4.3. 1/3 Duty Output Waveform

1/3 duty output waveform is shown below.

For 1/3 duty output mode, COM0 output, COM1 output, and COM2 output are used for LCD display. COM3 output is not used.

1/3 Bias Output Waveform Case

Liquid crystal elements that have maximum difference in potential between the common output and segment output light up.

■ Example of Content of Data Memory for Display

Segment	Content of Data Memory for Display

5. Setting

This section shows the setting of the LCD controller.

<Duty drive>

Setting Necessary for Use of LCD

Setting	Set Register	Set Method
Preliminary setting	LCD control register 1 (LCR1) Common pin switching register (LCDCMR)	See 6.3, 6.4
Division resistor setting	LCD control register 0 (LCR0)	See 7.9, 7.11
Port setting	Segment output register (SEGER) Common output V pin control register(COMVER)	See 6.8, 6.9
Display data setting	Data memory for display (VRAM)	See 7.2
Frame cycle setting	LCD control register 0 (LCR0)	See 7.3
Duty selection (activation)		See 7.5
Display selection		See 7.7

Setting Necessary for Cancellation of LCD Display

Setting	Set Register	Set Method
Non-display selection	LCD control register 0 (LCR0)	See 7.7

Setting Necessary for LCD Operation Stop

Setting	Set Register	Set Method
LCD operation stop	LCD control register 0 (LCR0)	See 7.6

Setting Necessary for LCD Display during PSS Timer Mode (Main Oscillation Operation/ Sub Oscillation Operation)

Setting	Set Register	Set Method
Display selection during PSS timer mode(main oscillation operation/ sub oscillation operation)	LCD control register 0 (LCR0)	See 7.8
Transition to PSS timer mode(main oscillation operation/ sub oscillation operation)	See chapter of "LOW-POWER CONSUMPTION".	-

< Static drive >

Setting Necessary for Use of LCD

Setting	Set Register	Set Method
Preliminary setting	LCD control register 1 (LCR1) Common pin switching register (LCDCMR)	See 6.3, 6.4
Port setting	Set the pin to LCDC output. See chapter of "I/O PORTS".	See 0, 6.9
	LCD control register (LCRS)	See 6.5
Display data setting	Data memory for display (LDR0,LDR1)	See 6.6
Frame cycle setting	LCD control register (LCRS)	See 7.3

Setting Necessary for LCD Operation Stop

Setting	Set Register	Set Method
LCD operation stop	LCD control register (LCRS)	See 7.6

Setting Necessary for LCD Display during PSS Timer Mode (Main Oscillation Operation/ Sub Oscillation Operation)

Setting	Set Register	Set Method
Display selection during PSS timer mode(main oscillation operation/ sub oscillation operation)	LCD control register (LCRS)	See 7.8
Transition to PSS timer mode(main oscillation operation/ sub oscillation operation)	See chapter of "LOW-POWER CONSUMPTION".	-

6. Registers

This section explains the registers of the LCD controller.

- Register map

Table 6-1 Registers of the LCD Controller

Register Abbreviation	Register Name	Reference
LCR0	LCD control register 0	6.1
VRAMn(n=0 to15)	Data memory for display	6.2
LCR1	LCDC control register 1	6.3
LCDCMR	Common pin switching register	6.4
LCRS	LCDC Static control register	6.5
LDR	Static LCD display data register	6.6

Table 6-2 Registers of LCD Port-related

Register Abbreviation	Register Name	Reference
LCD_KEYCDR	key code register	6.7
SEGER	Segment output Register	6.8
COMVER	Common output V pin control register	6.9

6.1. LCD Control Register 0: LCR0

The bit configuration of the LCD control register 0 is shown below.

This register selects a frame cycle with its clock to be used, selects display mode, enables the LCD controller to operate in the condition for selecting display/non-display mode, and controls LCD drive power.

■ LCR0

bit	7	6	5	4	3	2	1	0
Field	CSS	LCEN	VSEL	BK	MS1	MS0	FP1	FP0
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	1	0	0	0	0

[bit7] CSS: Clock selection Bit

Select a clock to be used for this module.

Bit	Operation
0	Main clock
1	Sub clock

For the single clock products, set "0".

[bit6] LCEN: PSS Timer Mode (Main Oscillation Operation / Sub Oscillation Operation) Operation Enable

Bit	Operation
0	LCD display stop in the PSS timer mode(main oscillation operation/ sub oscillation operation)
1	LCD display in the PSS timer mode(main oscillation operation/ sub oscillation operation)

When LCEN="1", do not stop the clock oscillation which selected by the CSS bit during the transition to PSS mode.

LCD display stop when power shutdown.

[bit5] VSEL: LCD Drive Power Control

Bit	Operation
0	Internal division resistor disconnection
1	Internal division resistor connection

When an external division resistor is to be connected, the LCD drive power control bit (VSEL) must be set to "0".

[bit4] BK: Blanking selection

Bit	Operation
0	LCD display
1	LCD no display

[bit3, bit2] MS1, MS0: Display Mode selection

MS1	MS0	Display Mode
0	0	LCD operation stop
0	1	1/2 duty output mode (Time division number: N=2, COM0, COM1)
1	0	1/3 duty output mode (Time division number: N=3, COM0 to COM2)
1	1	1/4 duty output mode (Time division number: N=4, COM0 to COM3)

When the display mode selection bits (MS [1:0]) are set to "00", the LCD controller's operation is stopped, and the common pin/segment pin output "L" level.

[bit1, bit0] FP1, FP0: Frame Cycle

FP1	FP0	Frame Cycle
0	0	For CSS=0 : $(2^{11} \times N)/F_{CL}$ For CSS=1 : $(2^{3} \times N)/F_{CL}$
0	1	For CSS=0 : $(2^{12} \times N)/F_{CL}$ For CSS=1 : $(2^{4} \times N)/F_{CL}$
1	0	For CSS=0 : $(2^{13} \times N)/F_{CL}$ For CSS=1 : $(2^{5} \times N)/F_{CL}$
1	1	For CSS=0 : $(2^{14} \times N)/F_{CL}$ For CSS=1 : $(2^{6} \times N)/F_{CL}$

F_{CL} : Main clock (LCR0:CSS=0) or sub clock (LCR0:CSS=1)

N : Time division number (depends on the setting of the display mode selection bits MS1, MS0)

Select the setting for FP1 and FP0 that is the optimum condition for the frame frequency of the LCD panel to be used.

6.2. Data Memory for Display: VRAM

The data memory for display is shown below.

Memory (VRAM) area for setting of data for display

- VRAM0 (SEG0, SEG1)
- VRAM1 (SEG2, SEG3)
- VRAM2 (SEG4, SEG5)
- VRAM3 (SEG6, SEG7)
- VRAM4 (SEG8, SEG9)
- VRAM5 (SEG10, SEG11)
- VRAM6 (SEG12, SEG13)
- VRAM7 (SEG14, SEG15)
- VRAM8 (SEG16, SEG17)
- VRAM9 (SEG18, SEG19)
- VRAM10 (SEG20, SEG21)
- VRAM11 (SEG22, SEG23)
- VRAM12 (SEG24, SEG25)
- VRAM13 (SEG26, SEG27)
- VRAM14 (SEG28, SEG29)
- VRAM15 (SEG30, SEG31)

bit	7	6	5	4	3	2	1	0
Field	D07	D06	D05	D04	D03	D02	D01	D00
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

The RAM for display can be read /written with any timing regardless of the LCD controller/driver operation.

Correspondence between VRAM and Common Pins/Segment Pins

VRAM0	bit3	bit2	bit1	bit0	SEG0
	bit7	bit6	bit5	bit4	SEG1
VRAM1	bit3	bit2	bit1	bit0	SEG2
	bit7	bit6	bit5	bit4	SEG3
VRAM2	bit3	bit2	bit1	bit0	SEG4
	bit7	bit6	bit5	bit4	SEG5
VRAM3	bit3	bit2	bit1	bit0	SEG6
	bit7	bit6	bit5	bit4	SEG7
VRAM4	bit3	bit2	bit1	bit0	SEG8
	bit7	bit6	bit5	bit4	SEG9

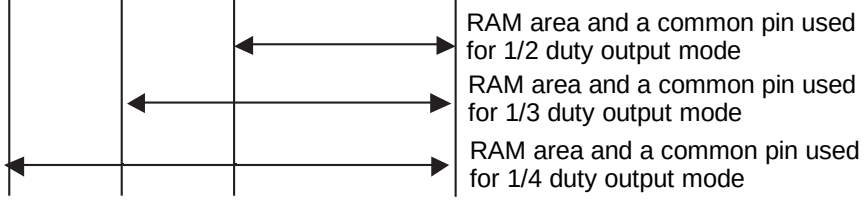
	bit7	bit6	bit5	bit4	SEG11
VRAM6	bit3	bit2	bit1	bit0	SEG12
	bit7	bit6	bit5	bit4	SEG13
VRAM7	bit3	bit2	bit1	bit0	SEG14
	bit7	bit6	bit5	bit4	SEG15
VRAM8	bit3	bit2	bit1	bit0	SEG16
	bit7	bit6	bit5	bit4	SEG17
VRAM9	bit3	bit2	bit1	bit0	SEG18
	bit7	bit6	bit5	bit4	SEG19
VRAM10	bit3	bit2	bit1	bit0	SEG20
	bit7	bit6	bit5	bit4	SEG21
VRAM11	bit3	bit2	bit1	bit0	SEG22
	bit7	bit6	bit5	bit4	SEG23
VRAM12	bit3	bit2	bit1	bit0	SEG24
	bit7	bit6	bit5	bit4	SEG25
VRAM13	bit3	bit2	bit1	bit0	SEG26
	bit7	bit6	bit5	bit4	SEG27
VRAM14	bit3	bit2	bit1	bit0	SEG28
	bit7	bit6	bit5	bit4	SEG29
VRAM15	bit3	bit2	bit1	bit0	SEG30
	bit7	bit6	bit5	bit4	SEG31
	COM3	COM2	COM1	COM0	



6.3. LCDC Control Register 1: LCR1

The bit configuration of the LCDC control register 1 is shown below.

■ LCR1

bit	7	6	5	4	3	2	1	0
Field	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
Attribute	R/W1	R/W1	R/W1	R/W1	R/W1	R/W1	R/W1	R/W1
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit7 to bit0] Reserved

When the LCD is used, set "11111111" always.

6.4. Common Pin Switching Register: LCDCMR

The bit configuration of the common pin switching register is shown below.

■ LCDCMR

bit	7	6	5	4	3	2	1	0
Field	DTCH	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
Attribute	R/W	R/W0	R/W0	R/W0	R/W1	R/W1	R/W1	R/W1
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit7] DTCH: Bias selection

Bit	Operation
0	1/3 bias
1	1/2 bias

[bit6 to bit4] Reserved

When the LCD is used, set "000" always.

[bit3 to bit0] Reserved

When the LCD is used, set "1111" always.

6.5. LCDC Static Control Register: LCRS

The bit configuration of the LCDC static control register is shown below.

■ LCRS

bit	7	6	5	4	3	2	1	0
Field	SCSS	LCSEN	LCS3	LCS2	LCS1	LCS0	FPS1	FPS0
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit7] SCSS: Frame Cycle Generation Clock for Static Drive selection Bit

Bit	Operation
0	Main clock
1	Sub clock

For the single clock products, set "0".

[bit6] LCSEN: PSS Timer Mode (Main Oscillation Operation / Sub Oscillation Operation) Operation Enable

Bit	Operation
0	LCD display stop in the PSS timer mode(main oscillation operation/ sub oscillation operation)
1	LCD display in the PSS timer mode(main oscillation operation/ sub oscillation operation)

When LCSEN="1", please do not stop the clock oscillation which selected by the SCSS bit during the transition to PSS mode.

LCD display stop when power shutdown.

[bit5:2] LCS3 to LCS0: Static Drive selection

LCS3	LCS2	LCS1	LCS0	Static Drive Selection Port
				Common / Segment Output
0	0	0	0	OFF
0	0	0	1	ST0, ST1
0	0	1	0	ST0 to ST2
0	0	1	1	ST0 to ST3
0	1	0	0	ST0 to ST4
0	1	0	1	ST0 to ST5
0	1	1	0	ST0 to ST6
0	1	1	1	ST0 to ST7
1	X	X	X	ST0 to ST8

Note:

- *For the use method for the static drive selection, refer to "4.5 Static Drive Output Waveform".*

[bit1:0] FPS1, FPS0: Frame Cycle

FPS1	FPS0	Frame Cycle
0	0	For SCSS=0 : $(2^{11} \times 4)/F_{CL}$ For SCSS=1 : $(2^{3} \times 4)/F_{CL}$
0	1	For SCSS=0 : $(2^{12} \times 4)/F_{CL}$ For SCSS=1 : $(2^{4} \times 4)/F_{CL}$
1	0	For SCSS=0 : $(2^{13} \times 4)/F_{CL}$ For SCSS=1 : $(2^{5} \times 4)/F_{CL}$
1	1	For SCSS=0 : $(2^{14} \times 4)/F_{CL}$ For SCSS=1 : $(2^{6} \times 4)/F_{CL}$

F_{CL} : Main clock (LCRS:SCSS=0) or sub clock (LCRS:SCSS=1)

Select the setting for FPS1 and FPS0 that is the optimum condition for the frame frequency of the LCD panel to be used.

The frame cycle during static drive is equal to the cycle of the 1/4 duty output mode.

The static drive is enabled when SEGER setting and any setting other than LCS [3:0] = "0000" are executed.

The duty drive is enabled when SEGER and LCS [3:0] = "0000" are set.

6.6. Static LCD Display Data Register: LDR

The bit configuration of the static LCD display data register is shown below.

■ LDR0

bit	15	14	13	12	11	10	9	8
Field	-		-	-	-	-	-	ST8
Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R0,WX	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit7:1] Undefined Bits

The read value is always "0". Writing has no effect on operation.

[bit0] ST8: Static Output Data

This bit is static output data for ST8.

■ LDR1 : Address 05BD$_H$ (Access : Byte, Half-word, Word)

bit	7	6	5	4	3	2	1	0
Field	ST7	ST6	ST5	ST4	ST3	ST2	ST1	ST0
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit7:0] ST7 to ST0: Static Output Data

These bits are static output data for ST0 to ST7.

Static Output Data Correspondence Table

LDR	Operation
ST8	ST8 static output data
ST7	ST7 static output data
ST6	ST6 static output data
ST5	ST5 static output data
ST4	ST4 static output data
ST3	ST3 static output data
ST2	ST2 static output data
ST1	ST1 static output data
ST0	ST0 static output data

This register is for setting of data output to the LCD static drive port (set by the LCRS register). The LCD static drive is executed by inverting output of the specified data periodically.

Common output pins are not specified especially. Assign common output to one of segments. For example, if ST0 to ST8 are assigned static drive pins, ST8 is a common pin and set to LDR0:ST8 = "0". Furthermore, by setting LDR1: ST [7:0] = "11111111", the LCD selected with ST0 to ST7 is displayed.

6.7. Key Code Register: LCD_KEYCDR

This section shows the bit configuration of the key code register.

This register makes the write setting of a register that has the function for protection against erroneous writing (SEGER, COMVER). If writing to this register is not done using the prescribed method, writing to the relevant register is invalid. This register is valid only for word access.

■ KEYCDR

bit	31	30	29	28	27	26	25	24
Field	KEY1	KEY0	SIZE1	SIZE0	Reserved			
Attribute	R0,W	R0,W	R0,W	R0,W	R0,WX	R0,WX	R0,WX	R0,WX

Initial value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	Reserved				ADR11	ADR10	ADR09	ADR08
Attribute	R0,WX	R0,WX	R0,WX	R0,WX	R0,W	R0,W	R0,W	R0,W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	ADR07	ADR06	ADR05	ADR04	ADR03	ADR02	ADR01	ADR00
Attribute	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W	R0,W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit31:30] KEY1 to KEY0: Key Code Setting Bits

You need to write "00", "01", "10", and "11" continuously to these bits in this order.

The key code setting becomes invalid immediately upon any writing to these bits in a different order. In such cases, you need to set the key codes again from the beginning.

Bit31:30		Description
0	0	1st key code
0	1	2nd key code
1	0	3rd key code
1	1	4th key code

[bit29:28] SIZE [1:0]: Access Size Setting Bits

These bits set the access size for writing to a key code target register.

Write the same data to these bits when writing the key codes of "00", "01", "10", and "11" to KEY [1:0] in this order.

Bit29:28		Description
0	0	Set byte access.
0	1	Set half-word access.
1	0	Set word access.
1	1	Reserved

[bit27:12] Reserved

Always write "0" to these bits.

[bit11:0] ADR11 to ADR0: Address Specification Bits

These bits set the lower 12 bits of the address of a key code target register. Write the same data to these bits when writing the key codes of "00", "01", "10", and "11" to KEY [1:0] in this order.

Bit11:0	Description
Set the lower 12 bits of the address of a key code target register.	

Notes:

The following are the notes on key code setting.

- *You need to write "00", "01", "10", and "11" continuously to KEY [1:0] in this order in 4 write operations.*
  The key code setting becomes invalid immediately upon any writing to these bits in a different order. In such cases, you need to set the key codes again from the beginning.

- *You need to write the same pair of values to SIZE [1:0] and ADR [11:0] 4 times when writing data to KEY [1:0] 4 times.*
  The key code setting becomes invalid upon any writing of a different pair of values. In such cases, you need to set the key codes again from the beginning.
- *When the KEYCDR register is read during writing to KEY [1:0], the key code setting becomes invalid. In such cases, you need to set the key codes again from the beginning.*
- *When access to the address set in ADR [11:0] occurs during writing to KEY [1:0], the key code setting becomes invalid. In such cases, you need to set the key codes again from the beginning.*
  When access to any register other than the above occurs, the key code setting does not become invalid.
  Writing the remaining data to KEY [1:0] subsequently makes the key code setting valid.
- *Once the address set in KEYCDR: ADR [11:0] is accessed after KEY [1:0] is set normally, it is required to set the key codes again to access the address again.*

6.8. Segment Output Register: SEGER

This section shows the bit configuration of the Segment output Register.

Segment output register (SEGER) is a register which control the segment output enable of LCD controller duty driving driver.

■ SEGER

bit	31	30	29	28	27	26	25	24
Field	SEGE7	SEGE6	SEGE5	SEGE4	SEGE3	SEGE2	SEGE1	SEGE0
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

bit	23	22	21	20	19	18	17	16
Field	SEGE15	SEGE14	SEGE13	SEGE12	SEGE11	SEGE10	SEGE9	SEGE8
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

bit	15	14	13	12	11	10	9	8
Field	SEGE23	SEGE22	SEGE21	SEGE20	SEGE19	SEGE18	SEGE17	SEGE16
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	1	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	SEGE31	SEGE30	SEGE29	SEGE28	SEGE27	SEGE26	SEGE25	SEGE24
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	1	1	1	1	1	1	1	1

[bit31:0] SEGEn (n=0 to 31)

SEGEn(n=0 to 31)	Operation
0	Disable LCDC segment output
1	Enable LCDC segment output

6.9. Common Output V Pin Control Register: COMVER

This section shows the bit configuration of the common output V pin control register.

Common output V pin control register (COMVER) is a register which control the common output enable of LCD controller static driving driver, input enable and selection of LCD controller reference voltage.

■ COMVER

bit	31	30	29	28	27	26	25	24
Field	VE3	VE2	VE1	VE0	COME3	COME2	COME1	COME0
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	1	1	1	1	1	1	1	1

bit	23	22	21	20	19	18	17	16
Field	Reserved							
Attribute	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX
Protection attribute	-	-	-	-	-	-	-	-
Initial value	1	1	1	1	1	1	1	1

bit	15	14	13	12	11	10	9	8
Field	Reserved							
Attribute	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX
Protection attribute	-	-	-	-	-	-	-	-
Initial value	1	1	1	1	1	1	1	1

bit	7	6	5	4	3	2	1	0
Field	Reserved							
Attribute	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX	R1,WX
Protection attribute	-	-	-	-	-	-	-	-
Initial value	1	1	1	1	1	1	1	1

[bit31] VE3

VE3	Operation
1	Use V3 pin as the LCDC V3 reference voltage input
0	VCC is used for the LCDC V3 reference voltage

Please to switch on the main oscillation state when switching external V3 and VCC as LCDC reference supply V3 input.

[bit30:28] VEn (n=0 to 2)

VEn(n=0 to 2)	Operation
0	Disable LCDC reference voltage input
1	Enable LCDC reference voltage input

[bit27:24] COMEn (n=0 to 3)

COMEn(n=0 to 3)	Operation
0	Disable LCDC common output
1	Enable LCDC common output

[bit23:0] Reserved

The read value is always "1". Writing has no effect on operation.

7. Q&A

This section shows Q&A of the LCD controller.

7.1. How Can I Set Pins to COM Output Pins or SEG Output Pins?

7.2. How to Set VRAM?

7.3 How Can I Setting the Frame Cycle?7.4. How Can I Set the Bias?

7.5. How Can I Set the Duty?

7.6. How Can I Control the LCD Operation Start/Stop?

7.7. How Can I Execute/Cancel the Display?

7.8. How Can I Display during the PSS Timer Mode (Main Oscillation Operation/ Sub Oscillation Operation)?

7.9. How Can I Select Either Internal or External for the Division Resistor?

7.10. How Can I Select Pin of V3 Voltage?

7.11. How Can I Select Either Internal or External for the Division Resistor?

7.12. How Can I Adjust the Brightness When the Internal Division Resistor is Used?

7.13. How Can I Block the Current with the External Division Resistor When the LCD Stops?

7.14. How Can I Display/Non-Display the LCD with Static Drive (ST0 to ST8)?

7.1. How Can I Set Pins to COM Output Pins or SEG Output Pins?

This section shows how to set pins to COM output pins or SEG output pins.

COM output and SEG output setting.

With software setting, ports can be switched to COM, SEG output.

Set pins for COM output and SEG output to peripheral output. See following table for pin setting.

<Duty drive>

Pin	V0-V3 and COM and SEG Setting Method	Port Setting Method
V0	Set pins to LCDC V0/V1/V2/V3 (LCDC reference power input). See 6.9.	See "Port Configuration 5.6 Analog Function Input or Output"
V1		
V2		
V3		
COM0		
COM1		
COM2		
COM3		
SEG0	See 6.8.

7.2. How to Set VRAM?

This section shows how to set VRAM.

<Duty drive>

The matrix of pins and bit locations of VRAM (n) is shown below. (n = 0 to 15)

1/2 Duty

Pin	COM1	COM0
SEG 2n	bit1	bit0
SEG 2n+1	bit5	bit4

1/3 Duty

Pin	COM2	COM1	COM0
SEG 2n	bit2	bit1	bit0
SEG 2n+1	bit6	bit5	bit4

1/4 Duty

Pin	COM3	COM2	COM1	COM0
SEG 2n	bit3	bit2	bit1	bit0
SEG 2n+1	bit7	bit6	bit5	bit4

(Non-selection waveforms are output from irrelevant pins.)

Example: 1/4 duty

When the bit6 of VRAMn is set to "1", the selection waveform is output from the SEGn+1 of COM2.

For bits with "0"setting, non-selection waveforms are output to pins.

7.3. How Can I Setting the Frame Cycle?

This section shows how to set pins to COM output pins or SEG output pins.

<Duty drive>

The frame cycle can be set with the frame cycle bits (LCR0: FP [1:0]).The following settings are available.

Frame Cycle (When a Main Clock Is Selected)	Selection Value
	Frame Cycle Bits (FP[1:0])
$(2^{11} \times N)$/ Main clock frequency	Set "00".
$(2^{12} \times N)$/ Main clock frequency	Set "01".
$(2^{13} \times N)$/ Main clock frequency	Set "10".
$(2^{14} \times N)$/ Main clock frequency	Set "11".

N (Time division number) = Value of MS [1:0] + "1"

Frame Cycle (When a Sub Clock Is Selected)	Selection Value
	Frame Cycle Bits (FP[1:0])
$(2^{3} \times N)$/ Sub clock frequency	Set "00".
$(2^{4} \times N)$/ Sub clock frequency	Set "01".
$(2^{5} \times N)$/ Sub clock frequency	Set "10".
$(2^{6} \times N)$/ Sub clock frequency	Set "11".

N (Time division number) = Value of MS [1:0] + "1"

< Static drive >

The frame cycle can be set with the frame cycle bits (LCRS: FPS [1:0]).The following settings are available.

Frame Cycle	Selection Value
	Frame Cycle Bits (FPS[1:0])
$(2^{11} \times 4)$/Main clock (F_{CL})	Set "00".
$(2^{12} \times 4)$/ Main clock (F_{CL})	Set "01".
$(2^{13} \times 4)$/ Main clock (F_{CL})	Set "10".
$(2^{14} \times 4)$/ Main clock (F_{CL})	Set "11".

7.4. How Can I Set the Bias?

This section shows how to set the bias.

<Duty drive>

Set the bias selection bit (LCDCMR: DTCH).

Bias	Bias Selection Bit (DTCH)
To set 1/3 bias	Set "0".
To set 1/2 bias	Set "1".

7.5. How Can I Set the Duty?

This section shows how to set the duty.

<Duty drive>

Set the display mode selection bits (LCR0: MS [1:0]).

Control Detail	Display Mode Selection Bits (MS[1:0])	N (Time Division Number)
LCD operation stop (Pin output "L")	Set "00".	-
To set 1/2 duty output mode	Set "01".	2
To set 1/3 duty output mode	Set "10".	3
To set 1/4 duty output mode	Set "11".	4

The display mode selection bits are also the control bit for operation start/stop.

7.6. How Can I Control the LCD Operation Start/Stop?

This section shows how to control the LCD operation start/stop.

<Duty drive>

Operation start/stop can be controlled with the display mode selection bits (LCR0: MS [1:0]).

See "7.5 How can I set the duty?".

<Static drive>

Operation start/stop can be controlled with the display mode selection bits (LCRS: LCS [3:0]).

7.7. How Can I Execute/Cancel the Display?

This section shows how to execute/cancel the LCD display.

<Duty drive>

The two methods below are available.

■ Setting of the blanking selection bit (LCR0:BK)

Control Detail	Blanking Selection Bit (BK)
To execute LCD display	Set "0".
To cancel LCD display (A non-selection waveform is output to a segment pin.)	Set "1".

■ Cancellation of display with operation stop by the display mode selection bits (LCR0: MS [1:0]).

Control Detail	Display Mode Selection Bits (MS[1:0])
LCD operation stop ("L" output from the common pin and segment pin.)	Set "00".

7.8. How Can I Display during the PSS Timer Mode (Main Oscillation Operation/ Sub Oscillation Operation)?

This section shows how to display during the PSS timer mode (main oscillation operation/ sub oscillation operation).

<Duty drive>

Set the PSS timer mode (main oscillation operation/ sub oscillation operation) operation enable bit (LCR0: LCEN).

Control Detail	PSS Timer Mode(Main Oscillation Operation/ Sub Oscillation Operation) Operation Enable Bit (LCEN)
For no LCD display in the PSS timer mode(main oscillation operation/ sub oscillation operation)	Set "0".
For LCD display in the PSS timer mode(main oscillation operation/ sub oscillation operation)	Set "1".

When LCEN="1", please do not stop the clock oscillation which selected by the CSS bit during the transition to PSS mode. LCD display stop when power shutdown.

<Static drive>

Set the PSS timer mode (main oscillation operation/ sub oscillation operation) operation enable bit (LCRS: LCSEN).

Control Detail	PSS Timer Mode(Main Oscillation Operation/ Sub Oscillation Operation) Operation Enable Bit (LCSEN)
For no LCD display in the PSS timer mode(main oscillation operation/ sub oscillation operation)	Set "0".
For LCD display in the PSS timer mode(main oscillation operation/ sub oscillation operation)	Set "1".

When LCSEN="1", please do not stop the clock oscillation which selected by the SCSS bit during the transition to PSS mode. LCD display stop when power shutdown.

7.9. How Can I Select Either Internal or External for the Division Resistor?

This section shows how to select either internal or external for the division resistor.

<Duty drive>

Set the LCD drive power control bit (LCR0: VSEL).

Control Detail	LCD Drive Power Control Bit (VSEL)
For use of the external division resistor (The internal division resistor is disconnected.)	Set "0".
For use of the internal division resistor (The internal division resistor is connected.)	Set "1".

7.10. How Can I Select Pin of V_3 Voltage?

This section shows how to select the pin of V_3 voltage.

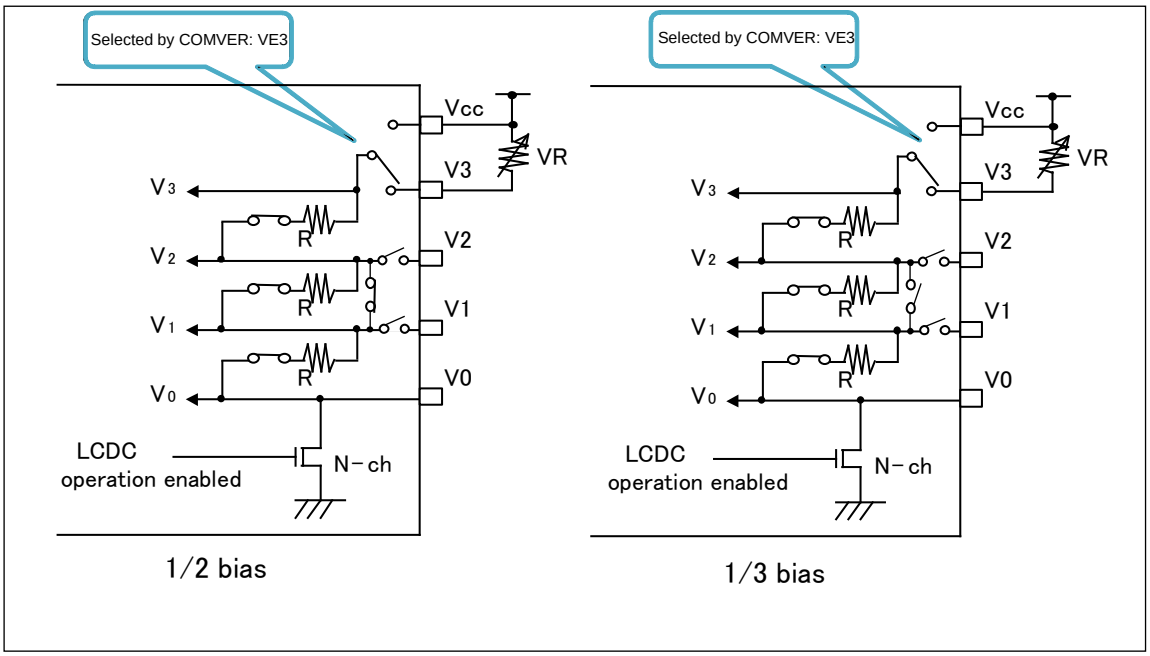
Set the COMVER: VE3 bit. See chapter of 6.9 for details.

7.11. How Can I Select Either Internal or External for the Division Resistor?

This section shows how to select either internal or external for the division resistor.

■ When the internal division resistor is selected

Even when the internal division resistor is used if the V3 pin is used as V_3 voltage, the external resistor must be connected between Vcc and V3.



■ When the external division resistor is selected

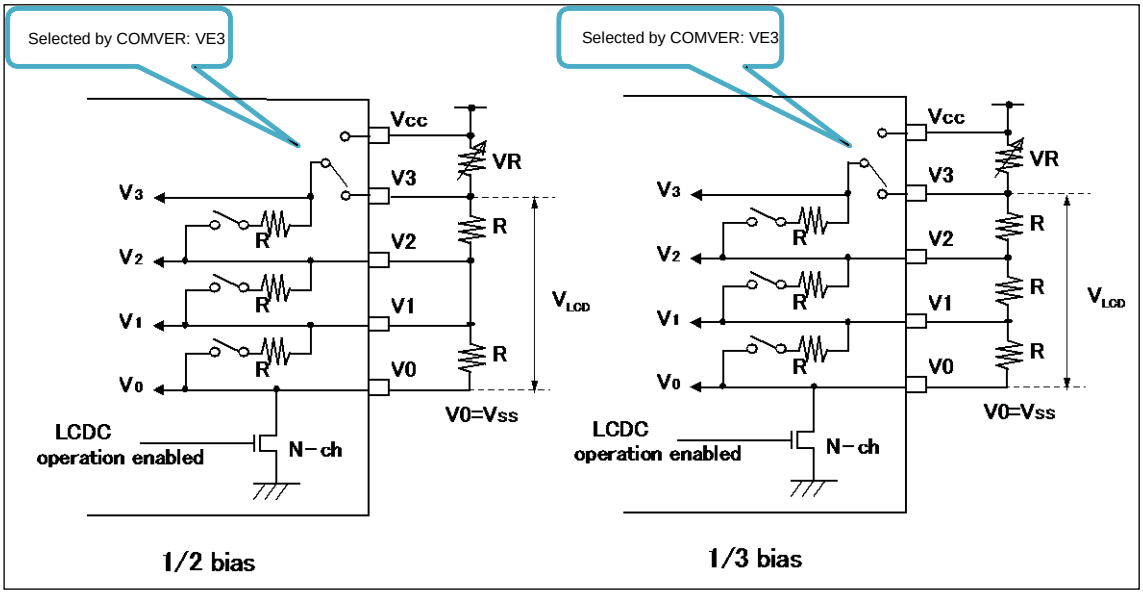
Voltage for the LCD drive is set with the external division resistor connected to the power pins for LCD drive (V0 to V3).

Setting of LCD drive voltage

	V3	V2	V1	V0
1/2 bias	VLCD	1/2VLCD	1/2VLCD	VSS
1/3 bias	VLCD	2/3VLCD	1/3VLCD	VSS

V_0 to V_3 : Voltage of V0 to V3 pins

V_{LCD} : Operation voltage of the LCD



To avoid the effect of the internal division resistor, the LCD drive power control bit (LCR0: VSEL) must be set to "0" to disconnect the internal division resistor.

7.12. How Can I Adjust the Brightness When the Internal Division Resistor is Used?

This section shows how to adjust the brightness when the internal division resistor is used.

If desired brightness cannot be obtained with the use of the internal division resistor, adjust the voltage V3 by putting a variable resister (VR) between the outer terminals Vcc and V3.

7.13. How Can I Block the Current with the External Division Resistor When the LCD Stops?

This section shows how to block the current with the external division resistor when the LCD stops.

The V0 pin is connected to the Vss (GND) via a transistor internally. Therefore, when the external division resistor is used, by connecting the Vss side of the external division resistor to the V0 pin, the current which flows on the LCD controller which is stopped can be blocked. Block the current with the display mode selection bits (MS [1:0] = "00").

7.14. How Can I Display/Non-Display the LCD with Static Drive (ST0 to ST8)?

This section shows how to display/non-display the LCD with static drive (ST0 to ST8).

When the LCD with static drive (ST0 to ST8) is switched to non-display after reset, set LDR0:ST8 = "0" and LDR1: ST [7:0] = "00000000", and set the static drive selection port (LCS [3:0]).

The same potential pulses are output from the static drive pins (ST0 to ST8).

When the LCD with static drive (ST0 to ST8) is switched from non-display to display, set LDR0:ST8 and LDR1: ST [7:0] without change of (LCS [3:0]).

When the LCD with static drive (ST0 to ST8) is switched from display to non-display, set LDR0:ST8 = "0" and LDR1: ST [7:0] = "00000000" without change of the static drive selection port (LCS [3:0]).

The same potential pulses are output from the static drive pins (ST0 to ST8).

8. Sample Program

This section shows sample program.

Setting procedure 1

With the 1/2 duty drive method, make the LCD display a four-digit number, "0 1 2 3".

Initial setting (LCDC)

<Initial setting>

1. - Port

	Register name
COM, SEG output setting for the port	See 6.8. and 6.9.

2. - Setting of VRAM

	Register name
Setting of VRAM	VRAM00-VRAM07

3. - Setting of control register

	Register name
Fixed value	LCR1
Bias setting	LCDCMR
Setting of control register	LCR0
	. LCEN
	. VSEL
	. BK
	. MS[1:0]
	. FP[1:0]

<Others>

(Note)

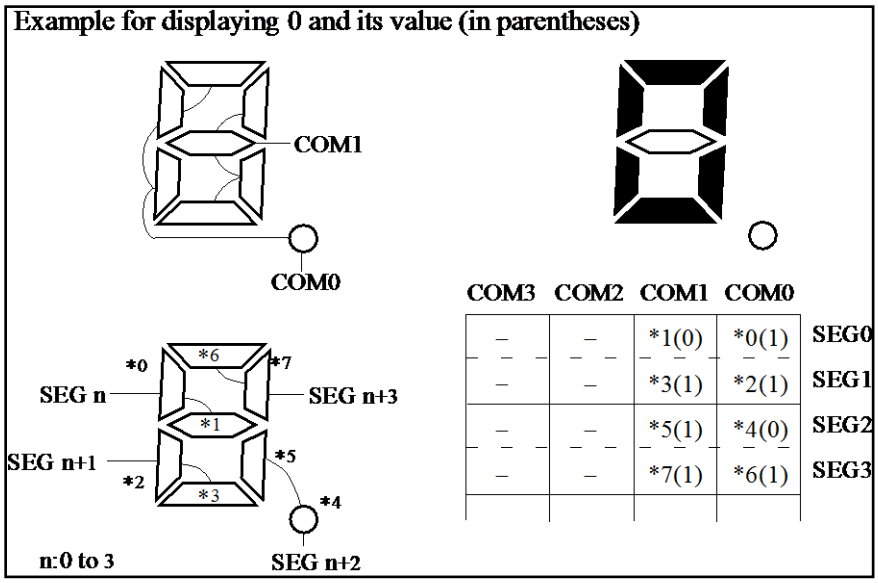
Clock-related setting and setting of _set_il (numerical value) in advance are required. See chapter of "CLOCK SYSTEM" and chapter of "INTERRUPT CONTROLLER" for details.

Program 1

```
void LCD_sample_1(void)
{
        LCDC_initial();
}
void LCDC_initial(void)
{
        PORT_SETTING_LCDC_OUT();    /* Set the LCD controller pin to */
                                    /* peripheral output.   */

        IO_VRAM00 = 0x31;
        IO_VRAM01 = 0x32;
        IO_VRAM02 = 0x00;
        IO_VRAM03 = 0x22;
        IO_VRAM04 = 0x32;
        IO_VRAM05 = 0x30;
        IO_VRAM06 = 0x22;
        IO_VRAM07 = 0x32;

        IO_LCR1.byte = 0xFF;        /* Set to FF. */
        IO_LCDCMR. byte = 0x0F;     /* 1/2 bias */
        IO_LCR0.byte = 0x04;        /* Setting value =0000_0100 */
                                    /* bit7 = 0 Clock selection    Main clock */
                                    /* bit6 = 0 LCEN    Display stopped with PSS mode   */
                                    /* bit5 = 0 VSEL Internal division resistor disconnected
                                    */
                                    /* bit4 = 0 BK Blanking selection bit */
                                    /* bit3-2 = 01 MS[1:0]          1/2 duty mode */
                                    /* bit1-0 = 00 FP[1:0] */
}
```



Example for displaying 0 and its value (in parentheses)
COM1
COM0
*0
*6
*7
SEG n
SEG n+3
*1
SEG n+1

– – *3(1) *2(1) SEG1
– – *5(1) *4(0) SEG2
– – *7(1) *6(1) SEG3

Setting procedure 2

With the1/3 duty drive method, make the LCD display a four-digit number , "0 1 2 3 ".

Initial setting (LCDC)

<Initial setting>

1. - Port

	Register name
COM, SEG output setting for the port	See 6.8. and 6.9.

2. - Setting of VRAM

	Register name
Setting of VRAM	VRAM00-VRAM05

3. - Setting of control register

Fixed value	LCR1
Bias setting	LCDCMR
Setting of control register	LCR0
	. LCEN
	. VSEL
	. BK
	. MS[1:0]
	. FP[1:0]

<Others>

(Note)

Clock-related setting and setting of _set_il (numerical value) in advance are required. See chapter of "CLOCK SYSTEM" and chapter of "INTERRUPT CONTROLLER" for details.

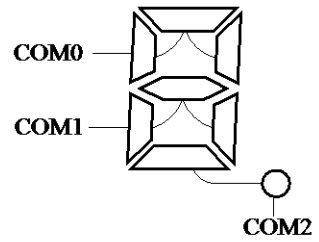
Program 2

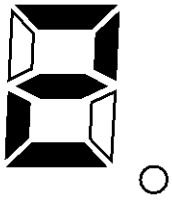
```
void LCD_sample_2(void)
{
        LCDC_initial();
}
void LCDC_initial(void)
{
        PORT_SETTING_LCDC_OUT();        /* Set the LCD controller pin to */
                                        /* peripheral output.    */

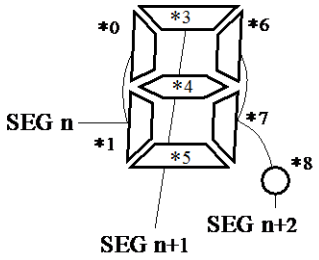
        IO_VRAM00 = 0x53;
        IO_VRAM01 = 0x03;
        IO_VRAM02 = 0x30;
        IO_VRAM03 = 0x72;
        IO_VRAM04 = 0x01;
        IO_VRAM05 = 0x37;

        IO_LCR1.byte = 0xFF;            /* Set to FF. */
        IO_LCDCMR. byte = 0x00;         /* 1/3 bias */
        IO_LCR0.byte = 0x08;            /* Setting value =0000_1000 */
                                        /* bit7 = 0 Clock selection Main clock */
                                        /* bit6 = 0 LCEN Display stopped with PSS mode */
                                        /* bit5 = 0 VSEL Internal division resistor disconnected */
                                        /* bit4 = 0 BK Blanking selection bit */
                                        /* bit3-2 = 10 MS[1:0]  1/3 duty   mode */
                                        /* bit1-0 = 00 FP[1:0] */
}
```

Example for displaying 2 and its value (in parentheses)







COM3	COM2	COM1	COM0		
–	(-)	*1(1)	*0(0)	SEG0	First digit
–	*5(1)	*4(1)	*3(1)	SEG1	
–	*8(0)	*7(0)	*6(1)	SEG2	
–	–	1	0	SEG3	Second digit
–	1	1	1	SEG4	
–	0	0	1	SEG5	

Setting procedure 3

With the 1/4 duty drive method, make the LCD display a four-digit number, "0 1 2 3 ".

Initial setting (LCD)

<Initial setting>

1. - PORT

	Register name
COM, SEG output setting for the port	See 6.8. and 6.9.

2. - Setting of VRAM

	Register name
Setting of VRAM	VRAM00-VRAM03

3. - Setting of control register

	registername . bit name

Setting of control register	LCR0
	. LCEN
	. VSEL
	. BK
	. MS[1:0]
	. FP[1:0]

<Others>

(Note)

Clock-related setting and setting of _set_il (numerical value) in advance are required. See chapter of "CLOCK SYSTEM" and chapter of "INTERRUPT CONTROLLER" for details.

Program 3

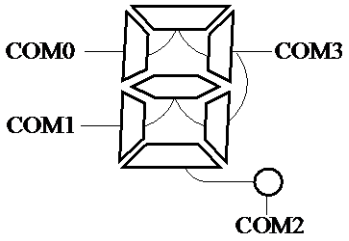
```
void LCD_sample_3(void)
{
        LCD_initial();
}

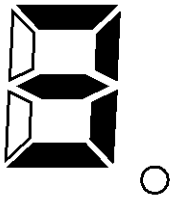
void lcdc_initial(void)
{
        PORT_SETTING_LCDC_OUT();        /* Set the LCD controller pin to */
                                        /* peripheral output. */

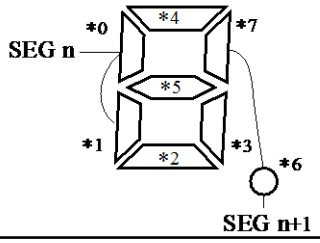
        IO_VRAM00 = 0x9F;
        IO_VRAM01 = 0x88;
        IO_VRAM02 = 0xB6;
        IO_VRAM03 = 0xBC;

        IO_LCR1.byte = 0xFF;            /* Set to FF. */
        IO_LCDCMR. byte = 0x00;         /* 1/3 bias */
        IO_LCR0.byte = 0x0C;            /* Setting value =0000_1100 */
                                        /* bit7 = 0 Clock selection Main clock */
                                        /* bit6 = 0 LCEN   Display stopped with PSS mode */
                                        /* bit5 = 0 VSEL Internal division resistor disconnected */
                                        /* bit4 = 0 BK Blanking selection bit */
                                        /* bit3-2 = 11 MS[1:0]  1/4 duty mode */
                                        /* bit1-0 = 00 FP[1:0] */
}
```

Example for displaying 3 and its value (in parentheses)







COM3	COM2	COM1	COM0	
*3(1)	*2(1)	*1(0)	*0(1)	SEG0
*7(0)	*6(0)	*5(1)	*4(1)	SEG1

Setting procedure 4

With the static drive method, make the LCD display an one-digit number.

Initial setting (LCD)

<Initial setting>

1. - PORT — Register name

COM, SEG output setting for the port	See 6.8. and 6.9.

2. - Data setting — Register name

Data setting	LDR0 LDR1

3. - Setting of control register — Register name . bit name

Fixed value	LCR1
Bias setting	LCDCMR
Setting of control register	LCRS
	. LCSEN
	. LCS[3:0]
	. FPS[1:0]

Program 4

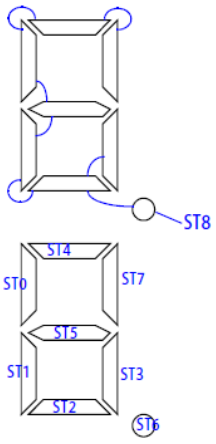
```
void LCD_sample_4(void)
{
        LCD_initial();
}

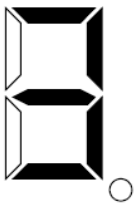
void lcdc_initial(void)
{
        PORT_SETTING_LCDC_OUT();        /* Set the LCD controller pin to */
                                        /* peripheral output.   */

        IO_LDR0.byte = 0x00;
        IO_LDR1.byte = 0xBC;

        IO_LCR1.byte = 0xFF;            /* Set to FF. */
        IO_LCDCMR. byte = 0x00;         /* 1/3 bias */
        IO_LCRS.byte = 0x20;            /* Setting value =0001_0000 */
                                        /* bit7 = 0 Clock selection Main clock */
                                        /* bit6 = 0 LCSEN   Non-display with PSS mode   */
                                        /* bit5-2 = 1000   LCS[3:0]   ST0 to ST8 */
                                        /* bit1-0 = 00 FPS[1:0]   Frame cycle setting */
}
```

Example) Values to display 3





LDR0/ LDR1 register

ST 8	ST 7	ST 6	ST 5	
0	1	0	1	
ST 4	ST 3	ST 2	ST 1	ST 0
1	1	1	0	0

9. Notes

This section shows notes.

- Since resistance value of the external division resisters depends on the LCD to be used, connect the resistors with a suitable value.
- Non-selection level waveforms are output from the COM2 and COM3 pins in 1/2 duty display mode and from the COM3 pin in 1/3 duty display mode.
- If the settings of the LCD drive power control (VSEL), duty selection (MS [1:0]), frame cycle selection (FP [1:0]), etc. are not proper, the LCD does not display correctly.
- When neither the LCD nor general-purpose ports are used, connect a pull-up or pull-down resistor to V3 to V0 pins.
- The static drive is enabled when any setting other than LCS [3:0] = "0000" is set. The duty drive is enabled when LCS [3:0] = "0000" is set.
- Setting of display/non-display of the LCD with static drive (ST0 to ST8)

  When the LCD with static drive (ST0 to ST8) is switched to non-display after reset, set LDR0:ST8 = "0" and LDR1:ST [7:0] = "00000000", and set the static drive selection port (LCS [3:0]). The same potential pulses are output from the static drive pins (ST0 to ST8).

When the LCD with static drive (ST0 to ST8) is switched from non-display to display, set LDR0:ST8 and LDR1:ST [7:0] without change of the static drive selection port (LCS [3:0]).
When the LCD with static drive (ST0 to ST8) is switched from display to non-display, set LDR0:ST8 = "0" and LDR1:ST [7:0] = "00000000" without change of the static drive selection port (LCS [3:0]).

The same potential pulses are output from the static drive pins (ST0 to ST8).

