This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you under its copyright rights in the Software, a personal, non-exclusive, nontransferable license (without the right to sublicense) (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units. Cypress also grants you a personal, non-exclusive, nontransferable, license (without the right to sublicense) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely to the minimum extent that is necessary for you to exercise your rights under the copyright license granted in the previous sentence. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and Company shall and hereby does release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. Company shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.

Cypress, the Cypress logo, Spansion, the Spansion logo, and combinations thereof, WICED, PSoC, CapSense, EZ-USB, F-RAM, and Traveo are trademarks or registered trademarks of Cypress in the United States and other countries. For a more complete list of Cypress trademarks, visit cypress.com. Other names and brands may be claimed as property of their respective owners.

| 14.1.17 | LCD_DATA15 | 1525 |
| 14.1.18 | LCD_DATA16 | 1526 |
| 14.1.19 | LCD_DATA17 | 1527 |

15. Low Power Comparator Registers 1528

| | | |
|---------|--------------------------|------|
| 15.1 | Register Details | 1528 |
| 15.1.1 | LPCOMP_ID | 1529 |
| 15.1.2 | LPCOMP_CONFIG | 1530 |
| 15.1.3 | LPCOMP_INTR | 1533 |
| 15.1.4 | LPCOMP_INTR_SET | 1534 |
| 15.1.5 | LPCOMP_INTR_MASK | 1535 |
| 15.1.6 | LPCOMP_INTR_MASKED | 1536 |
| 15.1.7 | LPCOMP_TRIM1 | 1537 |
| 15.1.8 | LPCOMP_TRIM2 | 1538 |
| 15.1.9 | LPCOMP_TRIM3 | 1539 |
| 15.1.10 | LPCOMP_TRIM4 | 1540 |

16. Programmable Analog Sub-System Registers 1541

| | | |
|--------|---------------------------|------|
| 16.1 | Register Details | 1541 |
| 16.1.1 | PASS_INTR_CAUSE | 1542 |
| 16.1.2 | PASS_DSAB_TRIM | 1543 |
| 16.1.3 | PASS_DSAB_DSAB_CTRL | 1544 |

17. ROM Table Registers 1545

| | | |
|---------|------------------------|------|
| 17.1 | Register Details | 1545 |
| 17.1.1 | ROMTABLE_ADDR | 1546 |
| 17.1.2 | ROMTABLE_DID | 1547 |
| 17.1.3 | ROMTABLE_PID4 | 1548 |
| 17.1.4 | ROMTABLE_PID5 | 1549 |
| 17.1.5 | ROMTABLE_PID6 | 1550 |
| 17.1.6 | ROMTABLE_PID7 | 1551 |
| 17.1.7 | ROMTABLE_PID0 | 1552 |
| 17.1.8 | ROMTABLE_PID1 | 1553 |
| 17.1.9 | ROMTABLE_PID2 | 1554 |
| 17.1.10 | ROMTABLE_PID3 | 1555 |
| 17.1.11 | ROMTABLE_CID0 | 1556 |
| 17.1.12 | ROMTABLE_CID1 | 1557 |
| 17.1.13 | ROMTABLE_CID2 | 1558 |
| 17.1.14 | ROMTABLE_CID3 | 1559 |

18. SAR ADC Registers 1560

| | | |
|---------|-------------------------|------|
| 18.1 | Register Details | 1560 |
| 18.1.1 | SAR_CTRL | 1563 |
| 18.1.2 | SAR_SAMPLE_CTRL | 1566 |
| 18.1.3 | SAR_SAMPLE_TIME01 | 1568 |
| 18.1.4 | SAR_SAMPLE_TIME23 | 1569 |
| 18.1.5 | SAR_RANGE_THRES | 1570 |
| 18.1.6 | SAR_RANGE_COND | 1571 |
| 18.1.7 | SAR_CHAN_EN | 1572 |
| 18.1.8 | SAR_START_CTRL | 1573 |
| 18.1.9 | SAR_CHAN_CONFIG0 | 1574 |
| 18.1.10 | SAR_CHAN_CONFIG1 | 1576 |
| 18.1.11 | SAR_CHAN_CONFIG2 | 1578 |
| 18.1.12 | SAR_CHAN_CONFIG3 | 1580 |
| 18.1.13 | SAR_CHAN_CONFIG4 | 1582 |
| 18.1.14 | SAR_CHAN_CONFIG5 | 1584 |
| 18.1.15 | SAR_CHAN_CONFIG6 | 1586 |
| 18.1.16 | SAR_CHAN_CONFIG7 | 1588 |
| 18.1.17 | SAR_CHAN_CONFIG8 | 1590 |
| 18.1.18 | SAR_CHAN_CONFIG9 | 1592 |
| 18.1.19 | SAR_CHAN_CONFIG10 | 1594 |
| 18.1.20 | SAR_CHAN_CONFIG11 | 1596 |

Revision History

9099

Register Mapping

The Register Mapping section discusses the registers and lists all the registers in mapping tables, in address order. For Architecture details, refer to PSoC 4200L Family PSoC 4 Architecture Technical Reference Manual (TRM).

Register General Conventions

The register conventions specific to this section and the Register Reference chapter are listed in this table.

| Convention | Description | Explanation |
|-----------------------------------|-------------------------|---|
| RW | Read/Write | These bits can be both read and written. |
| R | Read only | These bits can only be read. Writing has no effect on the bit value. |
| W | Write only | These bits can only be written. Reading the bit returns the reset value. |
| RW1C | Read/Write '1' to clear | These bits can be read as well as cleared by writing '1'. Writing '0' has no effect on the bit value. |
| RW0C | Read/Write '0' to clear | These bits can be read as well as cleared by writing '0'. Writing '1' has no effect on the bit value. |
| RW1S | Read/Write '1' to set | These bits can be read as well as set by writing '1'. Writing '0' has no effect on the bit value. |
| None / Reserved | Reserved bits | Keep these bits at the default value |
| 'x' in a register /bit field name | Multiple instances | Multiple instances/address ranges of the same register/bit field |

Acronyms

This table lists the acronyms used in this document

Table 3-1. Acronyms

| Symbol | Unit of Measure |
|--------|---|
| ABUS | analog output bus |
| AC | alternating current |
| ADC | analog-to-digital converter |
| AHB | AMBA (advanced microcontroller bus architecture) high-performance bus, an ARM data transfer bus |
| API | application programming interface |
| APOR | analog power-on reset |
| BC | broadcast clock |
| BOM | bill of materials |
| BR | bit rate |
| BRA | bus request acknowledge |
| BRQ | bus request |
| CAN | controller area network |
| CI | carry in |
| CMP | compare |
| CO | carry out |
| CPU | central processing unit |
| CRC | cyclic redundancy check |

Table 3-1. Acronyms

| Symbol | Unit of Measure |
|------------------|---|
| CSD | CapSense sigma delta |
| CT | continuous time |
| CTBm | continuous time block-mini |
| DAC | digital-to-analog converter |
| DC | direct current |
| DI | digital or data input |
| DMA | direct memory access |
| DNL | differential nonlinearity |
| DO | digital or data output |
| DSI | digital signal interface |
| DSM | deep-sleep mode |
| ECO | external crystal oscillator |
| EEPROM | electrically erasable programmable read only memory |
| EMIF | external memory interface |
| FB | feedback |
| FIFO | first in first out |
| FSR | full scale range |
| GPIO | general purpose I/O |
| HCI | host-controller interface |
| HFCLK | high-frequency clock |
| I ² C | inter-integrated circuit |
| IDE | integrated development environment |
| ILO | internal low-speed oscillator |
| IMO | internal main oscillator |
| INL | integral nonlinearity |
| I/O | input/output |
| IOR | I/O read |
| IOW | I/O write |
| IRES | initial power on reset |
| IRA | interrupt request acknowledge |
| IRQ | interrupt request |
| ISR | interrupt service routine |
| IVR | interrupt vector read |
| L2CAP | logical link control and adaptation protocol |
| LPCOMP | low-power comparator |
| LRb | last received bit |
| LRB | last received byte |
| LSb | least significant bit |
| LSB | least significant byte |
| LUT | lookup table |
| MISO | master-in-slave-out |
| MMIO | memory mapped input/output |
| MOSI | master-out-slave-in |
| MSb | most significant bit |

Table 3-1. Acronyms

| Symbol | Unit of Measure |
|--------|---|
| MSB | most significant byte |
| PC | program counter |
| PCH | program counter high |
| PCL | program counter low |
| PD | power down |
| PGA | programmable gain amplifier |
| PM | power management |
| PMA | PSoC memory arbiter |
| POR | power-on reset |
| PPOR | precision power-on reset |
| PRS | pseudo random sequence |
| PSoC® | Programmable System-on-Chip |
| PSRR | power supply rejection ratio |
| PSSDC | power system sleep duty cycle |
| PWM | pulse width modulator |
| RAM | random-access memory |
| RETI | return from interrupt |
| RF | radio frequency |
| ROM | read only memory |
| RW | read/write |
| SAR | successive approximation register |
| SC | switched capacitor |
| SCB | serial communication block |
| SIE | serial interface engine |
| SIO | special I/O |
| SE0 | single-ended zero |
| SNR | signal-to-noise ratio |
| SOF | start of frame |
| SOI | start of instruction |
| SP | stack pointer |
| SPD | sequential phase detector |
| SPI | serial peripheral interconnect |
| SPIM | serial peripheral interconnect master |
| SPIS | serial peripheral interconnect slave |
| SRAM | static random-access memory |
| SRSS | system resources sub-system |
| SROM | supervisory read only memory |
| SSADC | single slope ADC |
| SSC | supervisory system call |
| SYSCLK | system clock |
| SWD | single wire debug |
| TC | terminal count |
| TD | transaction descriptors |
| UART | universal asynchronous receiver/transmitter |

Table 3-1. Acronyms

| Symbol | Unit of Measure |
|--------|----------------------------|
| UDB | universal digital block |
| USB | universal serial bus |
| USBIO | USB I/O |
| WCO | watch crystal oscillator |
| WDT | watchdog timer |
| WDR | watchdog reset |
| XRES | external reset |
| XRES_N | external reset, active low |

1 Controller Area Network (CAN) Registers

This section discusses the Controller Area Network (CAN) registers. It lists all the registers in mapping tables, in address order.

1.1 Register Details

| Register Name | Address |
|----------------------|------------|
| CAN0_INT_STATUS | 0x402E0000 |
| CAN0_INT_EBL | 0x402E0004 |
| CAN0_BUFFER_STATUS | 0x402E0008 |
| CAN0_ERROR_STATUS | 0x402E000C |
| CAN0_COMMAND | 0x402E0010 |
| CAN0_CONFIG | 0x402E0014 |
| CAN0_ECR | 0x402E0018 |
| CAN0_CNTL | 0x402E0400 |
| CAN0_TTCAN_COUNTER | 0x402E0404 |
| CAN0_TTCAN_COMPARE | 0x402E0408 |
| CAN0_TTCAN_CAPTURE | 0x402E040C |
| CAN0_TTCAN_TIMING | 0x402E0410 |
| CAN0_INTR_CAN | 0x402E0414 |
| CAN0_INTR_CAN_SET | 0x402E0418 |
| CAN0_INTR_CAN_MASK | 0x402E041C |
| CAN0_INTR_CAN_MASKED | 0x402E0420 |
| CAN1_INT_STATUS | 0x402F0000 |
| CAN1_INT_EBL | 0x402F0004 |
| CAN1_BUFFER_STATUS | 0x402F0008 |
| CAN1_ERROR_STATUS | 0x402F000C |
| CAN1_COMMAND | 0x402F0010 |
| CAN1_CONFIG | 0x402F0014 |
| CAN1_ECR | 0x402F0018 |
| CAN1_CNTL | 0x402F0400 |
| CAN1_TTCAN_COUNTER | 0x402F0404 |
| CAN1_TTCAN_COMPARE | 0x402F0408 |
| CAN1_TTCAN_CAPTURE | 0x402F040C |

| Register Name | Address |
|----------------------|------------|
| CAN1_TTCAN_TIMING | 0x402F0410 |
| CAN1_INTR_CAN | 0x402F0414 |
| CAN1_INTR_CAN_SET | 0x402F0418 |
| CAN1_INTR_CAN_MASK | 0x402F041C |
| CAN1_INTR_CAN_MASKED | 0x402F0420 |

1.1.1 CAN0_INT_STATUS

Interrupt Status

Address: 0x402E0000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---------|-----------|---------|----------|----------|------------|---|
| SW Access | RW1C | RW1C | RW1C | RW1C | RW1C | RW1C | None | |
| HW Access | RW1S | RW1S | RW1S | RW1S | RW1S | RW1S | None | |
| Name | FORM_ERR | ACK_ERR | STUFF_ERR | BIT_ERR | OVR_LOAD | ARB_LOSS | None [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|------------|---------|--------|--------|-------------|---------|---------|
| SW Access | RW1C | RW1C | RW1C | RW1C | RW1C | RW1C | RW1C | RW1C |
| HW Access | RW1S | RW1S | RW1S | RW1S | RW1S | RW1S | RW1S | RW1S |
| Name | SST_FAILURE | STUCK_AT_0 | RTR_MSG | RX_MSG | TX_MSG | RX_MSG_LOSS | BUS_OFF | CRC_ERR |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------------|---|
| 15 | SST_FAILURE | Single shot transmission failure 0: Normal operation 1: A buffer set for single shot transmission experienced an arbitration loss or a bus error during transmission The sst_failure interrupt is set as well when the CAN controller is being stopped while an SST message is in the transmit buffer. user should transmit or remove respective SST messages before stopping the IP, to avoid triggering SST_FAILURE after writing COMMAND.RUN=0. Default Value: 0 |
| 14 | STUCK_AT_0 | Stuck at dominant error 0: Normal Operation 1: Indicates if the rx input remains stuck at 0 (dominant level) for more than 16 consecutive bit times. The "stuck at 0" condition is checked, only when COMMAND.RUN is set Default Value: 0 |

1.1.1 CAN0_INT_STATUS (continued)

| | | |
|----|-------------|---|
| 13 | RTR_MSG | RTR auto-reply message sent 0: Normal operation 1: Indicates that a RTR auto-reply message was sent Default Value: 0 |
| 12 | RX_MSG | Indicates that a message was received 0: Normal operation 1: A new message was successfully received and stored in a receive buffer which has its RxIntEBL flag asserted. Default Value: 0 |
| 11 | TX_MSG | Indicates that a message was sent 0: Normal operation 1: A message was successfully sent from a transmit buffer which has its TxIntEbl flag asserted. Default Value: 0 |
| 10 | RX_MSG_LOSS | when a new message arrives, but the RxMessage flag MSG_AV is set and LINK_FLAG is not set, RX_MSG_LOSS is set, and the new message is discarded. Default Value: 0 |
| 9 | BUS_OFF | The CAN has reached the bus off state Default Value: 0 |
| 8 | CRC_ERR | A CAN CRC error was detected Default Value: 0 |
| 7 | FORM_ERR | A CAN message format error was detected please ignore this interrupt, when ERROR_STATUS.ERROR_STATE=2'B1x Default Value: 0 |
| 6 | ACK_ERR | An CAN message acknowledge error was detected Default Value: 0 |
| 5 | STUFF_ERR | A bit stuffing error was detected Default Value: 0 |
| 4 | BIT_ERR | A bit error was detected Default Value: 0 |
| 3 | OVR_LOAD | An overload frame was received, or reactive overload frame condition is detected (ISO-11898-1 section 10.11) Default Value: 0 |
| 2 | ARB_LOSS | The arbitration was lost while sending a message Default Value: 0 |

1.1.2 CAN0_INT_EBL

Interrupt Enable

Address: 0x402E0004

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------------|------------------|--------------------|------------------|-------------------|-------------------|------|---------------------|
| SW Access | RW | RW | RW | RW | RW | RW | None | RW |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| SW Access | R | R | R | R | R | R | R | R |
| HW Access | RW | RW | RW | RW | RW | RW | RW | RW |
| Name | TX7_REQ_PEND | TX6_REQ_PEND | TX5_REQ_PEND | TX4_REQ_PEND | TX3_REQ_PEND | TX2_REQ_PEND | TX1_REQ_PEND | TX0_REQ_PEND |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|--------------|---|
| 23 | TX7_REQ_PEND | TxMessage Buffer Status Default Value: 0 |
| 22 | TX6_REQ_PEND | TxMessage Buffer Status Default Value: 0 |
| 21 | TX5_REQ_PEND | TxMessage Buffer Status Default Value: 0 |
| 20 | TX4_REQ_PEND | TxMessage Buffer Status Default Value: 0 |
| 19 | TX3_REQ_PEND | TxMessage Buffer Status Default Value: 0 |
| 18 | TX2_REQ_PEND | TxMessage Buffer Status Default Value: 0 |
| 17 | TX1_REQ_PEND | TxMessage Buffer Status Default Value: 0 |

1.1.3 CAN0_BUFFER_STATUS (continued)

| | | |
|----|--------------|---|
| 16 | TX0_REQ_PEND | TxMessage Buffer Status Default Value: 0 |
| 15 | RX15_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 14 | RX14_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 13 | RX13_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 12 | RX12_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 11 | RX11_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 10 | RX10_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 9 | RX9_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 8 | RX8_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 7 | RX7_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 6 | RX6_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 5 | RX5_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 4 | RX4_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 3 | RX3_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 2 | RX2_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 1 | RX1_MSG_AV | RxMessage Buffer Status Default Value: 0 |
| 0 | RX0_MSG_AV | RxMessage Buffer Status Default Value: 0 |

1.1.4 CAN0_ERROR_STATUS

CAN Error Status

Address: 0x402E000C

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | RW | | | | | | | |
| Name | TX_ERR_CNT [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------------|----|----|----|----|----|---|---|
| SW Access | R | | | | | | | |
| HW Access | RW | | | | | | | |
| Name | RX_ERR_CNT [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|---------|---------|---------------------|----|
| SW Access | None | | | | R | R | R | |
| HW Access | None | | | | RW | RW | RW | |
| Name | None [23:20] | | | | RXGTE96 | TXGTE96 | ERROR_STATE [17:16] | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|-------------|---|
| 19 | RXGTE96 | The Rx error counter is greater or equal 96 Default Value: 0 |
| 18 | TXGTE96 | The Tx error counter is greater or equal 96 Default Value: 0 |
| 17 : 16 | ERROR_STATE | The error state of the CAN node: "00": error active (normal operation) "01": error passive "1x": bus off Default Value: 0 |
| 15 : 8 | RX_ERR_CNT | The receive error counter according to the CAN 2.0 specification. When in bus-off state, this counter is used to count 128 groups of 11 recessive bits. it is fixed at 255 Default Value: 0 |

1.1.4 CAN0_ERROR_STATUS (continued)

| | | |
|-------|------------|--|
| 7 : 0 | TX_ERR_CNT | The transmitter error counter according to the CAN standard. When it is greater than 255, it is fixed at 255 Default Value: 0 |
|-------|------------|--|

1.1.5 CAN0_COMMAND

CAN Command Register

Address: 0x402E0010

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|-----------|---------------|--------|-----|
| SW Access | None | | | | RW | RW | RW | RW |
| HW Access | None | | | | RW | RW | RW | RW |
| Name | None [7:4] | | | | SRAM_TEST | LOOPBACK_TEST | LISTEN | RUN |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|-----------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | R | | | | | | | |
| Name | IP_REV_NUMBER [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------------------|----|----|----|--------------------------|----|----|----|
| SW Access | R | | | | R | | | |
| HW Access | R | | | | R | | | |
| Name | IP_MAJOR_VERSION [31:28] | | | | IP_MINOR_VERSION [27:24] | | | |

| Bits | Name | Description |
|---------|------------------|--|
| 31 : 28 | IP_MAJOR_VERSION | IP Major Version Number Default Value: 3 |
| 27 : 24 | IP_MINOR_VERSION | IP Minor Version Number Default Value: 0 |
| 23 : 16 | IP_REV_NUMBER | IP Revision Number Default Value: 0 |
| 3 | SRAM_TEST | SRAM test mode "0": Normal operation "1": Enable SRAM test mode it can be set, only when the IP is stopped (COMMAND.RUN=0, and really finished transition from run mode), this mode will not be used, so it should never be set. Default Value: 0 |

