OPTIREG™ Linear TLS102B0MB
High Precision Voltage Tracker

Features

• 20 mA current capability
• Very high accuracy tracking
• Output voltage adjustable down to 2.0 V
• Stable with ceramic output capacitors
• Very low dropout voltage of typically 120 mV at 20 mA
• Very low current consumption of typically 3 µA in off mode
• Wide input voltage range \(-16 \text{ V} \leq V_{\text{IN}} \leq 45 \text{ V}\)
• Wide temperature range: \(-40^\circ\text{C} \leq T_j \leq 150^\circ\text{C}\)
• Short circuit protected output (to GND and to battery)
• Reverse polarity protected input
• Overtemperature protection
• Green Product (RoHS compliant)

Potential applications

• Automotive sensor supply
• Protected sensor supply for off-board sensors
• Secondary voltage supply for automotive ECU
• High precision voltage tracking
• Precision voltage replication
• Power switch for off-board load

Product validation

Qualified for Automotive Applications.
Product validation according to AEC-Q100/101.

Description

The OPTIREG™ Linear TLS102B0MB is a monolithic integrated low-dropout voltage tracking regulator with high accuracy in small PG-SCT595-5 package. The TLS102B0MB is designed to supply off-board systems, for example sensors in powertrain management systems under the severe conditions of automotive applications. Therefore, the TLS102B0MB is equipped with additional protection functions against reverse polarity as well as short circuit to GND and battery. Up to a supply voltage of 40 V and up to an output current of 20 mA the output voltage follows the reference voltage applied to the EN/ADJ input with very high accuracy. The required minimum reference voltage at EN/ADJ is 2.0 V.

Notes:

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability.

2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” the normal operating range. Protection functions are not designed for continuous repetitive operation.

4. The minimum output capacitance requirement is applicable for a worst case capacitance tolerance of 30%
5. Relevant ESR value at $f = 10$ kHz.
6. Not subject to production test, specified by design.
7. Specified $R_{\text{thJA}}$ value is according to JEDEC JESD51-2,-5,-7 at natural convection on FR4 2s2p board; the product (chip and package) was simulated on a 76.2 × 114.3 × 1.5 mm$^3$ board with two inner copper layers (2 × 70 μm Cu, 2 × 35 μm Cu). Where applicable, a thermal via array next to the package contacted the first inner copper layer.
8. Package mounted on PCB FR4; 80 × 80 × 1.5 mm$^3$; 35 μm Cu, 5 μm Sn; horizontal position; zero airflow.
4 Block description and electrical characteristics

4.1 Tracking regulator

The regulator controls the output voltage $V_{\text{OUT}}$ by comparing it to the reference voltage applied to the EN/ADJ pin and driving a PNP pass transistor accordingly. The stability of the control loop depends on the following parameters:

- output capacitor $C_{\text{OUT}}$
- load current
- IC temperature
- poles and zeroes in the frequency response of the circuit including TLS102B0MB
- external circuitry

To ensure stable operation, the output capacitor’s capacitance and its equivalent series resistance $\text{ESR}$ must meet the requirements given in Table 3. Also the output capacitor must be sized suitably to buffer load transients.

An input capacitor $C_{\text{IN}}$ is strongly recommended to buffer disturbances on the line. Connect each capacitor close to the pins.

Protection circuitry prevents the TLS102B0MB itself as well as the application from destruction in case of catastrophic events. These safeguards contain the following:

- output current limitation
- reverse polarity protection
- thermal shutdown

**Output current limitation**

In order to protect the pass element and the package from excessive power dissipation the TLS102B0MB limits the maximum output current at high input voltage.

**Reverse polarity protection**

The TLS102B0MB allows a negative supply voltage. However, in reverse polarity condition several small currents flow into the TLS102B0MB causing an increase in the junction temperature. Thermal design must consider this effect, as the overtemperature protection circuit does not operate in reverse polarity condition.

**Thermal shutdown**

The overtemperature protection circuit prevents immediate destruction of the TLS102B0MB in certain fault conditions (for example a continuous short circuit at output) by switching off the power stage. As soon as the IC cools down sufficiently, the regulator restarts. If the fault is not removed, this then leads to an oscillatory behavior of the output voltage. Please note, that a junction temperature above 150°C is outside the maximum ratings and reduces the lifetime of the TLS102B0MB.

Current consumption $I_q$ versus junction temperature $T_j$

Current consumption $I_q$ versus junction temperature $T_j$ ($I_{OUT}$ low)
Current consumption in OFF mode $I_{q,\text{off}}$ versus junction temperature $T_j$
4.5 Enable/Adjust input

In order to reduce the quiescent current to a minimum, the TLS102B0MB can be switched to stand-by mode by setting the corresponding enable/adjust input “EN/ADJ” to “low”.

