OPTIREG™ Linear TLS715B0NAV50
Low dropout linear voltage regulator

Features
- Wide input voltage range from 4.0 V to 40 V
- Output voltage 5 V
- Output voltage accuracy ±2%
- Output current up to 150 mA
- Low current consumption of 36 µA
- Very low dropout voltage of typically 180 mV at 100 mA output current
- Stable with small output capacitor of 1 µF
- Enable
- Overtemperature shutdown
- Output current limitation
- Wide temperature range from -40°C up to 150°C
- Green Product (RoHS compliant)

Potential applications
- ADAS applications (CAN supply)
- Infotainment, Dashboard
- Automotive applications especially with tight space constraints

Product validation
Qualified for automotive applications. Product validation according to AEC-Q100/101.

Description
The OPTIREG™ Linear TLS715B0NAV50 is a low dropout linear voltage regulator for load current up to 150 mA. An input voltage of up to 40 V is regulated to $V_{Q,nom} = 5$ V with ±2% precision.

The TLS715B0NAV50, with a typical quiescent current of 36 µA, is the ideal solution for systems requiring very low operating current, such as those permanently connected to the battery.

It features a very low dropout voltage of 180 mV, when the output current is less than 100 mA. In addition, the dropout region begins at input voltages of 4.0 V (extended operating range). This makes the TLS715B0NAV50 suitable to supply automotive systems with start-stop requirements.

The device can be switched on and off by the Enable feature as described on Chapter “Enable” on Page 15. In addition, the TLS715B0NAV50’s new fast regulation concept requires only a single 1 µF output capacitor to maintain stable regulation.
The device is designed for the harsh environment of automotive applications. Therefore standard features like output current limitation and overtemperature shutdown are implemented and protect the device against failures like output short circuit to GND, over-current and over-temperature. The TLS715B0NAV50 can be also used in all other applications requiring a stabilized 5 V supply voltage.

Notes  
1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.  
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

4 Block description and electrical characteristics

4.1 Voltage regulation

The output voltage $V_Q$ is divided by a resistor network. This fractional voltage is compared to an internal voltage reference and drives the pass transistor accordingly.

The control loop stability depends on the output capacitor $C_Q$, the load current, the chip temperature and the internal circuit design. To ensure stable operation, the output capacitor’s capacitance and its equivalent series resistor ESR requirements given in Table 2 “Functional range” on Page 7 must be maintained. For details see the typical performance graph “Output capacitor series resistor ESR($C_Q$) versus output current $I_Q$” on Page 12. Since the output capacitor is used to buffer load steps, it should be sized according to the application’s needs.

An input capacitor $C_I$ is not required for stability, but is recommended to compensate line fluctuations. An additional reverse polarity protection diode and a combination of several capacitors for filtering should be used, in case the input is connected directly to the battery line. Connect the capacitors close to the regulator terminals.

Whenever the load current exceeds the specified limit, for example in case of a short circuit, the output current is limited and the output voltage decreases.

The overtemperature shutdown circuit prevents the IC from immediate destruction under fault conditions (for example output continuously short-circuited) by switching off the power stage. After the chip has cooled, the regulator restarts. This oscillatory thermal behaviour causes the junction temperature to exceed the maximum rating of 150°C and can significantly reduce the IC’s lifetime.

4.5 Enable

The TLS715B0NAV50 can be switched on and off by the enable feature. Connect a HIGH level as specified below (for example the battery voltage) to pin EN to enable the device; connect a LOW level as specified below (for example GND) to switch it off. The Enable function has a build-in hysteresis to avoid toggling between ON/OFF state, if signals with slow slopes are applied to the input.

Table 6 Electrical characteristics enable

5 Application information

5.1 Application diagram

![Application diagram](image)

Figure 4 Application diagram

5.2 Selection of external components

5.2.1 Input pin

The typical input circuitry for a linear voltage regulator is shown in the application diagram above. A ceramic capacitor at the input, in the range of 100 nF to 470 nF, is recommended to filter out the high frequency disturbances imposed by the line for example ISO pulses 3a/b. This capacitor must be placed very close to the input pin of the linear voltage regulator on the PCB.