1.1.5 CAN0_COMMAND (continued)

| | | |
|---|---------------|--|
| 2 | LOOPBACK_TEST | TEST_MODE[2]. With TEST_MODE[2:1], 00: normal operation 01: Listen-only mode, The output is held at "R" level. The CANmodule-III is only listening. 10: external loopback mode 11: internal loopback mode Default Value: 0 |
| 1 | LISTEN | TEST_MODE[1] Default Value: 0 |
| 0 | RUN | Run/Stop mode: "0": Sets the CAN controller into stop mode. Stop mode can be granted only in "bus idle" field Returns "0" when stopped. "1": Sets the CAN controller into run mode. Returns "1" when running. Default Value: 0 |

1.1.6 CAN0_CONFIG

CAN Configuration

Address: 0x402E0014

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-----------------|---|---|------------------|---------------|---|-------------------|---------------|
| SW Access | RW | | | RW | RW | | RW | RW |
| HW Access | R | | | R | R | | R | R |
| Name | CFG_TSEG2 [7:5] | | | AUTO_RES TART | CFG_SJW [3:2] | | SAMPLING _MODE | EDGE_MO DE |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|------|--------------|-----------------|-----------------|------------------|----|---|---|
| SW Access | None | RW | RW | RW | RW | | | |
| HW Access | None | R | R | R | R | | | |
| Name | None | ECR_MOD E | SWAP_EN DIAN | CFG_ARBI TER | CFG_TSEG1 [11:8] | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|---------------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | CFG_BITRATE [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------|---------------------|----|----|----|----|----|----|
| SW Access | None | RW | | | | | | |
| HW Access | None | R | | | | | | |
| Name | None | CFG_BITRATE [30:24] | | | | | | |

| Bits | Name | Description |
|---------|-------------|--|
| 30 : 16 | CFG_BITRATE | Prescaler for generating the time quantum which defines the TQ: 0: One time quantum equals 1 clock cycle 1: One time quantum equals 2 clock cycles ... 32767: One time quantum equals 32768 clock cycles Default Value: 0 |
| 14 | ECR_MODE | Error Capture mode 0: Free running: The ECR register shows the current bit position within the CAN frame 1: Capture mode: The ecr register shows the bit position and type of the last captured CAN error. Default Value: 0 |
| 13 | SWAP_ENDIAN | Swap Endian - the byte position of the CAN receive and transmit data fields can be modified to match the endian setting of the processor or the used CAN protocol 0: CAN data byte position is not swapped (big endian) 1: CAN data byte position is swapped (little endian) Default Value: 0 |

1.1.6 CAN0_CONFIG (continued)

| | | |
|--------|---------------|--|
| 12 | CFG_ARBITER | Transmit buffer arbiter 0: Round robin arbitration 1: Fixed priority arbitration Default Value: 0 |
| 11 : 8 | CFG_TSEG1 | Time segment 1 Length of the first time segment: $tseg1 = cfg_tseg1 + 1$ Time segment 1 includes the propagation time. $cfg_tseg1=0$ and $cfg_tseg1=1$ are not allowed. Default Value: 0 |
| 7 : 5 | CFG_TSEG2 | Time segment 2 Length of the second time segment: $tseg2 = cfg_tseg2 + 1$ $cfg_tseg2=0$ is not allowed; $cfg_tseg2=1$ is only allowed in direct sampling mode. Default Value: 0 |
| 4 | AUTO_RESTART | 0: After bus-off, the CAN core must be restarted by setting COMMAND.RUN register. This is the recommended setting. 1: After bus-off, the CAN core is restarting automatically after 128 groups of 11 recessive bits Default Value: 0 |
| 3 : 2 | CFG_SJW | Synchronization jump width - 1 $sjw = tseg1$ and $sjw = tseg2$ Default Value: 0 |
| 1 | SAMPLING_MODE | CAN bus bit sampling 0: One sampling point is used in the receiver path 1: 3 sampling points with majority decision are used Default Value: 0 |
| 0 | EDGE_MODE | CAN bus synchronization logic 0: Edge from R to D is used for synchronization 1: Both edges are used Note, only R to D edge shall be used for synchronization per ISO-11898-1 spec, so this bit should always be set 0 (by default) Default Value: 0 |

1.1.7 CAN0_ECR

Error Capture Register

Address: 0x402E0018

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-----------|---|---------|---------|------------------|---|---|----------------|
| SW Access | R | | R | R | R | | | RW |
| HW Access | RW | | RW | RW | RW | | | RW |

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------------|---|
| 15 | SST_FAILURE | Single shot transmission failure 0: Normal operation 1: A buffer set for single shot transmission experienced an arbitration loss or a bus error during transmission The sst_failure interrupt is set as well when the CAN controller is being stopped while an SST message is in the transmit buffer. user should transmit or remove respective SST messages before stopping the IP, to avoid triggering SST_FAILURE after writing COMMAND.RUN=0. Default Value: 0 |
| 14 | STUCK_AT_0 | Stuck at dominant error 0: Normal Operation 1: Indicates if the rx input remains stuck at 0 (dominant level) for more than 16 consecutive bit times. The "stuck at 0" condition is checked, only when COMMAND.RUN is set Default Value: 0 |

1.1.17 CAN1_INT_STATUS (continued)

| | | |
|----|-------------|---|
| 13 | RTR_MSG | RTR auto-reply message sent 0: Normal operation 1: Indicates that a RTR auto-reply message was sent Default Value: 0 |
| 12 | RX_MSG | Indicates that a message was received 0: Normal operation 1: A new message was successfully received and stored in a receive buffer which has its RxIntEBL flag asserted. Default Value: 0 |
| 11 | TX_MSG | Indicates that a message was sent 0: Normal operation 1: A message was successfully sent from a transmit buffer which has its TxIntEbl flag asserted. Default Value: 0 |
| 10 | RX_MSG_LOSS | when a new message arrives, but the RxMessage flag MSG_AV is set and LINK_FLAG is not set, RX_MSG_LOSS is set, and the new message is discarded. Default Value: 0 |
| 9 | BUS_OFF | The CAN has reached the bus off state Default Value: 0 |
| 8 | CRC_ERR | A CAN CRC error was detected Default Value: 0 |
| 7 | FORM_ERR | A CAN message format error was detected please ignore this interrupt, when ERROR_STATUS.ERROR_STATE=2'B1x Default Value: 0 |
| 6 | ACK_ERR | An CAN message acknowledge error was detected Default Value: 0 |
| 5 | STUFF_ERR | A bit stuffing error was detected Default Value: 0 |
| 4 | BIT_ERR | A bit error was detected Default Value: 0 |
| 3 | OVR_LOAD | An overload frame was received, or reactive overload frame condition is detected (ISO-11898-1 section 10.11) Default Value: 0 |
| 2 | ARB_LOSS | The arbitration was lost while sending a message Default Value: 0 |

|-----------|---------------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | CFG_BITRATE [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------|---------------------|----|----|----|----|----|----|
| SW Access | None | RW | | | | | | |
| HW Access | None | R | | | | | | |
| Name | None | CFG_BITRATE [30:24] | | | | | | |

| Bits | Name | Description |
|---------|-------------|--|
| 30 : 16 | CFG_BITRATE | Prescaler for generating the time quantum which defines the TQ: 0: One time quantum equals 1 clock cycle 1: One time quantum equals 2 clock cycles ... 32767: One time quantum equals 32768 clock cycles Default Value: 0 |
| 14 | ECR_MODE | Error Capture mode 0: Free running: The ECR register shows the current bit position within the CAN frame 1: Capture mode: The ecr register shows the bit position and type of the last captured CAN error. Default Value: 0 |
| 13 | SWAP_ENDIAN | Swap Endian - the byte position of the CAN receive and transmit data fields can be modified to match the endian setting of the processor or the used CAN protocol 0: CAN data byte position is not swapped (big endian) 1: CAN data byte position is swapped (little endian) Default Value: 0 |

1.1.22 CAN1_CONFIG (continued)

| | | |
|--------|---------------|--|
| 12 | CFG_ARBITER | Transmit buffer arbiter 0: Round robin arbitration 1: Fixed priority arbitration Default Value: 0 |
| 11 : 8 | CFG_TSEG1 | Time segment 1 Length of the first time segment: $tseg1 = cfg_tseg1 + 1$ Time segment 1 includes the propagation time. $cfg_tseg1=0$ and $cfg_tseg1=1$ are not allowed. Default Value: 0 |
| 7 : 5 | CFG_TSEG2 | Time segment 2 Length of the second time segment: $tseg2 = cfg_tseg2 + 1$ $cfg_tseg2=0$ is not allowed; $cfg_tseg2=1$ is only allowed in direct sampling mode. Default Value: 0 |
| 4 | AUTO_RESTART | 0: After bus-off, the CAN core must be restarted by setting COMMAND.RUN register. This is the recommended setting. 1: After bus-off, the CAN core is restarting automatically after 128 groups of 11 recessive bits Default Value: 0 |
| 3 : 2 | CFG_SJW | Synchronization jump width - 1 $sjw = tseg1$ and $sjw = tseg2$ Default Value: 0 |
| 1 | SAMPLING_MODE | CAN bus bit sampling 0: One sampling point is used in the receiver path 1: 3 sampling points with majority decision are used Default Value: 0 |
| 0 | EDGE_MODE | CAN bus synchronization logic 0: Edge from R to D is used for synchronization 1: Both edges are used Note, only R to D edge shall be used for synchronization per ISO-11898-1 spec, so this bit should always be set 0 (by default) Default Value: 0 |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------------|---|
| 2 | TT_CAPTURE | Logical and of corresponding request and mask bits. Default Value: 0 |
| 1 | TT_COMPARE | Logical and of corresponding request and mask bits. Default Value: 0 |
| 0 | INT_STATUS | Logical and of corresponding request and mask bits. Default Value: 0 |

2 CAN Receive Registers

This section discusses the CAN Receive Registers (CAN_RX) registers. It lists all the registers in mapping tables, in address order.

2.1 Register Details

| Register Name | Address |
|--|------------|
| CAN0_CAN_RX0_CONTROL | 0x402E00A0 |
| CAN0_CAN_RX0_ID | 0x402E00A4 |
| CAN0_CAN_RX0_DATA_HIGH | 0x402E00A8 |
| CAN0_CAN_RX0_DATA_LOW | 0x402E00AC |
| CAN0_CAN_RX0_AMR | 0x402E00B0 |
| CAN0_CAN_RX0_ACR | 0x402E00B4 |
| CAN0_CAN_RX0_AMR_DATA | 0x402E00B8 |
| CAN0_CAN_RX0_ACR_DATA | 0x402E00BC |
| CAN0_CAN_RX1_CONTROL | 0x402E00C0 |
| CAN0_CAN_RX1_ID | 0x402E00C4 |
| CAN0_CAN_RX1_DATA_HIGH | 0x402E00C8 |
| CAN0_CAN_RX1_DATA_LOW | 0x402E00CC |
| CAN0_CAN_RX1_AMR | 0x402E00D0 |
| CAN0_CAN_RX1_ACR | 0x402E00D4 |
| CAN0_CAN_RX1_AMR_DATA | 0x402E00D8 |
| CAN0_CAN_RX1_ACR_DATA | 0x402E00DC |
| CAN0_CAN_RX2_CONTROL | 0x402E00E0 |
| CAN0_CAN_RX2_ID | 0x402E00E4 |
| CAN0_CAN_RX2_DATA_HIGH | 0x402E00E8 |
| CAN0_CAN_RX2_DATA_LOW | 0x402E00EC |
| CAN0_CAN_RX2_AMR | 0x402E00F0 |
| CAN0_CAN_RX2_ACR | 0x402E00F4 |
| CAN0_CAN_RX2_AMR_DATA | 0x402E00F8 |
| CAN0_CAN_RX2_ACR_DATA | 0x402E00FC |
| CAN0_CAN_RX3_CONTROL | 0x402E0100 |
| CAN0_CAN_RX3_ID | 0x402E0104 |
| CAN0_CAN_RX3_DATA_HIGH | 0x402E0108 |

| Register Name | Address |
|------------------------|------------|
| CAN0_CAN_RX3_DATA_LOW | 0x402E010C |
| CAN0_CAN_RX3_AMR | 0x402E0110 |
| CAN0_CAN_RX3_ACR | 0x402E0114 |
| CAN0_CAN_RX3_AMR_DATA | 0x402E0118 |
| CAN0_CAN_RX3_ACR_DATA | 0x402E011C |
| CAN0_CAN_RX4_CONTROL | 0x402E0120 |
| CAN0_CAN_RX4_ID | 0x402E0124 |
| CAN0_CAN_RX4_DATA_HIGH | 0x402E0128 |
| CAN0_CAN_RX4_DATA_LOW | 0x402E012C |
| CAN0_CAN_RX4_AMR | 0x402E0130 |
| CAN0_CAN_RX4_ACR | 0x402E0134 |
| CAN0_CAN_RX4_AMR_DATA | 0x402E0138 |
| CAN0_CAN_RX4_ACR_DATA | 0x402E013C |
| CAN0_CAN_RX5_CONTROL | 0x402E0140 |
| CAN0_CAN_RX5_ID | 0x402E0144 |
| CAN0_CAN_RX5_DATA_HIGH | 0x402E0148 |
| CAN0_CAN_RX5_DATA_LOW | 0x402E014C |
| CAN0_CAN_RX5_AMR | 0x402E0150 |
| CAN0_CAN_RX5_ACR | 0x402E0154 |
| CAN0_CAN_RX5_AMR_DATA | 0x402E0158 |
| CAN0_CAN_RX5_ACR_DATA | 0x402E015C |
| CAN0_CAN_RX6_CONTROL | 0x402E0160 |
| CAN0_CAN_RX6_ID | 0x402E0164 |
| CAN0_CAN_RX6_DATA_HIGH | 0x402E0168 |
| CAN0_CAN_RX6_DATA_LOW | 0x402E016C |
| CAN0_CAN_RX6_AMR | 0x402E0170 |
| CAN0_CAN_RX6_ACR | 0x402E0174 |
| CAN0_CAN_RX6_AMR_DATA | 0x402E0178 |
| CAN0_CAN_RX6_ACR_DATA | 0x402E017C |
| CAN0_CAN_RX7_CONTROL | 0x402E0180 |
| CAN0_CAN_RX7_ID | 0x402E0184 |
| CAN0_CAN_RX7_DATA_HIGH | 0x402E0188 |
| CAN0_CAN_RX7_DATA_LOW | 0x402E018C |
| CAN0_CAN_RX7_AMR | 0x402E0190 |
| CAN0_CAN_RX7_ACR | 0x402E0194 |
| CAN0_CAN_RX7_AMR_DATA | 0x402E0198 |
| CAN0_CAN_RX7_ACR_DATA | 0x402E019C |
| CAN0_CAN_RX8_CONTROL | 0x402E01A0 |
| CAN0_CAN_RX8_ID | 0x402E01A4 |
| CAN0_CAN_RX8_DATA_HIGH | 0x402E01A8 |
| CAN0_CAN_RX8_DATA_LOW | 0x402E01AC |
| CAN0_CAN_RX8_AMR | 0x402E01B0 |

| Register Name | Address |
|-------------------------|------------|
| CAN0_CAN_RX8_ACR | 0x402E01B4 |
| CAN0_CAN_RX8_AMR_DATA | 0x402E01B8 |
| CAN0_CAN_RX8_ACR_DATA | 0x402E01BC |
| CAN0_CAN_RX9_CONTROL | 0x402E01C0 |

|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying the bits[21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR_MSG | Remote Bit '1': This is an RTR message '0': This is a regular message depending on RTR_REPLY setting, 0, this field will be updated by received data/remote frame 1, this field should be set to 0 (data frame type) by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame Default Value: Undefined |

2.1.17 CAN0_CAN_RX2_CONTROL (continued)

| | | |
|---------|------------|---|
| 20 | IDE_FMT | <p>Extended Identifier Bit</p> <p>'1': This is an extended format message</p> <p>'0': This is a standard format message</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>0: Message has 0 data bytes, data[63:0] is notvalid</p> <p>1: Message has 1 data byte, data[63:56] is valid</p> <p>..</p> <p>8: Message has 8 data bytes, data[63:0] is valid</p> <p>9-15: Message has 8 data bytes</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 7 | WPNL | <p>WPNL, Write Protectionion for bit [6:3].</p> <p>'0': Bits [6:3] are write protected,</p> <p>'1': Bits [6:3] are modified by writes.</p> <p>This WPNL bit must always be set in the same write that is modifying bits [6:3], as this bit state is not preserved.</p> <p>This bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 6 | LINK_FLAG | <p>Link Flag</p> <p>0: This buffer is not linked to the next</p> <p>1: This buffer is linked with next buffer</p> <p>Default Value: 0</p> |
| 5 | RX_INT_EBL | <p>RxIntEbl, Receive Interrupt Enable</p> <p>0: Interrupt generation is disabled</p> <p>'1': Interrupt generation is enabled</p> <p>Default Value: 0</p> |
| 4 | RTR_REPLY | <p>automatic message reply upon receipt of an RTR message</p> <p>0: Automatic RTR message handling disabled</p> <p>1: Automatic RTR message handling enabled</p> <p>when this bit is set, only RTR message can be received, by setting AMR.RTR=0, AMR.RTR=1. Otherwise, the RTR reply message content will corrupted by received non-RTR message.</p> <p>Default Value: 0</p> |
| 3 | BUFFER_EN | <p>Buffer Enable</p> <p>0: Buffer is disabled</p> <p>1: Buffer is enabled</p> <p>Default Value: 0</p> |

2.1.17 CAN0_CAN_RX2_CONTROL (continued)

| | | |
|---|----------------|---|
| 2 | RTR_ABORT | <p>RTR Abort Request</p> <p>'0': Idle</p> <p>'1': Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.</p> <p>Default Value: 0</p> |
| 1 | RTR_REPLY_PEND | <p>RTRReply_pending status</p> <p>'0': No RTR reply request pending</p> <p>'1': RTR reply request pending</p> <p>Default Value: 0</p> |
| 0 | MSG_AV_RTRSENT | <p>Msg Available/RTR Sent</p> <p>If RTRReply flag is set, this bit shows if an RTR auto-reply message has been sent, otherwise it indicates if the buffer contains a valid message.</p> <p>Read:</p> <p>'0': Idle</p> <p>'1': New message available (RTRreply=0), RTR auto-reply message sent (RTRreply=1).</p> <p>Write:</p> <p>'0': Idle</p> <p>'1': Acknowledges receipt of new message or transmission of RTR auto-reply message.</p> <p>Default Value: 0</p> |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying the bits[21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR_MSG | Remote Bit '1': This is an RTR message '0': This is a regular message depending on RTR_REPLY setting, 0, this field will be updated by received data/remote frame 1, this field should be set to 0 (data frame type) by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame Default Value: Undefined |

2.1.41 CAN0_CAN_RX5_CONTROL (continued)

| | | |
|---------|------------|---|
| 20 | IDE_FMT | <p>Extended Identifier Bit</p> <p>'1': This is an extended format message</p> <p>'0': This is a standard format message</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>0: Message has 0 data bytes, data[63:0] is notvalid</p> <p>1: Message has 1 data byte, data[63:56] is valid</p> <p>..</p> <p>8: Message has 8 data bytes, data[63:0] is valid</p> <p>9-15: Message has 8 data bytes</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 7 | WPNL | <p>WPNL, Write Protectionion for bit [6:3].</p> <p>'0': Bits [6:3] are write protected,</p> <p>'1': Bits [6:3] are modified by writes.</p> <p>This WPNL bit must always be set in the same write that is modifying bits [6:3], as this bit state is not preserved.</p> <p>This bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 6 | LINK_FLAG | <p>Link Flag</p> <p>0: This buffer is not linked to the next</p> <p>1: This buffer is linked with next buffer</p> <p>Default Value: 0</p> |
| 5 | RX_INT_EBL | <p>RxIntEbl, Receive Interrupt Enable</p> <p>0: Interrupt generation is disabled</p> <p>'1': Interrupt generation is enabled</p> <p>Default Value: 0</p> |
| 4 | RTR_REPLY | <p>automatic message reply upon receipt of an RTR message</p> <p>0: Automatic RTR message handling disabled</p> <p>1: Automatic RTR message handling enabled</p> <p>when this bit is set, only RTR message can be received, by setting AMR.RTR=0, AMR.RTR=1. Otherwise, the RTR reply message content will corrupted by received non-RTR message.</p> <p>Default Value: 0</p> |
| 3 | BUFFER_EN | <p>Buffer Enable</p> <p>0: Buffer is disabled</p> <p>1: Buffer is enabled</p> <p>Default Value: 0</p> |

