|---|
| 11 | SPI_BUS_ERROR | SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |
| 10 | SPI_EZ_STOP | SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0 |
| 9 | SPI_EZ_WRITE_STOP | SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0 |
| 8 | I2C_BUS_ERROR | I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |

19.1.68 SCB0_INTR_S (continued)

| | | |
|---|----------------|--|
| 7 | I2C_GENERAL | <p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 6 | I2C_ADDR_MATCH | <p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 5 | I2C_START | <p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p> |
| 4 | I2C_STOP | <p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p> |
| 3 | I2C_WRITE_STOP | <p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p> |
| 2 | I2C_ACK | <p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 1 | I2C_NACK | <p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 0 | I2C_ARB_LOST | <p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p> |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------------|---|
| 10 | UART_ARB_LOST | UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 9 | UART_DONE | UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 8 | UART_NACK | UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 7 | BLOCKED | AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0 |

19.1.72 SCB0_INTR_TX (continued)

| | | |
|---|-----------|--|
| 6 | UNDERFLOW | <p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 4 | EMPTY | <p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 1 | NOT_FULL | <p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 0 | TRIGGER | <p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p> |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|--------------|---|
| 11 | BREAK_DETECT | Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 10 | BAUD_DETECT | LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |

19.1.76 SCB0_INTR_RX (continued)

| | | |
|---|--------------|---|
| 9 | PARITY_ERROR | <p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p> |
| 8 | FRAME_ERROR | <p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p> |
| 7 | BLOCKED | <p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p> |
| 6 | UNDERFLOW | <p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 3 | FULL | <p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODE:</p> <p>BYTE_MODE is '0': # entries == FF_DATA_NR/2.</p> <p>BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 2 | NOT_EMPTY | <p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 0 | TRIGGER | <p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |

| Bits | Name | Description |
|---------|---------|--|
| 31 | ENABLED | <p>IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows:</p> <ul style="list-style-type: none"> - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. <p>When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0</p> |
| 25 : 24 | MODE | <p>Mode of operation (3: Reserved) Default Value: 3</p> <p>0x0: I2C: Inter-Integrated Circuits (I2C) mode.</p> |

19.1.80 SCB1_CTRL (continued)

0x1: SPI:

Serial Peripheral Interface (SPI) mode.

0x2: UART:

Universal Asynchronous Receiver/Transmitter (UART) mode.

| | | |
|----|-------------|---|
| 17 | BLOCK | <p>Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK is 1') or not ('BLOCK is 0'). If BLOCK is 0 and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX.</p> <p>Default Value: 0</p> |
| 16 | ADDR_ACCEPT | <p>Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0').</p> <p>In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers.</p> <p>In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO.</p> <p>Default Value: 0</p> |
| 11 | BYTE_MODE | <p>Determines the number of bits per FIFO data element:</p> <p>'0': 16-bit FIFO data elements.</p> <p>'1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7].</p> <p>Default Value: 0</p> |
| 10 | EZ_MODE | <p>Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first.</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |
| 9 | EC_OP_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |

19.1.80 SCB1_CTRL (continued)

| | | |
|-------|------------|--|
| 8 | EC_AM_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p> |
| 3 : 0 | OVS | <p>Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.</p> <p>In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.</p> <p>In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):</p> <ul style="list-style-type: none"> - MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock ≥ 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps. - MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock ≥ 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps. - MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock ≥ 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps. - MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock ≥ 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps. <p>The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.</p> <p>In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].</p> <p>In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. IP clock frequency of 16*57.6 KHz for 57.6 Kbps. IP clock frequency of 16*38.4 KHz for 38.4 Kbps. IP clock frequency of 16*19.2 KHz for 19.2 Kbps. IP clock frequency of 16*9.6 KHz for 9.6 Kbps. IP clock frequency of 16*2.4 KHz for 2.4 Kbps. IP clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. <p>In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bit rates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. IP clock frequency of 16*57.6 KHz for 57.6 Kbps. IP clock frequency of 16*38.4 KHz for 38.4 Kbps. IP clock frequency of 16*19.2 KHz for 19.2 Kbps. IP clock frequency of 16*9.6 KHz for 9.6 Kbps. IP clock frequency of 16*2.4 KHz for 2.4 Kbps. IP clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. <p>Low power mode, OVS field values (with the required IP clock frequency):</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. - 1: 32 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 32*57.6 KHz for 57.6 Kbps. - 2: 48 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 48*38.4 KHz for 38.4 Kbps. - 3: 96 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 96*19.2 KHz for 19.2 Kbps. - 4: 192 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 192*9.6 KHz for 9.6 Kbps. - 5: 768 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 768*2.4 KHz for 2.4 Kbps. - 6: 1536 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 1536*1.2 KHz for 1.2 Kbps. - all other values are not used in low power mode. <p>Default Value: 15</p> |

| Bits | Name | Description |
|------|---------|---|
| 0 | EC_BUSY | Indicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined |

| Name | MASTER_MODE | None [30:28] | | | SLAVE_SELECT [27:26] | | MODE [25:24] | |

| Bits | Name | Description |
|---------|--------------|---|
| 31 | MASTER_MODE | Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0 |
| 27 : 26 | SLAVE_SELECT | Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. Default Value: 0 |
| 25 : 24 | MODE | Submode of SPI operation (3: Reserved). Default Value: 3 |

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

| | | |
|----|------------------|--|
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0 |
| 11 | SSEL_POLARITY3 | Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0 |
| 10 | SSEL_POLARITY2 | Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0 |
| 9 | SSEL_POLARITY1 | Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0 |
| 8 | SSEL_POLARITY0 | Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0 |
| 5 | SCLK_CONTINUOUS | Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0 |
| 4 | LATE_MISO_SAMPLE | Changes the SCLK edge on which MISO is captured. Only used in master mode. When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK). When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master. Default Value: 0 |

19.1.82 SCB1_SPI_CTRL (continued)

| | | |
|---|----------------|---|
| 3 | CPOL | <p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is 0: SCLK is 0 when not transmitting data. - CPOL is 1: SCLK is 1 when not transmitting data. <p>Default Value: 0</p> |
| 2 | CPHA | <p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is 0, CPHA is 0: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is 0, CPHA is 1: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is 1, CPHA is 0: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is 1, CPHA is 1: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p> |
| 1 | SELECT_PRECEDE | <p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p> |
| 0 | CONTINUOUS | <p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data+G65 frames are send out with slave deselection.</p> <p>Default Value: 0</p> |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|-------------|--|
| 19 : 16 | BREAK_WIDTH | <p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of $10+1 = 11$ bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p> |

19.1.86 SCB1_UART_RX_CTRL (continued)

| | | |
|----|-----------------------|--|
| 13 | SKIP_START | <p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p> |
| 12 | LIN_MODE | <p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p> |
| 10 | MP_MODE | <p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p> |
| 9 | DROP_ON_FRAME_ERR OR | <p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p> |
| 8 | DROP_ON_PARITY_ERR OR | <p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p> |
| 6 | POLARITY | <p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p> |
| 5 | PARITY_ENABLED | <p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p> |
| 4 | PARITY | <p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p> |

19.1.86 SCB1_UART_RX_CTRL (continued)

| | | |
|-------|-----------|--|
| 2 : 0 | STOP_BITS | <p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p> |

| Name | MASTER_MODE | SLAVE_MODE | None [29:24] | | | | | |

| Bits | Name | Description |
|------|-----------------------|--|
| 31 | MASTER_MODE | Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0 |
| 30 | SLAVE_MODE | Slave mode enabled ('1') or not ('0'). Default Value: 0 |
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0 |
| 15 | S_NOT_READY_DATA_NACK | For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1 |

19.1.89 SCB1_I2C_CTRL (continued)

| | | |
|-------|-----------------------|--|
| 14 | S_NOT_READY_ADDR_NACK | <p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p> |
| 13 | S_READY_DATA_ACK | <p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 12 | S_READY_ADDR_ACK | <p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 11 | S_GENERAL_IGNORE | <p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p> |
| 9 | M_NOT_READY_DATA_NACK | <p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p> |
| 8 | M_READY_DATA_ACK | <p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p> |
| 7 : 4 | LOW_PHASE_OVS | <p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p> |

19.1.89 SCB1_I2C_CTRL (continued)

| | | |
|-------|----------------|---|
| 3 : 0 | HIGH_PHASE_OVS | <p>Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 peripheral clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be ≥ 6 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF high time should be ≥ 5 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p> |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|---|
| 23 : 16 | BASE_EZ_ADDR | I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 15 : 8 | CURR_EZ_ADDR | I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 5 | M_READ | I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |
| 4 | S_READ | I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |

19.1.90 SCB1_I2C_STATUS (continued)

| | | |
|---|-------------|---|
| 1 | I2C_EC_BUSY | Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined |
| 0 | BUS_BUSY | <p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0</p> |

19.1.91 SCB1_I2C_M_CMD

I2C master command register.