- When the LCD is used (static drive, duty drive), set the following.
  LCR1 [7:0] = "11111111"
  LCDCMR [3:0] = "1111"

In case of power shutdown, it works as following.

- When port setting is LCD output, output the "Low".
- LCD control is power shutdown, registers (LCR0, VRAMn (n=0 to 15), LCR1, LCDCMR, LCRS, LDR) of LCD control is initialized when returning from power shutdown.
- Registers (LCD_KEYCDR, SEGER, COMVER) of LCD port-related is not initialized.

CHAPTER 58: Sound Generator

This chapter explains the functions and operations of the Sound Generator(SG).

1. Overview
2. Configuration
3. Operations
4. Registers

SG-T01P00R02L01-E1-GBM01

1. Overview

The Sound Generator generates and outputs a tone pulse signal, a PWM pulse signal, or mixed one of both signals according to the setting by MCU. It is enabled to set the frequency of the tone pulse signal, sound volume (amplitude of PWM pulse), and length of sound. The Sound Generator consists of the following registers and counters.

- DMA Transfer Update Enable Register (SGDER)
- Sound Control Register (SGCR)
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Time Cycle Register (SGTCR)
- Tone Output Number Register (SGNR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)
- DMA Transfer Intermediate Register (SGDMAR)
- Interrupt Clear Register (SGCCR)
- PWM pulse generation counter
- Frequency counter
- Decrement counter
- Tone pulse counter

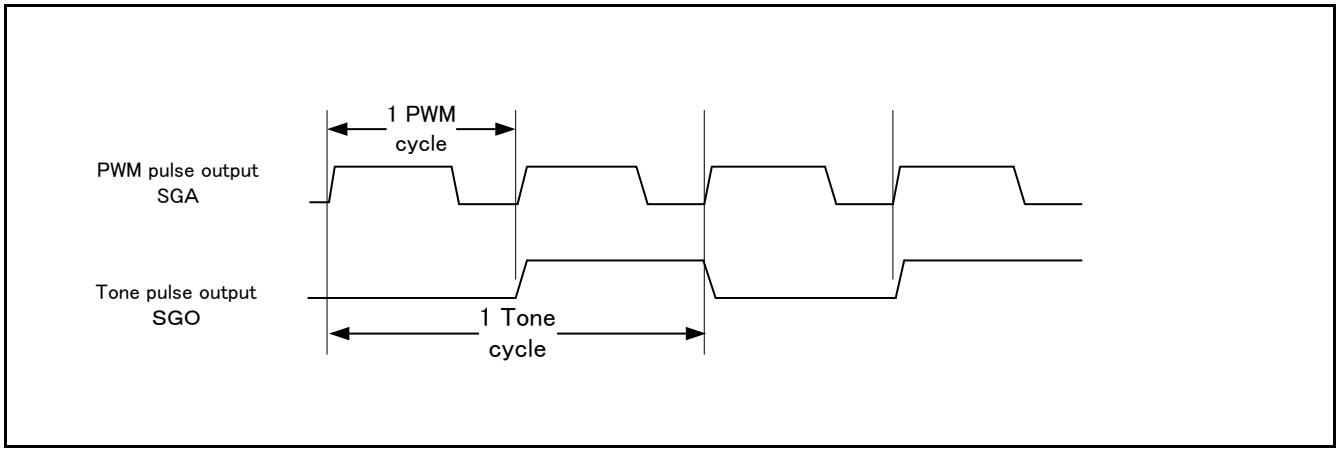
Functions of Sound Generator

Table 1-1 Functions of Sound Generator

No	Item	Function
1	Operation clock	Bus clock (BCLK)
2	Clock input	For clock input of the Sound Generator, divide the bus clock (BCLK) and use it. - 1 x BCLK - 1/2 x BCLK - 1/4 x BCLK - 1/8 x BCLK
3	Waveform	Rectangular wave for sound (tone pulse output, sound output from SGO pin)
4	Volume of sound	It is enabled to set their arbitrary level (PWM pulse output). (Amplitude output from SGA pin)
5	Frequency	It is enabled to set their arbitrary level for sound signal frequency. (Frequency setting and PWM cycle setting)
6	Length of sound	It is enabled to set their arbitrary level.
7	Interrupt	- It is enabled to generate interrupt requests at the end of outputting sound at programmed length (An overflow of Tone pulse counter). - It is enabled to generate interrupts by writing "1" to the Start bit (SGCR.ST) when in DMA mode (SGCR.DMA="1").

Output of Sound Generator

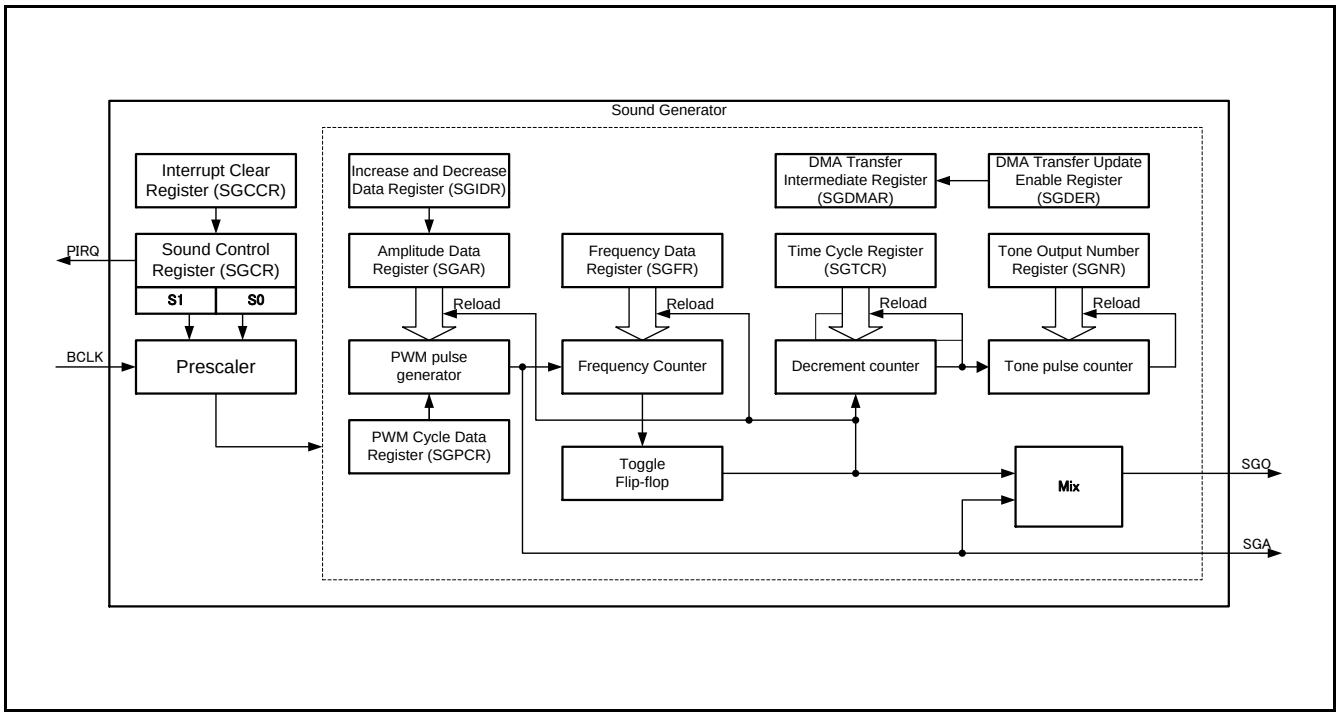
Figure 1-1 Example of output



2. Configuration

This chapter shows the block diagram of Sound Generator.

Figure 2-1 Block Diagram

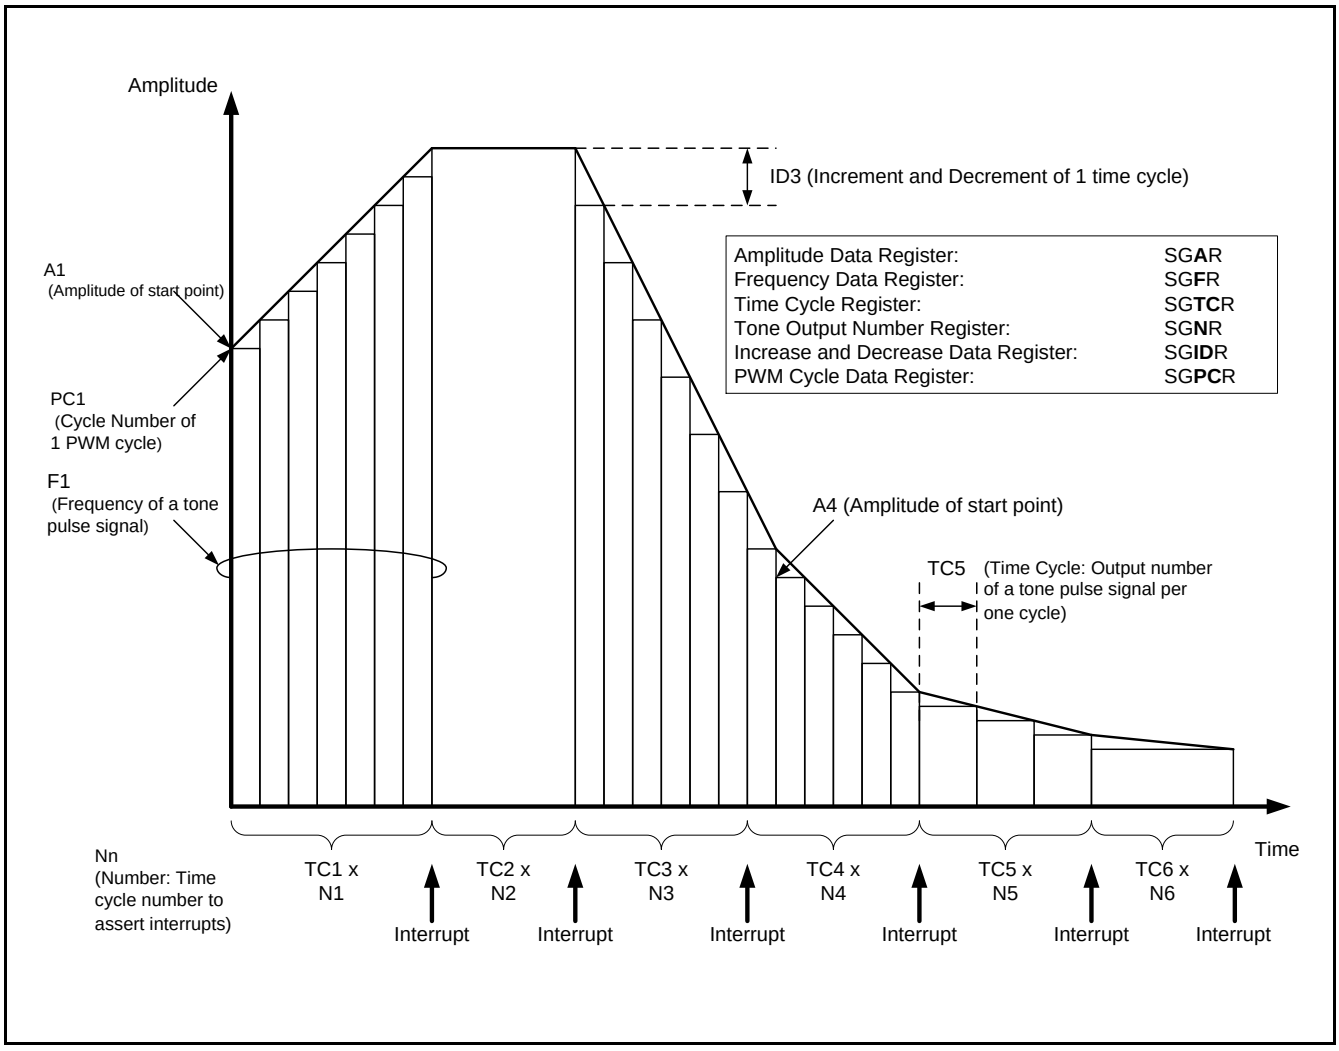


3. Operations

This chapter describes the Sound Generator operation.

The concept of Sound Generator operation is shown in the diagram as below.

Figure 3-1 The operation of Sound Generator (Conceptual Diagram)



Set the various values in the register as follows:

Amplitude of start point (An) (SGAR)	- to the Amplitude Data Register
Frequency of a tone pulse signal (Fn) (SGFR)	- to the Frequency Data Register
Output number of a tone pulse signal per one cycle (TCn)	- to the Time Cycle Register (SGTCR)
Time cycle number to assert interrupts (Nn)	- to the Tone Output Number Register

	(SGNR)
Increment and Decrement of 1 time cycle (IDn)	- to the Increase and Decrease Data Register (SGIDR)
Cycle Number of 1 PWM cycle (PCn)	- to the PWM Cycle Data Register (SGPCR)
Other information about Sound Generator control (SGCR)	- to the Sound Control Register

The Sound Generator outputs the tone pulse signal and the amplitude data according to the setting above.

In the conceptual diagram shown above, it outputs 6 steps of signal.

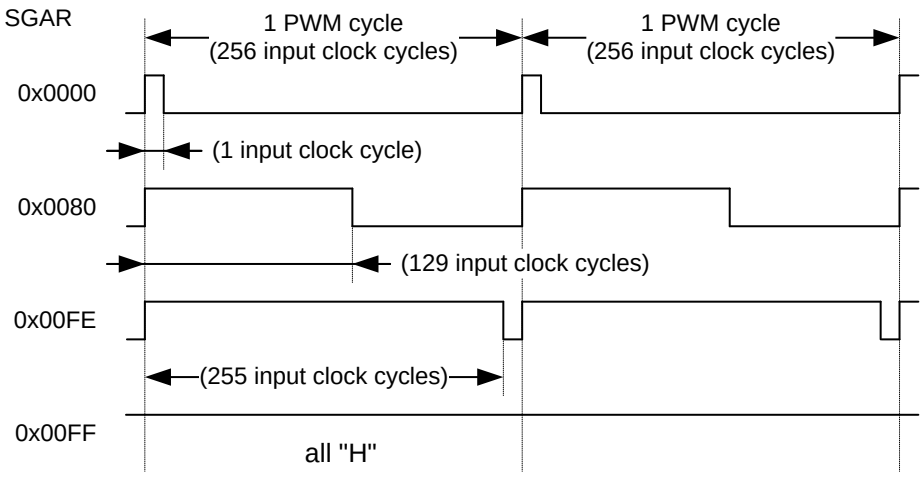
Each register, such as Amplitude Data Register, is supposed to be written at the following timing.

- Before starting signal output
- Each time after asserting an interrupt

3.1. Relation between the Amplitude Data Register (SGAR) and PWM Pulse

This section describes the relation between the Amplitude Data Register (SGAR) and a PWM pulse.

Figure 3-2 The Relation Between the Amplitude Data Register (SGAR) and PWM Pulse



The amplitude data is output as a PWM (Pulse Width Modulation) waveform on the SGA pin.

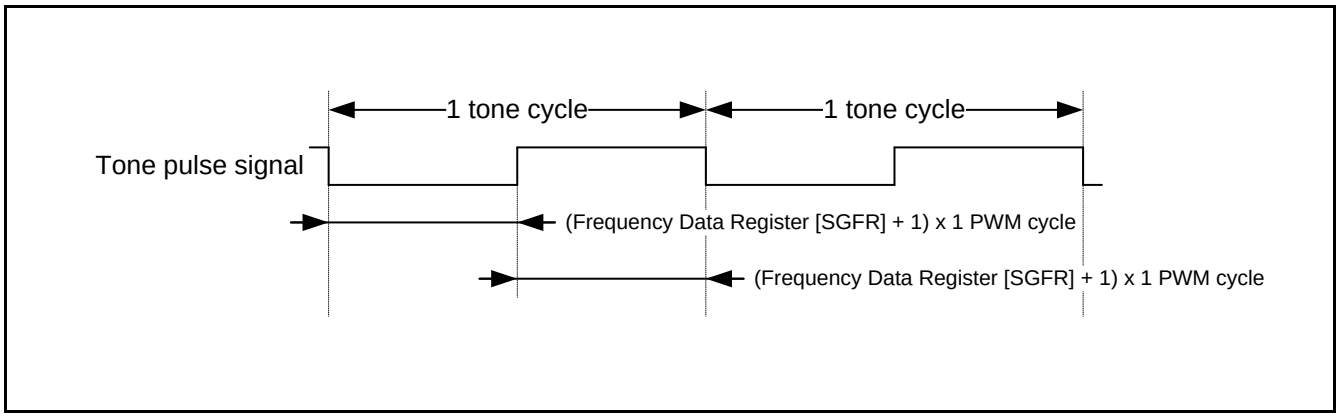
The length of a PWM cycle is programmable in the PWM Cycle Data Register (SGPCR). This length is based on the count of input clock. The initial value is 256 input clock cycle (SGPCR=0x00FF).

The value [Amplitude Data Register (SGAR) + 1] means the number of input clock cycles in which the SGA pin is "H" during 1 PWM cycle. Moreover, when the Amplitude Data Register (SGAR) is greater than or equal to the PWM Cycle Data Register (SGPCR), the SGA pin output is always "H".

3.2. Relation between the Frequency Data Register (SGFR) and Tone Pulse Signal

This section describes the relation between the Frequency Data Register (SGFR) and a tone pulse signal.

Figure 3-3 The Relation between the Frequency Data Register (SGFR) and Tone Pulse Signal



The tone pulse signal transits between "L" and "H" at every cycle of "(Frequency Data Register [SGFR] + 1) x 1 PWM cycle)". This signal is generated by an internal toggle flip-flop.

When the Tone output bit (TONE) of the Sound Control Register (SGCR) is "0", the tone pulse signal is mixed with a PWM pulse, and is output from the SGO pin. And when the Tone output bit (TONE) of the Sound Control Register (SGCR) is "1", the tone pulse signal is output without being mixed.

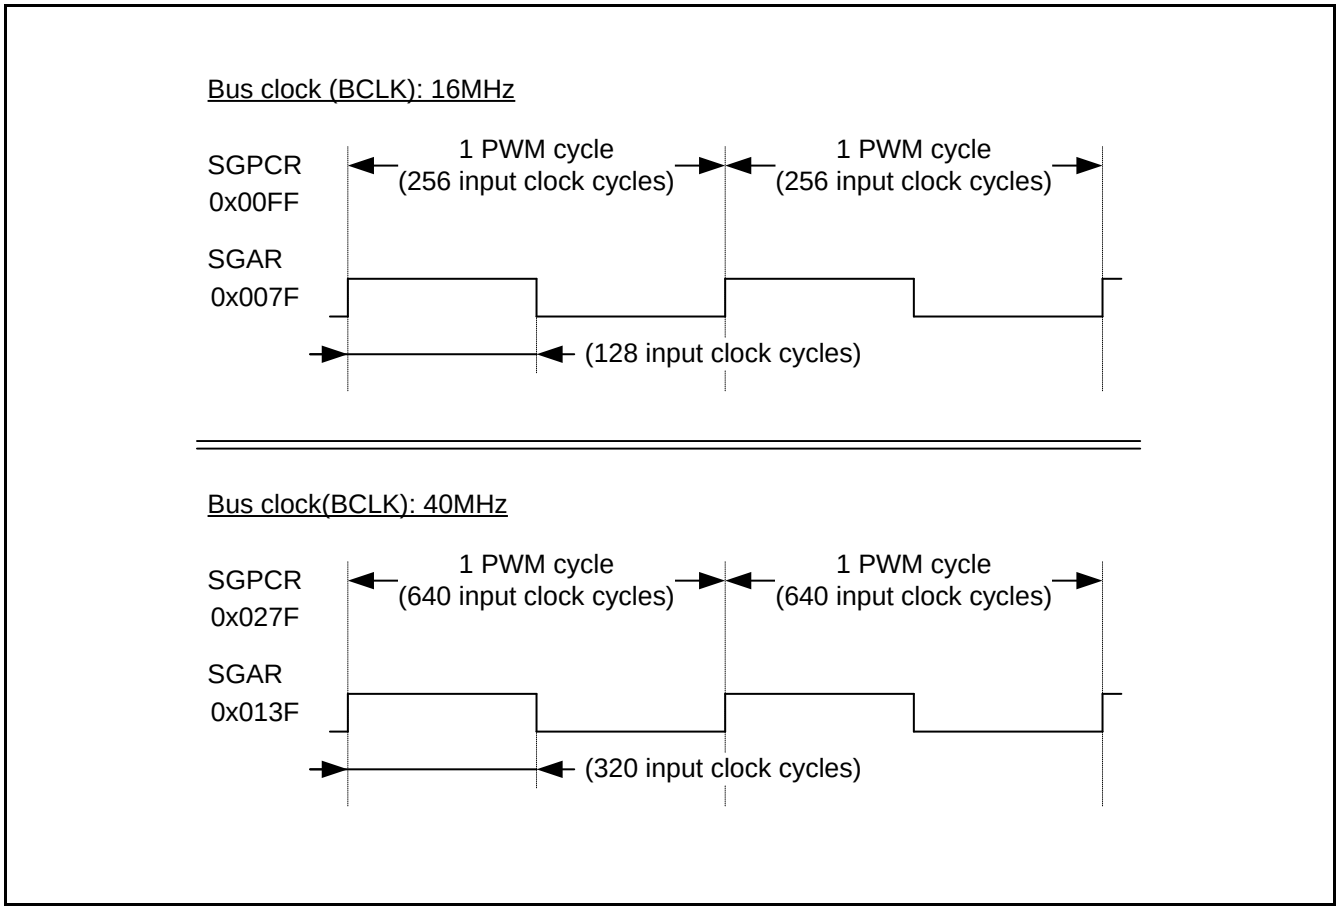
Note:

- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse.
  (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

3.3. Relation between the PWM Cycle Data Register (SGPCR) and PWM cycle

This section describes the relation between the PWM Cycle Data Register (SGPCR) and PWM cycle.

Figure 3-4 Relation between the PWM Cycle Data Register (SGPCR) and PWM cycle



The length of a PWM cycle is programmable in the PWM Cycle Data Register (SGPCR). This length is based on the count of input clock, and defined as "PWM Cycle Data Register [SGPCR] + 1". The input clock is created by dividing the bus clock.

The PWM cycle is a reference clock for a tone pulse signal (or a mixed signal of the tone pulse signal and a PWM pulse signal), and a PWM pulse signal.

To generate the same sound output both by the bus clock at 16 MHz and 40 MHz, for example, it can be made by changing the values of the PWM Cycle Data Register (SGPCR) and the Amplitude Data Register (SGAR). Because the bus clock proportion of 16 MHz and 40 MHz is 1:2.5, the same sound can be made by setting the values of these two registers to 1:2.5.

3.4. Relation between the DMA Transfer Update Enable Register (SGDER) and DMA Settings

This section describes the relation between the DMA Transfer Update Enable Register (SGDER) and DMA settings.

3.4.1. The Number of DMA Transfers

DMA Transfer Update Enable Register (SGDER) determines the number of DMA transfer, once or twice.

If all of SGDER.ARE1, SGDER.ARE0, SGDER.FRE and SGDER.NRE are "0", or

all of SGDER.TCRE, SGDER.IDRE, SGDER.PCRE1 and SGDER.PCRE0 are "0",

the DMA transfer occurs only once. Otherwise, the DMA transfer occurs twice.

3.4.2. DMA Transfer size

The DMA transfer size (1 byte, 2 bytes or 4 bytes) depends on the setting of the DMA Transfer Update Enable Register (SGDER).

The greater value of the following two becomes the DMA transfer size:

The value of SGDER.ARE1, SGDER.ARE0, SGDER.FRE, and SGDER.NRE,

The value of SGDER.TCRE, SGDER.IDRE, SGDER.PCRE1, and SGDER.PCRE0

The transfer size of 3 bytes is regarded as 4 bytes.

3.4.3. Transfer Byte Position in the DMA Transfer Intermediate Register (SGDMAR)

The DMA transfer byte position in the "DMA Transfer Intermediate Register (SGDMAR)" depends on the setting of the "DMA Transfer Update Enable Register (SGDER)" and the DMA transfer size.

If the size of a DMA transfer is less than 4 bytes, the byte position of DMA transfer is left-aligned.

The table below shows the relations between
"the setting of the DMA Transfer Update Enable Register (SGDER)"
and
"the byte position in the DMA Transfer Intermediate Register (SGDMAR)".
The byte position in the DMA Transfer Intermediate Register (SGDMAR) corresponds to the selection of the following registers.

- Amplitude Data Register (SGAR [15:0])
- Frequency Data Register (SGFR [7:0])
- Tone Output Number Register (SGNR [7:0])

The transfer size #1 is calculated by the setting of {SGDER.ARE1, SGDER.ARE0, SGDER.FRE, and SGDER.NRE} in the "DMA Transfer Update Enable Register (SGDER)". When this transfer size #1 is not 4 bytes, the transfer byte position is left-aligned.

Table 3-1 The Relations between the setting of the DMA Transfer Update Enable Register (SGDER) and the Transfer Byte Position of SGDMAR #1

No.	Setting of SGDER				Transfer Size #1 *	Transfer Byte Position of SGDMAR			
	ARE1	ARE0	FRE	NRE		SGAR [15:8]	SGAR [7:0]	SGFR [7:0]	SGNR [7:0]
1	0	0	0	0	0	-	-	-	-
2	1	0	0	0	1	SGDMAR [31:24]	-	-	-
3	0	1	0	0	1	-	SGDMAR [31:24]	-	-
4	1	1	0	0	2	SGDMAR [31:24]	SGDMAR [23:16]	-	-
5	0	0	1	0	1	-	-	SGDMAR [31:24]	-
6	1	0	1	0	2	SGDMAR [31:24]	-	SGDMAR [23:16]	-
7	0	1	1	0	2	-	SGDMAR [31:24]	SGDMAR [23:16]	-
8	1	1	1	0	4	SGDMAR [31:24]	SGDMAR [23:16]	SGDMAR [15:8]	-
9	0	0	0	1	1	-	-	-	SGDMAR [31:24]
10	1	0	0	1	2	SGDMAR [31:24]	-	-	SGDMAR [23:16]
11	0	1	0	1	2	-	SGDMAR [31:24]	-	SGDMAR [23:16]
12	1	1	0	1	4	SGDMAR [31:24]	SGDMAR [23:16]	-	SGDMAR [15:8]
13	0	0	1	1	2	-	-	SGDMAR [31:24]	SGDMAR [23:16]
14	1	0	1	1	4	SGDMAR [31:24]	-	SGDMAR [23:16]	SGDMAR [15:8]
15	0	1	1	1	4	-	SGDMAR [31:24]	SGDMAR [23:16]	SGDMAR [15:8]
16	1	1	1	1	4	SGDMAR [31:24]	SGDMAR [23:16]	SGDMAR [15:8]	SGDMAR [7:0]

*: The transfer size which is calculated by the setting of SGDER.ARE1, SGDER.ARE0, SGDER.FRE, and SGDER.NRE.

- : Do not care.

The table below shows the relations between
"the setting of the DMA Transfer Update Enable Register (SGDER)"
and
"the byte position in the DMA Transfer Intermediate Register (SGDMAR)".
The byte position in the DMA Transfer Intermediate Register (SGDMAR) corresponds to the selection of the following registers.
- Time Cycle Register (SGTCR[7:0])
- Increase and Decrease Data Register (SGIDR[7:0])
- PWM Cycle Data Register (SGPCR[15:0])

The transfer size #2 is calculated by the setting of {SGDER.TCRE, SGDER.IDRE, SGDER.PCRE1, and SGDER.PCRE0} in the DMA Transfer Update Enable Register (SGDER). When this transfer size #2 is not 4 bytes, the transfer byte position is left-aligned.

Table 3-2 The Relations Between the setting of the DMA Transfer Update Enable Register (SGDER) and Transfer Byte Position of SGDMAR #2

No.	Setting of SGDER				Transfer Size #2 *	Transfer Byte Position of SGDMAR			
	TCRE	IDRE	PCRE1	PCRE0		SGTCR [7:0]	SGIDR [7:0]	SGPCR [15:8]	SGPCR [7:0]
1	0	0	0	0	0	-	-	-	-
2	1	0	0	0	1	SGDMAR [31:24]	-	-	-
3	0	1	0	0	1	-	SGDMAR [31:24]	-	-
4	1	1	0	0	2	SGDMAR [31:24]	SGDMAR [23:16]	-	-
5	0	0	1	0	1	-	-	SGDMAR [31:24]	-
6	1	0	1	0	2	SGDMAR [31:24]	-	SGDMAR [23:16]	-
7	0	1	1	0	2	-	SGDMAR [31:24]	SGDMAR [23:16]	-
8	1	1	1	0	4	SGDMAR [31:24]	SGDMAR [23:16]	SGDMAR [15:8]	-
9	0	0	0	1	1	-	-	-	SGDMAR [31:24]
10	1	0	0	1	2	SGDMAR [31:24]	-	-	SGDMAR [23:16]
11	0	1	0	1	2	-	SGDMAR [31:24]	-	SGDMAR [23:16]
12	1	1	0	1	4	SGDMAR [31:24]	SGDMAR [23:16]	-	SGDMAR [15:8]
13	0	0	1	1	2	-	-	SGDMAR [31:24]	SGDMAR [23:16]
14	1	0	1	1	4	SGDMAR [31:24]	-	SGDMAR [23:16]	SGDMAR [15:8]
15	0	1	1	1	4	-	SGDMAR [31:24]	SGDMAR [23:16]	SGDMAR [15:8]
16	1	1	1	1	4	SGDMAR [31:24]	SGDMAR [23:16]	SGDMAR [15:8]	SGDMAR [7:0]

*: The transfer size which is calculated by the setting of SGDER.TCRE, SGDER.IDRE, SGDER.PCRE1, and SGDER.PCRE0.

- : Do not care.

3.4.4. DMA Transfer Image

This section shows an example of DMA transfer image, under the setting of DMA Transfer Update Enable Register (SGDER):

[SGDER.ARE1, SGDER.ARE0, SGDER.FRE, SGDER.NRE] ="1001"

[SGDER.TCRE, SGDER.IDRE, SGDER.PCRE1, SGDER.PCRE0] ="0100"

Condition:

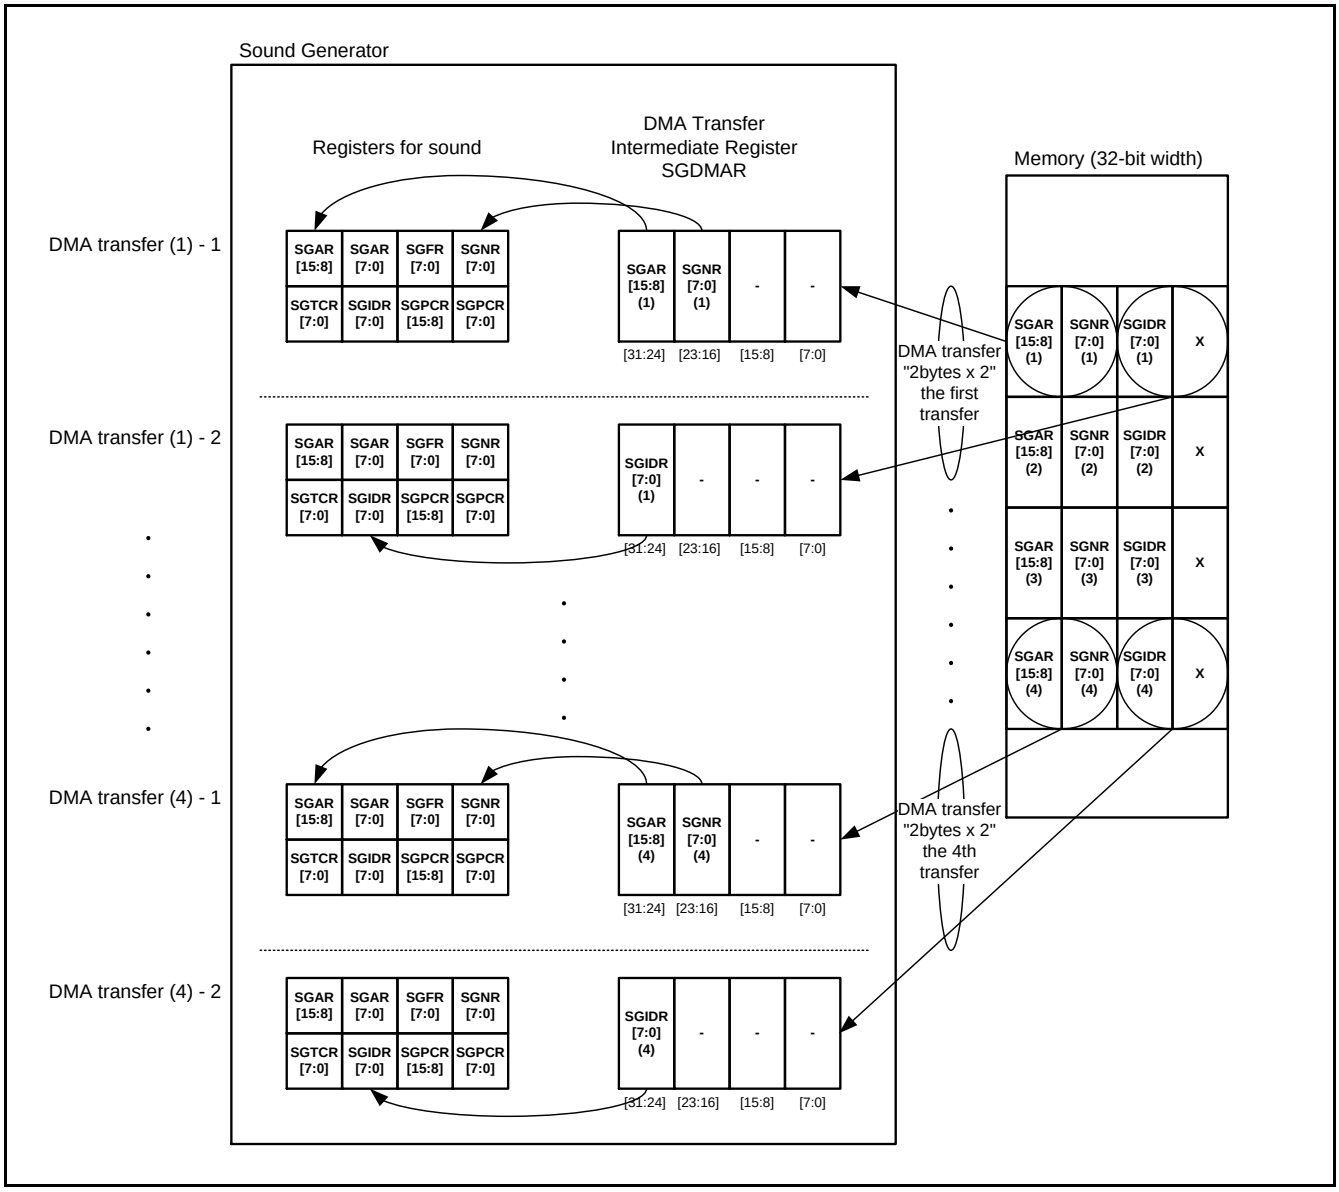
The number of times of DMA transfer : 2 times

DMA transfer size : 2 bytes

Transfer byte position of the DMA Transfer Intermediate Register (SGDMAR):

The first	SGDMAR[31:24]	← The amplitude data (upper byte) / SGAR[15:8]
	SGDMAR[23:16]	← The tone output number / SGNR[7:0]
	SGDMAR[15:0]	← Do not care
The second	SGDMAR[31:24]	← The increment and decrement data / SGIDR[7:0]
	SGDMAR[23:0]	← Do not care

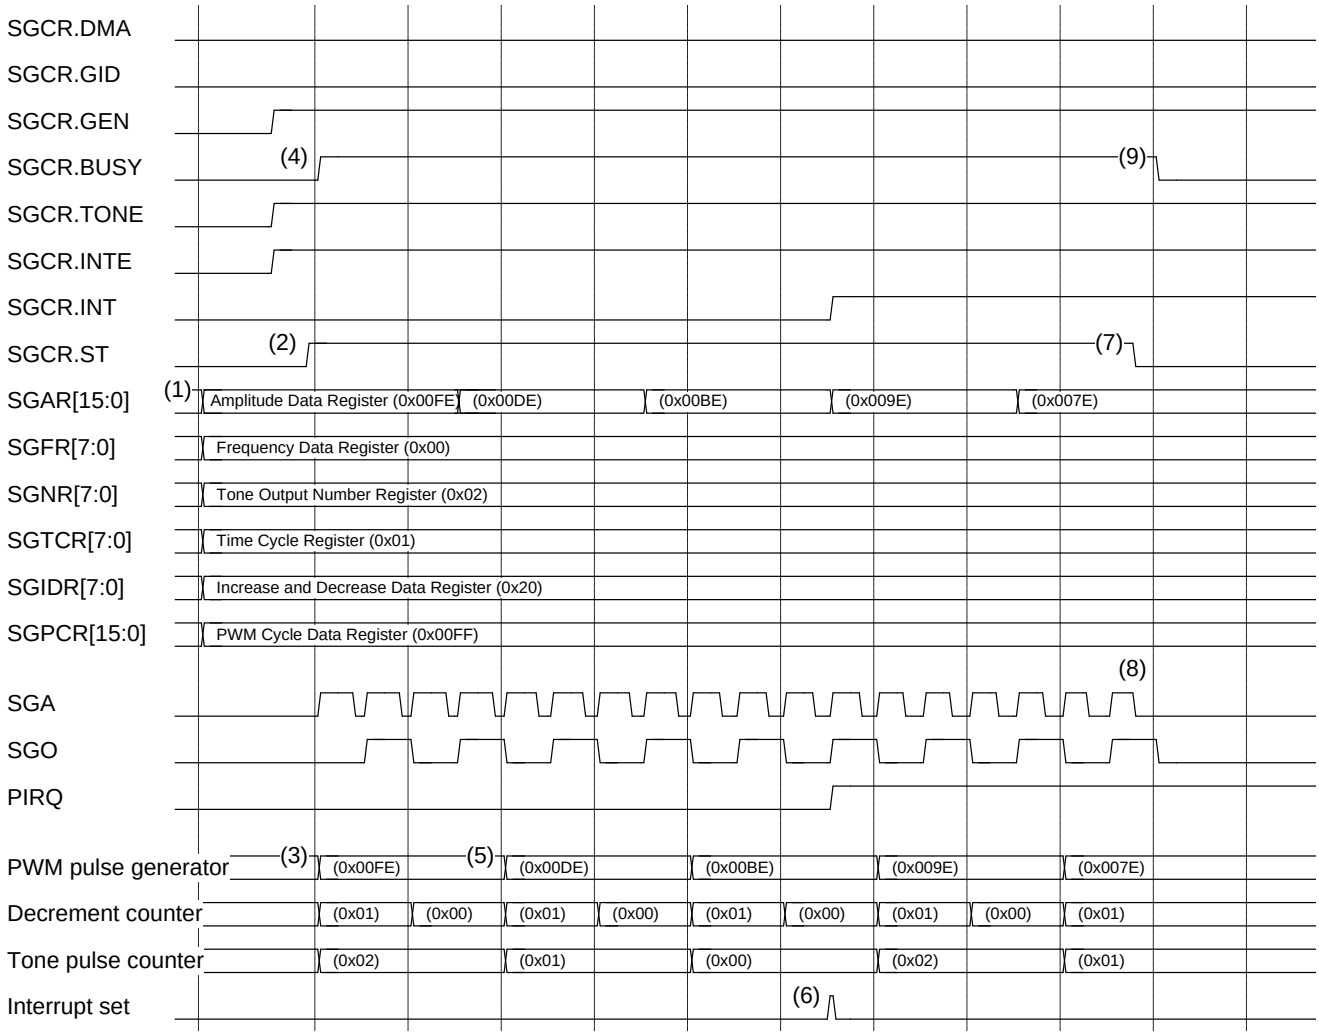
Figure 3-5 DMA Transfer Image



3.5. Sound Generator Operation

This section describes the Sound Generator operation as below

Figure 3-6 Sound Generator operation



(1) The reload values are written to the Amplitude Data Register (SGAR), the Frequency Data Register (SGFR), the Tone Output Number Register (SGNR), and the Time Cycle Register (SGTCR) by software. Also the selection of increment and decrement of the amplitude is written to the Increase and Decrease Data Register (SGIDR) by software as well as the number of cycles in 1 PWM cycle to the PWM Cycle Data Register (SGPCR).

Moreover, set other information to the Sound Control Register (SGCR) to control the Sound Generator. Initialize the Interrupt status bit (SGCR.INT) and set the Interrupt enable bit (SGCR.INTE).

(2) Write "1" to the Start bit (SGCR.ST).

(3) By setting "1" to the Start bit (SGCR.ST), the Amplitude Data Register (SGAR) value is loaded into the PWM pulse generator, the Frequency Data Register (SGFR) value into the Frequency counter, the Tone Output Number Register (SGNR) value into the Tone pulse counter, the Time Cycle Register (SGTCR) value into the Decrement counter.

(4) The operation flag (SGCR.BUSY) is automatically set.

(5) Due to the operation that the Decrement counter counts the number of tone pulses until it reaches the reload value, the Amplitude Data Register (SGAR) value decreases according to the setting of the Automatic increase/decrease enable bit (SGCR.GEN) and the Increase/decrease setting bit (SGCR.GID).

(6) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, it sets the Interrupt status bit (SGCR.INT) and asserts the Interrupt request (PIRQ).
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(7) Write "0" to the Start bit (SGCR.ST). The Sound Generator keeps operating until the Busy status bit (SGCR.BUSY) turns "0".

(8) The Sound Generator stops when the current tone cycle finishes.

(9) The Busy status bit (SGCR.BUSY) turns "0".

DMA transfer start interrupt setting enable bit (SGCR.DMA)

To assert the first Interrupt request (PIRQ) after starting (SGCR.ST="1"), there are two modes for the request. And the selection depends on the setting of the "DMA transfer start interrupt setting enable bit (SGCR.DMA)".

- Normal mode :
  When Sound Generator outputs the tone pulses, to the number programmed in the Time Cycle Register (SGTCR)
- DMA mode :
  Immediately after the setting of Start bit (writing "1" to SGCR.ST)
  (In this case, the Interrupt request (PIRQ) is regarded as the DMA transfer request.)

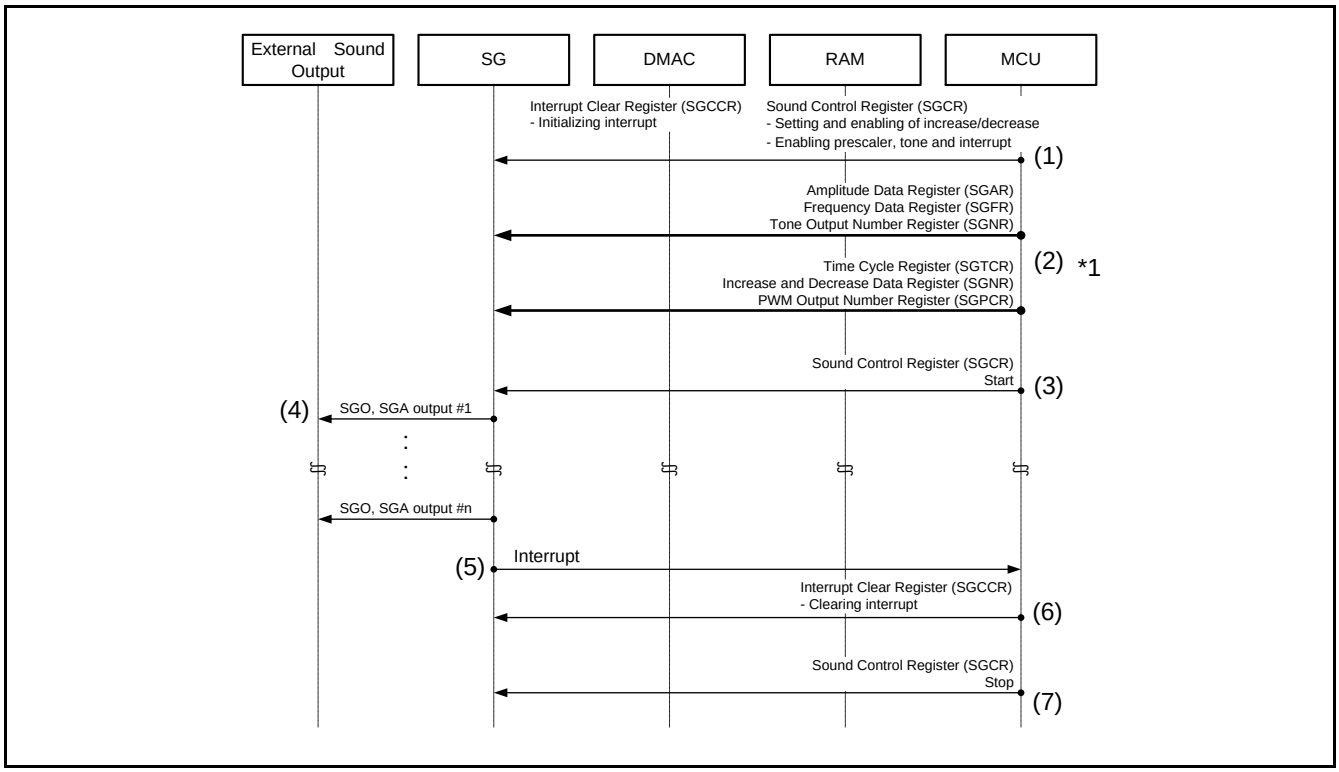
DMA transfer

The following registers are set through the DMA Transfer Intermediate Register (SGDMAR).
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Time Cycle Register (SGTCR)
- Tone Output Number Register (SGNR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

3.5.1. Single operation of Sound Generator by MCU

This section shows the single operation flow of the Sound Generator by MCU.

Figure 3-7 Single operation of Sound Generator by MCU



(1) Set the information to control the Sound Generator to the Sound Control Register (SGCR) by software. Initialize the Interrupt status bit (SGCR.INT) and set the Interrupt enable bit (SGCR.INTE).

(2) Set registers "Amplitude Data Register (SGAR)", "Frequency Data Register (SGFR)", "Tone Output Number Register (SGNR)", "Time Cycle Register (SGTCR)", "Increase and Decrease Data Register (SGIDR)" and "PWM Cycle Data Register (SGPCR)" by software. (*: Set only the necessary registers.)

(3) Write "1" to the Start bit (SGCR.ST).

(4) The outputs of SGO and SGA start.

(5) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(6) MCU clears the interrupt.