2.1.41 CAN0_CAN_RX5_CONTROL (continued)

| | | |
|---|----------------|---|
| 2 | RTR_ABORT | <p>RTR Abort Request</p> <p>'0': Idle</p> <p>'1': Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.</p> <p>Default Value: 0</p> |
| 1 | RTR_REPLY_PEND | <p>RTRReply_pending status</p> <p>'0': No RTR reply request pending</p> <p>'1': RTR reply request pending</p> <p>Default Value: 0</p> |
| 0 | MSG_AV_RTRSENT | <p>Msg Available/RTR Sent</p> <p>If RTRReply flag is set, this bit shows if an RTR auto-reply message has been sent, otherwise it indicates if the buffer contains a valid message.</p> <p>Read:</p> <p>'0': Idle</p> <p>'1': New message available (RTRreply=0), RTR auto-reply message sent (RTRreply=1).</p> <p>Write:</p> <p>'0': Idle</p> <p>'1': Acknowledges receipt of new message or transmission of RTR auto-reply message.</p> <p>Default Value: 0</p> |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying the bits[21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR_MSG | Remote Bit '1': This is an RTR message '0': This is a regular message depending on RTR_REPLY setting, 0, this field will be updated by received data/remote frame 1, this field should be set to 0 (data frame type) by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame Default Value: Undefined |

2.1.65 CAN0_CAN_RX8_CONTROL (continued)

| | | |
|---------|------------|--|
| 20 | IDE_FMT | <p>Extended Identifier Bit</p> <p>'1': This is an extended format message</p> <p>'0': This is a standard format message</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>0: Message has 0 data bytes, data[63:0] is not valid</p> <p>1: Message has 1 data byte, data[63:56] is valid</p> <p>..</p> <p>8: Message has 8 data bytes, data[63:0] is valid</p> <p>9-15: Message has 8 data bytes</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 7 | WPNL | <p>WPNL, Write Protection for bit [6:3].</p> <p>'0': Bits [6:3] are write protected,</p> <p>'1': Bits [6:3] are modified by writes.</p> <p>This WPNL bit must always be set in the same write that is modifying bits [6:3], as this bit state is not preserved.</p> <p>This bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 6 | LINK_FLAG | <p>Link Flag</p> <p>0: This buffer is not linked to the next</p> <p>1: This buffer is linked with next buffer</p> <p>Default Value: 0</p> |
| 5 | RX_INT_EBL | <p>RxIntEbl, Receive Interrupt Enable</p> <p>0: Interrupt generation is disabled</p> <p>'1': Interrupt generation is enabled</p> <p>Default Value: 0</p> |
| 4 | RTR_REPLY | <p>automatic message reply upon receipt of an RTR message</p> <p>0: Automatic RTR message handling disabled</p> <p>1: Automatic RTR message handling enabled</p> <p>when this bit is set, only RTR message can be received, by setting AMR.RTR=0, AMR.RTR=1. Otherwise, the RTR reply message content will corrupted by received non-RTR message.</p> <p>Default Value: 0</p> |
| 3 | BUFFER_EN | <p>Buffer Enable</p> <p>0: Buffer is disabled</p> <p>1: Buffer is enabled</p> <p>Default Value: 0</p> |

2.1.65 CAN0_CAN_RX8_CONTROL (continued)

| | | |
|---|----------------|---|
| 2 | RTR_ABORT | <p>RTR Abort Request</p> <p>'0': Idle</p> <p>'1': Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.</p> <p>Default Value: 0</p> |
| 1 | RTR_REPLY_PEND | <p>RTRReply_pending status</p> <p>'0': No RTR reply request pending</p> <p>'1': RTR reply request pending</p> <p>Default Value: 0</p> |
| 0 | MSG_AV_RTRSENT | <p>Msg Available/RTR Sent</p> <p>If RTRReply flag is set, this bit shows if an RTR auto-reply message has been sent, otherwise it indicates if the buffer contains a valid message.</p> <p>Read:</p> <p>'0': Idle</p> <p>'1': New message available (RTRreply=0), RTR auto-reply message sent (RTRreply=1).</p> <p>Write:</p> <p>'0': Idle</p> <p>'1': Acknowledges receipt of new message or transmission of RTR auto-reply message.</p> <p>Default Value: 0</p> |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying the bits[21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR_MSG | Remote Bit '1': This is an RTR message '0': This is a regular message depending on RTR_REPLY setting, 0, this field will be updated by received data/remote frame 1, this field should be set to 0 (data frame type) by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame Default Value: Undefined |

2.1.89 CAN0_CAN_RX11_CONTROL (continued)

| | | |
|---------|------------|--|
| 20 | IDE_FMT | <p>Extended Identifier Bit</p> <p>'1': This is an extended format message</p> <p>'0': This is a standard format message</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>0: Message has 0 data bytes, data[63:0] is not valid</p> <p>1: Message has 1 data byte, data[63:56] is valid</p> <p>..</p> <p>8: Message has 8 data bytes, data[63:0] is valid</p> <p>9-15: Message has 8 data bytes</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 7 | WPNL | <p>WPNL, Write Protection for bit [6:3].</p> <p>'0': Bits [6:3] are write protected,</p> <p>'1': Bits [6:3] are modified by writes.</p> <p>This WPNL bit must always be set in the same write that is modifying bits [6:3], as this bit state is not preserved.</p> <p>This bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 6 | LINK_FLAG | <p>Link Flag</p> <p>0: This buffer is not linked to the next</p> <p>1: This buffer is linked with next buffer</p> <p>Default Value: 0</p> |
| 5 | RX_INT_EBL | <p>RxIntEbl, Receive Interrupt Enable</p> <p>0: Interrupt generation is disabled</p> <p>'1': Interrupt generation is enabled</p> <p>Default Value: 0</p> |
| 4 | RTR_REPLY | <p>automatic message reply upon receipt of an RTR message</p> <p>0: Automatic RTR message handling disabled</p> <p>1: Automatic RTR message handling enabled</p> <p>when this bit is set, only RTR message can be received, by setting AMR.RTR=0, AMR.RTR=1. Otherwise, the RTR reply message content will corrupted by received non-RTR message.</p> <p>Default Value: 0</p> |
| 3 | BUFFER_EN | <p>Buffer Enable</p> <p>0: Buffer is disabled</p> <p>1: Buffer is enabled</p> <p>Default Value: 0</p> |

2.1.89 CAN0_CAN_RX11_CONTROL (continued)

| | | |
|---|----------------|---|
| 2 | RTR_ABORT | <p>RTR Abort Request</p> <p>'0': Idle</p> <p>'1': Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.</p> <p>Default Value: 0</p> |
| 1 | RTR_REPLY_PEND | <p>RTRReply_pending status</p> <p>'0': No RTR reply request pending</p> <p>'1': RTR reply request pending</p> <p>Default Value: 0</p> |
| 0 | MSG_AV_RTRSENT | <p>Msg Available/RTR Sent</p> <p>If RTRReply flag is set, this bit shows if an RTR auto-reply message has been sent, otherwise it indicates if the buffer contains a valid message.</p> <p>Read:</p> <p>'0': Idle</p> <p>'1': New message available (RTRreply=0), RTR auto-reply message sent (RTRreply=1).</p> <p>Write:</p> <p>'0': Idle</p> <p>'1': Acknowledges receipt of new message or transmission of RTR auto-reply message.</p> <p>Default Value: 0</p> |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying the bits[21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR_MSG | Remote Bit '1': This is an RTR message '0': This is a regular message depending on RTR_REPLY setting, 0, this field will be updated by received data/remote frame 1, this field should be set to 0 (data frame type) by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame Default Value: Undefined |

2.1.113 CAN0_CAN_RX14_CONTROL (continued)

| | | |
|---------|------------|---|
| 20 | IDE_FMT | <p>Extended Identifier Bit</p> <p>'1': This is an extended format message</p> <p>'0': This is a standard format message</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>0: Message has 0 data bytes, data[63:0] is notvalid</p> <p>1: Message has 1 data byte, data[63:56] is valid</p> <p>..</p> <p>8: Message has 8 data bytes, data[63:0] is valid</p> <p>9-15: Message has 8 data bytes</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 7 | WPNL | <p>WPNL, Write Protectionion for bit [6:3].</p> <p>'0': Bits [6:3] are write protected,</p> <p>'1': Bits [6:3] are modified by writes.</p> <p>This WPNL bit must always be set in the same write that is modifying bits [6:3], as this bit state is not preserved.</p> <p>This bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 6 | LINK_FLAG | <p>Link Flag</p> <p>0: This buffer is not linked to the next</p> <p>1: This buffer is linked with next buffer</p> <p>Default Value: 0</p> |
| 5 | RX_INT_EBL | <p>RxIntEbl, Receive Interrupt Enable</p> <p>0: Interrupt generation is disabled</p> <p>'1': Interrupt generation is enabled</p> <p>Default Value: 0</p> |
| 4 | RTR_REPLY | <p>automatic message reply upon receipt of an RTR message</p> <p>0: Automatic RTR message handling disabled</p> <p>1: Automatic RTR message handling enabled</p> <p>when this bit is set, only RTR message can be received, by setting AMR.RTR=0, AMR.RTR=1. Otherwise, the RTR reply message content will corrupted by received non-RTR message.</p> <p>Default Value: 0</p> |
| 3 | BUFFER_EN | <p>Buffer Enable</p> <p>0: Buffer is disabled</p> <p>1: Buffer is enabled</p> <p>Default Value: 0</p> |

2.1.113 CAN0_CAN_RX14_CONTROL (continued)

| | | |
|---|----------------|---|
| 2 | RTR_ABORT | <p>RTR Abort Request</p> <p>'0': Idle</p> <p>'1': Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.</p> <p>Default Value: 0</p> |
| 1 | RTR_REPLY_PEND | <p>RTRReply_pending status</p> <p>'0': No RTR reply request pending</p> <p>'1': RTR reply request pending</p> <p>Default Value: 0</p> |
| 0 | MSG_AV_RTRSENT | <p>Msg Available/RTR Sent</p> <p>If RTRReply flag is set, this bit shows if an RTR auto-reply message has been sent, otherwise it indicates if the buffer contains a valid message.</p> <p>Read:</p> <p>'0': Idle</p> <p>'1': New message available (RTRreply=0), RTR auto-reply message sent (RTRreply=1).</p> <p>Write:</p> <p>'0': Idle</p> <p>'1': Acknowledges receipt of new message or transmission of RTR auto-reply message.</p> <p>Default Value: 0</p> |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying the bits[21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR_MSG | Remote Bit '1': This is an RTR message '0': This is a regular message depending on RTR_REPLY setting, 0, this field will be updated by received data/remote frame 1, this field should be set to 0 (data frame type) by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame Default Value: Undefined |

2.1.137 CAN1_CAN_RX1_CONTROL (continued)

| | | |
|---------|------------|---|
| 20 | IDE_FMT | <p>Extended Identifier Bit</p> <p>'1': This is an extended format message</p> <p>'0': This is a standard format message</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>0: Message has 0 data bytes, data[63:0] is notvalid</p> <p>1: Message has 1 data byte, data[63:56] is valid</p> <p>..</p> <p>8: Message has 8 data bytes, data[63:0] is valid</p> <p>9-15: Message has 8 data bytes</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 7 | WPNL | <p>WPNL, Write Protectionion for bit [6:3].</p> <p>'0': Bits [6:3] are write protected,</p> <p>'1': Bits [6:3] are modified by writes.</p> <p>This WPNL bit must always be set in the same write that is modifying bits [6:3], as this bit state is not preserved.</p> <p>This bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 6 | LINK_FLAG | <p>Link Flag</p> <p>0: This buffer is not linked to the next</p> <p>1: This buffer is linked with next buffer</p> <p>Default Value: 0</p> |
| 5 | RX_INT_EBL | <p>RxIntEbl, Receive Interrupt Enable</p> <p>0: Interrupt generation is disabled</p> <p>'1': Interrupt generation is enabled</p> <p>Default Value: 0</p> |
| 4 | RTR_REPLY | <p>automatic message reply upon receipt of an RTR message</p> <p>0: Automatic RTR message handling disabled</p> <p>1: Automatic RTR message handling enabled</p> <p>when this bit is set, only RTR message can be received, by setting AMR.RTR=0, AMR.RTR=1. Otherwise, the RTR reply message content will corrupted by received non-RTR message.</p> <p>Default Value: 0</p> |
| 3 | BUFFER_EN | <p>Buffer Enable</p> <p>0: Buffer is disabled</p> <p>1: Buffer is enabled</p> <p>Default Value: 0</p> |

2.1.137 CAN1_CAN_RX1_CONTROL (continued)

| | | |
|---|----------------|---|
| 2 | RTR_ABORT | <p>RTR Abort Request</p> <p>'0': Idle</p> <p>'1': Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.</p> <p>Default Value: 0</p> |
| 1 | RTR_REPLY_PEND | <p>RTRReply_pending status</p> <p>'0': No RTR reply request pending</p> <p>'1': RTR reply request pending</p> <p>Default Value: 0</p> |
| 0 | MSG_AV_RTRSENT | <p>Msg Available/RTR Sent</p> <p>If RTRReply flag is set, this bit shows if an RTR auto-reply message has been sent, otherwise it indicates if the buffer contains a valid message.</p> <p>Read:</p> <p>'0': Idle</p> <p>'1': New message available (RTRreply=0), RTR auto-reply message sent (RTRreply=1).</p> <p>Write:</p> <p>'0': Idle</p> <p>'1': Acknowledges receipt of new message or transmission of RTR auto-reply message.</p> <p>Default Value: 0</p> |

| Bits | Name | Description |
|------|---------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying the bits[21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR_MSG | Remote Bit '1': This is an RTR message '0': This is a regular message depending on RTR_REPLY setting, 0, this field will be updated by received data/remote frame 1, this field should be set to 0 (data frame type) by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame Default Value: Undefined |

2.1.145 CAN1_CAN_RX2_CONTROL (continued)

| | | |
|---------|------------|--|
| 20 | IDE_FMT | <p>Extended Identifier Bit</p> <p>'1': This is an extended format message</p> <p>'0': This is a standard format message</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>0: Message has 0 data bytes, data[63:0] is not valid</p> <p>1: Message has 1 data byte, data[63:56] is valid</p> <p>..</p> <p>8: Message has 8 data bytes, data[63:0] is valid</p> <p>9-15: Message has 8 data bytes</p> <p>depending on RTR_REPLY setting,</p> <p>0, this field will be updated by received data/remote frame</p> <p>1, this field should be aligned offline and set by user in advance, will not be updated by received data/remote frame, and will be sent out in responsive data frame</p> <p>Default Value: Undefined</p> |
| 7 | WPNL | <p>WPNL, Write Protection for bit [6:3].</p> <p>'0': Bits [6:3] are write protected,</p> <p>'1': Bits [6:3] are modified by writes.</p> <p>This WPNL bit must always be set in the same write that is modifying bits [6:3], as this bit state is not preserved.</p> <p>This bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 6 | LINK_FLAG | <p>Link Flag</p> <p>0: This buffer is not linked to the next</p> <p>1: This buffer is linked with next buffer</p> <p>Default Value: 0</p> |
| 5 | RX_INT_EBL | <p>RxIntEbl, Receive Interrupt Enable</p> <p>0: Interrupt generation is disabled</p> <p>'1': Interrupt generation is enabled</p> <p>Default Value: 0</p> |
| 4 | RTR_REPLY | <p>automatic message reply upon receipt of an RTR message</p> <p>0: Automatic RTR message handling disabled</p> <p>1: Automatic RTR message handling enabled</p> <p>when this bit is set, only RTR message can be received, by setting AMR.RTR=0, AMR.RTR=1. Otherwise, the RTR reply message content will corrupted by received non-RTR message.</p> <p>Default Value: 0</p> |
| 3 | BUFFER_EN | <p>Buffer Enable</p> <p>0: Buffer is disabled</p> <p>1: Buffer is enabled</p> <p>Default Value: 0</p> |

2.1.145 CAN1_CAN_RX2_CONTROL (continued)

| | | |
|---|----------------|---|
| 2 | RTR_ABORT | <p>RTR Abort Request</p> <p>'0': Idle</p> <p>'1': Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.</p> <p>Default Value: 0</p> |
| 1 | RTR_REPLY_PEND | <p>RTRReply_pending status</p> <p>'0': No RTR reply request pending</p> <p>'1': RTR reply request pending</p> <p>Default Value: 0</p> |
| 0 | MSG_AV_RTRSENT | <p>Msg Available/RTR Sent</p> <p>If RTRReply flag is set, this bit shows if an RTR auto-reply message has been sent, otherwise it indicates if the buffer contains a valid message.</p> <p>Read:</p> <p>'0': Idle</p> <p>'1': New message available (RTRreply=0), RTR auto-reply message sent (RTRreply=1).</p> <p>Write:</p> <p>'0': Idle</p> <p>'1': Acknowledges receipt of new message or transmission of RTR auto-reply message.</p> <p>Default Value: 0</p> |

3 CAN Transmit Registers

This section discusses the CAN Transmit Registers (CAN_TX) registers. It lists all the registers in mapping tables, in address order.

3.1 Register Details

| Register Name | Address |
|--|------------|
| CAN0_CAN_TX0_CONTROL | 0x402E0020 |
| CAN0_CAN_TX0_ID | 0x402E0024 |
| CAN0_CAN_TX0_DATA_HIGH | 0x402E0028 |
| CAN0_CAN_TX0_DATA_LOW | 0x402E002C |
| CAN0_CAN_TX1_CONTROL | 0x402E0030 |
| CAN0_CAN_TX1_ID | 0x402E0034 |
| CAN0_CAN_TX1_DATA_HIGH | 0x402E0038 |
| CAN0_CAN_TX1_DATA_LOW | 0x402E003C |
| CAN0_CAN_TX2_CONTROL | 0x402E0040 |
| CAN0_CAN_TX2_ID | 0x402E0044 |
| CAN0_CAN_TX2_DATA_HIGH | 0x402E0048 |
| CAN0_CAN_TX2_DATA_LOW | 0x402E004C |
| CAN0_CAN_TX3_CONTROL | 0x402E0050 |
| CAN0_CAN_TX3_ID | 0x402E0054 |
| CAN0_CAN_TX3_DATA_HIGH | 0x402E0058 |
| CAN0_CAN_TX3_DATA_LOW | 0x402E005C |
| CAN0_CAN_TX4_CONTROL | 0x402E0060 |
| CAN0_CAN_TX4_ID | 0x402E0064 |
| CAN0_CAN_TX4_DATA_HIGH | 0x402E0068 |
| CAN0_CAN_TX4_DATA_LOW | 0x402E006C |
| CAN0_CAN_TX5_CONTROL | 0x402E0070 |
| CAN0_CAN_TX5_ID | 0x402E0074 |
| CAN0_CAN_TX5_DATA_HIGH | 0x402E0078 |
| CAN0_CAN_TX5_DATA_LOW | 0x402E007C |
| CAN0_CAN_TX6_CONTROL | 0x402E0080 |
| CAN0_CAN_TX6_ID | 0x402E0084 |
| CAN0_CAN_TX6_DATA_HIGH | 0x402E0088 |

| Register Name | Address |
|------------------------|------------|
| CAN0_CAN_TX6_DATA_LOW | 0x402E008C |
| CAN0_CAN_TX7_CONTROL | 0x402E0090 |
| CAN0_CAN_TX7_ID | 0x402E0094 |
| CAN0_CAN_TX7_DATA_HIGH | 0x402E0098 |
| CAN0_CAN_TX7_DATA_LOW | 0x402E009C |
| CAN1_CAN_TX0_CONTROL | 0x402F0020 |
| CAN1_CAN_TX0_ID | 0x402F0024 |
| CAN1_CAN_TX0_DATA_HIGH | 0x402F0028 |
| CAN1_CAN_TX0_DATA_LOW | 0x402F002C |
| CAN1_CAN_TX1_CONTROL | 0x402F0030 |
| CAN1_CAN_TX1_ID | 0x402F0034 |
| CAN1_CAN_TX1_DATA_HIGH | 0x402F0038 |
| CAN1_CAN_TX1_DATA_LOW | 0x402F003C |
| CAN1_CAN_TX2_CONTROL | 0x402F0040 |
| CAN1_CAN_TX2_ID | 0x402F0044 |
| CAN1_CAN_TX2_DATA_HIGH | 0x402F0048 |
| CAN1_CAN_TX2_DATA_LOW | 0x402F004C |
| CAN1_CAN_TX3_CONTROL | 0x402F0050 |
| CAN1_CAN_TX3_ID | 0x402F0054 |
| CAN1_CAN_TX3_DATA_HIGH | 0x402F0058 |
| CAN1_CAN_TX3_DATA_LOW | 0x402F005C |
| CAN1_CAN_TX4_CONTROL | 0x402F0060 |
| CAN1_CAN_TX4_ID | 0x402F0064 |
| CAN1_CAN_TX4_DATA_HIGH | 0x402F0068 |
| CAN1_CAN_TX4_DATA_LOW | 0x402F006C |
| CAN1_CAN_TX5_CONTROL | 0x402F0070 |
| CAN1_CAN_TX5_ID | 0x402F0074 |
| CAN1_CAN_TX5_DATA_HIGH | 0x402F0078 |
| CAN1_CAN_TX5_DATA_LOW | 0x402F007C |
| CAN1_CAN_TX6_CONTROL | 0x402F0080 |
| CAN1_CAN_TX6_ID | 0x402F0084 |
| CAN1_CAN_TX6_DATA_HIGH | 0x402F0088 |
| CAN1_CAN_TX6_DATA_LOW | 0x402F008C |
| CAN1_CAN_TX7_CONTROL | 0x402F0090 |
| CAN1_CAN_TX7_ID | 0x402F0094 |
| CAN1_CAN_TX7_DATA_HIGH | 0x402F0098 |
| CAN1_CAN_TX7_DATA_LOW | 0x402F009C |