Address: 0x40250068

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|--------|--------|-------|-----------------|---------|

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-----------------|---|
| 4 | M_STOP | When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. This command has a higher priority than I2C_M_CMD.M_START: in situations where both a STOP and a REPEATED START could be transmitted, M_STOP takes precedence over M_START. Default Value: 0 |
| 3 | M_NACK | When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 2 | M_ACK | When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 1 | M_START_ON_IDLE | When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'. Default Value: 0 |

19.1.91 SCB1_I2C_M_CMD (continued)

| | | |
|---|---------|---|
| 0 | M_START | <p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p> |
|---|---------|---|

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|---------------|---|
| 17 | FREEZE | When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0 |
| 16 | CLEAR | When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0 |
| 3 : 0 | TRIGGER_LEVEL | Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event is generated. Default Value: 0 |

19.1.96 SCB1_TX_FIFO_STATUS

Transmitter FIFO status register.

Address: 0x40250208

Retention: Not Retained

| HW Access | None | | | | W | | | |
| Name | None [31:28] | | | | WR_PTR [27:24] | | | |

| Bits | Name | Description |
|---------|----------|--|
| 27 : 24 | WR_PTR | FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0 |
| 19 : 16 | RD_PTR | FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0 |
| 15 | SR_VALID | Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0 |
| 4 : 0 | USED | Amount of enties in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR. Default Value: 0 |

19.1.97 SCB1_TX_FIFO_WR

Transmitter FIFO write register.

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|------------|--|
| 9 | MEDIAN | Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, its requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0 |
| 8 | MSB_FIRST | Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1 |
| 3 : 0 | DATA_WIDTH | Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7 |

19.1.99 SCB1_RX_FIFO_CTRL

Receiver FIFO control register.

Address: 0x40250304

Retention: Retained

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|------|--|
| 23 : 16 | MASK | Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0 |
| 7 : 0 | ADDR | Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). Default Value: 0 |

19.1.102 SCB1_RX_FIFO_RD

Receiver FIFO read register.

Address: 0x40250340

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|---|
| 15 : 0 | DATA | <p>Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used.</p> <p>This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register.</p> <p>A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined</p> |

19.1.103 SCB1_RX_FIFO_RD_SILENT

Receiver FIFO read register.

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|---------|---|
| 7 : 0 | EZ_DATA | Data in buffer memory location. In case of a blocked discarded access, a read access returns 0xffff:ffff and a write access is dropped. Note that the 0xffff:ffff value is unique (not a legal EZ_DATA byte value) and can be detected by SW. Note that a discarded write access can be detected by reading back the written value. Default Value: Undefined |

19.1.136 SCB1_INTR_CAUSE

Active clocked interrupt signal register

Address: 0x40250E00

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|--------|--------|----|----|---|---|

| Bits | Name | Description |
|------|-------------------|---|
| 11 | SPI_BUS_ERROR | SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |
| 10 | SPI_EZ_STOP | SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0 |
| 9 | SPI_EZ_WRITE_STOP | SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0 |
| 8 | I2C_BUS_ERROR | I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |

19.1.147 SCB1_INTR_S (continued)

| | | |
|---|----------------|--|
| 7 | I2C_GENERAL | <p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 6 | I2C_ADDR_MATCH | <p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 5 | I2C_START | <p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p> |
| 4 | I2C_STOP | <p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p> |
| 3 | I2C_WRITE_STOP | <p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p> |
| 2 | I2C_ACK | <p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 1 | I2C_NACK | <p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 0 | I2C_ARB_LOST | <p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p> |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------------|---|
| 10 | UART_ARB_LOST | UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 9 | UART_DONE | UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 8 | UART_NACK | UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 7 | BLOCKED | AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0 |

19.1.151 SCB1_INTR_TX (continued)

| | | |
|---|-----------|--|
| 6 | UNDERFLOW | <p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 4 | EMPTY | <p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 1 | NOT_FULL | <p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 0 | TRIGGER | <p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p> |

| Bits | Name | Description |
|------|--------------|---|
| 11 | BREAK_DETECT | Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 10 | BAUD_DETECT | LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |

19.1.155 SCB1_INTR_RX (continued)

| | | |
|---|--------------|---|
| 9 | PARITY_ERROR | <p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p> |
| 8 | FRAME_ERROR | <p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p> |
| 7 | BLOCKED | <p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p> |
| 6 | UNDERFLOW | <p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 3 | FULL | <p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODE:</p> <p>BYTE_MODE is '0': # entries == FF_DATA_NR/2.</p> <p>BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 2 | NOT_EMPTY | <p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 0 | TRIGGER | <p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |

| Bits | Name | Description |
|---------|---------|--|
| 31 | ENABLED | <p>IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows:</p> <ul style="list-style-type: none"> - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. <p>When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0</p> |
| 25 : 24 | MODE | <p>Mode of operation (3: Reserved) Default Value: 3</p> <p>0x0: I2C: Inter-Integrated Circuits (I2C) mode.</p> |

19.1.159 SCB2_CTRL (continued)

0x1: SPI:

Serial Peripheral Interface (SPI) mode.

0x2: UART:

Universal Asynchronous Receiver/Transmitter (UART) mode.

| | | |
|----|-------------|---|
| 17 | BLOCK | <p>Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK is 1') or not ('BLOCK is 0'). If BLOCK is 0 and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX.</p> <p>Default Value: 0</p> |
| 16 | ADDR_ACCEPT | <p>Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0').</p> <p>In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers.</p> <p>In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO.</p> <p>Default Value: 0</p> |
| 11 | BYTE_MODE | <p>Determines the number of bits per FIFO data element:</p> <p>'0': 16-bit FIFO data elements.</p> <p>'1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7].</p> <p>Default Value: 0</p> |
| 10 | EZ_MODE | <p>Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first.</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |
| 9 | EC_OP_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |

19.1.159 SCB2_CTRL (continued)

| | | |
|-------|------------|--|
| 8 | EC_AM_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p> |
| 3 : 0 | OVS | <p>Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.</p> <p>In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.</p> <p>In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):</p> <ul style="list-style-type: none"> - MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock ≥ 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps. - MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock ≥ 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps. - MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock ≥ 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps. - MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock ≥ 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps. <p>The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.</p> <p>In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].</p> <p>In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. IP clock frequency of 16*57.6 KHz for 57.6 Kbps. IP clock frequency of 16*38.4 KHz for 38.4 Kbps. IP clock frequency of 16*19.2 KHz for 19.2 Kbps. IP clock frequency of 16*9.6 KHz for 9.6 Kbps. IP clock frequency of 16*2.4 KHz for 2.4 Kbps. IP clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. <p>In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bit rates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. IP clock frequency of 16*57.6 KHz for 57.6 Kbps. IP clock frequency of 16*38.4 KHz for 38.4 Kbps. IP clock frequency of 16*19.2 KHz for 19.2 Kbps. IP clock frequency of 16*9.6 KHz for 9.6 Kbps. IP clock frequency of 16*2.4 KHz for 2.4 Kbps. | Bits | Name | Description |
|------|---------|---|
| 0 | EC_BUSY | Indicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined |

| Name | MASTER_MODE | None [30:28] | | | SLAVE_SELECT [27:26] | | MODE [25:24] | |

| Bits | Name | Description |
|---------|--------------|---|
| 31 | MASTER_MODE | Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0 |
| 27 : 26 | SLAVE_SELECT | Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. Default Value: 0 |
| 25 : 24 | MODE | Submode of SPI operation (3: Reserved). Default Value: 3 |