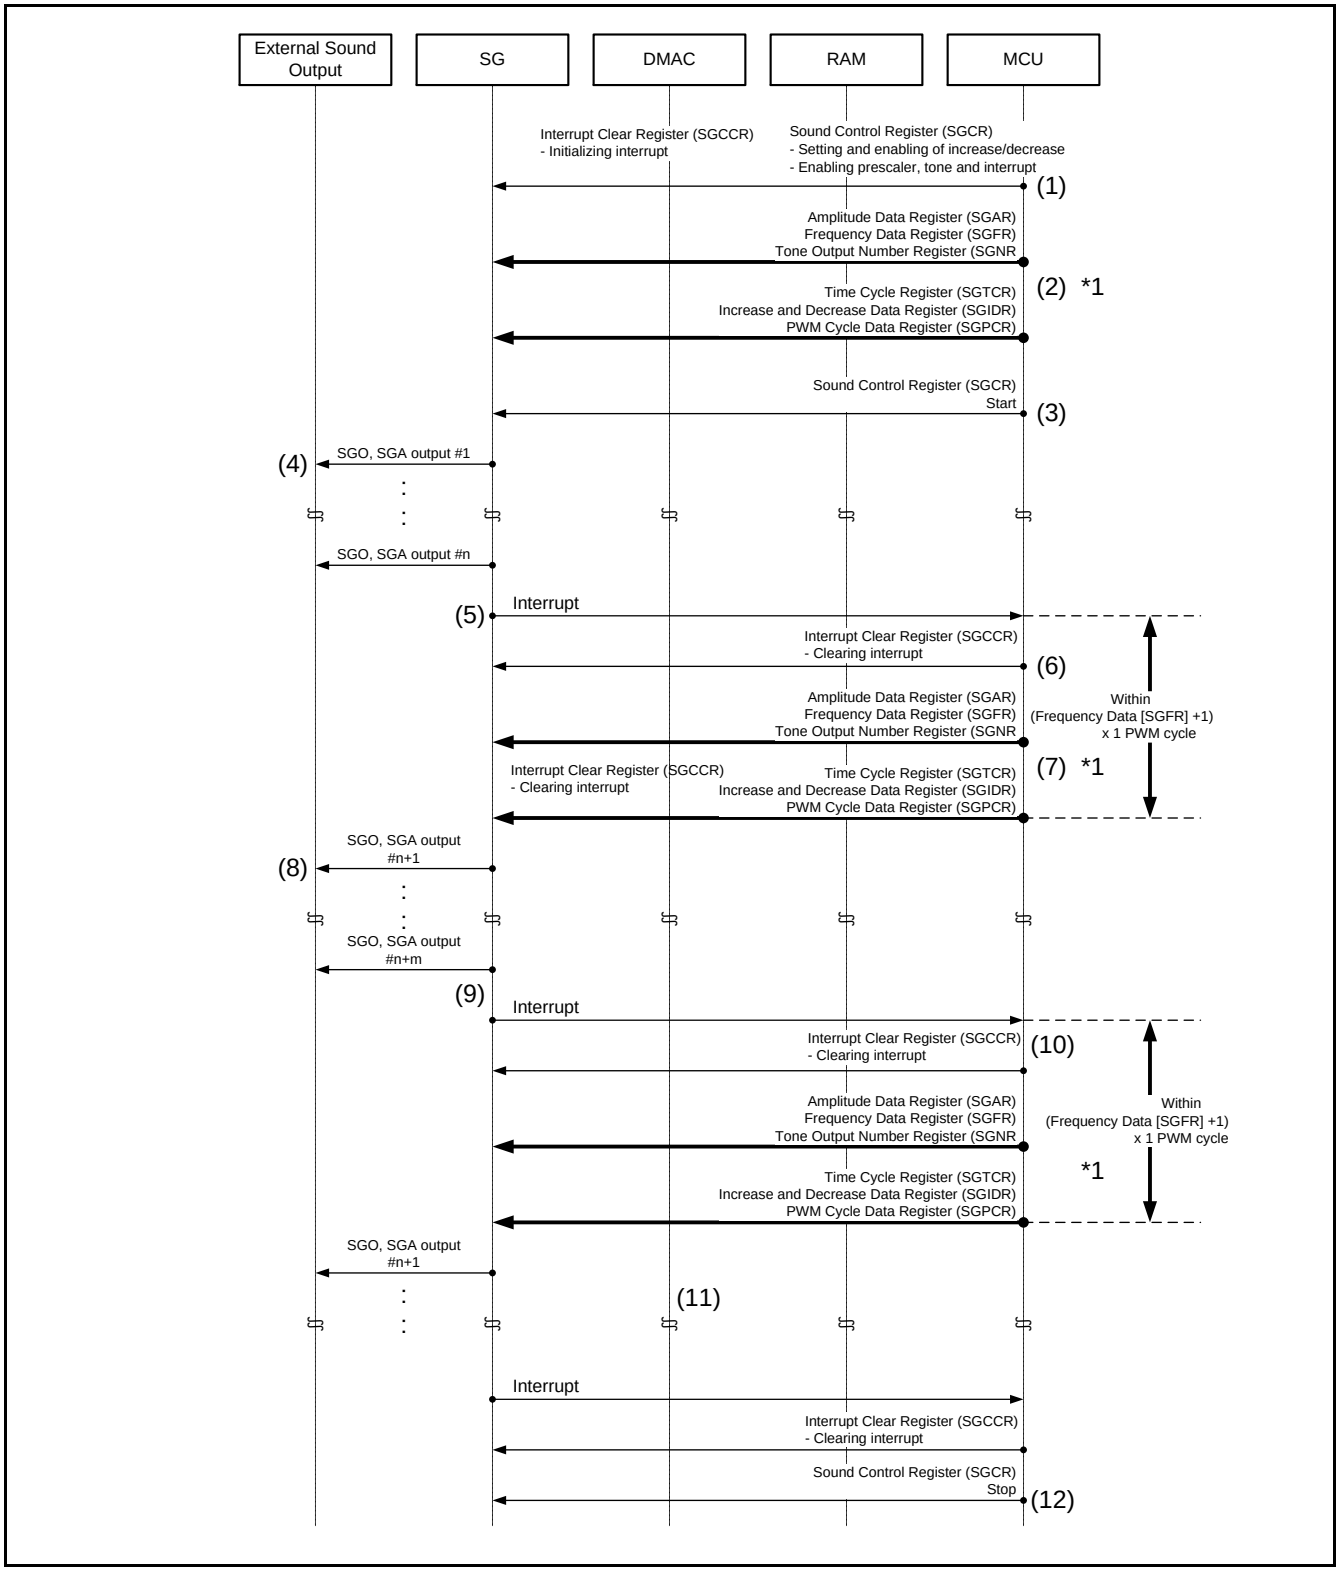
(7) Software writes "0" to the Start bit (SGCR.ST) to stop outputting the sound.

3.6. Continuous operation of Sound Generator by MCU

This section shows the continuous operation flow of the Sound Generator by MCU.

The flow from (7) is different from that of the single operation.

Figure 3-8 Continuous operation of Sound Generator by MCU



(1) Set the information to control the Sound Generator to the Sound Control Register (SGCR) by software. Initialize the Interrupt status bit (SGCR.INT) and set the Interrupt enable bit (SGCR.INTE).

(2) Set registers "Amplitude Data Register (SGAR)", "Frequency Data Register (SGFR)", "Tone Output Number Register (SGNR)", "Time Cycle Register (SGTCR)", "Increase and Decrease Data Register (SGIDR)" and "PWM Cycle Data Register (SGPCR)" by software. (*: Set only the necessary registers.)

(3) Write "1" to the Start bit (SGCR.ST).

(4) The outputs of SGO and SGA start.

(5) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(6) MCU clears the interrupt.

(7) Set registers "Amplitude Data Register (SGAR)", "Frequency Data Register (SGFR)", "Tone Output Number Register (SGNR)", "Time Cycle Register (SGTCR)", "Increase and Decrease Data Register (SGIDR)" and "PWM Cycle Data Register (SGPCR)" by software. (*: Set only the necessary registers.)

(8) The Sound Generator keeps outputting SGO and SGA, according to the register settings above.

(9) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(10) MCU clears the interrupt.

(11) Repeat the flow from 7 to 11 to continue outputting the sound.

(12) Software writes "0" to the Start bit (SGCR.ST) to stop outputting the sound.

Notes:

- *The software must finish the procedure from step 5 to 7, within the following time.*
  The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
- *In case of switching the selection of increase/decrease, it is needed to write "Increase/decrease setting bit (SGCR.GID)" and the "Automatic increase/decrease enable bit (SGCR.GEN)" in the Sound Control Register (SGCR) within above-mentioned limit time.*

3.7. Sound Generator operation with DMA

This section shows the flow of the Sound Generator operation with DMA.

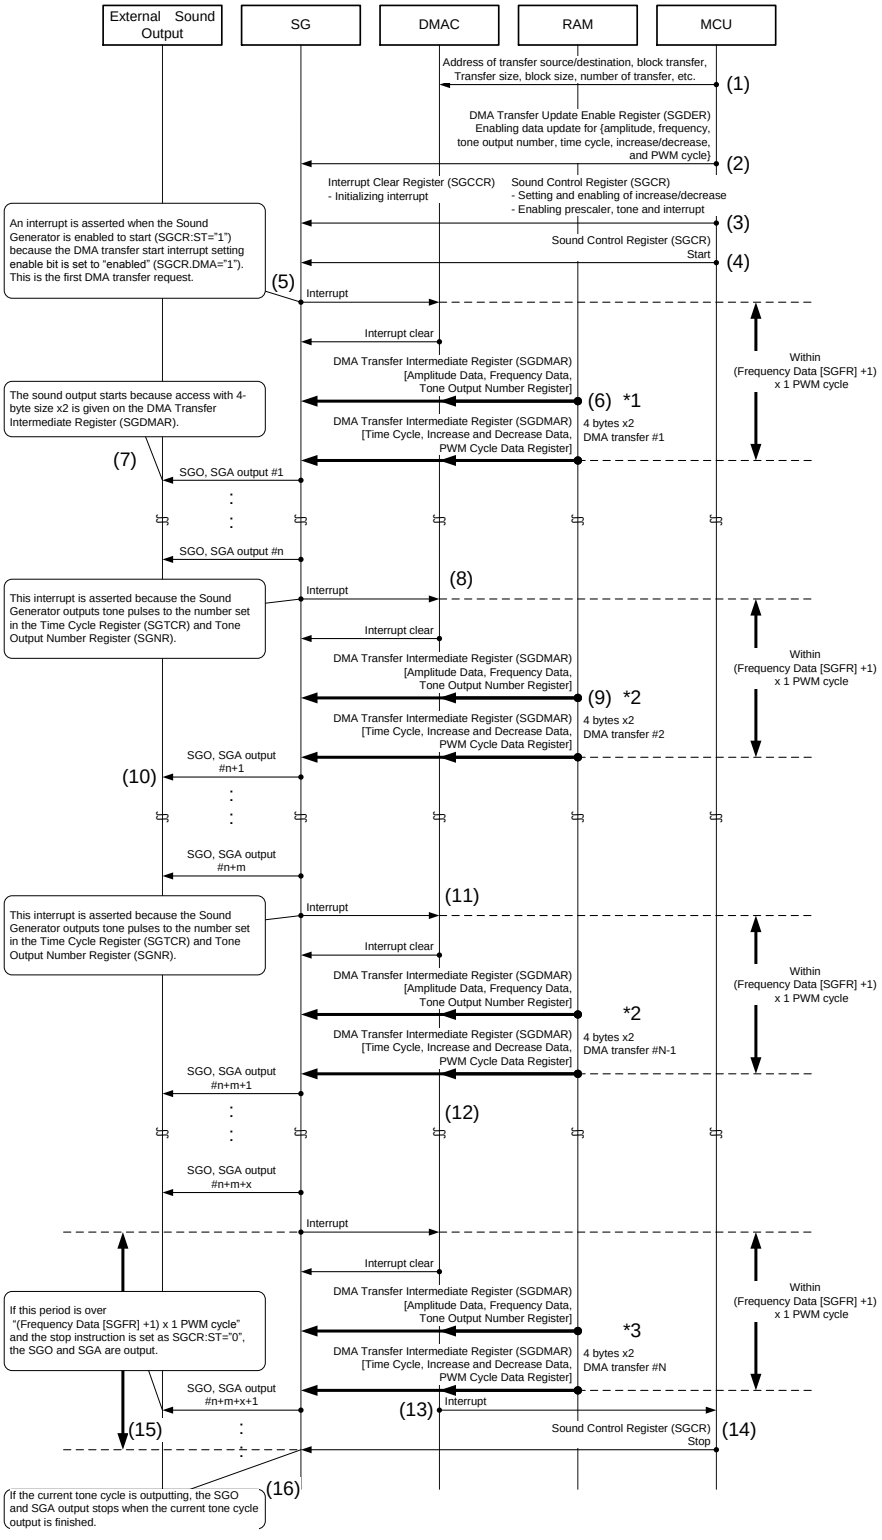
DMAC writes a register related to DMA in the Sound Generator. The timing of the first interrupt with DMA is different from the flow by MCU. The DMAC writes functional registers in the Sound Generator, through the DMA Transfer Intermediate Register (SGDMAR) which works as a window register.

Note:

- *Software needs to set the Interrupt enable bit (SGCR.INTE="1") in order to use the Interrupt request (PIRQ) as a DMA transfer request.*

3.7.1. In Case of DMA Transfer with 4-Byte size x 2 is Made N Times

Figure 3-9 Sound Generator operation with DMA (When in DMA Transfer with 4-Byte size x 2 is Made N Times)



(1) Software makes initial settings to those registers which are needed in DMA transfer. The DMA transfer is based on a block data of "4-byte size x 2", and this block can be repeated N times. DMAC sets following registers to prepare for a DMA transfer, through the "DMA Transfer Intermediate Register (SGDMAR)".
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

The destination address of the DMA transfer is a fixed one on the "DMA Transfer Intermediate Register (SGDMAR)".

(2) Software configures the "DMA Transfer Update Enable Register (SGDER)" to enable the automatic update of the following registers during DMA transfer.
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

(3) Software initialize Interrupt status bit (SGCR.INT) by writing "1" to Interrupt status clear bit (SGCCR.INTC). Then, the software configures the Sound Control Register (SGCR) in the needed mode, and this must include the following bit operations.
- DMA transfer start interrupt setting enable bit (SGCR.DMA) to "1"(enabled)
- Interrupt enable bit (SGCR.INTE) to "1"(enabled)

(4) Write "1" to the Start bit (SGCR.ST).

(5) The interrupt occurs immediately after setting Start bit (SGCR.ST), since the Sound Generator is enabled on DMA transfer (SGCR.DMA="1"). An Interrupt request (PIRQ) is asserted, and this interrupt is used as a DMA transfer request.

(6) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)". This operation configures the following registers by 2 steps.
[1st step]
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)

[2nd step]
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

(*: DMA block size must to be "4-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(7) The outputs of SGO and SGA start, according to the register settings above.

(8) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(9) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)".
(*2: DMA block size must to be "4-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(10) The Sound Generator keeps outputting SGO and SGA, according to the register settings above.

(11) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

DMAC doesn't assert an interrupt to MCU until the DMAC completes all DMA transfer (with 4-byte size x2, N times).

(12) Repeat the flow from 9 to 11 to continue outputting the sound.

(13) When DMAC completes all DMA transfer (with 4-byte size x2, N times), it asserts an interrupt to MCU.

(14) Software writes "0" to the Start bit (SGCR.ST) to stop outputting the sound.
(15) When above operation (14) was made within the following time, the Nth DMA transfer doesn't come to the output of SGO and SGA. The Sound Generator stops driving SGO and SGA just before outputting the data of Nth DMA transfer.
The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
(*3: The data of the Nth DMA transfer are written to the Sound Generator, however, they are not output. DMAC issues this Nth DMA transfer only to assert an interrupt toward the MCU.)

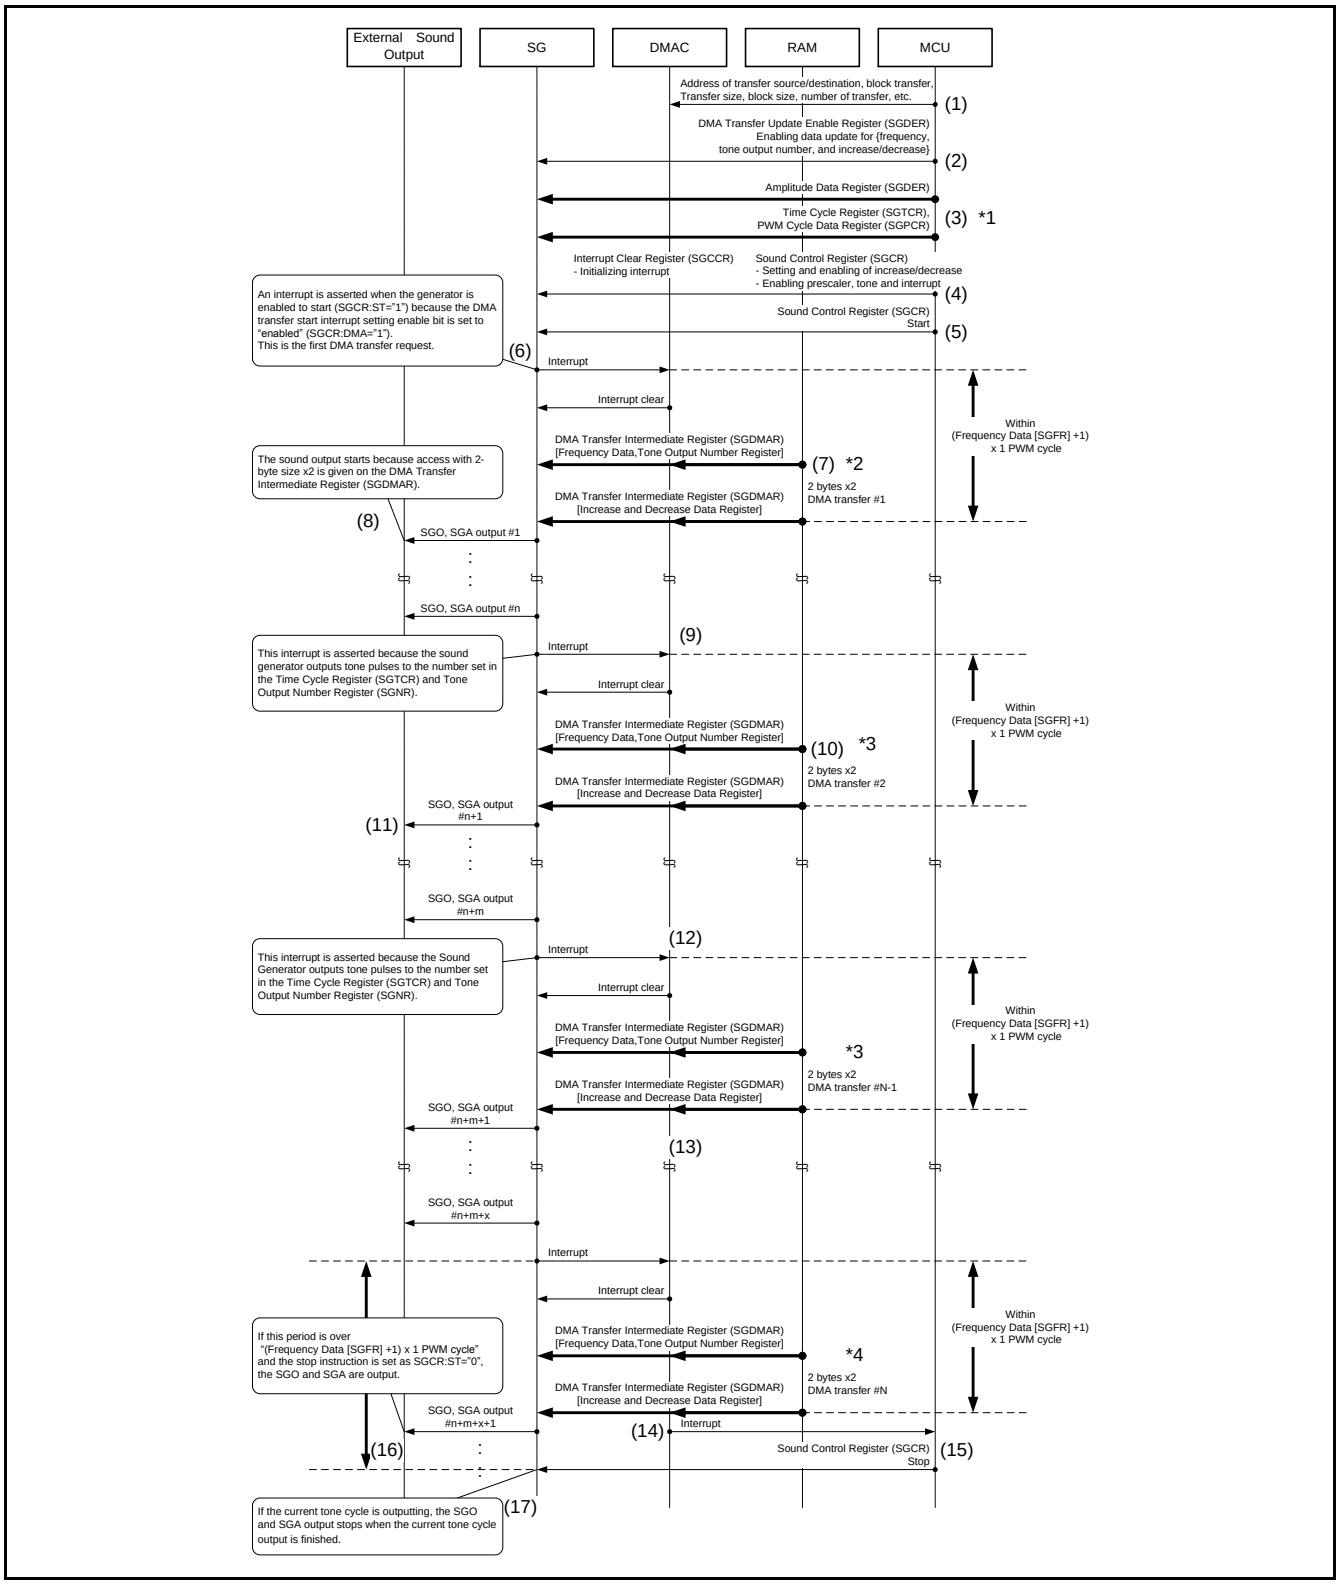
(16) If above (15) is not done within the limit time, the Sound Generator keeps driving SGO and SGA in order to output the data of the Nth DMA transfer. Then, the Sound Generator stops driving SGO and SGA after the end of all data.
(*3: The data of the Nth DMA transfer are written to the Sound Generator, and they are output to the end.)

Notes:

- *The DMAC must finish the sequence from step 5 to 6, within the following time.*
  The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
- *The DMA transfer error means the occurrence of delay in the sound data setting. It causes unsteady sound output. In that case, please fix the priority of DMA transfer in the system to finish all data transfer within the limit time.*

3.7.2. In Case of DMA Transfer with 2-Byte size x 2 is Made N Times

Figure 3-10 Sound Generator operation with DMA (When DMA Transfer with 2-Byte size x 2 is Made N Times)



(1) Software makes initial settings to those registers which are needed in DMA transfer. The DMA transfer is based on a block data of "2-byte size x 2", and this block can be repeated N times. DMAC sets following registers to prepare for a DMA transfer, through the "DMA Transfer Intermediate Register (SGDMAR)".
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Increase and Decrease Data Register (SGIDR)
The destination address of the DMA transfer is a fixed one on the "DMA Transfer Intermediate Register (SGDMAR)".

(2) Software configures the "DMA Transfer Update Enable Register (SGDER)" to enable the automatic update of the following registers during DMA transfer.
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Increase and Decrease Data Register (SGIDR)

(3) Software configures the "DMA Transfer Update Enable Register (SGDER)" to disable the automatic update of the following registers during DMA transfer.
- Amplitude Data Register (SGAR)
- Time Cycle Register (SGTCR)
- PWM Cycle Data Register (SGPCR)
(*: Set values to these registers which are not automatically updated.)

(4) Software initialize Interrupt status bit (SGCR.INT) by writing "1" to Interrupt status clear bit (SGCCR.INTC). Then, the software configures the Sound Control Register (SGCR) in the needed mode, and this must include the following bit operations.
- DMA transfer start interrupt setting enable bit (SGCR.DMA) to "1"(enabled)
- Interrupt enable bit (SGCR.INTE) to "1"(enabled)

(5) Write "1" to the Start bit (SGCR.ST).

(6) The interrupt occurs immediately after setting Start bit (SGCR.ST), since the Sound Generator is enabled on DMA transfer (SGCR.DMA="1"). An Interrupt request (PIRQ) is asserted, and this interrupt is used as a DMA transfer request.

(7) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)". This operation configures the following registers by 2 steps.
[1st step]
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
[2nd step]
- Increase and Decrease Data Register (SGIDR)
(*2: DMA block size must to be "2-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(8) The outputs of SGO and SGA start, according to the register settings above.

(9) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(10) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)".

(*3: DMA block size must to be "2-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(11) The Sound Generator keeps outputting SGO and SGA, according to the register settings above.

(12) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

DMAC doesn't assert an interrupt to MCU until the DMAC completes all DMA transfer (with 2-byte size x2, N times).

(13) Repeat the flow from 10 to 12 to continue outputting the sound.

(14) When DMAC completes all DMA transfer (with 2-byte size x2, N times), it asserts an interrupt to MCU.

(15) Software writes "0" to the Start bit (SGCR.ST) to stop outputting the sound.

(16) When above operation (15) was made within the following time, the Nth DMA transfer doesn't come to the output of SGO and SGA. The Sound Generator stops driving SGO and SGA just before outputting the data of Nth DMA transfer.
The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
(*4: The data of the Nth DMA transfer are written to the Sound Generator, however, they are not output. DMAC issues this Nth DMA transfer only to assert an interrupt toward the MCU.)

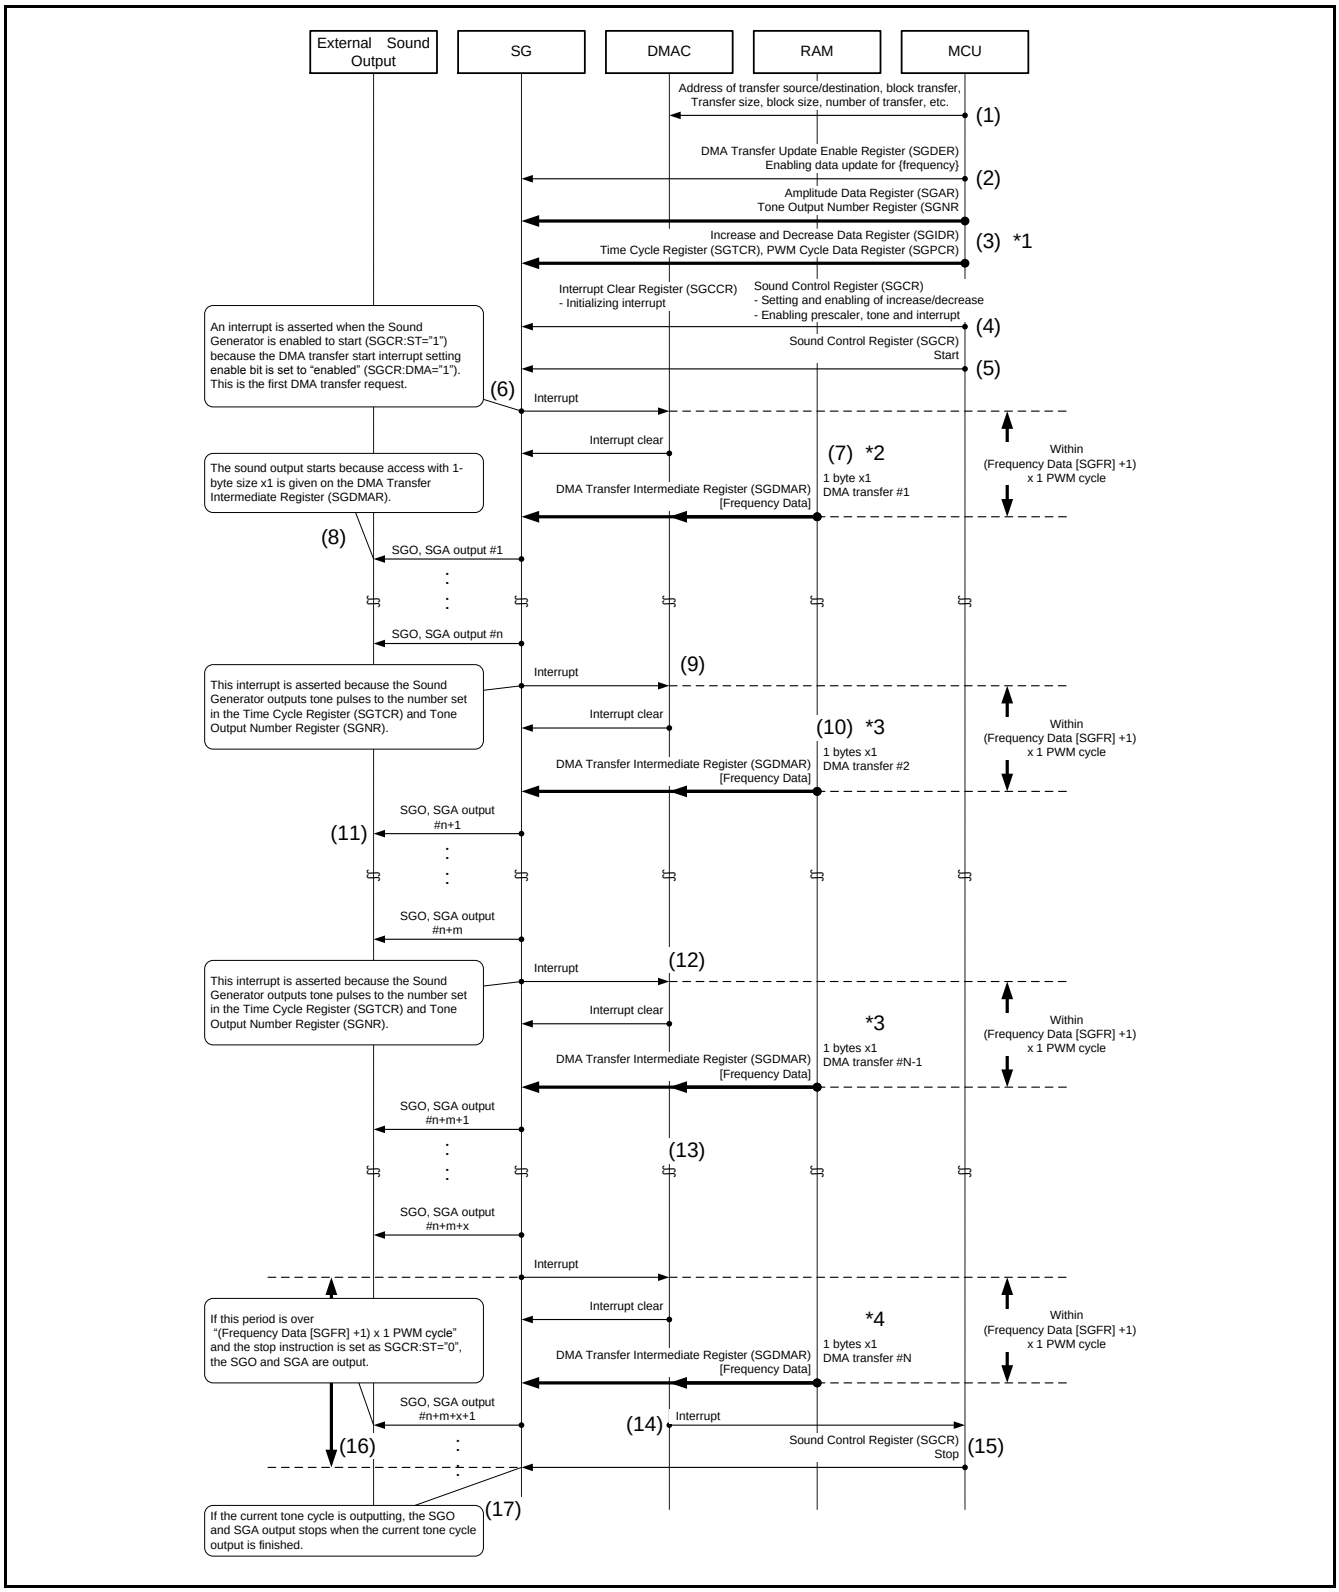
(17) If above (16) is not done within the limit time, the Sound Generator keeps driving SGO and SGA in order to output the data of the Nth DMA transfer. Then, the Sound Generator stops driving SGO and SGA after the end of all data.
(*4: The data of the Nth DMA transfer are written to the Sound Generator, and they are output to the end.)

Notes:

- *The DMAC must finish the sequence from step 6 to 7, within the following time.*
  The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
- *The DMA transfer error means the occurrence of delay in the sound data setting. It causes unsteady sound output. In that case, please fix the priority of DMA transfer in the system to finish all data transfer within the limit time.*

3.7.3. In Case of DMA Transfer with 1-Byte size x 1 is Made N Times

Figure 3-11 Sound Generator operation with DMA (When in DMA Transfer with 1-Byte size x 1 is Made N Times)



(1) Software makes initial settings to those registers which are needed in DMA transfer. The DMA transfer is based on a block data of "1-byte size x 2", and this block can be repeated N times. DMAC sets following registers to prepare for a DMA transfer, through the "DMA Transfer Intermediate Register (SGDMAR)".
- Frequency Data Register (SGFR)
The destination address of the DMA transfer is a fixed one on the "DMA Transfer Intermediate Register (SGDMAR)".

(2) Software configures the "DMA Transfer Update Enable Register (SGDER)" to enable the automatic update of the following registers during DMA transfer.
- Frequency Data Register (SGFR)

(3) Software configures the "DMA Transfer Update Enable Register (SGDER)" to disable the automatic update of the following registers during DMA transfer.
- Amplitude Data Register (SGAR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)
(*: Set values to these registers which are not automatically updated.)

(4) Software initialize Interrupt status bit (SGCR.INT) by writing "1" to Interrupt status clear bit (SGCCR.INTC). Then, the software configures the Sound Control Register (SGCR) in the needed mode, and this must include the following bit operations.
- DMA transfer start interrupt setting enable bit (SGCR.DMA) to "1"(enabled)
- Interrupt enable bit (SGCR.INTE) to "1"(enabled)

(5) Write "1" to the Start bit (SGCR.ST).

(6) The interrupt occurs immediately after setting Start bit (SGCR.ST), since the Sound Generator is enabled on DMA transfer (SGCR.DMA="1"). An Interrupt request (PIRQ) is asserted, and this interrupt is used as a DMA transfer request.

(7) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)". This operation configures the following register.
- Frequency Data Register (SGFR)
(*2: DMA block size must to be "1-byte size x 1" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(8) The outputs of SGO and SGA start, according to the register settings above.

(9) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(10) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)".
(*3: DMA block size must to be "1-byte size x 1" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(11) The Sound Generator keeps outputting SGO and SGA, according to the register settings above.

(12) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00

- Decrement counter is 0x00
- At the rising edge of SGO

DMAC doesn't assert an interrupt to MCU until the DMAC completes all DMA transfer (with 1-byte size x1, N times).

(13) Repeat the flow from 10 to 12 to continue outputting the sound.

(14) When DMAC completes all DMA transfer (with 1-byte size x1, N times), it asserts an interrupt to MCU.

(15) Software writes "0" to the Start bit (SGCR.ST) to stop outputting the sound.

(16) When above operation (15) was made within the following time, the Nth DMA transfer doesn't come to the output of SGO and SGA. The Sound Generator stops driving SGO and SGA just before outputting the data of Nth DMA transfer.
The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
(*4: The data of the Nth DMA transfer are written to the Sound Generator, however, they are not output. DMAC issues this Nth DMA transfer only to assert an interrupt toward the MCU.)

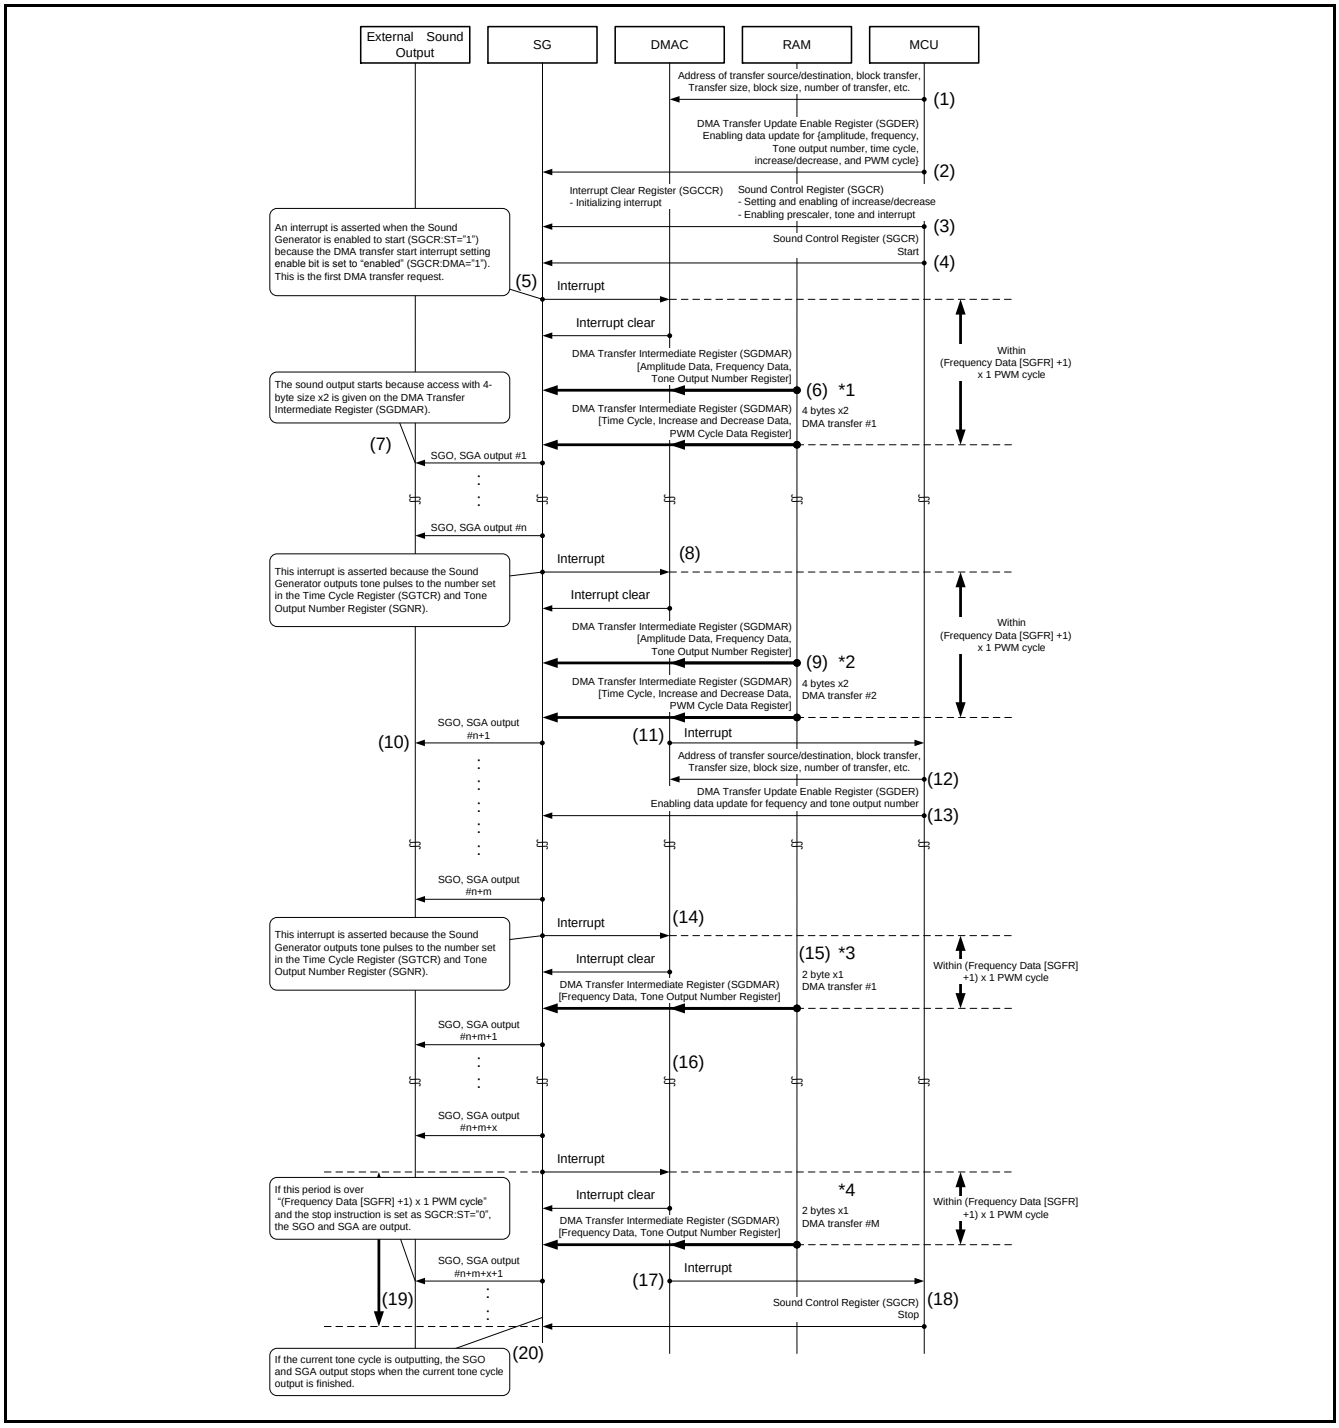
(17) If above (16) is not done within the limit time, the Sound Generator keeps driving SGO and SGA in order to output the data of the Nth DMA transfer. Then, the Sound Generator stops driving SGO and SGA after the end of all data.
(*4: The data of the Nth DMA transfer are written to the Sound Generator, and they are output to the end.)

Notes:

- *The DMAC must finish the sequence from step 6 to 7, within the following time.*
  The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
- *The DMA transfer error means the occurrence of delay in the sound data setting. It causes unsteady sound output. In that case, please fix the priority of DMA transfer in the system to finish all data transfer within the limit time.*

3.7.4. In Case of DMA Transfer with 4-Byte size x 2 is Made N Times and DMA Transfer with 2-Byte size x 1 is Made M Times (The Case the Transfer Byte size is Changed While Sound Outputting)

Figure 3-12 Sound Generator operation with DMA
(The case the transfer byte size is changed while sound is being output)



(1) Software makes initial settings to those registers which are needed in DMA transfer. The DMA transfer is based on a block data of "4-byte size x 2", and this block can be repeated N times. DMAC sets following registers to prepare for a DMA transfer, through the "DMA Transfer Intermediate Register (SGDMAR)".
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

The destination address of the DMA transfer is a fixed one on the "DMA Transfer Intermediate Register (SGDMAR)".

(2) Software configures the "DMA Transfer Update Enable Register (SGDER)" to enable the automatic update of the following registers during DMA transfer.
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

(3) Software initialize Interrupt status bit (SGCR.INT) by writing "1" to Interrupt status clear bit (SGCCR.INTC). Then, the software configures the Sound Control Register (SGCR) in the needed mode, and this must include the following bit operations.
- DMA transfer start interrupt setting enable bit (SGCR.DMA) to "1"(enabled)
- Interrupt enable bit (SGCR.INTE) to "1"(enabled)

(4) Write "1" to the Start bit (SGCR.ST).

(5) The interrupt occurs immediately after setting Start bit (SGCR.ST), since the Sound Generator is enabled on DMA transfer (SGCR.DMA="1"). An Interrupt request (PIRQ) is asserted, and this interrupt is used as a DMA transfer request.

(6) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)". This operation configures the following registers by 2 steps.
[1st step]
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)

[2nd step]
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

(*: DMA block size must to be "4-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(7) The outputs of SGO and SGA start, according to the register settings above.

(8) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(9) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)".
(*2: DMA block size must to be "4-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(10) The Sound Generator keeps outputting SGO and SGA, according to the register settings above.

(11) When DMAC completes all DMA transfer (with 4-byte size x2, N times), it asserts an interrupt to MCU.

(12) Software makes settings to those registers which are needed in DMA transfer. The DMA transfer is based on a block data of "2-byte size x 1", and this block can be repeated M times. DMAC sets following registers to prepare for a DMA transfer, through the "DMA Transfer Intermediate Register (SGDMAR)".
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
The destination address of the DMA transfer is a fixed one on the "DMA Transfer Intermediate Register (SGDMAR)".

(13) Software configures the "DMA Transfer Update Enable Register (SGDER)" to enable the automatic update of the following registers during DMA transfer.
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)

(14) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(15) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)".
(*3: DMA block size must to be "2-byte size x 1" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(16) Repeat the flow from 14 to 15 to continue outputting the sound.

(17) When DMAC completes all DMA transfer (with 2-byte size x1, M times), it asserts an interrupt to MCU.

(18) Software writes "0" to the Start bit (SGCR.ST) to stop outputting the sound.

(19) When above operation (18) was made within the following time, the Mth DMA transfer doesn't come to the output of SGO and SGA. The Sound Generator stops driving SGO and SGA just before outputting the data of Nth DMA transfer.
The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
(*4: The data of the Mth DMA transfer are written to the Sound Generator, however, they are not output. DMAC issues this Mth DMA transfer only to assert an interrupt toward the MCU.)

(20) If above (19) is not done within the limit time, the Sound Generator keeps driving SGO and SGA in order to output the data of the Mth DMA transfer. Then, the Sound Generator stops driving SGO and SGA after the end of all data.
(*4: The data of the Mth DMA transfer are written to the Sound Generator, and they are output to the end.)

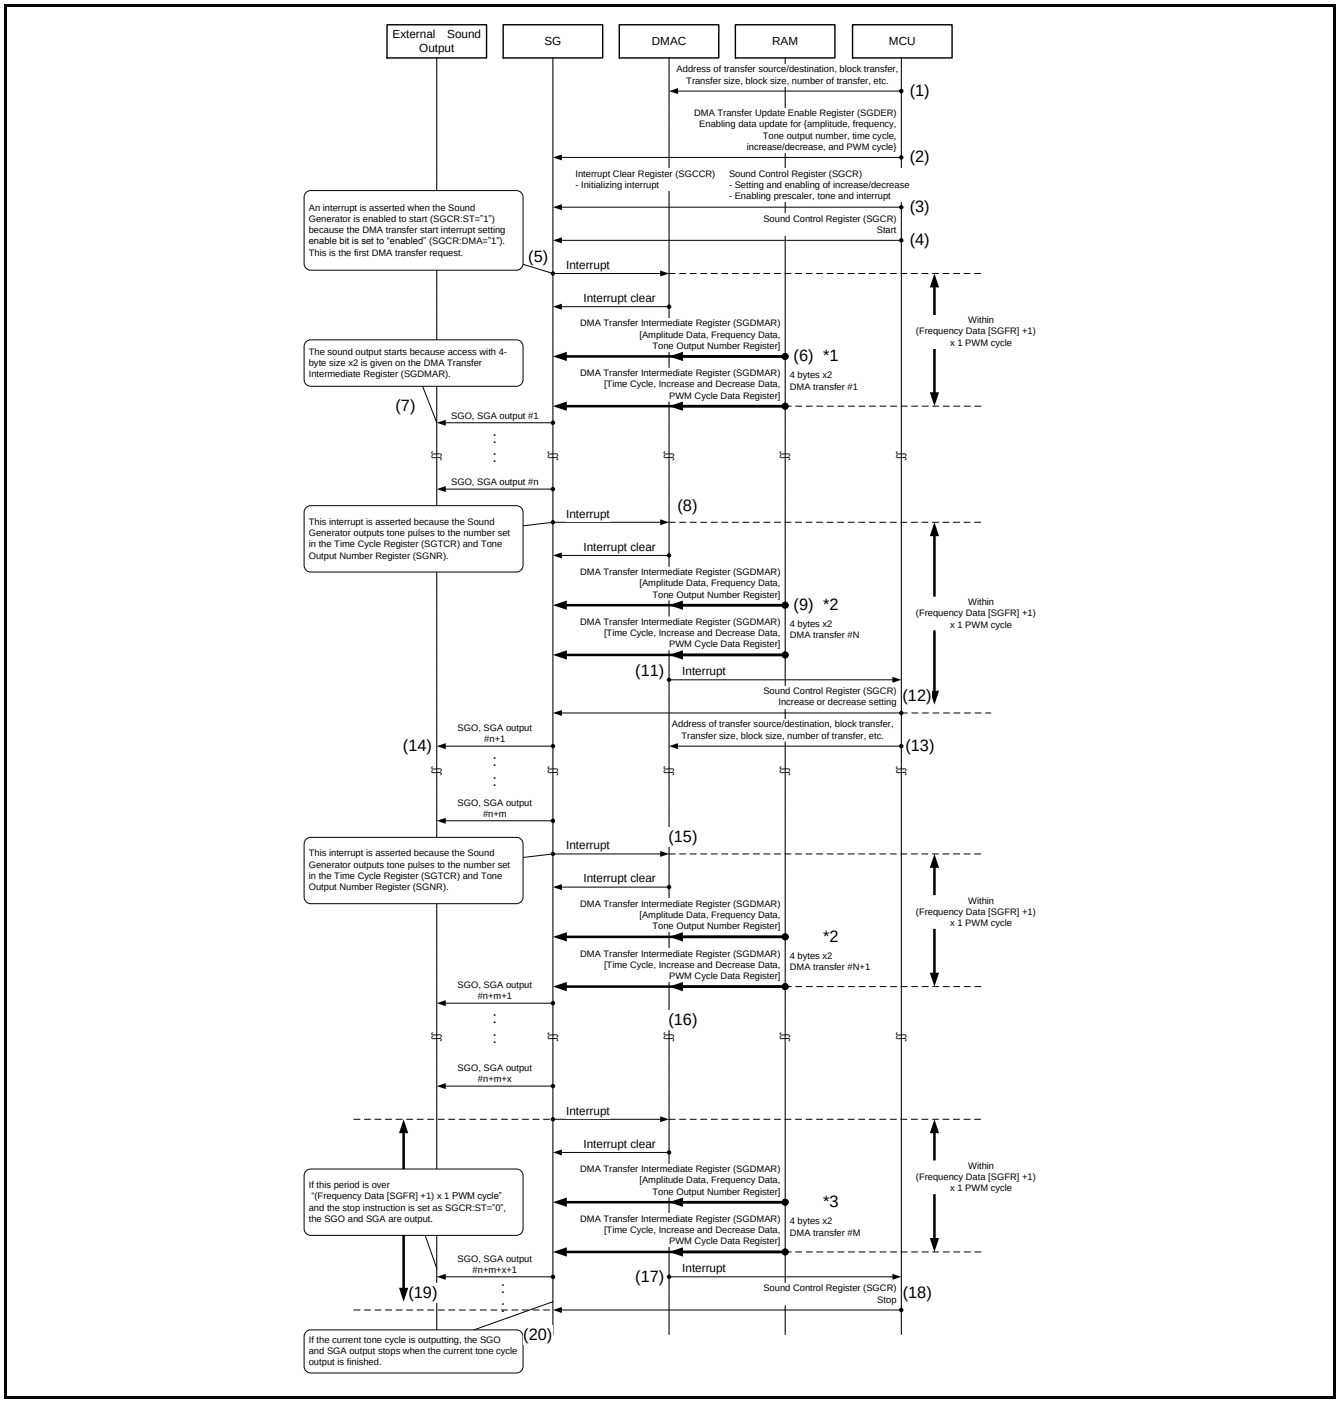
Notes:

- *The DMAC must finish the sequence from step 5 to 6, within the following time. The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle*
- *The DMA transfer error means the occurrence of delay in the sound data setting. It causes unsteady sound output. In that case, please fix the priority of DMA transfer in the system to finish all data transfer within the limit time.*

3.7.5. In Case of DMA Transfer with 4-Byte size x 2 is made N Times and DMA Transfer with 4-Byte size x 2 is Made M Times (The Case the Transfer Byte size and the Increase/Decrease setting is Changed While Sound Outputting)

Figure 3-13 Sound Generator operation with DMA

(The case the transfer byte size and increase/decrease setting is changed while sound is being output)



(1) Software makes initial settings to those registers which are needed in DMA transfer. The DMA transfer is based on a block data of "4-byte size x 2", and this block can be repeated N times. DMAC sets following registers to prepare for a DMA transfer, through the "DMA Transfer Intermediate Register (SGDMAR)".
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

The destination address of the DMA transfer is a fixed one on the "DMA Transfer Intermediate Register (SGDMAR)".