3.1.1 CAN0_CAN_TX0_CONTROL

TxMessage Buffer control/command

Address: 0x402E0020

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|------|----------------|----------|--------|
| SW Access | None | | | | RW | RW | RW | RW |
| HW Access | None | | | | RW | RW | RW | RW |
| Name | None [7:4] | | | | WPNL | TX_INT_EB L | TX_ABORT | TX_REQ |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------|------|-----|-----|-------------|----|----|----|
| SW Access | RW | None | RW | RW | RW | | | |
| HW Access | RW | None | RW | RW | RW | | | |
| Name | WPNH | None | RTR | IDE | DLC [19:16] | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------|--|
| 23 | WPNH | WPNH, Write Protection for bits[21:16]. '0': Bit [21:16] are write protected, '1': Bit [21:16] are modified by writes. The WPNH bit must always be set in the same write that is modifying bits [21:16] as this bit state is not preserved. The readback value of this bit is undefined. Default Value: Undefined |
| 21 | RTR | Remote Bit '0': This is a standard message '1': This is an RTR message Default Value: Undefined |
| 20 | IDE | Extended Identifier Bit '0': This is a standard format message '1': This is an extended format message Default Value: Undefined |

3.1.1 CAN0_CAN_TX0_CONTROL (continued)

| | | |
|---------|------------|--|
| 19 : 16 | DLC | <p>DLC, Data Length Code</p> <p>Invalid values are transmitted as they are, but the number of data bytes is limited to eight.</p> <p>0: Message has 0 data byte, data[63:0] is not used</p> <p>1: Message has 1 data byte, data[63:56] is used</p> <p>...</p> <p>8: Message has 8 data bytes, data[63:0] is used</p> <p>9-15: Message has 8 data bytes</p> <p>Default Value: Undefined</p> |
| 3 | WPNL | <p>WPNL: Write protection for bit [2].</p> <p>'0': Bit [2] is write protected,</p> <p>'1': Bit [2] is modified by writes</p> <p>The WPNL bit must always be set in the same write that is modifying bit [2] as this bit state is not preserved.</p> <p>This WPNL bit is always zero for readback.</p> <p>Default Value: 0</p> |
| 2 | TX_INT_EBL | <p>Tx Interrupt Enable</p> <p>0: Interrupt disabled</p> <p>1: Interrupt enabled, successful message transmission sets the TxMsg</p> <p>Default Value: 0</p> |
| 1 | TX_ABORT | <p>Transmit Abort Request</p> <p>'0': idle</p> <p>'1': Requests removal of a pending message.</p> <p>The message is removed the next time an arbitration loss happens or a CAN error is detected.</p> <p>The flag is cleared when the message was removed or when the message won arbitration.</p> <p>The TxReq flag is released at the same time</p> <p>when there is a pending TX message (read out TxReq=1 and TxAbort=0), Writing TxReq=1 and TxAbort=1 has no effect.</p> <p>for SST message,when the message is aborted, the TxReq fag is cleared, but the TxAbort fag remains asserted.</p> <p>Default Value: 0</p> |
| 0 | TX_REQ | <p>TxReq, Transmit Request</p> <p>Write:</p> <p>'0': idle</p> <p>'1': Message Transmit Request5</p> <p>Read:</p> <p>'0': TxReq completed</p> <p>'1': TxReq pending</p> <p>Default Value: 0</p> |

4 Cortex-M0 Registers

This section discusses the Cortex-M0 registers. It lists all the registers in mapping tables, in address order.

4.1 Register Details

| Register Name | Address |
|----------------|------------|
| CM0_DWT_PID4 | 0xE0001FD0 |
| CM0_DWT_PID0 | 0xE0001FE0 |
| CM0_DWT_PID1 | 0xE0001FE4 |
| CM0_DWT_PID2 | 0xE0001FE8 |
| CM0_DWT_PID3 | 0xE0001FEC |
| CM0_DWT_CID0 | 0xE0001FF0 |
| CM0_DWT_CID1 | 0xE0001FF4 |
| CM0_DWT_CID2 | 0xE0001FF8 |
| CM0_DWT_CID3 | 0xE0001FFC |
| CM0_BP_PID4 | 0xE0002FD0 |
| CM0_BP_PID0 | 0xE0002FE0 |
| CM0_BP_PID1 | 0xE0002FE4 |
| CM0_BP_PID2 | 0xE0002FE8 |
| CM0_BP_PID3 | 0xE0002FEC |
| CM0_BP_CID0 | 0xE0002FF0 |
| CM0_BP_CID1 | 0xE0002FF4 |
| CM0_BP_CID2 | 0xE0002FF8 |
| CM0_BP_CID3 | 0xE0002FFC |
| CM0_SYST_CSR | 0xE000E010 |
| CM0_SYST_RVR | 0xE000E014 |
| CM0_SYST_CVR | 0xE000E018 |
| CM0_SYST_CALIB | 0xE000E01C |
| CM0_ISER | 0xE000E100 |
| CM0_ICER | 0xE000E180 |
| CM0_ISPR | 0xE000E200 |
| CM0_ICPR | 0xE000E280 |
| CM0_IPRO | 0xE000E400 |

| Register Name | Address |
|---------------|-------------|
| CM0_IPR1 | 0xE000E404 |
| CM0_IPR2 | 0xE000E408 |
| CM0_IPR3 | 0xE000E40C |
| CM0_IPR4 | 0xE000E410 |
| CM0_IPR5 | 0xE000E414 |
| CM0_IPR6 | 0xE000E418 |
| CM0_IPR7 | 0xE000E41C |
| CM0_CPUID | 0xE000ED00 |
| CM0_ICSR | 0xE000ED04 |
| CM0_AIRCR | 0xE000ED0C |
| CM0_SCR | 0xE000ED10 |
| CM0_CCR | 0xE000ED14 |
| CM0_SHPR2 | 0xE000ED1C |
| CM0_SHPR3 | 0xE000ED20 |
| CM0_SHCSR | 0xE000ED24 |
| CM0_SCS_PID4 | 0xE000EFD0 |
| CM0_SCS_PID0 | 0xE000EFE0 |
| CM0_SCS_PID1 | 0xE000EFE4 |
| CM0_SCS_PID2 | 0xE000EFE8 |
| CM0_SCS_PID3 | 0xE000EFEC |
| CM0_SCS_CID0 | 0xE000EFF0 |
| CM0_SCS_CID1 | 0xE000EFF4 |
| CM0_SCS_CID2 | 0xE000EFF8 |
| CM0_SCS_CID3 | 0xE000EFFC |
| CM0_ROM_SCS | 0xE00FF000 |
| CM0_ROM_DWT | 0xE00FF004 |
| CM0_ROM_BPU | 0xE00FF008 |
| CM0_ROM_END | 0xE00FF00C |
| CM0_ROM_CSMT | 0xE00FF0CC |
| CM0_ROM_PID4 | 0xE00FFFD0 |
| CM0_ROM_PID0 | 0xE00FFFE0 |
| CM0_ROM_PID1 | 0xE00FFFE4 |
| CM0_ROM_PID2 | 0xE00FFFE8 |
| CM0_ROM_PID3 | 0xE00FF FEC |
| CM0_ROM_CID0 | 0xE00FFFF0 |
| CM0_ROM_CID1 | 0xE00FFFF4 |
| CM0_ROM_CID2 | 0xE00FFFF8 |
| CM0_ROM_CID3 | 0xE00FFFFC |

| SW Access | None | | | | | | | R |
| HW Access | None | | | | | | | RW |
| Name | None [23:17] | | | | | | | COUNT-FLAG |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-----------|---|
| 16 | COUNTFLAG | <p>Indicates whether the counter has counted to "0" since the last read of this register: '0': counter has not counted to "0". '1': counter has counted to "0".</p> <p>COUNTFLAG is set to '1' by a count transition from "1" to "0". COUNTFLAG is cleared to '0' by a read of this register, and by any write to the SYST_CVR register. Default Value: 0</p> |
| 2 | CLKSOURCE | <p>Indicates the SysTick counter clock source: '0': SysTick uses the low frequency clock "clk_lf". For this mode to function, "clk_lf" should be less than half the frequency of "clk_sys". Note that "clk_lf" is generated by a low accuracy ILO (Internal Low power Oscillator), with a target frequency of 32.768 kHz (frequency can be as low as 15 KHz and as high as 60 kHz). '1': SysTick uses the system/processor clock "clk_sys". Default Value: 0</p> |

4.1.19 CM0_SYST_CSR (continued)

| | | |
|---|---------|---|
| 1 | TICKINT | <p>Indicates whether counting to "0" causes the status of the SysTick exception to change to pending:</p> <p>'0': count to "0" does not affect the SysTick exception status.</p> <p>'1': count to "0" changes the SysTick exception status to pending.</p> <p>Changing the value of the counter to "0" by writing zero to the SYST_CVR register to "0" never changes the status of the SysTick exception.</p> <p>Default Value: 0</p> |
| 0 | ENABLE | <p>Indicates the enabled status of the SysTick counter:</p> <p>'0': counter is disabled.</p> <p>'1': counter is operating.</p> <p>Default Value: 0</p> |

| SW Access | R | R | None | | | | | |
| HW Access | None | RW | None | | | | | |
| Name | NOREF | SKEW | None [29:24] | | | | | |

| Bits | Name | Description |
|------|-------|---|
| 31 | NOREF | <p>Indicates whether a implementation defined reference clock is provided: '0': the reference clock is provided. '1': the reference clock is not provided. When this bit is '1', the SYST_CSR.CLKSOURCE is forced to '1' and cannot be cleared to '0'.</p> <p>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '0'. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '1'. Default Value: 0</p> |
| 30 | SKEW | <p>Indicates whether the 10ms calibration value is exact: '0': 10ms calibration value is exact. '1': 10ms calibration value is inexact, because of the clock frequency.</p> <p>In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '1' (due to the low accuracy ILO). In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '0'. Default Value: X</p> |

4.1.22 CM0_SYST_CALIB (continued)

23 : 0 TENMS

Optionally, holds a reload value to be used for 10ms (100Hz) timing, subject to system clock skew errors. If this field is "0", the calibration value is not known.

In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is 0x00:00147. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is 0x00:0000.
Default Value: X

|-----------|------------------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | RW | | | | | | | |
| Name | VECTACTIVE [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|---------------------|----|----|----|-------------|----|---|------------|
| SW Access | R | | | | None | | | R |
| HW Access | RW | | | | None | | | RW |
| Name | VECTPENDING [15:12] | | | | None [11:9] | | | VECTACTIVE |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|-------------|------------|------|---------------------|----|----|----|----|
| SW Access | R | R | None | R | | | | |
| HW Access | RW | RW | None | RW | | | | |
| Name | ISRPRE-EMPT | ISRPENDING | None | VECTPENDING [20:16] | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|-------------|--------------|----|------------|------------|-------------|------------|------|
| SW Access | RW1S | None | | RW1S | RW1C | RW1S | RW1C | None |
| HW Access | RW | None | | RW | R | RW | R | None |
| Name | NMIPEND-SET | None [30:29] | | PENDSV-SET | PENDSV-CLR | PENDST-SETb | PENDST-CLR | None |

| Bits | Name | Description |
|------|------------|--|
| 31 | NMIPENDSET | Activates an NMI exception or reads back the current state. Because NMI is the highest priority exception, it activates as soon as it is registered. Default Value: 0 |
| 28 | PENDSVSET | Sets a pending PendSV interrupt or reads back the current state. Use this normally to request a context switch. Writing PENDSVSET and PENDSVCLR to '1' concurrently is UNPREDICTABLE. Default Value: 0 |
| 27 | PENDSVCLR | Clears a pending PendSV interrupt. Default Value: 0 |
| 26 | PENDSTSETb | Sets a pending SysTick or reads back the current state. Writing PENDSTSET and PENDSTCLR to '1' concurrently is UNPREDICTABLE. Default Value: 0 |
| 25 | PENDSTCLR | Clears a pending SysTick, whether set here or by the timer hardware. Default Value: 0 |

4.1.36 CM0_ICSR (continued)

| | | |
|---------|-------------|---|
| 23 | ISRPREEMPT | Indicates whether a pending exception will be serviced on exit from debug halt state. Default Value: 0 |
| 22 | ISRPENDING | Indicates if an external configurable, NVIC generated, interrupt is pending. Default Value: 0 |
| 20 : 12 | VECTPENDING | The exception number for the highest priority pending exception. 0= No pending exceptions. The pending state includes the effect of memory-mapped enable and mask registers. It does not include the PRIMASK special-purpose register qualifier. Default Value: 0 |
| 8 : 0 | VECTACTIVE | The exception number for the current executing exception. 0= Thread mode. This is the same value as IPSR[8:0] Default Value: 0 |

4.1.37 CM0_AIRCR

Application Interrupt and Reset Control Register

Address: 0xE000ED0C

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|------------------|--------------------|------|
| SW Access | None | | | | | RW1S | RW1C | None |
| HW Access | None | | | | | R | R | None |
| Name | None [7:3] | | | | | SYSRESE- TREQ | VECTCL- RACTIVE | None |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------------|-------------|----|----|----|----|---|---|
| SW Access | R | None | | | | | | |
| HW Access | None | None | | | | | | |
| Name | ENDIAN- NESS | None [14:8] | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|-----------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | VECTKEY [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|-----------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | VECTKEY [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|---------------|--|
| 31 : 16 | VECTKEY | Vector Key. The value 0x05FA must be written to this register, otherwise the register write is UNPREDICTABLE. Readback value is UNKNOWN. Default Value: X |
| 15 | ENDIANNESS | Indicates the memory system data endianness: 0 little endian 1 big endian. See Endian support on page A3-44 for more information. Default Value: 0 |
| 2 | SYSRESETREQ | System Reset Request. Writing 1 to this bit asserts a signal to request a reset by the external system. This will cause a full system reset of the CPU and all other components in the device. See Reset management on page B1-240 for more information. Default Value: 0 |
| 1 | VECTCLRACTIVE | Clears all active state information for fixed and configurable exceptions. The effect of writing a 1 to this bit if the processor is not halted in Debug state is UNPREDICTABLE. Default Value: 0 |

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------------|--|
| 4 | SEVONPEND | Determines whether an interrupt transition from inactive state to pending state is a wakeup event: 0: transitions from inactive to pending are not wakeup events. 1: transitions from inactive to pending are wakeup events. See WFE on page A6-197 for more information. Default Value: 0 |
| 2 | SLEEPDEEP | An implementation can use this bit to select DeepSleep/Hibernate power modes upon execution of WFI/WFE: 0: Select Sleep mode 1: Select DeepSleep/Hibernate (depends on PWR_CONTROL.HIBERNATE) Default Value: 0 |
| 1 | SLEEPONEXIT | Determines whether, on an exit from an ISR that returns to the base level of execution priority, the processor enters a sleep state: 0 do not enter sleep state. 1 enter sleep state. See Power management on page B1-240 for more information. Default Value: 0 |

5 CPU Sub-System Registers

This section discusses the CPU Sub-System registers. It lists all the registers in mapping tables, in address order.

5.1 Register Details

| Register Name | Address |
|---------------------------------|------------|
| CPUSS_CONFIG | 0x40100000 |
| CPUSS_SYSREQ | 0x40100004 |
| CPUSS_SYSARG | 0x40100008 |
| CPUSS_INT_SEL | 0x40100020 |
| CPUSS_INT_MODE | 0x40100024 |
| CPUSS_NMI_MODE | 0x40100028 |
| CPUSS_FLASH_CTL | 0x40100030 |
| CPUSS_RAM_CTL | 0x40100038 |
| CPUSS_DMAC_CTL | 0x4010003C |
| CPUSS_SL_CTL0 | 0x40100100 |
| CPUSS_SL_CTL1 | 0x40100104 |
| CPUSS_SL_CTL2 | 0x40100108 |

5.1.1 CPUSS_CONFIG

Configuration register

Address: 0x40100000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|-------------|
| SW Access | None | | | | | | | RW |
| HW Access | None | | | | | | | R |
| Name | None [7:1] | | | | | | | VECT_IN_RAM |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|-------------|---|
| 0 | VECT_IN_RAM | 0': Vector Table is located at 0x0000:0000 in flash '1': Vector Table is located at 0x2000:0000 in SRAM Note that vectors for RESET and FAULT are always fetched from ROM. Value in flash/RAM is ignored for these vectors. Default Value: 0 |

5.1.2 CPUSS_SYSREQ

SYSCALL control register

Address: 0x40100004

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-----------------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | SYSCALL_COMMAND [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|------------------------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | SYSCALL_COMMAND [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|-------------|-----------|---------------|------------|--------------------|--------------|----|----|
| SW Access | RW | R | R | RW | RW | None | | |
| HW Access | R | A | RW | A | R | None | | |
| Name | SYSCALL_REQ | HMASTER_0 | ROM_ACCESS_EN | PRIVILEGED | DIS_RESET_VECT_REL | None [26:24] | | |

| Bits | Name | Description |
|------|---------------|---|
| 31 | SYSCALL_REQ | CPU/DAP writes a '1' to this field to request a SystemCall. The HMASTER_0 field indicates the source of the write access. Setting this field to '1' immediate results in a NMI. The SystemCall NMI interrupt handler sets this field to '0' after servicing the request. Default Value: 0 |
| 30 | HMASTER_0 | Indicates the source of the write access to the SYSREQ register. '0': CPU write access. '1': DAP write access. HW sets this field when the SYSREQ register is written to and SYSCALL_REQ is '0' (the last time it is set is when SW sets SYSCALL_REQ from '0' to '1'). Default Value: 0 |
| 29 | ROM_ACCESS_EN | Indicates that executing from Boot ROM is enabled. HW sets this field to '1', on reset or when the SystemCall NMI vector is fetched from Boot ROM. HW sets this field to '0', when the CPU is NOT executing from either Boot or System ROM. This bit is used for debug purposes only. Default Value: 1 |

5.1.2 CPUSS_SYSREQ (continued)

| | | |
|--------|--------------------|---|
| 28 | PRIVILEGED | Indicates whether the system is in privileged ('1') or user mode ('0'). Only CPU SW executing from ROM can set this field to '1' when ROM_ACCESS_EN is '1' (the CPU is executing a SystemCall NMI interrupt handler). Any other write to this field sets is to '0'. This field is used as the AHB-Lite hprot[1] signal to implement Cypress proprietary user/privileged modes. These modes are used to enable/disable access to specific MMIO registers and memory regions. Default Value: 1 |
| 27 | DIS_RESET_VECT_REL | Disable Reset Vector fetch relocation: '0': CPU accesses to locations 0x0000:0000 - 0x0000:0007 are redirected to ROM. '1': CPU accesses to locations 0x0000:0000 - 0x0000:0007 are made to flash. Note that this field defaults to '0' on reset, ensuring actual reset vector fetches are always made to ROM. Note that this field does not affect DAP accesses. Default Value: 0 |
| 15 : 0 | SYSCALL_COMMAND | Opcode of the system call being requested. Default Value: 0 |