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

| | | |
|----|------------------|--|
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0 |
| 11 | SSEL_POLARITY3 | Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0 |
| 10 | SSEL_POLARITY2 | Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0 |
| 9 | SSEL_POLARITY1 | Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0 |
| 8 | SSEL_POLARITY0 | Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0 |
| 5 | SCLK_CONTINUOUS | Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0 |
| 4 | LATE_MISO_SAMPLE | Changes the SCLK edge on which MISO is captured. Only used in master mode. When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK). When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master. Default Value: 0 |

19.1.161 SCB2_SPI_CTRL (continued)

| | | |
|---|----------------|---|
| 3 | CPOL | <p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is 0: SCLK is 0 when not transmitting data. - CPOL is 1: SCLK is 1 when not transmitting data. <p>Default Value: 0</p> |
| 2 | CPHA | <p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is 0, CPHA is 0: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is 0, CPHA is 1: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is 1, CPHA is 0: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is 1, CPHA is 1: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p> |
| 1 | SELECT_PRECEDE | <p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p> |
| 0 | CONTINUOUS | <p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data+G65 frames are send out with slave deselection.</p> <p>Default Value: 0</p> |

| Name | None [23:20] | | | | BREAK_WIDTH [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|-------------|--|
| 19 : 16 | BREAK_WIDTH | <p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of $10+1 = 11$ bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p> |

19.1.165 SCB2_UART_RX_CTRL (continued)

| | | |
|----|-----------------------|--|
| 13 | SKIP_START | <p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p> |
| 12 | LIN_MODE | <p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p> |
| 10 | MP_MODE | <p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p> |
| 9 | DROP_ON_FRAME_ERR OR | <p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p> |
| 8 | DROP_ON_PARITY_ERR OR | <p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p> |
| 6 | POLARITY | <p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p> |
| 5 | PARITY_ENABLED | <p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p> |
| 4 | PARITY | <p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p> |

19.1.165 SCB2_UART_RX_CTRL (continued)

| | | |
|-------|-----------|--|
| 2 : 0 | STOP_BITS | <p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p> |
|-------|-----------|--|

19.1.166 SCB2_UART_RX_STATUS

UART receiver status register.

| Name | MASTER_MODE | SLAVE_MODE | None [29:24] | | | | | |

| Bits | Name | Description |
|------|-----------------------|--|
| 31 | MASTER_MODE | Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0 |
| 30 | SLAVE_MODE | Slave mode enabled ('1') or not ('0'). Default Value: 0 |
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0 |
| 15 | S_NOT_READY_DATA_NACK | For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1 |

19.1.168 SCB2_I2C_CTRL (continued)

| | | |
|-------|-----------------------|--|
| 14 | S_NOT_READY_ADDR_NACK | <p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p> |
| 13 | S_READY_DATA_ACK | <p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 12 | S_READY_ADDR_ACK | <p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 11 | S_GENERAL_IGNORE | <p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p> |
| 9 | M_NOT_READY_DATA_NACK | <p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p> |
| 8 | M_READY_DATA_ACK | <p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p> |
| 7 : 4 | LOW_PHASE_OVS | <p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p> |

19.1.168 SCB2_I2C_CTRL (continued)

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|---|
| 23 : 16 | BASE_EZ_ADDR | I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 15 : 8 | CURR_EZ_ADDR | I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 5 | M_READ | I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |
| 4 | S_READ | I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |

19.1.169 SCB2_I2C_STATUS (continued)

| | | |
|---|-------------|---|
| 1 | I2C_EC_BUSY | Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined |
| 0 | BUS_BUSY | <p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0</p> |

19.1.170 SCB2_I2C_M_CMD

I2C master command register.

Address: 0x40260068

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-----------------|---|
| 4 | M_STOP | When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. This command has a higher priority than I2C_M_CMD.M_START: in situations where both a STOP and a REPEATED START could be transmitted, M_STOP takes precedence over M_START. Default Value: 0 |
| 3 | M_NACK | When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 2 | M_ACK | When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 1 | M_START_ON_IDLE | When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'. Default Value: 0 |

19.1.170 SCB2_I2C_M_CMD (continued)

| | | |
|---|---------|---|
| 0 | M_START | <p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'.</p> <p>Default Value: 0</p> |
|---|---------|---|

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|---------------|---|
| 17 | FREEZE | When '1', hardware reads from the transmitter FIFO do not remove FIFO entries. Freeze will not advance the TX FIFO read pointer. Default Value: 0 |
| 16 | CLEAR | When '1', the transmitter FIFO and transmitter shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0 |
| 3 : 0 | TRIGGER_LEVEL | Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event is generated. Default Value: 0 |

19.1.175 SCB2_TX_FIFO_STATUS

Transmitter FIFO status register.

Address: 0x40260208

| Name | None [31:28] | | | | WR_PTR [27:24] | | | |

| Bits | Name | Description |
|---------|----------|--|
| 27 : 24 | WR_PTR | FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0 |
| 19 : 16 | RD_PTR | FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0 |
| 15 | SR_VALID | Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0 |
| 4 : 0 | USED | Amount of enties in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR. Default Value: 0 |

19.1.176 SCB2_TX_FIFO_WR

| Bits | Name | Description |
|-------|------------|--|
| 9 | MEDIAN | Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, its requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0 |
| 8 | MSB_FIRST | Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1 |
| 3 : 0 | DATA_WIDTH | Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7 |

19.1.178 SCB2_RX_FIFO_CTRL

Receiver FIFO control register.

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|------|--|
| 23 : 16 | MASK | Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0 |
| 7 : 0 | ADDR | Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). Default Value: 0 |

19.1.181 SCB2_RX_FIFO_RD

Receiver FIFO read register.

Address: 0x40260340

Retention: Not Retained

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|---|
| 15 : 0 | DATA | <p>Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used.</p> <p>This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register.</p> <p>A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined</p> |

19.1.182 SCB2_RX_FIFO_RD_SILENT

| Bits | Name | Description |
|------|---------------|---|
| 3 | EZ_READ_STOP | <p>STOP detection after a read transfer occurred. Activated on the end of a read transfer (I2C STOP). This event is an indication that a buffer memory location has been read from.</p> <p>Only available for a slave request with an address match, in EZ and CMD_RESP modes, when EC_OP is '1'. Default Value: 0</p> |
| 2 | EZ_WRITE_STOP | <p>STOP detection after a write transfer occurred. Activated on the end of a write transfer (I2C STOP). This event is an indication that a buffer memory location has been written to. For EZ mode: a transfer that only writes the base address does NOT activate this event.</p> <p>Only available for a slave request with an address match, in EZ and CMD_RESP modes, when EC_OP is '1'. Default Value: 0</p> |
| 1 | EZ_STOP | <p>STOP detection. Activated on the end of a every transfer (I2C STOP).</p> <p>Only available for a slave request with an address match, in EZ and CMD_RESP modes, when EC_OP is '1'. Default Value: 0</p> |

19.1.216 SCB2_INTR_I2C_EC (continued)

| | | |
|---|---------|---|
| 0 | WAKE_UP | Wake up request. Active on incoming slave request (with address match). Only used when EC_AM is '1'. Default Value: 0 |
|---|---------|---|