(2) Software configures the "DMA Transfer Update Enable Register (SGDER)" to enable the automatic update of the following registers during DMA transfer.
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

(3) Software initialize Interrupt status bit (SGCR.INT) by writing "1" to Interrupt status clear bit (SGCCR.INTC). Then, the software configures the Sound Control Register (SGCR) in the needed mode, and this must include the following bit operations.
- DMA transfer start interrupt setting enable bit (SGCR.DMA) to "1"(enabled)
- Interrupt enable bit (SGCR.INTE) to "1"(enabled)

(4) Write "1" to the Start bit (SGCR.ST).

(5) The interrupt occurs immediately after setting Start bit (SGCR.ST), since the Sound Generator is enabled on DMA transfer (SGCR.DMA="1"). An Interrupt request (PIRQ) is asserted, and this interrupt is used as a DMA transfer request.

(6) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)". This operation configures the following registers by 2 steps.
[1st step]
- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)

[2nd step]
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

(*: DMA block size must to be "4-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(7) The outputs of SGO and SGA start, according to the register settings above.

(8) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

(9) DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)".
(*2: DMA block size must to be "4-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(10) The Sound Generator keeps outputting SGO and SGA, according to the register settings above.

(11) When DMAC completes all DMA transfer (with 4-byte size x2, N times), it asserts an interrupt to MCU.

(12) Change the increase/decrease setting of the Sound Control Register (SGCR) by software (SGCR.GID).

(13) Software makes settings to the DMAC. The DMA transfer is based on a block data of "4-byte size x 2 cycle", and this block can be repeated M times.

(14) The Sound Generator keeps outputting SGO and SGA.

(15) The Tone pulse counter counts the number of tone pulses. When the following conditions are satisfied, the interrupt is generated.
- Tone pulse counter is 0x00
- Decrement counter is 0x00
- At the rising edge of SGO

Then, DMAC clears the interrupt, and write registers in the Sound Generator through the "DMA Transfer Intermediate Register (SGDMAR)".
(*2: DMA block size must to be "4-byte size x 2" for the access to "DMA Transfer Intermediate Register (SGDMAR)")

(16) Repeat the step 15 to continue outputting the sound.

(17) When DMAC completes all DMA transfer (with 4-byte size x2, M times), it asserts an interrupt to MCU.

(18) Software writes "0" to the Start bit (SGCR.ST) to stop outputting the sound.

(19) When above operation (18) was made within the following time, the Mth DMA transfer doesn't come to the output of SGO and SGA. The Sound Generator stops driving SGO and SGA just before outputting the data of Nth DMA transfer.
The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
(*4: The data of the Mth DMA transfer are written to the Sound Generator, however, they are not output. DMAC issues this Mth DMA transfer only to assert an interrupt toward the MCU.)

(20) If above (19) is not done within the limit time, the Sound Generator keeps driving SGO and SGA in order to output the data of the Mth DMA transfer. Then, the Sound Generator stops driving SGO and SGA after the end of all data.
(*4: The data of the Mth DMA transfer are written to the Sound Generator, and they are output to the end.)

Notes:

- *The DMAC must finish the sequence from step 5 to 6, within the following time.*
  The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle
- *The DMA transfer error means the occurrence of delay in the sound data setting. It causes unsteady sound output. In that case, please fix the priority of DMA transfer in the system to finish all data transfer within the limit time.*
- *The DMAC must finish the sequence from step 8 to 12 (including the time for changing "the increase/decrease setting"), within the following time. The increase/decrease setting change comes into effect on the sound output from step 14, using the data of the Mth transfer with 4-byte size x 2.*
  The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle

3.8. Interrupt of Sound Generator

The interrupt from Sound Generator comes from the judgment of counting tone pulses.

Interrupt of Sound Generator

The interrupt control bit and its factor is shown in the following table.

Table 3-3 The Interrupt bit of Sound Generator and Its Factor

	Interrupt bit of Sound Generator (singular)
Interrupt status bit	Register: Sound Control Register (SGCR) Bit: Interrupt status bit (INT: bit1)
Interrupt enable bit	Register: Sound Control Register (SGCR) Bit: Interrupt enable bit (INTE: bit2)
Interrupt factor	Tone pulse count is greater than or equal to (Time Cycle Register [SGTCR] + 1) x (Tone Output Number Register [SGNR] + 1)

During the tone pulses are counted, when the count reaches the multiple of "Time Cycle Register [SGTCR] + 1" and "Tone Output Number Register [SGNR] + 1", the Interrupt status bit (SGCR.INT) is set. When the interrupt is allowed by the setting of SGCR.INTE, an Interrupt request (PIRQ) is subsequently asserted (to be "H").

4. Registers

This chapter shows the list of registers in Sound Generator.

There is not the restriction by privileged processing mode, when these registers are read or written.

Registers of Sound Generator

Table 4-1 The List of Registers of Sound Generator

Contracted Name	Register Name	Reference
SGDER	DMA Transfer Update Enable Register	4.1
SGCR	Sound Control Register	4.2
SGAR	Amplitude Data Register	4.3
SGFR	Frequency Data Register	4.4
SGNR	Tone Output Number Register	4.5
SGTCR	Time Cycle Register	4.6
SGIDR	Increase and Decrease Data Register	4.7
SGPCR	PWM Cycle Data Register	4.8
SGDMAR	DMA Transfer Intermediate Register	4.9
SGCCR	Interrupt Clear Register	4.10

The Meaning of the Register Bit Property Code

Table 4-2 The Meaning of the Register Bit Property Code

R	Read-Only Register. Only Read access is available, and Write access is ignored.
W	Write-Only Register. Only Write access is available, and Read access makes nothing.
R/W	Read/Write Register. Both Read access and Write access are available.
-	Both Read access and Write access make nothing.

4.1. DMA Transfer Update Enable Register (SGDER)

The DMA Transfer Update Enable Register (SGDER) is to enable the update of the registers (SGAR, SGFR, SGNR, SGTCR, SGIDR, SGPCR) which can be updated when in DMA transfer.

This setting is made for respective registers.

The Sound Generator identifies the register to be updated by DMA transfer according to the setting of this register.

It also recognizes the number of times of DMA transfer and the transfer byte size according to the setting of this register, as well as the valid byte position of the DMA Transfer Intermediate Register (SGDMAR).

bit	7	6	5	4	3	2	1	0
Field	ARE1	ARE0	FRE	NRE	TCRE	IDRE	PCRE1	PCRE0
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit7] ARE1 : Amplitude data (Upper Byte) Update enable bit

This bit is to enable the update of the amplitude data (upper byte) of the Amplitude Data Register (SGAR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the amplitude data (upper byte) is disabled.
1	The update of the amplitude data (upper byte) is enabled.

[bit6] ARE0 : Amplitude data (Lower Byte) Update enable bit

This bit is to enable the update of the amplitude data (lower byte) of the Amplitude Data Register (SGAR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the amplitude data (lower byte) is disabled.
1	The update of the amplitude data (lower byte) is enabled.

[bit5] FRE : Frequency data Update enable bit

This bit is to enable the update of the frequency data of the Frequency Data Register (SGFR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the frequency data is disabled.
1	The update of the frequency data is enabled.

[bit4] NRE : Tone output Number Update enable bit

This bit is to enable the update of the tone output number of the Tone Output Number Register (SGNR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the tone output number is disabled.
1	The update of the tone output number is enabled.

[bit3] TCRE : Time cycle Update enable bit

This bit is to enable the update of the time cycle of the Time Cycle Register (SGTCR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the time cycle is disabled.
1	The update of the time cycle is enabled.

[bit2] IDRE : Increase and Decrease data Update enable bit

This bit is to enable the update of the increase and decrease data of the Increase and Decrease Data Register (SGIDR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the increase and decrease data is disabled.
1	The update of the increase and decrease data is enabled.

[bit1] PCRE1 : PWM cycle data (Upper Byte) Update enable bit

This bit is to enable the update of the PWM cycle data (upper byte) of the PWM Cycle Data Register (SGPCR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the PWM cycle data (upper byte) is disabled.
1	The update of the PWM cycle data (upper byte) is enabled.

[bit0] PCRE0 : PWM cycle data (Lower Byte) Update enable bit

This bit is to enable the update of the PWM cycle data (lower byte) of the PWM Cycle Data Register (SGPCR) through the DMA Transfer Intermediate Register when in DMA transfer.

bit	Description
0	The update of the PWM cycle data (lower byte) is disabled.
1	The update of the PWM cycle data (lower byte) is enabled.

4.2. Sound Control Register (SGCR)

The Sound Control Register (SGCR) is to control interrupts and operation status of the Sound Generator.

bit	15	14	13	12	11	10	9	8
Field	Reserved	SRST	DMA	GID	GEN	Reserved	BUSY	Reserved
Attribute	-	W	R/W	R/W	R/W	-	R	-
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

bit	7	6	5	4	3	2	1	0
Field	S1	S0	TONE	SGOOE	SGAOE	INTE	INT	ST
Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W
Protection attribute	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0

[bit15] Reserved : Reserved bit

Always write "0" to this bit. The read value is "0".

[bit14] SRST : Software Reset bit

This bit is used to issue a software reset in the Sound Generator.

When in the read access, the read value is always "0". Writing "0" to this bit has no effect.

bit	Description
	Write
0	No effect.
1	Writing "1" issues a software reset.

[bit13] DMA : DMA Transfer Start Interrupt setting enable bit

This bit is to enable DMA transfer start interrupt.

bit	Description
0	Writing "1" to the Start bit (ST) does not make the Interrupt status bit (INT) set.
1	Writing "1" to the Start bit (ST) makes the Interrupt status bit (INT) set.

Note:

- *Do not change this setting while operating (ST="1").*

[bit12] GID : Increase/Decrease setting bit

This bit is for automatic increase/decrease setting of the sound, working with the Time Cycle Register (SGTCR), the Increase and Decrease Data Register (SGIDR), and the automatic increase/decrease enable bit (GEN).

This bit determines whether the value of Amplitude Data Register (SGAR) increases or decreases.

bit	Description
0	The value stored in the Amplitude Data Register (SGAR) decreases.
1	The value stored in the Amplitude Data Register (SGAR) increases.

Notes:

- *This bit is valid only when the automatic increase/decrease enable bit is set to "enabled"(GEN="1").*
- *If this bit is changed during the operation, it is reflected at the time when the value of "Amplitude Data Register (SGAR)" is automatically updated.*

[bit11] GEN : Automatic Increase/Decrease enable bit

This bit is for automatic increase/decrease setting of the sound, working with the Time Cycle Register (SGTCR), the Increase and Decrease Data Register (SGIDR), and the Increase/decrease setting bit (GID).

bit	Description
0	The automatic increase or decrease is disabled.
1	The automatic increase or decrease is enabled.

Note:

- *When this bit turns from "enabled" to "disabled", the Amplitude Data Register (SGAR) holds the value at that time.*

[bit10] Reserved : Reserved bit

Always write "0" to this bit. The read value is "0".

[bit9] BUSY : Busy Status bit

This bit is to indicate whether the Sound Generator is in operation or not.

This bit is only for read access, and the write access to this bit has no effect.

bit	Description
	Read
0	Sound Generator is inactive. This bit is cleared under any of following conditions. - Software reset is set (SRST="1"). - ST bit is cleared by writing "0". And the operation is completed after 1 tone cycle (current tone cycle) has finished.
1	Sound Generator is active. This bit is set when ST bit is written "1".

[bit8] Reserved : Reserved bit

Always write "0" to this bit. The read value is "0".

[bit7:6] S1, S0 : Operation clock Select bits

The combination of these bits controls the internal clock division, to determine the bit rate on the output sound.

S1	S0	Description
0	0	The division ratio at the Prescaler is 1.
0	1	The division ratio at the Prescaler is 2.
1	0	The division ratio at the Prescaler is 4.
1	1	The division ratio at the Prescaler is 8.

[bit5] TONE : Tone output bit

This bit controls the type of SGO output signal.

bit	Description
0	SGO outputs the mixed signal of tone pulse and PWM pulse.
1	SGO outputs a simple square wave (tone pulse), that is generated by the internal toggle flip-flop.

[bit4] SGOOE : SGO Signal output enable bit

This bit controls whether to enable the output of SGO.

bit	Description
0	SGO output is disabled.
1	SGO output is enabled.

[bit3] SGAOE : SGA Signal output enable bit

This bit controls whether to enable the output of SGA.

bit	Description
0	SGA output is disabled.
1	SGA output is enabled.

[bit2] INTE : Interrupt enable bit

This bit enables the interrupt request of the Sound Generator.

bit	Description
0	The interrupt by INT bit is masked, and the status of INT bit is not reflected to the output on PIRQ.
1	The interrupt by INT bit is not masked, and the status of INT bit is reflected to the output on PIRQ.

[bit1] INT : Interrupt Status bit

This is an interrupt flag of the Sound Generator.

This bit is only for read access, and the write access to this bit has no effect.

bit	Description	
	Read	Write
0	Sound Generator hasn't detected the end of tone pulses. This bit is cleared under any of following conditions. - Software reset is set (SRST="1"). - DMA transfer - Interrupt Clear bit is set (SGCCR.INTC="1")	No effect.
1	Sound Generator has detected the end of tone pulses. This bit is set under the following condition. - The number of tone pulse count is greater than or equal to (Time Cycle Register [SGTCR] + 1) x (Tone Output Number Register [SGNR] + 1)	No effect.

[bit0] ST : Start bit

This bit is a start trigger of the Sound Generator.

bit	Description
0	Writing "0" to this bit stops Sound Generator.
1	Writing "1" to this bit starts Sound Generator.

Notes:

- *Whether the Sound Generator is stopped or not can be seen on the status bit BUSY.*
- *This bit is cleared also when a software reset is issued (SRST = "1").*

4.3. Amplitude Data Register (SGAR)

The Amplitude Data Register (SGAR) stores the reload value for a PWM pulse generator.

The register value represents sound amplitude and is reloaded into the PWM pulse generator at the end of every tone cycle.

bit	15	14	13	12	11	10	9	8
Field	SGAR[15:8]							
Attribute	R/W							
Protection attribute	-							
Initial value	0x00							

bit	7	6	5	4	3	2	1	0
Field	SGAR[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	0x00							

[bit15:0] SGAR : Amplitude data bits

These bits store the reload value for the PWM pulse generator,
and the value is written either in the following ways.
(1)Software writes a value to this register.
(2)DMAC writes a value through DMA Transfer Intermediate Register (SGDMAR).

When in decreasing the value of this register, 0x0000 is the lower limit and the value doesn't roll over to 0xFFFF from it.

When in increasing the value of this register, 0xFFFF is the upper limit and the value doesn't roll over to 0x0000 from it.

In any case, the Sound Generator keeps operating until the Start bit (SGCR.ST) is cleared.

Notes:

- *The number of clock cycles in high width of 1 PWM is equal to "SGAR + 1".*
- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse.
  (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

4.4. Frequency Data Register (SGFR)

The Frequency Data Register (SGFR) stores the reload value for a Frequency counter.

bit	7	6	5	4	3	2	1	0
Field	SGFR[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	0x00							

[bit7:0] SGFR : Frequency data bits

These bits store the reload value for the Frequency counter,
and the value is written either in the following ways.
(1)Software writes a value to this register.
(2)DMAC writes a value through DMA Transfer Intermediate Register (SGDMAR).

Notes:

- *The number of PWM pulses is equal to "SGFR + 1".*
- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse.
  (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

4.5. Tone Output Number Register (SGNR)

The Tone Output Number Register (SGNR) stores the reload value for a Tone pulse counter.

The Tone pulse counter accumulates the number of tone pulses (or the number of sound increment/decrement). When the accumulated value reaches the reload value, it sets the Interrupt status bit (SGCR.INT). This operation is to reduce the frequency of interrupts.

bit	7	6	5	4	3	2	1	0
Field	SGNR[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	0x00							

[bit7:0] SGNR : Tone output Number bits

These bits store the reload value for the Tone pulse counter,
and the value is written either in the following ways.
(1)Software writes a value to this register.
(2)DMAC writes a value through DMA Transfer Intermediate Register (SGDMAR).

Notes:

- *The number of pulses is equal to "SGNR + 1".*
- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse.
  (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

4.6. Time Cycle Register (SGTCR)

The Time Cycle Register (SGTCR) stores the reload value for a Decrement counter.

bit	7	6	5	4	3	2	1	0
Field	SGTCR[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	0x00							

[bit7:0] SGTCR : Time cycle bits

These bits store the reload value for the Decrement counter,
and the value is written either in the following ways.
(1)Software writes a value to this register.
(2)DMAC writes a value through DMA Transfer Intermediate Register (SGDMAR).

Notes:

- *The number of pulses is equal to "SGTCR + 1".*
- *When SGTCR is 0x00, the automatic increase or decrease operation on the Amplitude Data Register (SGAR) occurs at each tone cycle.*
- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse.
  (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

4.7. Increase and Decrease Data Register (SGIDR)

The Increase and Decrease Data Register (SGIDR) stores the increment or decrement for the Amplitude Data Register (SGIDR).

bit	7	6	5	4	3	2	1	0
Field	SGIDR[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	0x00							

[bit7:0] SGIDR : Increase and Decrease data bits

These bits store the increment or decrement for the Amplitude Data Register (SGAR) , and the value is written either in the following ways.

(1)Software writes a value to this register.

(2)DMAC writes a value through DMA Transfer Intermediate Register (SGDMAR).

Note:

- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse.
  (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

4.8. PWM Cycle Data Register (SGPCR)

The PWM Cycle Data Register (SGPCR) stores the number of cycles in 1 PWM cycle.

bit	15	14	13	12	11	10	9	8
Field	SGPCR[15:8]							
Attribute	R/W							
Protection attribute	-							
Initial value	0x00							

bit	7	6	5	4	3	2	1	0
Field	SGPCR[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	0xFF							

[bit15:0] SGPCR : PWM cycle Number data bits

These bits store the number of cycles in 1PWM cycle,
and the value is written either in the following ways.
(1)Software writes a value to this register.
(2)DMAC writes a value through DMA Transfer Intermediate Register (SGDMAR).

Notes:

- *The number of cycles in 1 PWM is equal to "SGPCR + 1".*
- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse.
  (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

4.9. DMA Transfer Intermediate Register (SGDMAR)

The DMA Transfer Intermediate Register (SGDMAR) is available in DMA transfer, and works as a window to access several registers. The details are described in "3.4 Relation between the DMA Transfer Update Enable Register (SGDER) and DMA Settings".

bit	31	30	29	28	27	26	25	24
Field	SGDMAR[31:24]							
Attribute	W							
Protection attribute	-							
Initial value	0x00							

bit	23	22	21	20	19	18	17	16
Field	SGDMAR[23:16]							
Attribute	W							
Protection attribute	-							
Initial value	0x00							

bit	15	14	13	12	11	10	9	8
Field	SGDMAR[15:8]							
Attribute	W							
Protection attribute	-							
Initial value	0x00							

bit	7	6	5	4	3	2	1	0
Field	SGDMAR[7:0]							
Attribute	W							
Protection attribute	-							
Initial value	0x00							

[bit31:0] SGDMAR : DMA Transfer data bits

This register is used to write the following registers:

- Amplitude Data Register (SGAR)
- Frequency Data Register (SGFR)
- Tone Output Number Register (SGNR)
- Time Cycle Register (SGTCR)
- Increase and Decrease Data Register (SGIDR)
- PWM Cycle Data Register (SGPCR)

The details are described in "3.4 Relation between the DMA Transfer Update Enable Register (SGDER) and DMA Settings".

The read value is always 0x00000000.

Notes:

- *If the number of DMA transfer is greater than "the number determined by the DMA Transfer Update Enable Register (SGDER)", the value of this register is updated.*
- *When in reading corresponding registers (not through this register), please make sure the setting of "DMA Transfer Update Enable Register (SGDER)" is available for the target registers.*
- *As for the enabled setting register of the DMA Transfer Update Enable Register (SGDER), access is enabled to both the DMA Transfer Intermediate Register (SGDMAR) and individual registers (SGAR, SGFR, SGNR, SGTCR, SGIDR, SGPCR).*
- *During operation, in the case of changing a register value, meet the following either conditions.*
  (1)Sound generator is in the stop state (SGCR.BUSY="0").
  (2)The changing comes between an interrupt occurrence and falling edge of the first tone pulse. (The limit time = (Frequency Data Register [SGFR] + 1) x 1 PWM cycle)
  When it meets neither condition, the sound output cannot guarantee the expected duty ratio.

4.10. Interrupt Clear Register (SGCCR)

The Interrupt Clear Register (SGCCR) clears the Interrupt status bit (SGCR.INT) in the Sound Control Register (SGCR).

bit	15	14	13	12	11	10	9	8
Field	Reserved							
Attribute	-							
Protection attribute	-							
Initial value	0x00							

bit	7	6	5	4	3	2	1	0
Field	Reserved						INTC	Reserved
Attribute	-						W	-
Protection attribute	-						-	-
Initial value	0x00						0	0

Note:

- *Use 16- or 32-bit data access for the SGCCR register.*

[bit15:2] Reserved : Reserved bits

Always write "0" to these bits. The read value is "0".

[bit1] INTC : Interrupt Status Clear bit

When this bit is set, Interrupt status bit (SGCR.INT) is cleared.

The read value is "0".

bit	Description
	Write
0	No effect.
1	Interrupt status bit (SGCR.INT) is cleared.

[bit0] Reserved : Reserved bit

Always write "0" to this bit. The read value is "0".

CHAPTER 59: Stepper Motor Controller

This chapter explains the functions and operations of the Stepper Motor Controller (SMC).

1. Overview
2. Configuration
3. Operation of the Stepper Motor Controller
4. Registers

SMC-T01P00R01L01-E1-GBM01

1. Overview

This section lists the main features for Stepper Motor Controller.

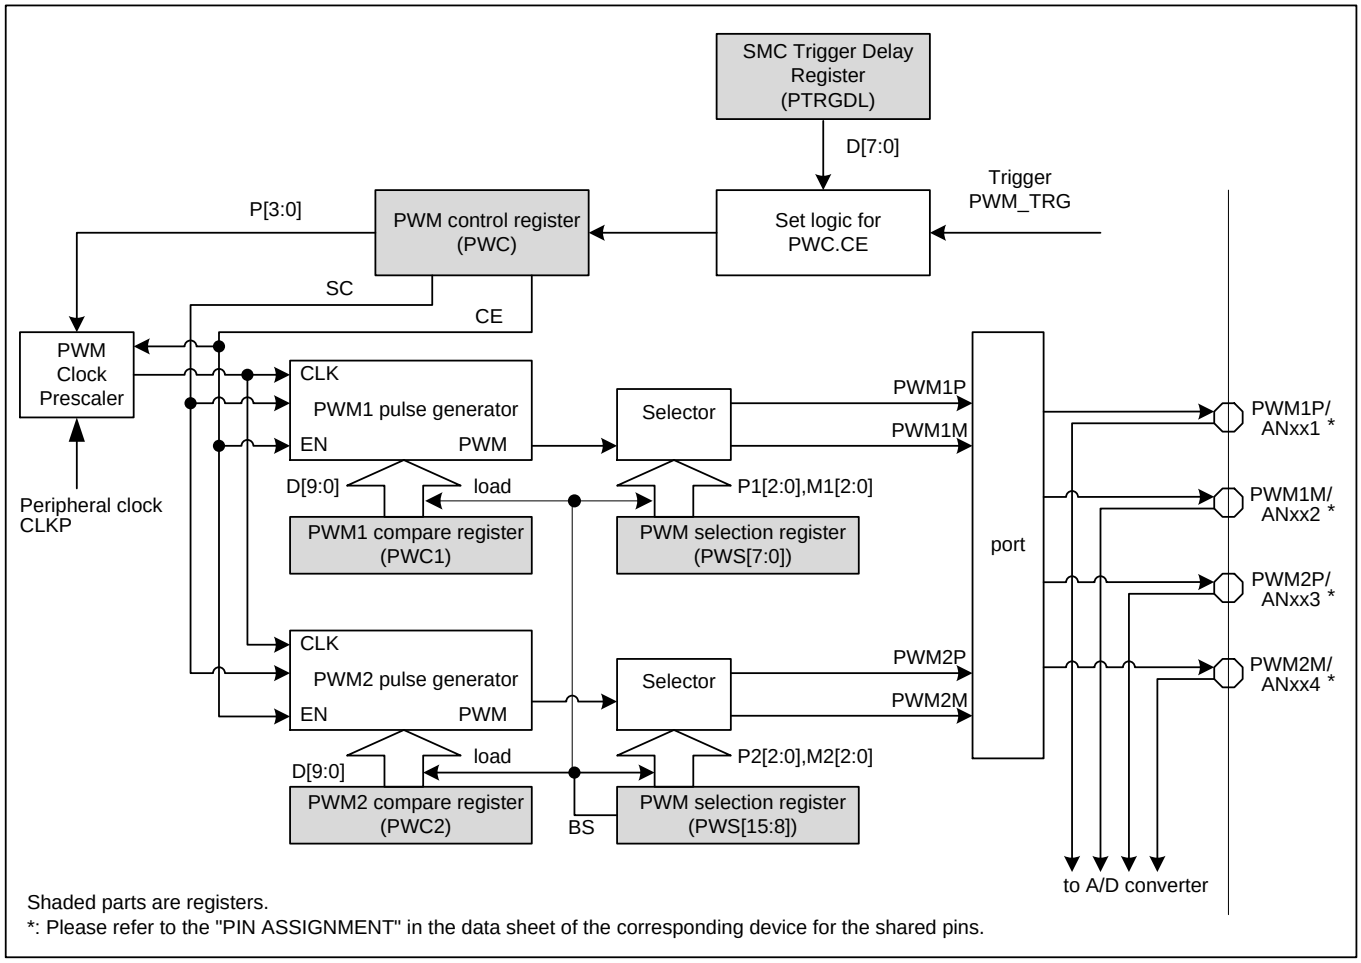
■ **Features of the Stepper Motor Controller:**

- Four high-current output drivers: Stepper Motor Controller provides four driver outputs with high current driving capability. Two motor coils can be connected directly to four stepper motor controller pins. The motor rotation is controlled by a combination of the PWM Pulse Generator and selector logic circuits.
- Two PWM Pulse Generators with 10-bit/8-bit operation mode (selected by software):
  - For the PWM pulse width in 8-bit operation mode, the duty can be specified within the range from 0% to 99.6%.
  - For the PWM pulse width in 10-bit operation mode, the duty can be specified within the range from 0% to 99.9%.
- A synchronization mechanism that enables synchronous operation of PWM Pulse Generators.
- A variable operating Clock Prescaler (the division ratio from a Peripheral clock can be selected by software).
  - Output selector logic ("H", "L", PWM pulse and "Hi-Z" signal levels can be selected).

2. Configuration

This section shows block diagrams of the Stepper Motor Controller.

Figure 59-1 Block Diagram of the Stepper Motor Controller



Shaded parts are registers.

*: Please refer to the "PIN ASSIGNMENT" in the data sheet of the corresponding device for the shared pins.

PWM Clock Prescaler
The PWM Clock Prescaler divides the Peripheral clock (CLKP) and generates the PWM operating clock. The PWM operating clock is used by the PWM Pulse Generators.

PWM1 Pulse Generator / PWM2 Pulse Generator
The PWM Pulse Generators generate the pulse-width modulated signals according to the waveform configuration and the selected operation mode.

Selector
This sub-module, based on configuration, selects the level of the signal that will be sent to the Stepper Motor Controller output pins.

Port
The Port controls the I/O port for the Stepper Motor Controller pins.

PWM Control Register (PWC)
The PWM Control Register (PWC) starts/stops the Stepper Motor Controller, sets the PWM Prescaler and selects the operation mode for the PWM Pulse Generators.

PWM1 and PWM2 Compare Registers (PWC1, PWC2)
The PWM1 and PWM2 Compare Registers determine the PWM pulse width.

PWM Selection Register (PWS)
The PWM Selection Register selects the signal levels ("H" and "L", PWM pulse and "Hi-Z") to be output to the Stepper Motor Controller pins. It also sets the update instruction for the system to synchronize the PWM Pulse Generators.

SMC Trigger Delay Register (PTRGDL)
The SMC Trigger Delay Register (PTRGDL) is used to delay the start of the operation by 0 to 255 clock cycles.

Set logic for PWC.CE
The Set logic for PWC.CE receives the trigger and waits for a configured delay time and sets automatically PWC.CE bit.

3. Operation of the Stepper Motor Controller

This section describes the operation of the Stepper Motor Controller.

3.1 Operation of PWM Pulse Generator

3.2 Selection of Motor Drive Signals

3.3 Synchronization System of Stepper Motor Controller

3.4 Operation of the SMC Trigger Delay Function

3.1. Operation of PWM Pulse Generator

The PWM period is determined by the selected division ratio from a Peripheral clock (CLKP) and the operation mode (8-bit/10-bit) of the PWM Pulse Generator:

- During configuration, software can select the PWM operating clock by specifying the division ratio for the Peripheral clock (CLKP). The division ratio for the Peripheral clock is defined by setting the PWM operating clock prescaler bits (PWC.P[3:0]).
- Software can also configure the operation mode for the counter that controls the PWM period. When the Operation Mode Switching bit (PWC.SC) is set to "0", 8-bit operation mode is selected (PWM period = 256 counts). If this bit is set to "1", 10-bit operation mode is selected (PWM period = 1024 counts).

Examples of operating clock values for different configurations are given in Table 59-1.

Table 59-1 Relation between PWM Operating Clock and PWM Period for Different Operation Modes

PWC P[3:0]	PWM Operating Clock (CLK)	PWM Period [µs] (CLKP = 16 MHz)		PWM Period [µs] (CLKP = 60 MHz)	
		PWC SC = "0"	PWC SC = "1"	PWC SC = "0"	PWC SC = "1"
0000	CLKP	16	64	4.267	17.067
0001	CLKP/4	64	256	17.067	68.267
0010	CLKP/5	80	320	21.333	85.333
0011	CLKP/6	96	384	25.6	102.4
0100	CLKP/8	128	512	34.133	136.533
0101	CLKP/10	160	640	42.667	170.667
0110	CLKP/12	192	768	51.2	204.8
0111	CLKP/16	256	1024	68.267	273.067
1000	CLKP/2	32	128	8.533	34.133
1001	CLKP/8	128	512	34.133	136.533
1010	CLKP/10	160	640	42.667	170.667
1011	CLKP/12	192	768	51.2	204.8
1100	CLKP/16	256	1024	68.267	273.067
1101	CLKP/20	320	1280	85.333	341.333
1110	CLKP/24	384	1536	102.4	409.6
1111	CLKP/32	512	2048	136.533	546.133

CLKP: Peripheral clock

The PWM pulse width (duty cycle) is determined by the PWM Compare Data Value (PWC1.D[9:0], PWC2.D[9:0]). In 8-bit operation mode (PWC.SC = "0"), the PWM Compare Data Value is taken from the PWC1.D[7:0], PWC2.D[7:0] bits and PWC1.D[9:8], PWC2.D[9:8] bits are "don't care". In 10-bit operation mode (PWC.SC = "1"), the PWM Compare Data Value is taken from the PWC1.D[9:0], PWC2.D[9:0] bits. Below are the ranges in which PWM Compare Data Values (PWC1.D[9:0], PWC2.D[9:0]) can be set:

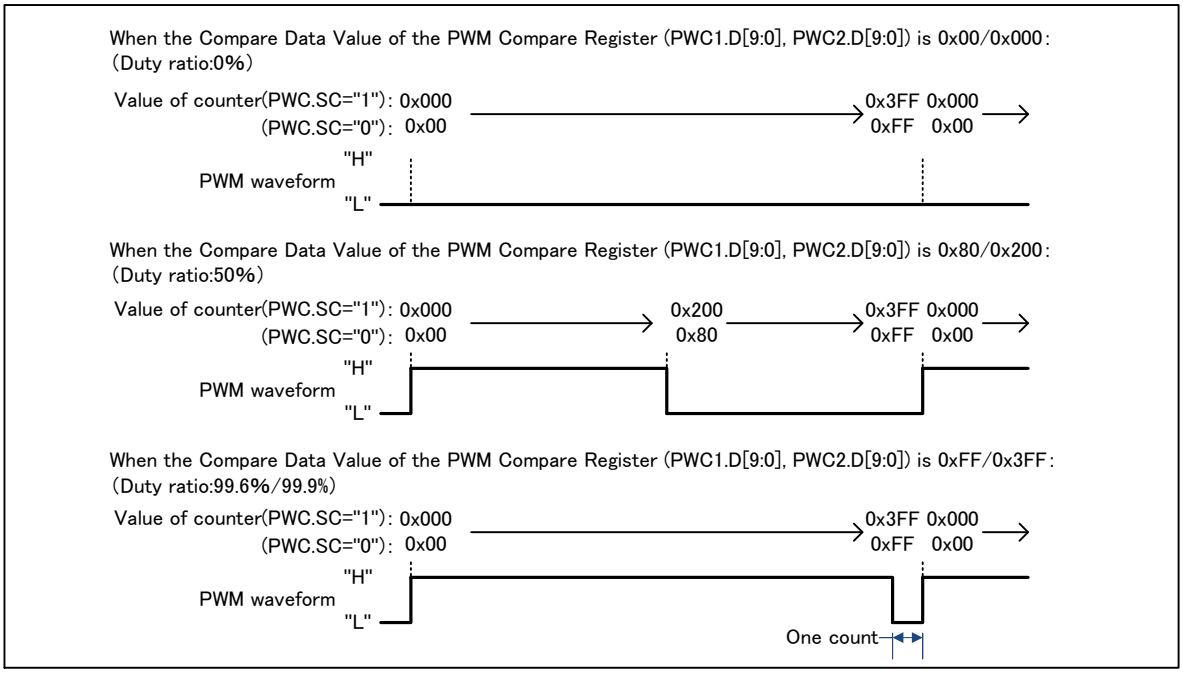
- In 8-bit operation mode (PWC.SC = "0") 0% to 99.6% (0x00 to 0xFF)
- In 10-bit operation mode (PWC.SC = "1") 0% to 99.9% (0x000 to 0x3FF)

The PWM Pulse Generator is started/stopped using the Count Enable bit (PWC.CE). When this bit is set to "1", the PWM Pulse Generator starts the counter that controls the PWM period. The counter

increments its value from 0x00 (0x000) at the rising edge of the PWM operating clock. The PWM Pulse Generator output remains at the "H" level until the counter value matches the PWM Compare Data Value. Once the PWM Compare Data Value is reached, the PWM Pulse Generator output changes to "L" and remains at the "L" level until the counter value overflows: 0xFF → 0x00 (0x3FF → 0x000).

Figure 59-2 shows the PWM waveforms generated by the PWM Pulse Generator.

Figure 59-2 Examples of PWM1 and PWM2 Output Waveforms



If the PWM Pulse Generator is stopped (PWC.CE = "0"), the setting of the PWM pulse width (duty cycle) and the output pin selection settings are not reflected on the Stepper Motor Controller outputs.

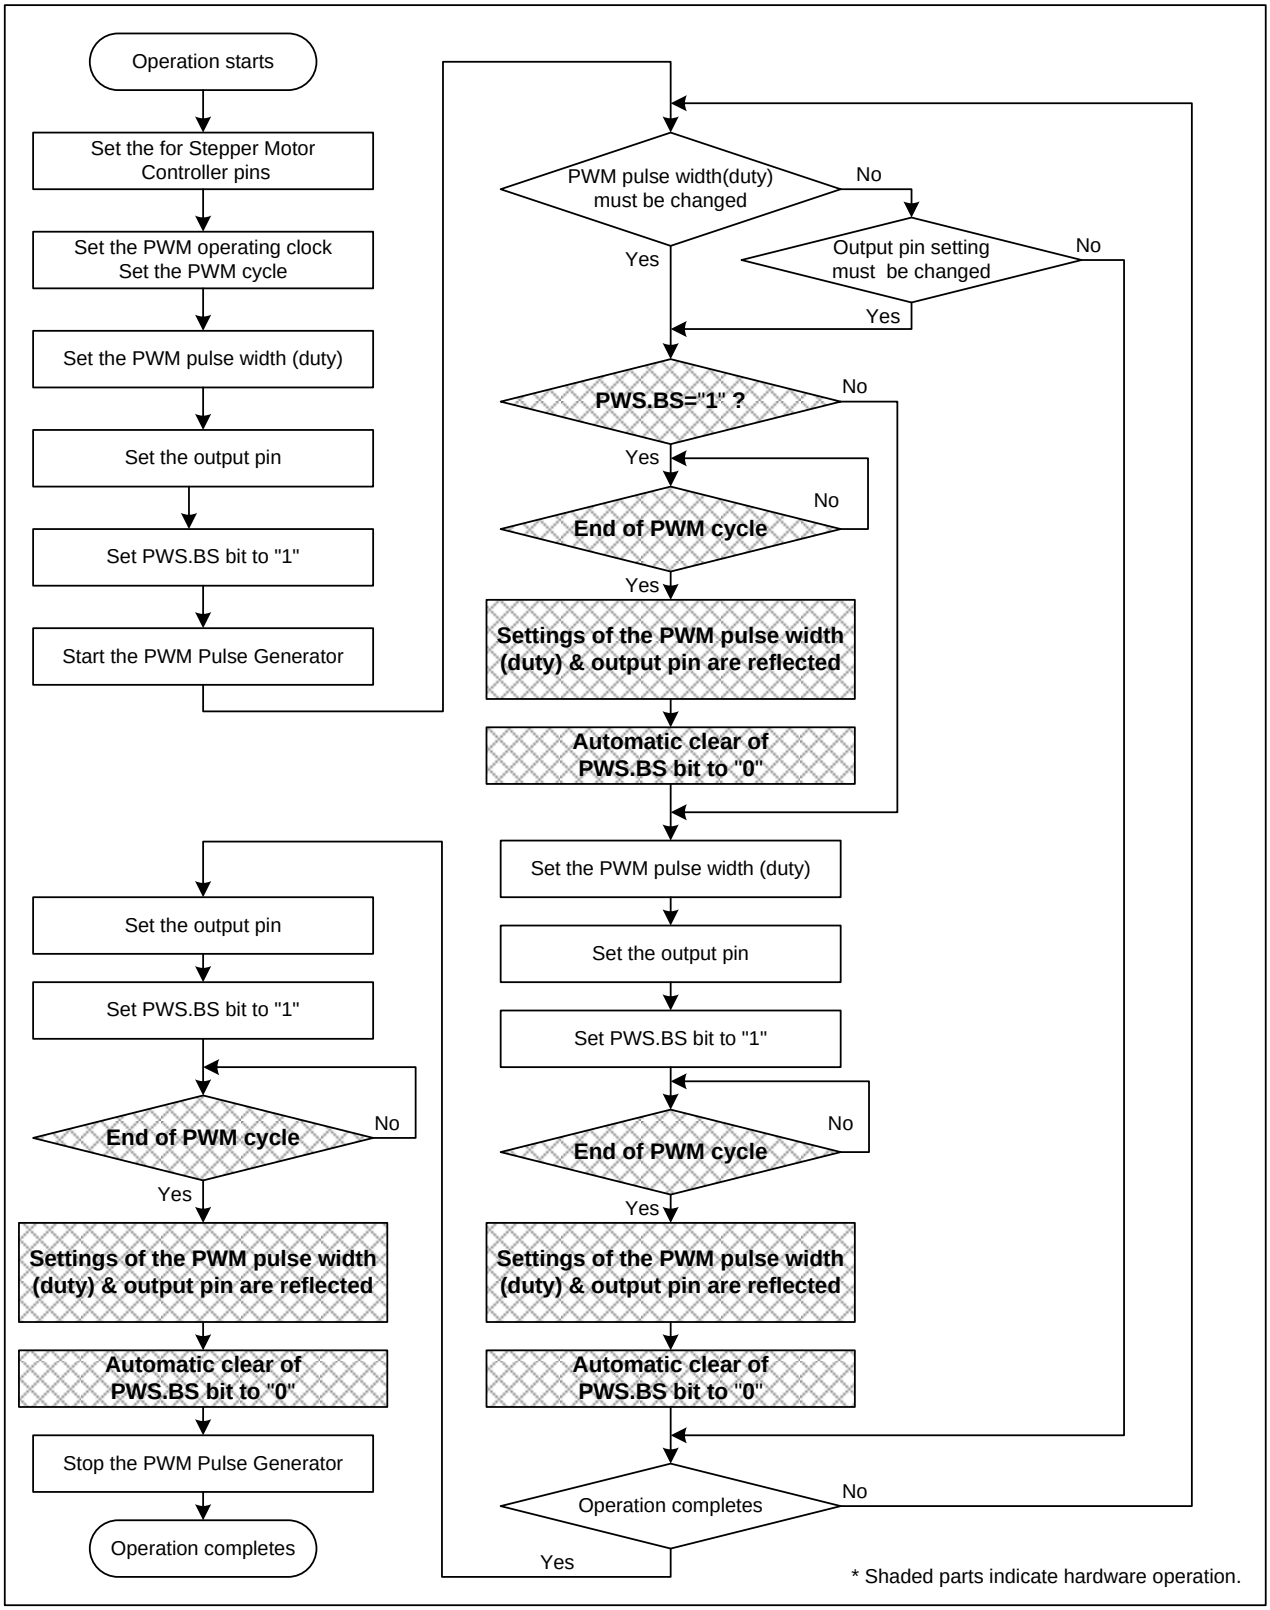
Notes:

- *If the PWM Pulse Generator is started(PWC.CE="1"), operate following steps because the PWM Pulse Generator.Compare Data Value must be initialized.*
  1. Set the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0])
  2. Set the PWM Selection Register.Output Selection bits(PWS.BS="1", PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0])
  3. Set the PWM Control Register.Count Enable bit(PWC.CE="1")
- *If the PWM Pulse Generator is stopped when the Output Update bit (PWS.BS) is "1", the PWS.BS bit will retain the value "1" until the PWM Pulse Generator is started and the beginning of the new PWM cycle is detected. As a result, the setting of the PWM pulse width (duty cycle) and the output pin selection settings are reflected on the Stepper Motor Controller outputs. To avoid this scenario, clear PWC.CE only after PWS.BS is automatically cleared by the SMC.*
- *If the PWS.BS bit is "1", keep the following registers value because the setting of the PWM pulse width (duty cycle) and the output pin selection settings are not reflected at the same time.*
  - PWM1 Compare Register.Compare Data Value(PWC1.D[9:0])
  - PWM2 Compare Register.Compare Data Value(PWC2.D[9:0])

- PWM Selection Register.Output Selection bits(PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0])

An example for the Stepper Motor Controller setting procedure is given on the Figure 59-3 .

Figure 59-3 Example of the Setting Procedure for the Stepper Motor Controller



3.2. Selection of Motor Drive Signals

The user can select the signal at each output pin of the Stepper Motor Controller according to the Table 59-2 and Table 59-3. The selection of output pin is done by configuring the PWM Selection Register (PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0]).

Table 59-2 Selection of Motor Drive Signals and Setting of PWM1 Selection Bits

PWS.P1[2:0]	PWM1P
000	L
001	H
01X	PWM pulse
1XX	Hi-Z

PWS.M1[2:0]	PWM1M
000	L
001	H
01X	PWM pulse
1XX	Hi-Z

X: don’t care

Table 59-3 Selection of Motor Drive Signals and Setting of PWM2 Selection Bits

PWS.P2[2:0]	PWM2P
000	L
001	H
01X	PWM pulse
1XX	Hi-Z

PWS.M2[2:0]	PWM2M
000	L
001	H
01X	PWM pulse
1XX	Hi-Z

X: don’t care

3.3. Synchronization System of Stepper Motor Controller

The Stepper Motor Controller contains a dedicated system developed to enable synchronization of PWM1 and PWM2 Pulse Generators, as well as Stepper Motor Controller output pin selection. The synchronization system is controlled by the PWM Selection Register Output Update bit (PWS.BS). Until the Output Update bit (PWS.BS) is set to "1", changes made to the PWM Compare Registers (PWC1, PWC2) and the PWM Selection Register (PWS) are not reflected on the output. Configuring the Stepper Motor Controller output pin selection and setting the Output Update bit (PWS.BS) simultaneously (in the same software access) is allowed.

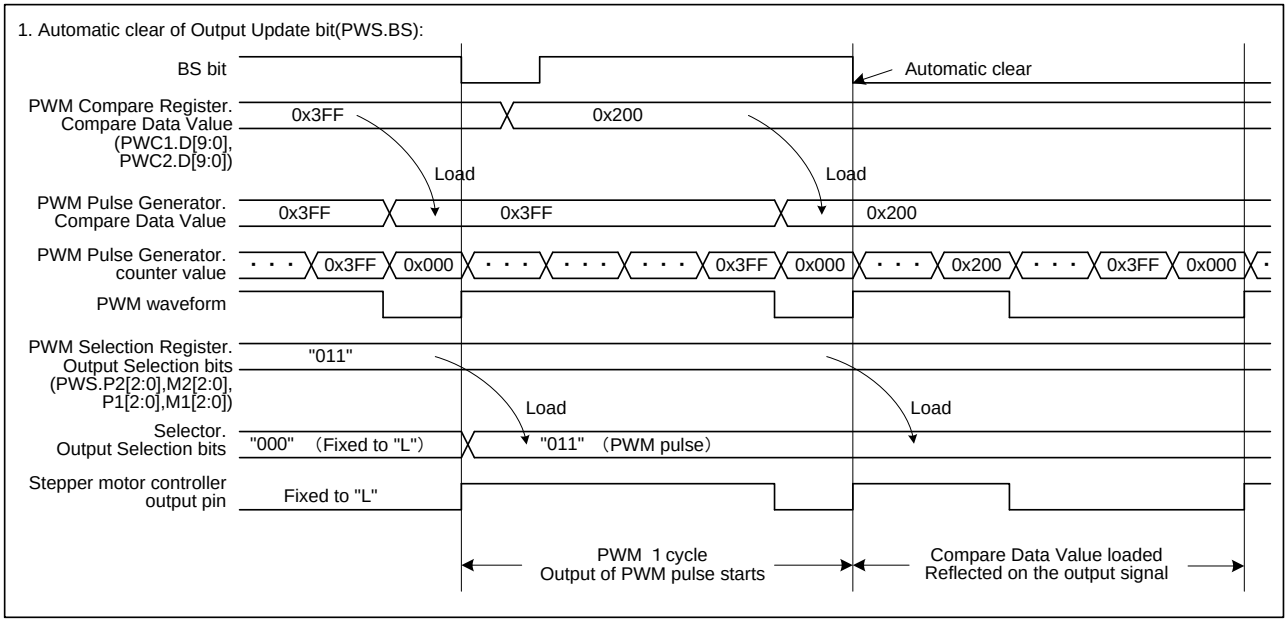
When the Output Update bit (PWS.BS) is set to "1" by software, and the end of current PWM cycle is detected, PWM Pulse Generator and motor drive selection logic will load values of the corresponding registers. The Output Update bit (PWS.BS) is automatically cleared to "0" at the beginning of the next PWM cycle.