5.1.3 CPOSS_SYSARG

SYSARG control register

Address: 0x40100008

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | SYSCALL_ARG [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|--------------------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | SYSCALL_ARG [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|---------------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | SYSCALL_ARG [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|---------------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | None | | | | | | | |
| Name | SYSCALL_ARG [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|-------------|---|
| 31 : 0 | SYSCALL_ARG | Argument to System Call specified in SYSREQ. Semantics of argument depends on system call made. Typically a pointer to a parameter block. Default Value: 0 |

5.1.4 CPUSS_INT_SEL

Interrupt multiplexer select register

Address: 0x40100020

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|-------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI [15:8] | | | | | | | |
| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI [23:16] | | | | | | | |
| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|---|
| 31 : 0 | DSI | <p>Specifies interrupt source: '0': Fixed Function. '1': DSI.</p> <p>When changing the source of a specific interrupt, it is advised to temporarily disable the interrupt using the CM0 NVIC's CLRENA and SETENA interrupt enable clear and set registers to prevent a spurious interrupt activation. In addition, the CM0 NVIC's CLRPEND interrupt pending clear register should be used clear a pending interrupt before re-enabling the interrupt.</p> <p>Default Value: 0</p> |

5.1.5 CPUSS_INT_MODE

DSI interrupt pulse mode register

Address: 0x40100024

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|---------------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI_INT_PULSE [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|----------------------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI_INT_PULSE [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|-----------------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI_INT_PULSE [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|-----------------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | DSI_INT_PULSE [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|---------------|---|
| 31 : 0 | DSI_INT_PULSE | Specifies DSI interrupt format: '0': level sensitive; i.e. no pulse generator. '1': pulse generator on rising edge. Default Value: 0 |

5.1.6 CPUSS_NMI_MODE

DSI NMI pulse mode register

Address: 0x40100028

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|---------------|
| SW Access | None | | | | | | | RW |
| HW Access | None | | | | | | | R |
| Name | None [7:1] | | | | | | | DSI_NMI_PULSE |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|---------------|---|
| 0 | DSI_NMI_PULSE | Specifies DSI NMI format: '0': level sensitive; i.e. no pulse generator. '1': pulse generator on rising edge. Default Value: 0 |

5.1.7 CPUSS_FLASH_CTL

FLASH control register

Address: 0x40100030

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---------|------------|---|----------------|---|
| SW Access | None | | | RW | None | | RW | |
| HW Access | None | | | R | None | | R | |
| Name | None [7:5] | | | PREF_EN | None [3:2] | | FLASH_WS [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|----------------------|
| SW Access | None | | | | | | | RW |
| HW Access | None | | | | | | | RW1C |
| Name | None [15:9] | | | | | | | FLASH_INV ALIDATE |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|-------------|----|
| SW Access | None | | | | | | RW | |
| HW Access | None | | | | | | R | |
| Name | None [23:18] | | | | | | ARB [17:16] | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|------------------|--|
| 17 : 16 | ARB | Arbitration policy: "0": CPU has priority "1": DW/DMA has priority "2": Roundrobin "3": Roundrobin - sticky Default Value: 0 |
| 8 | FLASH_INVALIDATE | 1': Invalidates the content of the flash controller's buffers. Default Value: 0 |
| 4 | PREF_EN | Prefetch enable: '0': disabled. This is a desirable setting when FLASH_WS is "0" or when predictable execution behavior is required. '1': enabled. Default Value: 0 |

5.1.7 CPUSS_FLASH_CTL (continued)

| | | |
|-------|----------|--|
| 1 : 0 | FLASH_WS | <p>Amount of ROM wait states:</p> <p>"0": 0 wait states (fast flash: [0, 24] MHz system frequency, slow flash: [0, 16] MHz system frequency)</p> <p>"1": 1 wait state (fast flash: [24, 48] MHz system frequency, slow flash: [16, 32] MHz system frequency)</p> <p>"2": 2 wait states (slow flash: [32, 48] MHz system frequency)</p> <p>"3": undefined</p> <p>Default Value: 0</p> |
|-------|----------|--|

5.1.8 CPUSS_RAM_CTL

RAM control register

Address: 0x40100038

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------|----|----|----|----|----|-------------|----|

6 CapSense Sigma-Delta Registers

This section discusses the CapSense Sigma-Delta registers. It lists all the registers in mapping tables, in address order.

6.1 Register Details

| Register Name | Address |
|---------------|------------|
| CSD0_ID | 0x40280000 |
| CSD0_CONFIG | 0x40280004 |
| CSD0_IDAC | 0x40280008 |
| CSD0_COUNTER | 0x4028000C |
| CSD0_STATUS | 0x40280010 |
| CSD0_INTR | 0x40280014 |
| CSD0_INTR_SET | 0x40280018 |
| CSD0_PWM | 0x4028001C |
| CSD0_TRIM1 | 0x4028FF00 |
| CSD0_TRIM2 | 0x4028FF04 |
| CSD1_ID | 0x40290000 |
| CSD1_CONFIG | 0x40290004 |
| CSD1_IDAC | 0x40290008 |
| CSD1_COUNTER | 0x4029000C |
| CSD1_STATUS | 0x40290010 |
| CSD1_INTR | 0x40290014 |
| CSD1_INTR_SET | 0x40290018 |
| CSD1_PWM | 0x4029001C |
| CSD1_TRIM1 | 0x4029FF00 |
| CSD1_TRIM2 | 0x4029FF04 |

6.1.1 CSD0_ID

ID & Revision Number

Address: 0x40280000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | ID [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------|----|----|----|----|----|---|---|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | ID [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | REVISION [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | None | | | | | | | |
| Name | REVISION [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|----------|--|
| 31 : 16 | REVISION | the version number is 0x0001 Default Value: 1 |
| 15 : 0 | ID | the ID of CSD peripheral is 0xE0E1 Default Value: 57569 |

6.1.2 CSD0_CONFIG

Configuration and Control

Address: 0x40280004

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|------------|-----------|------------|---------------|------------|-------------|---------------|
| SW Access | RW | RW | RW1S | RW | RW | RW | RW | RW |
| HW Access | R | R | RW1C | R | R | R | R | R |
| Name | PRS_12_8 | PRS_SELECT | PRS_CLEAR | RESERVED_1 | FILTER_ENABLE | BYPASS_SEL | SAMPLE_SYNC | DSI_SAMPLE_EN |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|----------|-----------|-----------|----------|---------------|---------------------|---|--------------|
| SW Access | RW | RW | RW | RW | RW | RW | | RW |
| HW Access | R | R | R | R | R | R | | R |
| Name | COMP_PIN | COMP_MODE | REFBUF_EN | SENSE_EN | SENSE_COMP_BW | SHIELD_DELAY [10:9] | | DSI_SENSE_EN |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------------|-------------|--------------|------|---------------|------------|-----------|----------|
| SW Access | RW | RW | RW | None | RW | RW | RW | RW |
| HW Access | R | R | R | None | R | R | RW | RW |
| Name | REFBUF_DRV | SENSE_INSEL | REBUF_OUTSEL | None | SENSE_COMP_EN | RESERVED_2 | POLARITY2 | POLARITY |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------|------------|------------|--------------------|----|----|------|------------|
| SW Access | RW | RW | RW | RW | | | None | RW |
| HW Access | R | R | R | R | | | None | R |
| Name | ENABLE | RESERVED_5 | RESERVED_4 | RESERVED_3 [28:26] | | | None | REFBUF_DRV |

| Bits | Name | Description |
|--|------------|--|
| 31 | ENABLE | Master enable of the CSD IP. Must be set to 1 for any CSD operation to function. Default Value: 0 |
| 30 | RESERVED_5 | Keep this bit at the default value Default Value: 0 |
| 29 | RESERVED_4 | Keep this bit at the default value Default Value: 0 |
| 28 : 26 | RESERVED_3 | Keep this field at the default value Default Value: 0 |
| 24 : 23 | REFBUF_DRV | Current drive strength for reference buffer. Default Value: 0 |
| 0x0: OFF: Current drive mode OFF | | |

6.1.2 CSD0_CONFIG (continued)

| | | |
|----|---------------|---|
| | | 0x1: DRV_1: Lowest current drive mode |
| | | 0x2: DRV_2: Mid current drive mode |
| | | 0x3: DRV_3: Highest current drive mode |
| 22 | SENSE_INSEL | Selects how the Cmod capacitor is connected to CSD modulator Default Value: 0 |
| | | 0x0: SENSE_CHANNEL1: Direct connection from Cmod to CSD modulator; direct connection is called channel1 |
| | | 0x1: SENSE_AMUXA: Cmod capacitor is connected CSD modulator through AMUXBUS-A. |
| 21 | REBUF_OUTSEL | Selects which AMUXBUS the reference buffer connects to. Default Value: 1 |
| | | 0x0: AMUXA: Connect to AMUXBUS-A (not normally used). |
| | | 0x1: AMUXB: Connect to AMUXBUS-B (normally used for all CSD operations). |
| 19 | SENSE_COMP_EN | Turns on the sense comparator circuit. Must be done some time before enable SENSE_EN. 0: Sense comparator is powered off. 1: Sense comparator is powered on. Default Value: 0 |
| 18 | RESERVED_2 | Keep this bit at the default value Default Value: 0 |
| 17 | POLARITY2 | For normal CSD operations this field is not used. When using the IDAC's for other-than-CSD purposes, this bit controls the IDAC2 polarity only. The IDAC register below provides the same functionality through POLARITY2_MIR bit. Default Value: 0 |
| | | 0x0: VSSIO: For non-CSD application, IDAC2 will source current. |
| | | 0x1: VDDIO: For non-CSD application, IDAC2 will sink current. |
| 16 | POLARITY | Selects the polarity of the sensing operation. When using the IDAC's for other-than-CSD purposes, this bit controls the IDAC1 polarity only. The IDAC register below provides the same functionality through POLARITY1_MIR bit. Default Value: 0 |
| | | 0x0: VSSIO: Normal: sensor switching between Vssio and Cmod. For non-CSD application, IDAC1 will source current. |
| | | 0x1: VDDIO: Inverted: sensor switch between Vddio and Cmod. For non-CSD application, IDAC1 will sink current. |
| 15 | COMP_PIN | Connects either the Cmod or Csh_tank sense return line to the reference buffer comparator. This switch must be set to the same pin that is being charged up by the reference buffer (through the AMUXBUS settings in GPIO). Default Value: 0 |

6.1.2 CSD0_CONFIG (continued)

| | | |
|--------|---------------|---|
| | | 0x0: CHANNEL1: Use the sense line designated as "Channel 1"; this is normally used to connect Cmod. |
| | | 0x1: CHANNEL2: Use the sense line designated as "Channel 2"; this is normally used to connect Csh_tank. |
| 14 | COMP_MODE | Selects between charging of the Cmod/Csh_tank capacitor using the GPIO digital output buffer or the CSD reference buffer. Note that using the GPIO requires proper configuration of the GPIO pin. Default Value: 0 |
| | | 0x0: CHARGE_BUF: Use CSD Reference Buffer to charge capacitor. Capacitor must be connected to AMUXBUS-A/B (see REBUF_OUTSEL) and selected using COMP_PIN. |
| | | 0x1: CHARGE_IO: Use GPIO Driver to charge capacitor. Capacitor must be selected using COMP_PIN, and GPIO must be in AMUXBUS-B mode. |
| 13 | REFBUF_EN | Enables the reference buffer/comparator circuits for charging Cmod/Csh_tank using the mode selected in COMP_MODE. Default Value: 0 |
| 12 | SENSE_EN | Enables the sensor and shield clocks, CSD modulator output and turns on the IDAC compensation current as selected by CSD_IDAC. Default Value: 0 |
| 11 | SENSE_COMP_BW | Selects bandwidth for sensing comparator Default Value: 1 |
| | | 0x0: LOW: Lower bandwidth |
| | | 0x1: HIGH: High bandwidth (default) |
| 10 : 9 | SHIELD_DELAY | Configures the delay between shield clock and sensor clock Default Value: 0 |
| | | 0x0: OFF: Delay line is off; sensor clock = shield clock |
| | | 0x2: 50NS: shield clock is delayed by 50-100ns delay w.r.t sensor clock |
| | | 0x3: 10NS: shield clock is delayed by 10-20ns delay w.r.t sensor clock |
| 8 | DSI_SENSE_EN | DSI_SENSE_EN = 1-> sensor clock is driven directly by DSI DSI_SENSE_EN = 0-> sensor clock is driven by PRS/divide-by-2/DIRECT_CLOCK Default Value: 0 |
| 7 | PRS_12_8 | Selects between 8-bit or 12-bit PRS sequence Default Value: 0 |
| | | 0x0: 8B: 8-bit PRS sequence ($G(x)=X^8+X^4+X^3+X^2+1$, period= 255) |
| | | 0x1: 12B: 12-bit PRS sequence ($G(x)=X^{12}+X^9+X^3+X^2+1$, period=4095) |
| 6 | PRS_SELECT | Selects between PRS and divide-by-2 for sensor clock Default Value: 0 |
| | | 0x0: DIV2: divide-by-2 is source of sensor clock |

6.1.2 CSD0_CONFIG (continued)

| | | |
|---|---------------|--|
| | | 0x1: PRS: PRS is source of sensor clock |
| 5 | PRS_CLEAR | When set, forces the pseudo-random generator to it's initial state. Note that it may take some time for this setting to take effect depending on the clock frequency used for clk_csd1. Hardware clears this bit at the same time PRS is cleared. Default Value: 0 |
| 4 | RESERVED_1 | Keep this bit at the default value Default Value: 0 |
| 3 | FILTER_ENABLE | Enables the digital filtering on the CSD comparator Default Value: 0 |
| | | 0x0: FILTER_OFF: Digital Filter is OFF and has no effect. |
| | | 0x1: FILTER_ON: Digital Filter is ON. The digital filter disables the IDAC and sample COUNTER, regardless of CSD comparator state, for 1 clk_csd2 clock cycle after the start of each measurement and from the first comparator trip to the end of each measurement. |
| 2 | BYPASS_SEL | Selects the source of sensor clock. Default Value: 0 |
| | | 0x0: PRS_OR_DIV2: Select divide-by-2 or pseudo-random sequence as source of sensor clock(see PRS_SELECT) |
| | | 0x1: DIRECT_CLOCK: Selects clk_csd1 directly as source of sensor clock |
| 1 | SAMPLE_SYNC | Enables double synchronizing of sample input from DSI (only relevant when DSI_SAMPLE_EN=1). Default Value: 1 |
| 0 | DSI_SAMPLE_EN | DSI_SAMPLE_EN = 1 -> COUNTER will count the samples generated by DSI DSI_SAMPLE_EN = 0 -> COUNTER will count the samples generated by CSD modulator Default Value: 0 |

6.1.3 CSD0_IDAC

IDAC Configuration

Address: 0x40280008

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------|---------------|------|---------------|------|--------------|--------------------|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | IDAC1 [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | None | | | RW | None | RW | RW | |
| HW Access | None | | | A | None | R | R | |
| Name | None [15:13] | | | POLARITY1_MIR | None | IDAC1_RA_NGE | IDAC1_MODE [9:8] | |
| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SW Access | None | RW | | | | | | |
| HW Access | None | R | | | | | | |
| Name | None | IDAC2 [22:16] | | | | | | |
| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| SW Access | None | RW | None | RW | None | RW | RW | |
| HW Access | None | R | None | A | None | R | R | |
| Name | None | FEEDBACK_MODE | None | POLARITY2_MIR | None | IDAC2_RA_NGE | IDAC2_MODE [25:24] | |

| Bits | Name | Description |
|------|---------------|---|
| 30 | FEEDBACK_MODE | This bit controls whether, during CSD operation, the IDAC is controlled from the sampling flip-flop or directly from the comparator. Default Value: 0 0x0: FLOP: Use feedback from sampling flip-flop (used in most modes). 0x1: COMP: Use feedback from comparator directly (used in single Cmod mutual cap sensing only) |
| 28 | POLARITY2_MIR | Mirror bit for POLARITY2 bit in CONFIG register Default Value: 0 |
| 26 | IDAC2_RANGE | Current multiplier setting for IDAC2. Default Value: 0 0x0: 4X: Use 4X gain setting. 0x1: 8X: Use 8X gain setting. |

6.1.3 CSD0_IDAC (continued)

| | | |
|---------|---------------|--|
| 25 : 24 | IDAC2_MODE | <p>Controls the usage mode of IDAC2 Default Value: 0</p> <p>0x0: OFF: IDAC2 is not used.</p> <p>0x1: FIXED: IDAC2 is active whenever CSD_CONFIG.SENSE_EN is asserted.</p> <p>0x2: VARIABLE: IDAC2 is switched on and off depending on the result of the comparator.</p> <p>0x3: DSI: IDAC2 is controlled from dsi input dsi_idac2_en. IDAC_SWAP in CSD_Regs is obsolete and IDAC2 is on AMUXBUSB. When IDAC2_MODE=3, HVIDAC is selected, and when IDAC2_MODE= 1/2, LVIDAC is selected</p> |
| 22 : 16 | IDAC2 | <p>Current setting for IDAC2 (7 bits). Default Value: 0</p> |
| 12 | POLARITY1_MIR | <p>Mirror bit for POLARITY bit in CONFIG register Default Value: 0</p> |
| 10 | IDAC1_RANGE | <p>Current multiplier setting for IDAC1. Default Value: 0</p> <p>0x0: 4X: Use 4X gain setting.</p> <p>0x1: 8X: Use 8X gain setting.</p> |
| 9 : 8 | IDAC1_MODE | <p>Controls the usage mode of IDAC1 Default Value: 0</p> <p>0x0: OFF: IDAC1 is not used.</p> <p>0x1: FIXED: IDAC1 is active whenever CSD_CONFIG.SENSE_EN is asserted.</p> <p>0x2: VARIABLE: IDAC1 is switched on and off depending on the result of the comparator.</p> <p>0x3: DSI: IDAC1 is controlled from dsi input dsi_idac1_en. IDAC_SWAP in CSD_Regs is Obsolete, and now IDAC1 is on AMUXBUSB. When IDAC1_MODE=3, HVIDAC is selected, and when IDAC1_MODE= 1/2, LVIDAC is selected</p> |
| 7 : 0 | IDAC1 | <p>Current setting for IDAC1 (8 bits). Default Value: 0</p> |

6.1.4 CSD0_COUNTER

CSD Counter Register

Address: 0x4028000C

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|---------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | COUNTER [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|----------------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | COUNTER [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|----------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | PERIOD [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|----------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | PERIOD [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|---------|--|
| 31 : 16 | PERIOD | <p>The remaining period (in clk_csd2 cycles) during which COUNTER will count the samples generated by CSD modulator or DSI.</p> <p>Firmware will write this field to the desired period, after which it will start counting down to 0. Upon completion of the sense operation, this field will be 0. Writing a non-0 value to this register initiates a sensing operation. It is assumed that the modulation is properly configured, all pins are properly selected and configured and that sense currents are flowing before this field is written.</p> <p>Default Value: 0</p> |
| 15 : 0 | COUNTER | <p>This is 16-bit sample counter. Firmware typically writes 0 to this field whenever a new sense operation is initiated by writing a non-0 value to PERIOD.</p> <p>Default Value: 0</p> |

6.1.5 CSD0_STATUS

Status Register

Address: 0x40280010

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|--------|----------|-----------|------------|
| SW Access | None | | | | R | R | R | R |
| HW Access | None | | | | RW | RW | RW | RW |
| Name | None [7:4] | | | | SAMPLE | COMP_OUT | CSD_SENSE | CSD_CHARGE |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------------|---|
| 3 | SAMPLE | Only for Debug/test purpose the output status of CSD modulator can be read by CPU Default Value: 0 |
| 2 | COMP_OUT | Only for Debug/test purpose the output status of CSD comparator can be read by CPU Default Value: 0 0x0: C_LT_VREF: Ctank < Vref 0x1: C_GT_VREF: Ctank > Vref |
| 1 | CSD_SENSE | Only for Debug/test purpose this internal signal (sensor clock) status can be read by CPU Default Value: 0 |
| 0 | CSD_CHARGE | Only for Debug/test purpose this internal signal status can be read by CPU. During shield operation if GPIO is used to charge/discharge the Cmod/Ctank capacitors, the charging/discharging status is available Default Value: 0 |