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------------------|---|
| 11 | SPI_BUS_ERROR | SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |
| 10 | SPI_EZ_STOP | SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0 |
| 9 | SPI_EZ_WRITE_STOP | SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0 |
| 8 | I2C_BUS_ERROR | I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |

19.1.226 SCB2_INTR_S (continued)

| | | |
|---|----------------|--|
| 7 | I2C_GENERAL | <p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 6 | I2C_ADDR_MATCH | <p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 5 | I2C_START | <p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p> |
| 4 | I2C_STOP | <p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p> |
| 3 | I2C_WRITE_STOP | <p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p> |
| 2 | I2C_ACK | <p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 1 | I2C_NACK | <p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 0 | I2C_ARB_LOST | <p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p> |

19.1.227 SCB2_INTR_S_SET

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------------|---|
| 10 | UART_ARB_LOST | UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 9 | UART_DONE | UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 8 | UART_NACK | UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 7 | BLOCKED | AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0 |

19.1.230 SCB2_INTR_TX (continued)

| | | |
|---|-----------|--|
| 6 | UNDERFLOW | <p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 4 | EMPTY | <p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 1 | NOT_FULL | <p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 0 | TRIGGER | <p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p> |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|--------------|---|
| 11 | BREAK_DETECT | Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 10 | BAUD_DETECT | LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |

19.1.234 SCB2_INTR_RX (continued)

| | | |
|---|--------------|---|
| 9 | PARITY_ERROR | <p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p> |
| 8 | FRAME_ERROR | <p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p> |
| 7 | BLOCKED | <p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p> |
| 6 | UNDERFLOW | <p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 3 | FULL | <p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODET:</p> <p>BYTE_MODE is '0': # entries == FF_DATA_NR/2.</p> <p>BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 2 | NOT_EMPTY | <p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 0 | TRIGGER | <p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |

| Bits | Name | Description |
|---------|---------|---|
| 31 | ENABLED | IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows: - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0 |
| 25 : 24 | MODE | Mode of operation (3: Reserved) Default Value: 3 0x0: I2C: Inter-Integrated Circuits (I2C) mode. |

19.1.238 SCB3_CTRL (continued)

0x1: SPI:

Serial Peripheral Interface (SPI) mode.

0x2: UART:

Universal Asynchronous Receiver/Transmitter (UART) mode.

| | | |
|----|-------------|---|
| 17 | BLOCK | <p>Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK is 1') or not ('BLOCK is 0'). If BLOCK is 0 and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and INTR_RX.</p> <p>Default Value: 0</p> |
| 16 | ADDR_ACCEPT | <p>Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0').</p> <p>In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when ADDR_ACCEPT is '1' for both I2C read and write transfers.</p> <p>In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO.</p> <p>Default Value: 0</p> |
| 11 | BYTE_MODE | <p>Determines the number of bits per FIFO data element:</p> <p>'0': 16-bit FIFO data elements.</p> <p>'1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_CTRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7].</p> <p>Default Value: 0</p> |
| 10 | EZ_MODE | <p>Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames not separated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first.</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |
| 9 | EC_OP_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).</p> <p>In UART mode this field should be '0'.</p> <p>Default Value: 0</p> |

19.1.238 SCB3_CTRL (continued)

| | | |
|-------|------------|--|
| 8 | EC_AM_MODE | <p>Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.</p> <p>In UART mode this field should be '0'. Default Value: 0</p> |
| 3 : 0 | OVS | <p>Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.</p> <p>In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.</p> <p>In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):</p> <ul style="list-style-type: none"> - MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps. - MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps. - MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps. - MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps. <p>The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.</p> <p>In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].</p> <p>In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. IP clock frequency of 16*57.6 KHz for 57.6 Kbps. IP clock frequency of 16*38.4 KHz for 38.4 Kbps. IP clock frequency of 16*19.2 KHz for 19.2 Kbps. IP clock frequency of 16*9.6 KHz for 9.6 Kbps. IP clock frequency of 16*2.4 KHz for 2.4 Kbps. IP clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. <p>In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bit rates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. IP clock frequency of 16*57.6 KHz for 57.6 Kbps. IP clock frequency of 16*38.4 KHz for 38.4 Kbps. IP clock frequency of 16*19.2 KHz for 19.2 Kbps. IP clock frequency of 16*9.6 KHz for 9.6 Kbps. IP clock frequency of 16*2.4 KHz for 2.4 Kbps. IP clock frequency of 16*1.2 KHz for 1.2 Kbps. - all other values are not used in normal mode. <p>Low power mode, OVS field values (with the required IP clock frequency):</p> <ul style="list-style-type: none"> - 0: 16 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 16*115.2 KHz for 115.2 Kbps. - 1: 32 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 32*57.6 KHz for 57.6 Kbps. - 2: 48 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 48*38.4 KHz for 38.4 Kbps. - 3: 96 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 96*19.2 KHz for 19.2 Kbps. - 4: 192 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 192*9.6 KHz for 9.6 Kbps. - 5: 768 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 768*2.4 KHz for 2.4 Kbps. - 6: 1536 times oversampling. <ul style="list-style-type: none"> IP clock frequency of 1536*1.2 KHz for 1.2 Kbps. - all other values are not used in low power mode. <p>Default Value: 15</p> |

19.1.239 SCB3_STATUS (continued)

| Name | MASTER_MODE | None [30:28] | | | SLAVE_SELECT [27:26] | | MODE [25:24] | |

| Bits | Name | Description |
|---------|--------------|---|
| 31 | MASTER_MODE | Master ('1') or slave ('0') mode. In master mode, transmission will commence on availability of data frames in the TX FIFO. In slave mode, when selected and there is no data frame in the TX FIFO, the slave will transmit all '1's. In both master and slave modes, received data frames will be lost if the RX FIFO is full. Default Value: 0 |
| 27 : 26 | SLAVE_SELECT | Selects one of the four outgoing SPI slave select signals: - 0: Slave 0, SPI_SELECT[0]. - 1: Slave 1, SPI_SELECT[1]. - 2: Slave 2, SPI_SELECT[2]. - 3: Slave 3, SPI_SELECT[3]. Only used in master mode. The IP should be disabled when changes are made to this field. Default Value: 0 |
| 25 : 24 | MODE | Submode of SPI operation (3: Reserved). Default Value: 3 |

0x0: SPI_MOTOROLA:

SPI Motorola submode. In master mode, when not transmitting data (SELECT is inactive), SCLK is stable at CPOL. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

0x1: SPI_TI:

SPI Texas Instruments submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive; i.e. no pulse is generated.

0x2: SPI_NS:

SPI National Semiconductors submode. In master mode, when not transmitting data, SCLK is stable at '0'. In slave mode, when not selected, SCLK is ignored; i.e. it can be either stable or clocking. In master mode, when there is no data to transmit (TX FIFO is empty), SELECT is inactive.