If the Output Update bit (PWS.BS) is equal to "1" and the software access is initiated to set this bit to "1" at the beginning of the PWM cycle (at the same time when an automatic clear of Output Update bit (PWS.BS) is issued), the Output Update bit (PWS.BS) will retain the value "1" (i.e. no change is made to the PWS.BS bit) and the automatic clearing is canceled for this PWM cycle.

The following scenario is shown on Figure 59-4:

1. Automatic clear of the Output Update bit (PWS.BS): load operation is executed and reflected on the output.

Figure 59-4 Load Timing of PWM Compare Register and PWM Selection Register



3.4. Operation of the SMC Trigger Delay Function

After the Stepper Motor Controller receives a trigger input (PWM_TRG), it waits for a configured delay time to elapse before the Count Enable bit (PWC.CE) is automatically set and the Stepper Motor Controller starts operating. The delay time is configured in the SMC Trigger Delay Register (PTRGDL). The Stepper Motor Controller will continue to operate until the Count Enable bit (PWC.CE) is reset by software.

Figure 59-5 demonstrates the software flow for receiving a trigger input (PWM_TRG). An example, illustrating how the trigger starts Stepper Motor Controller, is shown on Figure 59-6.

Note:

- *The trigger should only be received when the Stepper Motor Controller are not running (i.e. the Count Enable bit (PWC.CE) is cleared to "0").*

Figure 59-5 Flowchart for Triggering Stepper Motor Controller

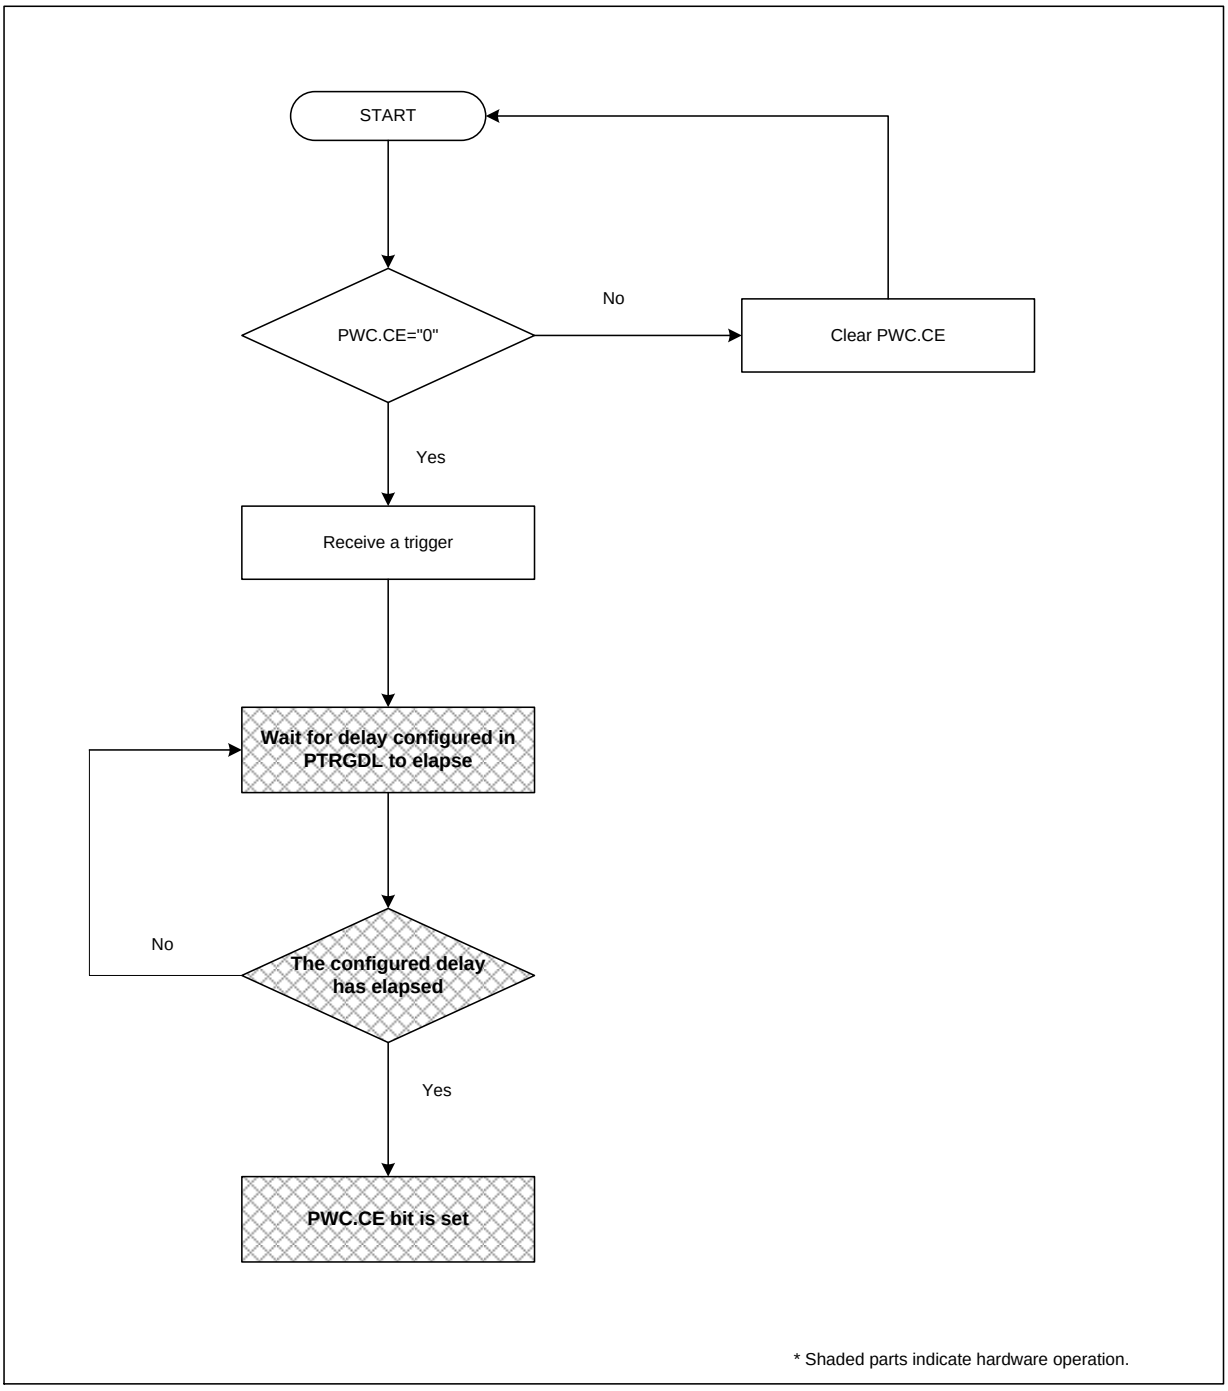


Figure 59-6 Timing diagram for Triggering of Stepper Motor Controller

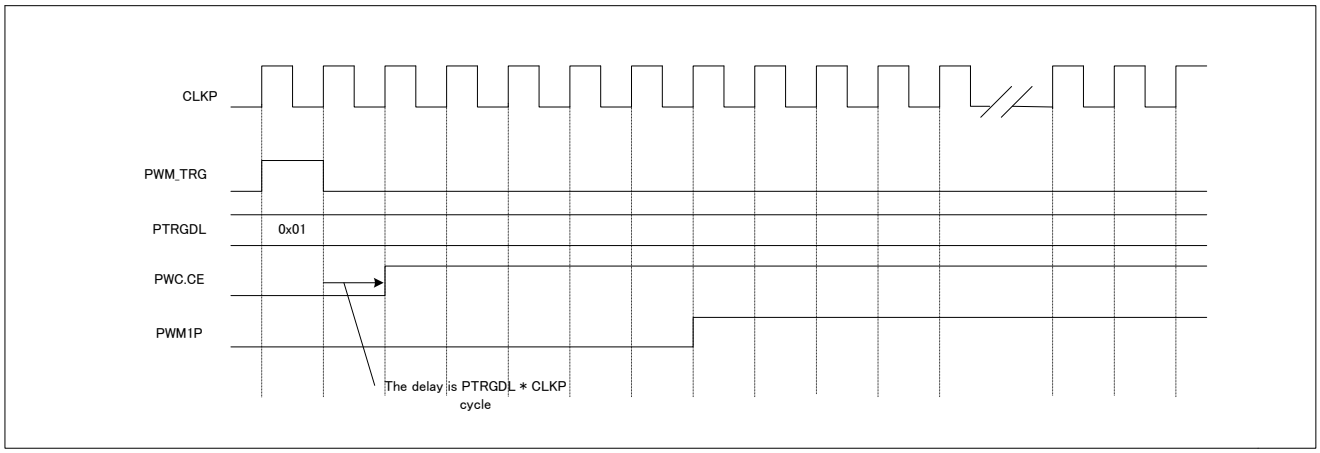

Figure 59-6 shows how the trigger starts Stepper Motor Controller (PTRGDL=0x01). If the SMC Trigger Delay Register (PTRGDL) setting is 0x00, PWC.CE is set immediately after receiving the trigger input (PWM_TRG). If the SMC Trigger Delay Register (PTRGDL) setting is 0x01, PWC.CE is set with a delay of one clock cycle after receiving the trigger input (PWM_TRG).

4. Registers

This section describes the registers of the Stepper Motor Controller.

There is not the restriction by privileged processing mode, when these registers are read or written.

■ The following registers are available for one Stepper Motor Controller:

PWM Control Register (PWC)

PWM1 and PWM2 Compare Registers (PWC1, PWC2)

PWM Selection Register (PWS)

PWM Selection Set Register (PWSS)

SMC Trigger Delay Register (PTRGDL)

Table 59-4 List of registers for the Stepper Motor Controller

Abbreviation	Register Name	Reference
PWC	PWM Control Register	4.1
PWC1	PWM1 Compare Register	4.2.1
PWC2	PWM2 Compare Register	4.2.2
PWS	PWM Selection Register	4.3
PWSS	PWM Selection Set Register	4.4
PTRGDL	SMC Trigger Delay Register	4.5

4.1. PWM Control Register (PWC)

The PWM Control Register starts/stops the Stepper Motor Controller, sets the PWM prescaler and selects the operation mode for the generation of the PWM pulse.

bit	15	14	13	12	11	10	9	8
Field	Reserved						P[3]	Reserved
Attribute	-						R/W	-
Protection attribute	-						-	-
Initial value	000000						0	0

bit	7	6	5	4	3	2	1	0
Field	Reserved	P[2:0]			CE	SC	Reserved	
Attribute	-	R/W			R/W	R/W	-	
Protection attribute	-	-			-	-	-	
Initial value	0	0			0	0	00	

[bit15:10] Reserved: Reserved Bits

When writing, always write "0".
When reading, "0" is always read.

[bit9] P[3]: PWM Operating Clock Prescaler Bit

P[3] bit, in combination with P[2:0] bits, specifies the clock input signal to the PWM Pulse Generators.

[bit8:7] Reserved: Reserved Bits

When writing, always write "0".
When reading, "0" is always read.

[bit6:4] P[2:0]: PWM Operating Clock Prescaler Bits

P[2:0] bits, in combination with P[3] bit, specify the clock input signal to the PWM Pulse Generators.

P[3]	P[2:0]	Description
0	000	PWM Operating clock is equal to the Peripheral clock (CLKP)
0	001	PWM Operating clock is equal to CLKP/4
0	010	PWM Operating clock is equal to CLKP/5
0	011	PWM Operating clock is equal to CLKP/6
0	100	PWM Operating clock is equal to CLKP/8
0	101	PWM Operating clock is equal to CLKP/10
0	110	PWM Operating clock is equal to CLKP/12
0	111	PWM Operating clock is equal to CLKP/16
1	000	PWM Operating clock is equal to CLKP/2
1	001	PWM Operating clock is equal to CLKP/8
1	010	PWM Operating clock is equal to CLKP/10
1	011	PWM Operating clock is equal to CLKP/12
1	100	PWM Operating clock is equal to CLKP/16
1	101	PWM Operating clock is equal to CLKP/20
1	110	PWM Operating clock is equal to CLKP/24
1	111	PWM Operating clock is equal to CLKP/32

CLKP: Peripheral clock

Note:

- *Configuration of the PWM Operating Clock Prescaler bits (P[3:0]) shall be done while counting operation is disabled (PWC.CE = "0").*

[bit3] CE: Count Enable Bit

The CE bit enables operation of the PWM Pulse Generators. When CE bit is set to "1", the PWM Pulse Generator starts its operating. The PWM2 Pulse Generator starts with the delay of one Peripheral clock cycle (CLKP) after the PWM1 Pulse Generator is started.

The CE bit can be set and cleared by the software. This bit also can be set to "1" by receiving trigger. To receive trigger, the CE bit must first be cleared to "0".

Bit	Description
0	Initializes and stops the operation of the PWM Pulse Generators
1	Starts the operation of the PWM Pulse Generators

Notes:

- *If the PWM Pulse Generator is started(CE="1"), operate following steps because the PWM Pulse Generator.Compare Data Value must be initialized.*
  1. Set the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0])
  2. Set the PWM Selection Register.Output Selection bits(PWS.BS="1", P2[2:0], M2[2:0], P1[2:0], M1[2:0])
  3. Set the PWM Control Register.Count Enable bit(CE="1")
- *If the PWM Pulse Generator is stopped (CE="0") when the PWM pulse is selected by the Output Selection bits (PWS.P2[2:0], M2[2:0], P1[2:0], M1[2:0]), the pin for which the PWM pulse is selected is fixed to the "L" level.*
- *If the trigger input is used, write "0" to the CE bit only when the CE bit is "1". Because the CE bit can be cleared at the same time when the CE bit is set by the trigger.*
- *The CE bit shall be set to "1" after the setting of the PWM Operating Clock Prescaler bits (PWC.P[3:0]) and the Operation Mode Switching bit (PWC.SC) is completed.*

[bit2] SC: Operation Mode Switching Bit

This bit specifies the operation mode of the PWM Pulse Generators

Bit	Description
0	8-bit operation mode is selected
1	10-bit operation mode is selected

Note:

- *The PWC.CE bit shall be set to "1" after the setting of the PWM Operating Clock Prescaler bits (PWC.P[3:0]) and the Operation Mode Switching bit (SC) is completed.*

[bit1:0] Reserved: Reserved bits

When writing, always write "0".
When reading, "0" is always read.

4.2. PWM1 and PWM2 Compare Registers (PWC1, PWC2)

The value of the 8/10 bit PWM1 and PWM2 Compare Registers determines the width of the PWM pulse. A value of 0x00 (0x000) indicates that the PWM duty cycle is 0%, while a value of 0xFF (0x3FF) indicates that the PWM duty cycle is 99.6% (99.9%).

4.2.1. PWM1 Compare Register(PWC1)

bit	15	14	13	12	11	10	9	8
Field	Reserved						D[9:8]	
Attribute	-						R/W	
Protection attribute	-						-	
Initial value	000000						XX	

bit	7	6	5	4	3	2	1	0
Field	D[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	XXXXXXXX							

[bit15:10] Reserved: Reserved Bits

When writing, always write "0".

When reading, "0" is always read.

[bit9:0] D[9:0]: PWM1 Compare Data Value

The PWM1 Compare Data Value D[9:0] are used to set the PWM1 duty cycle. When the Operation Mode Switching bit is set to 8-bit operation mode (PWC.SC= "0"), the compare data value is taken from D[7:0] bits and D[9:8] bits are "don't care". When the Operation Mode Switching bit is set to 10-bit operation mode (PWC.SC= "1"), the compare data value is taken from D[9:0] bits.

D[9:0]	Description
0x(0)00	0%
…	Set the PWM pulse width
0x(3)FF	(99.9%) 99.6%

Notes:

- *PWM Pulse Generator.Compare Data Value is updated at the end of PWM cycle, after PWS.BS bit is set to "1".*
- *When PWC.SC bit is set to "0" (PWM Pulse Generators are operating in 8-bit mode), D[9:8], PWC2.D[9:8] bits are "don't care".*
- *The software must always make a 16-bit write access to PWM1 and PWM2 Compare Registers (PWC1, PWC2) to ensure consistency of data. However, 8-bit write access to PWM1 or PWM2 Compare Register (PWC1, PWC2) is possible and will not result in error response.*
- *If the PWS.BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(D[9:0], PWC2.D[9:0]) and the PWM Selection Register.Output Selection bits (PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0]).*

4.2.2. PWM2 Compare Register(PWC2)

bit	15	14	13	12	11	10	9	8
Field	Reserved						D[9:8]	
Attribute	-						R/W	
Protection attribute	-						-	
Initial value	000000						XX	

bit	7	6	5	4	3	2	1	0
Field	D[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	XXXXXXXX							

[bit15:10] Reserved: Reserved Bits

When writing, always write "0".

When reading, "0" is always read.

[bit9:0] D[9:0]: PWM2 Compare Data Value

The PWM2 Compare Data Value D[9:0] bits are used to set the PWM2 duty cycle. When the Operation Mode Switching bit is set to 8-bit operation mode (PWC.SC= "0"), the compare data value is taken from D[7:0] bits and D[9:8] bits are "don't care". When the Operation Mode Switching bit is set to 10-bit operation mode (PWC.SC= "1"), the compare data value is taken from D[9:0] bits.

D[9:0]	Description
0x(0)00	0%
…	Set the PWM pulse width
0x(3)FF	(99.9%) 99.6%

Notes:

- *PWM Pulse Generator.Compare Data Value is updated at the end of PWM cycle, after PWS.BS bit is set to "1".*
- *When PWC.SC bit is set to "0" (PWM Pulse Generators are operating in 8-bit mode), PWC1.D[9:8], D[9:8] bits are "don't care".*
- *The software must always make a 16-bit write access to PWM1 and PWM2 Compare Registers (PWC1, PWC2) to ensure consistency of data. However, 8-bit write access to PWM1 or PWM2 Compare Register (PWC1, PWC2) is possible and will not result in error response.*
- *If the PWS.BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(PWC1.D[9:0], D[9:0]) and the PWM Selection Register.Output Selection bits (PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0]).*

4.3. PWM Selection Register (PWS)

The PWM Selection Register (PWS) sets the output state of the Stepper Motor Controller pins ("L", "H", PWM pulse or "Hi-Z") and allows the update of the PWM duty cycle or output pin states.

bit	15	14	13	12	11	10	9	8
Field	Reserved	BS	P2[2:0]			M2[2:0]		
Attribute	-	R/W	R/W			R/W		
Protection attribute	-	-	-			-		
Initial value	0	0	000			000		

bit	7	6	5	4	3	2	1	0
Field	Reserved		P1[2:0]			M1[2:0]		
Attribute	-		R/W			R/W		
Protection attribute	-		-			-		
Initial value	00		000			000		

[bit15] Reserved: Reserved Bit

When writing, always write "0".
When reading, "0" is always read.

[bit14] BS: Output Update Bit

The Output Update bit (BS) synchronously updates the Selector.Output Selection bits and PWM Pulse Generator.Compare Data Value (See Figure3-3). To change the settings for the PWM duty cycle or output pin states, the BS bit must be set to "1" after (or at the same time) a new configuration is written to the PWM1 and PWM2 Compare Registers (PWC1, PWC2) and PWM Selection Register (PWS). If the BS bit is set to "1" while PWM Pulse Generators are operating, the new settings are loaded at the end of the current PWM cycle. The BS bit is cleared automatically at the beginning of the following PWM cycle. As long as BS bit is "0", the PWM duty cycle and output pin states are not changed.

This bit can also be set by the PWSS.BSS bit.

Bit	Description
0	Disables the update of the setting for the PWM output
1	Enables the update of the setting for the PWM output

Notes:

- *If the PWM Pulse Generator is started(PWC.CE="1"), operate following steps because the PWM Pulse Generator.Compare Data Value must be initialized.*
  1. Set the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0])
  2. Set the PWM Selection Register.Output Selection bits(BS="1", PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0])
  3. Set the PWM Control Register:Count Enable bit(PWC.CE="1")
- *If the BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0]) and the PWM Selection Register.Output Selection bits (PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0]).*

[bit13:11] P2[2:0]: Plus Output 2 Selection Bits

The P2[2:0] bits select the output signal for PWM2P.

P2[2:0]	Description
000	"L": PWM2P output is fixed to low level
001	"H": PWM2P output is fixed to high level
01X	PWM pulse is driven on the PWM2P output
1XX	"Hi-Z": PWM2P output is set to high impedance

X: don't care

Note:

- *If the PWS.BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0]) and the PWM Selection Register.Output Selection bits (P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0]).*

[bit10:8] M2[2:0]: Minus Output 2 Selection Bits

The M2[2:0] bits selects the output signal for PWM2M.

M2[2:0]	Description
000	"L": PWM2M output is fixed to low level
001	"H": PWM2M output is fixed to high level
01X	PWM pulse is driven on the PWM2M output
1XX	"Hi-Z": PWM2M output is set to high impedance

X: don't care

Note:

- *If the PWS.BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0]) and the PWM Selection Register.Output Selection bits (PWS.P2[2:0], M2[2:0], PWS.P1[2:0], PWS.M1[2:0]).*

[bit7:6] Reserved: Reserved Bit

When writing, always write "0".

When reading, "0" is always read.

[bit5:3] P1[2:0]: Plus Output 1 Selection Bits

The P1[2:0] bits select the output signal for PWM1P.

P1[2:0]	Description
000	"L": PWM1P output is fixed to low level
001	"H": PWM1P output is fixed to high level
01X	PWM pulse is driven on the PWM1P output
1XX	"Hi-Z": PWM1P output is set to high impedance

X: don't care

Note:

- *If the PWS.BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(PWC1.D[9.0], PWC2.D[9:0]) and the PWM Selection Register.Output Selection bits (PWS.P2[2:0], PWS.M2[2:0], P1[2:0], PWS.M1[2:0]).*

[bit2:0] M1[2:0]: Minus Output 1 Selection Bits

The M1[2:0] bits selects the output signal for PWM1M.

M1[2:0]	Description
000	"L": PWM1M output is fixed to low level
001	"H": PWM1M output is fixed to high level
01X	PWM pulse is driven on the PWM1M output
1XX	"Hi-Z": PWM1M output is set to high impedance

X: don’t care

Note:

- *If the PWS.BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0]) and the PWM Selection Register.Output Selection bits (PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], M1[2:0]).*

4.4. PWM Selection Set Register (PWSS)

The PWM Selection Set Register is used to set the value of the PWS.BS bit.

bit	15	14	13	12	11	10	9	8
Field	Reserved	BSS	Reserved					
Attribute	-	W	-					
Protection attribute	-	-	-					
Initial value	0	0	000000					

bit	7	6	5	4	3	2	1	0
Field	Reserved							
Attribute	-							
Protection attribute	-							
Initial value	00000000							

[bit15] Reserved: Reserved Bit

When writing, always write "0".
When reading, "0" is always read.

[bit14] BSS: Set Bit for the Output Update Bit

This bit sets the value of PWS.BS bit.

Bit	Description
0	No effect
1	Sets the PWS.BS bit to "1". Reading of this bit returns "0".

Notes:

- *If the PWM Pulse Generators is started(PWC.CE="1"), operate following steps because the PWM Pulse Generator.Compare Data Value must be initialized.*
  1. Set the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0])
  2. Set the PWM Selection Register.Output Selection bits(PWS.BS="1", PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0])
  3. Set the PWM Control Register.Count Enable bit(PWC.CE="1")
- *If the PWS.BS bit is "1" , don't change the PWM Compare Register.Compare Data Value(PWC1.D[9:0], PWC2.D[9:0]) and the PWM Selection Register.Output Selection bits (PWS.P2[2:0], PWS.M2[2:0], PWS.P1[2:0], PWS.M1[2:0]).*

[bit13:0] Reserved: Reserved Bits

When writing, always write "0".
When reading, "0" is always read.

4.5. SMC Trigger Delay Register (PTRGDL)

The SMC Trigger Delay Register (PTRGDL) is used to delay the start of the operation by 0 to 255 clock cycles.

bit	15	14	13	12	11	10	9	8
Field	Reserved							
Attribute	-							
Protection attribute	-							
Initial value	00000000							

bit	7	6	5	4	3	2	1	0
Field	D[7:0]							
Attribute	R/W							
Protection attribute	-							
Initial value	00000000							

[bit15:8] Reserved: Reserved Bits

When writing, always write "0".
When reading, "0" is always read.

[bit7:0] D[7:0]: Trigger Delay Bits

The Trigger Delay bits (D[7:0]) configure a delay of the trigger input that starts the PWM operation from 0 to 255 clock cycles.

D[7:0]	Description
0x00	No delay (delay disabled)
0x01	Delay of 1 clock cycle between the trigger and the clock cycle in which the PWM generation starts
…	…
0xFF	Delay of 255 clock cycles between the trigger and the clock cycle in which the PWM generation starts

CHAPTER 60: Trigger Configuration of Stepper Motor Controller

This chapter explains the trigger configuration of stepper motor controller.

1. Overview
2. Configuration and Block Diagram
3. Operation
4. Registers

SMCTRG-T01P00R01L01-E1-GBM01

1. Overview

The chapter describes the function and its operation of both SMC trigger selection register and SMC trigger register. See the chapter of Stepper motor controller with this chapter.

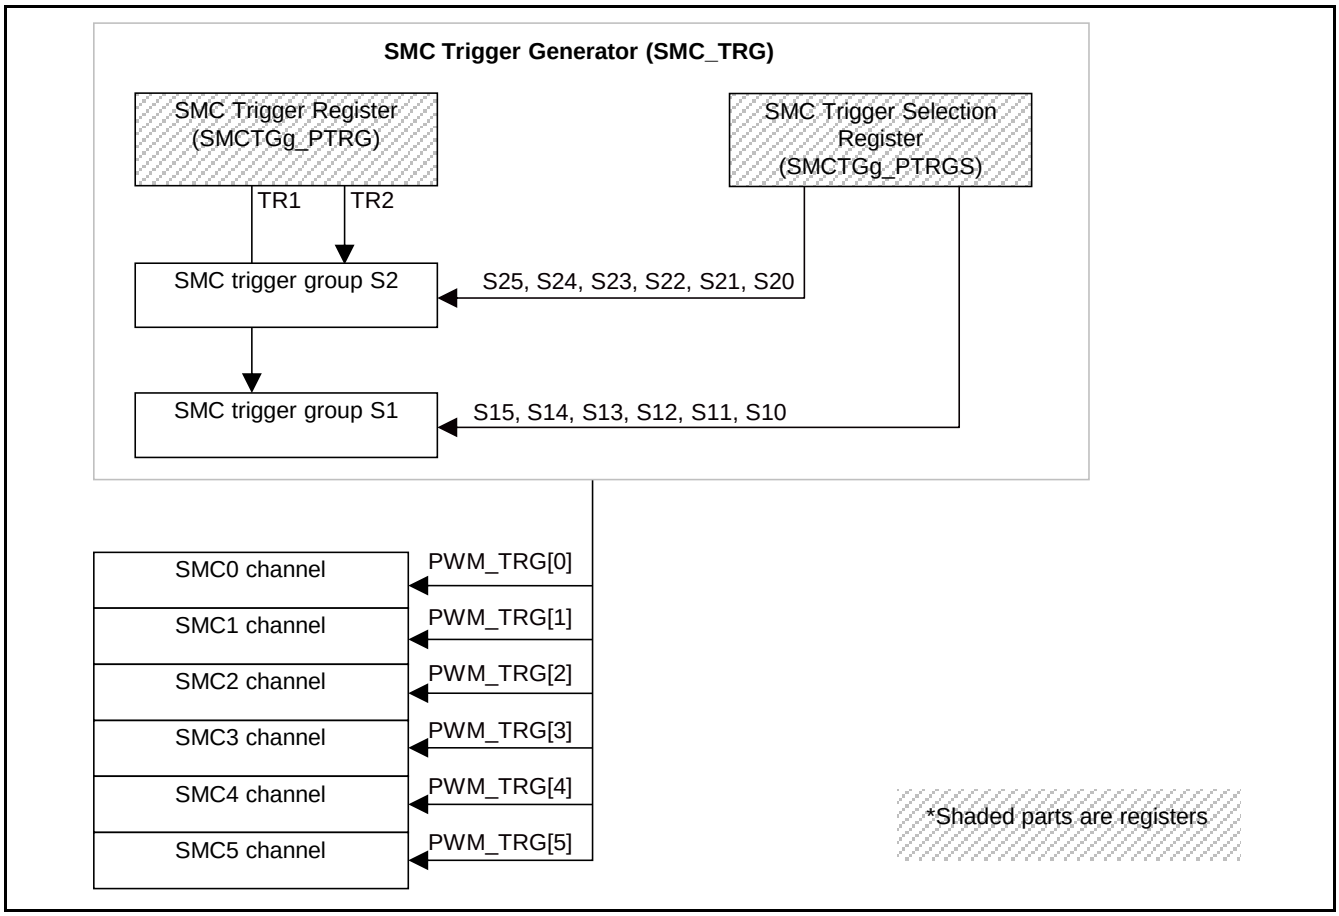
2. Configuration and Block Diagram

See the block diagram below.

Notes:

- *The suffix 'g' in the register name indicates that the register is an instance 'g' of the SMC Trigger Generator.*
- *The suffix 'i' in the register name indicates that the register is an instance 'i' of the SMC channel.*

Figure 2-1 Block Diagram of the SMC Module



3. Operation

The trigger configuration and its operation is described in 4.

4. Registers

Abbreviated Register Name	Register Name	Reference
SMCTGg_PTRGS	SMC Trigger Selection Register	4.1
SMCTGg_PTRG	SMC Trigger Register	4.2

4.1. SMC Trigger Selection Register (SMCTGg_PTRGS)

The SMC Trigger Selection Register (SMCTGg_PTRGS) selects multiple SMC channels that shall be triggered by the SMC Trigger Register to start operation synchronously or with a delay. The SMC channels can be combined into two trigger groups.

[bit13] S25 : Trigger Enable for Operation of SMC<6*g+5>

This bit selects SMC<6*g+5> for the SMC trigger group S2 (triggered by SMCTGg_PTRG:TR2).

S25	Description
0	SMC<6*g+5> is not triggered by SMCTGg_PTRG:TR2
1	SMC<6*g+5> is triggered by SMCTGg_PTRG:TR2

[bit12] S24 : Trigger Enable for Operation of SMC<6*g+4>

This bit selects SMC<6*g+4> for the SMC trigger group S2 (triggered by SMCTGg_PTRG:TR2).

S24	Description
0	SMC<6*g+4> is not triggered by SMCTGg_PTRG:TR2
1	SMC<6*g+4> is triggered by SMCTGg_PTRG:TR2

[bit11] S23 : Trigger Enable for Operation of SMC<6*g+3>

This bit selects SMC<6*g+3> for the SMC trigger group S2 (triggered by SMCTGg_PTRG:TR2).

S23	Description
0	SMC<6*g+3> is not triggered by SMCTGg_PTRG:TR2
1	SMC<6*g+3> is triggered by SMCTGg_PTRG:TR2

[bit10] S22 : Trigger Enable for Operation of SMC<6*g+2>

This bit selects SMC<6*g+2> for the SMC trigger group S2 (triggered by SMCTGg_PTRG:TR2).

S22	Description
0	SMC<6*g+2> is not triggered by SMCTGg_PTRG:TR2
1	SMC<6*g+2> is triggered by SMCTGg_PTRG:TR2

[bit9] S21 : Trigger Enable for Operation of SMC<6*g+1>

This bit selects SMC<6*g+1> for the SMC trigger group S2 (triggered by SMCTGg_PTRG:TR2).

S21	Description
0	SMC<6*g+1> is not triggered by SMCTGg_PTRG:TR2
1	SMC<6*g+1> is triggered by SMCTGg_PTRG:TR2

[bit8] S20 : Trigger Enable for Operation of SMC<6*g+0>

This bit selects SMC<6*g+0> for the SMC trigger group S2 (triggered by SMCTGg_PTRG:TR2).

S20	Description
0	SMC<6*g+0> is not triggered by SMCTGg_PTRG:TR2
1	SMC<6*g+0> is triggered by SMCTGg_PTRG:TR2

[bit5] S15 : Trigger Enable for Operation of SMC<6*g+5>

This bit selects SMC<6*g+5> for the SMC trigger group S1 (triggered by SMCTGg_PTRG:TR1).

S15	Description
0	SMC<6*g+5> is not triggered by SMCTGg_PTRG:TR1
1	SMC<6*g+5> is triggered by SMCTGg_PTRG:TR1

[bit4] S14 : Trigger Enable for Operation of SMC<6*g+4>

This bit selects SMC<6*g+4> for the SMC trigger group S1 (triggered by SMCTGg_PTRG:TR1).

S14	Description
0	SMC<6*g+4> is not triggered by SMCTGg_PTRG:TR1
1	SMC<6*g+4> is triggered by SMCTGg_PTRG:TR1

[bit3] S13 : Trigger Enable for Operation of SMC<6*g+3>

This bit selects SMC<6*g+3> for the SMC trigger group S1 (triggered by SMCTGg_PTRG:TR1).

S13	Description
0	SMC<6*g+3> is not triggered by SMCTGg_PTRG:TR1
1	SMC<6*g+3> is triggered by SMCTGg_PTRG:TR1

[bit2] S12 : Trigger Enable for Operation of SMC<6*g+2>

This bit selects SMC<6*g+2> for the SMC trigger group S1 (triggered by SMCTGg_PTRG:TR1).

S12	Description
0	SMC<6*g+2> is not triggered by SMCTGg_PTRG:TR1
1	SMC<6*g+2> is triggered by SMCTGg_PTRG:TR1

[bit1] S11 : Trigger Enable for Operation of SMC<6*g+1>

This bit selects SMC<6*g+1> for the SMC trigger group S1 (triggered by SMCTGg_PTRG:TR1).

S11	Description
0	SMC<6*g+1> is not triggered by SMCTGg_PTRG:TR1
1	SMC<6*g+1> is triggered by SMCTGg_PTRG:TR1

[bit0] S10 : Trigger Enable for Operation of SMC<6*g+0>

This bit selects SMC<6*g+0> for the SMC trigger group S1 (triggered by SMCTGg_PTRG:TR1).

S10	Description
0	SMC<6*g+0> is not triggered by SMCTGg_PTRG:TR1
1	SMC<6*g+0> is triggered by SMCTGg_PTRG:TR1

4.2. SMC Trigger Register (SMCTGg_PTRG)

The SMC Trigger Register is used to generate trigger signals for the two trigger groups configured in the SMC Trigger Selection Register (SMCTGg_PTRGS). The trigger group can be used to synchronously start several SMC channels. The operation (count enable) starts depending on the delay configured in the SMCi_PTRGDL register.

BIT_OFFSET	15	14	13	12	11	10	9	8
BIT_NAME	Reserved							
ACCESS_TYPE	R0,WX							
PROT_TYPE	Rp/Wp							
INITIAL_VALUE	0							

BIT_OFFSET	7	6	5	4	3	2	1	0
BIT_NAME	Reserved						TR2	TR1
ACCESS_TYPE	R0,WX						R0,W	R0,W
PROT_TYPE	Rp/Wp							
INITIAL_VALUE	0						0	0

[bit1] TR2 : SMC Trigger 2

This bit triggers the SMC trigger group S2 of SMCTGg. The configuration in SMCTGg_PTRGS:S2x determines which SMC channels are triggered. The trigger signal starts the delay counters (if enabled in SMCi_PTRGDL). If the delay has elapsed or the delay is disabled, the Count Enable (SMCi_PWC:CE) bits of the selected SMC channels will be set and the operation starts (PWM generation and output control).

TR2	Description
0	No effect
1	Triggers selected SMC channels via the Set logic for SMCi_PWC:CE

Notes:

- *This bit is cleared automatically to '0' after one clock cycle.*
- *A second trigger should not be applied to a group which has already been triggered. If this happens, the running delay counter will reset its value.*

[bit0] TR1 : SMC Trigger 1

This bit triggers the SMC trigger group S1 of SMCTGg. The configuration in SMCTGg_PTRGS:S1x determines which SMC channels are triggered. The trigger signal starts the delay counters (if enabled in SMCi_PTRGDL). If the delay has elapsed or the delay is disabled, the Count Enable (SMCi_PWC:CE) bits of the selected SMC channels will be set and the operation starts (PWM generation and output control).

TR1	Description
0	No effect
1	Triggers selected SMC channels via the Set logic for SMCi_PWC:CE

Notes:

- *This bit is cleared automatically to '0' after one clock cycle.*
- *A second trigger should not be applied to a group which has already been triggered. If this happens, the running delay counter will reset its value.*

CHAPTER 61: Partial Wakeup Control

This chapter explains the partial wakeup control function and its operations.

1. Overview
2. Configuration
3. Explanation of Operation
4. Registers
5. Precautions for Using This Device

PWU-T00P00R04L00-E1-GBB01

1. Overview

This section provides an overview of the partial wakeup control.

Partial wakeup (PWU) mode is implemented in this device.

PWU mode is one of the PSS (Power Saving State) modes. In this mode, only the functions required for voltage monitoring by the A/D converter are operating.

Effective use of this function enables monitoring of voltage, such as in sensor output, with low-power consumption and without starting the CPU.

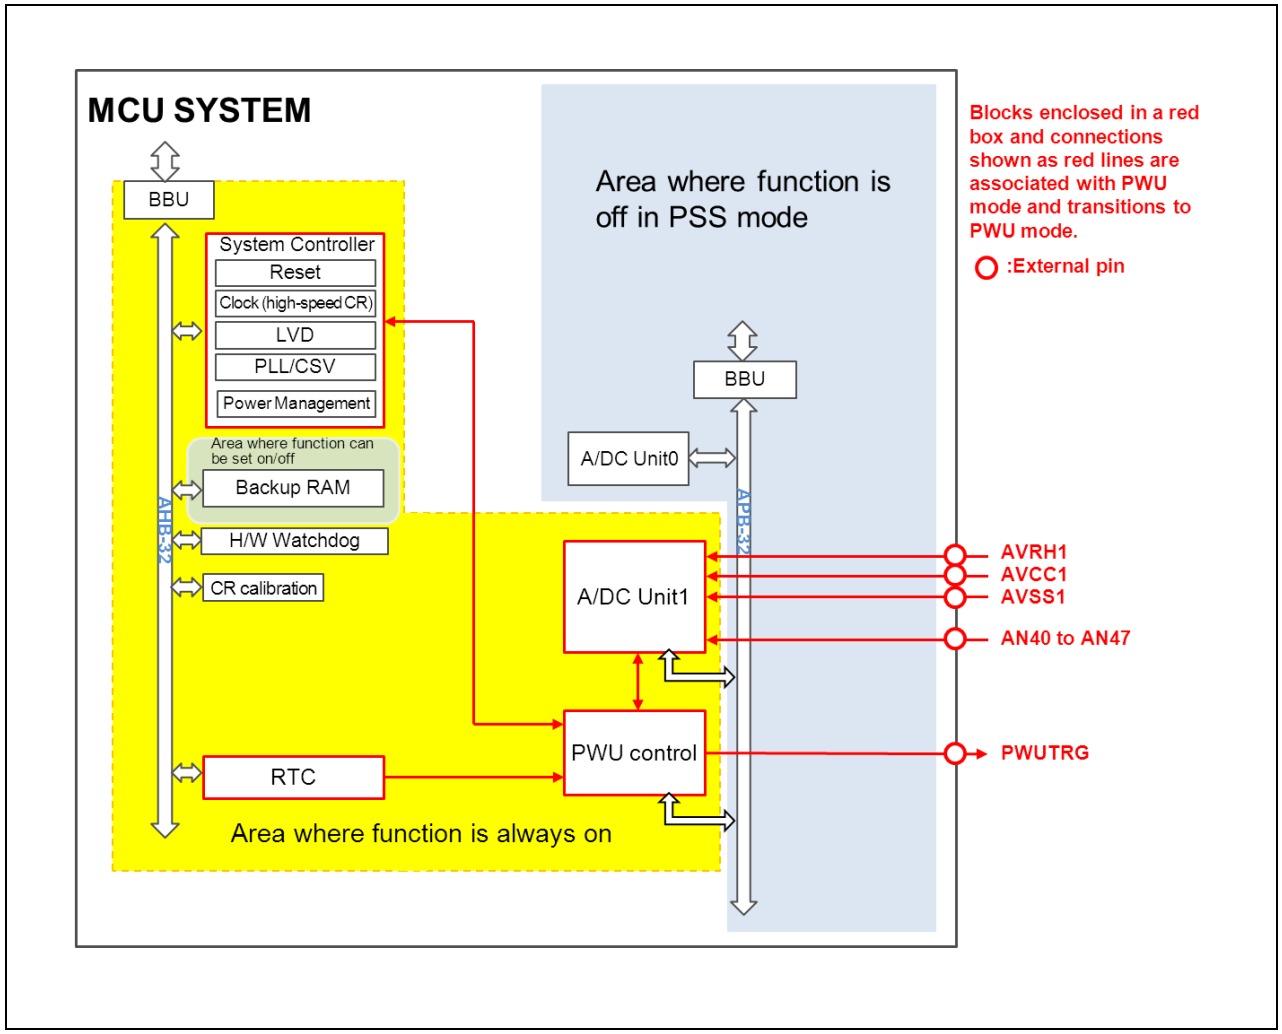
2. Configuration

This section explains the partial wakeup configuration.

Relationship Between the entire System and the partial wakeup Function

Figure 2-1 shows the relationship between the entire system and the partial wakeup function.

Figure 2-1 Relationship Between the Entire System and the Partial Wakeup Function (Describing Only the Relationship with Related Blocks)



■ RTC

This block counts the cycles for transitioning to PWU mode. The cycles can be set in steps of 8 ms, between 8 and 64 ms. For the setting method, see "3. Explanation of Operation."

Note:

The term of 8ms is generated from the following calculation in RTC.
0.25[s] ÷ 32 = 7.8125[ms] (≈ 8[ms])
Moreover as RTC operates with low-speed CR (typical 100KHz) in PWU mode, the actual cycles for transitioning to PWU mode become as the following.

7.81[ms] (The description in this chapter is “8ms”)
15.62[ms] (The description in this chapter is “16ms”)
23.43[ms] (The description in this chapter is “24ms”)
31.24[ms] (The description in this chapter is “32ms”)
39.05[ms] (The description in this chapter is “40ms”)
46.86[ms] (The description in this chapter is “48ms”)
54.67[ms] (The description in this chapter is “56ms”)
62.48[ms] (The description in this chapter is “64ms”)

■ System controller

- This block manages the device state (PSS or RUN).
- The block turns on the high-speed CR oscillator when transitioning to PWU mode.

■ PWU control

- This block controls the high-speed CR oscillator, the "PWUTRG" pin output function, and A/DC Unit1.
- In PWU mode, the block outputs "H" from the "PWUTRG" pin.
- The block starts A/D conversion within a certain time after the PWUTRG pin outputs "H". The time until A/D conversion start can be set in steps of 50 us, between 50 and 5100 us.

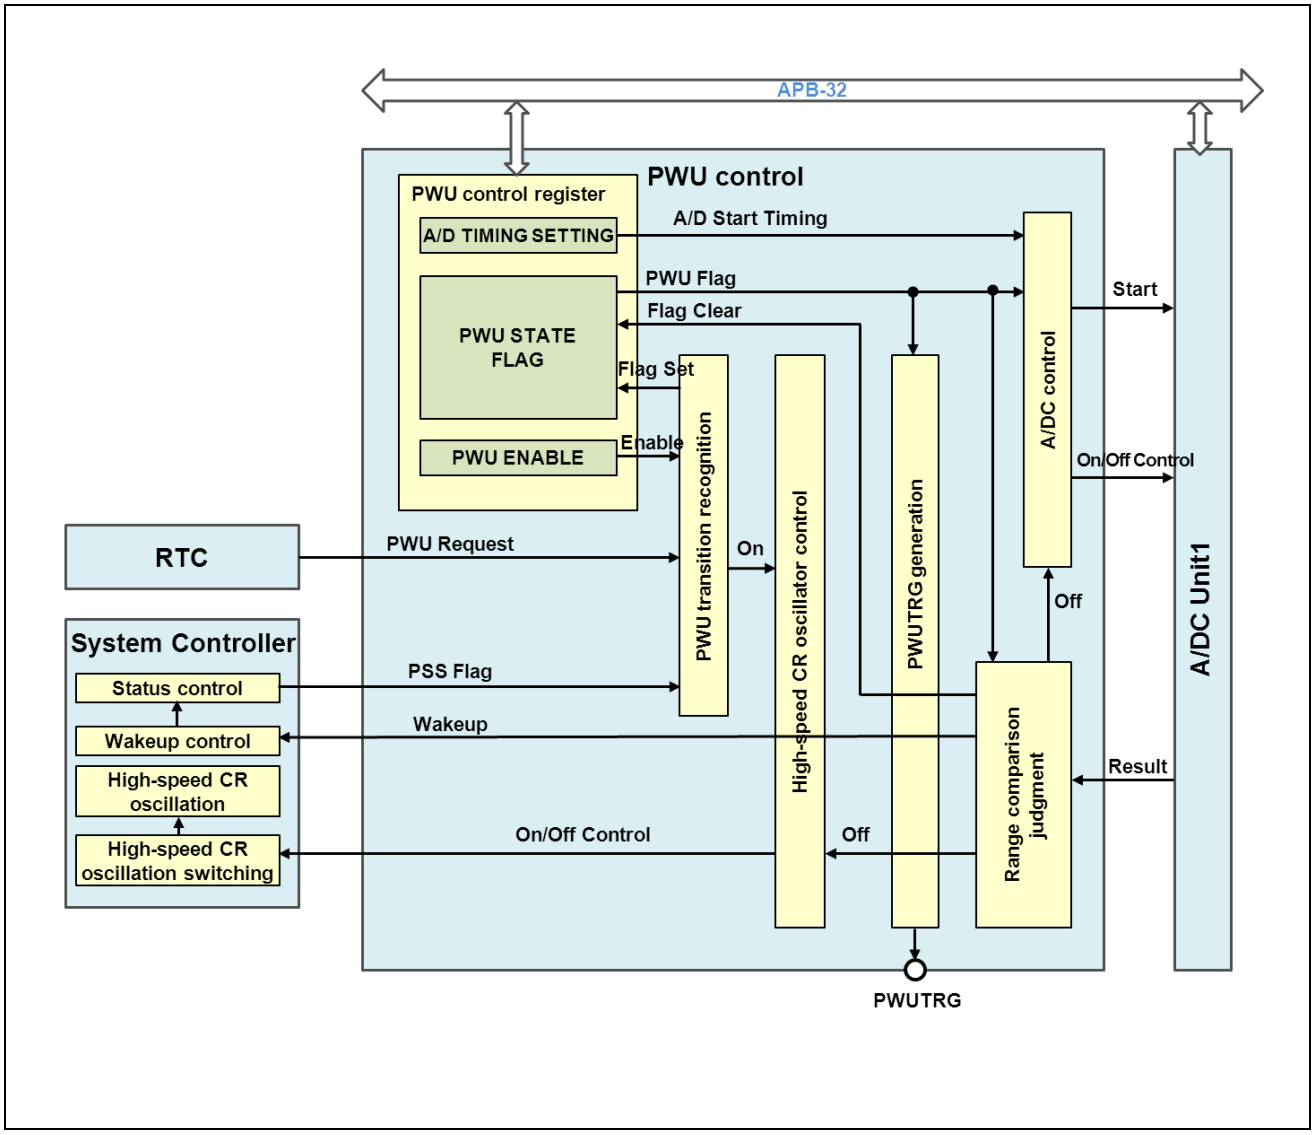
■ A/DC Unit1

- In PWU mode, the A/D converter can be used with the 8 channels from AN40 to AN47 out of all channels.
- In PWU mode, only the range comparison function of the A/D converter can be used. For details, see "CHAPTER: 12-BIT A/D CONVERTER."