6.1.6 CSD0_INTR

CSD Interrupt Request Register

Address: 0x40280014

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|------|
| SW Access | None | | | | | | | RW1C |
| HW Access | None | | | | | | | RW1S |
| Name | None [7:1] | | | | | | | CSD |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------|--|
| 0 | CSD | The CSD Interrupt request (IRQ) bit is set. Firmware must clear this bit as part of the interrupt handler. Default Value: 0 |

6.1.7 CSD0_INTR_SET

CSD Interrupt set register

Address: 0x40280018

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|------|
| SW Access | None | | | | | | | RW1S |
| HW Access | None | | | | | | | A |
| Name | None [7:1] | | | | | | | CSD |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------|---|
| 0 | CSD | Only for debug/test purpose this field can be set to '1' to set corresponding bit in interrupt request register INTR. Default Value: 0 |

6.1.8 CSD0_PWM

CSD PWM Register

Address: 0x4028001C

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---------------|---|-----------------|---|---|---|
| SW Access | None | | RW | | RW | | | |
| HW Access | None | | R | | R | | | |
| Name | None [7:6] | | PWM_SEL [5:4] | | PWM_COUNT [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|-----------|---|
| 5 : 4 | PWM_SEL | The mode of the PWM modulator Default Value: 0 0x0: OFF: The PWM modulator is OFF and it has no effect on sensor clock generated by PRS/divide-by-2 0x2: FIXED_HIGH: The PWM modulator changes the low phase of sensor clock to a fixed length (used during negative charge transfer mode). 0x3: FIXED_LOW: The PWM modulator changes the high phase of sensor clock to a fixed length (used during positive charge transfer mode). |
| 3 : 0 | PWM_COUNT | Pulse width modulation can be used to change the length of sensor clock pulse (low time/high time) when using PRS/Divide-by-2 as source of sensor clock. The length of the sensor clock pulse low/high time is multiples of clk_csd2 cycles. Default Value: 0 |

6.1.9 CSD0_TRIM1

CSD Trim Register

Address: 0x4028FF00

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------------------|---|---|---|----------------------|---|---|---|
| SW Access | RW | | | | RW | | | |
| HW Access | R | | | | R | | | |
| Name | IDAC2_SRC_TRIM [7:4] | | | | IDAC1_SRC_TRIM [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

| SW Access | RW | RW | RW | RW | | | None | RW |
| HW Access | R | R | R | R | | | None | R |
| Name | ENABLE | RESERVED_5 | RESERVED_4 | RESERVED_3 [28:26] | | | None | REFBUF_DRV |

| Bits | Name | Description |
|--|------------|--|
| 31 | ENABLE | Master enable of the CSD IP. Must be set to 1 for any CSD operation to function. Default Value: 0 |
| 30 | RESERVED_5 | Keep this bit at the default value Default Value: 0 |
| 29 | RESERVED_4 | Keep this bit at the default value Default Value: 0 |
| 28 : 26 | RESERVED_3 | Keep this field at the default value Default Value: 0 |
| 24 : 23 | REFBUF_DRV | Current drive strength for reference buffer. Default Value: 0 |
| 0x0: OFF: Current drive mode OFF | | |

6.1.12 CSD1_CONFIG (continued)

| | | |
|----|---------------|---|
| | | 0x1: DRV_1: Lowest current drive mode |
| | | 0x2: DRV_2: Mid current drive mode |
| | | 0x3: DRV_3: Highest current drive mode |
| 22 | SENSE_INSEL | Selects how the Cmod capacitor is connected to CSD modulator Default Value: 0 |
| | | 0x0: SENSE_CHANNEL1: Direct connection from Cmod to CSD modulator; direct connection is called channel1 |
| | | 0x1: SENSE_AMUXA: Cmod capacitor is connected CSD modulator through AMUXBUS-A. |
| 21 | REBUF_OUTSEL | Selects which AMUXBUS the reference buffer connects to. Default Value: 1 |
| | | 0x0: AMUXA: Connect to AMUXBUS-A (not normally used). |
| | | 0x1: AMUXB: Connect to AMUXBUS-B (normally used for all CSD operations). |
| 19 | SENSE_COMP_EN | Turns on the sense comparator circuit. Must be done some time before enable SENSE_EN. 0: Sense comparator is powered off. 1: Sense comparator is powered on. Default Value: 0 |
| 18 | RESERVED_2 | Keep this bit at the default value Default Value: 0 |
| 17 | POLARITY2 | For normal CSD operations this field is not used. When using the IDAC's for other-than-CSD purposes, this bit controls the IDAC2 polarity only. The IDAC register below provides the same functionality through POLARITY2_MIR bit. Default Value: 0 |
| | | 0x0: VSSIO: For non-CSD application, IDAC2 will source current. |
| | | 0x1: VDDIO: For non-CSD application, IDAC2 will sink current. |
| 16 | POLARITY | Selects the polarity of the sensing operation. When using the IDAC's for other-than-CSD purposes, this bit controls the IDAC1 polarity only. The IDAC register below provides the same functionality through POLARITY1_MIR bit. Default Value: 0 |
| | | 0x0: VSSIO: Normal: sensor switching between Vssio and Cmod. For non-CSD application, IDAC1 will source current. |
| | | 0x1: VDDIO: Inverted: sensor switch between Vddio and Cmod. For non-CSD application, IDAC1 will sink current. |
| 15 | COMP_PIN | Connects either the Cmod or Csh_tank sense return line to the reference buffer comparator. This switch must be set to the same pin that is being charged up by the reference buffer (through the AMUXBUS settings in GPIO). Default Value: 0 |

6.1.12 CSD1_CONFIG (continued)

| | | |
|--------|---------------|---|
| | | 0x0: CHANNEL1: Use the sense line designated as "Channel 1"; this is normally used to connect Cmod. |
| | | 0x1: CHANNEL2: Use the sense line designated as "Channel 2"; this is normally used to connect Csh_tank. |
| 14 | COMP_MODE | Selects between charging of the Cmod/Csh_tank capacitor using the GPIO digital output buffer or the CSD reference buffer. Note that using the GPIO requires proper configuration of the GPIO pin. Default Value: 0 |
| | | 0x0: CHARGE_BUF: Use CSD Reference Buffer to charge capacitor. Capacitor must be connected to AMUXBUS-A/B (see REBUF_OUTSEL) and selected using COMP_PIN. |
| | | 0x1: CHARGE_IO: Use GPIO Driver to charge capacitor. Capacitor must be selected using COMP_PIN, and GPIO must be in AMUXBUS-B mode. |
| 13 | REFBUF_EN | Enables the reference buffer/comparator circuits for charging Cmod/Csh_tank using the mode selected in COMP_MODE. Default Value: 0 |
| 12 | SENSE_EN | Enables the sensor and shield clocks, CSD modulator output and turns on the IDAC compensation current as selected by CSD_IDAC. Default Value: 0 |
| 11 | SENSE_COMP_BW | Selects bandwidth for sensing comparator Default Value: 1 |
| | | 0x0: LOW: Lower bandwidth |
| | | 0x1: HIGH: High bandwidth (default) |
| 10 : 9 | SHIELD_DELAY | Configures the delay between shield clock and sensor clock Default Value: 0 |
| | | 0x0: OFF: Delay line is off; sensor clock = shield clock |
| | | 0x2: 50NS: shield clock is delayed by 50-100ns delay w.r.t sensor clock |
| | | 0x3: 10NS: shield clock is delayed by 10-20ns delay w.r.t sensor clock |
| 8 | DSI_SENSE_EN | DSI_SENSE_EN = 1-> sensor clock is driven directly by DSI DSI_SENSE_EN = 0-> sensor clock is driven by PRS/divide-by-2/DIRECT_CLOCK Default Value: 0 |
| 7 | PRS_12_8 | Selects between 8-bit or 12-bit PRS sequence Default Value: 0 |
| | | 0x0: 8B: 8-bit PRS sequence ($G(x)=X^8+X^4+X^3+X^2+1$, period= 255) |
| | | 0x1: 12B: 12-bit PRS sequence ($G(x)=X^{12}+X^9+X^3+X^2+1$, period=4095) |
| 6 | PRS_SELECT | Selects between PRS and divide-by-2 for sensor clock Default Value: 0 |
| | | 0x0: DIV2: divide-by-2 is source of sensor clock |

6.1.12 CSD1_CONFIG (continued)

| | | |
|---|---------------|--|
| | | 0x1: PRS: PRS is source of sensor clock |
| 5 | PRS_CLEAR | When set, forces the pseudo-random generator to it's initial state. Note that it may take some time for this setting to take effect depending on the clock frequency used for clk_csd1. Hardware clears this bit at the same time PRS is cleared. Default Value: 0 |
| 4 | RESERVED_1 | Keep this bit at the default value Default Value: 0 |
| 3 | FILTER_ENABLE | Enables the digital filtering on the CSD comparator Default Value: 0 |
| | | 0x0: FILTER_OFF: Digital Filter is OFF and has no effect. |
| | | 0x1: FILTER_ON: Digital Filter is ON. The digital filter disables the IDAC and sample COUNTER, regardless of CSD comparator state, for 1 clk_csd2 clock cycle after the start of each measurement and from the first comparator trip to the end of each measurement. |
| 2 | BYPASS_SEL | Selects the source of sensor clock. Default Value: 0 |
| | | 0x0: PRS_OR_DIV2: Select divide-by-2 or pseudo-random sequence as source of sensor clock(see PRS_SELECT) |
| | | 0x1: DIRECT_CLOCK: Selects clk_csd1 directly as source of sensor clock |
| 1 | SAMPLE_SYNC | Enables double synchronizing of sample input from DSI (only relevant when DSI_SAMPLE_EN=1). Default Value: 1 |
| 0 | DSI_SAMPLE_EN | DSI_SAMPLE_EN = 1 -> COUNTER will count the samples generated by DSI DSI_SAMPLE_EN = 0 -> COUNTER will count the samples generated by CSD modulator Default Value: 0 |

6.1.13 CSD1_IDAC

IDAC Configuration

Address: 0x40290008

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------|---------------|------|---------------|------|--------------|--------------------|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | IDAC1 [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | None | | | RW | None | RW | RW | |
| HW Access | None | | | A | None | R | R | |
| Name | None [15:13] | | | POLARITY1_MIR | None | IDAC1_RA_NGE | IDAC1_MODE [9:8] | |
| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SW Access | None | RW | | | | | | |
| HW Access | None | R | | | | | | |
| Name | None | IDAC2 [22:16] | | | | | | |
| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| SW Access | None | RW | None | RW | None | RW | RW | |
| HW Access | None | R | None | A | None | R | R | |
| Name | None | FEEDBACK_MODE | None | POLARITY2_MIR | None | IDAC2_RA_NGE | IDAC2_MODE [25:24] | |

| Bits | Name | Description |
|------|---------------|---|
| 30 | FEEDBACK_MODE | This bit controls whether, during CSD operation, the IDAC is controlled from the sampling flip-flop or directly from the comparator. Default Value: 0 0x0: FLOP: Use feedback from sampling flip-flop (used in most modes). 0x1: COMP: Use feedback from comparator directly (used in single Cmod mutual cap sensing only) |
| 28 | POLARITY2_MIR | Mirror bit for POLARITY2 bit in CONFIG register Default Value: 0 |
| 26 | IDAC2_RANGE | Current multiplier setting for IDAC2. Default Value: 0 0x0: 4X: Use 4X gain setting. 0x1: 8X: Use 8X gain setting. |

6.1.13 CSD1_IDAC (continued)

| | | |
|---------|---------------|--|
| 25 : 24 | IDAC2_MODE | <p>Controls the usage mode of IDAC2 Default Value: 0</p> <p>0x0: OFF: IDAC2 is not used.</p> <p>0x1: FIXED: IDAC2 is active whenever CSD_CONFIG.SENSE_EN is asserted.</p> <p>0x2: VARIABLE: IDAC2 is switched on and off depending on the result of the comparator.</p> <p>0x3: DSI: IDAC2 is controlled from dsi input dsi_idac2_en. IDAC_SWAP in CSD_Regs is obsolete and IDAC2 is on AMUXBUSB. When IDAC2_MODE=3, HVIDAC is selected, and when IDAC2_MODE= 1/2, LVIDAC is selected</p> |
| 22 : 16 | IDAC2 | <p>Current setting for IDAC2 (7 bits). Default Value: 0</p> |
| 12 | POLARITY1_MIR | <p>Mirror bit for POLARITY bit in CONFIG register Default Value: 0</p> |
| 10 | IDAC1_RANGE | <p>Current multiplier setting for IDAC1. Default Value: 0</p> <p>0x0: 4X: Use 4X gain setting.</p> <p>0x1: 8X: Use 8X gain setting.</p> |
| 9 : 8 | IDAC1_MODE | <p>Controls the usage mode of IDAC1 Default Value: 0</p> <p>0x0: OFF: IDAC1 is not used.</p> <p>0x1: FIXED: IDAC1 is active whenever CSD_CONFIG.SENSE_EN is asserted.</p> <p>0x2: VARIABLE: IDAC1 is switched on and off depending on the result of the comparator.</p> <p>0x3: DSI: IDAC1 is controlled from dsi input dsi_idac1_en. IDAC_SWAP in CSD_Regs is Obsolete, and now IDAC1 is on AMUXBUSB. When IDAC1_MODE=3, HVIDAC is selected, and when IDAC1_MODE= 1/2, LVIDAC is selected</p> |
| 7 : 0 | IDAC1 | <p>Current setting for IDAC1 (8 bits). Default Value: 0</p> |

6.1.14 CSD1_COUNTER

CSD Counter Register

Address: 0x4029000C

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|---------------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | COUNTER [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|----------------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | COUNTER [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|----------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | PERIOD [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|----------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | A | | | | | | | |
| Name | PERIOD [31:24] | | | | | | | |

| Bits | Name | Description |
|---------|---------|--|
| 31 : 16 | PERIOD | <p>The remaining period (in clk_csd2 cycles) during which COUNTER will count the samples generated by CSD modulator or DSI.</p> <p>Firmware will write this field to the desired period, after which it will start counting down to 0. Upon completion of the sense operation, this field will be 0. Writing a non-0 value to this register initiates a sensing operation. It is assumed that the modulation is properly configured, all pins are properly selected and configured and that sense currents are flowing before this field is written.</p> <p>Default Value: 0</p> |
| 15 : 0 | COUNTER | <p>This is 16-bit sample counter. Firmware typically writes 0 to this field whenever a new sense operation is initiated by writing a non-0 value to PERIOD.</p> <p>Default Value: 0</p> |

6.1.15 CSD1_STATUS

Status Register

Address: 0x40290010

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|--------|----------|-----------|------------|
| SW Access | None | | | | R | R | R | R |
| HW Access | None | | | | RW | RW | RW | RW |
| Name | None [7:4] | | | | SAMPLE | COMP_OUT | CSD_SENSE | CSD_CHARGE |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------------|---|
| 3 | SAMPLE | Only for Debug/test purpose the output status of CSD modulator can be read by CPU Default Value: 0 |
| 2 | COMP_OUT | Only for Debug/test purpose the output status of CSD comparator can be read by CPU Default Value: 0 0x0: C_LT_VREF: Ctank < Vref 0x1: C_GT_VREF: Ctank > Vref |
| 1 | CSD_SENSE | Only for Debug/test purpose this internal signal (sensor clock) status can be read by CPU Default Value: 0 |
| 0 | CSD_CHARGE | Only for Debug/test purpose this internal signal status can be read by CPU. During shield operation if GPIO is used to charge/discharge the Cmod/Ctank capacitors, the charging/discharging status is available Default Value: 0 |

6.1.16 CSD1_INTR

CSD Interrupt Request Register

Address: 0x40290014

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|------|
| SW Access | None | | | | | | | RW1C |
| HW Access | None | | | | | | | RW1S |
| Name | None [7:1] | | | | | | | CSD |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------|--|
| 0 | CSD | The CSD Interrupt request (IRQ) bit is set. Firmware must clear this bit as part of the interrupt handler. Default Value: 0 |

6.1.17 CSD1_INTR_SET

CSD Interrupt set register

Address: 0x40290018

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---|---|---|---|---|------|
| SW Access | None | | | | | | | RW1S |
| HW Access | None | | | | | | | A |
| Name | None [7:1] | | | | | | | CSD |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|------|---|
| 0 | CSD | Only for debug/test purpose this field can be set to '1' to set corresponding bit in interrupt request register INTR. Default Value: 0 |

6.1.18 CSD1_PWM

CSD PWM Register

Address: 0x4029001C

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|------------|---|---------------|---|-----------------|---|---|---|
| SW Access | None | | RW | | RW | | | |
| HW Access | None | | R | | R | | | |
| Name | None [7:6] | | PWM_SEL [5:4] | | PWM_COUNT [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|-----------|---|
| 5 : 4 | PWM_SEL | The mode of the PWM modulator Default Value: 0 0x0: OFF: The PWM modulator is OFF and it has no effect on sensor clock generated by PRS/divide-by-2 0x2: FIXED_HIGH: The PWM modulator changes the low phase of sensor clock to a fixed length (used during negative charge transfer mode). 0x3: FIXED_LOW: The PWM modulator changes the high phase of sensor clock to a fixed length (used during positive charge transfer mode). |
| 3 : 0 | PWM_COUNT | Pulse width modulation can be used to change the length of sensor clock pulse (low time/high time) when using PRS/Divide-by-2 as source of sensor clock. The length of the sensor clock pulse low/high time is multiples of clk_csd2 cycles. Default Value: 0 |

6.1.19 CSD1_TRIM1

CSD Trim Register

Address: 0x4029FF00

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------------------|---|---|---|----------------------|---|---|---|
| SW Access | RW | | | | RW | | | |
| HW Access | R | | | | R | | | |
| Name | IDAC2_SRC_TRIM [7:4] | | | | IDAC1_SRC_TRIM [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|----------------|---|
| 7 : 4 | IDAC2_SRC_TRIM | IDAC2 trim bits for gain control in current source mode Default Value: 0 |
| 3 : 0 | IDAC1_SRC_TRIM | IDAC1 trim bits for gain control in current source mode Default Value: 0 |

6.1.20 CSD1_TRIM2

CSD Trim Register

Address: 0x4029FF04

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------------------|---|---|---|----------------------|---|---|---|
| SW Access | RW | | | | RW | | | |
| HW Access | R | | | | R | | | |
| Name | IDAC2_SNK_TRIM [7:4] | | | | IDAC1_SNK_TRIM [3:0] | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-------------|----|----|----|----|----|---|---|
| SW Access | None | | | | | | | |

| Bits | Name | Description |
|-------|----------------|---|
| 7 : 4 | IDAC2_SNK_TRIM | IDAC2 trim bits for gain control in current sink mode Default Value: 0 |
| 3 : 0 | IDAC1_SNK_TRIM | IDAC1 trim bits for gain control in current sink mode Default Value: 0 |

7 Continuous Time Block Mini Registers

This section discusses the Continuous Time Block Mini registers. It lists all the registers in mapping tables, in address order.