| | | |
|----|------------------|--|
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only used in master mode. Not used in National Semiconductors submode. '0': the SPI master MISO line "spi_miso_in" is connected to the SPI MISO pin. '1': the SPI master MISO line "spi_miso_in" is connected to the SPI master MOSI line "spi_mosi_out". In other words, in loopback mode the SPI master receives on MISO what it transmits on MOSI. Default Value: 0 |
| 11 | SSEL_POLARITY3 | Slave select polarity. SSEL_POLARITY3 applies to the outgoing SPI slave select signal 3 (master mode). Default Value: 0 |
| 10 | SSEL_POLARITY2 | Slave select polarity. SSEL_POLARITY2 applies to the outgoing SPI slave select signal 2 (master mode). Default Value: 0 |
| 9 | SSEL_POLARITY1 | Slave select polarity. SSEL_POLARITY1 applies to the outgoing SPI slave select signal 1 (master mode). Default Value: 0 |
| 8 | SSEL_POLARITY0 | Slave select polarity. SSEL_POLARITY0 applies to the outgoing SPI slave select signal 0 (master mode) and to the incoming SPI slave select signal (slave mode). For Motorola and National Semiconductors submodes: '0': slave select is low/'0' active. '1': slave select is high/'1' active. For Texas Instruments submode: '0': high/'1' active precede/coincide pulse. '1': low/'0' active precede/coincide pulse. Default Value: 0 |
| 5 | SCLK_CONTINUOUS | Only applicable in master mode. '0': SCLK is generated, when the SPI master is enabled and data is transmitted. '1': SCLK is generated, when the SPI master is enabled. This mode is useful for slave devices that use SCLK for functional operation other than just SPI functionality. Default Value: 0 |
| 4 | LATE_MISO_SAMPLE | Changes the SCLK edge on which MISO is captured. Only used in master mode. When '0', the default applies (for Motorola as determined by CPOL and CPHA, for Texas Instruments on the falling edge of SCLK and for National Semiconductors on the rising edge of SCLK). When '1', the alternate clock edge is used (which comes half a SPI SCLK period later). Late sampling addresses the round trip delay associated with transmitting SCLK from the master to the slave and transmitting MISO from the slave to the master. Default Value: 0 |

19.1.240 SCB3_SPI_CTRL (continued)

| | | |
|---|----------------|---|
| 3 | CPOL | <p>Indicates the clock polarity. Only used in SPI Motorola submode. This field, together with the CPHA field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - CPOL is 0: SCLK is 0 when not transmitting data. - CPOL is 1: SCLK is 1 when not transmitting data. <p>Default Value: 0</p> |
| 2 | CPHA | <p>Only applicable in SPI Motorola submode. Indicates the clock phase. This field, together with the CPOL field, indicates when MOSI data is driven and MISO data is captured:</p> <ul style="list-style-type: none"> - Motorola mode 0. CPOL is 0, CPHA is 0: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. - Motorola mode 1. CPOL is 0, CPHA is 1: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 2. CPOL is 1, CPHA is 0: MOSI is driven on a rising edge of SCLK. MISO is captured on a falling edge of SCLK. - Motorola mode 3. CPOL is 1, CPHA is 1: MOSI is driven on a falling edge of SCLK. MISO is captured on a rising edge of SCLK. <p>Default Value: 0</p> |
| 1 | SELECT_PRECEDE | <p>Only used in SPI Texas Instruments' submode.</p> <p>When '1', the data frame start indication is a pulse on the SELECT line that precedes the transfer of the first data frame bit.</p> <p>When '0', the data frame start indication is a pulse on the SELECT line that coincides with the transfer of the first data frame bit.</p> <p>Default Value: 0</p> |
| 0 | CONTINUOUS | <p>Continuous SPI data transfers enabled ('1') or not ('0'). This field is used in master mode. In slave mode, both continuous and non-continuous SPI data transfers are supported independent of this field.</p> <p>When continuous transfers are enabled individual data frame transfers are not necessarily separated by slave deselection (as indicated by the level or pulse on the SELECT line): if the TX FIFO has multiple data frames, data frames are send out without slave deselection.</p> <p>When continuous transfers are not enabled individual data frame transfers are always separated by slave deselection: independent of the availability of TX FIFO data frames, data+G65 frames are send out with slave deselection.</p> <p>Default Value: 0</p> |

| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|---|
| 23 : 16 | BASE_EZ_ADDR | SPI base EZ address. Address as provided by a SPI write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 15 : 8 | CURR_EZ_ADDR | SPI current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when SPI_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 1 | SPI_EC_BUSY | Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined |

| | | |
|---|----------|--|
| 0 | BUS_BUSY | <p>SPI bus is busy. The bus is considered busy ('1') during an ongoing transaction. For Motorola and National submodes, the busy bit is '1', when the slave selection (low active) is activated. For TI submode, the busy bit is '1' from the time the preceding/coinciding slave select (high active) is activated for the first transmitted data frame, till the last MOSI/MISO bit of the last data frame is transmitted.</p> <p>Default Value: Undefined</p> |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|-------------|--|
| 19 : 16 | BREAK_WIDTH | <p>Break width. BREAK_WIDTH + 1 is the minimum width in bit periods of a break. During a break the transmitted/received line value is '0'. This feature is useful for standard UART submode and LIN submode ("break field" detection). Once, the break is detected, the INTR_RX.BREAK_DETECT bit is set to '1'. Note that break detection precedes baud rate detection, which is used to synchronize/refine the receiver clock to the transmitter clock. As a result, break detection operates with an unsynchronized/unrefined receiver clock. Therefore, the receiver's definition of a bit period is imprecise and the setting of this field should take this imprecision into account. The LIN standard also accounts for this imprecision: a LIN start bit followed by 8 data bits allows for up to 9 consecutive '0' bit periods during regular transmission, whereas the LIN break detection should be at least 13 consecutive '0' bit periods. This provides for a margin of 4 bit periods. Therefore, the default value of this field is set to 10, representing a minimal break field with of $10+1 = 11$ bit periods; a value in between the 9 consecutive bit periods of a regular transmission and the 13 consecutive bit periods of a break field. This provides for slight imprecisions of the receiver clock wrt. the transmitter clock. There should not be a need to program this field to any value other than its default value.</p> <p>Default Value: 10</p> |

19.1.244 SCB3_UART_RX_CTRL (continued)

| | | |
|----|-----------------------|--|
| 13 | SKIP_START | <p>Only applicable in standard UART submode. When '1', the receiver skips start bit detection for the first received data frame. Instead, it synchronizes on the first received data frame bit, which should be a '1'. This functionality is intended for wake up from DeepSleep when receiving a data frame. The transition from idle ('1') to START ('0') on the RX line is used to wake up the CPU. The transition detection (and the associated wake up functionality) is performed by the GPIO2 IP. The woken up CPU will enable the SCB's UART receiver functionality. Once enabled, it is assumed that the START bit is ongoing (the CPU wakeup and SCB enable time should be less than the START bit period). The SCB will synchronize to a '0' to '1' transition, which indicates the first data frame bit is received (first data frame bit should be '1'). After synchronization to the first data frame bit, the SCB will resume normal UART functionality: subsequent data frames will be synchronized on the receipt of a START bit.</p> <p>Default Value: 0</p> |
| 12 | LIN_MODE | <p>Only applicable in standard UART submode. When '1', the receiver performs break detection and baud rate detection on the incoming data. First, break detection counts the amount of bit periods that have a line value of '0'. BREAK_WIDTH specifies the minum required amount of bit periods. Successful break detection sets the INTR_RX.BREAK_DETECT interrupt cause to '1'. Second, baud rate detection counts the amount of peripheral clock periods that are use to receive the synchronization byte (0x55; least significant bit first). The count is available through UART_RX_STATUS.BR_COUNTER. Successful baud rate detection sets the INTR_RX.BAUD_DETECT interrupt cause to '1' (BR_COUNTER is reliable). This functionality is used to synchronize/refine the receiver clock to the transmitter clock. The receiver software can use the BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte.</p> <p>Default Value: 0</p> |
| 10 | MP_MODE | <p>Multi-processor mode. When '1', multi-processor mode is enabled. In this mode, RX_CTRL.DATA_WIDTH should indicate a 9-bit data frame. In multi-processor mode, the 9th received bit of a data frame separates addresses (bit is '1') from data (bit is '0'). A received address is matched with RX_MATCH.DATA and RX_MATCH.MASK. In the case of a match, subsequent received data are sent to the RX FIFO. In the case of NO match, subsequent received data are dropped.</p> <p>Default Value: 0</p> |
| 9 | DROP_ON_FRAME_ERR OR | <p>Behaviour when an error is detected in a start or stop period. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost.</p> <p>Default Value: 0</p> |
| 8 | DROP_ON_PARITY_ERR OR | <p>Behaviour when a parity check fails. When '0', received data is send to the RX FIFO. When '1', received data is dropped and lost. Only applicable in standard UART and SmartCard submodes (negatively acknowledged SmartCard data frames may be dropped with this field).</p> <p>Default Value: 0</p> |
| 6 | POLARITY | <p>Inverts incoming RX line signal "uart_rx_in". Inversion is after local loopback. This functionality is intended for IrDA receiver functionality.</p> <p>Default Value: 0</p> |
| 5 | PARITY_ENABLED | <p>Parity checking enabled ('1') or not ('0'). Only applicable in standard UART submode. In SmartCard submode, parity checking is always enabled through hardware. In IrDA submode, parity checking is always disabled through hardware.</p> <p>Default Value: 0</p> |
| 4 | PARITY | <p>Parity bit. When '0', the receiver expects an even parity. When '1', the receiver expects an odd parity. Only applicable in standard UART and SmartCard submodes.</p> <p>Default Value: 0</p> |