An aluminum electrolytic capacitor in the range of 10 µF to 470 µF is recommended as an input buffer to smooth out high energy pulses, such as ISO pulse 2a. This capacitor should be placed close to the input pin of the linear voltage regulator on the PCB.

An overvoltage suppressor diode can be used to further suppress any high voltage beyond the maximum rating of the linear voltage regulator and protect the device against any damage due to over-voltage above 45 V.

The external components at the input are not mandatory for the operation of the voltage regulator, but they are recommended in order to protect the voltage regulator against external disturbances and damages.

5.2.2 Output pin

An output capacitor is mandatory for the stability of linear voltage regulators.

The requirement to the output capacitor is given in “Functional range” on Page 7. The graph “Output capacitor series resistor ESR(CQ) versus output current IQ” on Page 12 shows the stable operation range of the device.

TLS715B0NAV50 is designed to be stable with extremely low ESR capacitors. According to the automotive requirements, ceramic capacitors with X5R or X7R dielectrics are recommended.
Application information

The output capacitor should be placed as close as possible to the regulator’s output and GND pins and on the same side of the PCB as the regulator itself.

In case of rapid transients of input voltage or load current, the capacitance should be dimensioned in accordance and verified in the real application that the output stability requirements are fulfilled.

5.3 Thermal considerations

Knowing the input voltage, the output voltage and the load profile of the application, the total power dissipation can be calculated:

\[
P_D = (V_I - V_Q) \times I_Q + V_I \times I_q
\]

(5.1)

with

- \( P_D \): continuous power dissipation
- \( V_I \): input voltage
- \( V_Q \): output voltage
- \( I_Q \): output current
- \( I_q \): quiescent current

The maximum acceptable thermal resistance \( R_{thJA} \) can then be calculated:

\[
R_{thJA,max} = \frac{(T_{j,max} - T_a)}{P_D}
\]

(5.2)

with

- \( T_{j,max} \): maximum allowed junction temperature
- \( T_a \): ambient temperature

Based on the above calculation the proper PCB type and the necessary heat sink area can be determined with reference to the specification in “Thermal resistance” on Page 8.

Example

Application conditions:

- \( V_I = 13.5 \) V
- \( V_Q = 5 \) V
- \( I_Q = 100 \) mA
- \( T_a = 85^\circ \)C

Calculation of \( R_{thJA,max} \):

\[
P_D = (V_I - V_Q) \times I_Q + V_I \times I_q
\]

\[
= (13.5 \) V – 5 \) V \times 100 \) mA
\]

\[
= 0.85 \) W
\]

\[
R_{thJA,max} = \frac{(T_{j,max} - T_a)}{P_D}
\]

\[
= (150^\circ \) C – 85^\circ \) C \) / 0.85 \) W = 76.47 \) K/W
As a result, the PCB design must ensure a thermal resistance $R_{thJA}$ lower than 76.47 K/W. According to “Thermal resistance” on Page 8, the FR4 2s2p board can be used.

5.4 Reverse polarity protection
TLS715B0NAV50 is not self protected against reverse polarity faults and must be protected by external components against negative supply voltage. An external reverse polarity diode is needed. The absolute maximum ratings of the device as specified in “Absolute maximum ratings” on Page 6 must be kept.

IMPORTANT NOTICE
The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics ("Beschaffenheitsgarantie").
With respect to any examples, hints or any typical values stated herein and/or any information regarding the application of the product, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.
In addition, any information given in this document is subject to customer’s compliance with its obligations stated in this document and any applicable legal requirements, norms and standards concerning customer’s products and any use of the product of Infineon Technologies in customer’s applications.
The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer’s technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

WARNINGS
Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.
Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies’ products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.