7.1 Register Details

| Register Name | Address |
|---|------------|
| CTBM0_CTB_CTRL | 0x40300000 |
| CTBM0_OA_RES0_CTRL | 0x40300004 |
| CTBM0_OA_RES1_CTRL | 0x40300008 |
| CTBM0_COMP_STAT | 0x4030000C |
| CTBM0_INTR | 0x40300020 |
| CTBM0_INTR_SET | 0x40300024 |
| CTBM0_INTR_MASK | 0x40300028 |
| CTBM0_INTR_MASKED | 0x4030002C |
| CTBM0_OA0_SW | 0x40300080 |
| CTBM0_OA0_SW_CLEAR | 0x40300084 |
| CTBM0_OA1_SW | 0x40300088 |
| CTBM0_OA1_SW_CLEAR | 0x4030008C |
| CTBM0_CTB_SW_HW_CTRL | 0x403000C0 |
| CTBM0_CTB_SW_STATUS | 0x403000C4 |
| CTBM0_OA0_OFFSET_TRIM | 0x40300F00 |
| CTBM0_OA0_SLOPE_OFFSET_TRIM | 0x40300F04 |
| CTBM0_OA0_COMP_TRIM | 0x40300F08 |
| CTBM0_OA1_OFFSET_TRIM | 0x40300F0C |
| CTBM0_OA1_SLOPE_OFFSET_TRIM | 0x40300F10 |
| CTBM0_OA1_COMP_TRIM | 0x40300F14 |
| CTBM1_CTB_CTRL | 0x40310000 |
| CTBM1_OA_RES0_CTRL | 0x40310004 |
| CTBM1_OA_RES1_CTRL | 0x40310008 |
| CTBM1_COMP_STAT | 0x4031000C |
| CTBM1_INTR | 0x40310020 |
| CTBM1_INTR_SET | 0x40310024 |
| CTBM1_INTR_MASK | 0x40310028 |

| Register Name | Address |
|-----------------------------|------------|
| CTBM1_INTR_MASKED | 0x4031002C |
| CTBM1_OA0_SW | 0x40310080 |
| CTBM1_OA0_SW_CLEAR | 0x40310084 |
| CTBM1_OA1_SW | 0x40310088 |
| CTBM1_OA1_SW_CLEAR | 0x4031008C |
| CTBM1_CTB_SW_HW_CTRL | 0x403100C0 |
| CTBM1_CTB_SW_STATUS | 0x403100C4 |
| CTBM1_OA0_OFFSET_TRIM | 0x40310F00 |
| CTBM1_OA0_SLOPE_OFFSET_TRIM | 0x40310F04 |
| CTBM1_OA0_COMP_TRIM | 0x40310F08 |
| CTBM1_OA1_OFFSET_TRIM | 0x40310F0C |
| CTBM1_OA1_SLOPE_OFFSET_TRIM | 0x40310F10 |
| CTBM1_OA1_COMP_TRIM | 0x40310F14 |

7.1.1 CTBM0_CTBM_CTRL

global CTB and power control

Address: 0x40300000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------|----------------|--------------|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |
| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |
| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| SW Access | RW | RW | None | | | | | |
| HW Access | R | R | None | | | | | |
| Name | ENABLED | DEEPSLEEP_P_ON | None [29:24] | | | | | |

| Bits | Name | Description |
|------|--------------|--|
| 31 | ENABLED | - 0: CTB IP disabled (put analog in power down, open all switches) - 1: CTB IP enabled Default Value: 0 |
| 30 | DEEPSLEEP_ON | - 0: CTB IP disabled off during DeepSleep power mode - 1: CTB IP remains enabled during DeepSleep power mode (if ENABLED=1) Default Value: 0 |

7.1.2 CTBM0_OA_RES0_CTRL

Opamp0 and resistor0 control

Address: 0x40300004

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|---------------|---------------------|-------------|-------------|------|-------------------|--------------------|---|
| SW Access | RW | RW | RW | RW | None | RW | RW | |
| HW Access | R | R | R | R | None | R | R | |
| Name | OA0_DSI_LEVEL | OA0_BYPASS_DSI_SYNC | OA0_HYST_EN | OA0_COMP_EN | None | OA0_DRIVE_STR_SEL | OA0_PWR_MODE [1:0] | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|--------------|----|----|----|-------------|------|-------------------|---|
| SW Access | None | | | | RW | None | RW | |
| HW Access | None | | | | R | None | R | |
| Name | None [15:12] | | | | OA0_PUMP_EN | None | OA0_COMPINT [9:8] | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|-------|---------------|---|
| 11 | OA0_PUMP_EN | Opamp0 pump enable Default Value: 0 |
| 9 : 8 | OA0_COMPINT | Opamp0 comparator edge detect Default Value: 0 0x0: DISABLE: Disabled, no interrupts will be detected 0x1: RISING: Rising edge 0x2: FALLING: Falling edge 0x3: BOTH: Both rising and falling edges |
| 7 | OA0_DSI_LEVEL | Opamp0 comparator DSI (trigger) out level : 0=pulse, 1=level Default Value: 0 |

7.1.2 CTBM0_OA_RES0_CTRL (continued)

| | | |
|-------|---------------------|---|
| 6 | OA0_BYPASS_DSI_SYNC | Opamp0 bypass comparator output synchronization for DSI (trigger) output: 0=synchronize (level or pulse), 1=bypass (output async) Default Value: 0 |
| 5 | OA0_HYST_EN | Opamp0 hysteresis enable (10mV) Default Value: 0 |
| 4 | OA0_COMP_EN | Opamp0 comparator enable Default Value: 0 |
| 2 | OA0_DRIVE_STR_SEL | Opamp0 output strength select 0=1x, 1=10x Default Value: 0 |
| 1 : 0 | OA0_PWR_MODE | Opamp0 power level: 0=off Default Value: 0 |

8 Direct-Memory Access Registers

This section discusses the Direct-Memory Access registers. It lists all the registers in mapping tables, in address order.

8.1 Register Details

| Register Name | Address |
|----------------------|------------|
| DMAC_CTL | 0x40101000 |
| DMAC_STATUS | 0x40101010 |
| DMAC_STATUS_SRC_ADDR | 0x40101014 |
| DMAC_STATUS_DST_ADDR | 0x40101018 |
| DMAC_STATUS_CH_ACT | 0x4010101C |
| DMAC_CH_CTL0 | 0x40101080 |
| DMAC_CH_CTL1 | 0x40101084 |
| DMAC_CH_CTL2 | 0x40101088 |
| DMAC_CH_CTL3 | 0x4010108C |
| DMAC_CH_CTL4 | 0x40101090 |
| DMAC_CH_CTL5 | 0x40101094 |
| DMAC_CH_CTL6 | 0x40101098 |
| DMAC_CH_CTL7 | 0x4010109C |
| DMAC_CH_CTL8 | 0x401010A0 |
| DMAC_CH_CTL9 | 0x401010A4 |
| DMAC_CH_CTL10 | 0x401010A8 |
| DMAC_CH_CTL11 | 0x401010AC |
| DMAC_CH_CTL12 | 0x401010B0 |
| DMAC_CH_CTL13 | 0x401010B4 |
| DMAC_CH_CTL14 | 0x401010B8 |
| DMAC_CH_CTL15 | 0x401010BC |
| DMAC_CH_CTL16 | 0x401010C0 |
| DMAC_CH_CTL17 | 0x401010C4 |
| DMAC_CH_CTL18 | 0x401010C8 |
| DMAC_CH_CTL19 | 0x401010CC |
| DMAC_CH_CTL20 | 0x401010D0 |
| DMAC_CH_CTL21 | 0x401010D4 |

| Register Name | Address |
|------------------|------------|
| DMAC_CH_CTL22 | 0x401010D8 |
| DMAC_CH_CTL23 | 0x401010DC |
| DMAC_CH_CTL24 | 0x401010E0 |
| DMAC_CH_CTL25 | 0x401010E4 |
| DMAC_CH_CTL26 | 0x401010E8 |
| DMAC_CH_CTL27 | 0x401010EC |

8.1.1 DMAC_CTL

Control register

Address: 0x40101000

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------|--------------|----|----|----|----|----|----|
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [15:8] | | | | | | | |
| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SW Access | None | | | | | | | |
| HW Access | None | | | | | | | |
| Name | None [23:16] | | | | | | | |
| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| SW Access | RW | None | | | | | | |
| HW Access | R | None | | | | | | |
| Name | ENABLED | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|---------|---|
| 31 | ENABLED | <p>0': IP is disabled. Non-retainable MMIO registers and logic functionality are reset (retainable MMIO registers are NOT reset):</p> <ul style="list-style-type: none"> - INTR register is set to "0". - DW/DMA functionality is aborted. - DW/DMA controller input/pending triggers are de-activated. - DW/DMA controller output triggers are de-activated. <p>Disabling the IP has the same effect as an active "rst_sys_act_n" reset in DeepSleep power mode. To prevent a loss of active (pending) DW/DMA triggers when disabling the IP or when transitioning from Active to DeepSleep power mode, the STATUS.ACTIVE and STATUS_CH_ACTIVE.CH fields can be used.</p> <p>Note that most MMIO registers are retainable, and a transition from DeepSleep to Active/Sleep power modes makes the DW/DMA controller operational, and ready to react to DW/DMA input triggers that are activated after the transition. Triggers are Active/Sleep functionality.</p> <p>'1': IP is enabled.</p> <p>Default Value: 0</p> |

8.1.2 DMAC_STATUS

Status register

Address: 0x40101010

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------------|-----------|--------------|----|-----------------|---------------|----|----|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | DATA_NR [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | DATA_NR [15:8] | | | | | | | |
| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SW Access | None | | | | R | | | |
| HW Access | None | | | | W | | | |
| Name | None [23:21] | | | | CH_ADDR [20:16] | | | |
| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| SW Access | R | R | R | | None | R | | |
| HW Access | W | W | W | | None | W | | |
| Name | ACTIVE | PING_PONG | PRIO [29:28] | | None | STATE [26:24] | | |

| Bits | Name | Description |
|---------|-----------|---|
| 31 | ACTIVE | Specifies if there is a currently active (pending) channel in the data transfer engine: 0: no currently active channel. 1: currently active channel. Default Value: 0 |
| 30 | PING_PONG | Specifies whether the PING descriptor (0) or PONG descriptor (1) of the channel is currently in use. Default Value: Undefined |
| 29 : 28 | PRIO | Specifies the priority of the currently active channel. Default Value: Undefined |
| 26 : 24 | STATE | State of the data transfer engine. 0: DEFAULT state. 1: Loading descriptor (SRC, DST, CONTROL and STATUS words). 2: Loading data element from source location. 3: Storing data element to destination location. 4: Storing descriptor (STATUS word). 5: Wait for trigger de-activation. 6: Storing descriptor with error response (STATUS word). Default Value: 0 |

8.1.2 DMAC_STATUS (continued)

| | | |
|---------|---------|---|
| 20 : 16 | CH_ADDR | Specifies the channel number of the currently active channel. E.g. if we have 32 channels, the channel number address with CH_ADDR_WIDTH is LOG2 (32) = 5, and this field is a 5-bit field. If channel 7 is active, STATUS.ACTIVE is '1' and STATUS.CH_ADDR is "7". Default Value: Undefined |
| 15 : 0 | DATA_NR | Specifies the index of the currently active data transfer. This value increases from "0" to CONTROL.DATA_NR. Default Value: Undefined |

8.1.3 DMAC_STATUS_SRC_ADDR

Source address status register

Address: 0x40101014

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|--------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | ADDR [7:0] | | | | | | | |
| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| SW Access | R | | | | | | | |

| HW Access | RW1S | | | | | | | |
| Name | CH [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|---|
| 31 : 0 | CH | Set to '1', when event is detected. Write INTR field with '1', to clear bit. Write INTR_SET field with '1', to set bit. Default Value: 0 |

8.1.39 DMAC_INTR_SET

Interrupt set register

Address: 0x401017F4

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---|---|---|---|---|---|---|
| SW Access | RW1S | | | | | | | |
| HW Access | A | | | | | | | |
| Name | CH [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------|----|----|----|----|----|---|---|
| SW Access | RW1S | | | | | | | |
| HW Access | A | | | | | | | |
| Name | CH [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------------|----|----|----|----|----|----|----|
| SW Access | RW1S | | | | | | | |
| HW Access | A | | | | | | | |
| Name | CH [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------|----|----|----|----|----|----|----|
| SW Access | RW1S | | | | | | | |
| HW Access | A | | | | | | | |
| Name | CH [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|---|
| 31 : 0 | CH | Write INTR_SET field with '1' to set corresponding INTR field (a write of '0' has no effect). Default Value: 0 |

8.1.40 DMAC_INTR_MASK

Interrupt mask register

Address: 0x401017F8

Retention: Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---|---|---|---|---|---|---|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | CH [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------|----|----|----|----|----|---|---|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | CH [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | CH [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------|----|----|----|----|----|----|----|
| SW Access | RW | | | | | | | |
| HW Access | R | | | | | | | |
| Name | CH [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|--|
| 31 : 0 | CH | Mask for corresponding field in INTR register. Default Value: 0 |

8.1.41 DMAC_INTR_MASKED

Interrupt masked register

Address: 0x401017FC

Retention: Not Retained

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----------|---|---|---|---|---|---|---|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | CH [7:0] | | | | | | | |

| Bits | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|-----------|-----------|----|----|----|----|----|---|---|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | CH [15:8] | | | | | | | |

| Bits | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------|------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | CH [23:16] | | | | | | | |

| Bits | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|-----------|------------|----|----|----|----|----|----|----|
| SW Access | R | | | | | | | |
| HW Access | W | | | | | | | |
| Name | CH [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|------|---|
| 31 : 0 | CH | Logical and of corresponding request and mask fields. Default Value: 0 |

9 Direct-Memory Access Descriptor Registers

This section discusses the Direct-Memory Access Descriptor registers. It lists all the registers in mapping tables, in address order.

9.1 Register Details

| Register Name | Address |
|---|------------|
| DMAC_DESCR0_PING_SRC | 0x40101800 |
| DMAC_DESCR0_PING_DST | 0x40101804 |
| DMAC_DESCR0_PING_CTL | 0x40101808 |
| DMAC_DESCR0_PING_STATUS | 0x4010180C |
| DMAC_DESCR0_PONG_SRC | 0x40101810 |
| DMAC_DESCR0_PONG_DST | 0x40101814 |
| DMAC_DESCR0_PONG_CTL | 0x40101818 |
| DMAC_DESCR0_PONG_STATUS | 0x4010181C |
| DMAC_DESCR1_PING_SRC | 0x40101820 |
| DMAC_DESCR1_PING_DST | 0x40101824 |
| DMAC_DESCR1_PING_CTL | 0x40101828 |
| DMAC_DESCR1_PING_STATUS | 0x4010182C |
| DMAC_DESCR1_PONG_SRC | 0x40101830 |
| DMAC_DESCR1_PONG_DST | 0x40101834 |
| DMAC_DESCR1_PONG_CTL | 0x40101838 |
| DMAC_DESCR1_PONG_STATUS | 0x4010183C |
| DMAC_DESCR2_PING_SRC | 0x40101840 |
| DMAC_DESCR2_PING_DST | 0x40101844 |
| DMAC_DESCR2_PING_CTL | 0x40101848 |
| DMAC_DESCR2_PING_STATUS | 0x4010184C |
| DMAC_DESCR2_PONG_SRC | 0x40101850 |
| DMAC_DESCR2_PONG_DST | 0x40101854 |
| DMAC_DESCR2_PONG_CTL | 0x40101858 |
| DMAC_DESCR2_PONG_STATUS | 0x4010185C |
| DMAC_DESCR3_PING_SRC | 0x40101860 |
| DMAC_DESCR3_PING_DST | 0x40101864 |
| DMAC_DESCR3_PING_CTL | 0x40101868 |

| Register Name | Address |
|-------------------------|------------|
| DMAC_DESCR3_PING_STATUS | 0x4010186C |
| DMAC_DESCR3_PONG_SRC | 0x40101870 |
| DMAC_DESCR3_PONG_DST | 0x40101874 |
| DMAC_DESCR3_PONG_CTL | 0x40101878 |
| DMAC_DESCR3_PONG_STATUS | 0x4010187C |
| DMAC_DESCR4_PING_SRC | 0x40101880 |
| DMAC_DESCR4_PING_DST | 0x40101884 |
| DMAC_DESCR4_PING_CTL | 0x40101888 |
| DMAC_DESCR4_PING_STATUS | 0x4010188C |
| DMAC_DESCR4_PONG_SRC | 0x40101890 |
| DMAC_DESCR4_PONG_DST | 0x40101894 |
| DMAC_DESCR4_PONG_CTL | 0x40101898 |
| DMAC_DESCR4_PONG_STATUS | 0x4010189C |
| DMAC_DESCR5_PING_SRC | 0x401018A0 |
| DMAC_DESCR5_PING_DST | 0x401018A4 |
| DMAC_DESCR5_PING_CTL | 0x401018A8 |
| DMAC_DESCR5_PING_STATUS | 0x401018AC |
| DMAC_DESCR5_PONG_SRC | 0x401018B0 |
| DMAC_DESCR5_PONG_DST | 0x401018B4 |
| DMAC_DESCR5_PONG_CTL | 0x401018B8 |
| DMAC_DESCR5_PONG_STATUS | 0x401018BC |
| DMAC_DESCR6_PING_SRC | 0x401018C0 |
| DMAC_DESCR6_PING_DST | 0x401018C4 |
| DMAC_DESCR6_PING_CTL | 0x401018C8 |
| DMAC_DESCR6_PING_STATUS | 0x401018CC |
| DMAC_DESCR6_PONG_SRC | 0x401018D0 |
| DMAC_DESCR6_PONG_DST | 0x401018D4 |
| DMAC_DESCR6_PONG_CTL | 0x401018D8 |
| DMAC_DESCR6_PONG_STATUS | 0x401018DC |
| DMAC_DESCR7_PING_SRC | 0x401018E0 |
| DMAC_DESCR7_PING_DST | 0x401018E4 |
| DMAC_DESCR7_PING_CTL | 0x401018E8 |
| DMAC_DESCR7_PING_STATUS | 0x401018EC |
| DMAC_DESCR7_PONG_SRC | 0x401018F0 |
| DMAC_DESCR7_PONG_DST | 0x401018F4 |
| DMAC_DESCR7_PONG_CTL | 0x401018F8 |
| DMAC_DESCR7_PONG_STATUS | 0x401018FC |
| DMAC_DESCR8_PING_SRC | 0x40101900 |
| DMAC_DESCR8_PING_DST | 0x40101904 |
| DMAC_DESCR8_PING_CTL | 0x40101908 |
| DMAC_DESCR8_PING_STATUS | 0x4010190C |
| DMAC_DESCR8_PONG_SRC | 0x40101910 |

| Register Name | Address |
|--------------------------|------------|
| DMAC_DESCR8_PONG_DST | 0x40101914 |
| DMAC_DESCR8_PONG_CTL | 0x40101918 |
| DMAC_DESCR8_PONG_STATUS | 0x4010191C |
| DMAC_DESCR9_PING_SRC | 0x40101920 |
| DMAC_DESCR9_PING_DST | 0x40101924 |
| DMAC_DESCR9_PING_CTL | 0x40101928 |
| DMAC_DESCR9_PING_STATUS | 0x4010192C |

| Name | OPCODE [31:30] | | FLIPPING | PREEMPT-ABLE | SET_CAUSE | INV_DESCRIPTOR | WAIT_FOR_DEACT [25:24] | |

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.3 DMAC_DESCR0_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.3 DMAC_DESCR0_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.3 DMAC_DESCR0_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

9.1.4 DMAC_DESCR0_PING_STATUS

| SW Access | RW | None | | | | | | |
| HW Access | RW | None | | | | | | |
| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1).</p> <p>1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized.</p> <p>Default Value: Undefined</p> |

9.1.4 DMAC_DESCR0_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.11 DMAC_DESCR1_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.11 DMAC_DESCR1_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.11 DMAC_DESCR1_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

9.1.12 DMAC_DESCR1_PING_STATUS

| SW Access | RW | None | | | | | | |
| HW Access | RW | None | | | | | | |
| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.12 DMAC_DESCR1_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.19 DMAC_DESCR2_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.19 DMAC_DESCR2_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.19 DMAC_DESCR2_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.20 DMAC_DESCR2_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

9.1.27 DMAC_DESCR3_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.27 DMAC_DESCR3_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.27 DMAC_DESCR3_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.28 DMAC_DESCR3_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

9.1.35 DMAC_DESCR4_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.35 DMAC_DESCR4_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.36 DMAC_DESCR4_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

|------|------|-------------|
|------|------|-------------|

9.1.43 DMAC_DESCR5_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.43 DMAC_DESCR5_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.43 DMAC_DESCR5_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1).</p> <p>1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized.</p> <p>Default Value: Undefined</p> |

9.1.44 DMAC_DESCR5_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

|------|------|-------------|
|------|------|-------------|

9.1.51 DMAC_DESCR6_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.51 DMAC_DESCR6_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.51 DMAC_DESCR6_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.52 DMAC_DESCR6_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.59 DMAC_DESCR7_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.59 DMAC_DESCR7_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.59 DMAC_DESCR7_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.60 DMAC_DESCR7_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.67 DMAC_DESCR8_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.67 DMAC_DESCR8_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.67 DMAC_DESCR8_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1).</p> <p>1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized.</p> <p>Default Value: Undefined</p> |