19.1.244 SCB3_UART_RX_CTRL (continued)

| | | |
|-------|-----------|--|
| 2 : 0 | STOP_BITS | <p>Stop bits. STOP_BITS + 1 is the duration of the stop period in terms of halve bit periods. Valid range is [1, 7]; i.e. a stop period should last at least one bit period. If STOP_BITS is '1', stop bits error detection is NOT performed. If STOP_BITS is in [2, 7], stop bits error detection is performed and the associated interrupt cause INTR_RX.FRAME_ERROR is set to '1' if an error is detected. In other words, the receiver supports data frames with a 1 bit period stop bit sequence, but requires at least 1.5 bit period stop bit sequences to detect errors. This limitation is due to possible transmitter and receiver clock skew that prevents the design from doing reliable stop bit detection for short (1 bit bit period) stop bit sequences. Note that in case of a stop bits error, the successive data frames may get lost as the receiver needs to resynchronize its start bit detection. The amount of lost data frames depends on both the amount of stop bits, the idle ('1') time between data frames and the data frame value.</p> <p>Default Value: 2</p> |
|-------|-----------|--|

| Name | MASTER_MODE | SLAVE_MODE | None [29:24] | | | | | |

| Bits | Name | Description |
|------|-----------------------|--|
| 31 | MASTER_MODE | Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0 |
| 30 | SLAVE_MODE | Slave mode enabled ('1') or not ('0'). Default Value: 0 |
| 16 | LOOPBACK | Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0 |
| 15 | S_NOT_READY_DATA_NACK | For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1 |

19.1.247 SCB3_I2C_CTRL (continued)

| | | |
|-------|-----------------------|--|
| 14 | S_NOT_READY_ADDR_NACK | <p>For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when:</p> <ul style="list-style-type: none"> - EC_AM is '0', EC_OP is '0' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). <p>For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode):</p> <ul style="list-style-type: none"> - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. <p>Functionality is as follows:</p> <ul style="list-style-type: none"> - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. <p>Default Value: 1</p> |
| 13 | S_READY_DATA_ACK | <p>When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 12 | S_READY_ADDR_ACK | <p>When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'.</p> <p>Default Value: 1</p> |
| 11 | S_GENERAL_IGNORE | <p>When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure.</p> <p>Default Value: 1</p> |
| 9 | M_NOT_READY_DATA_NACK | <p>When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full).</p> <p>Default Value: 1</p> |
| 8 | M_READY_DATA_ACK | <p>When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full.</p> <p>Default Value: 1</p> |
| 7 : 4 | LOW_PHASE_OVS | <p>Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering.</p> <p>The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be ≥ 8 IP clock cycles and ≤ 16 IP clock cycles. Without input signal median filtering, the IF low time should be ≥ 7 IP clock cycles and ≤ 16 IP clock cycles.</p> <p>Default Value: 8</p> |

19.1.247 SCB3_I2C_CTRL (continued)

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|--------------|---|
| 23 : 16 | BASE_EZ_ADDR | I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 15 : 8 | CURR_EZ_ADDR | I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined |
| 5 | M_READ | I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/ idle or transmitting START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |
| 4 | S_READ | I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0'. Default Value: 0 |

19.1.248 SCB3_I2C_STATUS (continued)

| | | |
|---|-------------|--|
| 1 | I2C_EC_BUSY | <p>Indicates whether the externally clocked logic is potentially accessing the EZ memory and/or updating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable.</p> <p>Default Value: Undefined</p> |
| 0 | BUS_BUSY | <p>I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period).</p> <p>For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions).</p> <p>For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions).</p> <p>Default Value: 0</p> |

19.1.249 SCB3_I2C_M_CMD

I2C master command register.

Address: 0x40270068

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|--------|--------|-------|-----------------|---------|
| SW Access | None | | | RW | RW | RW | RW | RW |
| HW Access | None | | | RW1C | RW1C | RW1C | RW1C | RW1C |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-----------------|---|
| 4 | M_STOP | When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. This command has a higher priority than I2C_M_CMD.M_START: in situations where both a STOP and a REPEATED START could be transmitted, M_STOP takes precedence over M_START. Default Value: 0 |
| 3 | M_NACK | When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 2 | M_ACK | When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0 |
| 1 | M_START_ON_IDLE | When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection. As a result, bus idle detection is only functional after at least one I2C bus transfer has been detected on the bus (default/reset value of BUSY is '0'). A START is only transmitted when the master state machine is in the default state. When this action is performed, the hardware sets this field to '0'. Default Value: 0 |

19.1.249 SCB3_I2C_M_CMD (continued)

| | | |
|---|---------|--|
| 0 | M_START | <p>When '1', transmit a START or REPEATED START. Whether a START or REPEATED START is transmitted depends on the state of the master state machine. A START is only transmitted when the master state machine is in the default state. A REPEATED START is transmitted when the master state machine is not in the default state, but is working on an ongoing transaction. The REPEATED START can only be transmitted after a NACK or ACK has been received for a transmitted data element or after a NACK has been transmitted for a received data element. When this action is performed, the hardware sets this field to '0'. Default Value: 0</p> |
|---|---------|--|

19.1.250 SCB3_I2C_S_CMD

| HW Access | None | | | | W | | | |
| Name | None [31:28] | | | | WR_PTR [27:24] | | | |

| Bits | Name | Description |
|---------|----------|--|
| 27 : 24 | WR_PTR | FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0 |
| 19 : 16 | RD_PTR | FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0 |
| 15 | SR_VALID | Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is transmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0 |
| 4 : 0 | USED | Amount of enties in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR. Default Value: 0 |

19.1.255 SCB3_TX_FIFO_WR

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|------------|--|
| 9 | MEDIAN | Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptibility to errors. However, its requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0 |
| 8 | MSB_FIRST | Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1 |
| 3 : 0 | DATA_WIDTH | Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7 |

19.1.257 SCB3_RX_FIFO_CTRL

Receiver FIFO control register.

Address: 0x40270304

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---------------------|---|---|---|

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|---------------|---|
| 17 | FREEZE | When '1', hardware writes to the receiver FIFO have no effect. Freeze will not advance the RX FIFO write pointer. Default Value: 0 |
| 16 | CLEAR | When '1', the receiver FIFO and receiver shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0 |
| 3 : 0 | TRIGGER_LEVEL | Trigger level. When the receiver FIFO has more entries than the number of this field, a receiver trigger event is generated. Default Value: 0 |

19.1.258 SCB3_RX_FIFO_STATUS

Receiver FIFO status register.

Address: 0x40270308

Retention: Not Retained

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|------|--|
| 23 : 16 | MASK | Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0 |
| 7 : 0 | ADDR | Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). Default Value: 0 |

19.1.260 SCB3_RX_FIFO_RD

Receiver FIFO read register.

