## Ultra low quiescent current linear voltage regulator

Order now

Technical documents

Simulation

Family overview

Support

RoHS

## Features

- Ultra low quiescent current, typically 4.3  $\mu\text{A}$  at light loads
- Wide input voltage range from 3.7 V to 40 V
- Output voltage 5 V
- Output voltage accuracy  $\pm 2\%$
- Output current capability up to 500 mA
- Low dropout voltage, typically 190 mV, at output current below 100 mA
- Stable with ceramic output capacitor of 4.7  $\mu\text{F}$
- Overtemperature shutdown
- Output current limitation
- Wide temperature range
- Green Product (RoHS compliant)

## Potential applications

- Automotive supply systems or other supply systems that are connected to the battery permanently
- Automotive systems that need to operate in cranking condition
- General automotive applications

## Product validation

Qualified for automotive applications. Product validation according to AEC-Q100.

## Description

The OPTIREG™ linear voltage regulator TLS850A4TEV50 is a linear voltage regulator with high performance, low dropout voltage and ultra low quiescent current. With only 4.3  $\mu\text{A}$  typical quiescent current at light load and an input voltage range of 3.7 V to 40 V the device is perfectly suitable for automotive supply systems or other supply systems that are permanently connected to the battery.

The loop concept combines fast regulation and very high stability while requiring only one small ceramic capacitor of 4.7  $\mu\text{F}$  at the output. The operating range starts at an input voltage of 3.7 V (extended operating range). This makes the device suitable for automotive systems that need to operate in cranking condition.

Internal protection features, such as output current limitation and overtemperature shutdown, are designed to protect the device from immediate damage caused by failures such as

- output shorted to GND
- overcurrent condition
- overtemperature condition

# OPTIREG™ linear voltage regulator TLS850A4TEV50

## Ultra low quiescent current linear voltage regulator

---

### Description

The thermally conductive package enables sustained operation despite significant dissipation across the device.

$T_j = -40^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$ ; all voltages with respect to ground (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or condition	P-Number
		Min.	Typ.	Max.			
Voltage on input I	$V_I$	-0.3	–	45	V	1)	PRQ-35
Voltage on output Q	$V_Q$	-0.3	–	7	V	1)	PRQ-36
Junction temperature	$T_j$	-40	–	150	$^{\circ}\text{C}$	1)	PRQ-39
Storage temperature	$T_{\text{stg}}$	-55	–	150	$^{\circ}\text{C}$	1)	PRQ-40

**ESD robustness**

ESD robustness all pins (HBM)	$V_{\text{ESD\_HBM}}$	-2	–	2	kV	1) 2)	PRQ-41
ESD robustness all pins (CDM)	$V_{\text{ESD\_CDM}}$	-750	–	750	V	1) 3)	PRQ-194

1) Not subject to production test, specified by design.

2) Human body model (HBM) robustness according to AEC-Q100-002.

3) Charged device model (CDM) robustness according to AEC-Q100-011 Rev-D; voltage level refers to test condition (TC) mentioned in the standard.

*Note: Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the datasheet. Fault conditions are considered as outside the normal operating range. Protection functions are not designed for continuous repetitive operation.*

**3 General product characteristics**

**3.2 Functional range**

**Table 3 Functional range**

$T_j = -40^\circ\text{C}$  to  $+150^\circ\text{C}$ ; all voltages with respect to ground (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or condition	P-Number
		Min.	Typ.	Max.			
Input voltage range	$V_I$	$V_{Q,nom} + V_{dr}$	–	40	V	1)	PRQ-43

1) Not subject to production test, specified by design.

2) Specified  $R_{thJA}$  value is according to JEDEC JESD51-2,-5,-7 at natural convection on FR4 2s2p board; the product (chip and package) was simulated on a 76.2 × 114.3 × 1.5 mm<sup>3</sup> board with two inner copper layers (2 × 70 μm Cu, 2 × 35 μm Cu). Where applicable, a thermal via array next to the package contacted the first inner copper layer.

3) Specified  $R_{thJA}$  value is according to JEDEC JESD51-3 at natural convection on FR4 1s0p board; the product (chip and package) was simulated on a 76.2 × 114.3 × 1.5 mm<sup>3</sup> board with one copper layer (1 × 70 μm Cu).

*Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information visit [www.jedec.org](http://www.jedec.org).*

## 4 Voltage regulation

# 4 Voltage regulation

### 4.1 Functional description voltage regulation

The output voltage  $V_Q$  is internally divided by a resistor network. The device compares this fractional voltage to an internal voltage reference and drives the pass transistor accordingly.

The control loop stability depends on the following factors:

- output capacitor  $C_Q$
- load current
- chip temperature
- internal circuit design

#### Output capacitor

To ensure stable operation, the capacitance of the output capacitor and its equivalent series resistor (ESR) requirements as specified in [Table 3](#) must be maintained. The output capacitor must be sized according to the requirements of the application to be able to buffer load steps.

#### Input capacitors, reverse polarity protection diode

An input capacitor  $C_I$  is recommended to compensate for line influences.

In order to block influences such as pulses and high frequency distortion at the input, an additional reverse polarity protection diode and a combination of several capacitors for filtering should be used. Connect the capacitors close to the component's terminals.

#### Smooth ramp-up

In order to prevent overshoots during startup, a smooth ramp-up function is implemented. This ensures a reduced output voltage overshoot during startup, mostly independent from load and output capacitance.