Block Diagram of the partial wakeup Function

Figure 2-2 is a block diagram of the partial wakeup function.

Figure 2-2 Block Diagram of the Partial Wakeup Function



- PWU control register

  The configuration includes the "partial wakeup mode enable bit" and the "A/D conversion start time setting register." For details, see "CHAPTER 61:4. Registers."

- PWU transition recognition

  This block judges whether the conditions for transitioning to PWU mode are met. Also, the block turns on the high-speed CR oscillator.

- High-speed CR oscillator control
  This block is used for On/Off control of the high-speed CR oscillator in PWU mode.

- PWUTRG generation
  In PWU mode, this block outputs "H" from the "PWUTRG" pin.

- A/DC control
  This block is used to turn A/DC on or off and to adjust the timing of conversion start in PWU mode.
  The block starts A/D conversion within a certain time after the PWUTRG pin outputs "H".
  The time until A/D conversion start can be set in steps of 50 us, between 50 and 5100 us.

- Range comparison judgment
  This block determines, from an A/D conversion range comparison, whether to transition to RUN mode or PSS mode.
  To transition to RUN mode, it generates a Wakeup signal.
  After the completion of A/D conversion, the block generates a signal for turning off the high-speed CR oscillator and A/DC Unit1.

3. Explanation of Operation

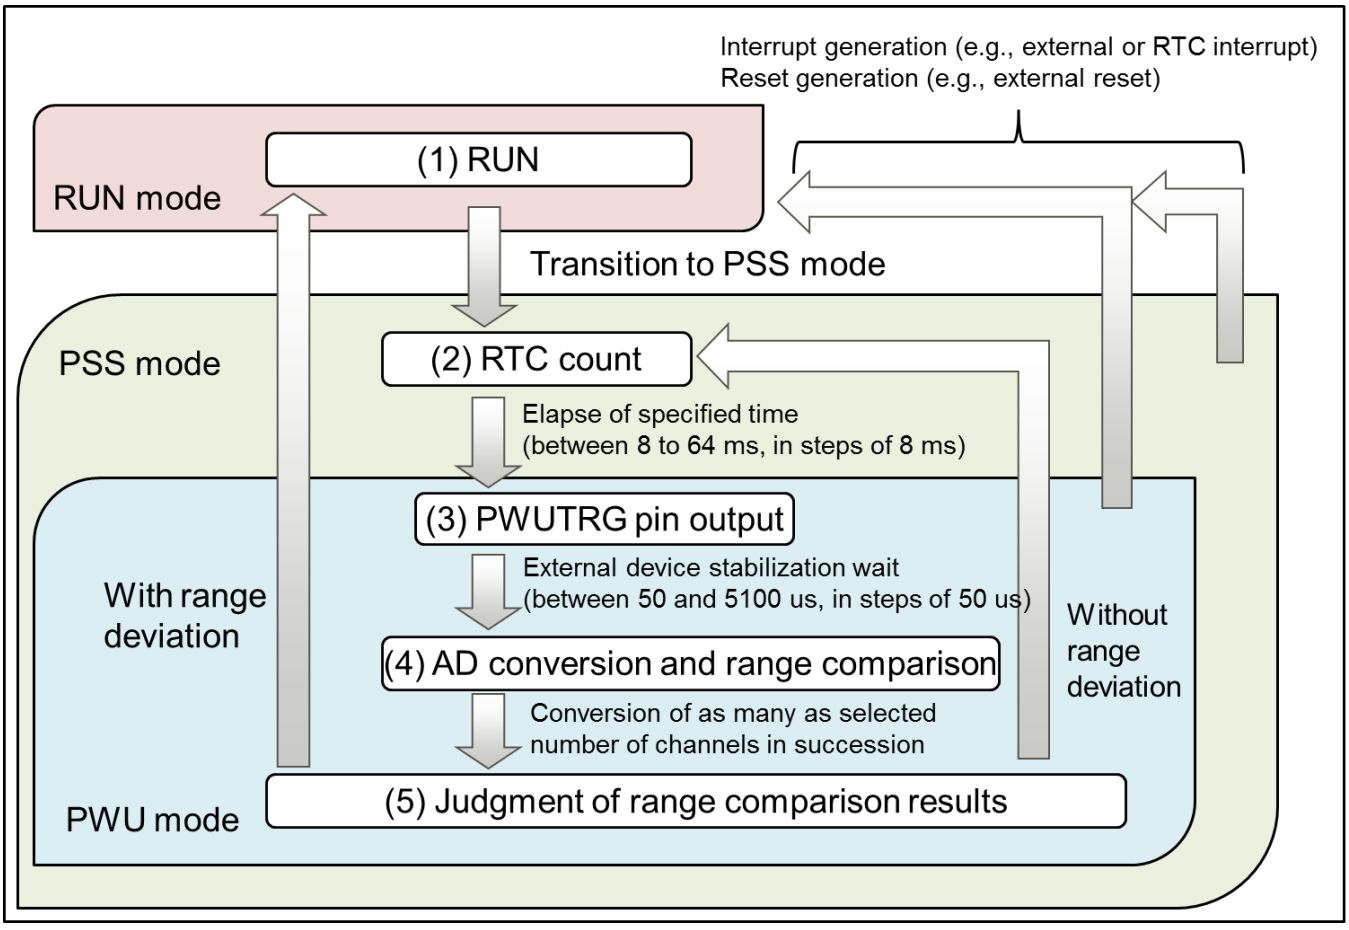
This section explains the operations of partial wakeup control.

3.1. State Transition Diagram

Figure 3-1 shows the relationship between partial wakeup mode and other modes.

The figure outlines the operations. For a more detailed explanation of the operations, see the next section, "Flowchart."

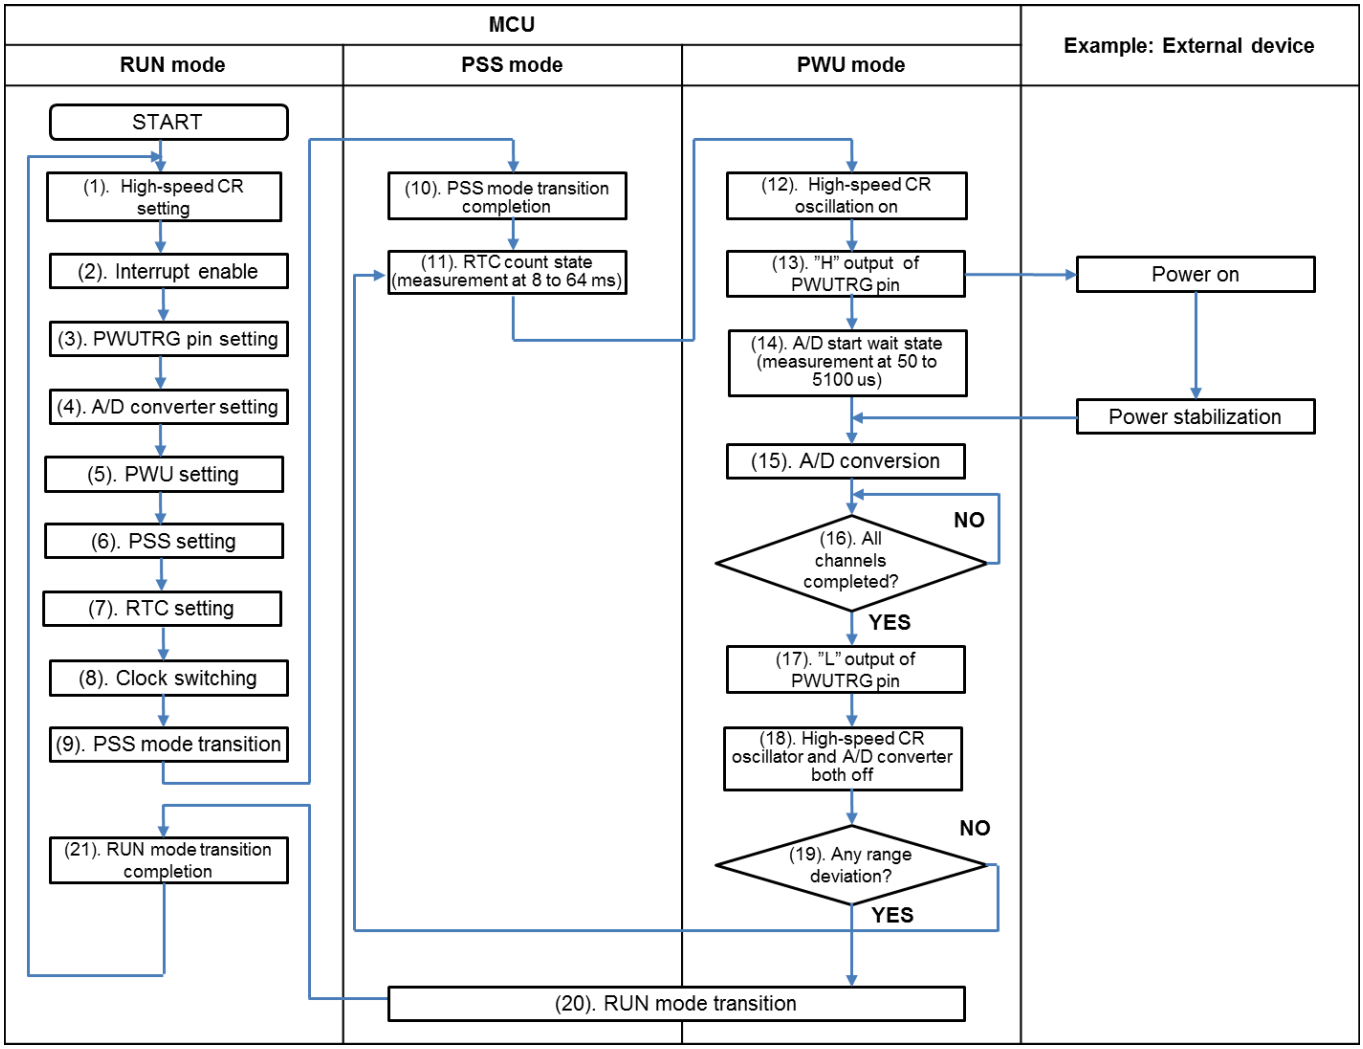
Figure 3-1 Partial Wakeup State Transition Diagram



3.2. Flowchart

This section uses the flowchart in Figure 3-2 to explain the partial wakeup function in detail.

Figure 3-2 Partial Wakeup Function Flowchart



(1) High-Speed CR Setting (Processing by Software)

(1)-1. Calibration

Software performs high-speed CR oscillation calibration and corrects any deviation in the A/D conversion time and any deviation in the period from PWUTRG pin output to A/D conversion start (external device stabilization wait time). Such deviations are due to process variations and variations depending on the use conditions.

For the setting method for the above, see "CHAPTER: CR CALIBRATION."

(1)-2. Stabilization wait time

Set the PSCL bit and CMPR bit in SYSC_FCRCTCPR register to initial (default) value.

These settings are applied to “(12) High-speed CR oscillation on.”

If stabilization wait time is set to large value and PWU mode time exceeds PWU transition cycle,

This device becomes illegal state.

In this state, the transition to RUN mode can’t occur by A/D converter range deviation.

For the setting method for the above, see "CHAPTER: SOURCE CLOCK TIMER."

(2) Interrupt Enable (Processing by Software)

You can treat enabled interrupt factors as return factors from PSS mode and PWU mode.
For any return due to an interrupt, there is a transition to the "(20)." processing.

The following can be specified: the interrupt of a resource not in the Power Down state, even in PSS mode.

Examples include external interrupt, RTC, NMI, low-voltage detection*1.

(*1 When used as an interrupt at the abnormal state detection)

For the method of enabling interrupts, see the chapters on the respective resources.
Note that this section does not cover A/DC-related settings because they are handled in the "(4)." processing.

(3) PWUTRG Pin Setting (Processing by Software)

Here, software makes the port output setting for output of the PWUTRG function.

You can set it by writing appropriate value to the POF bit in the corresponding PPC_PCFGRijj (i=0 to 4, jj=00 to 31) register.
For a corresponding register and setting, see "APPENDIX: VARIOUS SETTINGS OF I/O PORTS."

Note that this section does not cover settings related to "retaining the pin state in PSS mode" because they are handled in the "(6)." processing.

(4) A/D Converter Setting (Processing by Software)

Table 3-1 lists the setting values for writable registers related to A/D converter unit 1, corresponding to PWU mode.

The following values are degrees of limitations.

3: Always set values according to the "setting value."

2: The recommended setting is based on the "setting value." It can be changed to match the use conditions.

1: Set a value appropriate to the use conditions.

Interpret the values as described.

For a detailed explanation of the registers and the setting method, see "CHAPTER: 12-BIT A/D CONVERTER."

Note:

- *In PWU mode, the number of activation channel which can be used is maximum 8.*

Table 3-1 A/D Converter Settings

Register Name	Setting Value	Degree of Limitation
KEYCDR	Before writing to the ADER1 register, write to this register by using the prescribed method and then release the write protection.	3
ADER1	Set the bit corresponding to the pin used for analog input to "1", and set the other pins to "0". Except for AN40 to AN47, analog input is not supported, so set the ADEn (n=32 to 39, 48 to 63) bits to "0".	3
ADTSS1	Do not write.	3
ADTSE1	Set all bits to "0". (Software start is prohibited.)	3
ADCOMPB32 to ADCOMPB63	Do not use with the PWU function. (There is no effect on operation.)	1
ADTCS32 to ADTCS63 * Select only the registers corresponding to the numbers assigned as activation channels.	INTE=1'b0	3
	{STS1,STS0}=2'b10	3
	RPT=1'b1	3
	PRT=1'b0	3
	PRTS = Do not use with the PWU function. (There is no effect on operation.)	1
	{SEL1, SEL0} = Do not use with the PWU function. (There is no effect on operation.)	1
	BUFX = Do not use with the PWU function. (There is no effect on operation.)	1
	BTS = Do not use with the PWU function. (There is no effect on operation.)	1

Register Name	Setting Value	Degree of Limitation
ADTECS32 to ADTECS63 * Select only the registers corresponding to the numbers assigned as activation channels.	STS2=1'b0	3
	Value of {CHSEL4, CHSEL3, CHSEL2, CHSEL1, CHSEL0}=5'b01000 to 5'b01111 Activation channels and analog input pins are associated. Since only analog input pins AN40 to AN47 are associated, the settings must associate these pins.	3
ADRCUT4 to ADRCUT7	Set a value appropriate to the use conditions.	1
ADRCLT4 to ADRCLT7	Set a value appropriate to the use conditions.	1
ADRCCS32 to ADRCCS63 * Select only the registers corresponding to the numbers assigned as activation channels.	{RCOCD2, RCOCD1, RCOCD0}=3'b001	3
	RCOIRS = Set a value appropriate to the use conditions.	1
	RCOIE=1'b1	3
	RCOE=1'b1	3
	{RCOTS1, RCOTS0} = Set a value appropriate to use conditions.	1
ADSCANS1	SCIE=1'b1	3
	SCMD=1'b1	3
ADNCS16 to ADNCS31 * Select only the registers corresponding to the numbers assigned as activation channels.	CNTEN=1'b1	3
	{CCNT1, CCNT0}=2'b00	3
ADTCSC32 to ADTCSC63 * Select only the registers corresponding to the numbers assigned as activation channels.	Do not use with the PWU function.	1
ADRCIFC1	Write 1 to clear the range comparison interrupt flag corresponding to the number assigned as the activation channel. (Do not transition to PWU mode with interrupts left enabled.)	3
ADSCANSC1	Write 1 to clear the scan conversion completion interrupt flag. (Do not transition to PWU mode with interrupts left enabled.)	3
ADMD1	STPCEN=1'b0	2
	{CT1, CT0}=2'b00 (2'b11 is a prohibited setting.) The built-in high-speed CR oscillation clock (4 MHz) is divided according to the setting, and the compare time is measured using the divided clock. For details and notes on the settings, see "CHAPTER: 12-BIT A/D CONVERTER."	2
	{ST1, ST0}=2'b00 (2'b11 is a prohibited setting.) The built-in high-speed CR oscillation clock (4 MHz) is divided according to the setting, and the sampling time is measured using the divided clock. For details and notes on the settings, see "CHAPTER: 12-BIT A/D CONVERTER."	2
ADSTPCS8 to ADSTPCS15 * Select only the registers corresponding to the numbers assigned as activation channels.	{STCH1, STCH0}=2'b00 (2'b11 is a prohibited setting.) The built-in high-speed CR oscillation clock (4 MHz) is divided according to the setting, and the sampling time is measured using the divided clock. For details and notes on the settings, see "CHAPTER: 12-BIT A/D CONVERTER."	2

(5) PWU Setting (Processing by Software)

Here, software makes the following settings.

(5)-1. Enable the PWU function.

(5)-2. Set the external device stabilization wait time, which is the period between PWUTRG pin output and A/D conversion start.

You can select stabilization wait times from 50 to 5100 us, in steps of 50 us.

For the method of setting the above, see "CHAPTER 61:4. Registers" in this chapter.

(6) PSS Setting (Processing by Software)

Table 3-2 lists the setting values for the writable registers in the PSS profile register group and the writable registers of the system special setting registers. The following values are degrees of limitations.

3: Always set values according to the "setting value."

2: The recommended setting is based on the "setting value." It can be changed to match the use conditions.

1: Set a value appropriate to the use conditions.

Interpret the values as described.

For a detailed explanation of the registers and the setting method, see "CHAPTER: LOW-POWER CONSUMPTION."

Table 3-2 PSS Profile Register Group Settings

Register Name	Setting Value	Degree of Limitation
SYSC0_PSSPDCFGR	PD6_0EN=1'b0	3
	PD4_1EN = Set a value appropriate to the Backup RAM use conditions.	1
	PD4_0EN = Set a value appropriate to the Backup RAM use conditions.	1
	PD2EN=1'b0	3
SYSC0_PSSCKSRER	SSCG0EN=1'b0	3
	PLL0EN=1'b0	3
	MOSCEN=1'b0	3
	SCROSCEN=1'b1	3
	CROSCEN=1'b0	3
SYSC0_PSSCKSELR	CDMCUCCSL=3'b111	3
SYSC0_PSSCKER	ENCLKMCUCP=1'b0	3
	ENCLKMCUCH=1'b0	3
SYSC0_PSSCKDIVR	MCUCPDIV=4'b0000	3
	MCUCHDIV=5'b00000	3

Register Name	Setting Value	Degree of Limitation
SYSC0_PSSPLLxCNTR	PLLxISEL=1'b0	2
	PLLxDIVN=8'b00001101	2
	PLLxDIVM=4'b0001	2
	PLLxDIVL=2'b00	2
SYSC0_PSSSSCGxCNTR0	SSCGxISEL=1'b0	2
	SSCGxDIVN=8'b00001101	2
	SSCGxDIVM=4'b0001	2
	SSCGxDIVL=2'b00	2
SYSC0_PSSSSCGxCNTR1	SSCGxSSEN=1'b0	2
	SSCGxFREQ=2'b00	2
	SSCGxMODE=1'b0	2
	SSCGxRATE=10'b0000101001	2
SYSC0_PSSLVDCFGR	LVDL1S = Set a value appropriate to the use conditions.	1
	LVDL1V = Set a value appropriate to the use conditions.	1
	LVDL1E = Set a value appropriate to the use conditions.	1
	LVDH1S = Set a value appropriate to the use conditions.	1
	LVDH1V = Set a value appropriate to the use conditions.	1
	LVDH1E = Set a value appropriate to the use conditions.	1
SYSC0_PSSCSVCFGR	SSCG0CSVE=1'b0	3
	PLL0CSVE=1'b0	3
	MOCSVE=1'b0	3
SYSC0_PSSREGCFGR	RMSEL=1'b1	3
SYSC0_SPECFGR	HOLDIO_PD6_0=1’b0	3
	HOLDIO_PD2=1'b1 The setting by this bit is reflected immediately after writing register, it is not after PSS profile change.	3
	PSSPADCTRL=1'b0	3
	BRAMSC=1'b1 If the setting is PD4_0EN=1 or PD4_1EN=1, exercise Backup RAM sleep control to suppress current dissipation in PSS mode.	3
SYSC1_PSSCKSELR0	LAPP1ACSL=1’b0	3
	LAPP0ACSL=1’b0	3
	LCP1ACSL=1’b0	3
	LCP0ACSL=1’b0	3
	CD0CSL=3’b111 If this setting is not made, a PSS profile error occurs at a PSS mode transition.	3

(7) RTC Setting (Processing by Software)

The following shows examples of RTC settings. For details on the setting method, see "CHAPTER: REAL-TIME CLOCK."

Example of settings

(7)-1. Initialization settings

Sequence	Set Contents *1	Set Timing
1-1.	Write "1" to the ST bit in the RTC_WTCR register.	1st setting only after POR
1-2.	Write "0" to the ST bit in the RTC_WTCR register.	1st setting only after POR
1-3.	Wait until the CLK_STS bit in the RTC_WTSR register becomes 1'b0.	The setting “1-3” is required to set “1-4”. 1st setting only after POR (RTC Clock = 100KHz)
1-4.	Write "2'b10" to the RCKSEL bit in the RTC_WTCR register, write "1" to the CSM bit, and select the low-speed CR clock.	
1-5.	Set each bit in the RTC_WRT register.	1st setting only after POR

*1 Don’t write to the registers by bit level.
In bit-level-write, the no-change-bit have the function which the same value as read data is written to the register. In this case, the bit having difference function between read and write is changed to the other setting.
Therefore the bits no change is intended will be changed.

(7)-2. Calibration setting (for correcting any deviation in the count values due to variations in low-speed oscillation)

Sequence	Set Contents *1	Set Timing
2-1.	Write a value to the DURMW bit in the RTC_DURMW register, and set the calibration period. Normally, set the calibration period to 0.25[s]. To set a time 0.25[s] or shorter, a value of 0.25[s] divided by 1, 2, 4, 8, or 16 can be selected for the period. However, the lower the value set, the lower the accuracy becomes. (Related to the SCAL[2:0] bit) When the main clock is 4 MHz and the calibration period is set to 0.25[s], set DURMW bit value="0xF4240" (1'000'000 as a decimal).	1st setting only after POR

Sequence	Set Contents *1	Set Timing
2-2.	Set the related bits in the RTC_WTCR register as described below.	
	− Set the SCAL [2:0] bit according to the RTC_DURMW value. If the calibration period is set to 0.25[s], set "'3'b000".	1st setting only after POR
	− Set the CCKSEL bit to 1'b1, and select the low-speed CR.	1st setting only after POR (RTC Clock = 100KHz)
	− Set the ENUP bit according to the use conditions. To update the calibration result automatically as hardware, set "1'b1". To update it with software, set "1'b0".	1st setting only after POR
	− Set the ACAL bit to "1'b0", and disable the auto-calibration.	1st setting only after POR
2-3.	Write "1'b1" to the CALDC bit in the RTC_WINC register, and clear the calibration interrupt.	Clear the interrupt flag after interrupt occurs
2-4.	Write "1'b1" to the MTRG bit in the RTC_WTCR register, and start calibration.	Set in the timing you want to calibrate.(e.g. Post-PWU)
2-5.	Wait until the CALD bit in the RTC_WINS register becomes "1'b1".	The calibration is available on real time count.

*1 Refer to the previous table.

(7)-3. Partial wakeup setting - Case 1: When the ENUP bit in (7)-2-2 is set to "1'b1". -

Sequence	Set Contents *1	Set Timing
3-1.	Set the related bits in the RTC_PWUTRGCR register as described below.	
	Set the MD bit to "1'b1".	1st setting only after POR
	For the SEL bit, set the cycles for transitioning to PWU mode in accordance with the purpose. Values ranging from 8 to 64 ms can be selected in units of 8 ms.	The period of PWU can be switched.
3-2.	Wait until the BUSY bit in the RTC_PWUTRGSR register becomes 1'b0.	Set if RTC_PWUTRGCR register is changed.

*1 Refer to the previous table.

(7)-3. Partial wakeup setting - Case 2: When the ENUP bit in (7)-2-2 is set to "1'b0". -

Sequence	Set Contents *1	Set Timing
3-1.	Read the value of RTC_CNTCAL, execute [-1 processing], and then execute [divide-by-32 processing]. The RTC_CNTCAL includes the counter value of 0.25[s]. By dividing by 32, it generates a count value of approximately 8 ms.	Set if the calibration (the setting of “2-3”-”2-5”) is completed.
3-2.	Read the value of RTC_CNTCAL, and execute [-1 processing].	

Sequence	Set Contents *1	Set Timing
	Write the post processing value to the WTBR bit in the RTC_WTBR register.	
3-3.	Set the related bits in the RTC_PWUTRGCR register as described below.	
	− Set the C8MRL bit to the value calculated in "(7)-3-1."	Set if the calibration (the setting of “2-3”-”2-5”) is completed.
	− Set the MD bit to "1'b0".	1st setting only after POR
	− For the SEL bit, set the cycles for transitioning to PWU mode in accordance with the purpose. Values ranging from 8 to 64 ms can be selected in units of 8 ms.	The period of PWU can be switched.
3-4.	Wait until the BUSY bit in the RTC_PWUTRGSR register becomes 1'b0.	Set if RTC_PWUTRGCR register is changed.

*1 Refer to the previous table.

(7)-4. RTC count start

Sequence	Set Contents *1	Set Timing
4-1.	Set the RTC_WINE register, and enable the required interrupts.	1st setting only after POR
4-2.	Write "1" to each bit in the RTC_WINC register, and clear the interrupt flag.	Clear the interrupt flags after interrupts occur
4-3.	Write "1" to the ST bit in the RTC_WTCR register, and start counting.	1st setting only after POR (RTC Clock = 100KHz)

*1 Refer to the previous table.

(8) Clock Switching (Processing by Software)

Here, software makes the following settings.

(8)-1. Clock gear down operation

If the PLL clock is being used for operating the internal circuit, use the clock gear down function to set the clock frequency lower in stages to reduce the current fluctuations due to clock switching.

For details on how to use the clock gear down function, see the "Clock Gear" section in "CHAPTER: CLOCK SYSTEM."

(8)-2. Clock adjustment

To transition to the PSS, establish a 1:1:1:1 relationship between the CPU clock, the memory configuration clock, the SCU clock, and the MCUCH clock.

The absence of this relationship between these clocks may cause a malfunction.

Additionally, PLL and SSCG-PLL must be disabled before PSS mode transition.

Example of settings

Because the SCU clock operates with the high-speed CR oscillation clock,

switch the CPU clock (CLK_CPU), memory configuration clock (CLK_MEMC), and MCUCH clock (CLK_SYSC0H) so that they all operate with the high-speed CR oscillation clock.

(8)-2-1. Set the CD0CSL bit in the SYSC1_RUNCKSELR0 register to "All-0".

(8)-2-2. Set the HPMDIV bit and the SYSDIV bit in the SYSC1_RUNCKDIVR0 register to "All-0".

(8)-2-3. Set the CDMCUCCSL bit in the SYSC0_RUNCKSELR register to "All-0".

(8)-2-4. Set the MCUCHDIV bit in the SYSC0_RUNCKDIVR register to "All-0".

(8)-2-5. Set the PLL0EN and SSCG0EN bit in the SYSC0_RUNCKSRER register to "All-0".
(PLL and SSCG-PLL are disabled.)

(8)-2-6. Set the SYSC0_RUNPLL0CNTR, SYSC0_RUNSSCG0CNTR0 and SYSC0_RUNSSCG0CNTR1
register to appropriate value to avoid profile error.

For details on the combination of violation settings,
see "Profile" in "CHAPTER: LOW-POWER CONSUMPTION".

(8)-2-7. Set the SYSC1_RUNENR register to "0xAB".

(8)-2-8. Set the SYSC0_TRGRUNCNTR register to "0xAB". (The RUN profile update starts.)

(8)-2-9. Wait until the RUNDF0 bit in the SYSC0_SYSSTSR register becomes "1".

(9) PSS Mode Transition (Processing by Software)

See "Operation Procedure" in "CHAPTER: LOW-POWER CONSUMPTION," and transition to PSS mode.

(10) PSS Mode Transition Completion (Processing by Hardware)

There has been a transition to PSS mode according to the PSS profile register settings at "(6)."

(11) RTC Count State (Processing by Hardware)

Hardware waits until the RTC count value reaches the cycles set at "(7)."

After the cycles are reached, there is a transition to PWU mode.

For a transition from RUN mode to PSS mode, the RTC is not initialized. For this reason, after the transition from RUN mode to PSS mode, the time until the transition to PWU mode is less than the setting at "(7)."

(The time depends on the RTC count value at the transition to PSS mode.)

(12) High-Speed CR Oscillation on (Processing by Hardware)

Hardware turns on high-speed CR oscillation.

Stabilization wait time is inserted to turn on high-speed CR oscillation.

This wait time is set at “(1).”

PWU mode operates with the output clock of the high-speed CR oscillation.

(13) "H" Output of the PWUTRG Pin (Processing by Hardware)

Hardware changes PWUTRG to "H".

PWUTRG is "L" before this processing.

(14) A/D Start Wait State (Processing by Hardware)

Hardware waits until it arrives at the time set at "(5)."

The power supply of external devices is assumed to be stable during this wait period.

When the time comes, A/D conversion starts.

(15) A/D Conversion (Processing by Hardware)

A/D conversion is executed according to the settings at "(4)."

(16) A/D Conversion Judgment (Processing by Hardware)

Hardware waits until the conversion of all selected channels (maximum of 8 channels) completes.

(17) "L" Output of the PWUTRG Pin (Processing by Hardware)

Hardware switches PWUTRG output from "H" to "L".

(18) High-Speed CR Oscillator and A/D Converter both Off (Processing by Hardware)

Hardware turns off the high-speed CR oscillator and A/D converter.

(19) Range Comparison Judgment (Processing by Hardware)

Hardware judges whether a range deviation has arisen as a result of the A/D conversion at "(15)."

If no deviation has arisen, there is a transition to PSS mode again.

If a deviation has arisen, a WAKEUP signal is issued, followed by a transition to RUN mode to wake up the CPU.

(20) RUN Mode Transition (Processing by Hardware)

For details on the operation, see "Operation Procedure" in "CHAPTER: LOW-POWER CONSUMPTION."

(21) RUN Mode Transition Completion (Processing by Hardware)

The transition to RUN mode has completed.
There are the following notes to design software.

(21)-1. Regarding PSS enable setting

Set PSSEN0 bit in SYSC0_PSSENR register to "0x00".
Otherwise, written data to registers in SYSC0 is invalid. Bus error will occur.

But the set to PSSEN1 bit in SYSC1_PSSENR register is not required
because of initialization with power down.

(21)-2. Regarding the judgment of wakeup factor

If the following “(21)-2-1” and “(21)-2-2” both are "0" before "(9) PSS mode transition (processing by software)" and "1" after RUN mode transition, you are able to judge RUN mode transition occurred by A/DC range deviation.

(21)-2-1. Any bits among RCINT32 to RCINT63 in ADRCIF1 register

(21)-2-2. SCINT bit in ADSCANS1 register

Moreover, in case that you set in "(2). Interrupt enable" process,
RUN mode transition might occur by the factor you set.

You need to confirm these interrupt flag.

(21)-3. Regarding A/D Converter use after RUN mode transition

When A/D Converter is executed in PWU mode, A/D Converter becomes "Pause state". *1

In case of Pause state, BUSY flag is activated.
In case that BUSY flag is activated, the change of A/D Converter setting is impossible.
For example, When CNTEN bit in ADNCS16 to ADNCS31 registers is changed,

A/D Conversion started unexpectedly.
When you change A/D Converter setting after run mode transition,
clear the BUSY flag before changing the setting.

Example of settings
Write "1" to BUSYC bit in ADTCSC32 to ADTCSC63 register.

*1. Regarding "Pause state",
see the explanation of “Pause scan conversion when the conversion count is specified for each channel” in ”5.2.12. About the Scan Conversion Mode” in "CHAPTER: 12-BIT A/D CONVERTER."

3.3. Timing charts

Figure 3-3, Figure 3-4, and Figure 3-5 are timing charts related to the transition to partial wakeup mode.

Figure 3-3 With a Range Deviation Arising after a Transition from PSS Mode to PWU Mode

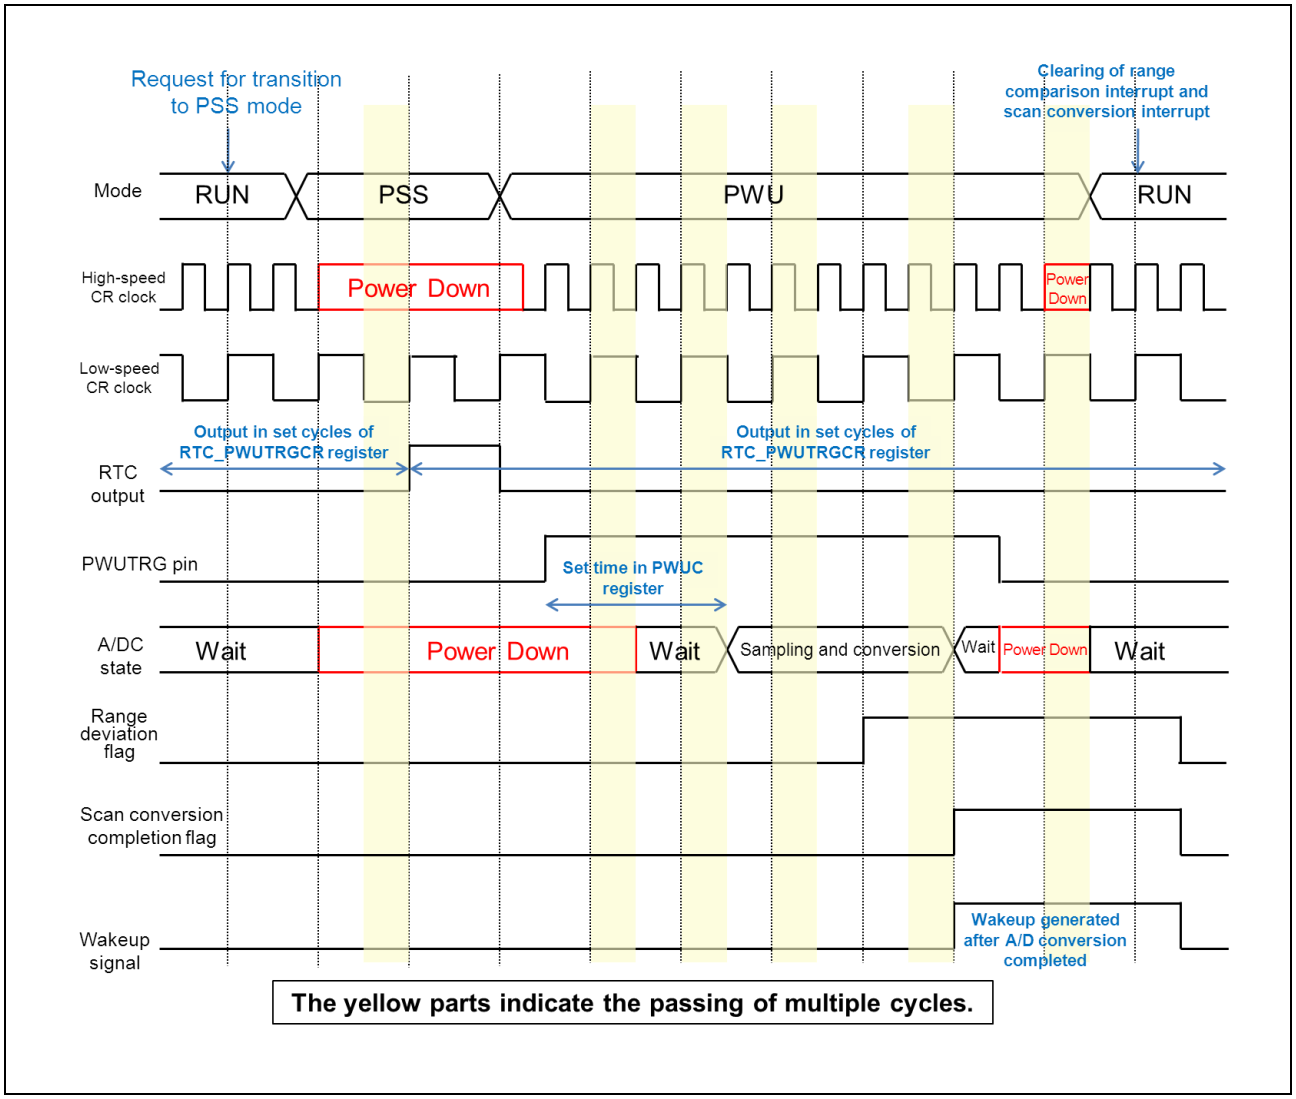


Figure 3-4 Without a Range Deviation Arising after a Transition from PSS Mode to PWU Mode

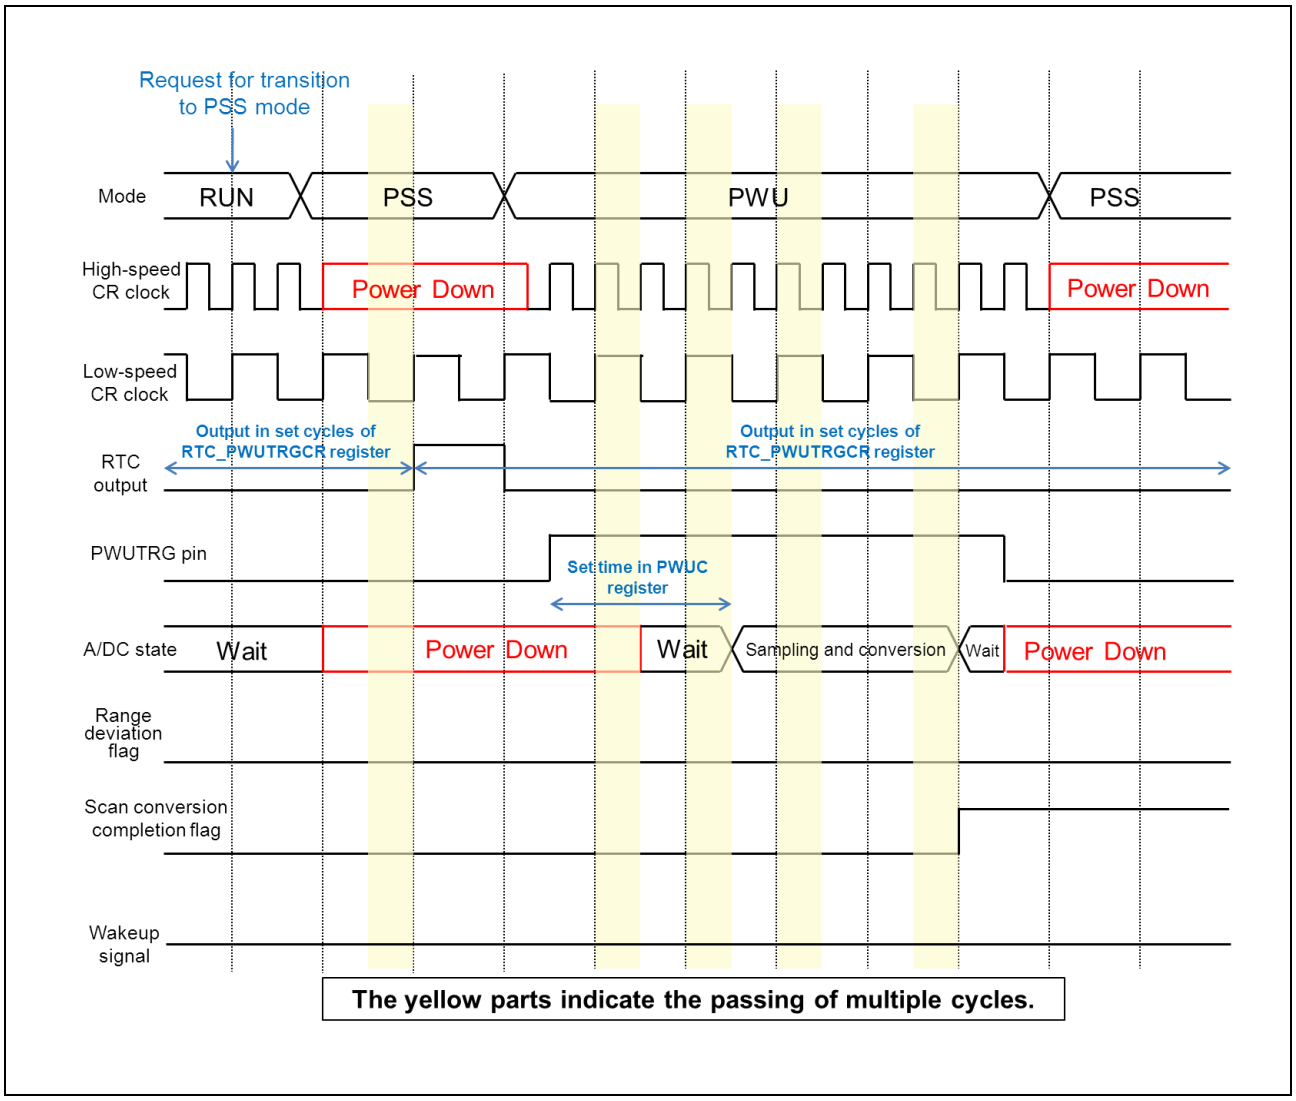

Figure 3-5 Until a Restart of A/D Conversion after Figure 3-4.

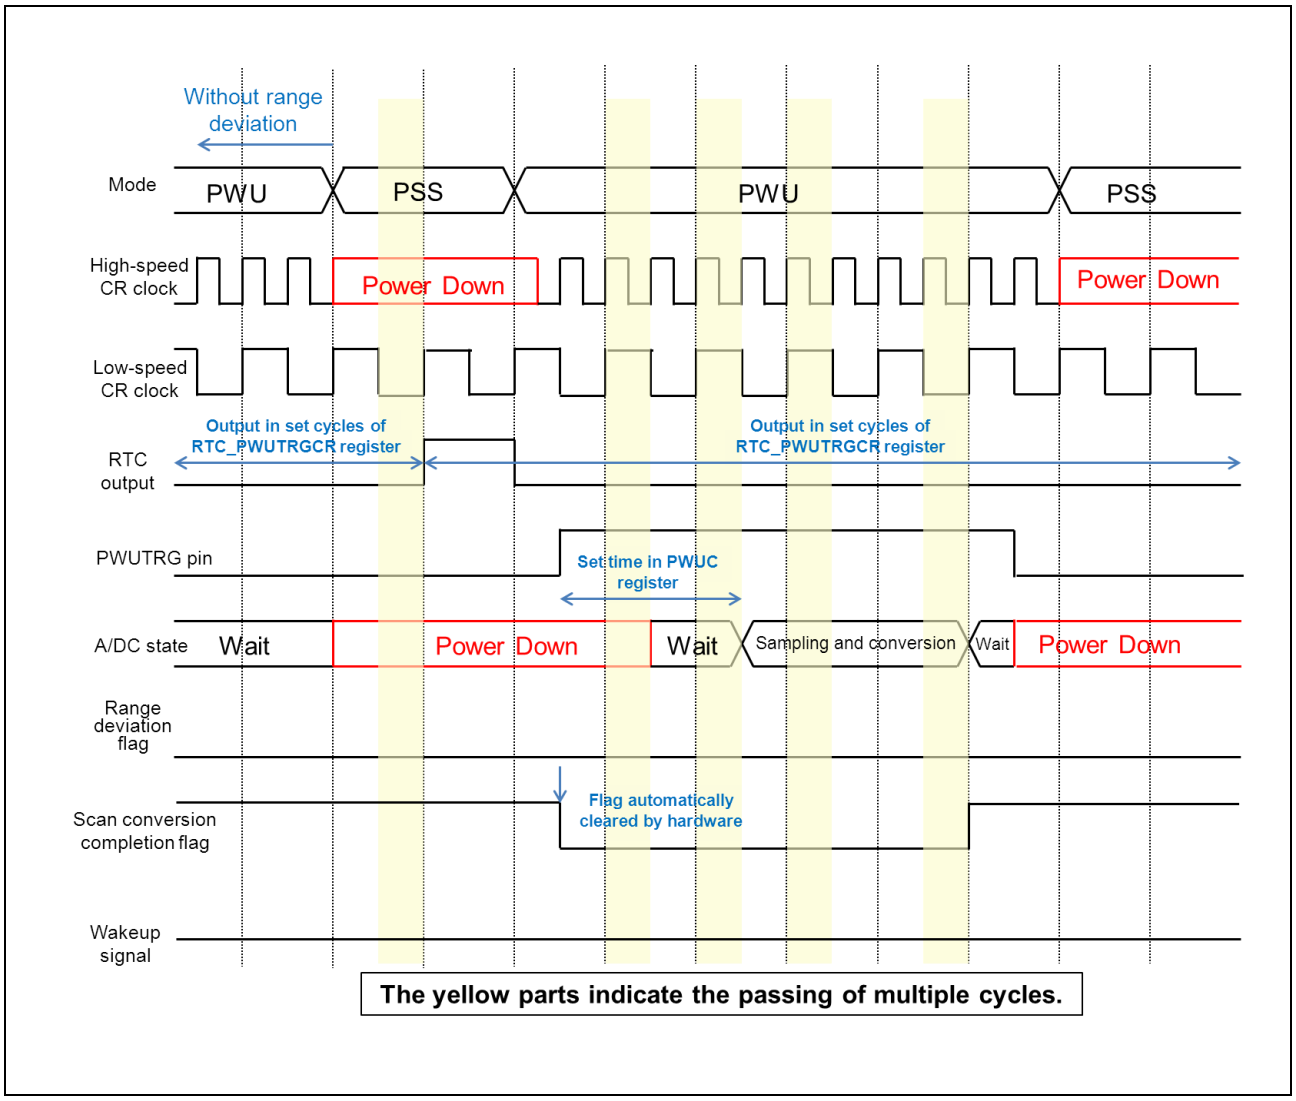

Note:

- *The clocks in the figures do not match the actual number of cycles.*

4. Registers

This section explains the partial wakeup control register.

Table 4-1 List of the Partial Wakeup Control Register

Abbreviated Register Name	Register Name	Reference
PWUC	PWU control register	4.1

Table 4-2 Memory Map and Initial Values of the Partial Wakeup Control Register

Offset	+3	+2	+1	+0
0x00000200	Reserved	Reserved	Reserved	PWUC 00000000

The offset value is the value for the "ADC1/PWU" area start address.

The partial wakeup register is deployed after the register of A/D converter unit 1.

4.1. PWU Control Register (PWUC)

The PWU control register (PWUC) is used to enable PWU mode and to set the period between PWUTRG pin output and A/D conversion start.

bit	7	6	5	4	3	2	1	0
Field	PWUE	ADSTS6	ADSTS5	ADSTS4	ADSTS3	ADSTS2	ADSTS1	ADSTS0
R/W Attribute	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Protection Attribute	-							
Initial Value	0	0	0	0	0	0	0	0

[bit7] PWUE: PWU Mode Enable Bit

Bit	Description
0	Disable transition to PWU mode.
1	Enable transition to PWU mode.

- This bit is used to enable transition to PWU mode.
- When this bit is "1", there is a transition from PSS mode to PWU mode.

[bit6:0] ADSTS [6:0]: A/D Conversion Start Time Setting Bits

ADSTS [6:0]	Setting	Value for High-Speed CR Oscillator, 4 MHz
0000000	200 cycles of high-speed CR oscillation cycle	50 us
0000001	400 cycles of high-speed CR oscillation cycle	100 us
0000010	600 cycles of high-speed CR oscillation cycle	150 us
…	…	…
n	(n+1)*200 cycles of high-speed CR oscillation cycle	(n+1)*50 us
…	…	…
1100011	20000 cycles of high-speed CR oscillation cycle	5000 us
1100100	20200 cycles of high-speed CR oscillation cycle	5050 us
1100101	20400 cycles of high-speed CR oscillation cycle	5100 us
110011x	20400 cycles of high-speed CR oscillation cycle	5100 us
1101xxx		
111xxxx		

These bits are used to set the period between PWUTRG pin output and A/D conversion start.