If the pin EN/ADJ is left open, an internal pull-down resistors keeps the voltage at the pin low and therefore ensures that the regulator is switched off.

5 Application information

Note: The following information is given as an example for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

5.1 Application diagram

![Application circuit diagram]

Figure 3 Application circuit

Note: This figure is a very simplified example of an application circuit. The function must be verified in the real application.

5.2 Selection of external components

5.2.1 Input pin

Figure 3 shows a typical input circuitry for a voltage tracking regulator. The following external components at the input are recommended in case of possible external disturbance.

Ceramic capacitor

A ceramic capacitor $C_{IN1}$ (100 nF to 470 nF) at the input filters high frequency disturbance imposed by the line, such as ISO pulses 3a/b. Place $C_{IN1}$ as close as possible to the input pin of the voltage tracking regulator on the PCB.
Aluminum electrolytic capacitor
An aluminum electrolytic capacitor $C_{IN2}$ (10 µF to 470 µF) at the input smoothens high energy pulses, such as ISO pulse 2a. Place $C_{IN2}$ close to the input pin of the voltage tracking regulator on the PCB.

Overvoltage suppression diode
A suitably sized diode $D_1$ suppresses high voltage beyond the maximum ratings of the circuit components and protects the devices from damage due to overvoltage.

5.2.2 Output pin
An output capacitor $C_{OUT}$ is mandatory for the stability of the voltage tracking regulator. The values for $C_{OUT}$ and $ESR_{C_{OUT}}$ must comply with the specifications in Table 3 described under Output capacitor’s capacitance required for stability and Output capacitor’s ESR required for stability. The graph of Output capacitor Equivalent Series Resistance $ESR_{C_{OUT}}$ versus output current $I_{OUT}$ shows the stable operating range of the TLS102B0MB.

For the automotive environment, ceramic capacitors with X5R or X7R dielectrics are recommended.
Place $C_{OUT}$ on the same side of the PCB as the regulator itself and as close as possible to both the tracker output pin and the GND pin.
To deal with rapid transients of input voltage or load current, $C_{OUT}$ must be dimensioned appropriately for the application. The output stability must be verified in the actual application.

5.2.3 Enable/Adjust pin

Figure 3 shows the typical input circuitry for a voltage tracking regulator. Typically the Enable/Adjust Pin is connected to a fixed voltage reference which is tracked by the regulator. In the example of the application diagram EN/ADJ is connected to the supply voltage of a microcontroller. Alternatively, the voltage reference can also be adjusted by a voltage divider.

5.3 Thermal considerations

Knowing the input voltage, the output voltage and the load profile of the application, the total power dissipation can be calculated by:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_q$$

Equation 1

with
- $P_D$: continuous power dissipation
- $V_{IN}$: input voltage
- $V_{OUT}$: output voltage
- $I_{OUT}$: output current
- $I_q$: quiescent current

The maximum acceptable thermal resistance $R_{thJA}$ can then be calculated by:
\[ R_{\text{thJA, max}} = \frac{T_{j, \text{max}} - T_a}{P_D} \]

Equation 2

with

- \( T_{j, \text{max}} \): maximum allowed junction temperature
- \( T_a \): ambient temperature

Based on the above calculation the proper PCB type and the necessary heat sink area can be determined with reference to the specification in Table 4.

Example

Application conditions:

- \( V_{\text{IN}} = 13.5 \text{ V} \)
- \( V_{\text{OUT}} = V_{\text{ADJ}} = 5 \text{ V} \)
- \( I_{\text{OUT}} = 20 \text{ mA} \)
- \( T_a = 125^\circ \text{C} \)

Calculation of \( R_{\text{thJA, max}} \):

\[
P_D = (V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{OUT}} + V_{\text{IN}} \times I_q = (13.5 \text{ V} - 5 \text{ V}) \times 20 \text{ mA} + 13.5 \text{ V} \times 0.9 \text{ mA} = 0.182 \text{ W}
\]

Equation 3

\[
R_{\text{thJA, max}} = \frac{T_{j, \text{max}} - T_a}{P_D} = \frac{150^\circ \text{C} - 125^\circ \text{C}}{0.182 \text{ W}} = 137.36 \text{ K/W}
\]

Equation 4

As a result, the PCB design must ensure a thermal resistance \( R_{\text{thJA, max}} \) lower than 137.36 K/W.

According to Table 4, at least 300 mm² heatsink area is required on the FR4 1s0p PCB, or the FR4 2s2p board can be used.
Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

In addition, any information given in this document is subject to customer's compliance with its obligations stated in this document and any applicable legal requirements, norms and standards concerning customer's products and any use of the product of Infineon Technologies in customer's applications.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

WARNINGS
Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.

Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.