Address: 0x40270340

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|--|
| 15 : 0 | DATA | <p>Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used.</p> <p>This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB3_RX_FIFO_RD_SILENT register.</p> <p>A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined</p> |

19.1.261 SCB3_RX_FIFO_RD_SILENT

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------------------|---|
| 11 | SPI_BUS_ERROR | SPI slave deselected at an unexpected time in the SPI transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |
| 10 | SPI_EZ_STOP | SPI slave deselected after any EZ SPI transfer occurred. Default Value: 0 |
| 9 | SPI_EZ_WRITE_STOP | SPI slave deselected after a write EZ SPI transfer occurred. Default Value: 0 |
| 8 | I2C_BUS_ERROR | I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0 |

19.1.305 SCB3_INTR_S (continued)

| | | |
|---|----------------|--|
| 7 | I2C_GENERAL | <p>I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 6 | I2C_ADDR_MATCH | <p>I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected.</p> <p>Default Value: 0</p> |
| 5 | I2C_START | <p>I2C slave START received. Set to '1', when START or REPEATED START event is detected.</p> <p>In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.</p> <p>Default Value: 0</p> |
| 4 | I2C_STOP | <p>I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>Default Value: 0</p> |
| 3 | I2C_WRITE_STOP | <p>I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address.</p> <p>In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.</p> <p>In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).</p> <p>Default Value: 0</p> |
| 2 | I2C_ACK | <p>I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 1 | I2C_NACK | <p>I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data).</p> <p>Default Value: 0</p> |
| 0 | I2C_ARB_LOST | <p>I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error.</p> <p>Default Value: 0</p> |

| Bits | Name | Description |
|------|---------------|---|
| 10 | UART_ARB_LOST | UART lost arbitration: the value driven on the TX line is not the same as the value observed on the RX line. This condition event is usefull when transmitter and receiver share a TX/RX line. This is the case in LIN or SmartCard modes. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 9 | UART_DONE | UART transmitter done event. This happens when the IP is done transferring all data in the TX FIFO; i.e. EMPTY is '1'. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 8 | UART_NACK | UART transmitter received a negative acknowledgement in SmartCard mode. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 7 | BLOCKED | AHB-Lite write transfer can not get access to the EZ memory (EZ data access), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'. Default Value: 0 |

19.1.309 SCB3_INTR_TX (continued)

| | | |
|---|-----------|--|
| 6 | UNDERFLOW | <p>Attempt to read from an empty TX FIFO. This happens when the IP is ready to transfer data and EMPTY is '1'.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full TX FIFO.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 4 | EMPTY | <p>TX FIFO is empty; i.e. it has 0 entries.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 1 | NOT_FULL | <p>TX FIFO is not full. Dependent on CTRL.BYTE_MODE: BYTE_MODE is '0': # entries != FF_DATA_NR/2. BYTE_MODE is '1': # entries != FF_DATA_NR.</p> <p>Only used in FIFO mode. Default Value: 0</p> |
| 0 | TRIGGER | <p>Less entries in the TX FIFO than the value specified by TX_FIFO_CTRL.</p> <p>Only used in FIFO mode. Default Value: 0</p> |

| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|--------------|---|
| 11 | BREAK_DETECT | Break detection is successful: the line is '0' for UART_RX_CTRL.BREAK_WIDTH + 1 bit period. Can occur at any time to address unanticipated break fields; i.e. "break-in-data" is supported. This feature is supported for the UART standard and LIN submodes. For the UART standard submodes, ongoing receipt of data frames is NOT affected; i.e. Firmware is expected to take the proper action. For the LIN submode, possible ongoing receipt of a data frame is stopped and the (partially) received data frame is dropped and baud rate detection is started. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |
| 10 | BAUD_DETECT | LIN baudrate detection is completed. The receiver software uses the UART_RX_STATUS.BR_COUNTER value to set the right IP clock (from the programmable clock IP) to guarantee successful receipt of the first LIN data frame (Protected Identifier Field) after the synchronization byte. Set to '1', when event is detected. Write with '1' to clear bit. Default Value: 0 |

19.1.313 SCB3_INTR_RX (continued)

| | | |
|---|--------------|---|
| 9 | PARITY_ERROR | <p>Parity error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '1', the received frame is dropped. If UART_RX_CTL.DROP_ON_PARITY_ERROR is '0', the received frame is send to the RX FIFO. In SmartCard submode, negatively acknowledged data frames generate a parity error. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO.</p> <p>Default Value: 0</p> |
| 8 | FRAME_ERROR | <p>Frame error in received data frame. Set to '1', when event is detected. Write with '1' to clear bit. This can be either a start or stop bit(s) error:</p> <p>Start bit error: after the detection of the beginning of a start bit period (RX line changes from '1' to '0'), the middle of the start bit period is sampled erroneously (RX line is '1'). Note: a start bit error is detected BEFORE a data frame is received.</p> <p>Stop bit error: the RX line is sampled as '0', but a '1' was expected. Note: a stop bit error may result in failure to receive successive data frame(s). Note: a stop bit error is detected AFTER a data frame is received.</p> <p>A stop bit error is detected after a data frame is received, and the UART_RX_CTL.DROP_ON_FRAME_ERROR field specifies whether the received frame is dropped or send to the RX FIFO. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '1', the received data frame is dropped. If UART_RX_CTL.DROP_ON_FRAME_ERROR is '0', the received data frame is send to the RX FIFO. Note that Firmware can only identify the erroneous data frame in the RX FIFO if it is fast enough to read the data frame before the hardware writes a next data frame into the RX FIFO; i.e. the RX FIFO does not have error flags to tag erroneous data frames.</p> <p>Default Value: 0</p> |
| 7 | BLOCKED | <p>AHB-Lite read transfer can not get access to the EZ memory (EZ_DATA accesses), due to an externally clocked EZ access. This may happen when STATUS.EC_BUSY is '1'.</p> <p>Default Value: 0</p> |
| 6 | UNDERFLOW | <p>Attempt to read from an empty RX FIFO.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 5 | OVERFLOW | <p>Attempt to write to a full RX FIFO. Note: in I2C mode, the OVERFLOW is set when a data frame is received and the RX FIFO is full, independent of whether it is ACK'd or NACK'd.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 3 | FULL | <p>RX FIFO is full. Note that received data frames are lost when the RX FIFO is full. Dependent on CTRL.BYTE_MODE:</p> <p>BYTE_MODE is '0': # entries == FF_DATA_NR/2.</p> <p>BYTE_MODE is '1': # entries == FF_DATA_NR.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 2 | NOT_EMPTY | <p>RX FIFO is not empty.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |
| 0 | TRIGGER | <p>More entries in the RX FIFO than the value specified by TRIGGER_LEVEL in SCB_RX_FIFO_CTL.</p> <p>Only used in FIFO mode.</p> <p>Default Value: 0</p> |

| 8 | FRAME_ERROR | Write with '1' to set corresponding bit in interrupt status register. Default Value: 0 |
| 7 | BLOCKED | Write with '1' to set corresponding bit in interrupt status register. Default Value: 0 |
| 6 | UNDERFLOW | Write with '1' to set corresponding bit in interrupt status register. Default Value: 0 |
| 5 | OVERFLOW | Write with '1' to set corresponding bit in interrupt status register. Default Value: 0 |

19.1.314 SCB3_INTR_RX_SET (continued)

| | | |
|---|-----------|--|
| 3 | FULL | Write with '1' to set corresponding bit in interrupt status register. Default Value: 0 |
| 2 | NOT_EMPTY | Write with '1' to set corresponding bit in interrupt status register. Default Value: 0 |
| 0 | TRIGGER | Write with '1' to set corresponding bit in interrupt request register. Default Value: 0 |

19.1.315 SCB3_INTR_RX_MASK

Receiver interrupt mask register.

Address: 0x40270FC8

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 0 | TRIGGER | Logical and of corresponding request and mask bits. Default Value: 0 |

20 Supervisory Flash (SFLASH) Registers

This section discusses the SFLASH registers. It lists all the registers in mapping tables, in address order.