5. Precautions for Using This Device

This section provides notes on using the partial wakeup control function.

Time until Transition to PWU Mode

For a transition from RUN mode to PSS mode, the RTC is not initialized.
For this reason, after the transition from RUN mode to PSS mode, the time until the transition to PWU mode is less than the setting at "(7)."
(The time depends on the RTC count value at the transition to PSS mode.)

Restrictions on A/D Conversion Data

If an interrupt factor other than a range comparison interrupt causes a return to RUN mode during A/D conversion, the A/D conversion results (values recorded in the A/D data register) are not guaranteed.
Examples of this factor include external interrupts and RTC interrupts.

Restrictions on the Range Comparison Function

The range comparison function sets the upper and lower limit thresholds for voltage and judges A/D conversion results.
8 analog input channels can be used in PWU mode.
However, for pairs of the upper limit thresholds and lower limit thresholds that can be set, select from 4 sets.

Restrictions on Port Settings

- Before transitioning to PSS mode, be sure to use the port function to set for output of the PWUTRG function.
- The state of ports at the generation of various resets is "output Hi-Z" and "input disabled."

Restrictions on Software Watchdog Timer Settings

If the settings of the software watchdog timer in PSS mode contradict the contents of the SYSC0_PSSCKSRER register that have been set in "PSS Setting (Processing by Software)" in Section "3.Explanation of Operation," a PSS profile error occurs. It cannot transition to PSS mode.
Be careful when setting the software watchdog timer.

For details on the combination of violation settings, see "Profile" in "CHAPTER: LOW-POWER CONSUMPTION".

For details on the setting procedure examples of the software watchdog timer, see " Example of set procedure " in "CHAPTER: SOFTWARE WATCHDOG TIMER."

Restrictions on the Cycles for transitioning to PWU Mode

The term of 8ms is generated from the following calculation in RTC.

0.25[s] ÷ 32 = 7.8125[ms] (≈ 8[ms])

Moreover as RTC operates with low-speed CR (typical 100KHz) in PWU mode, the actual cycles for transitioning to PWU mode become as the following.

7.81[ms] (The description in this chapter is “8ms”)
15.62[ms] (The description in this chapter is “16ms”)
23.43[ms] (The description in this chapter is “24ms”)
31.24[ms] (The description in this chapter is “32ms”)
39.05[ms] (The description in this chapter is “40ms”)
46.86[ms] (The description in this chapter is “48ms”)
54.67[ms] (The description in this chapter is “56ms”)
62.48[ms] (The description in this chapter is “64ms”)

CHAPTER 62: APPENDIX: Various Settings of I/O Ports

This appendix provides an overview of the I/O ports.

1. Input Level Setting
2. Output Drive Capacity Setting
3. Output Resource Selection
4. Resource Input Selection

SETTINGIO-T01P00R01L01-E1-GBM02

1. Input Level Setting

This section shows the I/O port input level settings.

PIL[1:0]	Description
00	CMOS hysteresis input (0.7 Vcc/0.3 Vcc)
01	Automotive input (0.8 Vcc/0.5 Vcc)
10	Setting prohibited
11	Setting prohibited

For details, see "OVERVIEW: 10. List of Pin Functions" and "OVERVIEW: 11. I/O Circuit Type."

2. Output Drive Capacity Setting

This section shows the I/O port output drive capacity settings.

ODR[1:0]	I_{OL}	I_{OH}
00	2mA	-2mA
01	1mA	-1mA
10	30mA	-30mA
11	Setting prohibited	Setting prohibited

The ports sharing the stepping motor controller output are available as 1mA/2mA/30mA settings.

For details, see "OVERVIEW: 10. List of Pin Functions" and "OVERVIEW: 11. I/O Circuit Type."

While a port is set to the stepping motor controller output, output drive capacity is 30mA regardless of the ODR setting.

3. Output Resource Selection

This section shows the output resource assignments and settings of each pin.

Table 3-1 List of Output Resources

Register (Offset)	Port	Resource Functional Outputs							
		POF=0	POF=1	POF=2	POF=3	POF=4	POF=5	POF=6	POF=7

CHAPTER 63: APPENDIX: State Transition

This appendix explains State transition.

1. Overview
2. Diagram of State transition
3. Fetching the Operation Mode
4. Changes to PSS and RUN

STATET-T01P00R01L01-E1-GBM02

1. Overview

This section gives a brief overview of State transition

Refer to the Low-power chapter for the detailed information for performing a change state.

2. Diagram of State Transition

This section shows diagram of state transitions.

The device state transitions for this series are shown below.

Figure 2-1 Diagram of Device State Transitions

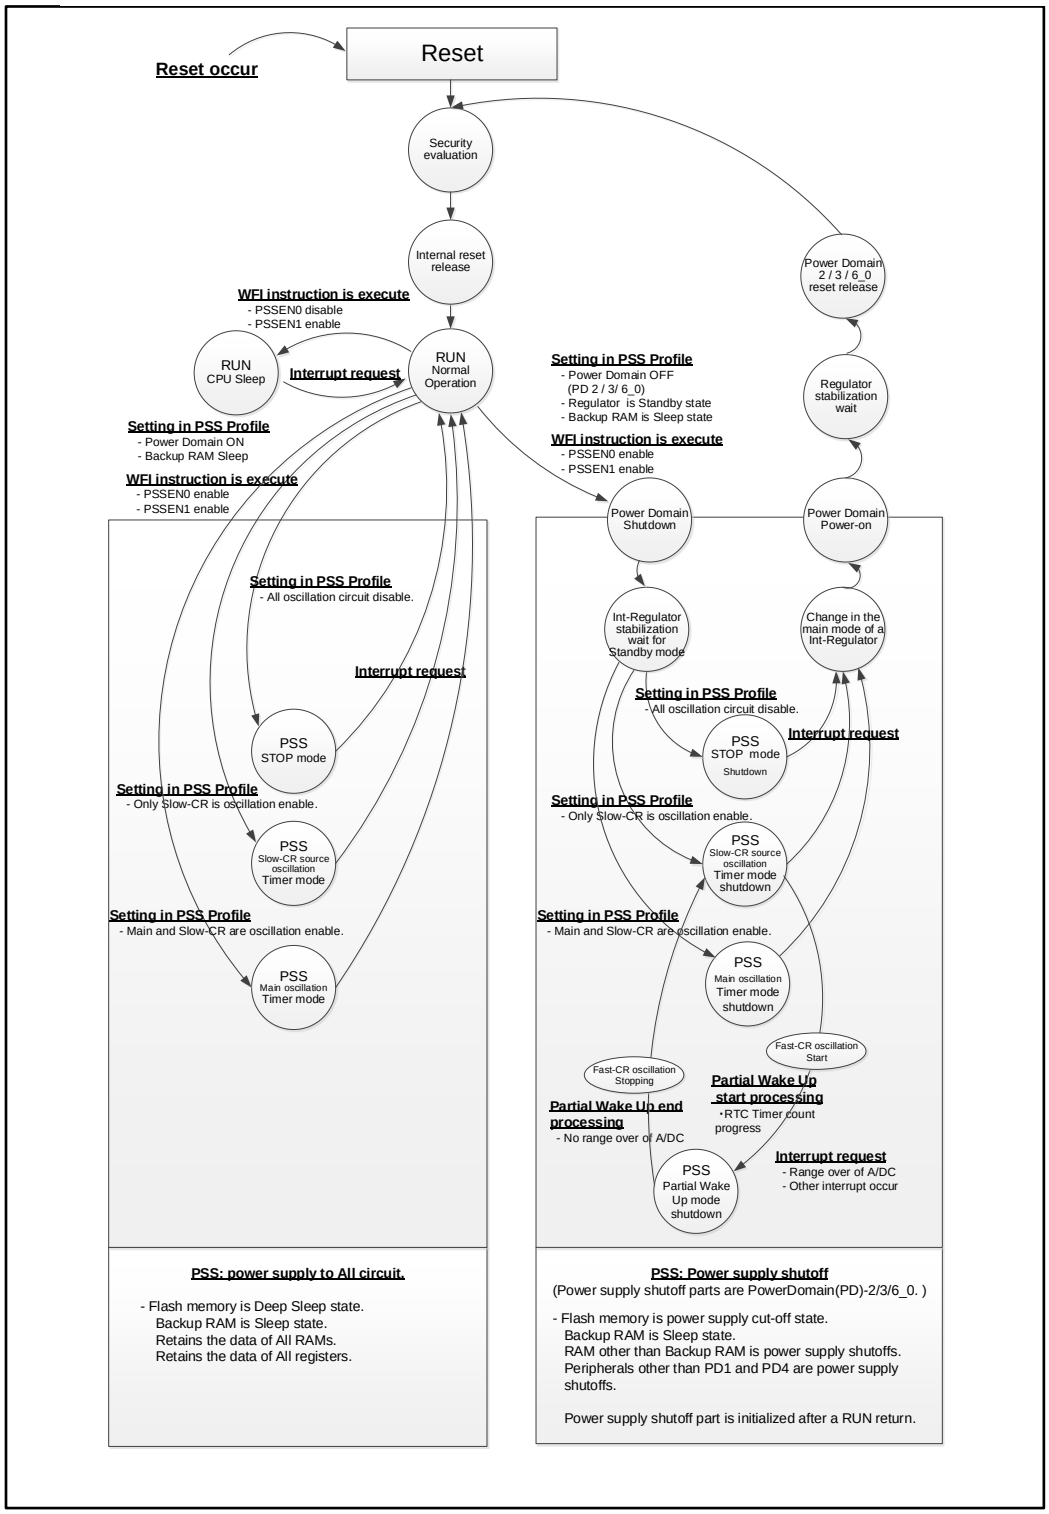

Table 2-1 RUN/PSS State Definitions

S6J312xHzC* supports only the below defined operating state.

Internal state and a frequency definition

		RUN Normal Operation 128MHz S6J312xHzC*	RUN CPU Sleep 128MHz S6J312xHzC*	PSS Slow-CR source oscillation Timer mode	PSS Main oscillation Timer mode	PSS STOP mode	PSS PWU mode Shutdown	PSS Slow-CR source oscillation Timer mode shutdown	PSS Main oscillation Timer mode shutdown	PSS STOP mode Shutdown
Clocks	CLK_CPU	128MHz	<-	Prohibition of an oscillation

	PD4	ON	ON	ON	ON	ON	ON	ON	ON	ON
	PD6	ON	ON	ON	ON	ON	OFF	OFF	OFF	OFF

The conditions for changing in each state.

		RUN Normal Operation 128MHz S6J312xHzC*	RUN CPU Sleep 128MHz S6J312xHzC*	PSS Slow-CR source oscillation Timer mode	PSS Main oscillation Timer mode	PSS STOP mode	PSS PWU mode Shutdown	PSS Slow-CR source oscillation Timer mode shutdown	PSS Main oscillation Timer mode shutdown	PSS STOP mode Shutdown
Setup for changes	PSSEN0	-	disable	enable	enable	enable	enable	enable	enable	enable
	PSSEN1	-	enable	enable	enable	enable	enable	enable	enable	enable
Changes start command		-	Execution of a WFI command.							

*x: A/9 、z: A/B

3. Fetching the Operation Mode

This section describes the Fetching the Operation Mode.

The operation mode is fetched by sampling the RST (Reset).

The following shows an operation sequence from an occurrence of reset cause to the determination of an operation mode.

Figure 3-1 Operation Mode Fetch Timing Chart

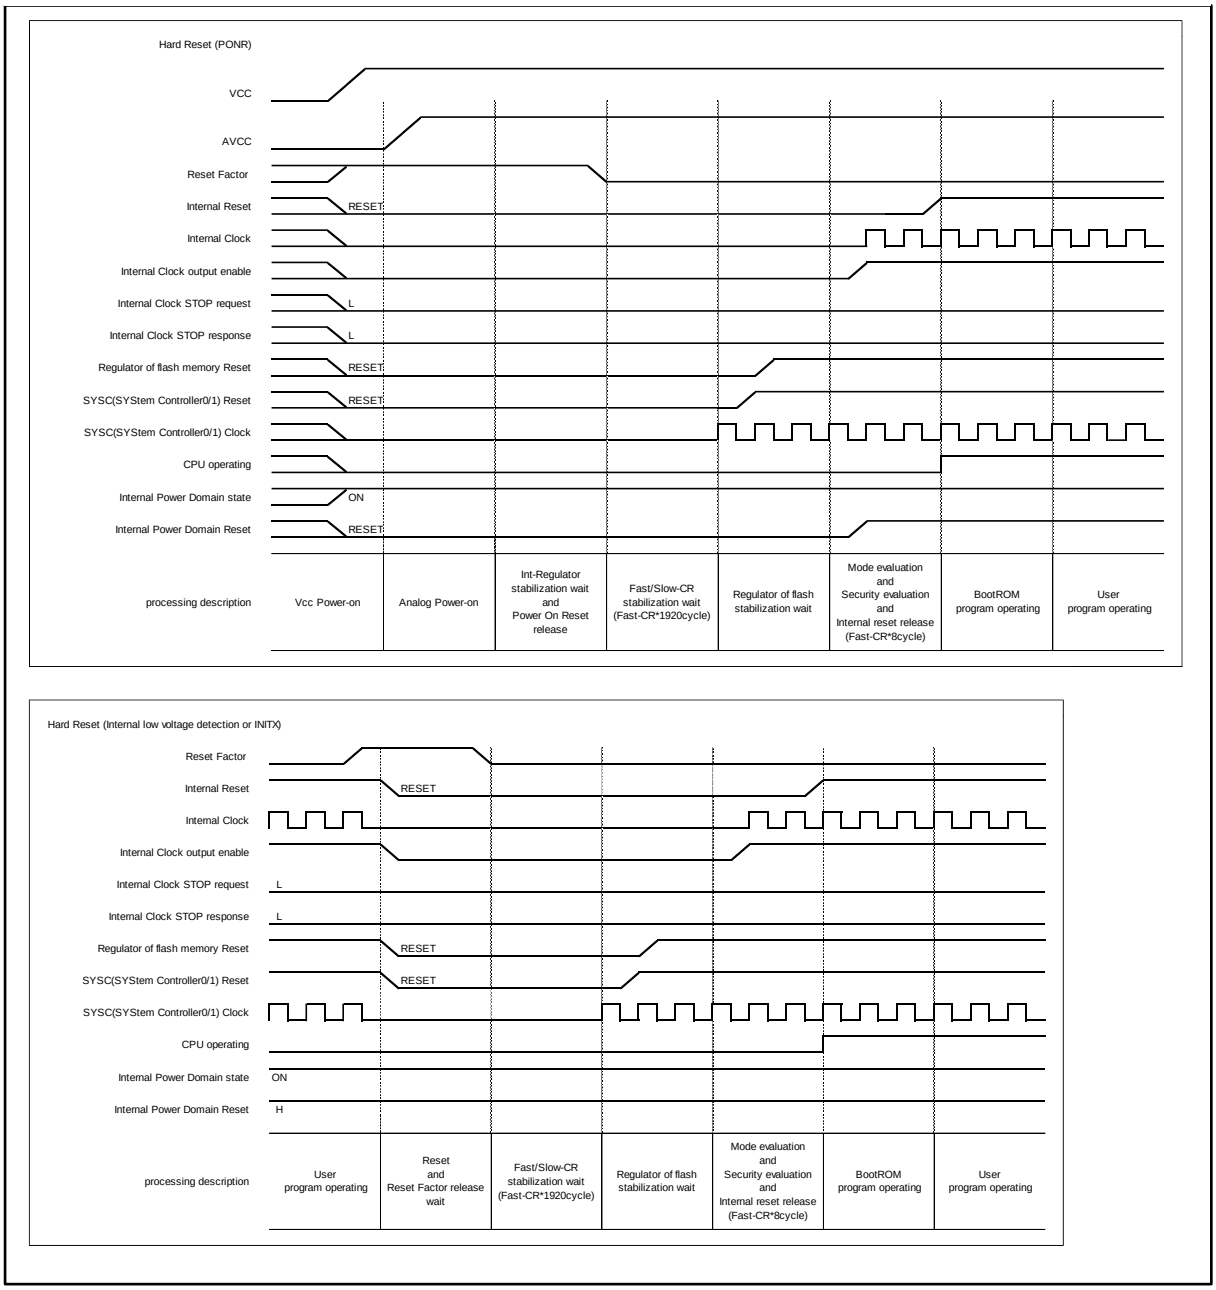

Figure 3-2 Operation Mode Fetch Timing Chart

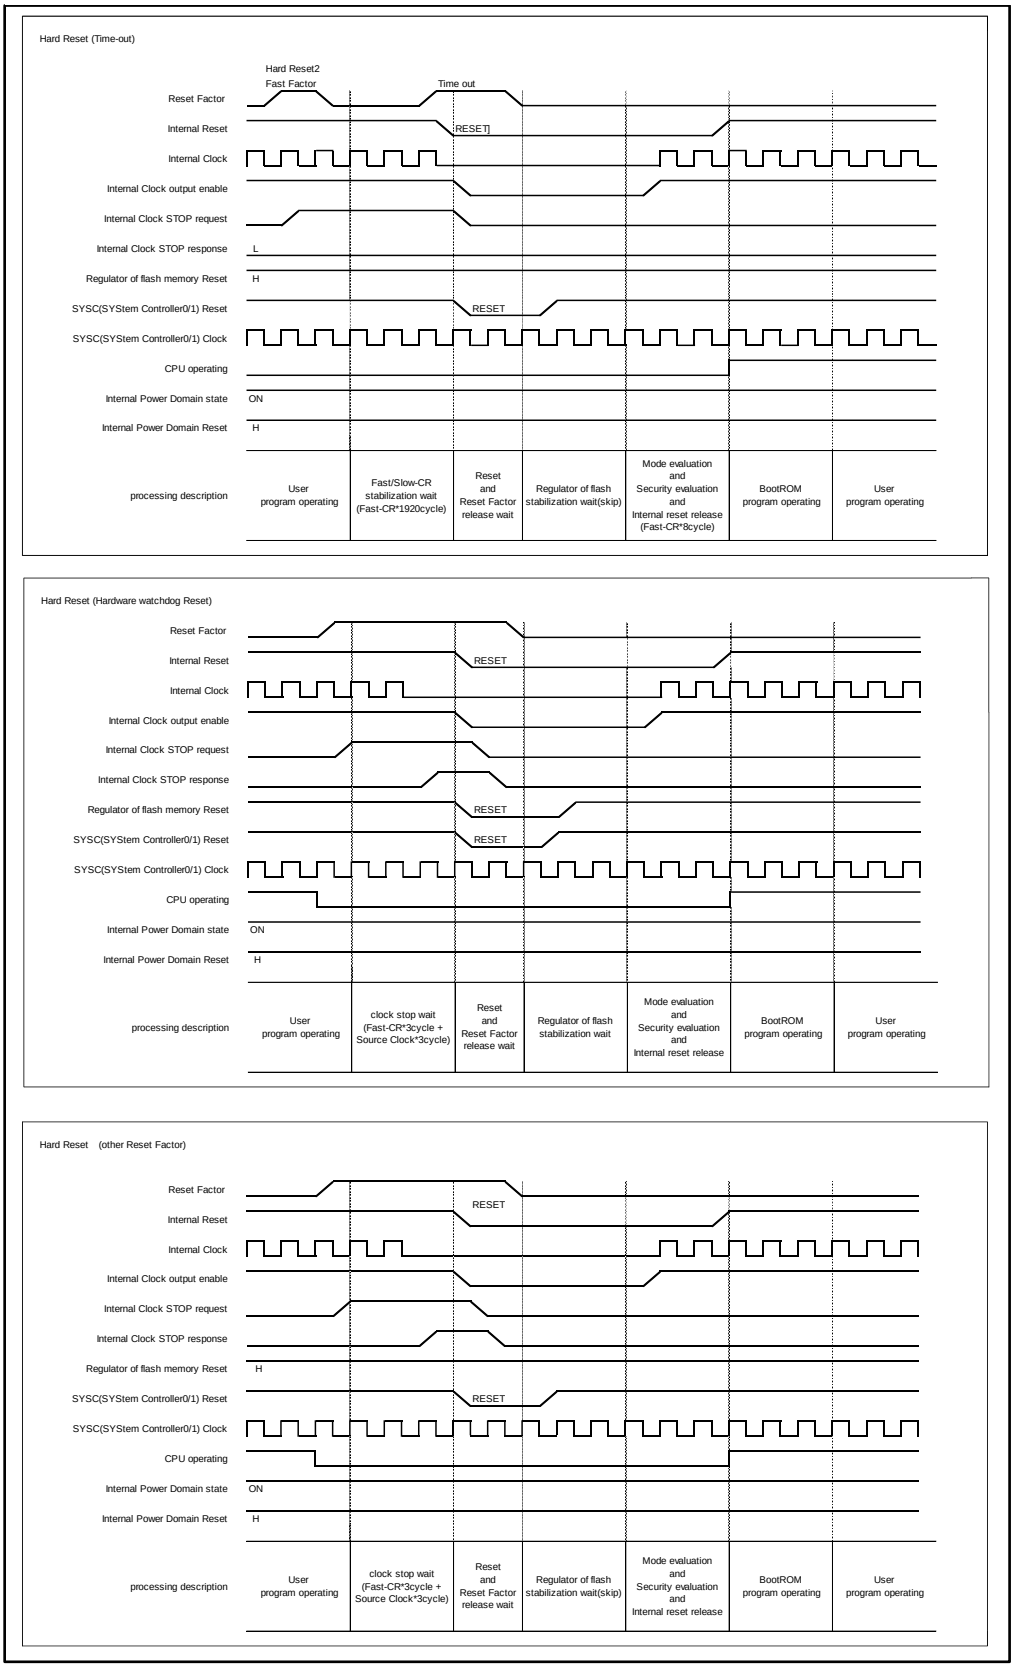

Figure 3-3 Operation Mode Fetch Timing Chart

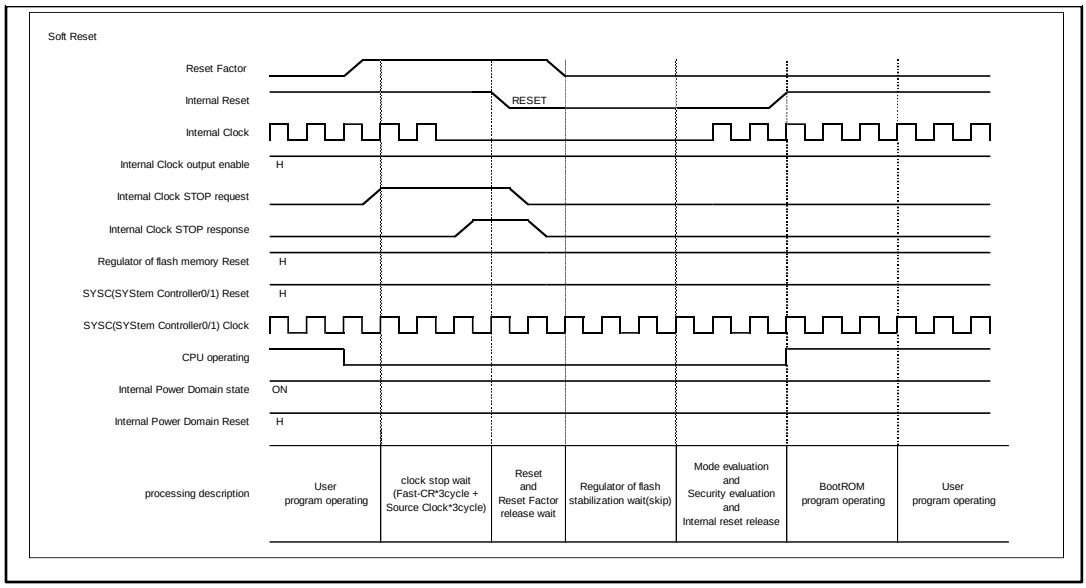

4. Changes to PSS and RUN

This section shows the sequence which changes to PSS and RUN.

Figure 4-1 Changes to PSS Timing Chart

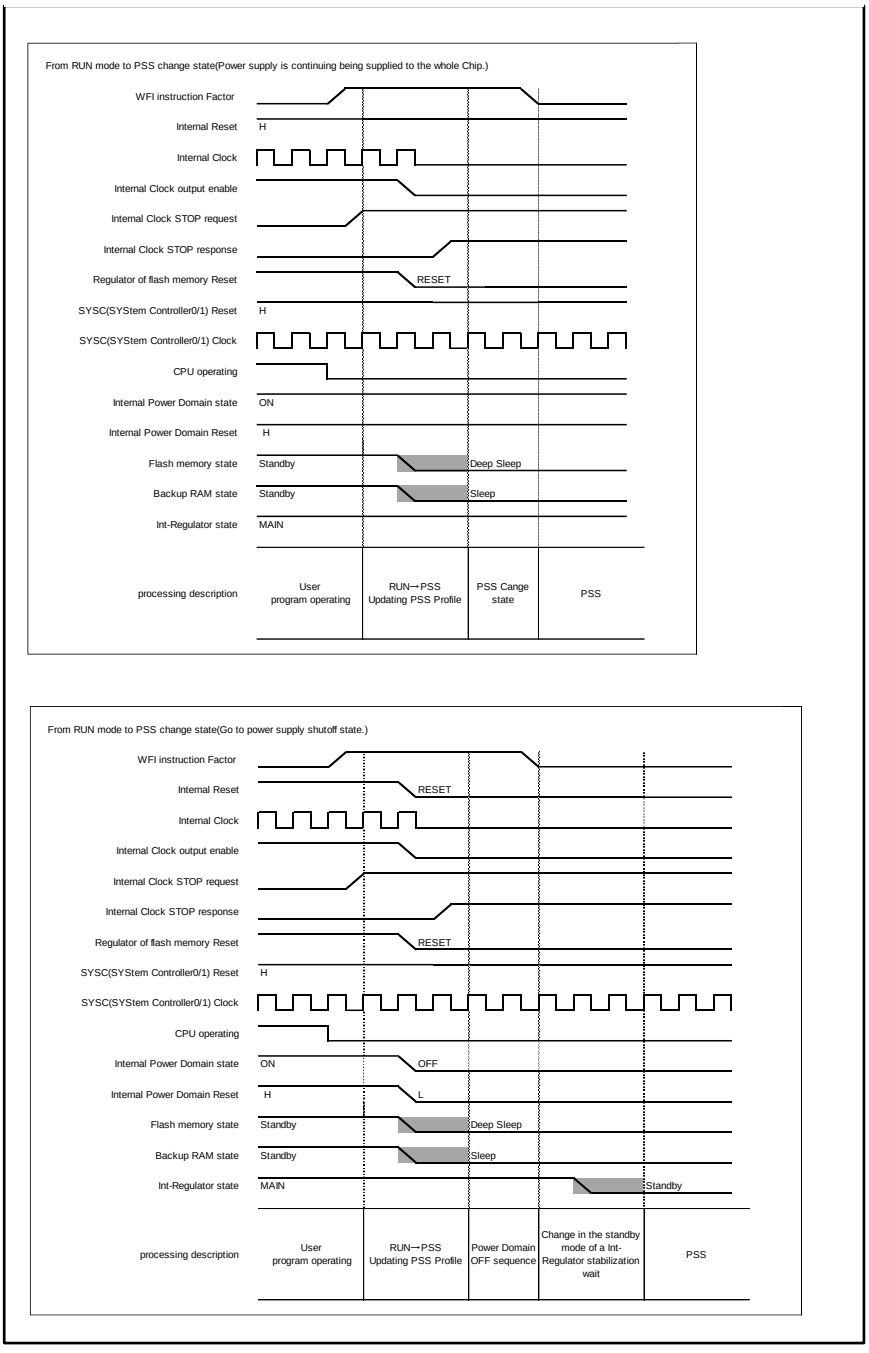

Figure 4-2 Changes to PSS Timing Chart

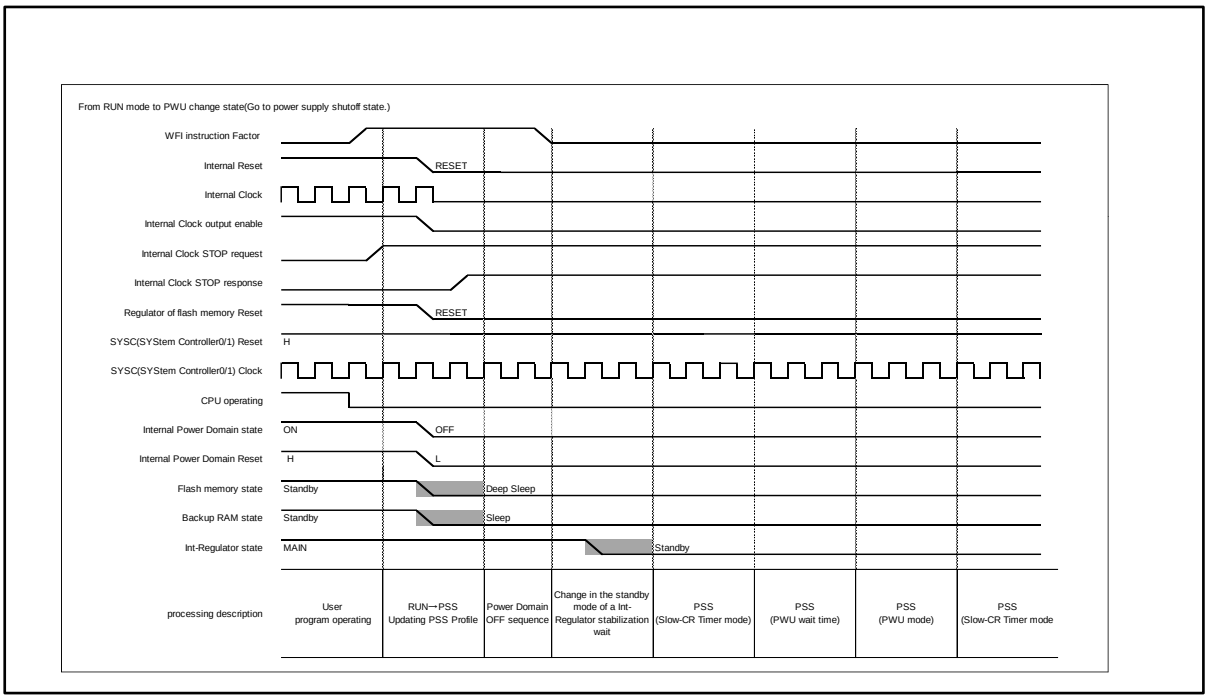

Figure 4-3 Changes to RUN Timing Chart

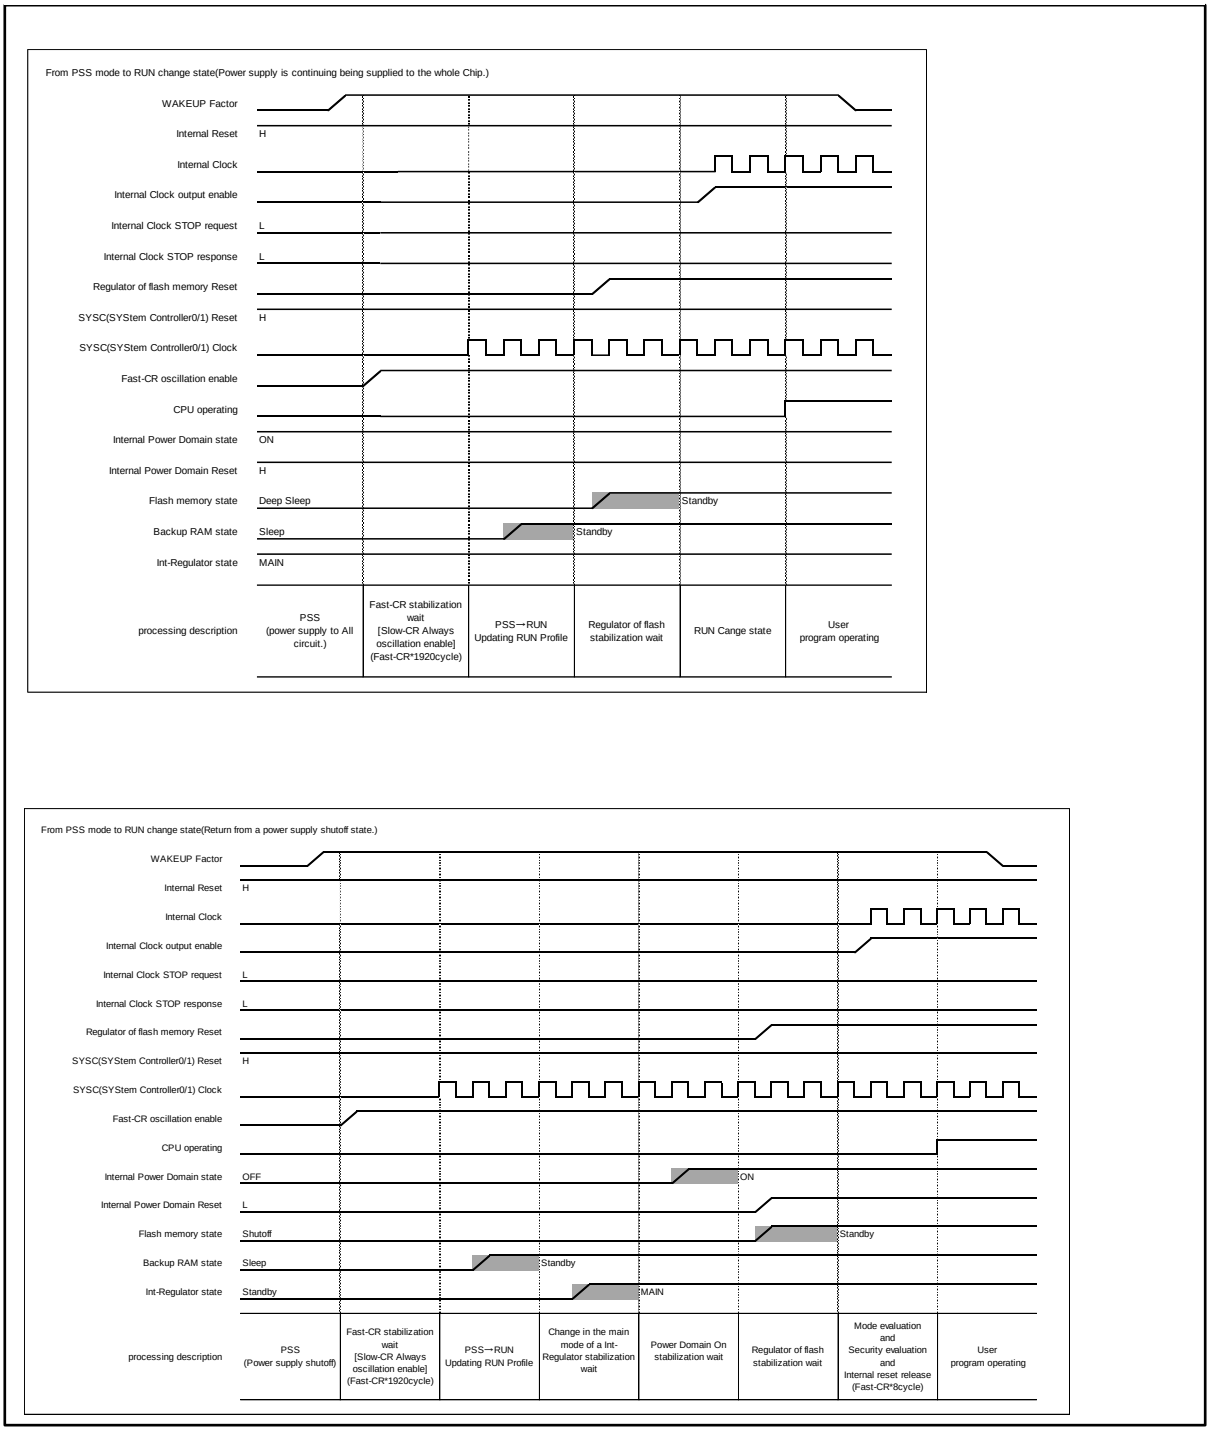


CHAPTER 64: APPENDIX: I/O Map

This chapter explains I/O MAP.

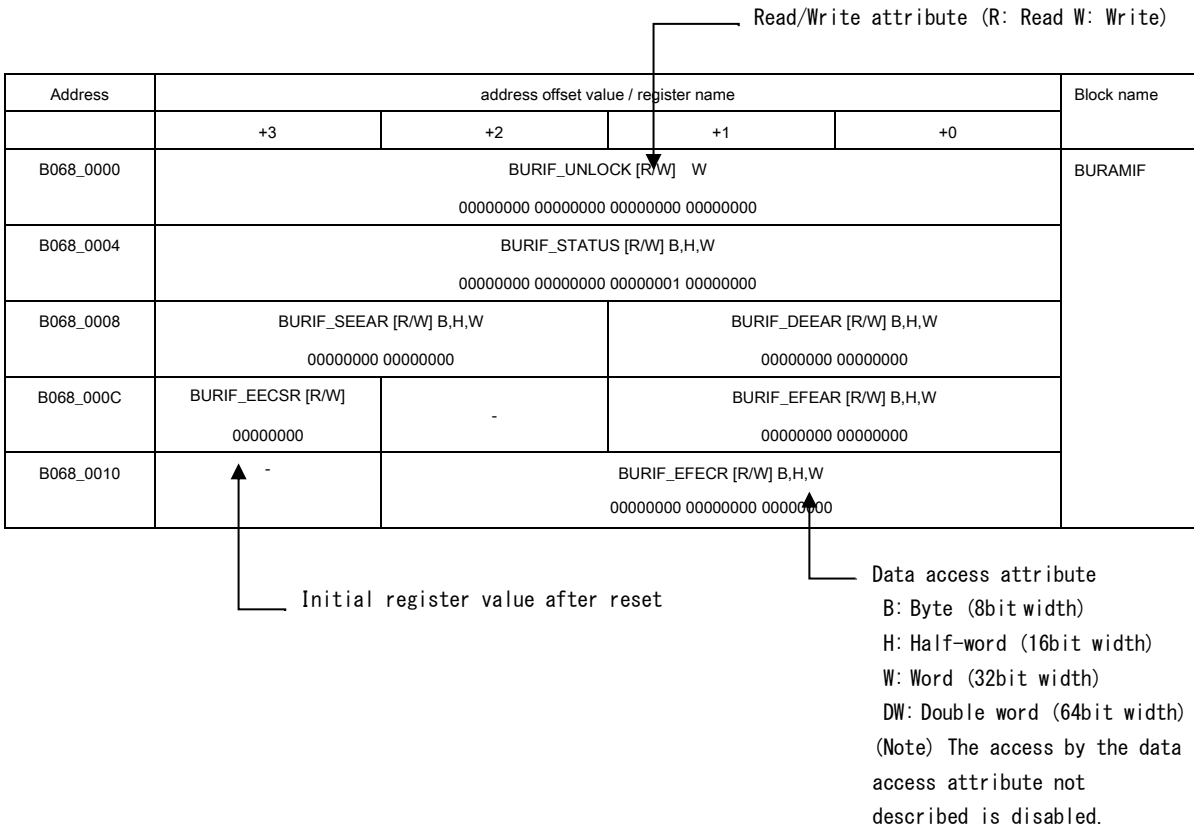
1. I/O MAP
2. I/O Map (S6J3120 series)
3. APPS#5

IOMAP-T01P00R01L01-E1-GBM03

1. I/O MAP

The following I/O map shows the relationship between memory space and registers for peripheral resources.

Figure 1-1 Legend of I/O Map



The initial register value after reset indicates as follows:

"1": Initial value "1"

"0": Initial value "0"

"X": Initial value undefined

"-": Reserved bit/Undefined bit

"*": Initial value "0" or "1" according to the setting

Note:

- *The access by the data access attribute not described is disabled.*

2. I/O Map (S6J3120 Series)

*1: The access size depends on the value of FWIDTH 17:16 of DDRHSSPIn_DMFIFOCFGS.

*2: An initial value depends on a set value. It sets it on the kind side.

*3: 00000111_11111111 8KB

*4: An initial value is XXXXXXXX_XXXXXXXX only at the reload timer.

*5: Because it is not CSIO mode, it reserves immediately after reset.

*6: Because it is not LIN mode, it reserves immediately after reset.

*7:Because it is not I^2C mode, it reserves immediately after reset.

*9: An initial value is 00000000 00000000 00000000 00000000 only at the PWM.

*10: An initial value is 00000000 00000000 only at the PPG.

*11:see 1.4.1.1 in "HWM of SHE"

*12:see "HWM of Lowpower"

*13:see "HWM of Hardware WatchdogTimer"

CHAPTER 65: APPENDIX: DMA Channel Activation Factors

This appendix shows DMA channel Activation Factors.

1. DMA Channel Activation Factors (S6J312xHzC*)

1. DMA Channel Activation Factors (S6J312xHzC*)

This section shows DMA channel activation factors in S6J312xHzC*.

DMA sources from the peripherals in S6J312xHzC*.

Number of Channels	Peripheral Functions	Type
0 to 7	Reserved	-
8	Ext-IRQ	1
9	Work Flash DREQ	1
10	FRT ch.0 Compare clear	2
11	FRT ch.0 Zero detection	2

331	Sound Generator ch.2	2
332 to 511	Reserved	-

* x: A/9, z:A/B

Type	Automatically cleared the interrupt factor flag of peripheral function by acceptance of DMA transfer request	Interrupt Enable
1	Not cleared.	Unnecessary(*1)
2	Cleared	Necessary
3(*2)	Not cleared	Necessary

*

*1: Necessary to enable DMA.

*2: Only Multi Function Serial function. The interrupt flag which is the factor of DMA transfer request is cleared when data transfer is started.

CHAPTER 66: APPENDIX: List of Interrupt Vector and NMI Map

This appendix shows List of Interrupt Vector and NMI Map

1. List of Interrupt Vector (S6J312xHzC*)
2. NMI Map (S6J312xHzC*)

LISTINT-T01P00R01L01-E1-GBM02

1. List of Interrupt Vector (S6J312xHzC*)

This section shows list of interrupt vector in S6J312xHzC*.
This list shows the assignments of interrupt factors and interrupt vectors/interrupt control registers.

*x: A/9, z: A/B

IRQ No.	Detail	IRQ Priority Register	Vector Address Register
0	Reserved		
1	System Control Status Interrupt Request	IRCn_IRQPL0:IRQPL1[4:0]	IRCn_IRQVA1
2	HW-WDT Pre-warning Interrupt Request	IRCn_IRQPL0:IRQPL2[4:0]	IRCn_IRQVA2
3	SW-WDT Pre-warning Interrupt Request	IRCn_IRQPL0:IRQPL3[4:0]	IRCn_IRQVA3
4 to 7	Reserved		
8	TCFLASH Interrupt Request	IRCn_IRQPL2:IRQPL8[4:0]	IRCn_IRQVA8
9	Reserved

CHAPTER 67: APPENDIX: Major Changes

Page	Section	Change Results
-	Cover	Added the full production names including SHE-OFF series as follows (Correct) S6J3120 Series 32-bit Microcontroller Spansion® TraveoTM Family S6J312AHAB/S6J3129HAB/S6J3128HAB S6J312AHBB/S6J3129HBB/S6J3128HBB HARDWARE MANUAL
-	Cover	Corrected information about Spansion to Cypress.
47	CHAPTER 0:Introduction	The item should be added as indicated by the shading below. (Correct) 30.About the 12-Bit A/D Converter 31.About the Secure Hardware Extension (SHE) 32.About the Partial Wakeup Control 33.Common items
49	CHAPTER 0:Introduction 2. About Clock System Specifications	Features of "For details" should be corrected as indicated by the shading below 2. About Clock System Specifications (Error) About PLL0 and SSCG PLL0 settings at the time of main clock 4 MHz input. The input frequency supplied to PLL must be divided by 1 (4 MHz). When CPUs operate at 112 MHz, usage by multiplying by 112 (PLLout=448 MHz) is recommended. When CPUs operate at 80 MHz, usage by multiplying by 120 (PLLout=480 MHz) is recommended. (Correct) About PLL0 and SSCG PLL0 settings at the time of main clock 4 MHz input. The input frequency supplied to PLL must be divided by 1 (4 MHz). When CPUs operate at 128 MHz, usage by multiplying by 128 (PLLout=512 MHz) is recommended. When CPUs operate at 80 MHz, usage by multiplying by 120 (PLLout=480 MHz) is recommended.

Page	Section	Change Results
49	CHAPTER 0:Introduction 2. About Clock System Specifications	Added item as follows: 5.1.3 PLL/SSCG stabilization time control register Setting the value 1000 to the PLLSTABS and SSCGSTABS bits is prohibited.
50	CHAPTER 0:Introduction 3. About Low-Power Consumption Specifications	Features of "For details" should be deleted as indicated by the shading below. −3 V I/O −Partial Wakeup
50	CHAPTER 0:Introduction 3. About Low-Power Consumption Specifications	Added the following description in features of “For details”. This model does not support IRQ_PW bit in MCG_IRSR0 register. This bit is always read to 0.
50	CHAPTER 0:Introduction 4.About Low-Voltage Detection Specifications	Features of "For details" should be deleted as indicated by the shading below (Error) The low-voltage detection voltage and the detection error are desired values.
51	CHAPTER 0:Introduction 7.About the Real Time Clock	Features of "For details" should be deleted as indicated by the shading below This model does not support Partial Wakeup.
52	CHAPTER 0:Introduction 9. About the Multi-function Serial Interface	Features of "For details" should be corrected as indicated by the shading below. (Error) This model does not support the I^2C communication function. It also does not support registers related to I^2C. (Correct) This model supports the I^2C communication function. - This model does not support high-speed mode. (Max. 400kbps) - This model does not support Min. IOL = 3mA with VOL = 0.4V. - At Multi-function serial ch.1, ch.2, and ch.12, I2C-UART function is not supported.

<table>
<tr><th>Page</th><th>Section</th><th>Change Results</th></tr>
<tr><td>52</td><td>CHAPTER 0:Introduction
9. About the Multi-function Serial Interface</td><td>Features of "For details" should be corrected as indicated by the shading below.
(Correct)

■The maximum frequency of a peripheral clock is 32 MHz in UART (asynchronous serial interface) operation mode.
■Hardware flow control is not supported in UART (asynchronous serial interface) operation mode.
■The maximum frequency of a peripheral clock is 32 MHz in CSIO (clock synchronous serial interface) operation mode.
■The maximum frequency of a peripheral clock is 32 MHz in LIN interface (v2.1) (LIN communication control interface (v2.1)) operation mode.</td></tr>
<tr><td>52</td><td>CHAPTER 0:Introduction
9. About the Multi-function Serial Interface</td><td>Added the following description.

When reset is issued, the following ports become "L" output as the initial state.
- SCS0_0 /SIN4_1 (assigned to P023)
- SIN1_0 (assigned to P028)
- SOT1_0 (assigned to P029)
- SCS1_0 (assigned to P031)
- SCK1_0 (assigned to P100)
- SIN2_0 (assigned to P408)
- SOT2_0 (assigned to P409)
- SOT4_1 (assigned to P024)
- SCS42_1 (assigned to P027)
- SCS43_1 (assigned to P030)
- SOT12_0 (assigned to P406)
- SCK12_0 /SCK10_1 (assigned to P407)
Take care of the above port while used as UART/CSIO/LIN.
When reset is issued, the communication may be disturbed by "L" output.
Regarding the initial state for each ports, refer to the data sheet "11.PIN STATUSES IN CPU STATUS".</td></tr>
<tr><td>55</td><td>CHAPTER 0:Introduction
16. About TCFLASH</td><td>Added the table of full production as follows:

■ This model supports TCFLASH memory sizes are as follows.