#### Output current limitation

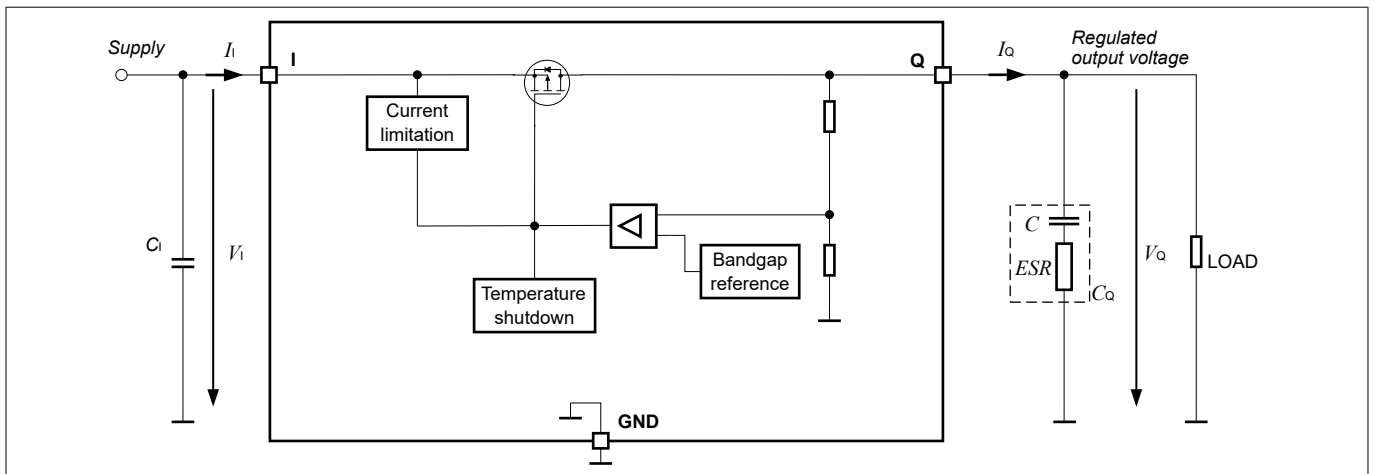

If the load current exceeds the specified limit, due to a short-circuit for example, then the device limits the output current and the output voltage decreases.

#### Overtemperature shutdown

The overtemperature shutdown circuit prevents the device from immediate destruction by switching off the power stage in the case of a fault condition, which could occur due to a permanent short-circuit at the output, for example. After the device cools down, the regulator restarts. This leads to an oscillatory behavior of the output voltage until the fault condition is removed.

However, any junction temperature above the maximum junction temperature  $T_J$  is outside the maximum ratings and therefore significantly reduces the lifetime of the device.

**6 Application information**

**6 Application information**

**6.1 Application diagram**

*Note: The following information is given as an example for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.*

**Figure 5 Application diagram**

*Note: This figure is a simplified example of an application circuit. The function must be verified in the application.*

**6.2 Selection of external components**

**6.2.1 Input pin**

Figure 5 shows an example of the input circuitry for a linear voltage regulator. A ceramic capacitor at the input, in the range of 100 nF to 470 nF, is recommended to filter out the high frequency disturbances imposed by the line, for example ISO pulses 3a/b. This capacitor must be placed very close to the input pin of the linear voltage regulator on the PCB.

An aluminum electrolytic capacitor in the range of 10  $\mu\text{F}$  to 470  $\mu\text{F}$  is recommended as an input buffer to smooth out high energy pulses, such as ISO pulse 2a. This capacitor must be placed close to the input pin of the linear voltage regulator.

An overvoltage suppressor diode can be used to further suppress any high voltage beyond the maximum rating of the linear voltage regulator and to protect the device from damage due to overvoltage.

The external components at the input pin are optional, but they are recommended to deal with possible external disturbances.

**6.2.2 Output pin**

An output capacitor is mandatory for the stability of linear voltage regulators. Furthermore, it serves as an energy buffer during load jumps, to compensate and maintain a constant output voltage potential. It must be dimensioned according to the specific requirements of the application. The requirements for the output capacitor are given in Table 3.

The device is designed to be stable with low ESR capacitors as well. According to automotive requirements, ceramic capacitors with X5R or X7R dielectrics are recommended.

The output capacitor should be placed as close as possible to the voltage regulator’s output and GND pin and on the same side of the PCB as the regulator itself.

## 6 Application information

In case of a possible transient voltage on the input or a transient load current, the capacitance should be dimensioned accordingly.

The configuration must be verified in the real application to ensure that the output stability requirements are fulfilled.

### 6.3 Thermal considerations

From the known input voltage, the output voltage and the load profile of the application, the total power dissipation can be calculated as follows:

$$P_D = (V_I - V_Q) \times I_Q + V_I \times I_q$$

#### Equation 1

with

- $P_D$ : continuous power dissipation
- $V_I$ : input voltage
- $V_Q$ : output voltage
- $I_Q$ : output current
- $I_q$ : quiescent current

The maximum acceptable thermal resistance  $R_{thJA}$  is given by:

$$R_{thJA} = \frac{T_{j,max} - T_a}{P_D}$$

#### Equation 2

with

- $T_{j,max}$ : maximum allowed junction temperature
- $T_a$ : ambient temperature

Based on the above calculation the proper PCB type and the necessary heat sink area can be determined by referring to the specification for thermal resistance in [Table 4](#).

### 6.4 Reverse polarity protection

The device has no internal protection against reverse polarity and thus requires an external reverse polarity protection diode against negative supply voltage.

The absolute maximum ratings of the device as specified in [Table 2](#) must be maintained.