20.1 Register Details

| Register Name | Address |
|-------------------|-----------|
| SFLASH_PROT_ROW0 | 0x0FFF000 |
| SFLASH_PROT_ROW1 | 0x0FFF001 |
| SFLASH_PROT_ROW2 | 0x0FFF002 |
| SFLASH_PROT_ROW3 | 0x0FFF003 |
| SFLASH_PROT_ROW4 | 0x0FFF004 |
| SFLASH_PROT_ROW5 | 0x0FFF005 |
| SFLASH_PROT_ROW6 | 0x0FFF006 |
| SFLASH_PROT_ROW7 | 0x0FFF007 |
| SFLASH_PROT_ROW8 | 0x0FFF008 |
| SFLASH_PROT_ROW9 | 0x0FFF009 |
| SFLASH_PROT_ROW10 | 0x0FFF00A |
| SFLASH_PROT_ROW11 | 0x0FFF00B |
| SFLASH_PROT_ROW12 | 0x0FFF00C |
| SFLASH_PROT_ROW13 | 0x0FFF00D |
| SFLASH_PROT_ROW14 | 0x0FFF00E |
| SFLASH_PROT_ROW15 | 0x0FFF00F |
| SFLASH_PROT_ROW16 | 0x0FFF010 |
| SFLASH_PROT_ROW17 | 0x0FFF011 |
| SFLASH_PROT_ROW18 | 0x0FFF012 |
| SFLASH_PROT_ROW19 | 0x0FFF013 |
| SFLASH_PROT_ROW20 | 0x0FFF014 |
| SFLASH_PROT_ROW21 | 0x0FFF015 |
| SFLASH_PROT_ROW22 | 0x0FFF016 |
| SFLASH_PROT_ROW23 | 0x0FFF017 |
| SFLASH_PROT_ROW24 | 0x0FFF018 |
| SFLASH_PROT_ROW25 | 0x0FFF019 |
| SFLASH_PROT_ROW26 | 0x0FFF01A |

| Register Name | Address |
|------------------------|-----------|
| SFLASH_PROT_ROW27 | 0x0FFF01B |
| SFLASH_PROT_ROW28 | 0x0FFF01C |
| SFLASH_PROT_ROW29 | 0x0FFF01D |
| SFLASH_PROT_ROW30 | 0x0FFF01E |
| SFLASH_PROT_ROW31 | 0x0FFF01F |
| SFLASH_PROT_ROW32 | 0x0FFF020 |
| SFLASH_PROT_ROW33 | 0x0FFF021 |
| SFLASH_PROT_ROW34 | 0x0FFF022 |
| SFLASH_PROT_ROW35 | 0x0FFF023 |
| SFLASH_PROT_ROW36 | 0x0FFF024 |
| SFLASH_PROT_ROW37 | 0x0FFF025 |
| SFLASH_PROT_ROW38 | 0x0FFF026 |
| SFLASH_PROT_ROW39 | 0x0FFF027 |
| SFLASH_PROT_ROW40 | 0x0FFF028 |
| SFLASH_PROT_ROW41 | 0x0FFF029 |
| SFLASH_PROT_ROW42 | 0x0FFF02A |
| SFLASH_PROT_ROW43 | 0x0FFF02B |
| SFLASH_PROT_ROW44 | 0x0FFF02C |
| SFLASH_PROT_ROW45 | 0x0FFF02D |
| SFLASH_PROT_ROW46 | 0x0FFF02E |
| SFLASH_PROT_ROW47 | 0x0FFF02F |
| SFLASH_PROT_ROW48 | 0x0FFF030 |
| SFLASH_PROT_ROW49 | 0x0FFF031 |
| SFLASH_PROT_ROW50 | 0x0FFF032 |
| SFLASH_PROT_ROW51 | 0x0FFF033 |
| SFLASH_PROT_ROW52 | 0x0FFF034 |
| SFLASH_PROT_ROW53 | 0x0FFF035 |
| SFLASH_PROT_ROW54 | 0x0FFF036 |
| SFLASH_PROT_ROW55 | 0x0FFF037 |
| SFLASH_PROT_ROW56 | 0x0FFF038 |
| SFLASH_PROT_ROW57 | 0x0FFF039 |
| SFLASH_PROT_ROW58 | 0x0FFF03A |
| SFLASH_PROT_ROW59 | 0x0FFF03B |
| SFLASH_PROT_ROW60 | 0x0FFF03C |
| SFLASH_PROT_ROW61 | 0x0FFF03D |

| 31 : 0 | ADDRESS | Start Address Default Value: X |

20.1.221 SFLASH_CSD_TRIM1_HVIDAC

CSD Trim Data for HVIDAC operation

Address: 0x0FFF260

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TRIM8 [7:0] | | | | | | | |

| Bits | Name | Description |
|-------|-------|-------------------------------|
| 7 : 0 | TRIM8 | Trim data Default Value: X |

20.1.222 SFLASH_CSD_TRIM2_HVIDAC

CSD Trim Data for HVIDAC operation

Address: 0x0FFF261

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TRIM8 [7:0] | | | | | | | |

| Bits | Name | Description |
|-------|-------|-------------------------------|
| 7 : 0 | TRIM8 | Trim data Default Value: X |

20.1.223 SFLASH_CSD_TRIM1_CSD

CSD Trim Data for (normal) CSD operation

Address: 0x0FFFF262

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TRIM8 [7:0] | | | | | | | |

| Bits | Name | Description |
|-------|-------|-------------------------------|
| 7 : 0 | TRIM8 | Trim data Default Value: X |

20.1.224 SFLASH_CSD_TRIM2_CSD

CSD Trim Data for (normal) CSD operation

Address: 0x0FFFF263

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TRIM8 [7:0] | | | | | | | |

| Bits | Name | Description |
|-------|-------|-------------------------------|
| 7 : 0 | TRIM8 | Trim data Default Value: X |

20.1.225 SFLASH_SAR_TEMP_MULTIPLIER

SAR Temperature Sensor Multiplication Factor

Address: 0x0FFF264

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-----------------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TEMP_MULTIPLIER [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|------------------------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TEMP_MULTIPLIER [15:8] | | | | | | | |

| Bits | Name | Description |
|--------|-----------------|--|
| 15 : 0 | TEMP_MULTIPLIER | Multiplier value for SAR temperature sensor in fixed point 0.16 format. Note: this field exists in products that contain SAR (m0s8sar) only. Default Value: X |

20.1.226 SFLASH_SAR_TEMP_OFFSET

SAR Temperature Sensor Offset

Address: 0x0FFF266

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TEMP_OFFSET [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|--------------------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | TEMP_OFFSET [15:8] | | | | | | | |

| Bits | Name | Description |
|--------|-------------|--|
| 15 : 0 | TEMP_OFFSET | Offset value for SAR temperature sensor in fixed point 10.6 format. Note: this field exists in products that contain SAR (m0s8sar) only. Default Value: X |

20.1.227 SFLASH_SKIP_CHECKSUM

Checksum Skip Option Register

Address: 0x0FFF269

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | SKIP [7:0] | | | | | | | |

| Bits | Name | Description |
|-------|------|--|
| 7 : 0 | SKIP | 0: Perform checksum check (see CHECKSUM field below) 1: Skip checksum check >1: Undefined - do not use Default Value: X |

20.1.228 SFLASH_PROT_VIRGINKEY0

Virgin Protection Mode Key

Address: 0x0FFFF270

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | KEY8 [7:0] | | | | | | | |

| Bits | Name | Description |
|-------|------|------------------------------|
| 7 : 0 | KEY8 | Key Byte Default Value: X |

20.1.229 SFLASH_PROT_VIRGINKEY1

Virgin Protection Mode Key

Address: 0x0FFFF271

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