<table><tr><th>Part number</th><th>TCFlash size (Byte)</th></tr><tr><td>S6J312AHzB*</td><td>1024K + 64K</td></tr><tr><td>S6J3129HzB*</td><td>768K + 64K</td></tr><tr><td>S6J3128HzB*</td><td>512K + 64K</td></tr></table>* z: A / B</td></tr>
<tr><td>58</td><td>CHAPTER 0:Introduction
28. About the LCD Controller</td><td>Added the table of full production as follows:
(Correct)
■When reset is issued, the following ports become "L" output as the initial state.
−P019, P023, P024, P027, P028, P029, P030, P031, P100, P406, P407, P408, P409
Therefore, don't add the Pull-up registers outside of this product to the above ports.
In case that the above ports are used as Pull-up, use the Pull-up function implemented in this product.</td></tr>
</table>

Page	Section	Change Results
58	CHAPTER 0:Introduction 30.About the 12-Bit A/D Converter	The item should be deleted as indicated by the shading below. (Correct) ■The following numbers are not supported as activation channels in this model. Channel No. 0, 1, 2, 4, 7, 8, 11, 16, 25, 26, 44, 45, 54, 63 ■This model does not support Partial Wakeup.
58	CHAPTER 0:Introduction 31.About the Secure Hardware Extension (SHE)	Features of "For details" should be added as indicated by the shading below. 31.About the Secure Hardware Extension (SHE)23.1. How to use Reset factor register This section explains restrictions on the operation specifications for the Secure Hardware Extension (SHE) Regarding S6J312xHBB*, The models are not supported SHE function. * x: A/9/8
58	CHAPTER 0:Introduction 32.About the Partial Wakeup Control	Features of "For details" should be added as indicated by the shading below. 32.About the Partial Wakeup Control This section explains restrictions on the operation specifications for Partial Wakeup Control This model does not support the following analog channels for partial wakeup. AN44(PWU_AN4), AN45(PWU_AN5)
64	CHAPTER 1:Overview 2.1. Cortex-R5 Core	Features of "For details" should be added as indicated by the shading below (Correct) ECC support for the TCM ports for RAM
65	CHAPTER 1:Overview 2. Features 2.2. Peripheral Functions	Features of "For details" should be corrected as indicated by the shading below. Built-in Flash memory size −Program: 1024 K + 64 KB (S6J312AHzB*)/768 K + 64 KB (S6J3129HzB*)/512 K + 64 KB (S6J3128HzB*) *z: A/B −Work: 112 KB (S6J312AHzB*)/ 112 KB (S6J3129HzB*)/112 KB (S6J3128HzB*) *z: A/B

2. Notes</td><td>Features of "For details" should be added as indicated by the shading below.

(Correct)
Flag clear
Note that the hardware operation of a write access to a register which has status flags may be later than program operations of software. The delay results from the fact that the write accesses and their signals are operated through multiple buses.
For example, when a software program intends to return from interrupt software routine (ISR) after clearing the interrupt flag, the return instruction may practically be executed before the completion of the write access as for hardware operation. That is, the CPU execution may immediately jump to the ISR again after returning from the ISR because the flag is not cleared.
To avoid such a phenomenon, the execution of Data Memory Barrier (DMB) instruction between the write access and the return instruction is recommended for the program. The return instruction is never executed before the completion of DMB execution.
It should be considered that the method takes a number of execution cycles and that it may cause some influence to application performance. For example, one time of the DMB execution is enough after a number of continuous flag clear operations.</td></tr>

Table 3 3 Example of SSCG PLL clock configuration
<table>
<tr><th>Input clock</th><th>Input clock divider configuration</th><th>SSCG PLLin</th><th>SSCG PLL Multiplier configuration</th><th>SSCG PLLout</th><th>Output divider configuration</th><th>SSCG PLL clock</th></tr>
<tr><td>4MHz</td><td>1</td><td>4MHz</td><td>128</td><td>512MHz</td><td>4</td><td>128MHz</td></tr>
<tr><td>4MHz</td><td>1</td><td>4MHz</td><td>120</td><td>480MHz</td><td>6</td><td>80MHz</td></tr>
</table>

Note:
− Make the input clock frequency division setting so that the SSCG PLL input clock (SSCG PLLin) is at 4 MHz. Make the multiplication setting so that the SSCG PLL output clock (SSCG PLLout) is at 400 MHz to 512 MHz.
− The maximum SSCG PLL clock frequency must be 128MHz.
Output divider configuration can be set by the following.
- SSCGDIVM bit in SYSC0_RUNSSCG0CNTR0 register
- SSCGDIVM bit in SYSC0_PSSSSCG0CNTR0 register
(e.g. If SSCG PLLout is 512MHz, these settings must be configured as "multiply by 4" and over multiplication setting.)

Page	Section	Change Results
271	CHAPTER 6:Low Power Consumption 4.1. RUN Profile Update	"Example explanations" should be modified as indicated by the shading below. (Error) 3. Start a profile update by writing 0xAB to the RUN profile update trigger register. (SYSC_TRGRUNCNTR:APPLY_RUN). 4. The control circuit confirms the new RUN profile contents. If the contents of settings have any problem, a profile error occurs, and an error interrupt (NMI) is generated. At the same time, "1" is set in system error interrupt factor register 1 (SYSC_SYSERRIR1:RUNERRIF0). The new profile contents are discarded, and the circuit operates with the contents of the profile currently in use. 5. When the new RUN profile contents have no problem, the control circuit reflects the profile contents as follows. 1. The circuit sets "1" in the system status register (SYSC_SYSSTSR:RUNSTS0). 2. The circuit copies the RUN profile contents to the APPLIED profile. 3. The copying reflects the following: clock oscillation enable/stop (also including oscillation stabilization wait), CSV setting changes, LVD setting changes, clock operation settings (source clock change, division, ON/OFF of each clock source), ON/OFF of each power domain, and clock stop settings (stopping a source clock). 4. When the RUN profile update is completed, the circuit clears the system status register. (SYSC_SYSSTSR:RUNSTS0) to "0" and sets "1" in the system status register (SYSC_SYSSTSR:RUNDF0). Also, if the system status interrupt enable register (SYSC_SYSINTER:RUNDIE0) is enabled, an interrupt is generated. (Correct) 3. Start a profile update by writing 0xAB to the RUN profile update trigger register. (SYSC0_TRGRUNCNTR:APPLY_RUN). 4. The control circuit confirms the new RUN profile contents. If the contents of settings have any problem, a profile error occurs, and an error interrupt (NMI) is generated. At the same time, "1" is set in system error interrupt factor register 1 (SYSC0_SYSERRIR1:RUNERRIF0). The new profile contents are discarded, and the circuit operates with the contents of the profile currently in use. 5. When the new RUN profile contents have no problem, the control circuit reflects the profile contents as follows. 1. The circuit sets "1" in the system status register (SYSC0_SYSSTSR:RUNSTS0). 2. The circuit copies the RUN profile contents to the APPLIED profile. 3. The copying reflects the following: clock oscillation enable/stop (also including oscillation stabilization wait), CSV setting changes, LVD setting changes, clock operation settings (source clock change, division, ON/OFF of each clock source), ON/OFF of each power domain, and clock stop settings (stopping a source clock). 4. When the RUN profile update is completed, the circuit clears the system status register. (SYSC0_SYSSTSR:RUNSTS0) to "0" and sets "1" in the system status register (SYSC0_SYSSTSR:RUNDF0). Also, if the system status interrupt enable register (SYSC0_SYSINTER:RUNDIE0) is enabled, an interrupt is generated.

Page	Section	Change Results
271	CHAPTER 6:Low Power Consumption 4.1. RUN Profile Update	The Note should be modified as indicated by the shading below. (Error) Notes: Any attempt to update a RUN profile again while a new RUN profile is being updated causes the generation of a system error interrupt (SYSC_SYSERRIR1:RUNTRGERRIF). Furthermore, the RUN profile of the re-update attempt becomes invalid. Before updating the RUN profile, confirm in the flags of the profile status register (SYSC_SYSPROSTSR:RUNPSTS) that there is no profile error. Any update of a RUN profile in the profile error state causes the generation of an NMI interrupt. Furthermore, the RUN profile settings are discarded. (Correct) Notes: Any attempt to update a RUN profile again while a new RUN profile is being updated causes the generation of a system error interrupt (SYSC0_SYSERRIR1:RUNTRGERRIF). Furthermore, the RUN profile of the re-update attempt becomes invalid. Before updating the RUN profile, confirm in the flags of the profile status register (SYSC0_SYSPROSTSR:RUNPSTS) that there is no profile error. Any update of a RUN profile in the profile error state causes the generation of an NMI interrupt. Furthermore, the RUN profile settings are discarded.

Page	Section	Change Results
273	CHAPTER 6:Low Power Consumption 4.2. Transition from RUN to PSS	"Example explanations" should be modified as indicated by the shading below. (Error) 5. Confirm the contents of the PSS/RUN profile to update. If the contents of the RUN/PSS profile settings have a problem, the system error interrupt flag register. (SYSC_SYSERRIR1:RUNWKERRIF0/PSSERRIF0) becomes valid. If either of the profiles has an error, an NMI interrupt is generated. The interrupt cannot be made invalid. Check the flag register contents for a description of the profile error, and correct the part that has the problem. 6. When the PSS profile contents have no problem, the control circuit reflects the profile contents as follows. 1. The circuit sets the PSS profile setting state of the CPU (SYSC_SYSSTSR:PSSSTS0) to "1". 2. The circuit copies the PSS profile contents to the APPLIED profile. 3. The circuit checks whether a WAKEUP request has been generated. If a WAKEUP request has been generated, the transition to PSS is canceled. Then, an NMI interrupt is generated, and the system error interrupt factor register (SYSC_SYSERRIR1:PSSTRGCIF0) is set to "1". 4. The circuit handles the following: clock oscillation enable/stop (also including oscillation stabilization wait), CSV setting changes, LVD setting changes, clock operation settings (source clock change, division, ON/OFF of each clock source), ON/OFF of each power domain, and clock stop settings (stopping a source clock). 5. The circuit sets the PSS profile setting state of each CPU (SYSC_SYSSTSR:PSSSTS0) to "0" and the PSS profile completion flag of each CPU (SYSC_SYSSTSR:PSSDF0) "1". (Correct) 5. Confirm the contents of the PSS/RUN profile to update. If the contents of the RUN/PSS profile settings have a problem, the system error interrupt flag register. (SYSC0_SYSERRIR1:RUNWKERRIF0/PSSERRIF0) becomes valid. If either of the profiles has an error, an NMI interrupt is generated. The interrupt cannot be made invalid. Check the flag register contents for a description of the profile error, and correct the part that has the problem. 6. When the PSS profile contents have no problem, the control circuit reflects the profile contents as follows. 1. The circuit sets the PSS profile setting state of the CPU (SYSC0_SYSSTSR:PSSSTS0) to "1". 2. The circuit copies the PSS profile contents to the APPLIED profile. 3. The circuit checks whether a WAKEUP request has been generated. If a WAKEUP request has been generated, the transition to PSS is canceled. Then, an NMI interrupt is generated, and the system error interrupt factor register (SYSC0_SYSERRIR1:PSSTRGCIF0) is set to "1". 4. The circuit handles the following: clock oscillation enable/stop (also including oscillation stabilization wait), CSV setting changes, LVD setting changes, clock operation settings (source clock change, division, ON/OFF of each clock source), ON/OFF of each power domain, and clock stop settings (stopping a source clock). 5. The circuit sets the PSS profile setting state of each CPU (SYSC0_SYSSTSR:PSSSTS0) to "0" and the PSS profile completion flag of each CPU (SYSC0_SYSSTSR:PSSDF0) "1".

730	CHAPTER 8:Clock Supervisor 6. Precautions for Using This Device	Features of "For details" should be corrected as indicated by the shading below. (Error) This section explains precautions for using the clock supervisor. - Profile settings are used to enable/disable operations of the clock supervisor. For details on the profile settings, see the following chapter: "LOW POWER CONSUMPTION." - To operate the clock supervisor, enable oscillation of the monitoring clock and reference clock. - To stop the clock supervisor, simultaneously stop oscillation of the monitoring clock. - After a reset is generated by the detection of a clock abnormality, the main clock supervisor reference clock returns to the high-speed CR clock. The clock of the detected abnormality must not be selected again. - To protect hardware, clock supervisor setting registers 0 and 1 must not be modified during operation of the clock supervisor. To change either of them, do so only after disabling operation of the clock supervisor. The response to any writing done here is a bus error. (Correct) This section explains precautions for using the clock supervisor. - Profile settings are used to enable/disable operations of the clock supervisor. For details on the profile settings, see the following chapter: "LOW POWER CONSUMPTION." - To operate the clock supervisor, enable oscillation of the monitoring clock and reference clock. - To stop the clock supervisor, simultaneously stop oscillation of the monitoring clock. - After a reset is generated by the detection of a clock abnormality, MCU will operate with FastCR clock. At this time, CSV cause clock must not be selected again - To protect hardware, clock supervisor setting registers 0 and 1 must not be modified during operation of the clock supervisor. To change either of them, do so only after disabling operation of the clock supervisor. The response to any writing done here is a bus error.
732	CHAPTER 9: Source Clock Timer 1. Overview	Revised oscillation stabilization wait time from “0.48ms” to “0.88ms”.

Page	Section	Change Results
778	CHAPTER 10: Real Time Clock 3. Operation of the Real Time Clock	Features of "For details" should be corrected as indicated by the shading below. (Error) **Calibration operation** The Calibration module provides automatic (and manual) RTC calibration. The module is able to operate in all run modes of the MCU if configured accordingly. The Main oscillation clock is used as an accurate time reference signal to measure the (normally) less accurate clock used for the RTC (CLKCAL). If the Main oscillator is switched off (e.g. during low-power mode), the Calibration module will temporarily switch it on, execute the calibration and switch it off afterwards to ensure low-current consumption. Two counters operate during a calibration cycle to measure CLKCAL. The Calibration clock countermeasures full clock cycles of CLKCAL and returns the value in RTC_CNTCAL. (Correct) **Calibration operation** The Calibration module provides automatic (and manual) RTC calibration. The module is able to operate in all run modes of the MCU if configured accordingly. The Main oscillation clock is used as an accurate time reference signal to measure the (normally) less accurate clock used for the RTC (CLKCAL). If the Main oscillator is switched off (e.g. during low-power mode), the Calibration module will temporarily switch it on, execute the calibration and switch it off afterwards to ensure low-current consumption. Two counters operate during a calibration cycle to measure CLKCAL. The Calibration clock counter measures full clock cycles of CLKCAL and returns the value in RTC_CNTCAL.

Page	Section	Change Results
781	CHAPTER 10: Real Time Clock 3. Operation of the Real Time Clock	Features of "For details" should be added as indicated by the shading below. (Error) Cyclic Calibration Cyclic Calibration, as shown in Figure 3 4, is done in Automatic Calibration mode. The Calibration trigger counter reloads the value configured in RTC_CALTRG and decrements on every second pulse from the RTC. It generates a calibration trigger when it expires. Then Main oscillator start request (MOSCREQ) is asserted to switch on the Main oscillation, which is available after specified stabilization time. The calibration now operates with the Main clock (CLK_MAIN). At the end of a Calibration cycle and with Automatic RTC_WTBR update enabled (RTC_WTCR: ENUP ='1'), RTC_WTBR will be updated with the measured (and scaled) value of RTC_CNTCAL. The Main oscillator start request (MOSCREQ) desserts at the end of the calibration to switch off the Main oscillator in low-power mode. As the Calibration trigger counter reloads after it expires, the Calibration operation repeats cyclically. If the Main clock is missing after MOSCREQ is asserted, a Calibration Failure Detection (CFD) interrupt is generated (if RTC_WINE: CFDE = '1'). The Calibration Trigger Register (RTC_CALTRIG) value defines the duration between two Calibrations. (Correct) Cyclic Calibration Cyclic Calibration, as shown in Figure 3 4, is done in Automatic Calibration mode. The Calibration trigger counter reloads the value configured in RTC_CALTRG and decrements on every second pulse from the RTC. It generates a calibration trigger when it expires. Then Main oscillator start request (MOSCREQ) is asserted to switch on the Main oscillation, which is available after specified stabilization time. The calibration now operates with the Main clock (CLK_MAIN). At the end of a Calibration cycle and with Automatic RTC_WTBR update enabled (RTC_WTCR: ENUP ='1'), RTC_WTBR will be updated with the measured (and scaled) value of RTC_CNTCAL. The Main oscillator start request (MOSCREQ) desserts at the end of the calibration to switch off the Main oscillator in low-power mode. As the Calibration trigger counter reloads after it expires, the Calibration operation repeats cyclically. If the Main clock is missing after MOSCREQ is asserted, a Calibration Failure Detection (CFD) interrupt is generated (if RTC_WINE: CFDE = '1'). The Calibration Trigger Register (RTC_CALTRIG) value defines the duration between two Calibrations.

873	CHAPTER 12: Backup RAM Interface 6. Precautions for Using Device	Features of "For details" should be corrected as indicated by the shading below. (Error) Power domain control for BackupRAM depends on profile setting. To detail profile setting information, please refer to the Chapter "Lowpower". When BackupRAM power restores, the completion for the profile setting needs to be confirmed through profile update status register, or start to access BackupRAM after confirmed profile update completion interrupt register. BackupRAM can configure SLEEP setting during transfer to PSS. To detail SLEEP control information, please refer to the Chapter "Lowpower". When BackupRAM returns from SLEEP setting, start to access BackupRAM after confirmed that PSS had transferred to RUN status through the device status register of the system status register. (Correct) Power domain control for Backup RAM depends on profile setting. To detail profile setting information, please refer to the Chapter "LOW POWER CONSUMPTION". When Backup RAM power restores, the completion for the profile setting needs to be confirmed through profile update status register, or start to access Backup RAM after confirmed profile update completion interrupt register. Backup RAM can configure SLEEP setting during transfer to PSS. To detail SLEEP control information, please refer to the Chapter "LOW POWER CONSUMPTION". When Backup RAM returns from SLEEP setting, start to access Backup RAM after confirmed that PSS had transferred to RUN status through the device status register of the system status register.
905	CHAPTER 14: Hardware Watchdog Timer 3. Explanation of Operation	"PSS operation setting" should be deleted as indicated by the shading below. (Error) - When the device state transitions from PSS to RUN, the enable bit is switched from the WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG) to the WDENRUN bit in the same register. However, the window setting is not switched immediately. For example, when the WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG) is set to "0" and the WDENRUN bit in the same register is set to "1", operation is as follows: Use of the window setting for PSS continues until the watchdog counter clear protection trigger sequence is executed. (Correct) - When the device state transitions from PSS to RUN, the enable bit is switched from the WDENPSS bit in the Hardware watchdog configuration register (HWDG_CFG) to the WDENRUN bit in the same register. However, the window setting is not switched immediately. Use of the window setting for PSS continues until the watchdog counter clear protection trigger sequence is executed.

1333	CHAPTER 24:Security 2.1.Security Scope	Features of "For details" should be deleted as indicated by the shading below (Error) 2.1 Security Scope This section explains scopes of the security supported in FCR4. Security Scope This product has following "security scope" to protect the device from unauthorized access. (Correct) 2.1 Security Scope This section explains scopes of the security. Security Scope This product has following "security scope" to protect the device from unauthorized access.
1333	CHAPTER 24:Security 2. Security Scope and Access Restriction by the Security 2.1.Security Scope	Features of "For details" should be corrected as indicated by the shading below (Error) Device Protection The ability to execute “chip erase” always exists. The marker MK_CEER does not have any functionality. (Correct) Device Protection The ability to execute “chip erase” function depends on the permission set by the marker MK_CEER. The possibility of doing chip erase can be removed, when the user intents to forbid the usage of other parties software on his system. However this removes any possibility for a recovery of a device when not implementing an unlock mechanism or forgetting the key for a device unlock. To protect the software IP only from being disassembled, debugged or copied – the normal security is enough and chip erase functionality should stay enabled.

4. Registers
4.4.Chip Erase Enable Register (TCFCFG0_CEER)</td><td>Features of "For details" should be corrected as indicated by the shading below
(Error)
[31:0] CEER: Chip Erase Enable Register
Disabling chip erase is not possible by this product. Writing to that register has no effect.

<table><tr><th>Value</th><th>Description</th></tr><tr><td>Any</td><td>No effect</td></tr></table>
(Correct)
[31:0] CEER: Chip Erase Enable Register
Full-chip erase can be forbidden using this marker.

<table><tr><th>Value</th><th>Description</th></tr><tr><td>0xFFFFFFFF</td><td>The chip erase of a secured device is enabled.</td></tr><tr><td>Other</td><td>Any other value disables the chip erase in non-USERMODE.</td></tr></table>
Without enabling the security by TCFCFG0_SER, the Chip Erase Enable Register has no meaning.

The chip erase can be triggered by JTAG equipment or Serial Loader equipment. It erases all sectors of the WORKFLASH and TCFLASH. Sectors used for SHE are not erased.

Notes:
− A secured device without an unlock mechanism implemented by the application and without the ability to erase the full device cannot be updated or tested anymore. Not programming the unlock marker value to CEEM should be used with absolute care!
− Single ECC errors are corrected. When double ECC errors are detected, the register is not updated from Flash and the chip erase will be disabled.</td></tr>

1637	CHAPTER 30: CAN FD Message RAM ECC Function Cover	Comment should be deleted as indicated by the shading below. (Error) This specification describes only the block of the CAN FD message RAM ECC function. For the external specifications of the CAN FD controller, see "Chapter: CAN FD Controller". * Furthermore, "Chapter: CAN FD Controller" describes TSS[1:0] register setting as TSS[1:0] : “10” = External timestamp counter value used , but this setting is forbidden for this product. If set, operation will be as same as “TSS[1:0] : “00”= Timestamp counter value always 0x0000”.
1638	CHAPTER 30: CAN FD Message RAM ECC Function 1.Overview	"1.Overview" should be corrected as indicated by the shading below. (Error) 1. Overview Note: − ECC error generation function of the message RAM is not supported for Traveo Platform. Therefore CAN FD ECC Error Insertion Control Register (FDFECR) is not writeable. (Correct) 1.Overview Note: −ECC error generation function of the message RAM is not supported for Traveo Platform. Therefore CAN FD ECC False Error Control Register (FDFECR) is not writeable.

1639	CHAPTER 30: CAN FD Message RAM ECC Function 2.Configuration	"Figure 2-1" should be corrected as indicated by the shading below. (Error)  (Correct) 
Page	Section	Change Results
1640	CHAPTER 30: CAN FD Message RAM ECC Function 2.Configuration	"2. Configuration" should be corrected as indicated by the shading below. (Correct) 2. Configuration Figure 2-1 is a block diagram of the CAN FD Message RAM ECC Function. ■Message RAM Consists of 32-bit RAM, in which Tx/Rx messages is stored. ■ECC Consists of 7 bits, in which the ECC data for bits 31 to 0 of the Message RAM is stored. ■ECC generator Generates ECC data from data to be written in the Message RAM. ■False error control Controls whether to generate ECC data that causes an ECC error or to output normal ECC data. ■ECC check & correction Combines Message RAM data and ECC data together to check for a single- or double-bit error. For a single-bit error, this circuit corrects the data. ■Bus arbiter Arbitrates access by the CPU and CAN FD Controller, and reads data from or writes data to the Message RAM. ■FDESCR CAN FD ECC error status clear register ■FDESR CAN FD ECC error status register ■FDFECR CAN FD ECC false error control register
1641	CHAPTER 30: CAN FD Message RAM ECC Function 3. Interrupts	"3. Interrupts" should be corrected as indicated by the shading below. (Error) 3. Interrupts Interrupts of the CAN FD message RAM ECC function The message RAM ECC supports the following interrupts. (Correct) 3. Interrupts Interrupts of the CAN FD Message RAM ECC Function The Message RAM ECC Function supports the following interrupts.

1642	CHAPTER 30: CAN FD Message RAM ECC Function 4. Explanation of Operation	"4. Explanation of Operation" should be corrected as indicated by the shading below. (Error) 4. Explanation of Operation This section explains the operation and function of the CAN FD message RAM ECC. This section explains the following functions. ■ Message RAM ECC generation ■ Message RAM ECC test ■ ECC error insertion function of the message RAM (Correct) 4. Explanation of Operation This section explains the operations and functions of the CAN FD Message RAM ECC. This section explains the following functions. ■Message RAM ECC generation ■Message RAM ECC check ■ECC false error control function of the Message RAM
1643	CHAPTER 30: CAN FD Message RAM ECC Function 4. Explanation of Operation 4.1. Message RAM ECC Generation	"4.1. Message RAM ECC Generation" should be corrected as indicated by the shading below. (Error) This section explains ECC generation of the message RAM. ECC generation The CAN FD message RAM is made up of 32 bits and an additional 7 bits for ECC. When data is written to the CAN FD message RAM, ECC data is generated from the write data based on the syndrome, and is written together with the write data. (Correct) This section explains ECC generation of the Message RAM. ECC generation The CAN FD Message RAM is made up of 32 bits and an additional 7 bits for ECC. When data is written to the CAN FD Message RAM, ECC data is generated from the write data based on the syndrome, and is written together with the write data.

Page	Section	Change Results
1644	CHAPTER 30: CAN FD Message RAM ECC Function 4. Explanation of Operation 4.2. Message RAM ECC Check	"4.2. Message RAM ECC Test" should be corrected as indicated by the shading below. (Error) 4.2. Message RAM ECC Test This section explains the ECC test of the message RAM. ECC test When data is read from the message RAM, the ECC data is also read. In the ECC test, calculation is performed based on the syndrome to determine whether the data in the message RAM is correct. If it is determined from the test result that the data in the message RAM is incorrect due to a RAM defect or another problem, the following operation is performed. ■ In the case where only 1 bit in the data is incorrect (single-bit error): The single-bit error occurrence bit (FDESR.SEI) is set and the RAM address is set in the CAN FD ECC single-bit error address register (FDSEAR). The incorrect 1-bit data is corrected and then is read as normal data. ■ In the case where 2 bits in the data are incorrect (double-bit error): The double-bit error occurrence bit (FDESR.DEI) is set and the RAM address is set in the CAN FD ECC double-bit error address register (FDDEAR). The incorrect data is not corrected and then is read as it is. If the interrupt enable bit corresponding to each error bit (FDESR.SEI or FDESR.DEI) has been set to "1", "1" is set in the error bit and an interrupt occurs at this time. **Stopping of the CAN FD controller upon error detection** If the CAN FD controller detects a double-bit error when it reads the message RAM, it sets the INIT bit in its CC control register. Then, the CAN FD controller stops. **Error response to CPU upon error detection** When error response is enabled (FDECR.CEREN = "1"), if the CPU reads the message RAM and a double-bit error is detected at this time, an error response is returned to the CPU. (Correct) 4.2. Message RAM ECC Check This section explains the ECC check of the Message RAM. ECC check When data is read from the Message RAM, the ECC data is also read. In the ECC check, calculation is performed based on the syndrome to determine whether the data in the Message RAM is correct. If it is determined from the check result that the data in the Message RAM, the following operation is performed. ■ In the case where only 1 bit in the data is incorrect (single-bit error): The single-bit error occurrence bit (FDESR.SEI) is set and the RAM address is set in the CAN FD ECC single-bit error address register (FDSEAR). The incorrect 1-bit data is corrected and then is read as normal data. ■ In the case where 2 bits in the data are incorrect (double-bit error): The double-bit error occurrence bit (FDESR.DEI) is set and the RAM address is set in the CAN FD ECC double-bit error address register (FDDEAR). The incorrect data is not corrected and then is read as it is. If the interrupt enable bit corresponding to each error bit (FDESR.SEI or FDESR.DEI) has been set to "1", an interrupt occurs when the error bit is set to "1". **Stopping of the CAN FD Controller upon error detection** If the CAN FD Controller detects a double-bit error when it reads the Message RAM, it sets the INIT bit in its CC control register (CCCR). Then, the CAN FD Controller stops. **Error response to CPU upon error detection** When error response is enabled (FDECR.CEREN = "1"), if the CPU reads the Message RAM and a double-bit error is detected at this time, an error response is returned to the CPU.

■ SRA15 to 0 are valid when the SEI bit in the CAN FD ECC status register (FDESR) is "1".
■ When the SEI bit in the CAN FD ECC status register (FDESR) changes from "0" to "1", the message RAM address is written in the CAN FD ECC single-bit error address register (FDSEAR). Then, this value is retained as long as the SEI bit in the CAN FD ECC status register (FDESR) is "1". Therefore, even if a single-bit error is detected more than once, this register retains the address value for the first detected error until the SEI bit in the CAN FD ECC status register (FDESR) is cleared to "0".

(Correct)
6.5. CAN FD ECC Single-bit Error Address Register (FDSEAR)
[bit15:0] SRA15 to SRA0: Double-bit error Message RAM address bits
<table>
<tr><th>SRA15 to SRA0</th><th>Description</th></tr>
<tr><td>0x0000</td><td>Indicates that a double-bit error has occurred at Message RAM address 0.</td></tr>

1658	CHAPTER 30: CAN FD Message RAM ECC Function 7. Precautions	"7. Precautions for Using This Device" should be corrected as indicated by the shading below. (Error) 7. Precautions for Using This Device This section explains precautions on the use of the CAN FD message RAM ECC. **Access to the message RAM** ■ To access the message RAM, perform 32-bit access. Using another number of bits as the unit of access may cause an ECC error or the writing of wrong data to the message RAM because the data in the message RAM is tested as 32-bit long data. **ECC test** ■ The data in the message RAM is undefined after power-on. Therefore, a double- or single-bit error may occur if the message RAM is read before data is written to the message RAM area to be used. After power-on, write data to the message RAM area to be used before reading the message RAM. ■ The following bits can be changed when the configuration change enable bit in the CC control register of the CAN FD controller (CCCR.CCE bit) is "1". – ECC error response enable bit (CEREN) in the CAN FD ECC error control register (FDECR) – ECC test disable bit (CEIV) in the CAN FD ECC error control register (FDECR) ■ If an ECC error is detected in read access to the message RAM from the CAN FD controller, the following bits are set: the error flags regarding the ECC of the CAN FD controller (IR.BEU and IR.BEC) and the error flags regarding the ECC of the message RAM (FDESR.DEI and FDESR.SEI). ■ If an ECC error is detected in read access to the message RAM from the CPU, the error flags regarding the ECC of the message RAM (FDESR.DEI and FDESR.SEI) are set. (Correct) 7. Precautions This section explains precautions on the use of the CAN FD Message RAM ECC. **Access to the Message RAM** ■ To access the Message RAM, perform 32-bit access. Using another number of bits as the unit of access may cause an ECC error or the writing of wrong data to the Message RAM because the data in the Message RAM is tested as 32-bit long data. **ECC check** ■ The data in the Message RAM is undefined after power-on. Therefore, a double- or single-bit error may occur if the Message RAM is read before data is written to the Message RAM area to be used. After power-on, write data to the Message RAM area to be used before reading the Message RAM. ■ The following bits can be changed when the configuration change enable bit in the CC control register of the CAN FD Controller (CCCR.CCE bit) is "1". – ECC error response enable bit (CEREN) in the CAN FD ECC error control register (FDECR) – ECC check disable bit (CEIV) in the CAN FD ECC error control register (FDECR) ■ If an ECC error is detected in read access to the Message RAM from the CAN FD Controller, the following bits are set: the error flags regarding the ECC of the CAN FD Controller (IR.BEU and IR.BEC) and the error flags regarding the ECC of the Message RAM (FDESR.DEI and FDESR.SEI). ■ If an ECC error is detected in read access to the Message RAM from the CPU, the error flags regarding the ECC of the Message RAM (FDESR.DEI and FDESR.SEI) are set.

Page	Section	Change Results
1658	CHAPTER 30: CAN FD Message RAM ECC Function 7. Precautions	"7. Precautions for Using This Device" should be corrected as indicated by the shading below. (Error) **ECC error insertion function** ■ Even if the TM_CANFERR signal is set to "L" after error data is written to the message RAM by using the ECC error insertion function, the error data remains in the message RAM. Therefore, reading this error data detects an ECC error. ■ When the TM_CANFERR signal is "L", the CAN FD ECC error insertion control register (FDFECR) cannot be written. When the TM_CANFERR signal becomes "L", the bits that have been set to "1" become "0". ■ With the ECC error insertion function, error data can be written to the message RAM by the CAN FD controller or CPU. (Correct) **ECC False Error Control Function** ■ Even if the TM_CANFERR signal is set to "L" after error data is written to the Message RAM by using the ECC false error control function, the error data remains in the Message RAM. Therefore, reading this error data detects an ECC error. ■ When the TM_CANFERR signal is "L", the CAN FD ECC false error control register (FDFECR) cannot be written. When the TM_CANFERR signal becomes "L", the bits that have been set to "1" become "0". ■ With the ECC false error control function, error data can be written to the Message RAM by the CAN FD Controller or CPU.

(Error)

FTICR2, FTICR1: FIFO2 data count indication bit, FIFO1 data count indication bit
<table>
<tr><td>Write</td><td>Set the number of valid data items that generates an interrupt.</td></tr>
<tr><td>Read</td><td>Read valid data count.</td></tr>
</table>

Notes:
– Any setting that exceeds the FIFO capacity is prohibited.
– The setting value cannot be read.
– As the FIFO data count for transmission, the transmission data count that has been written, minus 1, is displayed as the valid data count. This is because an attempt to write data to the TDR register stores the data in the transmission FIFO if the TDR register contains data that is yet to be transmitted. When the data in the TDR register is transmitted, the data in the transmission FIFO that has not yet been transmitted is transferred to the TDR register.
– The FIFO data count for reception represents the data count received by the reception FIFO but which has not yet been read. The data count does not include the data that has been received by the RDR register.
– If block transfer is performed during DMA transfer, only block size 1 can be set. To perform block transfer with ECR:TXBLKEN = 1, set the block size value in this register.

(Correct)
[bit15:8] FTICR2: FIFO2 Data Count Indication Byte
[bit7:0] FTICR1:FIFO1 Data Count Indication Byte

Page	Section	Change Results
2519	CHAPTER 38:Base Timer 3.Operations of the Base Timer	Features of "For details" should be corrected as indicated by the shading below. (Error) 16-bit PWM timer The 16-bit PWM timer starts counting down from the set cycle value upon trigger activation. The first output at that time is the L level. 16-bit PPG timer The 16-bit PPG timer starts counting down from the set value in the L width setting reload register upon trigger activation. The first output at that time is the L level. 16-bit reload timer The output level is either toggle output or pulse output. Toggle output is the output inverted for each underflow by the MDSE bit setting. Pulse output is the output of "H" due to the start of counting or "L" due to an underflow.. 16-bit PWC timer The PWC timer starts the 16-bit up counter upon input of the set measurement start edge. The timer stops the counter upon the detection of a measurement end edge. The count value at this time is stored as a pulse width in the data buffer register. (Correct) 16-Bit PWM Timer The 16-bit PWM Timer starts counting down from the set cycle value upon trigger activation. In the beginning the output level is "L". 16-Bit PPG Timer The 16-bit PPG Timer starts counting down from the set value in the Low Width Setting Reload Register (PRLL) upon trigger activation. In the beginning the output level is "L". 16-Bit Reload Timer The output level is defined by the MDSE bit setting - the polarity of the output is toggled each time an underflow is detected, or, the output is set to "H" when counting starts and switches to "L" when an underflow is detected. 16-Bit PWC Timer The PWC Timer starts the 16-bit up counter upon detection of the measurement start edge, and stops the counter upon the detection of a measurement end edge. The resulting count value will be stored as the measured pulse width in the Data Buffer Register (DTBF).

Page	Section	Change Results
2520	CHAPTER 38:Base Timer 4.32-bit Mode Operation	Features of "For details" should be corrected as indicated by the shading below. (Error) 32-bit mode settings There is no need to set reset mode. After the writing of the T32 bit, the change to 32-bit operation mode is reflected immediately, so change the settings for both channels in the count stopped state. 32-bit mode operation Timer start, waveform output, and interrupt signals for the even-numbered channel are valid. (The odd-numbered channel is fixed at "L" and masked.) (Correct) 32-Bit Mode Settings There is no need to set the odd-numbered channel to Reset mode. After the writing of the T32 bit, the change to 32-bit operation mode is reflected immediately, so change the settings for both channels while the counter is in a stopped state. 32-Bit Mode Operation The timer start, waveform output, and interrupt signals of the even-numbered channel are valid. (The corresponding signals for the odd-numbered channel will be masked to "L".)
2523	CHAPTER 38:Base Timer 5.Debug Mode	Features of "For details" should be added as indicated by the shading below. (Correct) 5.Debug Mode If it goes into a Debug mode, operation of the Base Timer can be stopped and debugged. If all the following conditions are satisfied, it will go into the Debug mode. −The debug enable bit (DBGEN) of the Base Timer Debug Register (BT_DEBUG) is "1". −The debug signal (DEBUG) is active. It becomes the following operation when it goes into the Debug mode. −The prescaler stop. −The timer stop. −The output waveform stop. −It holds the output value at the time of the stop. −The trigger is ignored in PWM Timer, PPG Timer or Reload timer. −The measurement edge is ignored in PWC Timer. It becomes the following operation when it restores from the Debug mode. −The prescaler is resumed from the stopped value. −The timer is resumed from the stopped value. −The output waveform resumes the output from the stopped state. Note: −Register access is possible in the Debug mode.

Page	Section	Change Results
2528	CHAPTER 38:Base Timer 9.Notes on Using the Base Timer	Features of "For details" should be corrected as indicated by the shading below. (Error) Notes on using the PWC timer If the PWC mode setting (FMD2 to FMD0 = "100") and the measurement start setting (CTEN="1") are made from a system reset and reset mode at the same time, the resulting operation may depend on the state of the immediately preceding measurement signal. If a measurement start edge is detected at the same time that a restart is set in continuous measurement mode, the timer starts counting immediately from "0x0001". If a restart is performed after a count operation begins, operations such as the following may occur, depending on the timing. (Correct) Notes on using the PWC Timer If the PWC mode setting (FMD2 to FMD0 = "100") and the measurement start setting (CTEN="1") are set simultaneously after a system reset assertion or upon leaving Reset mode, the PWC Timer operation may vary due to the state of the immediately preceding measurement signal. When operating in continuous measurement mode, if a measurement start edge is detected at the same time that the Base Timer has been restarted, the timer starts counting immediately from 0x0001. If a restart is performed after a count operation begins, operations such as the following may occur, depending on the timing the restart has been performed.

In 32-bit mode, the value of the lower 16 bits is read for the even-numbered channel, and the value of the upper 16 bits for the odd-numbered channel. (Correct) 10.4.3.Data Buffer Register (DTBF) The Data Buffer Register (DTBF) is a register that can read the measurement value or count value of the PWC Timer. In 32-bit mode, if this is an even-numbered channel the lower 16 bits will be read similarly, for odd number channels, the upper 16 bits will be read.
2623	CHAPTER38: Base Timer 10.4.4.Base Timer Debug Register (BT_DEBUG)	Added the section ” 10.4.4.Base Timer Debug Register (BT_DEBUG)”
2628	CHAPTER 39: Base Timer I/O SELECTION FUNCTION 3. Explanation of Operation	"I/O mode 2" should be corrected as indicated by the shading below (Error) I/O mode 2: External trigger sharing mode This mode enables simultaneous input of external start triggers to the base timers of 2 channels. The base timers of the 2 channels can be started simultaneously. (Correct) I/O mode 2: PPG trigger 2-channel sharing mode This mode enables simultaneous input of external start triggers to the base timers of 2 channels. The base timers of the 2 channels can be started simultaneously.

Page	Section	Change Results
2636	CHAPTER 39: Base Timer I/O SELECTION FUNCTION 4.4 Simultaneous Soft Start Register (BT_BTSSSR0)	"4.4 Simultaneous Soft Start Register (BT_BTSSSR0)" should be corrected as indicated by the shading below (Error) 4.4. Simultaneous Soft Start Register (BT_BTSSSR0) [bit11:0] SSSR11 to SSSR0: Simultaneous soft start bits These bits represent input signals in I/O modes 5 and 6. For details on connections, see the block diagram of each I/O mode in "3. Explanation of Operation." Writing "1" starts the corresponding channel, and writing "0" is invalid Up to 12 channels with channel numbers 0 to 11 can be started simultaneously. (Correct) 4.2. Simultaneous Soft Start Register (BT_BTSSSR0) [bit11:0] SSSR11 to SSSR0: Simultaneous soft start bits These bits represent input signals in I/O modes 5 and 6. For details on connections, see the block diagram of each I/O mode in "3. Explanation of Operation." Writing "1" starts the corresponding channel, and writing "0" has no effect. Up to 12 channels with channel numbers 0 to 11 can be started simultaneously.

2639 to 2680	CHAPTER40 Base Timer Simultaneous Operation	Added a new chapter named “CHAPTER40 Base Timer Simultaneous Operation”
2682	CHAPTER 41: 32-Bit Free-Run Timer 1. Overview of the 32-Bit Free-Run Timer	Features of "For details" should be corrected as indicated by the shading below. (Error) 1. Overview of the 32-bit Free-run Timer This timer can be used with the 32-bit input capture and the 32-bit output compare. This timer can measure the input pulse width and external clock cycle. The 9 types of counter operation clocks (φ, φ/2, φ/4, φ/8, φ/16, φ/32, φ/64, φ/128, and φ/256) (φ: peripheral clock) can be selected. The count value is reset to "00000000H" when a hardware reset occurs, software clears the timer, or the value of the compare clear register and the count value match in up count mode. The output value of the 32-bit counter can be used as a clock count of the output compare and the input capture. (Correct) 1. Overview of the 32-bit Free-run Timer This timer can be used with the 32-bit Input Capture and the 32-bit Output Compare. The 9 types of count clocks (ϕ, ϕ/2, ϕ/4, ϕ/8, ϕ/16, ϕ/32, ϕ/64, ϕ/128, and ϕ/256) (ϕ: peripheral clock) can be selected. The count value is reset to 0x00000000 when a hardware reset occurs, clears the timer, or the value of the Compare Clear Register and the count value match in up count mode. The output value of the 32-bit Free-run Timer can be used as a clock count of the 32-bit Output Compare and the 32-bit Input Capture.

2718	CHAPTER41:32-Bit Free-Run Timer 5.Precautions for Using This Device	Features of "For details" should be corrected as indicated by the shading below. (Error) When accessing the timer state control register (TCCS) This register supports writing from the bit-band alias area. For the bit-band alias area, see "CHAPTER: BIT-BAND UNIT." [x] In the normal reading mode, the interrupt mask counter value is read from MSI2 to MSI0. When accessing the timer extended state control register (TECCS) In the normal reading mode, the interrupt mask counter value is read from MSI5 to MSI3. When setting using a program When the hardware is reset, the count value becomes "00000000H", but the 0 detection interrupt flag is not set. When the timer mode bit (MODE: bit5 of the timer state control register (TCCS)) is in the up count mode (MODE: bit5=0), the count value is updated to 0 and fixed to 0. Then, the 0 detection interrupt flag and the compare clear flag are set at every count clock. When the timer count mode bit (MODE: bit5 of the timer state control register (TCCS)) is in the up/down count mode (MODE: bit5=1), the count value is counted up from "00000000H" to "FFFFFFFFH", and this up count operation is repeated. The 0 detection interrupt flag and the compare clear flag are set to "1" when the count value becomes 0. (Correct) When Accessing the Timer State Control Register (TCCS) In the normal reading mode, the interrupt mask counter value is read from Interrupt Mask Selection bits(MSI[2:0]) in the Timer State Control Register (TCCS). When Accessing the Timer Extended State Control Register (TECCS) In the normal reading mode, the interrupt mask counter value is read from Compare Clear Interrupt Mask Selection bits(MSI[5:3]) in the Timer Extended State Control Register (TECCS). When Setting Using a Program When the hardware is reset, the count value becomes 0x00000000, but the 0 Detection Interrupt Flag (IRQZF) in the Timer State Control Register (TCCS) is not set. When the timer mode bit (the Timer Count Mode bit(MODE) in the Timer State Control Register (TCCS)) is in the up count mode (the Timer Count Mode bit(MODE) in the Timer State Control Register (TCCS) ="0"), the count value is updated to 0x000000000 and fixed to 0x000000000. Then, the 0 Detection Interrupt Flag (IRQZF) in the Timer State Control Register (TCCS) and the Compare Clear Interrupt Flag (ICLR) in the Timer State Control Register (TCCS) are set at every count clock. When the Timer Count Mode bit (MODE) in the Timer State Control Register (TCCS) is in the up/down count mode (Timer Count Mode bit(MODE) in the Timer State Control Register (TCCS) ="1"), the count value is counted up from 0x00000000 to 0xFFFFFFFF, and this up count operation is repeated. The 0 Detection Interrupt Flag (IRQZF) in the Timer State Control Register (TCCS) and the Compare Clear Interrupt Flag (ICLR) in the Timer State Control Register (TCCS) are set to "1" when the count value becomes 0x000000000.

922	CHAPTER 14:Hardware Watchdog Timer 3.Explanation of Operation.	Features of "For details" should be corrected as indicated by the shading below. The following figure shows the Hardware watchdog operation in RUN. (Error) The watchdog counter in RUN always operates. When the device state transitions from RUN to PSS, the processing transitions to the operation of the watchdog in PSS. For details, see The following figure shows the Hardware watchdog operation in PSS. 5.During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Do this to clear the watchdog counter periodically. 6.If a runaway state caused by a user program occurs and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI). 7.According to the value of the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Hardware watchdog reset delay counter register (HWDG_RSTDLY) are inserted. 8.After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3 6. (Correct) 1.The watchdog counter in RUN always operates. 2.When the device state transitions from RUN to PSS, the processing transitions to the operation of the watchdog in PSS. For details, see Figure 3-5. 3.During the operation of the watchdog counter, execute the watchdog counter clear protection trigger sequence within the range between the window upper limit value and lower limit value that have been specified beforehand. Do this to clear the watchdog counter periodically. 4.If a runaway state caused by a user program occurs and prevents periodic clearing, the watchdog counter reaches the window upper limit value. Then, processing transitions to the flow that generates the watchdog reset request or watchdog interrupt request (NMI). 5.According to the value of the IRQEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT), the prior warning interrupt request is generated. At the same time, as many cycles as are set for the delay time in the Hardware watchdog reset delay counter register (HWDG_RSTDLY) are inserted. 6.After the elapse of the time corresponding to the number of cycles for the delay time, the watchdog reset request or watchdog interrupt request (NMI) is generated according to the value of the RSTEN bit in the Hardware watchdog interrupt configuration register (HWDG_INT). When the watchdog interrupt request (NMI) is generated, the processing transitions to the operation of the test function of the watchdog. For details, see Figure 3 6.
925	CHAPTER 14:Hardware Watchdog Timer 3.Explanation of Operation.	Features of "For details" should be corrected as indicated by the shading below. The following figure shows the operation of the test function of the Hardware watchdog. Revision History

Document Revision History

Document Title: S6J3120 Series 32-bit Microcontroller Traveo™ Family Hardware Manual Document Number: 002-04855			
Revision	**ECN No.**	**Origin of Change**	**Description of Change**
**	-	HIHA	New Spec
*A	4993756	WECU	Added 144pin PWUTRG function. Added simultaneous function which select each channel of ADC in each channel of the BaseTimer as 1:N. Stipulate select method as 1:N. Add a function to stop the BaseTimer / FreeRunTimer, during debug operation. Added simultaneous function for start timing of PWM does not overlap. Revised access restriction in Non-USERMODE: full chip erase is invalid Added I2C function. Updated CANFD macro (updated to v3.2.0). Updated MFS macro. Added description for error reply in" DMA Complex Subsystem"as When stopping DMA_CLK and accessing a register, an error reply is returned. Added "CLK_STS" bit inChapter of " REAL TIME CLOCK". Published MPU(Memory Protection Unit) for AXI of SHE. Revised operating frequency to 128MHz, and revised clock frequency based 128MHz. Added partial wakeup macro. Added full product names. For detail, see "CHAPTER 67: APPENDIX: Major Changes".
*B	5348483	WECU	Revised the title. Revised TYPO. Revised part number from S6J312xxxB to S6J312xxxC. For detail, see "Major Changes".

Revision	ECN No.	Origin of Change	Description of Change
*C	5371743	WECU	Added Note in Low-Voltage Detection. For detail, see “Major Changes”.
*D	5645073	TMOR	Added specfication limitation and so on. For detail, see “Major Changes”.
*E	6245707	MXNI	Part Number Option is updated. S6J3128HAC, S6J3128HBC is removed. Revised Chapters are the following: CHAPTER 1: Overview, CHAPTER 5: Clock System, CHPATER 6: Low Power Consumption, CHPATER 17: TCFLASH, CHPATER 63: APPENDIX: State Transition, CHPATER 65: APPENDIX: DMA Channel Activation Factors, CHPATER 66: APPENDIX: List of Interrupt Vector and NMI Map