9.1.68 DMAC_DESCR8_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.75 DMAC_DESCR9_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.75 DMAC_DESCR9_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.75 DMAC_DESCR9_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1).</p> <p>1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized.</p> <p>Default Value: Undefined</p> |

9.1.76 DMAC_DESCR9_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.83 DMAC_DESCR10_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.83 DMAC_DESCR10_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.83 DMAC_DESCR10_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.84 DMAC_DESCR10_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.91 DMAC_DESCR11_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.91 DMAC_DESCR11_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.91 DMAC_DESCR11_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.92 DMAC_DESCR11_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.99 DMAC_DESCR12_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.99 DMAC_DESCR12_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.99 DMAC_DESCR12_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.100 DMAC_DESCR12_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.107 DMAC_DESCR13_PING_CTL (continued)

| | | |
|---------|-------------|--|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.107 DMAC_DESCR13_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.107 DMAC_DESCR13_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.108 DMAC_DESCR13_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.115 DMAC_DESCR14_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.115 DMAC_DESCR14_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.115 DMAC_DESCR14_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| HW Access | RW | None | | | | | | |
| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.116 DMAC_DESCR14_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.123 DMAC_DESCR15_PING_CTL (continued)

| | | |
|---------|-------------|--|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.123 DMAC_DESCR15_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.123 DMAC_DESCR15_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.124 DMAC_DESCR15_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.131 DMAC_DESCR16_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.131 DMAC_DESCR16_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.131 DMAC_DESCR16_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.132 DMAC_DESCR16_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

|------|------|-------------|

9.1.139 DMAC_DESCR17_PING_CTL (continued)

| | | |
|---------|-------------|--|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.139 DMAC_DESCR17_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.139 DMAC_DESCR17_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1).</p> <p>1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized.</p> <p>Default Value: Undefined</p> |

9.1.140 DMAC_DESCR17_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

|------|------|-------------|
|------|------|-------------|

9.1.147 DMAC_DESCR18_PING_CTL (continued)

| | | |
|---------|-------------|--|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.147 DMAC_DESCR18_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.148 DMAC_DESCR18_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

|------|------|-------------|
|------|------|-------------|

9.1.155 DMAC_DESCR19_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.155 DMAC_DESCR19_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.155 DMAC_DESCR19_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. | Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.156 DMAC_DESCR19_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

|------|------|-------------|
|------|------|-------------|

9.1.163 DMAC_DESCR20_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.163 DMAC_DESCR20_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.163 DMAC_DESCR20_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.164 DMAC_DESCR20_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.171 DMAC_DESCR21_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.171 DMAC_DESCR21_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.171 DMAC_DESCR21_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.172 DMAC_DESCR21_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.179 DMAC_DESCR22_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.179 DMAC_DESCR22_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.179 DMAC_DESCR22_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1).</p> <p>1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized.</p> <p>Default Value: Undefined</p> |

9.1.180 DMAC_DESCR22_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.187 DMAC_DESCR23_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.187 DMAC_DESCR23_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.187 DMAC_DESCR23_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.188 DMAC_DESCR23_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.195 DMAC_DESCR24_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.195 DMAC_DESCR24_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.195 DMAC_DESCR24_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.196 DMAC_DESCR24_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.203 DMAC_DESCR25_PING_CTL (continued)

| | | |
|---------|-------------|--|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.203 DMAC_DESCR25_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.203 DMAC_DESCR25_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.204 DMAC_DESCR25_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Name | OPCODE [31:30] | | FLIPPING | PREEMPT-ABLE | SET_CAUSE | INV_DESCRIPTOR | WAIT_FOR_DEACT [25:24] | |

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.211 DMAC_DESCR26_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.211 DMAC_DESCR26_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.211 DMAC_DESCR26_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.212 DMAC_DESCR26_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.219 DMAC_DESCR27_PING_CTL (continued)

| | | |
|---------|-------------|--|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.219 DMAC_DESCR27_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.219 DMAC_DESCR27_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| SW Access | RW | None | | | | | | |
| HW Access | RW | None | | | | | | |
| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.220 DMAC_DESCR27_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.227 DMAC_DESCR28_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.227 DMAC_DESCR28_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.227 DMAC_DESCR28_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.228 DMAC_DESCR28_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.235 DMAC_DESCR29_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHI_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHI_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.235 DMAC_DESCR29_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.235 DMAC_DESCR29_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.236 DMAC_DESCR29_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP-PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

9.1.243 DMAC_DESCR30_PING_CTL (continued)

| | | |
|---------|-------------|---|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated).</p> <p>Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures.</p> <p>Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled.</p> <p>Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]).</p> <p>Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0.</p> <p>Default Value: Undefined</p> |

9.1.243 DMAC_DESCR30_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

9.1.243 DMAC_DESCR30_PING_CTL (continued)

| | | |
|---------|-----------|---|
| 17 : 16 | DATA_SIZE | <p>Specifies the data element size:</p> <p>0: Byte (8 bits).</p> <p>1: Halfword (16 bits).</p> <p>2: Word (32 bits).</p> <p>DATA_SIZE, SRC_TRANSFER_SIZE and DST_TRANSFER_SIZE together determine how data elements are transferred. The following are the 9 legal settings:</p> <ul style="list-style-type: none"> - DATA is 8 bit, SRC is 8 bit, DST is 8 bit - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 8 bit - DATA is 8 bit, SRC is 8 bit, DST is 32 bit (higher 24 bits are made 0) - DATA is 8 bit, SRC is 32 bit (higher 24 bits are dropped), DST is 32 bit (higher 24 bits are made 0) - DATA is 16 bit, SRC is 16 bit, DST is 16 bit - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 16 bit - DATA is 16 bit, SRC is 16 bit, DST is 32 bit (higher 16 bits are made 0) - DATA is 16 bit, SRC is 32 bit (higher 16 bits are dropped), DST is 32 bit (higher 16 bits are made 0) - DATA is 32 bit, SRC is 32 bit, DST is 32 bit <p>Default Value: Undefined</p> |
| 15 : 0 | DATA_NR | <p>Number of data elements that are transferred by a single descriptor.</p> <p>In DW mode (OPCODE is 0) each trigger initiates the transfer of a single data element. This field specifies the source and/or destination buffer size in data elements: buffer size = DATA_NR+1. The buffer is typically associated to a memory structure.</p> <p>In DMA mode (OPCODE is 1 or 2) each trigger initiates the transfer of DATA_NR+1 data elements.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.244 DMAC_DESCR30_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| Bits | Name | Description |
|------|------|-------------|
|------|------|-------------|

9.1.251 DMAC_DESCR31_PING_CTL (continued)

| | | |
|---------|-------------|--|
| 31 : 30 | OPCODE | <p>Specifies the specific data transfer (only when the VALID bit of the descriptors STATUS word is 1):</p> <p>0: A single trigger initiates a single data element transfer (DW mode). This opcode specifies a transfer of a single data element. The current descriptor is completed when the amount of transferred single data elements equals the programmed buffer size (DATA_NR+1).</p> <p>1: A single trigger initiates a single descriptor transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure. The current descriptor is completed when its data transfer is completed.</p> <p>2: A single trigger initiates a descriptor list transfer (DMA mode). This opcode specifies a transfer of DATA_NR+1 data elements as specified by the current descriptor structure and by successive valid descriptors. The current descriptor is completed when its data transfer is completed. This OPCODE relies on FLIPPING to be set to '1', such that the CHi_CTL.PING_PONG field is flipped/inverted and the successive descriptor is used. This continues for as long as the successive descriptor is valid. Note that as the HW is using the PING/PONG descriptor, the SW can prepare the alternate PONG/PING descriptor. The interrupt mechanism is used by HW to convey to the SW that the current descriptor is completed (and can be prepared for a successive transfer).</p> <p>After completion of the opcode (and waiting for de-activation, the channel's output trigger is activated). Default Value: Undefined</p> |
| 29 | FLIPPING | <p>1: On completion of the current descriptor structure, the current descriptor identifier CHi_CTL.PING_PONG is flipped/inverted. In DMA mode, descriptor list transfer, flipping of the current descriptor identifier can be used to construct a linked list of descriptor structures. Default Value: Undefined</p> |
| 28 | PREEMPTABLE | <p>1: Transfer is preemptable. In DMA mode (OPCODE is 1 or 2), multi data element transfers are constructed out of multiple single data element load (from the source location) and store (to the destination location) sequences. This field allows higher priority activated channels to preempt the current transfer in between these atomic (load, store) sequences. Preemption will NOT deactivate the current channel. As a result, after completion of a higher priority activated channel, the current channel is rescheduled. Default Value: Undefined</p> |
| 27 | SET_CAUSE | <p>1: On completion of the current descriptor structure, the interrupt cause field of the channel is set to 1 (INTR.CH[i]). Default Value: Undefined</p> |
| 26 | INV_DESCR | <p>1: On completion of the current descriptor structure, the VALID bit of the descriptors STATUS word is set to 0. Default Value: Undefined</p> |

9.1.251 DMAC_DESCR31_PING_CTL (continued)

| | | |
|---------|-------------------|---|
| 25 : 24 | WAIT_FOR_DEACT | <p>Specifies whether the data transfer engine should wait for the channel to be deactivated; i.e. the selected system trigger is not active. This field is used to synchronize the controllers data transfer(s) with the agent that generated the trigger. This field is ONLY used at the completion of an opcode. E.g., a FIFO indicates that it is empty and it needs a new data sample. The agent removes the trigger ONLY when the data sample has been written by the transfer engine AND received by the agent. Furthermore, the agents trigger may be delayed by a few cycles before it reaches the DW/DMA controller. This field is used for level sensitive trigger, which reflect state (pulse sensitive triggers should have this field set to "0"). The wait cycles incurred by this field reduce DW/DMA controller performance.</p> <p>0: Do not wait for de-activation (for pulse sensitive triggers).</p> <p>1: Wait for up to 4 cycles.</p> <p>2: Wait for up to 8 cycles.</p> <p>3: Wait indefinitely. This option may result in DW/DMA controller lockup if the system trigger is not de-activated by the source agent.</p> <p>Default Value: Undefined</p> |
| 23 | SRC_ADDR_INCR | <p>Specifies whether the source location address is incremented by the SRC_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0: No increment, typically used for receive (RX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 22 | SRC_TRANSFER_SIZE | <p>Specifies the bus transfer size to the source location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for source components with data elements that are smaller than their 32-bit bus interface width. E.g., an ADC source has a 32-bit bus transfer size, but only provides a 16-bit data element.</p> <p>Default Value: Undefined</p> |
| 21 | DST_ADDR_INCR | <p>Specifies whether the destination location address is incremented by the DST_TRANSFER_SIZE after each single data element transfer or not.</p> <p>0 : No increment, typically used for transmit (TX) FIFO structures.</p> <p>1: Increment, typically used for memory structures.</p> <p>Default Value: Undefined</p> |
| 20 | DST_TRANSFER_SIZE | <p>Specifies the bus transfer size to the destination location:</p> <p>0: As specified by DATA_SIZE.</p> <p>1: Word (32 bits).</p> <p>Distinguishing bus transfer size from data element size allows for destination components with data elements that are smaller than their 32-bit bus interface width. E.g., a DAC destination has a 32-bit bus transfer size, but only requires a 16-bit data element.</p> <p>Default Value: Undefined</p> |

| Name | VALID | None [30:24] | | | | | | |

| Bits | Name | Description |
|------|-------|--|
| 31 | VALID | <p>0: Invalid, cannot be used for a data transfer. An attempt to use this descriptor for a data transfer will result in an INVALID_DESCR response code (and the interrupt cause bit is set to 1). 1: Valid.</p> <p>Hardware set this field to 0 when a descriptor is done, but only if CONTROL.INV_DESCR is 1.</p> <p>Software sets this field to 1 when a descriptor is initialized. Default Value: Undefined</p> |

9.1.252 DMAC_DESCR31_PING_STATUS (continued)

18 : 16 RESPONSE

Response code (the first two codes NO_ERROR and DONE are the result of normal behavior, the other codes are the result of erroneous behavior).

0/NO_ERROR: No error. Setting this response does NOT set the interrupt cause bit to 1. STATUS.VALID is NOT affected. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is not updated. This response is used for an unused or not completed descriptor. Software should set the RESPONSE field to 0/NO_ERROR during descriptor initialization.

1/DONE: Descriptor is done (without errors). Setting this response sets the interrupt cause bit to 1 if CONTROL.SET_CAUSE is 1. STATUS.VALID is set to 0 if CONTROL.INV_DESCR is 1. CHi_CTL.ENABLED is NOT affected. CHi_CTL.PING_PONG is updated if CONTROL.FLIP_PING is 1.

2/SRC_BUS_ERROR: Bus error while loading data from the source location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

3/DST_BUS_ERROR: Bus error while storing data to the destination location. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

4/SRC_MISAL: Misalignment of source address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

5/DST_MISAL: Misalignment of destination address. This occurs on a 16-bit bus transfer that is not 2-byte aligned or on a 32-bit bus transfer that is not 4-byte aligned. Setting this response sets the interrupt cause bit to 1. STATUS.VALID is set 0. CHi_CTL.ENABLED is set to 0.

CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

6/INVALID_DESCR: Invalid descriptor (STATUS.VALID is 0). This occurs when an activated channel has an invalid descriptor. CHi_CTL.ENABLED is set to 0. CHi_CTL.PING_PONG is not updated (it identifies the descriptor that caused the error).

Default Value: Undefined

15 : 0 CURR_DATA_NR

Specifies the index of the current data transfer. This value increases from 0 to CONTROL.DATA_NR. HW sets this field:

- When a descriptor is done (RESPONSE is DONE), the field is set to "0" when PING_CTL.INV_DESCR is '0' and the field is set to PING_CTL.DATA_NR when PING_CTL.INV_DESCR is '1'.

- When a descriptor is not done (RESPONSE is NO_ERROR), the field reflects the progress of a data transfer.

- In case of erroneous behavior (RESPONSE is neither DONE or NO_ERROR), the field is not updated, but keeps its value to ease debugging.

HW only modifies this field for an active descriptor (STATUS.VALID to be 1). At descriptor initialization, SW should set this field to 0.

This field allows software to read the progress of the data transfer. Note that SRC.ADDR and DST.ADDR represent base addresses and are not modified during data transfer. However, STATUS.CURR_DATA_NR is modified during data transfer and provides an offset wrt. the base addresses.

Default Value: Undefined

| HW Access | None | | | | | | | |
| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|--------|----------|---|
| 13 : 0 | PORT_INT | Each IO port has an associated bit field in this register. The bit field reflects the IO port's interrupt line (bit field i reflects "gpio_interrupts[i]" for IO port i). The register is used when the system uses a shared/combined interrupt line "gpio_interrupt". The SW ISR reads the register to determine which IO port(s) is responsible for the shared/combined interrupt line "gpio_interrupt". Once, the IO port(s) is determined, the IO port's INTR register is read to determine the IO pad(s) in the IO port that caused the interrupt. Default Value: 0 |

11 GPIO Port Registers

This section discusses the GPIO Port registers. It lists all the registers in mapping tables, in address order.

11.1 Register Details

| Register Name | Address |
|------------------------------------|------------|
| GPIO_PRT0_DR | 0x40040000 |
| GPIO_PRT0_PS | 0x40040004 |
| GPIO_PRT0_PC | 0x40040008 |

| Name | None [31:24] | | | | | | | |

| Bits | Name | Description |
|------|----------|--|
| 8 | FLT_DATA | Reads of this register return the logical state of the filtered pin. Default Value: 0 |
| 7 | DATA7 | Pin 7 state. Default Value: 0 |
| 6 | DATA6 | Pin 6 state. Default Value: 0 |
| 5 | DATA5 | Pin 5 state. Default Value: 0 |
| 4 | DATA4 | Pin 4 state. Default Value: 0 |
| 3 | DATA3 | Pin 3 state. Default Value: 0 |
| 2 | DATA2 | Pin 2 state. Default Value: 0 |
| 1 | DATA1 | Pin 1 state. Default Value: 0 |

11.1.29 GPIO_PRT3_PS (continued)

| | | |
|---|-------|--|
| 0 | DATA0 | <p>Pin 0 state:</p> <p>1: Logic high, if the pin voltage is above the input buffer threshold, logic high.</p> <p>0: Logic low, if the pin voltage is below that threshold, logic low.</p> <p>If the drive mode for the pin is set to high Z Analog, the pin state will read 0 independent of the voltage on the pin.</p> <p>Default Value: 0</p> |
|---|-------|--|

| Name | PORT_IB_MODE_SEL [31:30] | | None [29:26] | | | | PORT_SLOW | PORT_VTRIP_SEL |

| Bits | Name | Description |
|---------|------------------|---|
| 31 : 30 | PORT_IB_MODE_SEL | <p>This field selects the input buffer reference. The size (1 or 2 bits) and functionality is dependent on the IO cell.</p> <p>For GPIO cells, bit PORT_IB_MODE_SEL[1] is not used</p> <p>"0"/"2": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1"/"3": vcchib. (VCC in Hibernate mode)</p> <p>For GPIO_OVT:</p> <p>"0": CMOS input buffer (PORT_VTRIP_SEL is '0'), LVTTTL input buffer (PORT_VTRIP_SEL is '1')</p> <p>"1": vcchib.(VCC in Hibernate mode)</p> <p>"2": OVT.</p> <p>"3": Reference (possibly from reference generator cell).</p> <p>For SIO cell, this field is present but not used as the SIO cell does not provide input buffer mode select functionality</p> <p>Default Value: 0</p> |
| 25 | PORT_SLOW | <p>This field controls the output edge rate of all pins on the port:</p> <p>'0': fast.</p> <p>'1': slow.</p> <p>Default Value: 0</p> |

11.1.30 GPIO_PRT3_PC (continued)

| | | |
|---------|----------------|--|
| 24 | PORT_VTRIP_SEL | <p>The GPIO cells include a VTRIP_SEL signal to alter the input buffer voltage. Note: this bit is ignored for SIO ports, the VTRIP_SEL settings in the SIO register are used instead (a separate VTRIP_SEL is provided for each pin pair).</p> <p>0: input buffer functions as a CMOS input buffer.</p> <p>1: input buffer functions as a LVTTTL input buffer.</p> <p>Default Value: 0</p> |
| 23 : 21 | DM7 | <p>The GPIO drive mode for pin 7.</p> <p>Default Value: 0</p> |
| 20 : 18 | DM6 | <p>The GPIO drive mode for pin 6.</p> <p>Default Value: 0</p> |
| 17 : 15 | DM5 | <p>The GPIO drive mode for pin 5.</p> <p>Default Value: 0</p> |
| 14 : 12 | DM4 | <p>The GPIO drive mode for pin 4.</p> <p>Default Value: 0</p> |
| 11 : 9 | DM3 | <p>The GPIO drive mode for pin 3.</p> <p>Default Value: 0</p> |
| 8 : 6 | DM2 | <p>The GPIO drive mode for pin 2.</p> <p>Default Value: 0</p> |
| 5 : 3 | DM1 | <p>The GPIO drive mode for pin 1.</p> <p>Default Value: 0</p> |
| 2 : 0 | DM0 | <p>The GPIO drive mode for pin 0.</p> <p>Note: when initializing IO's that are connected to a live bus (such as I2C), make sure the HSIOM is properly configured (HSIOM_PRT_SELx) before turning the IO on here to avoid producing glitches on the bus.</p> <p>Default Value: 0</p> <p>0x0: OFF: Mode 0 (analog mode): Output buffer off (high Z). Input buffer off.</p> <p>0x1: INPUT: Mode 1: Output buffer off (high Z). Input buffer on.</p> <p>0x2: 0_PU: Mode 2: Strong pull down ('0'), weak/resistive pull up (PU). Input buffer on.</p> <p>0x3: PD_1: Mode 3: Weak/resistive pull down (PD), strong pull up ('1'). Input buffer on.</p> <p>0x4: 0_Z: Mode 4: Strong pull down ('0'), open drain (pull up off). Input buffer on.</p> <p>0x5: Z_1: Mode 5: Open drain (pull down off), strong pull up ('1'). Input buffer on.</p> <p>0x6: 0_1: Mode 6: Strong pull down ('0'), strong pull up ('1'). Input buffer on.</p> <p>0x7: PD_PU: Mode 7: Weak/resistive pull down (PD), weak/resistive pull up (PU). Input buffer on.</p> |
